Hello I'm Dava Newman at Kennedy Space Center, let's go Inside KSC.

Kennedy officials cut the ribbon on a new launch pad dedicated to the needs of small-class launch vehicles.

Dubbed Pad 39C, the area is inside the 39B complex perimeter and will host the liftoffs of rockets carrying small payloads such as cubesats into orbit.

A NASA instrument called EPIC snapped a photo of the full sunlit-face of Earth from a million miles away as part of the DSCOVR mission.

The DSCOVR spacecraft launched from Kennedy earlier this year and has taken position 1 million miles away to constantly assess conditions on the Sun and Earth for NOAA.

And remember Space Port Magazine takes you further Inside KSC.
