Hi, I'm Annessa doorknob at NASA Kennedy.

You're going inside KSC NASA's Orion spacecraft, which performed flawlessly during its first flight test launch on December fifth from Cape Canaveral Air Force Station.

And lift loss after the dawn of Orion.

At a new era of American space exploration, new generation spacecraft orbited Earth twice before slamming into the atmosphere at 20,000 miles per hour to test the TCO and conditions close to what it will encounter returning from lunar orbit in the future.

Parachuted into the Pacific Ocean.
and a half hours after launch or cruise

from NASA the US Navy and Lockheed Martin treatment we as a species are meant to push human presence into the solar system and this is a first step in starting to do that and remember spaceport magazine takes you further inside KSC
