Watch for bright spark

A once-in-a-lifetime visitor from outer space is heading for earth at 35,000 miles per hour.

By the late autumn of 1985 and through to the first two weeks of 1986 inhabitants of the northern hemisphere should be able to see the rare visitor, Halley's Comet, first with binoculars and then with the naked eye.

But the best view of the comet will be had from space probes.
