Hey, I’m NASA Kennedy’s Michelle Crowe, taking you Inside KSC!

The first launch of 2015 saw a SpaceX Falcon 9 roar off the launch pad at Cape Canaveral Air Force Station.

Its Dragon capsule delivered almost three tons of supplies, equipment and science experiments to the International Space Station.

This Dragon mission ups the total of cargo delivered to the station by SpaceX to more than nine tons, much of which was processed here at Kennedy for launch.

This included experiments such as BRIC-19 and 20, along with VEGGE, a project to grow lettuce on the station.

More processing is expected here at KSC as CASIS and others plan new experiments in microgravity aboard the ISS.

And remember, Spaceport Magazine digs deeper Inside KSC!
