

1

00:00:00,000 --> 00:00:08,520

There are an awful lot of stars in our universe and our star, our sun, has a lot of planets

2

00:00:08,520 --> 00:00:15,080

around it and it would seem highly egotistical I think that if we thought that we were the

3

00:00:15,080 --> 00:00:19,440

only planet in the entire universe that had life on it.

4

00:00:19,440 --> 00:00:22,760

No matter how far you can see when you're looking into the universe you just aren't

5

00:00:22,760 --> 00:00:26,560

looking at the end of it and it doesn't make any difference whether you're doing it with

6

00:00:26,560 --> 00:00:30,600

your naked eye with a reasonably high power telescope or the biggest thing that we have

7

00:00:30,600 --> 00:00:37,600

here on earth we just can't see to the end of it and I can't imagine myself that there

8

00:00:37,600 --> 00:00:42,440

aren't environments throughout that entire universe that are in some way similar to ours.
