for example a comet is a comet's tail

is just the solar wind going over this

icy body stripping off particles

ionizing the particles and they're

glowing in there no it looks really big

it is actually a small star actually

made out of an old large refrigerator

box so my two friends and I got inside

the box to actually view the Eclipse and

I really wish somebody had a camera

thing about a sign is the fact that it

has a win actually plasma that comes off

the surface of the Sun that's flowing

towards the Earth rotates uniform The
Sun has a differential rotation imagine

the valley moving and the nose refuses

to move and that's what we're not

differential is that it is one of the

primary sources of energy and so without

it there would be no life on Earth

you
