six to liftoff the final space shuttle 

mission to repair and upgrade the Hubble 

Space Telescope is the subject of a new 

43 minute IMAX film narrated by Leonardo 

DiCaprio Hubble 3d was premiered during 

a special event held at the National Air 

and Space Museum in Washington the movie 

features the NASA astronauts from 

sts-125 the final space shuttle mission 

to the telescope who serviced Hubble in 

May 2009 an IMAX 3d camera mounted in 

space shuttle Atlantis as payload Bay 

filmed their progress a lot of cameras 

rolling while you're up there of course
everybody was watching it was mission

that kept me on the edge of my seat

while we were doing understood thrilled

that everybody worked together and it

came out as well as it did in the air I

remember the first Hubble launch and

obviously Charlie Bolden my boss was a

pilot on the first launch so we talked

about this a lot and I love the fact

that the public sort of gets this story

and it

melting of science and human spaceflight

in a perfect way that's helping to

overcome challenges you couldn't write a
better story the Hubble Space Telescope

explores our universe 24 hours a day 365 days a year

beaming hundreds of thousands of images

back to us here on earth it is one of NASA's most successful and long-lasting science missions and has helped determine the age of the universe the identity of quasars and the existence of dark energy

Hubble 3d opens an IMAX and IMAX 3d theaters worldwide on March 19th
