I'm NASA Kennedy's Kelsey Legard and I'm bringing you Inside KSC.

NASA's OSIRIS-REx spacecraft continues through systems testing at Kennedy as it is prepared for a complex mission due to launch in September.

After this year's launch, the spacecraft is to survey an asteroid up-close and even take a sample of it for return to Earth in 2023.

A spacecraft that launched from the Florida Spaceport in 2011 is reaching its scientific objective.

The Juno spacecraft, one of the largest interplanetary probes ever dispatched by NASA, is to enter Jupiter's orbit on July Fourth to begin intensive studies of the largest planet in the solar system.

Researchers hope to decipher Jupiter's magnetic field properties and answer other questions using the Juno's findings.
And remember Space Port Magazine digs deeper Inside KSC.
