

However, on Saturday last, August 10, at about 1.03 pm, when looking out of the bedroom window, I noticed in the distant mid-sky at rather a lower height than the average aeroplane would travel, an object which I assumed at first to be a form of kite.

As it moved nearer, I was amazed to observe that it was apparently self-motivated, elliptical in shape with a circular central indentation, and in the reflected rays from the sun, a bright silvery colour.

From that distance it appeared as a disc about 12 to 15 inches diameter and say, two inches deep. It was spinning round slowly, moving towards the park at its western edge, over the Woodgate Valley area in the direction of the university, somewhat quicker than the speed at which a plane would normally be flying.

I am completely

mystified as my eyesight is quite good, and there is no chance that I was mistaken.

Surely I cannot have been the only person to observe this object?

C.D.

Selly Oak.

## Saucer spotted

I consider myself to be a logical person, and in the past have read about sightings of flying saucers with scepticism.
