> @of GRACEFUL UNDULATING formations (Pelican Point No. 9, see below).
Nothing
> @about pelican formations with ERRATIC irregular motion, like speedboats going

> @over ROUGH WATER.
>
> That depends on what kind of wind the kite is flying in. I have
> seen Chinese kites in very stiff winds with their tails
> thrashing violently, and I have seen them in smooth winds with
> the tails gently undulating.

COMMENTS: Since Arnold kept using words such as "JERKING" and "ERRATIC" and "ROUGH WATER" it must be the former not the latter, which is my whole point.

> @Here are my lists once again:
>
> AAAAACKKK! Please stop repeating everything from the previous
> posts in each post, unless it is absolutely necessary.

COMMENTS: Sorry! Unfortunately it seems to be necessary much of the time in order to know what was being replied to. Here, it was the case that if I didn't repeat my lists of Pelican and Arnold-Object Flight Behaviors then James would not respond.

I want to

@ @ Subject: RE: 'Pilot' Magazine, June 2000 - Report of UFO Incident
@ @
@ @
@ @ @ @
@ @ Larry,
@ @
@ @ I just demonstrated the fact of physical optics that it is an
@ @ impossibility for a double exposure to impose a DARKER image
@ @ (i.e., take away light) from an already exposed photographic
@ @ emulsion. You just go right on ahead and ignore what I proved.
@
@ It can be darker if automatic development compensates for the
@ added exposure.
@
@ COMMENTS: Nonsense! Developers cannot select out one
@ exposure from another superimposed on the same piece of film!
@ Nor can developers select one specific image on a picture
@ from the others immediately adjacent or surrounding it on the
@ same picture and develop it differently. Again this is utter
@ madness.

I didn't say they did. What I mean is that the automatic developer adjusts the exposure time on the PRINT to compensate for an overly dark or overly light original image. So the double exposed item can make a "shadow" where the darker parts of the second image are, because the overexposed parts are reduced down to normal exposure settings. The machines also look for certain parts of the image to adjust color correction.

A manual printing of the negative would have been done through a similar procedure, using a light meter to set the exposure and color balance.

Some systems have an operator look at each image to check for wrong settings before printing. If the operator thinks something is wrong, he then

adjusts the exposure manually. Thus the color balance of a friend's photo was "adjusted" to make the dog in the picture a light brown. The dog had been dyed kelly green for a St. Patrick's Day party.

And, yes, an experienced film developer can adjust the exposure of one part if he wants to (but in a darkroom, not on an automatic system). The process is called dodging, and involves making part of the exposure with dodging tool waved across the parts of the print to be lighter. My late uncle taught me a lot about photography, and this was one of the tricks I saw him use. Those nice portraits that fade out at the edges are dodged.

The image could also have been caused by a light leak in the developer, if it jammed during that roll of film.

MORE COMMENTS: This is tantamount to hoaxing the photo since it is highly unlikely that the UFO image would be picked out by chance. What I was talking about was normal developer equipment unguided to select parts of the film and thus unable to reverse the light-addition effect of a double exposure.

@ The photo is taken from inside the car or plane that was sold! That @ doesn't sound like madness to me.

@
@ COMMENT: Since the photo is set at infinity (see distant @ terrain) a window photographed from inside would be so out of @ focus and within the hyperfocal distance that nothing like @ the UFO image would be seen at all.

This depends on the camera, the exposure, and the distance of the photographer from the window. The focus seems about right for a person in the left rear seat taking the picture.

MORE COMMENTS: The focus is wrong and you know it. Someone taking a picture that far away from the window would either (a) obviously have the window frame in view with sky and ground below BLOCKED by the roof or cabin of the aircraft or auto, or (b) have to use a telephoto lens aimed through the distant window in order to eliminate the roof and cabin in which case the alleged "sales sticker" would comprise a large fraction of the view out the window and would be completely out of focus.

@

@

@ @

@ Larry,

@

@ I just demonstrated the fact of physical optics that it is an

@ impossibility for a double exposure to impose a DARKER image

@ (i.e., take away light) from an already exposed photographic

@ emulsion. You just go right on ahead and ignore what I proved.

It can be darker if automatic development compensates for the added exposure.

COMMENTS: Nonsense! Developers cannot select out one exposure from another superimposed on the same piece of film! Nor can developers select one specific image on a picture from the others immediately adjacent or surrounding it on the same picture and develop it differently. Again this is utter madness.

@ As for your imagining seeing automobiles you just posted the

@ statement suggesting as a "double exposure" image situation

@ that: "Might the object be the location where a mandatory

@ vehicle sales sticker was removed, leaving the sticky parts

@ attached to a window?"

@ How can another vehicle, with the "sales sticker" window
@ area, be under two other vehicles (note your statement below
@ that the "object" is below the station wagon and approaching
@ car)? If the "object" is an area of car window then the size
@ of the entire vehicle must overlap and encompass the other
@ two alleged vehicles. This is madness!

The photo is taken from inside the car or plane that was sold! That doesn't sound like madness to me.

COMMENT: Since the photo is set at infinity (see distant terrain) a window photographed from inside would be so out of focus and within the hyperfocal distance that nothing like the UFO image would be seen at all.

@ There is another simpler explanation than a conspiracy to
@ double expose car images: The photo James has posted appears
@ to be from a PRINTED MAGAZINE and IMAGES FROM THE OTHER SIDE
@ OF THE PAGE apparently are showing through. Whether they are
@ ads for automobiles or something else entirely I can't tell.

That makes sense! I'll buy that, if the original page has them on the other side. Do we have it? And is the shadow part of the other side, or the original image?

Which means we don't have a "virgin" copy of the photo to look at.

And the original object could still be the remains of a new plane sticker (don't laugh, they're required in this state). It's even on the correct window.

@ @

@ Double exposure cannot subtract light from an area of a photo

@ (e.g., adding a

@ shadow). It can only add light, increasing the density of

@ exposed silver

@ halide grains. Once exposed to light a second exposure

@ cannot take back any

@ of the silver halide grains that have already been exposed.

Right. But it can add more light to the other areas, causing the automatic film

processing to be offset by that amount. It reminds me of the time I took some

amateur astronomical photos, and sent the film off to be developed

commercially. The color slides that resulted appeared to have been taken in the

daytime, jiggered around by automatic color correction in the film processing.

The new expanded scan shows that the object is blurred (and is thus close to the camera), and it also shows faint images of automobiles in the sky between

the object and the wing. That also suggests double exposure.

It also shows more detail in color variations on the object. Might the object be the

location where a mandatory vehicle sales sticker was removed, leaving the sticky parts attached to a window?

Kathleen,

Thanks for your observations. Can you get your pilot friend to fly Arnold's route at his 9,500-foot altitude and take pictures of Rainier and Little Tahoma? Have him start over Mineral and fly on heading to Yakima and snap away. I'd like to know exactly at what location Little Tahoma comes into view.

Regards,

Brad Sparks

To All:

In the spirit of the 53rd anniversary of Arnold's sighting I camped at Mt. Rainier last weekend (since it opened early this year). As I painfully dragged my behind up two trails (one to the base of Little Tahoma)...a 1800 ft. climb in 2 hours and another on Sunday, doing 2,000 ft in 2 hours to the top of Sunrise. I was of course in my usual awe of this volcano. No matter how many times I go there, try different trails, get on the highest logging road my Jeep will carry me to get yet another angle of her, I am always reminded of the emense size of this mountain. Little Tahoma is NOT as Bruce mentioned at the base of the mountain. I was at 4,200 feet when I started and climbed to over 6,200 according to my GPS and not anywhere near Little Tahoma's beginning. Little Tahoma is an offshoot of the lower peaks. The snow fields were blowing last weekend and I could not help but notice they could not in any way shape or form be mistaken for anything other than snow or clouds just forming.

Last night I drove up to a remote spot on Mt. Rainier's Northwest side. If you look at a map I was close to what is known as Grand Park. I was with another UFO person. I shot some video as there was steam coming out of the top last night. Even steam could not be mistaken for anything other than steam, snow or clouds. This other person who is a private pilot and I debated how objects would appear over the mountain and from what elevation. He is in agreement pelicans was a definat NO-NO. He is a native of the Pacific Northwest

by the way, pilot and has never seen a pelican in this area.

I think we need to have a get together to Seattle. Anyone is welcome. I'll gladly take you up there, show you different angles and views and then make a decision what possibilities Kenneth Arnold could have seen. How about it James?

>alternative?

Whadaya mean, untenable? My solution was to have the objects lower than the 9500 (or 10,000) ft that Arnold estimated. If they actually dipped below a peak of the ridge then they were as low as the height of the ridge, i.e. below 7000 ft (or whatever height is assigned to the ridge. This is clearly lower than 9500 ft. Also, this is much lower than Little Tahoma.

>Once again.

>DRAW A MAP!

>Based on which scenario - Brad's or your own?

Pick any pelican scenario you like. It could have pelicans at appoximately Arnold's altitude, but you could have them above or below as you choose to make them seen to be flying at an altitude of 7000 ft or an altitude of 11000 ft.

How far above or below depends upon the angle you assume from Arnolds plane to the peak that they supposedly disappeared behind and it also depends upon how far from the plane you

assume the pelicans were when they passed in front of Arnold.

Simple!

>With Little Tahoma being established as the almost certain 'peak'
>Arnold used as a distance marker - I did have the same doubts as
>yourself, that's why I specifically checked them out - if you
>could possibly now clarify what your scenario actually is, then
we can maybe make some further progress.

Sure. As I wrote above, draw a map showing the flight of pelicans and the flight of Arnold's plane. Make some reasonable assumptions about Arnold's speed toward the east or east northeast (if toward Rainier), then flight direction of teh geese, the speed of the geese, and the initial starting locations (Arnold at some position near Mineral and the geese no more than 5 miles from his plane in a direction somewhat to the north of the direction t Mt. Rainier). Let the geese be a bit higher than Arnold if you think the mountain peak they seemed to disappear behind was Little Tahoma. In fact, the angle upward from Arnold's plane (9500) to Little Tahoma (11,000 --rough numbers) at a distance of, say, 23 miles is about 0.8 degree. That means that if the pelicans were, say, 5 miles away when they were between Arnold and LT, they were about 70 ft higher than Arnold. If they were closer than 5 miles (hint... they were closer) then they were less than 66 ft above Arnold.

Easy to draw a map and see what happens.

Brad,

I appreciate what you're saying, however, there are simply too many references that the objects flew in front of Mt. Rainier.

There's one remaining clarification from Arnold which is crucial and comes from the UFO Symposium transcript:

"And, of course, I was very puzzled by the fact that they didn't have tails, but I got a good look at their image on the snow. Now, when they gave off this flash they would appear to be round. When they turned lengthwise or flatwise to me they were very, very thin. And actually they disappeared behind a sharp projection on Mt. Rainier in the snow field to my eyesight and since I knew approximately where I was, flying of course toward the mountain, I knew where they had passed. I thought my judgement and my clocking could be within reasonable limits as to about how fast they were going".

This "sharp projection _on_ Mt. Rainier in the snow field" is probably in hindsight the most telling confirmation that it was Little Tahoma.

By definition, Little Tahoma is a "sharp projection _on_ Mt. Rainier".

The absolute fact that Arnold also confirmed how he viewed the

objects against Mt. Rainier - which he naturally couldn't have if they travelled behind it - is clearly evident in all of his main accounts:

"but I could see them against the snow, of course, on Mt. Rainier..."

Source: Radio interview

"Very shortly they approached Mt. Rainier, and I observed their outline against the snow quite plainly".

"I am making a drawing to the best of my ability, which I am including, as to the shape I observed these objects to be as they passed the snow covered ridges as well as Mt. Rainier".

Source: Report to the Air force

"I watched as these objects rapidly neared the snow border of Mount Rainier, all the time thinking to myself that I was observing a whole formation of jets. In group count, such as I have used in counting cattle and game from the air, they numbered nine. They were flying diagonally in an echelon formation with a larger gap in their echelon between the first four and the last five. What startled me most at this point was the fact that I could not find any tails on them. I felt sure that, being jets, they had tails, but figured they must be camouflaged in some way so that my eyesight could not perceive them. I knew the Air Force was very artful in the knowledge and use of camouflage. I observed the objects' outlines plainly as they flipped and flashed along against the snow and also against the sky".

Source: 'The Coming of the Saucers'

"They seemed to be in an echelon formation, however, in getting a look at them against the sky and against the snow of Mt. Rainier as they approached I just couldn't discern any tails on them..."

"And, of course, I was very puzzled by the fact that they didn't have tails, but I got a good look at their image on the snow".

Source: UFO Symposium

It is overwhelmingly attested that Arnold claimed the objects flew across Mt. Rainier and also believed they briefly disappeared behind Little Tahoma, which he statedly relied on as

evidence of how far distant they were.

As we know it's an impossibility they flew in front of the mountain and also behind the further away Little Tahoma, Arnold was mistaken and the evidence confirming this is comprehensive.

Best wishes,

James Easton.

Subject: Re: New Kenneth Arnold Sketch?Status:

James,

It looks interesting and the objects look like bat-like crescents. I'm not sure exactly how this helps anything. It's hard to tell if the first image is meant to be a frontal / tail-end cross-sectional view or a side view because the bulge is in the center in either case.

Can you supply a transcript of this assertedly new Arnold testimony? Do the credits identify the producers and researchers who could be tracked down?

Brad

In a message dated Tue, 11 Jul 2000 3:12:38 PM Eastern Daylight Time, "James Easton" <voyager@ufoworld.co.uk> writes:

<<

I recent acquired from a second-hand CD and video shop, a 1993 video entitled, "The UFO Phenomenon", by Labyrinth Media Ltd.

Always curious if these older productions might contain worthwhile/little-known material, I've only got so far as the Arnold case - just after some interesting material about the 'Foo fighters' - and would you believe it...

Not only does this video feature some aerial footage of Mt. Rainier, Little Tahoma et al - and apparently taken from a comparable location to Arnold's position - the brief narrative, which is an actor's 'voice-over' and apparently supposed to be a verbatim Kenneth Arnold testimony, is an account I've never heard before.

Of even more interest and if actually drawn by Arnold, would be absolutely fundamental new evidence, is a sketch I've previously neither seen or heard about.

Using a digital camera, I've eventually managed to capture a flicker-free copy of the on-screen image and this can be seen at:

http://www.ufoworld.co.uk/arnold/arn_new.jpg

Can anyone identify this drawing/where and when it originated?

If a 'genuine Arnold', why hasn't it come up in discussions

before now?

Best wishes,

James Easton.

The other problem remains where, over the Christmas Holidays, one could find enough crews to fly that many helicopters. This seems to have stumped Schuessler's team as well, since all known units with such helicopters were checked and their personnel were almost all on leave during this period.

From: Bill Rose <bill.rose@virgin.net>
Subject: Cash-Landrum IncidentMessage-id: <3870AAE1.1E2A@virgin.net>

1) Does anyone know why Cash/Landrum decided they had seen Chinooks as opposed to numbers of the slightly smaller but fairly similar CH-46 Vertol Helicopter which was in widespread US service at that time. Were the witnesses really that capable of determining the difference in this situation? The case appears to have hinged on this issue.

2) Could they have accurately determined just how close the nearest helicopters were to the unidentified platform?

3)Where could the flight have come from and been going to? (Allowing for local conditions and the range of the helicopters)

4)Were there any other witnesses along the flight route? This was a big formation of aircraft! Were they flying too low to be picked up by civil radar?

5)Does anyone have an opinion on what the unidentified platform was?

6)During the nuclear powered NB-36H tests in the mid-1950s, it was standard procedure to also fly a C-119 transporter which contained a unit of fully armed paratroopers who would deal with an emergency. Could we assume the accompanying helicopters also carried troops for this purpose?

Subject: Re: Voyager Newsletter - Issue No. 9

Hi All

>Burroughs describes seeing a red light above a blue light, both
>of which were "flashing on and off".

Two things occur to me.

1. Could this have been an emergency vehicle (police/fire/ambulance - or even a Coastguard Land Rover!) in the distance.
2. I saw flashing red and blue lights and a brilliant white light just before Christmas. It was the local Police helicopter hovering at about 300 feet on a pitch dark night using it's Nightsun spot light during a search of some woodland. And with the wind conditions that night I didn't hear any noise from the chopper. I noted that the police had put a large rotating blue beacon under the chopper in addition to its normal navigation lights. So it was showing red on top and blue below. I assume this is used only when its on task as I've not seen it used when it flies around on patrol.

Re Special Ops

>"They did not make a lot of sound, but they came in fast. When
>they departed, they turned their lights back on and went off in
>separate directions. We did exercises with the SAS all the time".

I bought a book over Xmas called "Chinook" and written by an ex-crew member of a Chinook used by the Special Forces flight of 7 Sqdn based at Odiham. Their primary job is to support the SAS (and other UK Special Forces). It makes interesting reading, especially the night ops when they would fly at 50 feet or lower using night vision kit and carrying SAS troopers into their exercise zones. He talks of two areas (but he does not give their exact locations for obvious reasons), one is close to the SAS HQ at Hereford and one "near Newcastle". He also mentions that they were told to get out as fast as possible after the SAS had been dropped as the Chinook would give their location away, so it was lights on and foot down. Meanwhile the SAS disappeared into the night...

Cheers

Wow...

Not the first time the USAF has got egg on its face because of a TV show.

In the 1980's a UK TV news team was interviewing the PR guy at an USAF base in England. He was denying that the US were flying U2 / TR1 missions from the UK when one was towed out of a hanger in the distance...

Did I laugh....

Cheers

John

> [snip]

Hello James,

Regarding these 'triangular UFOs' in Scotland, has anybody seriously investigated the "Fife incident", which allegedly occurred on 23rd September 1996? According to a Malcolm Robinson, during this incident, several witnesses observed at close distance a 'huge black triangular object', several small 'beings' and a great 'being', and a lot of other extraordinary details, the whole report looking like a bad Sci-Fi short story. Who is Malcolm Robinson? What is the "Strange Phenomena Investigations" team which he founded in 1979? Was the "Fife incident" investigated by Malcolm Robinson himself or by somebody else? Do the witnesses "Mary", "Peter", "Jane" and "Susan" really exist?

I remember another post comparing this to the Stephen Michalak(sp?) case. I was wondering if you were aware of any comparison between the medical histories of these 2 people? (Cash and Michalak) Also, concerning the Michalak case.....have you considered the possibility, as I've read elsewhere, that he may have encountered a testing of the "maybe still being developed" Avro Car? This would fit the shape described in the Michalak case, although not in the Cash incident.

> It should be noted that Betty Cash was satisfied the encounter
> originated from a secret government operation and was not, "from
> outer space with little green men, that's for sure".

This would seem the case also in the Michalak evidence concerning his attempts to communicate with them after hearing what sounded like human communication in a recognizable language.

Thanks for the other info within your reply it was very helpful and I have printed it for future reference.

Respectfully,
Todd Lemire

Jean-Pierre,

I don't know what happened about this case, however, last I heard
(maybe from Tim Matthews), the story didn't have any substance.
As you say, it all sounded too ridiculous from the start.

If no-one on the list knows the full story, I'll ask elsewhere.

>Who is Malcolm Robinson? What is the "Strange Phenomena
>Investigations" team which he founded in 1979?

Malcolm has been involved with UFO research for many years and I
believe he is now active in BUFORA. SPI was and maybe still is an
organisation which investigated UFO and ghost, etc. reports.

I saw something on TV last night which I wanted to ask you about.
There was a program on the Discovery channel called, 'Mysteries
of the Unexplained' and it featured some UFO related material
(Karl Pflock was interviewed about the Mogul project).

Mentioning the Belgian sightings, the program displayed a sketch
which looked to be identical to the delta-shaped object which is
evident when the Petit-Rechain photograph is 'cleaned up'.

Whilst this drawing was on screen, the background narrative
claimed that witness reports were supported by photographs and
the Petit-Rechain photograph was then shown (but not the
'cleaned-up version').

Was this sketch from another witness, or was it intended to depict the Petit-Rechain object?

Unfortunately, that didn't seem to be clear, however, my impression was that this sketch of a delta-shaped object was being shown as additional evidence, unrelated to the photograph.

If I recall correctly (this was only on screen briefly), although it had the three 'edge' lights and a central light, the central light had other features surrounding it and the angle was different from the 'overhead' Petit-Rechain perspective.

I've never been aware of any other evidence for a delta-shaped, rather than triangular object sighted during the 'flap' and certainly not the sketch of one.

Are you familiar with such a drawing?

James Easton.

May I suggest that the differences between a Chinook and a Sea Knight are not obvious to inexperienced observer. Most people see a twin rotored helicopter as a Chinook be it a CH-46, 47, H-21, H-21 or a Belvedere. The last three are unlikely in this case, but watch any TV programme with Chinooks and there will invariable be some footage of a Sea Knight popping up.

I'd be wary of any-one saying they were definitely one or the other.

Most CH-46 are based in California, Virginia and the Carolinas, ie where the boats are. CH-47 are spread widely and i lack up to date info on their bases.

On the other hand, people in the East Texas area would be well aware of the Goodyear Blimp. There is a blimp hangar just north east of Houston. Out towards Kingwood I think. So to see it going about its business would be normal.

John,

The exercise area near Newcastle would be Otterburn Range. A forsaken place. Near Spadeadam Waste where Blue Streak's engines were tested. Excellent place for aircraft photography.

>appears to have hinged on this issue.

Bill,

There's a lengthy discussion of this case in 'The Age of the
UFO', edited by Peter Brookesmith and it neatly summarises
explanations for some of the points you've raised.

Re the above:

"Many of the helicopters were the large double rotor type with
four wheels, and a large housing to the rear".

"The evidence of all the witnesses to the Huffman event was
consistent. all were interrogated separately, not only about the
UFO but also the helicopters. They provided consistent
descriptions and sketches that indicated they had seen a larger
number of CH-47s, plus several other helicopters of a common
type. They were also given silhouette charts and asked to
identify any helicopters that appeared to be the same as the ones
they had seen. Again, all the witnesses agreed in their
identification of CH-47s".

An unanswered question is whether the charts also contained
silhouettes of CH-46s.

>2) Could they have accurately determined just how close the
>nearest helicopters were to the unidentified platform?

I'm not aware of any reason we should doubt this. When the
helicopters and enigmatic object moved away and the witnesses
continued their journey, it was apparently some five minutes
later that they again saw the object which "was still lighting up
the surrounding area and illuminating the helicopters".

>3)Where could the flight have come from and been going to?

>(Allowing for local conditions and the range of the helicopters)

Good question.

>4)Were there any other witnesses along the flight route? This
>was a big formation of aircraft! Were they flying too low to be
>picked up by civil radar?

There were other witnesses to the helicopters -

"Bettie, Vickie and Colby were not the only witnesses to the strange happenings at Huffman. An off-duty Dayton policeman and his wife were driving home from Cleveland through the Huffman area the same night and also observed a large number of CH-47 helicopters. A man living in Crosby, directly under the flight path, also reported seeing a number of heavy helicopters flying overhead".

Re the civil radar:

"Other information provided by Houston [airport] was that outside a 15-mile (24-kilometre) radius from the airport, helicopters must stay below an altitude of 1800 feet (550 metres), and that due to technical limitations the Houston control radar is restricted to a minimum altitude of 2000 feet (600 metres) around Lake Houston (the Huffman area)".

>5)Does anyone have an opinion on what the unidentified platform
>was?

It was something that apparently could remain airborne whilst only requiring the occasional 'blast' of propulsion. It was also seemingly slow moving, even when the 'rocket jets' were in action.

We're looking for a vehicle that was white or metallic in appearance, which glowed brightly, was large and resembled a diamond shape, but wasn't 'pointed' at the top or bottom and had the above flight characteristics.

That narrows the possibilities and there's only one object I can think of which that all seems to be describing.

Needs more evidence though and some questions remain puzzling.

Maybe someone can clarify this - was there ever evidence of 'scorch marks' on the road where the object was seen to hover?

James.

> Are you familiar with such a drawing?

Well, first I must say that, strictly speaking, "delta-shaped" is an expression coming from the (capital) fourth letter of the Greek alphabet, and should mean in fact "triangular". However, in The Concise Oxford Dictionary, it is said that a delta wing is "the triangular swept-back wing of an aircraft", and generally this kind of wing is not strictly triangular (see for example the Vulcan). If I had to define geometrically the shape of the Petit-Rechain object, I would say "a pentagon with two sides parallel and an axis of symmetry", but let's say that it is "delta-shaped".

During the evening of November 29, 1989, which saw the massive

arrival of the "Belgian wave", several witnesses saw clearly this "delta shape", probably because it was not yet complete night. Professor A. Meessen himself draw at least one sketch of a "delta-shaped" object in the SOBEPS book chapter about what happened this day, from the descriptions made by witnesses. The days after that massive arrival, there were less sightings (which means IMHO that it was not a media induced phenomenon...) and the "object" appeared generally when it was really night; people spoke then of "triangle" or "triangle with rounded corners". IMHO, this is an argument in favour of the authenticity of the Petit-Rechain photo: a hoaxter would have made a triangle, since practically nobody knew of the "delta shape" observed the first day.

@
@Hello Brad & List,
@
@ Thanks for your input Brad. Would you or anyone else on this
@list have any input on possible explanations for a "red orb" that
@was spotted over a nuclear power plant. It appeared to pulsate,
@implode on itself, and then disappear (vertically) at a
@tremendous rate of speed for a sighting duration of approx. 3
@mins. I would mainly like to hear what terrestrial
@explanations/objects could be given for this sighting.

Sounds like another fire balloon prank. There are two ways one of these can appear to disappear at a tremendous rate of speed:

1. When the last candle burns out, the fire balloon stays put, but dims out. With an object of small angular size at any distance farther than 30 feet, the human visual system can't tell the difference between a dimming object and an object moving directly away along the line of sight.
2. One of the candles set fire to the crossbar or envelope. The sudden increase in heat will cause the fire balloon to rise rapidly, then burn up. See the Redmond Oregon case of 9/24/59 for a classic example of this effect.

@Respectfully,

@Todd Lemire

I think the "Bonnybridge Triangle" needs clarification. As far as I am aware, the "Triangle" is as in "Bermuda", ie a region.

I'd be more likely to describe it as the "Buckfast Triangle" :)))

Dear all

That model wouldn't happen to be one the Flight Dynamics Lab / Lockheed proposed shapes as shown on pages 49 and 50 of Bill Sweetman's "Aurora" book?

Talking about a 75 degree delta vehicle based on the FDL-5 shape that Lockheed and the Flight Dynamics Lab worked on in the 1960s. Sweetman says:

"This configuration used a stablization technique called "Compression sharing" to dispense with the large wing-tip fins of the X-20 and other aircraft. It also featured flip-out wings to reduce its landing speed and retractable fairings in front of the split windshield"

The photo is credited to the USAF vi David Selegan

Could it be that Lockheed were taking the piss?

Incidently, this photo is the closest I have seen to an aircraft matching what I saw in August 89.

The Blimp base was located off Interstate 45, just barely north of Houston. Several years ago (after the Cash-Landrum event) the Goodyear people packed up and left town.

I think that a lot of people in the Houston area would be familiar with what the blimp looked like at night, however, it could be tricky. On several occasions it caused me to do a double take or three.

I would be surprised if John Schuessler hadn't checked the whereabouts of the blimp on that evening. Being that it was the holiday season, I imagine the blimp was out of the area at one of the many football games played all over the country.

James asked about scorch marks on the road and to the best of my knowledge there weren't scorch marks but the road was damaged. I can't swear to it, but I'm pretty sure I've seen pictures of the road. The pavement was buckled in appearance and the straight line that is painted down the center had become very wavy. Maybe I imagined that picture in my head after being told about the effects from the sighting. I know that Schuessler intended to get a sample of the road material but the damaged part had been quickly repaired. That, if true, is probably the most mysterious thing about this! Road repair just doesn't happen _that_ quickly! <G>

I've got a book that has an artist impression of it. It says it was
designed as two man (tandem cockpit) recon vehicle. It looks like
something out of James Bond :-)

Putting my other hat I was going to make a scale model of it but never got
around to it.

Cheers

John

@
@"I was watching a TLC program today called 'Billion Dollar Secret' and
@something very interesting caught my eye.
@
@Jane's Nick Cook was interviewing the head of the Air Force when I began
@looking at the collection of models on the shelves behind his head. Notice
@anything funny? On the left side of the screen was an unidentifiable
@aircraft that looked remarkably like the stealth swing wing 'switch blade'
@that I've been chasing for the last few years.
@
@Take a look at the attached frame grabbed stills and tell me what you
@think".
@
@
@I've attached the images for any comments.

Notice that the cockpit is a lot larger on that plane than on the others on the shelf, indicating that the scale is different. It's fuzzy, but it looks somewhat like the little mid-'50s experimental jet fighter with the vee tail (patterned after the successful Beechcraft Bonanza). It might even BE a Beechcraft Bonanza model, with the propeller blades removed so it looks like it's in flight.

Nothing with a fuselage like that could be even remotely considered stealth technology. It would paint a very clear image on RADAR.

@international treaty all satellite launches must be registered
@with COSPAR and given an International Designation (such as
@1999-13C). The trick is when there are multiple satellites
@released from an unmanned mission or from a Space Shuttle. The
@"hidden" satellites are from these piggyback flights. Still,
@some of these are eventually found out from detection of signals
@or optically (there are reportedly some "sleeper" sats with no
@transmissions, painted with Stealth absorptive coatings etc. but
@then these DON'T MAKE SETI SIGNAL PROBLEMS EITHER).

@This still doesn't change the fact that SETI astronomers can
@observe telltale Doppler shifts of a satellite. If in Near
@Earth Orbit it is obvious when the Doppler shifts approach
@orbital velocity of 8 km/sec.

But there is no Doppler shift when the satellite is moving
perpendicular to the line of sight. Since the antenna is moving
on a slow, fixed tracking schedule (or just rotating with the
Earth), it would pick up the signal for the time the satellite is
crossing the line of sight of the antenna, then the signal would
just vanish.

By the way, how are you going to measure a Doppler shift if you
don't know the original frequency? It makes sense only if the
Doppler shift is changing, and that happens only if the antenna
is pointed along the satellite's orbit.

And remember, spy satellites transmit short bursts of data, not
continuously. There's not time to notice a change in Doppler

shift with these. Sometimes they scatter the frequencies subsequent bursts are sent on, to prevent unauthorized reception by those not knowing what frequency comes next.

The sleeper satellites don't transmit, they drop film capsules (which are 3-foot objects shaped like the Apollo command module).

@What cases are there of NORAD hiding spy satellites from Gemini @astronauts who saw them? This would be LIFE THREATENING and @dangerous. NORAD and NASA have an agreement whereby NORAD is @required to warn NASA of any close approaches of ANY orbiting @object to a manned NASA space mission. Since NASA can and does @handle classified information there wouldn't be a problem with @disclosing some spy satellite, especially since all NORAD needs @to do is give a NORAD Catalog Number and the close approach @parameters, not identify the satellite's classified mission. @This sounds to me like a desperate effort to explain away Gemini @UFO cases which even Jim Oberg never resorted to.

I am referring to objects seen, but not making close approaches. NORAD reported that it tracked them, but did not identify them or IDENTIFIED THEM AS SOMETHING ELSE. These are the UFO cases involving astronauts:

Mercury 3: John Glenn first reported the "firefly" effect caused by cosmic rays striking the retina of an eye, and the urine ice crystals produced by dumping wastes into space. These became routine for later astronauts, so they were not reported again.

Mercury 5: An object was seen only on RADAR that appeared to parallel the spacecraft for one orbit. The astronaut saw nothing. This was probably nothing but a part of the launch vehicle. It was lost from the RADAR after the spacecraft maneuvered.

Gemini 1: RADAR picked up parts of the launch vehicle. No visual.

Gemini 4: An object was seen and photographed. The frame before the UFO photo was accidentally exposed, and recorded the window of the spacecraft with the sun shining on the rim. That was the photo released as the "UFO." The accidental exposure caused the records to be one frame off. The actual photo shows nothing but an extra dot of light among the stars. It was probably a small bit of debris from the Gemini itself.

Gemini 7: The object was photographed and reported by RADAR, but never identified. It may have been a spy satellite.

Gemini 8: This visible object was the Agena for the mission,

reflecting sun that made it visible before it was expected to be seen.

Gemini 11: The objects were tentatively identified as the Proton 3 satellite and its booster, but UFO investigators found that the orbit was wrong for what was observed. NORAD did not say the object was not there, it said the object was something else that was in the general area, but farther away. This is one of the probable spy satellites.

Gemini 12: Two objects appeared in photos that were not noticed by the crew when they were taken. One was a lens flare, and the other was some trash that floated out of the hatch.

Apollo 11: An automatic camera recorded a lens flare.

Apollo 12: The S4-B doors for the LEM stayed in the vicinity of the spacecraft, and were seen through a telescope by an amateur astronomer watching the spacecraft from the ground. The crew also saw them and asked about them.

Apollo 13: An amateur astronomer on the ground saw the expanding gas cloud from the ruptured oxygen tank through his telescope and reported it.

STS-82 Shuttle: The astronauts were talking about a control they hadn't been briefed on at one point, and ice crystals reflecting the sun at another. The UFO "story" was taken out of context from the audio. I know the brother of one of the astronauts, who gave me the true story.

@Subject: Info on December 24th 1966 Sighting?

@
@Hello list,

@I'm looking for some information on a sighting that occurred on
@the above mentioned date over the North Pacific Ocean between
@Japan and Anchorage Alaska. Does anyone here have any info on
@sightings that occurred in this region or on this date? I've got
@a witness statement from a Pilot who witnessed this object, but
@I'd like to see if there is any correlating reports.

I don't have info on that particular case, but I do have info
that the Gemini 2 Agena came apart, and the fragments from that
were re-entering all that week and the next. The Lima Peru
sighting from an airliner (Condon case 11) and the Haynesville
Louisiana (Condon case 10) sighting, both on 12/30/66, probably
resulted from re-entries of fragments from the Agena.

@Thank You,
@Todd Lemire

@> objects, each seen by one of the men, but too insignificant to be
@> noticed by the other?

@No, the men were able to see each other. The UFO was definitely
@bigger than a person therefore both would have seen two UFOs if
@this were the case. The smaller objects would of had to be at
@least 10 meters away from each witness for them to misperceive
@the distance.

True.

@Using the same angular sizes described by the witnesses these
@smaller objects would have to be 10s of meters in size.
@Definitely NOT insignificant to be noticed by the other?

Not quite, it depends on whether they were looking at a solid
elipsoid, a tilted disk, or a flat ellipsoid.

@> @I still don't see how it would draw attention away from areas
@> @that were hundreds or thousands of miles away. No UFOlogists
@> @that reside near those bases or express an interest in them have
@> @spent time investigating this case. Still near zero in my

@> They flocked to the Socorro NM, Wanaque NJ, Exeter NH, Dexter MI,
@> Pascagoula MS, and Snowflake AZ sightings. Even the attentions of
@> those who didn't go were diverted from other cases they had been
@> looking at.

@These have not been proven to be military diversions. Not even close.

I didn't say they were, but that they were evidence of the flocking of UFOlogists, which the military might have noted as being useful. This is just a line of thought of a possibility, not a serious attempt at explanation. I was just saying that this was a lot more probable than an alien spaceship.

@> Larry Robinson:

@> @> The probability of an ET visit is near zero too.

@> Martin Jasek:

@> @> The variables in the modified Drake Equation cannot be defined

@> @> visit is near zero.

@> Larry Robinson:

@> All it takes is one of the Drake probabilities to be near zero,

@> since they are multiplied together to find the final probability.

@No, all it takes is one variable to be much greater than zero to

@multiply with the one that is near zero to give a probability

@that is likely.

I used to teach probability. This is a common fallacy regarding consecutive events. It's similar to (fallaciously) saying that because of the "law of averages" the probability of a heads is more likely now that I flipped 4 tails in a row. But the probability is still .5 that I will flip a tails, no matter how many tails I got in a row.

No probability value can be greater than one (certainty) or less than zero (impossibility). A high probability of one factor can do NOTHING to undo the very low probability of another. As they multiply, the result is always a LOWER value than any of the factors, unless all factors but one have a value of one (certainty).

@<snip>

@

@> Emotional fears of scientists have nothing to do with it, because

@> there are other causes for many of the items you cite. A kaboodle

@> of marginal cases is nothing but a kaboodle of marginal cases.

@> They do not compound into the equivalent of one airtight case.

@The cases are not marginal!! I don't think the witnesses and

@hard working UFO investigators appreciate the term kaboodle!

I was saying that no matter how many million marginal cases you have, they don't add up to anything more than a huge collection

(which is what kaboodle means, according to my dictionary) of marginal cases. You can't "sum" them into more significance than they each have by themselves. However, independent sightings of the same object at the same time DO sum to more significance.

I did not intend to say that the cases were poor. Marginal cases are defined in most scientific disciplines as cases that are not yet proven to be a specific thing (such as sightings without hard evidence of a new specie of frog not yet shown to exist). We seem to be quibbling semantics here. Sorry about the confusion.

This is actually one of the best documented and best researched cases I have seen. But without proof, a report is just a report -- a marginal case in the definition I am using.

@> Here are some alternate causes for the things you cite:

@>

@> 1. Fire balloons explain many of the night cases where objects
@> are seen to do fantastic things. They rotate, wobble, swing like
@> a pendulum, and change speed, all at the mercy of the wind. The
@> reason they are not identified as such is that they are farther
@> away than the 30 foot limit on binocular vision against a uniform
@> background. Most people imagine them to be a lot larger and
@> farther away, because they assume they are piloted, controlled
@> vehicles.

@>

@> 2. How "credible" the witness is has absolutely NO effect on the
@> human inability to determine size or distance against a uniform
@> background when the object is farther away than 30 feet (and that
@> is the best case -- some people lose it at 15 feet). No amount of
@> training can fix this problem, but it can alert people that it
@> exists. A cop near here reported a fire balloon (approximately 1.5
@> feet in diameter at the base and 4 feet high) as a flying
@> transparent two-story house. Two more cops in a helicopter in
@> Kentucky chased an identical object, saying it was lens shaped,
@> extremely maneuverable, and much bigger than the helicopter.

@>

@> 3. Ground traces may or may not have anything to do with the UFO.
@> One set of traces that appeared near here a few years ago,
@> supposedly linked to a UFO seen by a child, was actually made by
@> a telephone company arm-and-bucket truck two days earlier. Pads
@> sticking out of the truck to stabilize it when the bucket is
@> raised made a triangle of three square imprints in the relatively
@> hard ground. The tires made no imprints in the same ground.

@>

@> 4. The National Enquirer prizes and other financial enticements
@> generate UFO occupant cases. A LOT of people will fake sightings
@> for a chance to collect a million dollars.

@

@Yeah right, the world is full of UFO hoax millionaires.

I didn't say they all collected, but that they tried to collect.
One try actually succeeded in collecting the prize (Delphos KS,
11/2/71).

@> 5. The Brookings Institute is a liberal think-tank for political
@> policy, not a body of true scientific inquiry. Everything they do
@> is as suspect as a 3 dollar bill with Bill Clinton's picture on
@> it. Their political belief is that "ordinary people are like
@> little children, and government must take care of them." That
@> report is typical of what they put out as "objective research."
@> The RAND Corporation is a similar entity.
@>
@> 6. The "real" reason many companies do not consider UFOs to be a
@> serious subject is that their customers tend to evaporate
@> whenever they start doing something in a UFO vein of research.
@> This is probably because bookstores and magazine racks throw UFOs
@> into the occult bins along with witchcraft, ghosts, and psychics.

@This is only a perception that they will be ridiculed or lose
@customers. The attitudes toward this are changing. I think we
@are making progress.

The problem is the all-business types who lump UFOs in with
psychics, ghosthunters, and witches.

@> 7. My big question is: Whenever someone sees an unidentified
@> object in the sky, why do they think of space aliens first???

@It is up to UFO investigators to assess possible conventional
@explanations first. I believe we have done this here and we are
@left with non-human intelligence as the "most likely" cause.

I meant, why do the WITNESSES think of space aliens first???
There are so many other possibilities! Why think aliens first???
A non-conventional explanation does not have to be an alien
explanation.

I don't think we can say that we are left with nothing but
non-human intelligence, because that means that EVERY other
possibility (no matter how remote) has been totally eliminated.
We have not even scratched the surface of other possibilities. I
could prove a time ship from the future using the same faulty
logic. It could be something else that we haven't even begun to
imagine. This is the logic error that I see time and time again
from the pro-alien people.

@> I don't care whether there are aliens or not.

@How can you possibly not care about something like that? It is
@one of the most important questions that relates to our
@existence in our Universe.

I mean that I have no personal preference one way or the other. I
will be just as delighted to find out that there are aliens as I
would to find out positively that there are not. I want to know
the truth (which DOES matter to me), but it doesn't matter to me
which outcome is true.

But I want positive proof one way or another, not just a claim
that there are aliens based on nothing but witness reports. I
remember the Piltdown man, cold fusion, and the Nandi bear (a
sighting of a live gorilla). And since it is impossible to prove
that something does not exist without making an exhaustive search
of the entire universe, the burden of proof must be on those
claiming that there are aliens, until we have the technology to
make that exhaustive search.

@> And never underestimate the power of a wager. I have several
@> cases of pranks in my files that were the results of either
@> making a bet on whether someone could pull off a fake UFO, or
@> of losing a bet with the prank as the payoff.
@>
@> A supposition: Suppose FOX2 and FOX3 were in cahoots on their
@> own stories, and also released fire balloons along the
@> highway that all of the the others saw.

@Please see my comments about the possibility of a hoax in the
@early stages of our discussion. Severely inconsistent with the
@demeanor of the witnesses!

Witness sincerity, witness composure, and witness veracity have
been shown to be independent variables in cases of strange
encounters (UFO or other). None of them can be used to
demonstrate any of the others. In many confirmed hoaxes, demeanor
was the factor that made officials believe the story.

@> There is no reason why a mirage can't be seen over a large area.
@> All it requires is that the atmospheric lens or mirror causing
@> the effect be large. And if a mirror effect can cause a
@> multiplication of images, it can also cause the image to be seen
@> in different directions at the same time.
@>
@> Also, didn't the sightings in the three locations happen at three
@> different times?

@90 degrees different observation angles at the exact same time
@for the Fox Lake sightings! Please sight horizontal bending
@cases with these sizes of angles!

Not according to the maps in the website. All of the observations at Fox lake appear to be along the same line of sight at that site.

I have seen two of these myself. In one case, a distant truck loomed in my rear window, suddenly appearing to be bearing down on me from behind as I was passing another car. Suddenly, the image contracted vertically and lifted into the air. A few miles later, the real truck came up behind me.

In the other case, again it was a truck that appeared to be approaching me, but this time it was head-on. It was on the same section of road, but I was going the other way (I was in the same lane both times -- hmmm). Again, I saw the real truck a minute later.

My parents also saw this another time on the same road (I was asleep in the back when it happened), as had many of the people who lived there. The effect disappeared when a soybean field next to the road was turned into a housing subdivision.

@> Why didn't anyone going south see it? Were there no southbound cars at all when the giant UFO hovered over Fox Lake?

@We don't know if anybody going south saw it because we have not interviewed anyone that was traveling southbound at the time of the sightings. Yes there were vehicles traveling south reported. We have not located any of these potential southbound witnesses. Some of the southbound witnesses would have likely been City of Whitehorse residents (population 22,000) All the witnesses traveling northbound had ties to the villages of Carmacks and Pelly Crossing (300-500 people each) therefore it comes as no surprise that none of the northbound witnesses could give us names of the southbound witnesses.

This could give us some hard data. If any witnesses are found that did NOT see the object where it should have been according to the theory you propose, that provides very valuable data too. This is one kind of information that UFO investigators must always strive to collect. One southbound witness, whether he saw the UFO or not, can give us a wealth of information. Go get it!

@> @> But I have not one single case in my files that was definitely an alien craft. I have unknowns, but the fact that they are Unidentified Flying Objects does not mean that they are alien craft. There are too many other possibilities.

@> @As stated above. Everybody has their own degree of proof. IMHO
@> the evidence is overwhelming.

@> But what gives the observations (other than the little men cases)
@> any degree of alien origin at all? You have observations, but no
@> indication at all of origin or cause.

@My opinion still stands, still the most likely explanation given
@all the data.

On what basis? I still don't see how that is the most likely explanation without a preconceived belief in extraterrestrial life. I see time travel, government staged events*, military secrets*, satanic activity*, pranks*, hoaxes*, advertizing stunts*, and misinterpretations* as all being more likely than visits by extraterrestrials.

* = Already proven to have caused some UFO sighting reports.

@ "Most likely explanation" is not proof, since the last skeptic
@ would have to be convinced by a live alien walking in front of
@ him (maybe). However, there are a great deal of scientific
@ theories unrelated to UFOs that are not proven but are accepted
@ by the scientific community as most likely because they fit the
@ data.

I am quite skeptical of the Darwinian model of the origin of life too, because it is only one of many possibilities. It just happens to be the possibility that NOTHING ELSE happened, so it is the default case. But the ET hypothesis is NOT the default case, because the misinterpretation case is simpler, not introducing new agents just to explain the observations.

@The same should work for ufology! It is unfair that ufolgy
@doesn't receive the same funding as other sciences. It is is
@starting to receive the respect more and more however.

Unfair? What does "fair" have to do with sources of funding for scientific research? Fair is where you show your livestock and offer it for sale.

Is there a salable product or a way to save lives that can be developed from UFOlogy? Those are the rationales (an expected return) behind all scientific funding. Maybe the air traffic control system is the place to look for funds.

@
@
@000~000~000~000
@
@
@1. Operation BlunderPope
@
@2. Further Thoughts on RAF Bentwaters/Woodbridge
@
@A forthcoming publication, which I hope to provide more news
@about shortly, will feature the RAF Bentwaters/Woodbridge case
@and will include previously unpublished documents from the
@original witnesses statements taken in early January, 1981.
@
@Details of the contents have previously been made known and
@further information can be found on my web site at:
@
@http://web.ukonline.co.uk/voyager/enigma.htm
@
@However, there may be one or two 'surprises' still to be
@unveiled.
@
@
@It's taken considerable time and reflection to make sense of the
@overall evidence contained in these critical, earliest

@testimonies. Setting out the sequence of events in their
@chronological order, this is a fresh look at what those accounts
@reveal.

@
@At approximately 0300 on the morning of 26th December, 1980, two
@members of the 81st Security Police Squadron (SPS), Airman First
@Class John Burroughs and Staff Sergeant Bud Steffans, were on
@duty at RAF Woodbridge's east gate.

@
@They noticed unfamiliar lights in the forest, directly east of
@the long and straight east gate road.

@
@Burroughs describes seeing a red light above a blue light, both
@of which were "flashing on and off".

@
@They decided to investigate and travelled to the end of east gate
@road, where it joined the 'main' road through Rendlesham Forest.
@Turning right, they proceeded for some 20 yards to a 'logging
@track' on their left hand side.

@
@This provided a direct view due east and Burroughs states they
@could still see the red and blue lights, plus, now a white light
@"shining onto the trees".

@This is where Orfordness lighthouse could first begin to
@complicate matters. They were now looking along a road which faced
@due east, where the lighthouse was situated on the coast.

@
@The red and blue lights couldn't conceivably have been related to
@the lighthouse. The white light may have been.

In the first account of the sighting I ever saw, a civilian
police car had been dispatched to a residence east of the woods,
because the redicent had seen something bright fall into the
forest. Could the lights have been on that police car?

@The red light and blue light are the features which remain
@consistent in all three accounts and they are the ones which we
@could hopefully find an explanation for.

@
@All evidence supports they definitely can't relate to the
@lighthouse.

@3. Cash-Landrum 'Special-Ops' Unit Identified?

@
@It's important to also bear in mind the background which the RAF

@Bentwaters/Woodbridge case was set against.

@

@This was in the midst of the Iran hostage crisis.

@

@The twin-base complex was a US facility on British soil and any
@special operations taking place, especially relating to the
@situation in Iran, may only have been known about at the highest
@level.

@

@

@I believe a military 'special ops' training exercise was at least
@in part responsible for another classic UFO encounter, a drama
@which was soon to unfold on the other side of the Atlantic.

@

@During the evening of 29th December, 1980, Betty Cash, Vickie
@Landrum and Colby Landrum were travelling along Highway FM1485 in
@eastern Texas. It was a quiet road in a sparsely populated area.

@

@They noticed a bright light above the trees and as it descended
@towards them, it hovered at tree-top level.

@

@Diamond-shaped and much larger than their car, the object
@intermittently expelled a 'cone of fire', apparently downwards.
@This caused it to rise slightly, similar to a hot-air balloon
@using a burner to keep aloft.

@

@The object also reportedly glowed brightly and something emitted
@an occasional beeping noise.

@

@With the object now above the road, the witnesses got out of
@their car, reportedly experiencing an intense heat and light from
@the object.

@

@Suddenly, a large number of helicopters appeared overhead,
@seemingly arriving from all directions. The unidentified object
@was then lost from sight behind some trees and the helicopters
@left.

@

@Driving further on, the object and helicopters were again seen in
@close proximity. The witnesses counted 23 helicopters and these
@were identified as mainly CH-47 Chinooks, plus faster single-
@rotor helicopters, similar to a Bell-Huey.

@

@The witnesses apparently all suffered from illness afterwards,
@with Betty Cash, who was closest to the object, being the most
@poorly. It's generally assumed this was directly related to the
@incident.

@

@

@Despite extensive enquiries, no trace of the helicopters' origins

@was ever found, with Houston Airport unable to assist and
@military bases in Texas and Louisiana denying any possible
@involvement.

@

@It remained a mystery.

One possibility that hasn't been explored is that a metal cable
lowered from one of the helicopters fouled a power line. I have
seen a similar event (but the cable hung from a fixed object, and
a very strong wind blew it into the lines), and the effect was
dazzling. It could also have emitted ultraviolet light, or even
X-rays, enough to have caused the sicknesses.

@>> (ionizing radiation that can travel 140 feet in air wouldn't be stopped by
@>> windshield glass).

The tilt of the windshield with respect to the location of the source may have reflected some of the radiation away. Glass also does filter out some far ultraviolet and x-rays. In addition, there is the plastic layer between the glass panes in the safety glass. Also, the car body was shielding the lower parts of the bodies of those who remained in the car.

@

@>What chemical, that you are aware of, would show these type of

@

@>symptoms within Betty?

@

@>

@

@>Todd Lemire

@

@

@Brad has raised a valid point regarding the windshield glass, unless this form

@

@of radiation is unfamiliar to current scientific theory.

@

@COMMENTS: I should also add that the car body and engine block would add

@very little shielding because ionizing radiation has a high incidence of

@scattering in its propagation. It's like getting sunburned on a heavily overc

@ast day -- the burn comes from all directions not just the direction of the

@sun.

That's true for gamma radiation, but not for x-radiation or ultraviolet. The car body will stop most x-rays from getting through. Ultraviolet, x, and gamma rays are all forms of ionizing radiation. An electric arc produces visible light, ultraviolet, and x-rays, but not gamma rays.

@On the other hand, if the effects were caused by a chemical, wouldn't there

@have been a residue or evidence of such in the area where the incident

@occurred.

@

@COMMENTS: Apparently there was never any testing for chemical residues,

@though it must be pointed out there are chemical warfare agents that leave no

@residues and likewise for many inorganic gases. In fact, there were

@apparently no soil samples even taken during the first year (I'm not sure

@about whether samples of the road marks were taken either). I remember Bill

@Moore in the mid-80's complaining that he was the first to secure soil

@samples from the Cash-Landrum site, but it was years after the fact, and once

@he did he couldn't find anyone interested in doing tests on the soil.

@

@If there had been a large emission of ionizing radiation at the Cash-Landrum

@site, evidence would remain in the soil that would be permanent. One does

@not need to rely on Geiger counters and radiation survey meters to detect

@fast-decaying traces of short-lived radioactive nuclides (induced

@radioactivity in the normally nonradioactive soil), which require site

@surveying soon after the incident. Neutron irradiation would also

@permanently shift ratios of stable non-radioactive isotopes into the higher

@mass numbers, which can be determined at any time by accelerator mass

@spectrometry. Gamma and beta radiation would leave residual excitation

@levels in rock crystals which can be determined at any time by

@thermoluminescence. In the Cash-Landrum case, there were strange delays in

@the start of the investigation which would have largely ruined any
@Geiger-counter-type radiation surveying. One local investigator withheld
@crucial information from his fellow colleagues for a month because of a
@strange notion of confidentiality, even as Betty Cash was talking to the
@National Enquirer!
@
@
@
@
@This case has received a fair amount of attention from UFO researchers and the
@
@medical community (or at least those who were involved in their treatment).
@
@The fact that we are debating the cause here would appear to show that it
@
@remains unknown. The "easy" answers don't appear to fit, and speculative
@
@answers remain . . . well, . . . just that.
@
@
@I don't want to sidetrack this thread, but it should be mentioned that this
@
@case is not the only one that the medical community is unable to resolve.
@
@Stephen Michalak's alleged encounter near Falcon Lake in Manitoba, Canada
@
@remains one of interest.
@
@COMMENTS: I read the report at your cited link (below) and was intrigued to
@find the similarities between the Cash-Landrum and Michalak cases. In both
@there was rapid onset of GI tract symptoms -- within minutes -- which would
@represent a fatal dose of ionizing radiation if that had been the cause
@ (rapidity of onset is roughly proportional to dose). In both cases there
@were skin burns or lesions. But in the Michalak case there were actual
@medical references to allergic reactions, urticaria (hives), suggesting
@contact dermatitis (skin damage due to chemical exposure). And there was
@testing conducted for standard acute radiation syndrome but which resulted in
@inconsistent findings, lymphocyte count drops (lymphocytopenia) but no
@platelet count drop (thrombocytopenia), etc.
@

@Hi Jim,
@
@Excellent point! Although I don't know if the helicopters were ever
@reportedly closer than 140 feet to the UFO, the crews' exposure would have
@been over a much longer duration than the few minutes that Cash and the
@Landrums were at 140 feet, possibly hours.

That's assuming that the source was a gamma ray source. We are
forgetting x-rays and ultraviolet. The car and helicopter bodies
would protect against those.

> @Earth Orbit it is obvious when the Doppler shifts approach
> @orbital velocity of 8 km/sec.
>
>
> But there is no Doppler shift when the satellite is moving
> perpendicular to the line of sight.

COMMENTS: A perpendicular point of transmission from a satellite would be extremely rare.

Since the antenna is moving

- > on a slow, fixed tracking schedule (or just rotating with the
- > Earth), it would pick up the signal for the time the satellite is
- > crossing the line of sight of the antenna, then the signal would
- > just vanish.

COMMENTS: Many radio astronomy antennas are multiples and equipped for DOPPLER INTERFEROMETRY.

- > By the way, how are you going to measure a Doppler shift if you
- > don't know the original frequency? It makes sense only if the
- > Doppler shift is changing, and that happens only if the antenna
- > is pointed along the satellite's orbit.

COMMENTS: Using Doppler Interferometry the change of frequency as a satellite moved at some angle off of strictly perpendicular would be easily detected. And in fact the location of the radio source as Near Earth Orbit would be easily TRIANGULATED using interferometry, giving radial ranges on the order of 100's or 1,000's of km instead of light-years.

Because the angular velocity of a satellite is greatest when perpendicular and closest to the receiver it resides there for the LEAST amount of time. MOST of the time satellites are at various slant angles.

- > And remember, spy satellites transmit short bursts of data, not
- > continuously.

COMMENTS: Good point but not true for all intelligence satellites -- for some the amount of data download is so vast it cannot be sent in bursts.

There's not time to notice a change in Doppler
> shift with these.

COMMENTS: Another good point. But if a velocity vector is determined with Doppler interferometry and another burst is detected further along the same path, then the frequencies can be compared, unless (as you point out next) they are randomly shifted to make interception difficult.

Sometimes they scatter the frequencies

- > subsequent bursts are sent on, to prevent unauthorized reception

- > by those not knowing what frequency comes next.
- >
- > The sleeper satellites don't transmit, they drop film capsules
- > (which are 3-foot objects shaped like the Apollo command module).
- >
- >
- >
- > @What cases are there of NORAD hiding spy satellites from Gemini
- > @astronauts who saw them? This would be LIFE THREATENING and
- > @dangerous. NORAD and NASA have an agreement whereby NORAD is
- > @required to warn NASA of any close approaches of ANY orbiting
- > @object to a manned NASA space mission. Since NASA can and does
- > @handle classified information there wouldn't be a problem with
- > @disclosing some spy satellite, especially since all NORAD needs
- > @to do is give a NORAD Catalog Number and the close approach
- > @parameters, not identify the satellite's classified mission.
- > @This sounds to me like a desperate effort to explain away Gemini
- > @UFO cases which even Jim Oberg never resorted to.
- >
- > I am referring to objects seen, but not making close approaches.
- > NORAD reported that it tracked them, but did not identify them or
- > IDENTIFIED THEM AS SOMETHING ELSE. These are the UFO cases
- > involving astronauts:

COMMENTS: You had said NORAD had hid from the Gemini astronauts the existence of spy satellites which would have otherwise explained their space-UFO sightings. You don't give even a single bit of evidence of NORAD allegedly doing this in your long list below, making the list irrelevant insofar as supporting your claim.

You've changed your story now to say NORAD didn't "hide" the spy satellites but merely didn't "identify them or IDENTIFIED THEM AS SOMETHING ELSE," but you still haven't given ANY examples of either case in your list below.

- > Mercury 3: John Glenn first reported the "firefly" effect caused
- > by cosmic rays striking the retina of an eye, and the urine ice
- > crystals produced by dumping wastes into space. These became
- > routine for later astronauts, so they were not reported again.

COMMENTS: This has nothing to do with NORAD "hiding spy satellites" from GEMINI astronauts who sighted UFO's in space since this was a MERCURY mission -- and no mention of NORAD at all.

- > Mercury 5: An object was seen only on RADAR that appeared to
- > parallel the spacecraft for one orbit. The astronaut saw nothing.
- > This was probably nothing but a part of the launch vehicle. It

> was lost from the RADAR after the spacecraft maneuvered.

COMMENTS: This has nothing to do with NORAD "hiding spy satellites" from GEMINI astronauts and you say the MERCURY astronaut saw nothing anyway.

> Gemini 1: RADAR picked up parts of the launch vehicle. No visual.

COMMENTS: This has nothing to do with NORAD "hiding spy satellites" from GEMINI astronauts as this was an UNMANNED mission.

> Gemini 4: An object was seen and photographed. The frame before
> the UFO photo was accidentally exposed, and recorded the window
> of the spacecraft with the sun shining on the rim. That was the
> photo released as the "UFO." The accidental exposure caused the
> records to be one frame off. The actual photo shows nothing but
> an extra dot of light among the stars. It was probably a small
> bit of debris from the Gemini itself.

COMMENTS: I don't understand how photos can be "a frame off" from anything. Either a photo was taken or it wasn't.

The fact of the matter is that the released "photo" was part of a MOVIE film consisting of DOZENS of frames lasting several seconds showing a bright whitish EGG-SHAPED light with an arced streamer or tail. Not some defect on one picture.

The problem with sun reflection off a window rim is that the movie camera lens was held almost right up against the window so the rim could not possibly have been in focus.

> Gemini 7: The object was photographed and reported by RADAR, but
> never identified. It may have been a spy satellite.

COMMENTS: Where is NORAD hiding anything here?

> Gemini 8: This visible object was the Agena for the mission,
> reflecting sun that made it visible before it was expected to be
> seen.

COMMENTS: Where is NORAD hiding anything here?

> Gemini 11: The objects were tentatively identified as the Proton
> 3 satellite and its booster, but UFO investigators

COMMENTS: That's me and Bruce Maccabee.

found that the

> orbit was wrong for what was observed.

COMMENTS: Bruce and I found that NORAD tracking data placed the satellite behind the earth, below the horizon, impossible to have been seen.

NORAD did not say the

> object was not there, it said the object was something else

> that was in the general area, but farther away.

COMMENTS: This is very confused. NORAD said the Proton 3 satellite was there -
- nothing about saying "something else" was there. Bruce and I found out from analyzing NORAD's tracking data on Proton 3, the elsets, that it was actually something like 3,000 km away and behind the earth.

NORAD cataloged NOTHING else in the vicinity of the Gemini 11.

This is one of

> the probable spy satellites.

COMMENTS: Based on WHAT EVIDENCE? NORAD gave NASA a complete catalog of space objects encountering the Gemini 11 and only Proton 3 came up that was even reasonably viable as a possible candidate.

> Gemini 12: Two objects appeared in photos that were not noticed

> by the crew when they were taken. One was a lens flare, and the

> other was some trash that floated out of the hatch.

COMMENTS: Nothing about NORAD hiding anything here.

> Apollo 11: An automatic camera recorded a lens flare.

COMMENTS: You missed the mysterious fluttering
"moon pigeon" videotaped after liftoff which resulted in a detailed Lockheed investigation. Jim Oberg uncovered this. It's a bit of a mystery.

> Apollo 12: The S4-B doors for the LEM stayed in the vicinity of

> the spacecraft, and were seen through a telescope by an amateur

> astronomer watching the spacecraft from the ground. The crew also

> saw them and asked about them.

COMMENTS: Nothing about NORAD here (and it's NOT Gemini program either).

Problem is that the S-IVB doors for the LM, called SLA panels (Spacecraft Lunar Adapter), were ejected BACKWARDS and away from from the Apollo 12 spacecraft. The flashing light was observed FORWARD or AHEAD of the Apollo 12.

> Apollo 13: An amateur astronomer on the ground saw the expanding
> gas cloud from the ruptured oxygen tank through his telescope and

Hi Larry,

You make some good points so let me respond (below) with COMMENTS.

Brad

In a message dated Thu, 6 Jan 2000 1:05:33 PM Eastern Standard Time, Larry Robinson S/AP/EIS Kinesiology <lrobins@indiana.edu> writes:

> @Earth Orbit it is obvious when the Doppler shifts approach
> @orbital velocity of 8 km/sec.
>
>
> But there is no Doppler shift when the satellite is moving
> perpendicular to the line of sight.

COMMENTS: A perpendicular point of transmission from a satellite would be extremely rare.

Since the antenna is moving

- > on a slow, fixed tracking schedule (or just rotating with the
- > Earth), it would pick up the signal for the time the satellite is
- > crossing the line of sight of the antenna, then the signal would
- > just vanish.

COMMENTS: Many radio astronomy antennas are multiples and equipped for DOPPLER INTERFEROMETRY.

- > By the way, how are you going to measure a Doppler shift if you
- > don't know the original frequency? It makes sense only if the
- > Doppler shift is changing, and that happens only if the antenna
- > is pointed along the satellite's orbit.

COMMENTS: Using Doppler Interferometry the change of frequency as a satellite moved at some angle off of strictly perpendicular would be easily detected. And in fact the location of the radio source as Near Earth Orbit would be easily TRIANGULATED using interferometry, giving radial ranges on the order of 100's or 1,000's of km instead of light-years.

Because the angular velocity of a satellite is greatest when perpendicular and closest to the receiver it resides there for the LEAST amount of time. MOST of the time satellites are at various slant angles.

- > And remember, spy satellites transmit short bursts of data, not
- > continuously.

COMMENTS: Good point but not true for all intelligence satellites -- for some the amount of data download is so vast it cannot be sent in bursts.

There's not time to notice a change in Doppler
> shift with these.

COMMENTS: Another good point. But if a velocity vector is determined with Doppler interferometry and another burst is detected further along the same path, then the frequencies can be compared, unless (as you point out next) they are randomly shifted to make interception difficult.

Sometimes they scatter the frequencies

- > subsequent bursts are sent on, to prevent unauthorized reception

- > by those not knowing what frequency comes next.
- >
- > The sleeper satellites don't transmit, they drop film capsules
- > (which are 3-foot objects shaped like the Apollo command module).
- >
- >
- >
- > @What cases are there of NORAD hiding spy satellites from Gemini
- > @astronauts who saw them? This would be LIFE THREATENING and
- > @dangerous. NORAD and NASA have an agreement whereby NORAD is
- > @required to warn NASA of any close approaches of ANY orbiting
- > @object to a manned NASA space mission. Since NASA can and does
- > @handle classified information there wouldn't be a problem with
- > @disclosing some spy satellite, especially since all NORAD needs
- > @to do is give a NORAD Catalog Number and the close approach
- > @parameters, not identify the satellite's classified mission.
- > @This sounds to me like a desperate effort to explain away Gemini
- > @UFO cases which even Jim Oberg never resorted to.
- >
- > I am referring to objects seen, but not making close approaches.
- > NORAD reported that it tracked them, but did not identify them or
- > IDENTIFIED THEM AS SOMETHING ELSE. These are the UFO cases
- > involving astronauts:

COMMENTS: You had said NORAD had hid from the Gemini astronauts the existence of spy satellites which would have otherwise explained their space-UFO sightings. You don't give even a single bit of evidence of NORAD allegedly doing this in your long list below, making the list irrelevant insofar as supporting your claim.

You've changed your story now to say NORAD didn't "hide" the spy satellites but merely didn't "identify them or IDENTIFIED THEM AS SOMETHING ELSE," but you still haven't given ANY examples of either case in your list below.

- > Mercury 3: John Glenn first reported the "firefly" effect caused
- > by cosmic rays striking the retina of an eye, and the urine ice
- > crystals produced by dumping wastes into space. These became
- > routine for later astronauts, so they were not reported again.

COMMENTS: This has nothing to do with NORAD "hiding spy satellites" from GEMINI astronauts who sighted UFO's in space since this was a MERCURY mission -- and no mention of NORAD at all.

- > Mercury 5: An object was seen only on RADAR that appeared to
- > parallel the spacecraft for one orbit. The astronaut saw nothing.
- > This was probably nothing but a part of the launch vehicle. It

> was lost from the RADAR after the spacecraft maneuvered.

COMMENTS: This has nothing to do with NORAD "hiding spy satellites" from GEMINI astronauts and you say the MERCURY astronaut saw nothing anyway.

> Gemini 1: RADAR picked up parts of the launch vehicle. No visual.

COMMENTS: This has nothing to do with NORAD "hiding spy satellites" from GEMINI astronauts as this was an UNMANNED mission.

> Gemini 4: An object was seen and photographed. The frame before
> the UFO photo was accidentally exposed, and recorded the window
> of the spacecraft with the sun shining on the rim. That was the
> photo released as the "UFO." The accidental exposure caused the
> records to be one frame off. The actual photo shows nothing but
> an extra dot of light among the stars. It was probably a small
> bit of debris from the Gemini itself.

COMMENTS: I don't understand how photos can be "a frame off" from anything. Either a photo was taken or it wasn't.

The fact of the matter is that the released "photo" was part of a MOVIE film consisting of DOZENS of frames lasting several seconds showing a bright whitish EGG-SHAPED light with an arced streamer or tail. Not some defect on one picture.

The problem with sun reflection off a window rim is that the movie camera lens was held almost right up against the window so the rim could not possibly have been in focus.

> Gemini 7: The object was photographed and reported by RADAR, but
> never identified. It may have been a spy satellite.

COMMENTS: Where is NORAD hiding anything here?

> Gemini 8: This visible object was the Agena for the mission,
> reflecting sun that made it visible before it was expected to be
> seen.

COMMENTS: Where is NORAD hiding anything here?

> Gemini 11: The objects were tentatively identified as the Proton
> 3 satellite and its booster, but UFO investigators

COMMENTS: That's me and Bruce Maccabee.

found that the

> orbit was wrong for what was observed.

COMMENTS: Bruce and I found that NORAD tracking data placed the satellite behind the earth, below the horizon, impossible to have been seen.

NORAD did not say the

> object was not there, it said the object was something else

> that was in the general area, but farther away.

COMMENTS: This is very confused. NORAD said the Proton 3 satellite was there -
- nothing about saying "something else" was there. Bruce and I found out from analyzing NORAD's tracking data on Proton 3, the elsets, that it was actually something like 3,000 km away and behind the earth.

NORAD cataloged NOTHING else in the vicinity of the Gemini 11.

This is one of

> the probable spy satellites.

COMMENTS: Based on WHAT EVIDENCE? NORAD gave NASA a complete catalog of space objects encountering the Gemini 11 and only Proton 3 came up that was even reasonably viable as a possible candidate.

> Gemini 12: Two objects appeared in photos that were not noticed

> by the crew when they were taken. One was a lens flare, and the

> other was some trash that floated out of the hatch.

COMMENTS: Nothing about NORAD hiding anything here.

> Apollo 11: An automatic camera recorded a lens flare.

COMMENTS: You missed the mysterious fluttering
"moon pigeon" videotaped after liftoff which resulted in a detailed Lockheed investigation. Jim Oberg uncovered this. It's a bit of a mystery.

> Apollo 12: The S4-B doors for the LEM stayed in the vicinity of

> the spacecraft, and were seen through a telescope by an amateur

> astronomer watching the spacecraft from the ground. The crew also

> saw them and asked about them.

COMMENTS: Nothing about NORAD here (and it's NOT Gemini program either).

Problem is that the S-IVB doors for the LM, called SLA panels (Spacecraft Lunar Adapter), were ejected BACKWARDS and away from from the Apollo 12 spacecraft. The flashing light was observed FORWARD or AHEAD of the Apollo 12.

> Apollo 13: An amateur astronomer on the ground saw the expanding

just to keep the record straight, the flight was called MA-6. Cosmic rays
causing retinal flashes were not experienced until Apollo ventured beyond the
van Allen belts. The water for the snowflakes from MA-6 was from a flash
evaporator "water spray boiler"), to cool on-board electronics, not from a
urine dump.

The fifth manned Mercury flight was MA-8 with Schirra. I have never seen any other versions of this story. Radar tracking does not extend for a full orbit -- each site can only observe perhaps 5-6% of an orbit, and most flying time is out of radio contact and beyond radar tracking. No manned spacecraft maneuvered until Gemini-3 in 1965.

You're not deliberately making this easy on me, are you?? <g>

The released image was from a cine camera, not a frame-by-frame still camera. The released picture shows no stars. McDivitt says its the edge of the window with a bolt reflecting the sun. My hypothesis is that the beer-can shaped object seen by eye was the Gemini's own Titan second stage (McDivitt disagrees).

There's lots of cine film of the booster during the rendezvous (Gemini-4 and Gemini-7 were the first two attempts to rendezvous in orbit, with the booster second stage -- what a coincidence they are famous for "UFOs"!!), but no stills that I ever could find. Borman makes it clear he referred to the 'bogie' when talking about the booster he was performing rendezvous on, as a joke. I am unaware of any radar reports of a UFO associated with Gemini-07.

Subject: Re: Info on December 24th 1966 Sighting?Message-id:
<61.618859e6.25a69298@aol.com>

The NORAD catalog shows two Agena Target stages decaying on Dec 29 and 30, 1966, and no fragments or debris, but since their orbital inclinations were 29 degs they could not have decayed farther north than 29 N latitude -- i.e., could NOT have decayed over Japan or Alaska.

Larry,

You still need to cite a HORIZONTAL mirage case with bending of 90 degrees. These cases you mention say nothing about HORIZONTAL refraction, and one mentions a VERTICAL refraction instead.

What is the physics of such alleged HORIZONTAL mirages and how is it possible? Aren't you trying to explain one unproved phenomenon with another unproved phenomenon?

Brad

> There are so many other possibilities! Why think aliens first???

> A non-conventional explanation does not have to be an alien explanation.

>

> I don't think we can say that we are left with nothing but non-human intelligence, because that means that EVERY other possibility (no matter how remote) has been totally eliminated.

> We have not even scratched the surface of other possibilities. I could prove a time ship from the future using the same faulty logic. It could be something else that we haven't even begun to imagine. This is the logic error that I see time and time again from the pro-alien people.

>

> @> I don't care whether there are aliens or not.

>

> @How can you possibly not care about something like that? It is one of the most important questions that relates to our existence in our Universe.

>

> I mean that I have no personal preference one way or the other. I will be just as delighted to find out that there are aliens as I would to find out positively that there are not. I want to know the truth (which DOES matter to me), but it doesn't matter to me which outcome is true.

>

> But I want positive proof one way or another, not just a claim that there are aliens based on nothing but witness reports. I remember the Piltdown man, cold fusion, and the Nandi bear (a sighting of a live gorilla). And since it is impossible to prove that something does not exist without making an exhaustive search of the entire universe, the burden of proof must be on those claiming that there are aliens, until we have the technology to make that exhaustive search.

COMMENTS: My point was that ionizing radiation sufficiently energetic as to penetrate 140 feet of air isn't going to be stopped by a little windshield glass. We weren't discussing nonionizing radiations such as UV. In a later posting I discussed the fact that ionizing radiations propagate with high scattering so the car body would not have given much shielding -- it's like getting a sunburn from all directions on a heavily overcast day or getting burned even under an umbrella.

 > and x-rays, but not gamma rays.

COMMENTS: UV is not usually considered ionizing radiation for medical purposes but actinic. UV could not possibly deliver something on the order of 1,000 rems (or 10 Sv) to the whole body but would have literally fried the skin without penetrating far into underlying tissues. X-rays could not cross 140 feet of air.

COMMENTS: I just posted the response on these points which eliminate UV and x-rays. I'm not assuming gamma radiation there's also neutrons to consider -- and reject along with gamma as not consistent with what would otherwise be absolutely fatal doses.

I'm surprised you haven't suggested FIRE BALLOONS yet. Maybe some prankster fire balloons are capable of thermonuclear reactions! :)

- > (certainty).

One important number in the equation which is greater than one is the number of stars. It is possible that distance may not be a factor in space travel given enough advancements in science and engineering. In which case the number of stars plugged into the Drake Equation is orders of magnitude more than for a single galaxy.

Many didn't think aliens first. They thought, trucks, planes first - as shown in the witness testimonies. As Bruce Maccabee said.

- > I don't think we can say that we are left with nothing but
- > non-human intelligence, because that means that EVERY other

I didn't say "nothing but non-human intelligence". I will say however that non-human intelligence is more likely than the remote possibilities that you site.

- > @> I don't care whether there are aliens or not.

Maybe one out of a hundred that could be effectively deceitful, but not all 22. I trusted everyone of them based on their demeanor.

- > @> There is no reason why a mirage can't be seen over a large area.

- > at Fox lake appear to be along the same line of sight at that
- > site.

Your phrase "the same line of sight" is misleading. The witnesses were located "along a strait line (more or less)" would be a better phrase. Just because they are in a strait line doesn't equate to all the witnesses looking in the same direction. FOX 4,5 were looking

NNW, FOX 3 was looking NW, and FOX2 was looking WSW. This is a 90 degree angle between the extremes! Where is that mirage case with HORIZONTAL bending of 90 degrees?

- > I have seen two of these myself. In one case, a distant truck

Yes I agree. Unfortunately, somebody driving the highway and not seeing anything unusual is much less likely to recall the date and time precisely.

- > @> @> But I have not one single case in my files that was definitely an

If the ET hypothesis turns out to be true then I think there would be. Maybe far into the future there would be a "pay off", maybe we would never figure out how they work.

- > Those are the rationales (an expected
- > return) behind all scientific funding. Maybe the air traffic
- > control system is the place to look for funds.

There are many benefits, many of them not scientific. Also, not all science is done for immediate monetary gain. It is a possible benefit perhaps centuries into the future. There are plenty of projects like that, that receive funding.

<

If I recall the Drake equation correctly, not all the factors are
probabilities
and hence limited to the range 0 to 1.

Hi,

An important point about this case is that the effects were only more severe on Betty Cash, but quite present in both Colby and Vickie Landrum. What effects - if any - there were on the helicopter crews are as unknown as the identity of these crews. If the presence of the helicopters is being hidden (as it clearly is by someone, for some reason) that may, of course, be at least partly because of any serious ill effects some of their crews experienced.

Bear in mind that Betty Cash was not only outside the car longer and not shielded by the metal doors (as the other two had these between themselves and the UFO even when out of the car) - Betty walked to the front of the car, some yards nearer the UFO and stayed out several minutes longer.

Moreover, she had a pre-existent serious illness which both skeptics and lawyers acting for the state used against her claim that the undoubtedly major after effects were directly and solely attributable to the encounter. Even if they were a consequence (as seems virtually certain to some degree) they may have in her case also exacerbated a prior condition confusing the medical diagnosis and making it difficult to know which effect is a consequence of innate medical factors or ones triggered by 'emissions' from the UFO.

I have always followed this case closely because of its remarkable (at times even spooky) coincidental links with Rendlesham over the very same few days (a third Rendlesham encounter even occurred on the same night at near identical times allowing for the time zone differences) Aside from the circumstantial similarities (such as it occurring on a road used mostly for logging vehicles inside a pine forest) there are the weirder ties like the incident happening by the road to the small settlement of Eastgate (and the east gate at Rendlesham - of course - is the centre point of the whole affair). Indeed in 'Sky Crash' we actually have a chapter on Cash-Landrum because as long ago as 1983 we suspected (but have never been able to prove) a connection. But it is worth remembering that at USAF Woodbridge in 1980 one of their main attributes was the Aerospace Rescue and Recovery squadron that used helicopters to recover for NASA any space capsules that might come down near the UK. And as we know Huffman is not very far from Houston - presenting again that tie with NASA.

However, the one clue about the Cash-Landrum case that has always intrigued me is the little known effect Betty Cash described about the burn mark

created by her wedding ring after proximity to the UFO. I have investigated several similar cases from 'radiating' UFOs and there are others on the records. Indeed, even before Cash Landrum happened I wrote one such case up in FSR and started a column to debate it. The outcome of the various ideas and research suggestions proffered led to the view that the burn results from an eddy current induced into the metal band of the ring. This circulates freely and gives off the heat creating the burn to the finger. The eddy current would have to be induced into the metal band by a fairly specific type of EM radiation. So this helps to point us in the right direction.

Best wishes,

Jenny Randles

It's worth emphasizing that there is not a monolithic SETI program. SETI programs have been carried out by different groups, at different institutions, at different times. The "Wow!" signal was seen by the Ohio State radio astronomy group.

You're correct, though, that a number of candidate signals have been seen by different SETI programs that have all of the characteristics expected for an ETI transmission, except repeatability. Namely the candidate signals are narrowband, with bandwidths far narrower than any known process, and typically near a "magic" frequency, like the 1420 MHz neutral hydrogen line. In many cases, one can constrain the distance or the sky position to the transmitter. These are consistent with an origin outside of the solar system.

Strictly, repeatability is not a characteristic required of an ETI transmission. We produce all kinds of time-varying transmissions, and it is easy to imagine reasons why an ETI might also. However,

repeatability is required from the scientific standpoint of being able to decide what the signal is.

Interestingly enough, I think it was also at Ohio State that radio astronomer Kraus announced detection of an ET signal circa 1954-5 but he was never heard on the subject again. Years later it came out that the signal was actually rocket launch telemetry from Soviet launch site Kapustin Yar which was bouncing off an ionospheric duct to travel around the world. The NSA had already discovered this and was exploiting the effect to intercept the signals but didn't want the Soviets to know so they silenced Kraus.

@> @
@> @Hi Larry,

@> @NORAD cannot and does not hide ALL spy satellites -- most DO get
@> @cataloged/located and there is an amateur community tracking
@> @such satellites and supplying orbital element sets (elsets). By
@> @international treaty all satellite launches must be registered
@> @with COSPAR and given an International Designation (such as
@> @1999-13C). The trick is when there are multiple satellites
@> @released from an unmanned mission or from a Space Shuttle. The
@> @"hidden" satellites are from these piggyback flights. Still,
@> @some of these are eventually found out from detection of signals
@> @or optically (there are reportedly some "sleeper" sats with no
@> @transmissions, painted with Stealth absorptive coatings etc. but
@> @then these DON'T MAKE SETI SIGNAL PROBLEMS EITHER).

@> @This still doesn't change the fact that SETI astronomers can
@> @observe telltale Doppler shifts of a satellite. If in Near
@> @Earth Orbit it is obvious when the Doppler shifts approach
@> @orbital velocity of 8 km/sec.

@> But there is no Doppler shift when the satellite is moving
@> perpendicular to the line of sight.

@COMMENTS: A perpendicular point of transmission from a
@satellite would be extremely rare.

Not for a SETI sweep of the cosmos. Usually the antenna is pointed neither east nor west, letting the earth's rotation sweep it around the right ascension axis. One declination is selected for each 24 hour sweep. That makes all satellites in east-west orbits cross the sensitive area at right angles.

BTW, a friend of mine has an amateur SETI system. So far, the only intelligence he has picked up was the city's dispatch radio leaking in through a back lobe of the antenna pattern and overloading the tuner in the receiver.

@> Since the antenna is moving
@> on a slow, fixed tracking schedule (or just rotating with the
@> Earth), it would pick up the signal for the time the satellite is
@> crossing the line of sight of the antenna, then the signal would
@> just vanish.

@COMMENTS: Many radio astronomy antennas are multiples and
@equipped for DOPPLER INTERFEROMETRY.

And SETI rarely gets enough funding to rent time on one of those big monsters. Usually, they have to be content with one dish at a time.

@> By the way, how are you going to measure a Doppler shift if you
@> don't know the original frequency? It makes sense only if the
@> Doppler shift is changing, and that happens only if the antenna
@> is pointed along the satellite's orbit.

@COMMENTS: Using Doppler Interferometry the change of frequency
@as a satellite moved at some angle off of strictly perpendicular
@would be easily detected. And in fact the location of the radio
@source as Near Earth Orbit would be easily TRIANGULATED using
@interferometry, giving radial ranges on the order of 100's or
@1,000's of km instead of light-years.

@Because the angular velocity of a satellite is greatest when
@perpendicular and closest to the receiver it resides there for
@the LEAST amount of time. MOST of the time satellites are at
@various slant angles.

See above.

@> And remember, spy satellites transmit short bursts of data, not
@> continuously.

@COMMENTS: Good point but not true for all intelligence
@satellites -- for some the amount of data download is so vast it
@cannot be sent in bursts.

It only takes one. And see below, where the intelligence
satellite sends one burst on each frequency in turn. Anyone
listening on only one frequency hears only one burst. In SETI
scans, if the receiver's frequency sweep is not on the burst
frequency when the satellite uses it, it will miss that burst
entirely.

@There's not time to notice a change in Doppler > shift with
@these.

@COMMENTS: Another good point. But if a velocity vector is
@determined with Doppler interferometry and another burst is
@detected further along the same path, then the frequencies can
@be compared, unless (as you point out next) they are randomly
@shifted to make interception difficult.

Doppler Interferometry is something SETI rarely gets to play
with.

@> Sometimes they scatter the frequencies
@> subsequent bursts are sent on, to prevent unauthorized reception
@> by those not knowing what frequency comes next.
@>
@> The sleeper satellites don't transmit, they drop film capsules
@> (which are 3-foot objects shaped like the Apollo command module).

@COMMENTS: You had said NORAD had hid from the Gemini astronauts
@the existence of spy satellites which would have otherwise
@explained their space-UFO sightings. You don't give even a
@single bit of evidence of NORAD allegedly doing this in your
@long list below, making the list irrelevant insofar as
@supporting your claim.

@You've changed your story now to say NORAD didn't "hide" the spy
@satellites but merely didn't "identify them or IDENTIFIED THEM
@AS SOMETHING ELSE," but you still haven't given ANY examples of
@either case in your list below.

Semantics! I consider concealing the identity of something as
hiding it.

@> Mercury 3: John Glenn first reported the "firefly" effect caused
@> by cosmic rays striking the retina of an eye, and the urine ice
@> crystals produced by dumping wastes into space. These became
@> routine for later astronauts, so they were not reported again.

@COMMENTS: This has nothing to do with NORAD "hiding spy
@satellites" from GEMINI astronauts who sighted UFO's in space
@since this was a MERCURY mission -- and no mention of NORAD at
@all.

I copied a list of ALL astronaut sightings I have records on to
the letter for comparison. I did not bother to delete the other
sightings. I did not mean to imply that NORAD hid something in
each sighting.

@> Mercury 5: An object was seen only on RADAR that appeared to
@> parallel the spacecraft for one orbit. The astronaut saw nothing.
@> This was probably nothing but a part of the launch vehicle. It
@> was lost from the RADAR after the spacecraft maneuvered.

The existence of the RADAR sighting was not released to the
public, but learned of from leaks. NORAD initially assumed the
possibility that the Russians had something following our
spacecraft, and kept the sighting quiet because of that.

@> Gemini 1: RADAR picked up parts of the launch vehicle. No visual.

@> Gemini 4: An object was seen and photographed. The frame before
@> the UFO photo was accidentally exposed, and recorded the window
@> of the spacecraft with the sun shining on the rim. That was the
@> photo released as the "UFO." The accidental exposure caused the
@> records to be one frame off. The actual photo shows nothing but
@> an extra dot of light among the stars. It was probably a small
@> bit of debris from the Gemini itself.

@COMMENTS: I don't understand how photos can be "a frame off"
@from anything. Either a photo was taken or it wasn't.

The astronauts wrote down in the log each thing they had
photographed, and each film sequence was later indexed to that

log for identification. The log and the strips of film taken were off from each other because the camera was activated by accident.

@The fact of the matter is that the released "photo" was part of
@a MOVIE film consisting of DOZENS of frames lasting several
@seconds showing a bright whitish EGG-SHAPED light with an arced
@streamer or tail. Not some defect on one picture.

Sorry, my notes were fuzzy on this, and it's been years since I wrote them. I had forgotten (and my notes said nothing to remind me) that it was a cine event. I need to fix my notes and master case list to reflect this. (insert DING sound of hammer hitting head here) I do have a copy of a contact print of a sequence of four frames, but it is in a book, and not able to be kept with the notes.

@The problem with sun reflection off a window rim is that the
@movie camera lens was held almost right up against the window so
@the rim could not possibly have been in focus.

In this case, the camera was accidentally started while not being held by an astronaut. The egg shaped object is nothing but the sun shining on the rounded window corner, and the tail is the straighter part of the window next to it. Printing the film lighter than normal confirmed this (I have a copy). The strip was underexposed because the camera was set to photograph things outside the capsule (in bright sun) at the time.

The accidental start of the camera caused the log to not match up with the film strips shot, but to be one item off. The next strip of film was the actual object the crew was puzzled about, and analysis of that strip showed the object to be debris from the capsule.

Source: A James Lovell interview I taped on TV.

@> Gemini 7: The object was photographed and reported by RADAR, but
@> never identified. It may have been a spy satellite.

@COMMENTS: Where is NORAD hiding anything here?

They may have known what it was, but not identified it for the astronauts, where the transmissions would have been picked up by the TV networks.

@> Gemini 8: This visible object was the Agena for the mission,
@> reflecting sun that made it visible before it was expected to be
@> seen.

@> Gemini 11: The objects were tentatively identified as the Proton
@> 3 satellite and its booster, but UFO investigators

@COMMENTS: That's me and Bruce Maccabee.

(It would be helpful to know your name in this case. I knew Bruce worked on this, but all the info I have on you is "RB47expert.")

@found that the orbit was wrong for what was observed.

@COMMENTS: Bruce and I found that NORAD tracking data placed the
@satellite behind the earth, below the horizon, impossible to
@have been seen.

@> NORAD did not say the
@> object was not there, it said the object was something else
@> that was in the general area, but farther away.

@COMMENTS: This is very confused. NORAD said the Proton 3
@satellite was there -- nothing about saying "something else" was
@there. Bruce and I found out from analyzing NORAD's tracking
@data on Proton 3, the elsets, that it was actually something
@like 3,000 km away and behind the earth.

@NORAD cataloged NOTHING else in the vicinity of the Gemini 11.

Nothing they would admit to anyway. The Proton 3 satellite WAS
the "something else" they said was there instead of a spy
satellite.

We have to remember that the purpose of NORAD at the time had
nothing to do with UFOs, but rather the security of this country.
Hiding alien invaders was the farthest thing from their minds.

Suppose there had been a spy satellite there. Remember that at
the time Premier Breshnyev had his finger poised over "The
Button," and the Cold War was at its height. President Johnson
had just escalated the Vietnam war. Also, the existence of spy
satellites had not yet been disclosed. What could NORAD do that
wouldn't cause an international incident?

1. If it was one of ours, the Soviets would have learned about
its existence and orbit.
2. If it was one of theirs, our disclosure of its existence could
have caused caused a new round of tension.
3. Calling it a UFO would have the same effect, because the

Soviet government (and the news media) could conclude that either case 1 or case 2 was true, especially since it was shaped like earthly space hardware, not the typical UFO shapes.

4. The only prudent thing to do at the time: "Identify" it as the nearest non-secret object available.

5. Once the UFO story got out, the corresponding record of the spy satellite would have been altered to keep it out of the media should an investigation ensue.

You realize that the US military would much prefer a UFO mystery to an international incident. That's why they said they "had a flying disk" at Roswell, and later subbed the RaWin balloon for the (secret) Mogul balloon in the press conference. If the Soviets had found out about Mogul at that time, nuclear war was a possibility.

[BTW, when I was a kid, I had a roll of that pink (actually magenta) adhesive tape with the violet symbols on it. Ben Franklin stores sold it in a set of 4 rolls of decorative tape for 49 cents. The other 3 rolls had different symbols and colors. The green roll had a red sine wave and dots, the yellow roll had cyan squares and circles, and the white roll had black and red playing card pips. The tape was just like the white tape used in first-aid kits back then. Once I saw a published drawing of the symbol shapes, my memory was jolted, and I remember making paper crafts with that tape.]

@> This is one of the probable spy satellites.

@COMMENTS: Based on WHAT EVIDENCE? NORAD gave NASA a complete @catalog of space objects encountering the Gemini 11 and only @Proton 3 came up that was even reasonably viable as a possible @candidate.

I have no solid evidence, but this is the typical thing they would have done. Who says the list NASA was given at the time is the same one they later published? Maybe the orbits of the Proton 3 and the spy satellite were transposed on purpose.

@> Gemini 12: Two objects appeared in photos that were not noticed @> by the crew when they were taken. One was a lens flare, and the @> other was some trash that floated out of the hatch.

@> Apollo 11: An automatic camera recorded a lens flare.

@COMMENTS: You missed the mysterious fluttering "moon pigeon" @videotaped after liftoff which resulted in a detailed Lockheed

@investigation. Jim Oberg uncovered this. It's a bit of a
@mystery.

I don't have a detailed account of this investigation. I have a
tape purported to show this, but it is very bad, and the object
is obviously something kicked up by the engine blast.

@> Apollo 12: The S4-B doors for the LEM stayed in the vicinity of
@> the spacecraft, and were seen through a telescope by an amateur
@> astronomer watching the spacecraft from the ground. The crew also
@> saw them and asked about them.

@Problem is that the S-IVB doors for the LM, called SLA panels
@ (Spacecraft Lunar Adapter), were ejected BACKWARDS and away from
@ from the Apollo 12 spacecraft. The flashing light was observed
@ FORWARD or AHEAD of the Apollo 12.

Yes, but which way is forward? After the LEM is attached, the
Command Module ends up facing backward to the line of flight.
They could not see what was "in front" of them, because the
service module was facing forward for the upcoming braking
maneuver for lunar orbit insertion.

I also remember that on one flight (I thought it was this one),
the ejection mechanism fired, but the doors got stuck. They freed
them by firing the S4-B thrusters to shake them loose.

@> Apollo 13: An amateur astronomer on the ground saw the expanding
@> gas cloud from the ruptured oxygen tank through his telescope and
@> reported it.

@You missed the Skylab 3 case with photos and optical range
@tracking, Aug 26, 1973.

I don't have it. Do you have details?

We had a UFO "blackout" here between March 1969 and November
1973, when the local magazine and paperback distributor did not
carry any UFO-related materials. When Project Blue Book shut
down, he decided he would lose money on any UFO publication. All
of the UFO materials I acquired during that period were bought on
trips out of town.

@> STS-82 Shuttle: The astronauts were talking about a control they
@> hadn't been briefed on at one point, and ice crystals reflecting
@> the sun at another. The UFO "story" was taken out of context from
@> the audio. I know the brother of one of the astronauts, who gave
@> me the true story.

Maybe another set of NORAD stories is in order. Unfortunately, my source for these is now gone (the library disposed of it) and I don't have the exact dates:

Case 1: '50s

- RADAR tracked a UFO entering Canada from Alaska.
- An Eskimo reported contrails over the Aleutian Islands.
- The telephone lines to Alaska went dead.
- A UFO was spotted visually over Baffin Island.
- RADAR tracked a number of unknowns in the Pacific west of Oregon.

The nuclear bombers were placed on alert.

They woke up the President. They had concluded that a nuclear attack was possible.

- The UFO entering Canada from Alaska was a commercial flight with a dead RADAR transponder.
- The telephone failure was a bad power supply tube in the a relay station.
- The UFO over Baffin Island was a supply plane heading for Greenland.
- The objects off Oregon were Coast Guard vessels going to the aid of a disabled ship.
- Nobody knows what the Eskimo saw.

Case 2: '60s

- The brand new BMEWS (Ballistic Missile Early Warning System) RADAR had been turned on only three days. It suddenly gave a warning that one, then three, then more than 99 missiles were detected on the eastern horizon.
- The computer equipment in BMEWS failed to give a projected target location, and seemed to be confused about the current position of the missiles.

NORAD placed the nuclear strike force on alert.

After finding out that Premier Krushchev was in New York for a UN meeting, they decided that it had to be a false alarm, so they did not wake up the President. They shut off the warnings and concentrated on solving the problem. To an outsider, the solution is funny:

BMEWS had seen the Moon rising.

Nobody had dreamed that the RADAR signals would make it all the way to the moon and return over two seconds later. By that time, the transmitter had sent out many more pulses, and the system assumed that the pulses were returns from the latest pulse sent.

They programmed the computer to recognize the moon and ignore it.

In both of these cases, the focus was on a nuclear attack, NOT a UFO sighting case. Space aliens and other unknown phenomena did not enter the realm of possibilities considered. Possible Soviet attacks were the urgent reason for such responses.

The ENTIRE reason regulation AFR-202 existed was for the quick detection of and response to clandestine acts of war. Hiding alien spaceships was not the reason this regulation was written, although many ET proponents think otherwise.

@just to keep the record straight, the flight was called MA-6.
@Cosmic rays causing retinal flashes were not experienced until
@Apollo ventured beyond the van Allen belts. The water for the
@snowflakes from MA-6 was from a flash evaporator "water spray
@boiler"), to cool on-board electronics, not from a urine dump.

Thank you. I discovered the error within an hour of my email, but
was not anywhere near my workstation. My files are at home, but
my internet access is at work. But I do remember that radiation
strikes also caused Mercury and Gemini astronauts to see flashes
(not as bright), because I knew about them before Apollo flew.

The first urine dump was on the first manned Gemini mission. I
got confused about the source of the ice crystals, because the
book I used said "ice crystals" without revealing the source,
and in the next sentence, mentioned the urine dumps on Gemini
and Apollo.

The nature of the urine dump objects was not generally revealed
to the public until the release of the Condon report because it
was considered to be in poor taste at the time.

Chaps,

There were 14 FDL study shapes, including the FDL-8, which was later used as a basis for the X-24B. The FDL-5 reached mock-up stage.

There was also the Maneuvering Re-entry Research Vehicle (MRRV) was to be launched in orbit from a Shuttle payload bay. The MRRV also had a 75 degree delta wing with flip out low speed wings.

Chris

Subject: Re: SETI signals?

Regarding this message from Larry:

>

Gemini 11: The objects were tentatively identified as the Proton 3 satellite and its booster, but UFO investigators found that the orbit was wrong for what was observed. NORAD did not say the object was not there, it said the object was something else that was in the general area, but farther away. This is one of the probable spy satellites.

<

Since I was one of the UFO investigators who found the "orbit was wrong for what was observed" (Brad was the other investigator) I have something to say on this. First, Oberg publicly proclaimed (in magazine articles) that the Proton was the explanation, even AFTER I had demonstrated conclusively (using some Goddard data that HE supplied.... and had miscalculated....) that the Proton was far behind the GT 11, and had sent him the results of my calculations. (A couple of years ago a guy at Goddard took my calculations... all "in hand and calculator type" and repeated them using modern techniques and arrived at the same result). Second, once Oberg admitted (in that well-referenced, peer reviewed, widely acclaimed organ of information dispersion called Saucer Smear), even he admitted that he was not able to identify an actual satellite. Third, as I pointed out before, whatever it was, was quite close to the GT-11, especially close if it was a rather small "secret" satellite. Moreover, the photos clearly show blobs of light - direct or reflected - indicating some size to the object (not just a simple sphere). The blobs reoriented between photos indicating rotation, if a single object consisting of several reflecting surfaces (e.g., solar panel "wings" or some such).

IF NORAD was aware of a secret satellite close to the GT 11, then the Proton explanation must be attributed to a "cover up" that would merely deflect public awareness of what the astronauts reported, even though it was a potentially dangerous situation. Dangerous because orbits were not that finely calculated in those days: if they knew a secret satellite was going to be anywhere near the orbit of the GT 11 they couldn't rule out the possibility of a collision.

@<<Mercury 5: An object was seen only on RADAR that appeared to
@parallel the spacecraft for one orbit. The astronaut saw nothing.
@This was probably nothing but a part of the launch vehicle. It
@was lost from the RADAR after the spacecraft maneuvered. >>

@The fifth manned Mercury flight was MA-8 with Schirra. I have
@never seen any other versions of this story. Radar tracking does
@not extend for a full orbit -- each site can only observe
@perhaps 5-6% of an orbit, and most flying time is out of radio
@contact and beyond radar tracking. No manned spacecraft
@maneuvered until Gemini-3 in 1965.

@You're not deliberately making this easy on me, are you?? <g>

No, I got the wrong flight. The one I wanted was the one with
Gordon Cooper. Maybe there's another misprint in the magazine I
got this case out of. It's full of typogoofical errors (It's the
one that moved the Oloron and Gaillac (France) cases into 1954).

There were tracking sites in Cape Canaveral FL, Bermuda, The
Azores, Madrid, Johannesburg, Athens, Bombay, Woomera
(Australia), Guam, Honolulu HI, Goldstone CA, Alamogordo NM, and
Houston TX.

I don't remember the spacecraft being out of radio contact except
on the Glenn and Carpenter flights, and during re-entry.

The Mercury spacecraft did not change orbits, but they did rotate
occasionally to position the viewing window (and the heat shield
for re-entry). That was the "maneuver" I referred to. The
thruster could have thrown small debris into another orbit. They
had to have the ability to rotate, or they couldn't have used the
spinning re-entry method.

The story said that this unknown object paralld the spacecraft

for one full orbit. It's possible that this entire UFO story is a hoax, considering the source:

"The Real Report on Flying Saucers" Real Magazine, 1968.

@There's lots of cine film of the booster during the rendezvous
@ (Gemini-4 and Gemini-7 were the first two attempts to rendezvous
@ in orbit, with the booster second stage -- what a coincidence
@ they are famous for "UFOs"!!), but no stills that I ever could
@ find. Borman makes it clear he referred to the 'bogie' when
@ talking about the booster he was performing rendezvous on, as a
@ joke. I am unaware of any radar reports of a UFO associated with
@ Gemini-07.

They spelled "bogey" wrong in the reports too. A bogie is the coupled pair of axles with 4 wheels seen on most railroad cars, or slang for a certain 1940s actor. A bogey is a demonic spirit, a bad golf score, or an unidentified aircraft.

They did not rendezvous with their own booster stage, but with an Agena sent up on a separate Atlas booster. The Agena was much smaller in diameter than the Gemini capsule (it was chosen for that reason). Their own upper stage was too massive for the purpose. The Agena's original purpose was an upper stage for launching satellites with the booster used for the Mercury program, and they found a new use for those now surplus objects.

Actually, Gemini 6 (which had been scrubbed earlier, and was now scheduled to go after Gemini 7) was sent up to salvage the mission and rendezvous with Gemini 7, because the Agena failed to reach orbit. That was the mission where they coupled the two spacecraft together and did an artificial gravity experiment.

BTW, were you aware that the booster used for the first Mercury launch was a missile originally designed to carry nuclear warheads?

Why am I getting two of each of these emails?

<<Since I was one of the UFO investigators who found the "orbit was wrong for what was observed" (Brad was the other investigator) I have something to say on this. >>

Here's a memo I prepared a few years ago..

APRIL 6, 1996

Here's the way my research on the Gemini-11 "wingman" report (the word the crew used to describe the object they sighted in September 1966) has been evolving.

Fusses over "7" and "11" have one lesson to teach: a person can have lapses of memory, or at different times recount different remembered versions of a past event, and not be a "liar". That event may be a few weeks in the past, or decades in the past. What's important is what really happened once any confusion is cleared up.

The Gemini-11 sighting got listed in several UFO books as anomalous, but it was alleged at the time that tracking data showed it had been the Proton-3 spacecraft in a terminal orbital decay.

The crew's eyewitness description (I've confirmed this with personal conversations and letters with Pete Conrad and Dick Gordon) of the object (they saw it much more sharply than the photographs turned out) was strongly consistent with a manmade object in general (orbital altitude, speed, ballistic motion, free end-over-end tumbling) and Proton-3 specifically (it was described as having "attached booster stages" around its waist, like the triangle-tipped stages of a Titan-3, when it turned out later to actually have triangle-tipped solar panels around its waist -- pretty good corroboration!). This eyewitness description, meanwhile, was utterly unlike any 'classic' UFO apparition.

At a UFO conference at Fort Smith in 1975, a young officer from NORAD -- Captain Steve Pease -- discussed NORAD's role in tracking objects in space and showed a slide of one of the Gemini-11 photos, enlarged and labeled "Proton-3". In front of the audience and later in face-to-face conversations, he was explicit that NORAD computers had later shown the close fly-by. I attended that conference, and later felt motivated to obtain tracking data to match the two orbits myself.

It was this data which I obtained and analyzed in 1977 and shared with Bruce Maccabee and Brad Sparks. The Proton-3 data was from NORAD tracking and was bouncing all over the sky as the satellite neared final decay and fiery reentry. The Gemini-11 data was harder to obtain, but I finally found a NASA-JSC document which provided equator crossing longitudes. Some manipulation was needed to match the formats, and I didn't know if the two different types of data were compatible but I tried anyway, and in the end I couldn't get them closer than five or six minutes. There never was a time when I said I'd solved it and Maccabee pointed out a simple arithmetic error -- that's a garbled memory and I have the letters we exchanged to prove it.

I did not consider that computational result as proof they the object was NOT Proton-3 for a fundamental reason: the computational process itself had never been verified as reliable with any other checkable satellite conjunction or close approach. I didn't know if it would work even if the objects HAD passed close by, because it was new and was an untried process.

This is an important philosophical difference between me and other, pro-UFO analysts: the failure of an unverified computational algorithm has often been cited as PROOF that an original hypothesis is false, when it may only cast doubt on the mathematical model used, especially as in this case when the math model had NEVER then or later been validated as efficacious.

During the mail exchanges, Brad Sparks indicated to me that he had found a close approach with another US satellite. But he was not going to publish his identification or share it with me -- as deputy research director of APRO, under James Harder, his side was happy to champion "astronaut UFO cases" and they had a doctrinaire aversion to releasing solutions of cases they liked to use for publicity purposes. Again, I have the letters to prove this.

I was satisfied (as they were) that the object seen by Conrad and Gordon was a manmade satellite, and was willing to accept Sparks's claim (had he only sent my verifiable data), but I remained suspicious the object really was Proton-3 but that the problem lay in the computational approach to the mix-and-match data.

However, I was happy to admit I could not PROVE it had been Proton-3, and that's the way I wrote it up in my publications.

I kept the data (it had been a real trial to obtain it in 1976), and recently I tried to see if an outsider could find the data themselves if they wanted to start from scratch. It was a challenge.

I also looked at the data again using new satellite predictor programs now available in home computers (in 1977-8 we did it by pencil). It was clear that the old analysis was naive and inadequate -- in other words, that when approached in 1996, an entirely different answer was possible. The old "math model" had indeed been inadequate and conclusions based on its failure were untenable.

I may well publish those results in a refereed journal such as the Journal of Scientific Exploration, or in MUFON's UFO Journal. If so, please forgive me for not scooping myself until it appears (such magazines require original unpublished research, not information already released via press conferences and the 'net).

In the meantime I am delighted to collect quotations from self-proclaimed experts who have never done a satellite computation about how it's impossible for me to be right, or to tell the truth, or to really solve the case. Patience is a virtue of the older and wiser heads, and I have plenty of time to let things shake out. And time to chuckle over well-earned "I told you so's".

Meanwhile, I do encourage independent analysis efforts, untainted by any material provided by me and hence potential accusable of being forged, faked, or twisted by me. It has been lonely for twenty years appearing to be the only person in the UFO field with the ability to do from-scratch satellite tracking computations (Maccabee and Sparks, don't forget, used data -I- had obtained). When I am asked for "independent support" of my conclusions, what am I supposed to say, that nobody else even knows HOW to attempt the analysis? Or that nobody else in the UFO field has bothered to learn?

Nope, we need more interested people, because satellite tracking data has been crucial to solving major UFO cases around the world (US, Russia, France, Middle East, China, Argentina, New Zealand, etc etc) that otherwise would have remained "unexplained". Hmmm ... now that MIGHT explain why pro-UFO folks really DON'T want to learn this art, it's too heartbreaking to really solve favorite cases -- nah, that's too cynical and cruel, it can't be true...

What do I think the Gemini-11 sighting was? Right now with what I've seen, and considering all the evidence at my disposal, I'd say the following odds express my view:

Proton-3	65%
Other manmade satellite	30%
Other spaceflight-related event	5%
Unexplainable stimulus	<<< 1%

This application of satellite tracking computations to solving classic UFO cases has been highly productive and a lot of fun, and all I can say is, if you're interested, get involved, because there's practically -NO- knowledgeable work being done in the UFO world, they -NEED- the help. And despite nastinesses here on the 'net by loud-mouthed know-it-all would-be dragon-slayers, most serious ufologists of all persuasions appreciate sound technical help.

And as the dragon usually said after the match, "Burp!".

Subject: Re: Gemini-7Cc: UFORL@listbot.com

This statement (below) is incorrect. Gemini-4 attempted, and Gemini-7 succeeded at, a rendezvous with their own Titan second stage. Since it was only an hour or two after launch, they never got very far away, so they didn't need the sophisticated tracking and maneuver targeting procedures needed for the Gemini-6 rendezvous with Gemini-7, or all the 1966 missions.

From: JamesOberg@aol.com
Subject: Re: Gemini-7 bogeyMessage-id: <b6.b61daf41.25a796c4@aol.com>

Back to the original issue, what Borman was seeing when he talked about the "bogey". Here is the whole story, usually covered up or distorted in the UFO literature.

Note - The following is an excerpt from an article "Flying the Gusmobile" about the Gemini missions. Published on the site of "Air and Space" magazine July 14. <http://www.airspacemag.com:80/ASM/Mag/Index/1998/AS/ftgm.html>

(snipped)

At almost twice the length of Gemini 5, Commander Frank Borman's Gemini 7 mission may have been even more trying, but it grabbed the attention of at least one Hollywood producer.

"Right after we got into orbit we were supposed to 'station keep' or fly formation with the booster," Borman says. "We were flying formation and taking photographs and infrared measurements and I started calling it a 'bogey,' which is an old fighter pilot term. Well, a lot of the UFO freaks on the ground picked this up and said we had seen a UFO because we had referred to our booster as a bogey.

"Just this past year I got a call from a producer at 'Unsolved Mysteries' and they said, 'We read your account about your seeing a UFO on Gemini 7 and would you come on the program?' I told them: 'I'd love to come on your program because I'd love to straighten that out.'

"I explained what it was I saw, and I said, 'I don't think there were UFOs,' and the producer said, 'Well, I'm not sure we want you on the program.' "

@> asleep in the back when it happened), as had many of the people
@> who lived there. The effect disappeared when a soybean field next
@> to the road was turned into a housing subdivision.

All of these occurred on sunny days, where heat was rising from the road. The hot air created a column above this perfectly straight road on a windless day. The surrounding air above the fields remained cool, and a long lens was created that bent the light from the truck to form an enlarged upright virtual image of it much closer to the witness. It is significant that no other traffic was on the road, otherwise the air would have been disturbed by intervening vehicles and the lens would have been destroyed.

BTW, the oncoming truck image was somewhat blurry. I didn't get to study the rear image too well, because I was passing another car at the time, and it appeared only while I was in the oncoming lane. Possibly the wake of the car being passed (or my own)

caused the image to rise and split as the air lens was destroyed.
And of course, since I didn't see the third one, I can't comment,
but just after I got up to see if it would return, a car passed
going in the opposite direction.

@> bodies of those who remained in the car.

@COMMENTS: My point was that ionizing radiation sufficiently
@energetic as to penetrate 140 feet of air isn't going to be
@stopped by a little windshield glass. We weren't discussing

@nonionizing radiations such as UV. In a later posting I
@discussed the fact that ionizing radiations propagate with high
@scattering so the car body would not have given much shielding
@-- it's like getting a sunburn from all directions on a heavily
@overcast day or getting burned even under an umbrella.

It depends on the frequency and the responses of different materials:

Air is transparent to UV, x, and gamma rays at short distances. At long distances (on the order of several miles) air becomes opaque to x and gamma rays, just as water becomes opaque to visible light at great distances.

Ozone is opaque to UV. Far UV ionizes and breaks oxygen molecules apart, causing the formation of ozone.

Glass is opaque to far UV and near (soft) x-rays. It is clear to near UV, far x-rays and gamma rays.

Some plastics are clear to visible light, but either block or fluoresce in response to far UV. Most plastics are clear at x and gamma frequencies, but some plastics are remarkably opaque at lower (soft) x-ray frequencies.

All metals are opaque at UV and x-ray frequencies, but all except lead become translucent at gamma frequencies.

Some minerals become translucent at x-ray frequencies. Others, especially barium and strontium salts, are opaque. Some fluoresce, while others, while still others are transparent. Many act as diffraction gratings at x-ray frequencies, deflecting x-rays at certain angles.

X rays can and do cause radiation sickness with overexposures. My great grandmother was a victim of this, when they were trying to use x-rays as a treatment for arthritis.

Far UV is an ionizing radiation for some compounds, including molecular oxygen.

@> would protect against those.
@>

@COMMENTS: I just posted the response on these points which
@eliminate UV and x-rays. I'm not assuming gamma radiation
@there's also neutrons to consider -- and reject along with gamma
@as not consistent with what would otherwise be absolutely fatal
@doses.

There are some possibilities we haven't considered yet. Here are
some questions to ask:

1. The radiation source might have nothing to do with the sighting. There are cases of exposures from poorly operated construction materials testing systems. There was also a case where a kid found a "spent" medical radiation source in a dump and took it home.
2. How sure are we of the actual distance to the object?
3. You can't lump x-rays into one category. Different frequencies do different things. Low frequency (soft) x-rays can travel farther in air, but are stopped more easily by glass and other substances. I used to work with x-ray crystallography.
4. Could the convoy have been an emergency attempt to get a malfunctioning reactor (or something else equally nasty) away from populated areas?
5. UV may not be an ionizing radiation as such, but people have been treated for sunburn-like exposures and nausea after being exposed to mercury vapor or halogen lamps with broken outer (UV-blocking) envelopes. There is a warning about this on the replacement halogen bulb I bought last month.
6. Could the whatever-it-was have been producing a chemical irritant?
7. Could an unrelated chemical irritant have been in the area?
8. Was the UFO a hazardous object suspended by a long cable from a helicopter?
9. Was the radiation emitted in a directional beam, or omnidirectionally?
10. Could a radioactive substance have been given off by the object, and ingested and/or inhaled by Cash?
11. Could the victims have been intentionally poisoned because they saw something secret?
12. Could the symptoms be a combination of unrelated effects? I was recently misdiagnosed as having severe gastrointestinal problems. The symptoms were severe abdominal pain, vomiting, mucus discharges. I had a kidney stone, with an unrelated allergic reaction to latex materials in the doctor's office. I knew the mucus discharges and vomiting were latex reactions -- I have had enough of them -- but the doctor could not understand that there were two illnesses (one iatrogenic) occurring at the same time.

13. Were any steps taken at the time to isolate the offending material or radiation?
14. Has anyone endeavored to test the soil and foliage in the area?
15. Could an accidental exposure to excess x-rays have occurred at the hospital and compounded with the original effects?
16. Could the hospital bve covering up for a case of malpractice or technical failure to avoid a big lawsuit?

@I'm surprised you haven't suggested FIRE BALLOONS yet. Maybe
@some prankster fire balloons are capable of thermonuclear
@reactions! :)

No, but one produced ultraviolet radiation. It contained a magnesium flare.

From: RB47Expert@aol.com
Subject: Re: Gemini-11Message-id: <a1.a19810cb.25a7b7eb@aol.com>

Hi Jim,

I'm glad you pointed out the trickiness of memory as I don't recall telling you that I had positively identified another satellite object to explain Gemini 11 and I certainly never told you it was going to be covered up to protect the pro-UFO side. As you have attested in this posting it can take years to investigate a case. In this instance the other satellite leads didn't pan out so there was nothing to publish beyond the refutation of the Proton 3 calculations that Bruce already published. (If you doubt that, then just identify the other satellite yourself, it's the same satellite data that is available to everyone.)

Incidentally, I did independently obtain satellite tracking data back in 1976-7 -- and in fact I also obtained the capsule orientation data on Gemini 11 showing it was almost exactly level (I think it was something like -0.01 deg) heads up pointed forward. The point of using YOUR data was to try to repeat and confirm YOUR calculations, and it was not because of some inability to know how to obtain NORAD elsets from NASA-Goddard.

The arithmetic error Bruce and I found was a plus sign instead of a minus sign on the differences between NORAD's predictions of Proton 3's orbit and the actual orbit.

I will be very interested to see how you revive Proton 3 once again -- if you can. One major problem I can foresee right now, assuming my fuzzy memory on this is correct, is that the object was photographed as above the level of the Gemini so the orbit had to be higher and the Gemini itself was in the highest orbit of the entire Gemini program to date. The Proton 3 was in a LOW virtually CIRCULAR orbit that was just hours from decay.

Sincerely,

Brad

Subject: Re: The 'Yukon' Case Message-id: <24.24ef5d50.25a7bd63@aol.com>

Hi Larry,

Martin Jasek asked you to cite an instance of a mirage bending an image by 90 degrees HORIZONTALLY which you had previously claimed was a known phenomenon that actually occurs (i.e., 90-deg shift in azimuth or compass direction).

You responded with no quantitative figures and nothing about a horizontal shift of image only a VERTICAL shift.

When I asked you for the physics justifying such an assertion you respond with physics for ordinary VERTICALLY displaced mirages which are not in dispute.

See my COMMENTS (below) at the specific points in your posting.

Brad

 > @> @> multiplication of images, it can also cause the image to be seen
 > @> @> in different directions at the same time.

COMMENTS: Here is one place where you claim that mirage effects can shift images into "DIFFERENT DIRECTIONS." In other places not quoted here I recall you said these horizontal direction shifts can be as much as 90 degrees.

> @> @> Also, didn't the sightings in the three locations happen at three
 > @> @> different times?
 > @>
 > @> @90 degrees different observation angles at the exact same time
 > @> @for the Fox Lake sightings! Please sight horizontal bending
 > @> @cases with these sizes of angles!

COMMENTS: Here is where Martin asked you for specific cases of such 90-degree HORIZONTAL bending of images.

> @> Not according to the maps in the website. All of the observations

- > @> at Fox lake appear to be along the same line of sight at that
- > @> site.
- > @>
- > @> I have seen two of these myself. In one case, a distant truck
- > @> loomed in my rear window, suddenly appearing to be bearing down
- > @> on me from behind as I was passing another car. Suddenly, the
- > @> image contracted vertically

COMMENTS: Here you say the image shifted "VERTICALLY." Nothing about a horizontal compass direction (azimuth) shift. In this case the image of the truck and the real truck were both BEHIND you, so there is no indication of any HORIZONTAL shift of the image.

and lifted into the air. A few miles

- > @> later, the real truck came up behind me.
- > @>
- > @> In the other case, again it was a truck that appeared to be
- > @> approaching me, but this time it was head-on. It was on the same
- > @> section of road, but I was going the other way (I was in the same
- > @> lane both times -- hmmm). Again, I saw the real truck a minute
- > @> later.

COMMENTS: Were the truck and the image both "head-on"? There is nothing here about a HORIZONTAL direction shift.

- > @> My parents also saw this another time on the same road (I was
- > @> asleep in the back when it happened), as had many of the people
- > @> who lived there. The effect disappeared when a soybean field next
- > @> to the road was turned into a housing subdivision.

COMMENTS: Where is the HORIZONTAL direction shift?

- > All of these occurred on sunny days, where heat was rising

COMMENTS: "RISING" is VERTICAL refractive language.

from

- > the road. The hot air created a column above

COMMENTS: More VERTICAL refractive language.

@> (certainty).

@One important number in the equation which is greater than one
@is the number of stars. It is possible that distance may not be
@a factor in space travel given enough advancements in science
@and engineering. In which case the number of stars plugged into
@the Drake Equation is orders of magnitude more than for a single
@galaxy.

Then it is no longer a probability, but an expected value.

@> @<snip>

@> @

@>

@> I meant, why do the WITNESSES think of space aliens first???
@> There are so many other possibilities! Why think aliens first???
@> A non-conventional explanation does not have to be an alien
@> explanation.

@Many didn't think aliens first. They thought, trucks, planes
@first - as shown in the witness testimonies. As Bruce Maccabee
@said.

I don't know how many accounts I have where the first thing the
witnesses thought was space aliens. I am even a victim of this:
When I first heard of the 1965 Northeast blackout on the day it
happened, for some reason the first thing I thought of was space
invaders. Too many aliens in cartoons? The only UFO case I had
ever heard of at the time was the Fairfield IL case in 1963.

@> I don't think we can say that we are left with nothing but
@> non-human intelligence, because that means that EVERY other
@> possibility (no matter how remote) has been totally eliminated.
@> We have not even scratched the surface of other possibilities. I
@> could prove a time ship from the future using the same faulty
@> logic. It could be something else that we haven't even begun to

@> imagine. This is the logic error that I see time and time again
@> from the pro-alien people.

@I didn't say "nothing but non-human intelligence". I will say
@however that non-human intelligence is more likely than the
@remote possibilities that you site.

Based on what evidence?

@> Witness sincerity, witness composure, and witness veracity have
@> been shown to be independent variables in cases of strange
@> encounters (UFO or other). None of them can be used to
@> demonstrate any of the others. In many confirmed hoaxes, demeanor
@> was the factor that made officials believe the story.

@Maybe one out of a hundred that could be effectively deceitful,
@but not all 22. I trusted everyone of them based on their
@demeanor.

I'm not suggesting that all 22 witnesses are lying, but that one
or more of them staged something believable for the others (the
more distant observers) to see. It's a possibility to be checked
out.

@> @> There is no reason why a mirage can't be seen over a large area.
@> @> All it requires is that the atmospheric lens or mirror causing
@> @> the effect be large. And if a mirror effect can cause a
@> @> multiplication of images, it can also cause the image to be seen
@> @> in different directions at the same time.
@> @>
@> @> Also, didn't the sightings in the three locations happen at three
@> @> different times?
@>
@> @90 degrees different observation angles at the exact same time
@> @for the Fox Lake sightings! Please sight horizontal bending
@> @cases with these sizes of angles!
@>
@> Not according to the maps in the website. All of the observations
@> at Fox lake appear to be along the same line of sight at that
@> site.

@Your phrase "the same line of sight" is misleading. The
@witnesses were located "along a strait line (more or less)"
@would be a better phrase. Just because they are in a strait line
@doesn't equate to all the witnesses looking in the same
@direction. FOX 4,5 were looking NNW, FOX 3 was looking NW, and
@FOX2 was looking WSW. This is a 90 degree angle between the
@extremes! Where is that mirage case with HORIZONTAL bending of

@90 degrees?

I am looking at the map of the Fox Lake area with FOX2, 3, 4, and 5's views on it, the map you referred me to in the timetable. They are all looking in the same direction.

@> I have seen two of these myself. In one case, a distant truck
@> loomed in my rear window, suddenly appearing to be bearing down
@> on me from behind as I was passing another car. Suddenly, the
@> image contracted vertically and lifted into the air. A few miles
@> later, the real truck came up behind me.

@

@As Brad Sparks stated, a vertical mirage

@

@> In the other case, again it was a truck that appeared to be
@> approaching me, but this time it was head-on. It was on the same
@> section of road, but I was going the other way (I was in the same
@> lane both times -- hmmm). Again, I saw the real truck a minute
@> later.

@>

@

@Again, vertical bending

Then why was the image wide enough to appear to be a close truck?
If the truck was over a mile away, and only vertical bending
happened, why didn't I see a tall, pencil thin truck instead of a
truck wide enough to fill the traffic lane at close range? There
had to be horizontal bending.

Donald Menzel, in one of his books, quotes a similar case he
witnessed himself, where a mirage caused a tavern sign 50 miles
away to appear to be lights on a truck only 100 feet away.

<snip>

@> This could give us some hard data. If any witnesses are found
@> that did NOT see the object where it should have been according
@> to the theory you propose, that provides very valuable data too.
@> This is one kind of information that UFO investigators must
@> always strive to collect. One southbound witness, whether he
@> saw the UFO or not, can give us a wealth of information. Go get
@> it!

@Yes I agree. Unfortunately, somebody driving the highway and not
@seeing anything unusual is much less likely to recall the date
@and time precisely.

Unfortunately, right -- Unless they had a banquet, a family
gathering, or some other special event that was on a known date.
A good source there might be a hotel guest lists for events or

rooms.

@> visits by extraterrestrials.
@>
@> * = Already proven to have caused some UFO sighting reports.

@* I don't think they could have caused this one, in my opinion.

Twenty-five years ago, I was "certain" the 1964 Socorro NM, 1965 Exeter NH, 1966 Dexter MI, 1966 Ravenna OH, and 1952 Washington National cases would never be solved. I now have very viable solutions for all of them. I don't have any proof (yet) for any of them, but the proof (or culprits) would be very hard to find.

It takes lots of luck and lots of time for this kind stuff to surface. All of the solutions depend on information I didn't have 25 years ago.

@> @> "Most likely explanation" is not proof, since the last skeptic
@> @> would have to be convinced by a live alien walking in front of
@> @> him (maybe). However, there are a great deal of scientific
@> @> theories unrelated to UFOs that are not proven but are accepted

@> @starting to receive the respect more and more however.
@>
@> Unfair? What does "fair" have to do with sources of funding for
@> scientific research? Fair is where you show your livestock and
@> offer it for sale.
@>
@> Is there a salable product or a way to save lives that can be
@> developed from UFOlogy?

@If the ET hypothesis turns out to be true then I think there
@would be. Maybe far into the future there would be a "pay off",
@maybe we would never figure out how they work.

That's a big IF! The expected value to consider is:

1. Figure the expected payoff of the desired result
2. Multiply it by the probability of the result occurring
3. Subtract the cost of the research.

If the final value is positive, do the research.

@> Those are the rationales (an expected
@> return) behind all scientific funding. Maybe the air traffic
@> control system is the place to look for funds.

@There are many benefits, many of them not scientific. Also, not
@all science is done for immediate monetary gain. It is a
@possible benefit perhaps centuries into the future. There are
@plenty of projects like that, that receive funding.

Only if the expected value of the research is still positive
after the cost has been subtracted. Otherwise a philanthropic
sponsor is needed.

Here is a similar case: I figured out the expected value for the
Publisher's Clearinghouse Sweepstakes. I multiplied the value of
each prize by the probability of winning it, and added them up.

The expected value was negative once I subtracted the cost of the
stamp needed to mail the entry.

@>do NOTHING to undo the very low probability of another. As they
@>multiply, the result is always a LOWER value than any of the
@f>actors, unless all factors but one have a value of one
@>(certainty).
@
@<
@
@If I recall the Drake equation correctly, not all the factors are
@probabilities
@and hence limited to the range 0 to 1.

That makes the output an expected value, not a probability. But
the Drake equation is easily converted to a probability.

Thanks Larry for the info on these sightings. Please feel free
to visit the account of the Pilots sighting I've published at
<http://members.home.net/tlemire/UFOCENTRAL.html> under the link
"Your Encounters". The objects sighted in my opinion show flight
characteristics very unlike those of satellite debris.

@Cc: UFORL@listbot.com

@Subject: Re: Gemini-7

@

@

@This statement (below) is incorrect. Gemini-4 attempted, and Gemini-7
@succeeded at, a rendezvous with their own Titan second stage. Since it was
@only an hour or two after launch, they never got very far away, so they
@didn't need the sophisticated tracking and maneuver targeting procedures
@needed for the Gemini-6 rendezvous with Gemini-7, or all the 1966 missions.

@In a message dated 1/7/00 1:10:04 PM, lrobins@indiana.edu wrote:

@<<They did not rendezvous with their own booster stage, but with an
@Agena sent up on a separate Atlas booster. The Agena was much
@smaller in diameter than the Gemini capsule (it was chosen for
@that reason). Their own upper stage was too massive for the
@purpose. The Agena's original purpose was an upper stage for
@launching satellites with the booster used for the Mercury
@program, and they found a new use for those now surplus objects.>>

Aha. Those rendezvous events were for close approach, but not
docking. I do remember that. (Hey, that was 35 years ago!) I was
thinking of docking and tethered-coupling events. Gemini 7 was
supposed to be the first actual docking with an Agena (but the
Agena didn't show up, so they did the booster rendezvous again,
then launched Gemini 6 and tethered to that instead). Gemini 8
had that little thruster problem, so Gemini 9 was the first fully
successful docking with another spacecraft (an Agena).

@> And of course, since I didn't see the third one, I can't comment,

@> but just after I got up to see if it would return, a car passed

@> going in the opposite direction.

@>

@

@How are these horizontal?

If there had been no horizontal bending, the image of the truck would have looked like a giant vertical pencil instead.

Continuing straight lines of sight to the actual truck more than a mile away would mean that the close image of the truck would appear no wider than the actual angle subtended by the distant truck. There had to be bending in both directions (and opposite bending on each side of center of the truck image) for the truck to be expanded in both the vertical and horizontal direction and remain centered in the lane.

Menzel's sighting had the same expansion in the horizontal direction, so the tavern sign looked like a close truck.

In all four cases, a long, extremely straight road was heated by the sun to create the effect. Three of the cases occurred in the same place (but in the one I didn't see, the mirage was seen in the opposite direction). All of the events I was connected with lasted less than 20 seconds, but Menzel's lasted almost an hour, and his wife was driving their car toward it all that time.

It is also significant that they both saw the mirage, from opposite sides of the front seat. Also, both of my parents saw the mirage the time I was asleep. Both times I saw it myself, I was alone in the car.

One would wonder what the truck drivers saw in each of the two cases I saw.

I would go back there and investigate the next time I am in northern Indiana, but the effects disappeared when a soybean field to the west of the highway was turned into a housing development. Apparently a long uninterrupted stretch of road surrounded by uniform farm fields is necessary to create the effect. I would suspect that a uniform temperature gradient enters into the picture.

@Hi Larry,

@

@Martin Jasek asked you to cite an instance of a mirage bending an image by 90 degrees HORIZONTALLY which you had previously claimed was a known phenomenon that actually occurs (i.e., 90-deg shift in azimuth or compass direction).

@

@You responded with no quantitative figures and nothing about a horizontal shift of image only a VERTICAL shift.

@

@When I asked you for the physics justifying such an assertion you respond with physics for ordinary VERTICALLY displaced mirages which are not in dispute.

@

@See my COMMENTS (below) at the specific points in your posting.

@> @>

@> @> @90 degrees different observation angles at the exact same time

@> @> @for the Fox Lake sightings! Please sight horizontal bending

@> @> @cases with these sizes of angles!

@COMMENTS: Here is where Martin asked you for specific cases of
@such 90-degree HORIZONTAL bending of images.

@> @> Not according to the maps in the website. All of the observations

@> @> at Fox lake appear to be along the same line of sight at that

@> @> site.

@> @>

@> @> I have seen two of these myself. In one case, a distant truck

@> @> loomed in my rear window, suddenly appearing to be bearing down

@> @> on me from behind as I was passing another car. Suddenly, the

@> @> image contracted vertically

@COMMENTS: Here you say the image shifted "VERTICALLY." Nothing
@about a horizontal compass direction (azimuth) shift. In this
@case the image of the truck and the real truck were both BEHIND
@you, so there is no indication of any HORIZONTAL shift of the
@image.

But the truck was as WIDE as a close truck appears too. If just
vertical bending had occurred, I would have seen a tall, but
verrrrry skinny truck.

It was not displaced sideways, but it was expanded sideways to
appear to fill the traffic lane at close range.

@and lifted into the air. A few miles

@> @> later, the real truck came up behind me.

@> @>

@> @> In the other case, again it was a truck that appeared to be

@> @> approaching me, but this time it was head-on. It was on the same

@> @> section of road, but I was going the other way (I was in the same

@> @> lane both times -- hmmm). Again, I saw the real truck a minute

@> @> later.

@COMMENTS: Were the truck and the image both "head-on"? There
@is nothing here about a HORIZONTAL direction shift.

So how did it get to be wide enough to appear as a normal truck?
Figure the geometry, and the image should have appeared to be 8
feet tall and an inch wide.

@> @> My parents also saw this another time on the same road (I was

@> @> asleep in the back when it happened), as had many of the people

@> @> who lived there. The effect disappeared when a soybean field next

@> @> to the road was turned into a housing subdivision.

@> All of these occurred on sunny days, where heat was rising

Hi Todd,

Now that I've had a chance to read Slater's account written 33 years after the fact, my impression is that these are very Low Strangeness incidents and that the radar-only event was a meteor (with the speed underestimated), the first visual event was a head-on meteor and the stationary-seeming lights were miscellaneous but didn't display unexplainable behavior or structure.

<<Those rendezvous events were for close approach, but not docking. I do remember that. (Hey, that was 35 years ago!) I was thinking of docking and tethered-coupling events.>>
Age gives us humility when it comes to our own memories, and that's one of the few bonuses you earn for those many years.

<, Gemini 7 was supposed to be the first actual docking with an Agena (but the Agena didn't show up, so they did the booster rendezvous again, then launched Gemini 6 and tethered to that instead). >>

No, Gemini-7 was always a non-Agena long duration mission. The tethered experiments were on Gemini-11 and Gemini-12, almost a year later.

<<Gemini 8 had that little thruster problem, so Gemini 9 was the first fully successful _docking_ with another spacecraft (an Agena).>>

No, Gemini-8 docked successfully to its Agena, and the thruster problem occurred soon afterwards. Gemini-9's Agena blew up, so another target -- the "angry alligator", it was called, when it's aero shroud didn't separate -- went up instead.

Mr. Robins, we all need to sing a few stanzas from Maurice Chevalier in "Gigi", about "Ah yes, I remember it well." And then a few rounds of wine!!

I have mirage photos taken by Robert Sheaffer of distant ships
on Lake Michigan... these photos show considerable vertical
stretching of the images.

But, anyway, the angles of bending observed here are a small fraction of a degree. This is nowhere near 90 degree horizontal... or vertical.... bending by a mirage.

From: bruce maccabee <brumac@compuserve.com>
Subject: Re: Gemini-11

Regarding Oberg's contribution to the The Gemini 11 discussion, Brad wrote:

>

I will be very interested to see how you revive Proton 3 once again -- if you can. One major problem I can foresee right now, assuming my fuzzy memory on this is correct, is that the object was photographed as above the level of the Gemini so the orbit had to be higher and the Gemini itself was in the highest orbit of the entire Gemini program to date. The Proton 3 was in a LOW virtually CIRCULAR orbit that was just hours from decay.

<

The astronaut report suggested that the object went in front and below. Of more interest is that it was first seen at the 10 o'clock position (roughly). This means to the left or NORTH east of the Gemini 11, and since it appeared to pass below and in front. it was moving toward the east-southeast... that is, it had a southward velocity component/.

The Proton 3, on the other and, was moving northward at the time and, if first seen on the LEFT side, would have been observed to move (northward) AWAY from the Gemini 11, i.e., it would not appear to pass in front and below.

The altitude of the Gemini 11 estimated at 300 km. That of the P-3 estimated at 225 km

This is already too great for the P-3 to make images as large as in the photographs, even if the astronauts had been able to look straight down at the P-3.

From: bruce maccabee <brumac@compuserve.com>
Subject: Re: Gemini-11

Regarding Oberg's response to my comments about Gemini 11 and th Proton 3:

>And as the dragon usually said after the match, "Burp!".

<

I guess the dragon had an acid stomach. Something indigestible, perhaps?

So far as I know, neither Oberg nor anyone else has shown the Proton 3 to be

to the left front of and within 10 miles of, the Gemini 11 at the time the photos were taken.

Similarly, so far as I know, no one has refuted the Maccabee/Sparks calculations

which place the Proton 3 nearly 3000 miles behind and to the right of the Gemini 11

craft at a time when they were looking forward (at that distance the P-3 was well over the horizon).

Hence I am surprised that Jim would assign a probability as high as 65% to the

identification as the Proton 3 until he can prove my/Sparks' analysis was off by

more than 1000 miles.

Larry, I created a special figure and page so that we can better visualize the viewing directions:

<http://www.ufobc.org/yukon/2234foxlaketraject.htm>

Drawings by FOX2 are also of assistance:

<http://www.ufobc.org/yukon/2207fox2draw2neg.htm>

and

<http://www.ufobc.org/yukon/2208fox2draw3neg.htm>

Note the witnesses ARE NOT looking in the same direction. The differences in the viewing directions is nearly 90 degrees! How could HORIZONTAL bending be the cause? The examples you site are just a fraction of a degree in the horizontal. Again, do you have ANY examples of horizontal bending mirage cases with the sizes of angles approaching 90 degrees?

This approach is absurd! A noble prize winning physicist once said that man

will never harness the power of the atom. A few years later it happened. Man will never solve the mysteries of flight, etc. There is no way one can determine the probability of innovation. Advancements in science come when people find ways of doing things in UNPREDICTABLE ways.

@> perpendicular to the line of sight.

@COMMENTS: A perpendicular point of transmission from a
@satellite would be extremely rare.

Not for a SETI sweep of the cosmos. Usually the antenna is
pointed neither east nor west, letting the earth's rotation sweep
it around the right ascension axis. One declination is selected
for each 24 hour sweep. That makes all satellites in east-west
orbits cross the sensitive area at right angles.

MORE COMMENTS: Unless the declination selected is directly above the SETI
antenna site it will NOT be at right angles to crossing earth satellites.
For example, if the SETI site is at, say, 40 N latitude, and the selected
declination is at say 10 degs N then satellites with transmissions would be
picked up NOT at "right angles" but at no more than 60 degs elevation above
the horizon. In that situation the only way the satellite flight path would
be at right angles to the SETI antenna is if the satellite coincidentally was
in a 40-deg inclination orbit. But most satellites found that far north in
the mid-latitudes will be in roughly 90-deg polar orbits or Russia's high
latitude/inclination orbits.

BTW, a friend of mine has an amateur SETI system. So far, the
only intelligence he has picked up was the city's dispatch radio
leaking in through a back lobe of the antenna pattern and
overloading the tuner in the receiver.

MORE COMMENTS: The spy satellite does not have to be directly above the SETI
antenna (thus possibly at "right angles") to be received but could be
received through an antenna SIDE-LOBE off at some oblique angle above the
horizon.

@> Since the antenna is moving
@> on a slow, fixed tracking schedule (or just rotating with the
@> Earth), it would pick up the signal for the time the satellite is
@> crossing the line of sight of the antenna, then the signal would
@> just vanish.

@COMMENTS: Many radio astronomy antennas are multiples and
@equipped for DOPPLER INTERFEROMETRY.

And SETI rarely gets enough funding to rent time on one of those
big monsters. Usually, they have to be content with one dish at a
time.

MORE COMMENTS: A lot of interferometry these days is done simply by linking
radio telescopes without a special "monster" set up such as the VLA on the
Plains of San Agustin, New Mexico. If one linked antenna receives a signal
not received by the other antennas then they know instantly that the signal
is NOT coming from deep space but is from near-earth, i.e., most likely a
satellite.

@> By the way, how are you going to measure a Doppler shift if you
@> don't know the original frequency? It makes sense only if the
@> Doppler shift is changing, and that happens only if the antenna
@> is pointed along the satellite's orbit.

@COMMENTS: Using Doppler Interferometry the change of frequency
@as a satellite moved at some angle off of strictly perpendicular
@would be easily detected. And in fact the location of the radio
@source as Near Earth Orbit would be easily TRIANGULATED using
@interferometry, giving radial ranges on the order of 100's or
@1,000's of km instead of light-years.

@Because the angular velocity of a satellite is greatest when
@perpendicular and closest to the receiver it resides there for
@the LEAST amount of time. MOST of the time satellites are at
@various slant angles.

See above.

@> And remember, spy satellites transmit short bursts of data, not
@> continuously.

@COMMENTS: Good point but not true for all intelligence
@satellites -- for some the amount of data download is so vast it
@cannot be sent in bursts.

It only takes one. And see below, where the intelligence
satellite sends one burst on each frequency in turn. Anyone
listening on only one frequency hears only one burst. In SETI

scans, if the receiver's frequency sweep is not on the burst frequency when the satellite uses it, it will miss that burst entirely.

MORE COMMENTS: As I've pointed out several times before such spy satellite signals would be ENCRYPTED transmissions. Not a repetitious pattern but encrypted text. How in the world would the SETI astronomer not see that? That would be the tipoff right there that it's from a Near Earth Orbit spy sat.

@There's not time to notice a change in Doppler > shift with @these.

@COMMENTS: Another good point. But if a velocity vector is @determined with Doppler interferometry and another burst is @detected further along the same path, then the frequencies can @be compared, unless (as you point out next) they are randomly @shifted to make interception difficult.

Doppler Interferometry is something SETI rarely gets to play with.

@> Sometimes they scatter the frequencies
@> subsequent bursts are sent on, to prevent unauthorized reception
@> by those not knowing what frequency comes next.
@>
@> The sleeper satellites don't transmit, they drop film capsules
@> (which are 3-foot objects shaped like the Apollo command module).

@COMMENTS: You had said NORAD had hid from the Gemini astronauts @the existence of spy satellites which would have otherwise @explained their space-UFO sightings. You don't give even a @single bit of evidence of NORAD allegedly doing this in your @long list below, making the list irrelevant insofar as @supporting your claim.

@You've changed your story now to say NORAD didn't "hide" the spy @satellites but merely didn't "identify them or IDENTIFIED THEM @AS SOMETHING ELSE," but you still haven't given ANY examples of @either case in your list below.

Semantics! I consider concealing the identity of something as hiding it.

MORE COMMENTS: NO IT'S NOT "SEMANTICS." To "hide" something is to conceal its very existence. To misidentify something still discloses its existence.

Your story changed from one of NORAD allegedly concealing the existence of spy satellites to a story of NORAD merely misidentifying spy satellites.

You had previously claimed that NORAD had hid the very existence of spy satellites from the Gemini missions that sighted space UFO's and that that was why the sightings remained unidentified -- but that means NORAD was endangering the lives of our astronauts needlessly when all they needed to disclose was a mere SATELLITE CATALOG NUMBER and approach parameters WITHOUT DISCLOSING ANY CLASSIFIED MISSION PROFILE. The idea NORAD did that is sheer nonsense. NORAD had a formal agreement with NASA to continuously calculate approach parameters of ALL KNOWN satellite objects during MANNED NASA missions for purposes of SAFETY, to warn of possible collisions.

@> Mercury 3: John Glenn first reported the "firefly" effect caused
@> by cosmic rays striking the retina of an eye, and the urine ice
@> crystals produced by dumping wastes into space. These became
@> routine for later astronauts, so they were not reported again.

@COMMENTS: This has nothing to do with NORAD "hiding spy
@satellites" from GEMINI astronauts who sighted UFO's in space
@since this was a MERCURY mission -- and no mention of NORAD at
@all.

I copied a list of ALL astronaut sightings I have records on to the letter for comparison. I did not bother to delete the other sightings. I did not mean to imply that NORAD hid something in each sighting.

MORE COMMENTS: All these listings then were IRRELEVANT PADDING if they did not support your contention that NORAD hid spy satellites thus allowing Gemini sightings to remain as "UFO's."

@> Mercury 5: An object was seen only on RADAR that appeared to
@> parallel the spacecraft for one orbit. The astronaut saw nothing.
@> This was probably nothing but a part of the launch vehicle. It
@> was lost from the RADAR after the spacecraft maneuvered.

The existence of the RADAR sighting was not released to the public, but learned of from leaks. NORAD initially assumed the possibility that the Russians had something following our spacecraft, and kept the sighting quiet because of that.

@> Gemini 1: RADAR picked up parts of the launch vehicle. No visual.

@> Gemini 4: An object was seen and photographed. The frame before

@> the UFO photo was accidentally exposed, and recorded the window
@> of the spacecraft with the sun shining on the rim. That was the
@> photo released as the "UFO." The accidental exposure caused the
@> records to be one frame off. The actual photo shows nothing but
@> an extra dot of light among the stars. It was probably a small
@> bit of debris from the Gemini itself.

@COMMENTS: I don't understand how photos can be "a frame off"
@from anything. Either a photo was taken or it wasn't.

The astronauts wrote down in the log each thing they had
photographed, and each film sequence was later indexed to that
log for identification. The log and the strips of film taken were
off from each other because the camera was activated by accident.

MORE COMMENTS: I don't recall any such circumstance with the Gemini 4 film.

@The fact of the matter is that the released "photo" was part of
@a MOVIE film consisting of DOZENS of frames lasting several
@seconds showing a bright whitish EGG-SHAPED light with an arced
@streamer or tail. Not some defect on one picture.

Sorry, my notes were fuzzy on this, and it's been years since I
wrote them. I had forgotten (and my notes said nothing to remind
me) that it was a cine event. I need to fix my notes and master
case list to reflect this. (insert DING sound of hammer hitting
head here) I do have a copy of a contact print of a sequence of
four frames, but it is in a book, and not able to be kept with
the notes.

@The problem with sun reflection off a window rim is that the
@movie camera lens was held almost right up against the window so
@the rim could not possibly have been in focus.

In this case, the camera was accidentally started while not being
held by an astronaut.

MORE COMMENTS: How is that possible when the space between the astronaut's
head and the window was about 12 inches and the movie camera itself was about
9-1/2 inches long???? (Camera data from NASA Photogrammetrist Richard W.
Underwood, Aug 17, 1976, and Sept 19, 1977.) I never heard this story
before. Besides, it's IRRELEVANT.

The egg shaped object is nothing but the
sun shining on the rounded window corner,

MORE COMMENTS: I measured the elliptical image as having a major-minor axis
ratio of 1.5 +/- 0.1. The sun is perfectly round (ratio 1.0) to within these

margins.

and the tail is the straighter part of the window next to it. Printing the film lighter than normal confirmed this (I have a copy). The strip was underexposed because the camera was set to photograph things outside the capsule (in bright sun) at the time.

The accidental start of the camera caused the log to not match up with the film strips shot, but to be one item off. The next strip of film was the actual object the crew was puzzled about, and analysis of that strip showed the object to be debris from the capsule.

Source: A James Lovell interview I taped on TV.

MORE COMMENTS: Lovell was NOT on the McDivitt-White Gemini 4 mission.

@> Gemini 7: The object was photographed and reported by RADAR, but @> never identified. It may have been a spy satellite.

@COMMENTS: Where is NORAD hiding anything here?

They may have known what it was, but not identified it for the astronauts, where the transmissions would have been picked up by the TV networks.

@> Gemini 8: This visible object was the Agena for the mission, @> reflecting sun that made it visible before it was expected to be @> seen.

@> Gemini 11: The objects were tentatively identified as the Proton @> 3 satellite and its booster, but UFO investigators

@COMMENTS: That's me and Bruce Maccabee.

(It would be helpful to know your name in this case. I knew Bruce worked on this, but all the info I have on you is "RB47expert.")

Larry, I've been corresponding with you for something like a year now and I don't bother typing out my name Brad Sparks every time.

@found that the orbit was wrong for what was observed.

@COMMENTS: Bruce and I found that NORAD tracking data placed the @satellite behind the earth, below the horizon, impossible to

@have been seen.

@> NORAD did not say the

@> object was not there, it said the object was something else

@> that was in the general area, but farther away.

@COMMENTS: This is very confused. NORAD said the Proton 3
@satellite was there -- nothing about saying "something else" was
@there. Bruce and I found out from analyzing NORAD's tracking
@data on Proton 3, the elsets, that it was actually something
@like 3,000 km away and behind the earth.

@NORAD cataloged NOTHING else in the vicinity of the Gemini 11.

Nothing they would admit to anyway. The Proton 3 satellite WAS
the "something else" they said was there instead of a spy
satellite.

MORE COMMENTS: Again, this is ridiculous that NORAD would endanger the
lives
of astronauts to conceal the existence of a supposed spy satellite when all
it needed to do was list any such satellite as a mere SATELLITE CATALOG
NUMBER without identifying it further as anything at all. We don't even know
if any such hidden spy sat even existed -- this is purely hypothetical
supposition on your part.

The distance to the Proton 3 was actually about 5,000 km, my memory was off
but conservative in understating the discrepancy.

We have to remember that the purpose of NORAD at the time had
nothing to do with UFOs, but rather the security of this country.
Hiding alien invaders was the farthest thing from their minds.

MORE COMMENTS: No one said anything about "Hiding alien invaders." Why did
you bring that up? It's a red herring, a distraction from the issue at hand.
And NORAD's mission DID have to do with UFO's, it always has, regardless
whether they are called "UFO's" or "Uncorrelated Targets" (UCT's) or
"Unidentified Aircraft" or whatever.

Suppose there had been a spy satellite there.

MORE COMMENTS: Yes it is ALL "supposition."

Remember that at
the time Premier Breshnyev had his finger poised over "The

Button," and the Cold War was at its height. President Johnson had just escalated the Vietnam war. Also, the existence of spy satellites had not yet been disclosed. What could NORAD do that wouldn't cause an international incident?

MORE COMMENTS: I told you again and again "what NORAD could do." It could list the spy satellite as an otherwise unidentified SATELLITE CATALOG NUMBER like all of the other spy satellites.

1. If it was one of ours, the Soviets would have learned about its existence and orbit.

MORE COMMENTS: The Soviets had skin-track radars just as we did. They didn't need a NORAD announcement to know a satellite was flying overhead.

2. If it was one of theirs, our disclosure of its existence could have caused caused a new round of tension.

3. Calling it a UFO would have the same effect, because the Soviet government (and the news media) could conclude that either case 1 or case 2 was true, especially since it was shaped like earthly space hardware, not the typical UFO shapes.

4. The only prudent thing to do at the time: "Identify" it as the nearest non-secret object available.

MORE COMMENTS: All NORAD had to do was say "Object 1234 was projected to pass within XXXX km of Gemini 11 at 1825 GMT on Sept 13, 1966." No one had to say anything about satellite Object 1234's mission or even if it was a satellite instead of some debris. (The number 1234 is arbitrary for illustration.) In fact that was standard procedure with spy satellites -- to list them as space object catalog numbers without disclosing a satellite name or mission or identity.

5. Once the UFO story got out, the corresponding record of the spy satellite would have been altered to keep it out of the media should an investigation ensue.

You realize that the US military would much prefer a UFO mystery to an international incident. That's why they said they "had a flying disk" at Roswell, and later subbed the RaWin balloon for the (secret) Mogul balloon in the press conference. If the Soviets had found out about Mogul at that time, nuclear war was a possibility.

[BTW, when I was a kid, I had a roll of that pink (actually magenta) adhesive tape with the violet symbols on it. Ben

Franklin stores sold it in a set of 4 rolls of decorative tape for 49 cents. The other 3 rolls had different symbols and colors. The green roll had a red sine wave and dots, the yellow roll had cyan squares and circles, and the white roll had black and red playing card pips. The tape was just like the white tape used in first-aid kits back then. Once I saw a published drawing of the symbol shapes, my memory was jolted, and I remember making paper crafts with that tape.]

@> This is one of the probable spy satellites.

@COMMENTS: Based on WHAT EVIDENCE? NORAD gave NASA a complete @catalog of space objects encountering the Gemini 11 and only @Proton 3 came up that was even reasonably viable as a possible @candidate.

I have no solid evidence, but this is the typical thing they would have done. Who says the list NASA was given at the time is the same one they later published? Maybe the orbits of the Proton 3 and the spy satellite were transposed on purpose.

MORE COMMENTS: See above. Again, all NORAD had to do was say "Object 1234 was projected to pass within XXXX km of Gemini 11 at 1825 GMT on Sept 13, 1966." No one had to say anything about satellite Object 1234's mission or even if it was a satellite instead of some debris. (The number 1234 is arbitrary for illustration.) In fact that was standard procedure with spy satellites -- to list them as space object catalog numbers without disclosing a satellite name or mission or identity.

@> Gemini 12: Two objects appeared in photos that were not noticed @> by the crew when they were taken. One was a lens flare, and the @> other was some trash that floated out of the hatch.

@> Apollo 11: An automatic camera recorded a lens flare.

@COMMENTS: You missed the mysterious fluttering "moon pigeon" @videotaped after liftoff which resulted in a detailed Lockheed @investigation. Jim Oberg uncovered this. It's a bit of a @mystery.

I don't have a detailed account of this investigation. I have a tape purported to show this, but it is very bad, and the object is obviously something kicked up by the engine blast.

@> Apollo 12: The S4-B doors for the LEM stayed in the vicinity of @> the spacecraft, and were seen through a telescope by an amateur @> astronomer watching the spacecraft from the ground. The crew also @> saw them and asked about them.

@Problem is that the S-IVB doors for the LM, called SLA panels
@ (Spacecraft Lunar Adapter), were ejected BACKWARDS and away from
@ the Apollo 12 spacecraft. The flashing light was observed
@ FORWARD or AHEAD of the Apollo 12.

Yes, but which way is forward?

MORE COMMENTS: Forward or "ahead" is from the context of my statement along the trajectory path to the lunar intercept point, not which way the spacecraft happened to be pointing at the time. I'm sorry I wasn't more clear. (See more below.)

After the LEM is attached, the
Command Module ends up facing backward to the line of flight.
They could not see what was "in front" of them, because the
service module was facing forward for the upcoming braking
maneuver for lunar orbit insertion.

MORE COMMENTS: I didn't say DIRECTLY "in front." If the x-axis is parallel with the Apollo spacecraft's trajectory then I simply mean positive x values for "forward" or "ahead" and negative x values for "behind."

I also remember that on one flight (I thought it was this one),
the ejection mechanism fired, but the doors got stuck. They freed
them by firing the S4-B thrusters to shake them loose.

MORE COMMENTS: Absolutely not. It was normal deployment on Apollo 12,
which
meant a backward negative-x velocity vector.

@> Apollo 13: An amateur astronomer on the ground saw the expanding
@> gas cloud from the ruptured oxygen tank through his telescope and
@> reported it.

@You missed the Skylab 3 case with photos and optical range
@tracking, Aug 26, 1973.

I don't have it. Do you have details?

MORE COMMENTS: I interviewed Skylab-3 astronaut Dr. Owen K. Garriott in Oct 1973, right after his return from the flight, about his sighting, photography and optical ranging to the unidentified reddish-orange object which was flashing or rotating about once per second. There were 4 color photos taken (NASA SL3-118-2140).

Yes, that is where I got it from. Stanton Friedman's lectures. Not sure if it is an original quote from him or not?

Hello Brad,

Thanks Brad for reading and commenting on the sighting by Mr. Slater. I agree with you that the description of the object sighted alongside the craft fits a typical description of a meteor but if we take Slater's (embellished, I agree) description at face value, what can explain his stating that the object "paced" the craft and then accelerated showing an obvious flight path correction both left and right. Also, what about the horizontal flight path and the fact that it disappeared out of their sight "straight ahead"? I'd certainly like to agree with your meteor explanation but there seems to be a few discrepancies. I've included part of Slater's description below.

"This extremely bright light paced along side us for a few minutes. No, that's probably not true; I lost track of time, it was probably less than a minute. All of a sudden it took off. I have no idea how fast it was going. All I know is that we were going Mach .80 and this thing ran off and left us like we were standing still. After it got a ways in front of us it cut over to the right until it was directly in front of us and then

corrected to the left, accelerated, and went out of sight straight ahead. Although I had entertained the thought of the existence of UFOs for some time, this was beyond my scope of reasoning."

Respectfully,
Todd Lemire

Hi Todd,

The problem is that we're having to hyperanalyze almost every word Slater utters 33 years after the fact to try to figure out what happened and even then he admits in re the "pacing" that he doesn't know how long that lasted, he admits he overestimated the time. And what we need are accurate QUANTITATIVE details of direction, elevation angle, timing, etc. These are the kind of details that needed to be obtained at the time of the incident not 1/3 century later. What if the only unexplained details that would seem to put it into the UFO category happen to be the details that are erroneous or misremembered?

It so happens that in the RB-47 case of July 17, 1957, the crew saw a headon meteor which looked like it was pacing them for a while then suddenly veered off at tremendous speed and disappeared. That was due to perspective effects of the distance to the meteor and a slight offset from directly headon.

Brad

Hello Brad,

Thanks again for your opinions and ideas. Being new to the investigative field I like to pick the brains of those more experienced than myself. I was mainly interested if meteors could display this type of flight characteristic (horizontal flight path) and what some of other flight characteristics meteors could display.

Thanks for the help,
Todd Lemire

Hi Todd,

Yes, meteors can have very shallow nearly horizontal flight paths. In some cases they seem to have braked by air friction down to earth orbital velocity -- which would be perfectly horizontal if oriented correctly.

But it's unclear just how close to horizontal the light or lights seen by Slater really were. One degree? 10 degs?

The only element of strangeness I can see is the seeming right-left swerving and that may have been an optical illusion -- or even a memory error after so many years.

Brad

From: Edoardo Russo <edoardo.russo@torino.ALPcom.it>
Subject: FAA data on JAL747

Hello Folks in the far, far west (from my viewpoint),

I learned that the FAA was selling all pertinent data about the JAL747 sighting of November 1986 fame.

Did somebody buy it all? Is it available at a lesser price than the 200 bucks FAA asked at the time? (our pilot-case cataloguer would be interested in getting it.)

Thanks and regards

@Hi Todd,

@Now that I've had a chance to read Slater's account written 33
@years after the fact, my impression is that these are very Low
@Strangeness incidents and that the radar-only event was a meteor
@(with the speed underestimated), the first visual event was a
@headon meteor and the stationary-seeming lights were
@miscellaneous but didn't display unexplainable behavior or
@structure.

@Brad

This seems to be a common effect with RADAR and meteors. Since
the meteor is so far away, it registers on RADAR as a second or
third-trip echo (a distance normally beyond the range of the
RADAR). This causes the plotted distance and speed to be reduced
accordingly.

This caused a large number of sightings in the early days of
RADAR, but since transponders are now in general use, such
sightings are rare (or easily identified through experience).

Examples of such sightings:

- * Many were seen during World War II, but were attributed at the
time to electronic noise.

- * Congaree AFB, South Carolina, 8/20/52.

- * Parts of the 8/13/56 Lakenheath/Bentwaters case could have
been this effect, since a meteor shower is normally observed on
that night, and the UFOs were traveling in the correct direction.

@>lasted less than 20 seconds, but Menzel's lasted almost an hour,
@>and his wife was driving their car toward it all that time.>

@

@I have mirage photos taken by Robert Sheaffer of distant ships
@on Lake Michigan... these photos show considerable vertical
@stretching of the images.

@

@But, anyway, the angles of bending observed here are a small
@fraction of a degree. This is nowhere near 90 degree horizontal...
@or vertical.... bending by a mirage.

The images I saw were at least 10 degrees wide. Otherwise, I
wouldn't have been about to take evasive action in the first case
I encountered. In the case where the image loomed behind me, I
thought a speeding truck had come up very quickly, and was about
to hit me. I was just about to abandon the pass to let him by
when the image lifted and split apart.

The horizontal gradients would have been caused by the hot air
rising from the road, surrounded by the cooler air from the
fields on either side. There would be one on each side. The total
bending had to be at least 5 degrees on each side to produce the
effect, though the amount that occurred over each small section
of road would be small. The effect is similar to the effect in a
light pipe with a variable density.

By the way, the amount of definition in the horizontal direction
was a lot less than the definition in the vertical direction. In
the head-on encounter, the horizontal divisions of the radiator
grille were seen, but the vertical ones were not (compared to the
actual truck seen a minute later). The tires were also not seen
as anything but a dark band beneath the bumper. The windshield
was a solid apparent reflection of the sky, but the cab top was
distinct, although the clearance lights weren't seen.

In my first case (the image behind me), part of the effect that
made me think it was a real truck was that it was just after
sunset, and things weren't too distinct anyway. The truck didn't
have its lights on yet. I wonder if I would have seen a solid
band of light at headlight level if they had been on.

I have not been able to identify the location or date of the case
where a spread of at least 90 degrees was reported (I certainly
did not see one myself). The effect seems to have been generated
in a kaleidoscopic manner, since 8 separate copies of the same
image appeared side by side. Since the object replicated was

symmetrical, it is not known whether half of the images were mirror images. The report is briefly cited in "The Handbook of Unusual Natural Phenomena" (cited in earlier posting). One possibility is that the effect that causes sundogs might have occurred close to the ground.

@Regarding Oberg's contribution to the The Gemini 11 discussion, Brad
@wrote:
@>
@I will be very interested to see how you revive Proton 3 once again -- if
@you can. One major problem I can foresee right now, assuming my fuzzy
@memory on this is correct, is that the object was photographed as above the
@level of the Gemini so the orbit had to be higher and the Gemini itself was
@in the highest orbit of the entire Gemini program to date. The Proton 3
@was in a LOW virtually CIRCULAR orbit that was just hours from
@decay.
@<
@
@The astronaut report suggested that the object went in front and below.
@Of more interest is that it was first seen at the 10 o'clock position
@(roughly). This means to the
@left or NORTH east of the Gemini 11, and since it appeared to pass below
@and in front. it was moving toward the east-southeast... that is, it had a
@southward velocity component/.
@The Proton 3, on the other and, was moving northward at the time and, if
@first seen on the LEFT side, would have been observed to move (northward)
@AWAY from the Gemini 11, i.e., it would not appear to pass in front and
@below.
@
@The altitude of the Gemini 11 estimated at 300 km. That of the P-3
@estimated at 225 km
@This is already too great for the P-3 to make images as large as in the
@photographs, even if the
@astronauts had been able to look straight down at the P-3.
@

One thing that might be confusing things here is that the
astronauts rarely flew with the nose forward, or with the earth
"below" them. The most common orientation used was one where the
retro-rockets and the heat shield face the direction of motion
(ready for use), and the earth is "overhead" in the windows when

the astronauts are seated. The shuttle does this too, but flips over after the main engine does the retro burn.

The only times a Gemini or Apollo capsule flew nose-foreward were:

- shortly after launch
- during certain docking maneuvers
- during certain observations

for Apollo only:

- during translunar injection
- translunar flight before LEM extraction
- in lunar orbit
- during and the transearth injection burn
- Apollo 13's transearth flight (since the LEM provided transearth injection, but the service module provided retro fire)

At all times where maneuvering or observation was not necessary, the orientation used was that for the safest return of the astronauts if something went wrong (including loss of maneuvering thrusters). In addition, passive thermal control (PTC) was used in Apollo flights. This is where the spacecraft was continuously rotated slowly so the sun heated all sides evenly.

@

@Martin

@

@>Nice to have some backup going there martin. I don't think there are too

@>many overheated extremely straight and long roads there....are there? His

@>focus on mirage is a little much when we're talking winter in the North

@>country isn't it?

@>Mike

TRUE! But there can be other temperature gradients.

I was not positing this as THE answer, but simply one that had to be considered. My own sightings and those of Menzel and others are given as showing that horizontal bending can occur (answering a question posed by Martin). The physics of such bending depend on gradient junctions between different temperatures occurring at angles other than horizontal. Possible causes of such vertical or oblique junctions include:

- The edge of a column of warmer air rising over a city or town.

- Warmer air rising from a river that has not yet frozen over.

- A weather front.

- Exhaust (clear) from a smokestack has a profound effect on what is seen through it, especially on cold days. (Obviously this was not the case in the sighting at hand, but I suggest experimenting with it to see the effects of horizontal bending).

In any of these cases, the person seeing the phenomenon would have to be looking at the gradient junction almost edge-on (as I was) for the effect to manifest itself.

Any turbulence in the air would destroy the junction and the effect.

Does anyone have the weather conditions (especially wind) and forecast for the area at the time of the sighting? We can put this theory to bed quite readily with that.

One other (remote) possibility is that each light seen is the vertical mirage of a separate light source much farther north. But that wouldn't explain the motion of the object.

I cite two more cases of horizontal bending (but not nearly so pronounced) cited in UFO literature:

- Hynek saw the jet exhaust from the airliner he was riding in distort the image of a plane going the other way into a disk shape with the long axis horizontal. When his plane banked, he could see the other plane clearly because the exhaust missed its image. I have seen this effect myself while riding in a small airliner. Only the clouds above were distorted (It was a high wing plane, and I initially thought I was seeing a short contrail coming from the engine).

- Menzel (on the ground) saw the exhaust of a jet plane cross Jupiter in the sky. The image of Jupiter expanded into an ellipse with the long axis horizontal, and with arcs and bright points inside. Within a few seconds, it collapsed into Jupiter again.

@>

@> Then it is no longer a probability, but an expected value.

@

@Bingo!

But expected value is not what I was discussing. I was comparing the probability of various possible causes of the Yukon sightings, and the probability of an ET spacecraft is extremely low. It is much lower than the probability of a large prank released to be seen, and it is much lower than the probability that all of the witnesses were lying.

@This approach is absurd! A noble prize winning physicist once said that man
@will never harness the power of the atom. A few years later it happened. Man
@will never solve the mysteries of flight, etc. There is no way one can
@determine the probability of innovation. Advancements in science come when
@people find ways of doing things in UNPREDICTABLE ways.

@Martin

This is not how research is always done, but this is how research
is FUNDED by profitable organizations.

The Wrights did not have any outside funding to play with. They
financed their own project. When they tried to get funding, the
lenders applied the formula I gave and refused the loans. So they
mortgaged their business instead.

Government funded the harnessing of the atom, because they were
afraid of the consequences if the enemy (we were in a war,
remember) found a way to do it first. Those negative consequences
were enough to tip the balance toward doing the research. They
are not present in most research decisions, and were not
addressed in the simpler method used in most research decisions
which I gave.

There were THREE possible outcomes in the harnessing of the atom:

1. Atomic power is possible, we get it first.
2. Atomic power is possible, enemy gets it first.
3. Atomic power is not possible.

Until we were in a war, there was very little funding for atomic
research. After the war, when atomic power was a certainty, there

was much more private funding available.

In both cases, the formula I gave was used repeatedly by different individuals and organizations. It is a common business practice, which is taught (and I used to teach it) in business school. This is the third time this week I have seen well-known practical knowledge labeled as "absurd," "silly," or "poppycock" by people who don't want to believe it is the truth.

In a survey in 1950, 90 percent said we would have cured cancer by 2000, but only 10 percent said we would land on the moon by then.

They also said in 1865 that no passenger could breathe if trains got up to 60 mi/hr. Anybody can make a semi-educated statement about anything.

That includes space aliens.

@Subject: Re: Gemini-11
@
@@
@Regarding Oberg's contribution to the The Gemini 11 discussion, Brad
@wrote:
@>
@I will be very interested to see how you revive Proton 3 once again -- if
@you can. One major problem I can foresee right now, assuming my fuzzy
@memory on this is correct, is that the object was photographed as above the
@level of the Gemini so the orbit had to be higher and the Gemini itself was
@in the highest orbit of the entire Gemini program to date. The Proton 3
@was in a LOW virtually CIRCULAR orbit that was just hours from
@decay.

COMMENTS: The Proton 3 decayed three days later at about 1752 UT +/- 20 mins (16 Sept 66). At the time of the Gemini 11 UFO incident, about 1825 UT on 13 Sep 66, it was in a low orbit with semimajor axis about 6582 km, period about 88.56 mins, eccentricity about 0.00776, inclination about 63.43 degs, as interpolated from NORAD elsets from before and after the encounter (elsets 28-32 before, 33 after).

@
@The astronaut report suggested that the object went in front and below.
@Of more interest is that it was first seen at the 10 o'clock position
@(roughly). This means to the
@left or NORTH east of the Gemini 11, and since it appeared to pass below

@and in front. it was moving toward the east-southeast... that is, it had a
@southward velocity component/.
@The Proton 3, on the other and, was moving northward at the time and, if
@first seen on the LEFT side, would have been observed to move (northward)
@AWAY from the Gemini 11, i.e., it would not appear to pass in front and
@below.

COMMENTS: Bruce is correct. The Proton 3 was headed northeast and was about 15 minutes away from a northbound equator crossing at roughly 1840 UT, prior crossing about 1712 UT, the sighting at about 1825 UT, all on 13 Sep 66. Astronauts Conrad and Gordon both reported to NASA-JSC photogrammetrist Richard W. Underwood on 21 Sep 66 that the UFO photography had been taken at 27h43m into the flight, or about 1825 UT/GMT/Z, according to Underwood's report.

My calculations of relative position at 1825 UT on 13 Sep 66 are as follows approximately:

Gemini 11
Latitude 25 S
Longitude 8 W
Altitude 309 km

Proton 3
Latitude 53 S
Longitude 61 W
Altitude 242 km

The Gemini 11 orbital elements are from NASA-JSC Flight Control Division trajectory printouts, NORAD elset for Object 2415 (Gemini 11), and the TRW Gemini 11 Orbit and Re-entry Trajectory Reconstruction (TRW Note 66 FMT-262, 20 Dec 66). The Proton 3 orbital elements are from the NORAD elsets.

@The altitude of the Gemini 11 estimated at 300 km. That of the P-3
@estimated at 225 km

COMMENTS: As noted above, I get about 309 km and 242 km respectively, which still supports Bruce's point (see below) that even if the Gemini 11 had been directly on top of the Proton 3 the distance separating them, about 67 km, was too great for the angular size of about 0.45 degs measured on the film, which at that distance would correspond to object dimensions of about 530 meters or about 1,700 feet -- much too large for the approximately 13-foot Proton 3 satellite (called the N-4 spacecraft, serial no. 4, by the Soviets). (Also, the photos are taken against a dark space background, not against the earth.)

@This is already too great for the P-3 to make images as large as in the
@photographs, even if the

@astronauts had been able to look straight down at the P-3.

@

One thing that might be confusing things here is that the astronauts rarely flew with the nose foreward, or with the earth "below" them.

COMMENTS: The Gemini 11 WAS nose forward, heads up, according to the astronauts' testimony, and the NASA-JSC Flight Control Division trajectory/attitude printouts.

The most common orientation used was one where the retrorockets and the heat shield face the direction of motion (ready for use), and the earth is "overhead" in the windows when the astronauts are seated. The shuttle does this too, but flips over after the main engine does the retro burn.

The only times a Gemini or Apollo capsule flew nose-foreward were:

- shortly after launch
- during certain docking maneuvers

COMMENTS: The Gemini 11 was docked with the Agena.

- during certain observations

for Apollo only:

- during translunar injection
- translunar flight before LEM extraction
- in lunar orbit
- during and the transearth injection burn
- Apollo 13's transearth flight (since the LEM provided transearth injection, but the service module provided retro fire)

At all times where maneuvering or observation was not necessary, the orientation used was that for the safest return of the astronauts if something went wrong (including loss of maneuvering thrusters). In addition, passive thermal control (PTC) was used in Apollo flights. This is where the spacecraft was continuously rotated slowly so the sun heated all sides evenly.

@
@@> @@
@@> @Hi Larry,
@

@@> But there is no Doppler shift when the satellite is moving
@@> perpendicular to the line of sight.

@@COMMENTS: A perpendicular point of transmission from a
@@satellite would be extremely rare.

@Not for a SETI sweep of the cosmos. Usually the antenna is
@pointed neither east nor west, letting the earth's rotation sweep
@it around the right ascension axis. One declination is selected

@for each 24 hour sweep. That makes all satellites in east-west
@orbits cross the sensitive area at right angles.

@MORE COMMENTS: Unless the declination selected is directly above the SETI
@antenna site it will NOT be at right angles to crossing earth satellites.
@For example, if the SETI site is at, say, 40 N latitude, and the selected
@declination is at say 10 degs N then satellites with transmissions would be
@picked up NOT at "right angles" but at no more than 60 degs elevation above
@the horizon. In that situation the only way the satellite flight path would
@be at right angles to the SETI antenna is if the satellite coincidentally was
@in a 40-deg inclination orbit. But most satellites found that far north in
@the mid-latitudes will be in roughly 90-deg polar orbits or Russia's high
@latitude/inclination orbits.

One has to remember that the SETI system is sweeping frequencies
too. The time of observation at one frequency in one direction is
a series of brief encounters.

@BTW, a friend of mine has an amateur SETI system. So far, the
@only intelligence he has picked up was the city's dispatch radio
@leaking in through a back lobe of the antenna pattern and
@overloading the tuner in the receiver.

@
@MORE COMMENTS: The spy satellite does not have to be directly above the
SETI
@antenna (thus possibly at "right angles") to be received but could be
@received through an antenna SIDE-LOBE off at some oblique angle above the
@horizon.

That's true, and raises a whole new nest of problems, since any
doppler shift measured would not correspond to Earth orbit
objects assumed to be in the direction the antenna is pointing.

@@COMMENTS: Many radio astronomy antennas are multiples and
@@equipped for DOPPLER INTERFEROMETRY.

@
@And SETI rarely gets enough funding to rent time on one of those
@big monsters. Usually, they have to be content with one dish at a
@time.

@
@MORE COMMENTS: A lot of interferometry these days is done simply by linking
@radio telescopes without a special "monster" set up such as the VLA on the
@Plains of San Agustin, New Mexico. If one linked antenna receives a signal
@not received by the other antennas then they know instantly that the signal
@is NOT coming from deep space but is from near-earth, i.e., most likely a
@satellite.

Again, SETI rarely gets to use more than one dish at a time.

@@> And remember, spy satellites transmit short bursts of data, not
@@> continuously.

@@COMMENTS: Good point but not true for all intelligence
@@satellites -- for some the amount of data download is so vast it
@@cannot be sent in bursts.

@It only takes one. And see below, where the intelligence
@satellite sends one burst on each frequency in turn. Anyone
@listening on only one frequency hears only one burst. In SETI
@scans, if the receiver's frequency sweep is not on the burst
@frequency when the satellite uses it, it will miss that burst
@entirely.

@MORE COMMENTS: As I've pointed out several times before such spy satellite
@signals would be ENCRYPTED transmissions. Not a repetitious pattern but
@encrypted text. How in the world would the SETI astronomer not see that?
@That would be the tipoff right there that it's from a Near Earth Orbit spy
@sat.

Most of them send encrypted images, not text. The spy satellites
I am talking about take photos from space. The telemetry they
send is unlike other forms of communications. Some spy satellites
may operate in a mode similar to that used by radio control
planes, just taking orders from the ground, with a quick
acknowledge burst after every command received.

@@COMMENTS: You had said NORAD had hid from the Gemini astronauts
@@the existence of spy satellites which would have otherwise
@@explained their space-UFO sightings. You don't give even a
@@single bit of evidence of NORAD allegedly doing this in your
@@long list below, making the list irrelevant insofar as
@@supporting your claim.

@
@@You've changed your story now to say NORAD didn't "hide" the spy
@@satellites but merely didn't "identify them or IDENTIFIED THEM
@@AS SOMETHING ELSE," but you still haven't given ANY examples of
@@either case in your list below.

@
@Semantics! I consider concealing the identity of something as
@hiding it.

@MORE COMMENTS: NO IT'S NOT "SEMANTICS." To "hide" something is
@to conceal its very existence. To misidentify something still
@discloses its existence. Your story changed from one of NORAD
@allegedly concealing the existence of spy satellites to a story
@of NORAD merely misidentifying spy satellites.

I'm not changing my story, you're misunderstanding me. It is probably a difference in word usage between where you are and where I am. Here is what I have been trying to say all along:

NORAD (and possibly NASA) may have hidden the true identities of the objects seen visually or on RADAR in several cases involving astronauts. This was concealing the existence of spy satellites AS A CLASS from the general public.

@You had previously claimed that NORAD had hid the very existence of spy
@satellites from the Gemini missions that sighted space UFO's and that that
@was why the sightings remained unidentified -- but that means NORAD was endangering the lives of our astronauts needlessly when all they needed to disclose
@was a mere SATELLITE CATALOG NUMBER and approach parameters WITHOUT
@DISCLOSING ANY CLASSIFIED MISSION PROFILE. The idea NORAD did that is sheer
@nonsense. NORAD had a formal agreement with NASA to continuously calculate
@approach parameters of ALL KNOWN satellite objects during MANNED NASA
@missions for purposes of SAFETY, to warn of possible collisions.

OK, so the correct satellite catalog number is given to the astronauts. Some nosey newsman gets hold of it (through listening to the capcom link on an all-band radio), and demands to know what mission by what government endangered our astronauts. What were they going to do then?

@I copied a list of ALL astronaut sightings I have records on to
@the letter for comparison. I did not bother to delete the other
@sightings. I did not mean to imply that NORAD hid something in
@each sighting.

@MORE COMMENTS: All these listings then were IRRELEVANT PADDING
@if they did not support your contention that NORAD hid spy
@satellites thus allowing Gemini sightings to remain as "UFO's."

Actually, I just didn't have time to delete the others. I had a meeting to go to, so I just pasted the entire list in and annotated the ones that had NORAD connections.

@@> Mercury 5: An object was seen only on RADAR that appeared to
@@> parallel the spacecraft for one orbit. The astronaut saw nothing.
@@> This was probably nothing but a part of the launch vehicle. It
@@> was lost from the RADAR after the spacecraft maneuvered.
@
@The existence of the RADAR sighting was not released to the
@public, but learned of from leaks. NORAD initially assumed the

@possibility that the Russians had something following our
@spacecraft, and kept the sighting quiet because of that.

This should have been Mercury 6. My source had a misprint in it.

@@> Gemini 4: An object was seen and photographed. The frame before
@@> the UFO photo was accidentally exposed, and recorded the window
@@> of the spacecraft with the sun shining on the rim. That was the
@@> photo released as the "UFO." The accidental exposure caused the
@@> records to be one frame off. The actual photo shows nothing but
@@> an extra dot of light among the stars. It was probably a small
@@> bit of debris from the Gemini itself.

@MORE COMMENTS: I don't recall any such circumstance with the Gemini 4 film.

I didn't find this out until after "Apollo 13" was released. I
saw an interview with Lovell on TV.

@MORE COMMENTS: How is that possible when the space between the astronaut's
@head and the window was about 12 inches and the movie camera itself was about
@9-1/2 inches long???? (Camera data from NASA Photogrammetrist Richard W.
@Underwood, Aug 17, 1976, and Sept 19, 1977.) I never heard this story
@before. Besides, it's IRRELEVANT.

@The egg shaped object is nothing but the
@sun shining on the rounded window corner,
@

@MORE COMMENTS: I measured the elliptical image as having a major-minor
axis
@ratio of 1.5 +/- 0.1. The sun is perfectly round (ratio 1.0) to within these
@margins.

But a curved surface changes the shape of reflections. Like I
said, I have a copy of a frame from the shot printed very light,
and it shows the capsule interior filling the rest of the frame.

I will tell you the reference for the copy I have when I find it
again (it's in a book).

@and the tail is the straighter part of the window next to it.
@Printing the film lighter than normal confirmed this (I have a
@copy). The strip was underexposed because the camera was set to
@photograph things outside the capsule (in bright sun) at the
@time.

@The accidental start of the camera caused the log to not match up
@with the film strips shot, but to be one item off. The next strip

@of film was the actual object the crew was puzzled about, and
@analysis of that strip showed the object to be debris from the
@capsule.

@Source: A James Lovell interview I taped on TV.

@MORE COMMENTS: Lovell was NOT on the McDivitt-White Gemini 4 mission.

I know. He did the TV interview and was asked about UFOs in space
and about that photo in particular.

@@> Gemini 7: The object was photographed and reported by RADAR, but
@@> never identified. It may have been a spy satellite.

@@COMMENTS: Where is NORAD hiding anything here?

@They may have known what it was, but not identified it for the
@astronauts, where the transmissions would have been picked up by
@the TV networks.

@@> Gemini 8: This visible object was the Agena for the mission,
@@> reflecting sun that made it visible before it was expected to be
@@> seen.

@@> Gemini 11: The objects were tentatively identified as the Proton
@@> 3 satellite and its booster, but UFO investigators
@@> found that the orbit was wrong for what was observed.

@Nothing they would admit to anyway. The Proton 3 satellite WAS
@the "something else" they said was there instead of a spy
@satellite.

@MORE COMMENTS: Again, this is ridiculous that NORAD would
@endanger the lives of astronauts to conceal the existence of a
@supposed spy satellite when all it needed to do was list any
@such satellite as a mere SATELLITE CATALOG NUMBER without
@identifying it further as anything at all. We don't even know
@if any such hidden spy sat even existed -- this is purely
@hypothetical supposition on your part.

@The distance to the Proton 3 was actually about 5,000 km, my
@memory was off but conservative in understating the discrepancy.

Do we know what they really told NASA? Or is what we know only
what the PRESS was told? Those are two very different things.
Think about this:

NASA's main concern was: Can anything (no matter what) hit the Gemini capsule?

NORAD's main concern was: Keep Gemini from hitting anything, and keep the public from learning the truth about spy satellites.

NASA didn't care WHAT it was, only that it wouldn't pose a threat. So NORAD could have identified it by name as anything and satisfied them, so long as NORAD knew it wasn't a danger.

@We have to remember that the purpose of NORAD at the time had
@nothing to do with UFOs, but rather the security of this country.
@Hiding alien invaders was the farthest thing from their minds.

@MORE COMMENTS: No one said anything about "Hiding alien invaders." Why
did
@you bring that up? It's a red herring, a distraction from the issue at hand.
@ And NORAD's mission DID have to do with UFO's, it always has, regardless
@whether they are called "UFO's" or "Uncorrelated Targets" (UCT's) or
@"Unidentified Aircraft" or whatever.

It wasn't to the author of the article I got the info out of.
This person was so worried about alien invaders that he presumed
that all military preparedness during the cold war was really
there to repel alien invaders (and that the cold war was a
pretext). NORAD's mission with UFOs was to look for foreign
invaders (planes or missiles with bombs on them), not
extraterrestrial ones.

@Suppose there had been a spy satellite there.
@

@MORE COMMENTS: Yes it is ALL "supposition."

@Remember that at the time Premier Breshnyev had his finger
@poised over "The Button," and the Cold War was at its height.
@President Johnson had just escalated the Vietnam war. Also, the
@existence of spy satellites had not yet been disclosed. What
@could NORAD do that wouldn't cause an international incident?

@MORE COMMENTS: I told you again and again "what NORAD could
@do." It could list the spy satellite as an otherwise
@unidentified SATELLITE CATALOG NUMBER like all of the other spy
@satellites.

Do you really think the press would have sat still for that?
Remember when they started digging into Iran-Contra. The
President's plea for them to stay out of it only whetted their
journalistic appetites. If NORAD had done what you suggest, the
whole secrecy of the spy satellites would have been exposed at

that time, rather than several years later. As soon as one reporter found he couldn't get the identity of the satellite (or if two reporters came up with different identities)

@1. If it was one of ours, the Soviets would have learned about @its existence and orbit.

@MORE COMMENTS: The Soviets had skin-track radars just as we did. They @didn't need a NORAD announcement to know a satellite was flying overhead.

Yes, but they didn't know what the satellite did. If NORAD had issued a number without delving into the purpose of the satellite, they would have a pretty good guess.

@2. If it was one of theirs, our disclosure of its existence could @have caused caused a new round of tension.

@3. Calling it a UFO would have the same effect, because the @Soviet government (and the news media) could conclude that either @case 1 or case 2 was true, especially since it was shaped like @earthly space hardware, not the typical UFO shapes.

@4. The only prudent thing to do at the time: "Identify" it as @the nearest non-secret object available.

@MORE COMMENTS: All NORAD had to do was say "Object 1234 was @projected to pass within XXXX km of Gemini 11 at 1825 GMT on @Sept 13, 1966." No one had to say anything about satellite @Object 1234's mission or even if it was a satellite instead of @some debris. (The number 1234 is arbitrary for illustration.) @In fact that was standard procedure with spy satellites -- to @list them as space object catalog numbers without disclosing a @satellite name or mission or identity.

That's how they listed them, but that's not what the reporters would want to know. They would press and press until they got an answer on why that satellite was up there. (is this why they call them the press? :))

Also, this may have been the first time NORAD had to deal with the situation, and they may have come up with a quick solution to their dilemma on the fly.

@5. Once the UFO story got out, the corresponding record of the @spy satellite would have been altered to keep it out of the @media should an investigation ensue.

@You realize that the US military would much prefer a UFO mystery

@to an international incident. That's why they said they "had a
@flying disk" at Roswell, and later subbed the RaWin balloon for
@the (secret) Mogul balloon in the press conference. If the
@Soviets had found out about Mogul at that time, nuclear war was a
@possibility.

@MORE COMMENTS: Absolutely not. It was normal deployment on Apollo 12,
which
@meant a backward negative-x velocity vector.

Relative to the trajectory, or the direction the crew was facing?

I know the doors got stuck on one Apollo mission, but I can't
remember which one it was. I do know that the school year was in
session at the time, so it wasn't Apollo 11 or Apollo 14.

@MORE COMMENTS: I interviewed Skylab-3 astronaut Dr. Owen K. Garriott in
Oct
@1973, right after his return from the flight, about his sighting, photography
@and optical ranging to the unidentified reddish-orange object which was
@flashing or rotating about once per second. There were 4 color photos taken
@(NASA SL3-118-2140).

Larry,

My COMMENTS below. But let me just say at the outset we covered this issue about meteors at the 1956 Lakenheath-Bentwaters case last year on this List.

In a message dated Wed, 12 Jan 2000 9:58:00 AM Eastern Standard Time, Larry Robinson S/AP/EIS Kinesiology <lrobin@indiana.edu> writes:

COMMENTS: In my posting on Aug 25, 1999, on this List to you we covered this issue of the Perseids. The ground observers SAW the Perseids and REPORTED them as separate from the UFO's that they saw – as pointed out by astronomer J. Allen Hynek in his 1956 analysis of the case for the Air Force in which he discounted the meteor shower hypothesis on this basis. I pointed out that at 10:55 PM on Aug 13, 1956, in east England the Perseid radiant would have sent meteors on a heading of about 237 degs (about SW), a very different direction than the radar-tracked UFO on the heading of about 270-295 degs (about W to WNW). The Perseid shower radiant was also too high above the horizon, at about 26 degs elevation, to send a meteor on a long 60-mile virtually horizontal path as tracked on radar at Bentwaters.

I pointed out my discovery in early 1998 of a long overlooked HEIGHT-FINDER effect in the radar data that proved the extreme low altitude of the UFO as reported by the ground and airborne visual observers. The ground observers reported the UFO streaked over them at fantastic speed from E to W at an altitude of about 2,000 to 4,000 feet. The crew of the C-47 saw the light streak UNDER their 4,000-foot-altitude aircraft from E to W. At the same time the Bentwaters radar tracked the high-speed UFO traveling E to W over the base from 30 miles east to 30 miles west in a straight line of a dozen or more blips on the screen.

The radar operator noted that one blip 2 miles E of base was followed “immediately” or about a half sweep (1 second) later 3 miles W of base. Because the MPN-11A radar beam was only about 9 degrees high in vertical width, there was a “blind zone” directly above radar station. To avoid this radar “blind zone” and remain visible on the screen out to a distance of about 2-1/2 miles an object MUST be LOWER than about 2,500 feet. This radar HEIGHT-FINDING effect proves the ground-air visual observers were correct in putting the UFO at the extremely low altitude of 2,000 to 4,000 feet. Such a low altitude would have been impossible for a meteor to maintain in horizontal flight

From: James Easton <voyager@ukonline.co.uk>
Subject: Kenneth Arnold - New EvidenceMessage-id:
<007e01bf5d87\$82482ec0\$591886d4@voyager>

When I first raised the suggestion that Kenneth Arnold might have been deceived by a formation of American White Pelicans, it was noted as merely an expansion of the theory expounded by Martin Kottmeyer. See:

<http://web.ukonline.co.uk/voyager/>

Martin thought swans were the likely candidate and was unaware that pelicans were even a possibility in that area.

The story has come a long way since and I mentioned on this list some correspondence received from Dr Jacqueline Mitton, who has for the past 10 years been the media spokesperson for the prestigious Royal Astronomical Society:

"I found what you had to say of great interest and your detailed research adds strong weight to the interpretation of Arnold's sighting as birds. I wish I'd known about it before giving my talk at the British Association for the Advancement of Science".

It is of course welcome and much appreciated when the mainstream scientific community take an interest in a ufologist's research and devoid of any religious fervour, will consider it objectively.

This recognition is, after all, what ufology strives for.

I'm not sure what Dr Mitton found most convincing in the evidence that Kenneth Arnold may have been, like many others, simply deceived by a flock of birds.

Perhaps it was highlighting logic that if the objects sighted weren't alien spaceships, the most unlikely scenario of all, then with a number of researchers having ruled out any conceivable aircraft being responsible, the fact there were reportedly nine objects must at least suggest birds.

I was able to cite expert testimonies from Pacific north-west ornithologists, who first recognised similarities with the distinctive flight characteristics Arnold observed - that reverse echelon formation, the distinguishing flapping and gliding motion (comparative to Arnold's comments of how the objects "fluttered and sailed"), how the objects in flight resembled "the tail of a

Chinese kite", those reflective qualities etc. - as being analogous to a formation of American White Pelicans.

It was a possible explanation supported by the experiences of Peter Kingsmill, Director General of the Redberry Pelican Project and a recognised world authority on these birds.

Doubtless, further scientific evidence from recognised authoritative sources and first-hand testimonies, especially that of a glider pilot who had been joined in flight by these gregarious birds and confirmed their remarkable airspeed, all helped to establish the basis of a case.

There was also Arnold's infinitely less celebrated and later encounter with "twenty to twenty five brass coloured objects which looked like ducks" and were the same size, yet, according to Arnold "were not ducks, because ducks don't fly that fast", which indicated he may have been predisposed to making errors of judgement under some circumstances.

Overall, there was enough substance to merit a positive appraisal from Dr Mitton.

Not forgetting, of course, that subsequent publication on the 'Project-1947' mailing list of a relatively fundamental newspaper account about a 'flying saucer', when only eight days after Arnold's enigmatic sighting, another pilot and his co-pilot witnessed "nine big round disks" in the same area, only to discover these 'flying saucers' were a flight of pelicans.

Now added to that body of evidence is why Arnold maybe underestimated the likely airspeed of those objects he originally thought were ducks.

A recent UK documentary, broadcast on national BBC TV, featured the film-makers who had pioneered films of birds in flight. It was noted therein, and I'm sure can be endorsed elsewhere, that ducks are capable of flying at some 75 miles per hour.

It has to be questioned whether Arnold, or any contemporary pilot, realised this.

Arnold was now also on the 'look out' for 'flying saucers'.

I have considerable empathy for the predicament he found himself in, when what was originally merely a perceived observation of unidentified jet aircraft, overnight became miscomprehended hysteria.

If he did mistakenly assume that a formation of nine birds - keeping in mind that pelicans have a 10 foot wingspan and would be a rare sighting in that region - were distant aircraft, how could they appear so unusual?

The answer could simply be that they were a quite exceptional encounter and Arnold easily assumed the mysterious objects were aircraft, much larger and much further away than in reality.

The evidence which already existed to support this can be found in Martin Kottmeyer's early work - see:

<http://www.reall.org/newsletter/v05/n06/resolving-arnold-part-1.html>

<http://www.reall.org/newsletter/v05/n07/resolving-arnold-part-2.html>

We should also note the following comments from experienced observers of these birds:

"Some refer to them as the 'Hecla Air Force'. Others call them the 'Icelandic Air Force'. Either way, once the visitor has seen them flying in formation, they understand the military designation".

More than this however, is what seems to be quite significant evidence, revealed here for the first time.

Previously missing was an account from someone who provided a detailed description of how these birds appeared in flight, ideally a person who wasn't familiar with them.

Would this match Arnold's own report and perceptions?

If the descriptions were not only similarly, they used the same metaphors, then surely this must point towards the probable explanation for Arnold's sighting.

In an article entitled, 'Pelicans', by G. Alexander Virden and which dates from 1995, the writer recalls his own encounter with a much larger formation, witnessed from the ground.

The comparisons which can be highlighted are not so much striking as extraordinary. Arnold's comments are in inverted commas [the asterisks are my emphasis], followed by Virden's remarks:

"...and I could see them only plainly when they seemed to tip their wing, **or whatever it was**, and the sun flashed on them".

The sun burns the whites of their perfectly rigid backs upon the

negative of my mind, blinding my eye to all else.

"They didn't fly in a conventional formation that's taught in our army, they seemed to kind of weave in and out right above the mountaintops, and I would say that they even went down into the canyons in several instances..."

Rising and falling as much as a hundred feet in the air, all following the slightest twitch to the left or right as they glide effortlessly through the morning sky.

"They were flying diagonally in echelon formation with a larger gap in their echelon between the first four and last five".

Then I realize about thirty birds trail in a line, and second and third squadrons move up, to the left and right. Bombers, they are too large for fighters, yet more graceful, flying in perfect formation. The second and third groups fan out, from the center line, forming flawlessly into Vs, mirroring the very image of flight.

"They flew in a definite formation but erratically".

The staccato movement is like the first film of a bird in flight, one frame at a time.

"Or maybe it would be best to describe their flight characteristics as very similar to a formation of geese, in a rather diagonal chain-like line, as if they were linked together".

They are a kind of third reality, all moving impeccably together without a sound... all following the lead of the first.

"As I put it to newsmen in Pendleton, Oregon, they flew like a saucer would if you skipped it across the water".

They all executed the ripple, at the precise point the first started to climb.

"They **fluttered and sailed**..."

...each waiting for the bird in front to flap his wings, for two powerful strokes, before returning to a glide.

"As I described them at the time their flight was like speed boats on rough water or similar to the tail of a Chinese kite that I once saw blowing in the wind".

They appear as crepe paper strips, tied to an invisible wind.
[End]

Also now brought to bear for the first time is a scientific fact which offers an explanation for the particularly bright and reflective nature of the objects which baffled Kenneth Arnold.

It's little known that pelicans have one further attribute in their already impressive capabilities.

They can appear to have a 'silver gleam..'.

Subject: Re: The 'Yukon' Case

Larry wrote:

>

I cite two more cases of horizontal bending (but not nearly so pronounced) cited in UFO literature:

- Hynek saw the jet exhaust from the airliner he was riding in distort the image of a plane going the other way into a disk shape with the long axis horizontal. When his plane banked, he could see the other plane clearly because the exhaust missed its image. I have seen this effect myself while riding in a small airliner. Only the clouds above were distorted (It was a high wing plane, and I initially thought I was seeing a short contrail coming from the engine).

- Menzel (on the ground) saw the exhaust of a jet plane cross Jupiter in the sky. The image of Jupiter expanded into an ellipse with the long axis horizontal, and with arcs and bright points inside. Within a few seconds, it collapsed into Jupiter again.

<

I can except image distortion over a small angle.. degree or less (generally MUCH less) as a result of atmospheric temperature gradients... these effects are seen all the time This is far from 10 degree lateral bending and FAR FAR from 90 degree bending. I dare say that the boundary between a complete vacuum and sea level atmospheric density would not produce 90 degree bending, either by refraction or reflection at the sharp boundary.

Subject: Re: The 'Yukon' Case

Larry wrote:

>The horizontal gradients would have been caused by the hot air rising from the road, surrounded by the cooler air from the fields on either side. There would be one on each side. The total bending had to be at least 5 degrees on each side to produce the effect, though the amount that occurred over each small section of road would be small. The effect is similar to the effect in a light pipe with a variable density.
<

Menzelian analysis!

Light is bent into the denser air (higher refractivity). Light pipe type guidance requires the higher density at the center. You have argued the air above the road is less dense than the air at the sides.... probably correct for a hot road... and hence light (direct or reflected) radiating from a distant object on the road should be "split apart" or diverged (not converged) like a negative lens, making the truck appear more distant. Assuming your description is accurate and not the result of a "moon illusion" type of effect, one must stretch farther to explain the effective magnification of the truck image.

Sun dogs won't work.

Subject: Re: Kenneth Arnold - New EvidenceMessage-id:
<76.e784a7.25af61f3@aol.com>

James,

I knew it was only a matter of time before you'd find some non-scientific writer's account of watching graceful birds in flight that recounts in POETIC words how blindingly bright they seemed in the sun. You don't give bibliographic documentation for Virden's account. You don't indicate whether Virden might have been in the darkness of early morning with dark-adapted eyes adjusting to what would then indeed seem like blinding light from sunlit birds high in the sky -- but Arnold was in midafternoon with sun-adapted eyes.

And Virden's poetry still does not mesh with Arnold's account of almost "ARC LIGHT" brightness, a "TREMENDOUS FLASH" which "LIT UP my whole AIRCRAFT, even the cockpit" (1977 FATE Symp pp. 19-20); a "BRIGHT FLASH" that "REFLECTED ON MY AIRPLANE" (letter to AAF July 1947); "a TREMENDOUSLY BRIGHT FLASH LIT UP the surfaces of my AIRCRAFT" (COTS 1952 p. 51b), like "sun" reflected off a "mirror" it "ALMOST BLINDED you" (KWRC radio transcript June 26, 1947).

And don't forget Arnold also said: "As I mentioned before, they seemed to be linked together in a sort of diagonal chainlike formation, similar to geese -- but THEY WERE NOT GEESE!" (FATE p. 20)

Virden's classic "V" bird formation is NOT the same as Arnold's single-file straight-line formation.

And you still cannot explain Arnold's very specific wide range of azimuths -- first seeing the flashes far to the north of Mt. Rainier, passing Rainier, flying to Mt. Adams, passing south of Adams, well over 100 degrees of compass direction. I've told you that Arnold would have had to ORBIT a slower-moving flock of birds in order to see them appear across such a wide range of directions, but orbiting would always put them out his passenger side window (given his reported clockwise turn just before the sighting) instead of crossing directly in front of his windshield as he actually reported. DRAW A MAP, as Bruce Maccabee says, and you would see what we mean. You still haven't done that or answered my point

Sincerely,

Brad Sparks

In a message dated 1/12/00 9:29:52 PM, voyager@ukonline.co.uk writes:

"Some refer to them as the 'Hecla Air Force'. Others call them the 'Icelandic Air Force'. Either way, once the visitor has seen them flying in formation, they understand the military designation".

More than this however, is what seems to be quite significant evidence, revealed here for the first time.

Previously missing was an account from someone who provided a detailed description of how these birds appeared in flight, ideally a person who wasn't familiar with them.

Would this match Arnold's own report and perceptions?

If the descriptions were not only similarly, they used the same metaphors, then surely this must point towards the probable explanation for Arnold's sighting.

In an article entitled, 'Pelicans', by G. Alexander Virden and which dates from 1995, the writer recalls his own encounter with a much larger formation, witnessed from the ground.

The comparisons which can be highlighted are not so much striking as extraordinary. Arnold's comments are in inverted commas [the asterisks are my emphasis], followed by Virden's remarks:

"...and I could see them only plainly when they seemed to tip

their wing, **or whatever it was**, and the sun flashed on them".

The sun burns the whites of their perfectly rigid backs upon the negative of my mind, blinding my eye to all else.

"They didn't fly in a conventional formation that's taught in our army, they seemed to kind of weave in and out right above the mountaintops, and I would say that they even went down into the canyons in several instances..."

Rising and falling as much as a hundred feet in the air, all following the slightest twitch to the left or right as they glide effortlessly through the morning sky.

"They were flying diagonally in echelon formation with a larger gap in their echelon between the first four and last five".

Then I realize about thirty birds trail in a line, and second and third squadrons move up, to the left and right. Bombers, they are too large for fighters, yet more graceful, flying in perfect formation. The second and third groups fan out, from the center line, forming flawlessly into Vs, mirroring the very image of flight.

"They flew in a definite formation but erratically".

The staccato movement is like the first film of a bird in flight,

one frame at a time.

"Or maybe it would be best to describe their flight characteristics as very similar to a formation of geese, in a rather diagonal chain-like line, as if they were linked together".

They are a kind of third reality, all moving impeccably together without a sound... all following the lead of the first.

"As I put it to newsmen in Pendleton, Oregon, they flew like a saucer would if you skipped it across the water".

They all executed the ripple, at the precise point the first started to climb.

"They **fluttered and sailed**...".

...each waiting for the bird in front to flap his wings, for two powerful strokes, before returning to a glide.

"As I described them at the time their flight was like speed boats on rough water or similar to the tail of a Chinese kite that I once saw blowing in the wind".

They appear as crepe paper strips, tied to an invisible wind.

[End]

Also now brought to bear for the first time is a scientific fact which offers an explanation for the particularly bright and reflective nature of the objects which baffled Kenneth Arnold.

It's little known that pelicans have one further attribute in their already impressive capabilities.

They can appear to have a 'silver gleam..'.

Subject: ReptiloidsMessage-id:
<005a01bf5df1\$14c94720\$904905c3@LuisR.GonzalezManso>

Martin Kottmeyer is working in a chronology on reptilian aliens. He asked my help for any reptilian alien CE3s in my part of the world besides the Zanfretta case. And also asked if any reptoid material has been reaching into European culture in the last few years.

He mentioned TV series as "Lost World" and "V", films as "Enemy Mine", sf works by Burroughs and even Dr. Dale Russell's 1981 intelligent dinosaur *Stenonychosaurus*. I will suggest sf works by Harry Harrison "West of Eden" and Robert J. Sawyer "The Quintaglio Ascension", films as "The Last Starfighter", etc.

Any suggestions?

From: Larry Robinson S/AP/EIS Kinesiology <lrobins@indiana.edu>
Subject: Astronauts, panel meter photo, & Lakenheath

I revved up my research engines last night and have some more details on a few cases we have been discussing. Rather than clutter the system with many posts, I decided to combine them into a single email.

PANEL METER PHOTO:

I found the photo of the panel meter I had mentioned earlier. Unfortunately, it has no caption. But you can find it in:

Flying Saucers Pictorial

(C) 1967 Real Magazine

LAKENHEATH/BENTWATERS:

Brad:

I was not referring to the part of this case where the object went under the airplane when I said that a part of the case might be caused by a 2nd/3rd trip echo and a meteor.

I was referring to the part where an object streaked westbound (only on RADAR) and was seen for only two blips east of the Bentwaters station and two blips west, covering a total of 66 miles. This might have been the result of two separate meteors and 2nd/3rd trip echoes.

The object that flew under the plane is the only part of the sighting that I consider really unexplained. Jenny Randles blows the lid off of the rest of the case in her book "UFOs: Danger In the Air." (Hey Jenny, I finally got a copy!)

ASTRONAUT SIGHTINGS:

Date: Thu, 13 Jan 2000 14:39:50 -0500
From: bruce maccabee <brumac@compuserve.com>
Subject: Kenneth Arnold -Amusing "Evidence"

James wrote in his "New Evidence"

>

[ARNOLD WROTE]"They didn't fly in a conventional formation that's taught in our army, they seemed to kind of weave in and out right above the mountaintops, and I would say that they even went down into the canyons in several instances..."

[VIRDEN, a "pelicanist", wrote about pelicans seen from the ground]
Rising and falling as much as a hundred feet in the air, all following the slightest twitch to the left or right as they glide effortlessly through the morning sky.

<

Ha ha. amusing. On the one hand we are to believe that Arnold saw pelicans which could have been NO MORE THAN a couple of miles from his plane. Now we have Arnold's description of them (above) as being near the mountain tops and going down into the canyons ... hence the altitudes of the objects changed.

The similarity being pointed out here is that, ob, by the way, pelicans go up and down in altitude, "rising and falling as much as a hundred feet in the air..."

Hence we are to use this comparison as a point in favor of identifying the objects Arnold saw as pelicans.....
because BOTH THOSE OBJECTS AND PELICANS GO UP AND DOWN AS THEY FLY ALONG....

OK. Which part of Arnold's description are we to accept as true and which to reject as false? We must accept Arnold's description of them going down.... "and I would say they even went down"... but we must REJECT THE NEXT THREE WORDS ..."..into the canyons" because if we accept those dreaded (by pelicanists) words,. then all avian-hell breaks loose....
Why,.

those pelicans must have been about 80 ft in width (wingspan) because they were, if they went down into the canyons, OVER 20 miles from Arnold's plane!

So, which is it Jim, do we accept "down" and reject "canyons".... and if so,

why, or do we accept "down " AND "canyons" and reject pelicans?

DRAW A MAP!!!! showing the track which the "pelicans" must have followed to be able to get away from Arnold after he turned his plane "sideways" and rolled down his window,.... etc.

AND NOW TO FURTHER NEW EVIDENCE:

@effect, though the amount that occurred over each small section
@of road would be small. The effect is similar to the effect in a
@light pipe with a variable density.
@<
@
@Menzelian analysis!
@
@Light is bent into the denser air (higher refractivity). Light pipe type
@guidance
@requires the higher density at the center. You have argued the air above
@the
@road is less dense than the air at the sides.... probably correct for a hot
@road...
@and hence light (direct or reflected) radiating from a distant object on
@ the road should be "split apart" or diverged (not converged)
@like a negative lens, making the truck appear more distant.
@Assuming your description is accurate and not the result of a "moon
@illusion" type of effect, one must stretch farther to explain the effective
@magnification of the truck image.
@
@Sun dogs won't work.

You are right about the direction of bending according to physics.

But how can a hot road make a distant object loom above its normal position?

All I know is that I saw it, My parents said they saw it, and Menzel said he saw it. Also. the book "Handbook of Unusual

Natural Phenomena" lists cases where distant objects were seen to be too large (vertically and horizontally), but does not explain them.

Possibly the fields were hotter than the road. The soil was black with fertilizer and the growth was short at the times this happened. The road was concrete, not asphalt. All of the sightings occurred after 5 pm. I hadn't really considered those facts before. All of the sightings occurred in June, never in July or August (the only times of the year any of us were ever there).

This combination would also explain why developing one of the fields destroyed the effect. I am going to have to sketch this out and see if I can make any sense of it.

I thought of the moon illusion. It would make the truck appear larger than if the truck were up in the air, but it wouldn't make it seem near enough that trigonometric distance methods seemed to work. One thought is that the effect depressed the road rather than raising the truck, but the width still doesn't make sense.

It also occurs to me that some of the bending had to happen over the fields, not the road, for the image to have been as wide as it was.

Here's another possibility that might work for my sightings, but not for Menzel's: The far truck was the illusory image. But the near one was the one that was out of focus.

I just did an experiment: I grabbed my heat gun and aimed it in different directions:

1. I saw a small amount of distortion (much less than a degree) when I looked across the edge of the stream of hot air (the gun was pointed at right angles to my line of sight, and about a foot away).
2. I saw about 5 times as much distortion when I sighted along the edge stream of hot air (the gun pointed directly away from me). Objects seen right at the edge were deflected about half a degree toward the center of the stream.
3. I got about the same amount of bending by sighting alongside a 12 foot long radiator (hot water, not steam).
4. I saw the most bending when I aimed the stream straight up and sighted along the edge of it. It seemed to be almost a degree.

Of course, the stream only travels about two feet before it widens and dissipates. But I think I am on the right track in thinking that the line of sight is along the temperature gradient itself.

Date: Thu, 13 Jan 2000 17:42:16 -0500 (EST)
From: RB47Expert@aol.com
Subject: Re: Gemini-7 bogeyMessage-id: <b3.2cfdb6.25afaec8@aol.com>

Jim,

The actual air-to-ground communications transcript for the Gemini 7 flight, printed in the Condon Report, has the astronauts reporting the "bogey" on the left at their 10 o'clock position SEPARATE from their "booster" on the right at their 2 o'clock position, or about 120 degrees apart in direction:

Spacecraft: Gemini 7 here, Houston how do you read?

Capcom: Loud and clear. 7, go ahead.

Spacecraft: Bogey at 10 o'clock high.

Capcom: This is Houston. Say again 7.

[BOGEY AT 10 O'CLOCK:]

Spacecraft: Said we have a bogey at 10 o'clock high.

Capcom: Roger. Gemini 7., is that the booster or is that an actual sighting'?

Spacecraft: We have several, looks like debris up here. Actual sighting.

Capcom: You have any more information? Estimate distance or size?

Spacecraft: We also have the booster in sight.

Capcom: Understand you also have the booster in sight, Roger.

<SNIP>

[BOOSTER AT 2 O'CLOCK:]

Spacecraft: Roger -- Spacecraft (Lovell) I have the booster on my side, it's a brilliant body

in the sun, against a black background with trillions of particles on it.

Capcom: Roger. What direction is it from you?

Spacecraft: It's about at my 2 o'clock position. (Lovell)

Capcom: Does that mean that it's ahead of you?

Spacecraft: It's ahead of us at 2 o'clock, slowly tumbling.

>6 was another unmanned flight, to test some changes.>>

The smaller Redstone booster carried MR-1,2,3,and 4. The larger Atlas booster carried MA-1,2,3, etc...

MR-3 and MR-4 were manned, as were MA-6 through 9.

Not realizing that two booster series were involved can lead to confusion and invalid suppositions.

Hi Jim,

It's hard to tell which testimony of the "on-the-scene witness" you're talking about as the one we should believe -- (a) the testimony of both astronauts (Borman and Lovell) directly by radio from space aboard the Gemini 7 in real-time in 1965 as the sighting occurred right in front of their eyes, or (b) the off-the-cuff statement of only one some 30+ years after the fact made without consulting records from 1965. Seems more like a folklore-style memory error has crept in over the years.

The sighting has essentially ZERO Strangeness on Hynek's Strangeness Index. The only element of strangeness is the object's presence without a NORAD warning or prediction. Nothing about the object's BEHAVIOR or SHAPE was unexplainable or inconsistent with space debris. It's just that it was at the wrong place at the wrong time in effect.

UFOlogists who keep pushing marginal astronaut "UFO" cases keep ignoring the extremely low near-zero Strangeness of most of these cases. The shocker for me is the STS-48 Space Shuttle case with the still low Strangeness acrobatics of the particles (that was really the only thing strange about them). To me it proves that debris and ice particles can do amazing things and have nothing to do with the UFO phenomenon or ET's, Jack Kasher's extensive analysis notwithstanding (as you know I think it's wrong but don't have time to research it), and calls for a re-evaluation of astronaut UFO cases in general.

MORE COMMENTS: This is nitpicking -- UV is not considered "ionizing radiation" for purposes of radiobiology. In any case only hard X-rays, gamma rays and neutrons will propagate over 140 feet to the Cash-Landrum witnesses, so most of what you said is irrelevant to the case.

Hi Luis

I think BBC TV's Dr Who had reptilian aliens in it on one occasion. They
also had insect-type ones as well (Both during the early-70s I think)

Cheers

John

@From: RB47Expert@aol.com
@@To: UFORL@listbot.com
@Subject: Re: Re: Gemini-7 bogey

@
@Hi Jim,

@It's hard to tell which testimony of the "on-the-scene witness"
@you're talking about as the one we should believe -- (a) the
@testimony of both astronauts (Borman and Lovell) directly by
@radio from space aboard the Gemini 7 in real-time in 1965 as the
@sighting occurred right in front of their eyes, or (b) the
@off-the-cuff statement of only one some 30+ years after the fact
@made without consulting records from 1965. Seems more like a
@folklore-style memory error has crept in over the years.

@The sighting has essentially ZERO Strangeness on Hynek's
@Strangeness Index. The only element of strangeness is the
@object's presence without a NORAD warning or prediction.
@Nothing about the object's BEHAVIOR or SHAPE was unexplainable
@or inconsistent with space debris. It's just that it was at the
@wrong place at the wrong time in effect.

@UFOlogists who keep pushing marginal astronaut "UFO" cases keep
@ignoring the extremely low near-zero Strangeness of most of
@these cases. The shocker for me is the STS-48 Space Shuttle
@case with the still low Strangeness acrobatics of the particles
@(that was really the only thing strange about them). To me it
@proves that debris and ice particles can do amazing things and
@have nothing to do with the UFO phenomenon or ET's, Jack
@Kasher's extensive analysis notwithstanding (as you know I think
@it's wrong but don't have time to research it), and calls for a
@re-evaluation of astronaut UFO cases in general.

This is the most sensible statement on the entire subject I have
ever read.

@Brad

It's positively amazing how much stuff can fall off a spacecraft or booster. Among them are:

Sheets of ice, frozen on the surface of the booster body surrounding the cryogenic tanks

Remnants of explosive bolts used for stage separation, and the associated clamps and hardware attached to them

Gaskets from between stages

Bits of insulation and paint shaken loose during the launch

Covers used to make upper stages aerodynamically stable during the atmospheric part of a launch, and the remnants of their explosive bolts

Waste dumps

Vented materials

Anything else that is intentionally jettisoned

Debris from malfunctions

Stuff astronauts lost in space (NORAD was tracking a camera and a radio lost by astronauts for years)

That's not even strange. They had just been launched into an orbit that rarely if ever took them over NORAD's northern Russia-facing sites. NORAD wasn't tracking with skin track radar anyway, they deliberately avoided painting the vehicle with possibly EMI-inducing pulses, using its active transponder instead. Objects only a few meters apart don't show up separately on radar anyway. So your concept of what would have been "normal" for space radar is not accurate.

@>

@> No, but one produced ultraviolet radiation. It contained a

@> magnesium flare.

@MORE COMMENTS: No fatalities, no radiation.

That was not intended as a serious attempt to solve this sighting, but....

Take away radiation as the cause of the symptoms, and a magnesium flare balloon becomes a possibility.

Do we have any physicians out there who could recognize the symptoms as having some other cause?

What about CO? One time I had intense gastrointestinal problems after (unknown to me at the time) the rear pipe had disconnected from my car's exhaust system.

From: RB47Expert@aol.com
Subject: Re: Gemini-7 bogeyMessage-id: <b6.532ca4.25b0fbf9@aol.com>

Hi Jim,

Sorry about the confusion but the quote you selected is actually from me rather than Larry Robinson and it was talking about NORAD not predicting or warning of a close approach of the "bogey," rather than talking about NORAD tracking capabilities for the Gemini 7. Thanks for the info about NORAD refraining from skin-tracking Geminis. The Condon Report discussion indicates the astronauts referred to the "bogey" as in polar orbit (about 90 degs inclination mentioned in the air-ground transcript), which would exclude debris from the Gemini 7 itself, which was in a 29-deg orbit.

Taking just the one sentence misses the context which was my point that the ONLY element of Strangeness in the entire encounter of the "bogey" was in not showing up on NORAD's predictions of space object close-approaches to the Gemini 7 -- the object was in the wrong place at the wrong time. I agree it's a weak point -- that's why I said "low" or "near-zero" Strangeness -- because it relies on the accuracy and thoroughness of NORAD's coverage, which was by no means 100% in 1965 or even today.

The reason astronaut UFO cases rank so extremely low on Hynek's Strangeness Index is quite obvious when we take a moment to think about it: Note that in this and virtually ALL astronaut "UFO" encounters there is/are NO electromagnetic effects, NO radio interference with astronaut communications, NO entities seen, NO abductions of astronauts, NO "missing time," NO burn marks, NO wild gyrating flight behavior, NO "saucer" or other unconventional satellite shapes (except possibly the ellipse in the GT-4 film), NO emissions of beams, NO radioactivity, NO "psychic" messages, etc. etc.

> @Cash-Landrum illness their symptomatology (extremely rapid onset
> @of GI tract symptoms etc.) they would have received FATAL doses
> @and ALL THREE would be DEAD.
>
> What if the exposures were localized to only certain organs?

FURTHER COMMENTS: The claim is that they suffered whole-body ionizing radiation syndrome -- it is necessary that the vital organs be exposed in order for the syndrome to occur. The fact that GI tract symptoms and skin lesions and epilation (hair loss on the head) occurred indicate effectively whole-body exposure IF it was ionizing radiation.

- > How do you know that the exposure occurred at the time of the
- > sighting? Could an earlier exposure have caused symptoms, the
- > onset of which seemed rapid only because the timing was
- > associated with the sighting time?

FURTHER COMMENTS: There was also no "latency period" either. In standard radiation syndrome, clinical and near-fatal doses (typically 100 to 1,000 rems or cSv's, centisieverts) result in the "prodrome" or initial onset of nausea, vomiting, diarrhea about 1-2 days after exposure, which lasts a day or two then symptoms disappear for 1-2 weeks only to return again, lasting weeks. If Cash-Landrum had been unknowingly exposed to 100-1000-rem doses about 1-2 days before the UFO incident then they would have experienced the "latency" period of disappearance and then return of symptoms, but that didn't happen. If they had been exposed to fatal 1000+ rem doses at any time then they would have died.

- >
- > @> 2. How sure are we of the actual distance to the object?
- >
- > @MORE COMMENTS: I think there were marks on the road.
- >
- > How do we know the object made them?

FURTHER COMMENTS: If I recall correctly witnesses identified the spots onsite and marks were found, but see Schuessler's reports for details.

- >
- > (snip)
- >
- >
- > @MORE COMMENTS: No fatalities, no radiation, no UV. See above
- > @and prior postings.
- >
- > UV usually doesn't cause fatalities.

FURTHER COMMENTS: But a severe dose of UV sufficient to cause systemic effects would have resulted in severe sunburn-like skin burns and eye burns, requiring all 3 witnesses to be hospitalized (only Betty Cash was hospitalized) and such SEVERE photodermatitis was not found.

I agree, I have seen flocks of large birds myself from a small aircraft. It was really obvious what they were. It is also really obvious that they were flying slow relative to our aircraft.

@

@@> @@

@@> @Hi Larry,

@

@@> But there is no Doppler shift when the satellite is moving
@@> perpendicular to the line of sight.

@@COMMENTS: A perpendicular point of transmission from a
@@satellite would be extremely rare.

@Not for a SETI sweep of the cosmos. Usually the antenna is
@pointed neither east nor west, letting the earth's rotation sweep
@it around the right ascension axis. One declination is selected
@for each 24 hour sweep. That makes all satellites in east-west
@orbits cross the sensitive area at right angles.

@MORE COMMENTS: Unless the declination selected is directly above the SETI
@antenna site it will NOT be at right angles to crossing earth satellites.
@For example, if the SETI site is at, say, 40 N latitude, and the selected
@declination is at say 10 degs N then satellites with transmissions would be
@picked up NOT at "right angles" but at no more than 60 degs elevation above
@the horizon. In that situation the only way the satellite flight path would
@be at right angles to the SETI antenna is if the satellite coincidentally
was
@in a 40-deg inclination orbit. But most satellites found that far north in
@the mid-latitudes will be in roughly 90-deg polar orbits or Russia's high
@latitude/inclination orbits.

One has to remember that the SETI system is sweeping frequencies
too. The time of observation at one frequency in one direction is
a series of brief encounters.

@BTW, a friend of mine has an amateur SETI system. So far, the
@only intelligence he has picked up was the city's dispatch radio
@leaking in through a back lobe of the antenna pattern and
@overloading the tuner in the receiver.

@
@MORE COMMENTS: The spy satellite does not have to be directly above the
SETI
@antenna (thus possibly at "right angles") to be received but could be
@received through an antenna SIDE-LOBE off at some oblique angle above the
@horizon.

That's true, and raises a whole new nest of problems, since any
doppler shift measured would not correspond to Earth orbit
objects assumed to be in the direction the antenna is pointing.

FURTHER COMMENTS: Side lobes means greater Doppler effect. But in any case
the most important determinant would be the obvious ENCRYPTION of the signals
which would be the tipoff that they're from a spy sat.

@@COMMENTS: Many radio astronomy antennas are multiples and
@equipped for DOPPLER INTERFEROMETRY.

@

@And SETI rarely gets enough funding to rent time on one of those
@big monsters. Usually, they have to be content with one dish at a
@time.

@

@MORE COMMENTS: A lot of interferometry these days is done simply by linking
@radio telescopes without a special "monster" set up such as the VLA on the
@Plains of San Agustin, New Mexico. If one linked antenna receives a signal
@not received by the other antennas then they know instantly that the signal
@is NOT coming from deep space but is from near-earth, i.e., most likely a
@satellite.

Again, SETI rarely gets to use more than one dish at a time.

@@> And remember, spy satellites transmit short bursts of data, not
@@> continuously.

@@COMMENTS: Good point but not true for all intelligence
@@satellites -- for some the amount of data download is so vast it
@@cannot be sent in bursts.

@It only takes one. And see below, where the intelligence
@satellite sends one burst on each frequency in turn. Anyone
@listening on only one frequency hears only one burst. In SETI
@scans, if the receiver's frequency sweep is not on the burst
@frequency when the satellite uses it, it will miss that burst
@entirely.

@MORE COMMENTS: As I've pointed out several times before such spy satellite
@signals would be ENCRYPTED transmissions. Not a repetitious pattern but
@encrypted text. How in the world would the SETI astronomer not see that?
@That would be the tipoff right there that it's from a Near Earth Orbit spy
@sat.

Most of them send encrypted images, not text. The spy satellites
I am talking about take photos from space. The telemetry they
send is unlike other forms of communications. Some spy satellites
may operate in a mode similar to that used by radio control
planes, just taking orders from the ground, with a quick
acknowledge burst after every command received.

FURTHER COMMENTS: Doesn't matter whether it's images or digital images, the
signal is reduced to encrypted text. Encrypted messages would be obvious.

@@COMMENTS: You had said NORAD had hid from the Gemini astronauts
@@the existence of spy satellites which would have otherwise

@@explained their space-UFO sightings. You don't give even a @@single bit of evidence of NORAD allegedly doing this in your @@long list below, making the list irrelevant insofar as @@supporting your claim.

@

@@You've changed your story now to say NORAD didn't "hide" the spy @@satellites but merely didn't "identify them or IDENTIFIED THEM @@AS SOMETHING ELSE," but you still haven't given ANY examples of @@either case in your list below.

@

@Semantics! I consider concealing the identity of something as @hiding it.

@MORE COMMENTS: NO IT'S NOT "SEMANTICS." To "hide" something is @to conceal its very existence. To misidentify something still @discloses its existence. Your story changed from one of NORAD @allegedly concealing the existence of spy satellites to a story @of NORAD merely misidentifying spy satellites.

I'm not changing my story, you're misunderstanding me. It is probably a difference in word usage between where you are and where I am. Here is what I have been trying to say all along:

NORAD (and possibly NASA) may have hidden the true identities of the objects seen visually or on RADAR in several cases involving astronauts. This was concealing the existence of spy satellites AS A CLASS from the general public.

FURTHER COMMENTS: See below.

@You had previously claimed that NORAD had hid the very existence of spy @satellites from the Gemini missions that sighted space UFO's and that that @was why the sightings remained unidentified -- but that means NORAD was endang

@ering the lives of our astronauts needlessly when all they needed to disclose

@was a mere SATELLITE CATALOG NUMBER and approach parameters WITHOUT

@DISCLOSING ANY CLASSIFIED MISSION PROFILE. The idea NORAD did that is sheer

@nonsense. NORAD had a formal agreement with NASA to continuously calculate @approach parameters of ALL KNOWN satellite objects during MANNED NASA @missions for purposes of SAFETY, to warn of possible collisions.

OK, so the correct satellite catalog number is given to the astronauts. Some nosey newsman gets hold of it (through listening to the capcom link on an all-band radio), and demands to know what mission by what government endangered our astronauts. What were they going to do then?

FURTHER COMMENTS: If NORAD predicted a very close approach by a classified satellite it could have been quietly handled by alerting the astronauts on the back channel used for private communications on medical conditions etc. In that case astronauts would not blab aloud about "bogeys" and such. If NORAD failed to predict a close approach, in most cases it won't have radar skin-tracking to figure out how close so the predicted distance will be all it has. The satellite catalog number could be given out with the erroneously large distance and no newsman would know enough to know the distance -- here we are 30+ years later, and we're still trying to figure it out. No indication of classified mission need be mentioned. The updated orbital parameters would not even need be released (the approach parameters just give catalog numbers, time and distance).

@I copied a list of ALL astronaut sightings I have records on to
@the letter for comparison. I did not bother to delete the other
@sightings. I did not mean to imply that NORAD hid something in
@each sighting.

@MORE COMMENTS: All these listings then were IRRELEVANT PADDING
@if they did not support your contention that NORAD hid spy
@satellites thus allowing Gemini sightings to remain as "UFO's."

Actually, I just didn't have time to delete the others. I had a meeting to go to, so I just pasted the entire list in and annotated the ones that had NORAD connections.

@@> Mercury 5: An object was seen only on RADAR that appeared to
@@> parallel the spacecraft for one orbit. The astronaut saw nothing.
@@> This was probably nothing but a part of the launch vehicle. It
@@> was lost from the RADAR after the spacecraft maneuvered.
@

@The existence of the RADAR sighting was not released to the
@public, but learned of from leaks. NORAD initially assumed the
@possibility that the Russians had something following our
@spacecraft, and kept the sighting quiet because of that.

This should have been Mercury 6. My source had a misprint in it.

@@> Gemini 4: An object was seen and photographed. The frame before
@@> the UFO photo was accidentally exposed, and recorded the window
@@> of the spacecraft with the sun shining on the rim. That was the
@@> photo released as the "UFO." The accidental exposure caused the
@@> records to be one frame off. The actual photo shows nothing but
@@> an extra dot of light among the stars. It was probably a small
@@> bit of debris from the Gemini itself.

@MORE COMMENTS: I don't recall any such circumstance with the Gemini 4 film.

I didn't find this out until after "Apollo 13" was released. I saw an interview with Lovell on TV.

@MORE COMMENTS: How is that possible when the space between the astronaut's head and the window was about 12 inches and the movie camera itself was about 9-1/2 inches long???? (Camera data from NASA Photogrammetrist Richard W. Underwood, Aug 17, 1976, and Sept 19, 1977.) I never heard this story before. Besides, it's IRRELEVANT.

@The egg shaped object is nothing but the sun shining on the rounded window corner,
@
@MORE COMMENTS: I measured the elliptical image as having a major-minor axis ratio of 1.5 +/- 0.1. The sun is perfectly round (ratio 1.0) to within these margins.

But a curved surface changes the shape of reflections. Like I said, I have a copy of a frame from the shot printed very light, and it shows the capsule interior filling the rest of the frame.

FURTHER COMMENTS: NASA photogrammetrist Richard Underwood told me the hyperfocal distance for that camera and settings was about 2 feet, so the window frame, curved or not, could not have been in focus. The ellipse has sharp edges, in focus.

I will tell you the reference for the copy I have when I find it again (it's in a book).

@and the tail is the straighter part of the window next to it.
@Printing the film lighter than normal confirmed this (I have a copy). The strip was underexposed because the camera was set to photograph things outside the capsule (in bright sun) at the time.

@The accidental start of the camera caused the log to not match up with the film strips shot, but to be one item off. The next strip of film was the actual object the crew was puzzled about, and analysis of that strip showed the object to be debris from the capsule.

@Source: A James Lovell interview I taped on TV.

@MORE COMMENTS: Lovell was NOT on the McDivitt-White Gemini 4 mission.

I know. He did the TV interview and was asked about UFOs in space and about that photo in particular.

@@> Gemini 7: The object was photographed and reported by RADAR, but
@@> never identified. It may have been a spy satellite.

@@COMMENTS: Where is NORAD hiding anything here?

@They may have known what it was, but not identified it for the
@astronauts, where the transmissions would have been picked up by
@the TV networks.

@@> Gemini 8: This visible object was the Agena for the mission,
@@> reflecting sun that made it visible before it was expected to be
@@> seen.

@@> Gemini 11: The objects were tentatively identified as the Proton
@@> 3 satellite and its booster, but UFO investigators
@@> found that the orbit was wrong for what was observed.

@Nothing they would admit to anyway. The Proton 3 satellite WAS
@the "something else" they said was there instead of a spy
@satellite.

@MORE COMMENTS: Again, this is ridiculous that NORAD would
@endanger the lives of astronauts to conceal the existence of a
@supposed spy satellite when all it needed to do was list any
@such satellite as a mere SATELLITE CATALOG NUMBER without
@identifying it further as anything at all. We don't even know
@if any such hidden spy sat even existed -- this is purely
@hypothetical supposition on your part.

@The distance to the Proton 3 was actually about 5,000 km, my
@memory was off but conservative in understating the discrepancy.

Do we know what they really told NASA? Or is what we know only
what the PRESS was told? Those are two very different things.
Think about this:

NASA's main concern was: Can anything (no matter what) hit the
Gemini capsule?

NORAD's main concern was: Keep Gemini from hitting anything, and keep the public from learning the truth about spy satellites.

NASA didn't care WHAT it was, only that it wouldn't pose a threat. So NORAD could have identified it by name as anything and satisfied them, so long as NORAD knew it wasn't a danger.

@We have to remember that the purpose of NORAD at the time had
@nothing to do with UFOs, but rather the security of this country.
@Hiding alien invaders was the farthest thing from their minds.

@MORE COMMENTS: No one said anything about "Hiding alien invaders." Why did

@you bring that up? It's a red herring, a distraction from the issue at hand.

@ And NORAD's mission DID have to do with UFO's, it always has, regardless
@whether they are called "UFO's" or "Uncorrelated Targets" (UCT's) or
@"Unidentified Aircraft" or whatever.

It wasn't to the author of the article I got the info out of.
This person was so worried about alien invaders that he presumed that all military preparedness during the cold war was really there to repel alien invaders (and that the cold war was a pretext). NORAD's mission with UFOs was to look for foreign invaders (planes or missiles with bombs on them), not extraterrestrial ones.

@Suppose there had been a spy satellite there.

@

@MORE COMMENTS: Yes it is ALL "supposition."

@Remember that at the time Premier Breshnyev had his finger
@poised over "The Button," and the Cold War was at its height.
@President Johnson had just escalated the Vietnam war. Also, the
@existence of spy satellites had not yet been disclosed. What
@could NORAD do that wouldn't cause an international incident?

@MORE COMMENTS: I told you again and again "what NORAD could
@do." It could list the spy satellite as an otherwise
@unidentified SATELLITE CATALOG NUMBER like all of the other spy
@satellites.

Do you really think the press would have sat still for that?
Remember when they started digging into Iran-Contra. The President's plea for them to stay out of it only whetted their journalistic appetites. If NORAD had done what you suggest, the whole secrecy of the spy satellites would have been exposed at that time, rather than several years later. As soon as one reporter found he couldn't get the identity of the satellite (or

if two reporters came up with different identities)

FURTHER COMMENTS: USAF, CIA, NRO and NSA launched spy sats all the time in the 60's with announcements (usually from Vandenberg AFB) of a "classified launch" and nothing like an Iran-Contra investigation ever occurred -- these launches happened DOZENS of times EACH YEAR.

@1. If it was one of ours, the Soviets would have learned about @its existence and orbit.

@MORE COMMENTS: The Soviets had skin-track radars just as we did. They @didn't need a NORAD announcement to know a satellite was flying overhead.

Yes, but they didn't know what the satellite did. If NORAD had issued a number without delving into the purpose of the satellite, they would have a pretty good guess.

FURTHER COMMENTS: NORAD catalog numbers don't tell you anything about a satellite's mission. It's the orbital parameters that tell you virtually everything you need to know about whether a mission is low altitude photo recon, mid-altitude SIGINT, ocean surveillance, Molniya-style communications, etc. etc. Read Klass' Secret Sentries in Space (1971). This stuff has been out for years.

@2. If it was one of theirs, our disclosure of its existence could @have caused caused a new round of tension.

@3. Calling it a UFO would have the same effect, because the @Soviet government (and the news media) could conclude that either @case 1 or case 2 was true, especially since it was shaped like @earthly space hardware, not the typical UFO shapes.

@4. The only prudent thing to do at the time: "Identify" it as @the nearest non-secret object available.

@MORE COMMENTS: All NORAD had to do was say "Object 1234 was @projected to pass within XXXX km of Gemini 11 at 1825 GMT on @Sept 13, 1966." No one had to say anything about satellite @Object 1234's mission or even if it was a satellite instead of @some debris. (The number 1234 is arbitrary for illustration.) @In fact that was standard procedure with spy satellites -- to @list them as space object catalog numbers without disclosing a @satellite name or mission or identity.

That's how they listed them, but that's not what the reporters would want to know. They would press and press until they got an answer on why that satellite was up there. (is this why they call

them the press? :))

FURTHER COMMENTS: See above. This is a misunderstanding of NORAD catalog numbers.

Also, this may have been the first time NORAD had to deal with the situation, and they may have come up with a quick solution to their dilemma on the fly.

FURTHER COMMENTS: Even from reading the Condon Report it's obvious NORAD had to deal with it a year before Gemini 11, i.e., with Gemini 4.

@5. Once the UFO story got out, the corresponding record of the @spy satellite would have been altered to keep it out of the @media should an investigation ensue.

@You realize that the US military would much prefer a UFO mystery @to an international incident. That's why they said they "had a @flying disk" at Roswell, and later subbed the RaWin balloon for @the (secret) Mogul balloon in the press conference. If the @Soviets had found out about Mogul at that time, nuclear war was a @possibility.

@MORE COMMENTS: Absolutely not. It was normal deployment on Apollo 12, which @meant a backward negative-x velocity vector.

Relative to the trajectory, or the direction the crew was facing?

FURTHER COMMENTS: Gee how much more explicit do I have to get I SAID the "VELOCITY VECTOR"!!!!

I know the doors got stuck on one Apollo mission, but I can't remember which one it was. I do know that the school year was in session at the time, so it wasn't Apollo 11 or Apollo 14.

@MORE COMMENTS: I interviewed Skylab-3 astronaut Dr. Owen K. Garriott in Oct @1973, right after his return from the flight, about his sighting, photography @and optical ranging to the unidentified reddish-orange object which was @flashing or rotating about once per second. There were 4 color photos taken

@(NASA SL3-118-2140).

Larry & List,

My COMMENTS.

Brad

In a message dated 1/13/00 10:22:06 AM, lrobins@indiana.edu writes:

<<

I revved up my research engines last night and have some more details on a few cases we have been discussing. Rather than clutter the system with many posts, I decided to combine them into a single email.

PANEL METER PHOTO:

I found the photo of the panel meter I had mentioned earlier. Unfortunately, it has no caption. But you can find it in:

Flying Saucers Pictorial

(C) 1967 Real Magazine

COMMENTS: What are you talking about here? I recall nothing about any "panel meter."

LAKENHEATH/BENTWATERS:

Brad:

I was not referring to the part of this case where the object went under the airplane when I said that a part of the case might be caused by a 2nd/3rd trip echo and a meteor.

I was referring to the part where an object streaked westbound (only on RADAR) and was seen for only two blips east of the Bentwaters station and two blips west, covering a total of 66 miles. This might have been the result of two separate meteors

and 2nd/3rd trip echoes.

COMMENTS: I'm not familiar with any instance of only 4 blips on a radar UFO fast-track that night at Bentwaters. There was one fast-track with 9 blips in 16 seconds.

The object that flew under the plane is the only part of the sighting that I consider really unexplained. Jenny Randles blows the lid off of the rest of the case in her book "UFOs: Danger In the Air." (Hey Jenny, I finally got a copy!)

COMMENTS: I don't have the book but from what I know her Venom crew interviews have logs showing their intercepts occurred around 2-3 AM whereas the intercept reported to the Condon Committee by USAF controller Forrest Perkins and later confirmed by RAF controller F. H. C. Wimbledon occurred around 12 midnight, hence were two different unrelated interception episodes.

Indeed they did say so, but then, who gives them any credit for expertise anyway? <grin>

Seriously, they only said "polar orbit" for a cloud of debris because it was seen crossing the Gemini's flight path at a small rate. Dr. Roach did not know until I told him, that objects departing from an area at right angles to the velocity vector will soon RETURN in the opposite direction. With the tumbling, venting Titan second stage and assorted debris all nearby, heading off in different directions, there is no dearth of candidate prosaic sources for such particles.

Hello List,

Could someone help me out with a term that I came across in the book titled "Clear Intent" called "meaconing". Does anyone know what this is? In the book, it states that it "is a classified Air Force term and the authors cannot provide a definition of it." This word was mentioned in a discussion about the Iranian UFO case within the book.

Jim,

I think what you say makes sense, and until this recent exchange I had all along considered that you had solved this case. But I think now I want to review more data on the Gemini 7 "bogey" -- such as any early astronaut interviews or debriefings to clear up ambiguities in the air-ground transcript -- especially since Roach was so adamant that the hypothesis that the "bogey" and the particles were debris from the Gemini 7 itself was "IMPOSSIBLE if they were travelling in a POLAR ORBIT as they appeared to the ASTRONAUTS to be doing" (Condon Report p. 208). Astronaut Borman in the transcript refers to the "path of the vehicle at 90 degrees" then talks about "they" are in "polar orbit," which is ambiguous (CR p. 207).

I tend to agree with you that the astronauts were just mistaken about the polar orbit but I'd like to get more data first. As you imply, crossing at right angles is not the same thing as being in polar orbit. Debris from the Gemini 7 is the number one candidate and as you pointed out to Roach, such material in similar orbits to the Gemini will weave back and forth over the Gemini's path at every node.

At this point the only element of Strangeness is that the "bogey" was at the wrong place at the wrong time -- it didn't accelerate away from the Gemini at high velocity, didn't do cartwheels, didn't blast the astronauts with ray guns, wasn't shaped like a saucer so far as we know, etc.

Brad

Todd & Jim,

Jim is right. I've seen an excellent definition of "meaconing" (masking beaconing) from the US Army Signal Center, found by Jim Klotz on the Web (<http://www.gordon.army.mil/tsd/31C/h05lp1wkbk3.htm>):

"Meaconing is a system of receiving radio beacon signals from NAVAIDs [navigational aids] and rebroadcasting them on the same frequency to confuse navigation. The enemy conducts meaconing operations against us to prevent our aircraft and ships from arriving at their intended targets or destinations. When enemy meaconing operations are successful:

- (1) Aircraft are lured into hot landing zones or enemy air space.
- (2) Ships are diverted from their intended routes.
- (3) Bombers expend ordnance over false target areas.
- (4) Ground stations receive inaccurate bearings or position locations."

Hello list,

I've got another request concerning a case that occurred on October 27, 1975 to a man named David Stephens and Glen Gray that occurred in Oxford, Maine on route 26. This case involved Dr. Herbert Hopkins of Old Orchard Beach, Maine who conducted 8 hypnotic sessions on Stephens. Does anyone here know if a report or book has been published on this incident (other than the short summary in "Clear Intent")? Who conducted the actual investigation? Any information I could use to obtain a complete version of this investigation and hypnotic transcripts would be greatly appreciated.

Thanks in advance!
Todd Lemire

AFAIK.

Indeed it is the use of false beacons. In fact the RAF developed it during WW2 and managed to "persuade" a FW190 pilot that he was over Nazi-occupied France and got it to land at a RAF airfield! The look of surprise on the German pilot's face when his aircraft was surrounded by RAF personnel was a delight to behold. The FW190 ended up at Farnborough for testing. The RAF also used the technique to redirect Nazi bombers away from their targets as they were following radio signals beamed from occupied France. I believe the Luftwaffe developed a counter to it soon afterwards.

Cheers

From: Bill Rose <bill.rose@virgin.net>
Subject: MeaconingMessage-id: <38847188.3754@virgin.net>

Meaconing was a technique developed by British scientists early in WW11 to counter Luftwaffe radio navigation beams. The Germans used several different frequencies, which all had seperate names like X or Y Gerat.

RAF 80 Wing undertook a range of deception operations and countermeasures which included meaconing and my uncle - Wing Commander Bill Hughes was responsible for setting most of the "Outstations" and running them until about 1943.

Unfortunately, he died in very mysterious circumstances in mid-1944, so I have limited information on his activities. At that time, 80 Wing's operations ranked alongside code breaking at Bletchley Park in terms of secrecy and my family were largely kept in the dark, only managing to piece together some of the details after the war.

80 Wing also set fires in the wrong places to fool the Luftwaffe and undertook special ops behind enemy lines with SOE, lifting German radar equipment, etc.

Rather annoyingly,(certainly for me) much of the official documentation on the history of 80 Wing remains classified and I have been unable to gain access to it. Good old MoD, as usual!

However, about 3 years ago, Laurie Brettingham wrote "Beam Benders" published by Midland Counties and it is still (I think) available.

If any of you want to know more about meaconing, I would recommend this book and if anyone is doing serious research into this area, I can put you in touch with him, providing you contact me directly.

Incidentally, the late Marcus Morris who set up the Eagle comic in 1950 had been a chaplain in the RAF during WW11 and may have picked up on the term meaconing, altered it to Mekon for his evil Venuisian leader of the Treens. (One of the Dan Dare sites may have detailed info on the Mekons's name origin)

Hope this info proves useful,

Bill Rose

Hi List,

R. V. Jones wrote an outstanding and detailed account of WWII meaconing (though I don't think he used that term) in his book, Wizard War: British Scientific Intelligence, 1939-1945. He was responsible for directing the false beaconing effort and I think he was the inventor of many of the techniques. (When CIA's OSI was commissioned to investigate UFO's in late July 1952 pursuant to President Truman's orders I think Jones was consulted by OSI for the British Scientific Intelligence perspective on UFO's.)

I think the episode was called "The Arena" and aired sometime around 1967.
The reptilian was called a Gorn.

@@From: RB47Expert@aol.com

@@@@To: UFORL@listbot.com

@@Subject: Re: SETI signals?

@@

@@@@

@@@MORE COMMENTS: As I've pointed out several times before such
@@spy satellite signals would be ENCRYPTED transmissions. Not a
@@repetitious pattern but encrypted text. How in the world
@@would the SETI astronomer not see that? That would be the
@@tipoff right there that it's from a Near Earth Orbit spy sat.

@Most of them send encrypted images, not text. The spy satellites
@I am talking about take photos from space. The telemetry they
@send is unlike other forms of communications. Some spy satellites
@may operate in a mode similar to that used by radio control
@planes, just taking orders from the ground, with a quick
@acknowledge burst after every command received.

@FURTHER COMMENTS: Doesn't matter whether it's images or digital

@images, the signal is reduced to encrypted text. Encrypted
@messages would be obvious.

How could you possibly know what their "encrypted image" looks
(or sounds) like? I'm talking analog here as well as digital. It
could look like some variant of scrambled TV (who says they used
the standard scan rates?), SSTV (slow scan, sent over audio
channels), telemetry, interleaved CW binary, multichannel binary,
multiple subcarriers, or even early FAX transmissions. Different
parts of the picture might even be interleaved and sent
simultaneously on different bands, making a short, but very busy
burst of information.

@OK, so the correct satellite catalog number is given to the
@astronauts. Some nosey newsman gets hold of it (through listening
@to the capcom link on an all-band radio), and demands to know
@what mission by what government endangered our astronauts. What
@were they going to do then?

@

@FURTHER COMMENTS: If NORAD predicted a very close approach by a
classified

@satellite it could have been quietly handled by alerting the astronauts on
@the back channel used for private communications on medical conditions etc.
@In that case astronauts would not blab aloud about "bogeys" and such. If
@NORAD failed to predict a close approach, in most cases it won't have radar
@skin-tracking to figure out how close so the predicted distance will be all
@it has. The satellite catalog number could be given out with the erroneously
@large distance and no newsman would know enough to know the distance -- here
@we are 30+ years later, and we're still trying to figure it out. No
@indication of classified mission need be mentioned. The updated orbital
@parameters would not even need be released (the approach parameters just give
@catalog numbers, time and distance).

But suppose NORAD was counting on the astronauts not noticing the
object (or assumed it wouldn't be that visible to them). Then a
flap ensued when one of the astronauts said something about it on
the public channel. TOO LATE! Now we gotta cobble up something
the press will believe and fast!

(snip)

@@MORE COMMENTS: I told you again and again "what NORAD could
@@do." It could list the spy satellite as an otherwise
@@unidentified SATELLITE CATALOG NUMBER like all of the other spy
@@satellites.

@

@Do you really think the press would have sat still for that?
@Remember when they started digging into Iran-Contra. The
@President's plea for them to stay out of it only whetted their

@journalistic appetites. If NORAD had done what you suggest, the @whole secrecy of the spy satellites would have been exposed at @that time, rather than several years later. As soon as one @reporter found he couldn't get the identity of the satellite (or @if two reporters came up with different identities)

@FURTHER COMMENTS: USAF, CIA, NRO and NSA launched spy sats all @the time in the 60's with announcements (usually from Vandenberg @AFB) of a "classified launch" and nothing like an Iran-Contra @investigation ever occurred -- these launches happened DOZENS of @times EACH YEAR.

"Classified Launch" also was used for ballistic missile tests and other purposes too. Some of them were later revealed as samplings for radioactive fission products in the upper atmosphere. Nobody knew whether the launch went into orbit or not. But an astronaut endangerment might have tipped the balance in favor of an investigation.

@@1. If it was one of ours, the Soviets would have learned about @@its existence and orbit.

@@MORE COMMENTS: The Soviets had skin-track radars just as we @@did. They didn't need a NORAD announcement to know a satellite @@was flying overhead.

@Yes, but they didn't know what the satellite did. If NORAD had @issued a number without delving into the purpose of the @satellite, they would have a pretty good guess.

@FURTHER COMMENTS: NORAD catalog numbers don't tell you anything @about a satellite's mission. It's the orbital parameters that @tell you virtually everything you need to know about whether a @mission is low altitude photo recon, mid-altitude SIGINT, ocean @surveillance, Molniya-style communications, etc. etc. Read @Klass' Secret Sentries in Space (1971). This stuff has been out @for years.

No, but the Soviets could have combined the orbit data with the reluctance of NORAD to identify it, and ended up with more than NORAD wanted them to have.

@@2. If it was one of theirs, our disclosure of its existence could @@have caused caused a new round of tension.

Your catalog number disclosure (combined with silence on the identity of the object) would have immediately tipped off the

Soviets that we knew what they were up to. The CIA used to leave enemy bugs in place too, and feed them false information. Part of the "deterrence game" at the time was to try to mislead the enemy spy satellites with drill convoys and even fake missile sites.

@That's how they listed them, but that's not what the reporters @would want to know. They would press and press until they got an @answer on why that satellite was up there. (is this why they call @them the press? :))

@FURTHER COMMENTS: See above. This is a misunderstanding of @NORAD catalog numbers.

The number means beans to the reporter, but might be valuable to the enemy agent. The reporter would want to know what the object was for. "Proton 3" placated them long enough for the issue to fade from the headlines.

@Also, this may have been the first time NORAD had to deal with @the situation, and they may have come up with a quick solution to @their dilemma on the fly.

@FURTHER COMMENTS: Even from reading the Condon Report it's @obvious NORAD had to deal with it a year before Gemini 11, i.e., @with Gemini 4.

@@You realize that the US military would much prefer a UFO mystery @@to an international incident. That's why they said they "had a @@flying disk" at Roswell, and later subbed the RaWin balloon for @@the (secret) Mogul balloon in the press conference. If the @@Soviets had found out about Mogul at that time, nuclear war was a @@possibility.

And in the Proton 3 case, they may have tried to come up with a solution that removed both the spy satellite and the UFO problems.

@@MORE COMMENTS: Absolutely not. It was normal deployment on @@Apollo 12, which meant a backward negative-x velocity vector.

@Relative to the trajectory, or the direction the crew was facing?

@FURTHER COMMENTS: Gee how much more explicit do I have to get I SAID the
@"VELOCITY VECTOR"!!!!

That was as clear as mud! There were two velocities, the door and the spacecraft. Which one was not very clear from the MORE COMMENTS statement above, without additional info not evident?

@FURTHER COMMENTS: I doubt that, the Secretary of the Air Force Office of Information had to coordinate a campaign to reduce publicity over the incidents which was incredibly stupid if they wanted to keep Stealth quiet -- they should have stopped the overflights the first time it leaked out. How many times do they need to overfly nuclear weapons depots to make their point? Please provide documentation.

The info was not released until the 1990s, after the stealth was made public. I will provide the info when I find it again (The problem with finding info quickly is that I don't create a separate file on something unless I think I will need it again quickly. A lot of it is in books. Even if I do make a file on a sighting, the info isn't where my email computer is.)

@Of course the main reason was that any UFO report might really have an invading enemy aircraft as its cause.

@FURTHER COMMENTS: You're really denigrating or denying the military's interest in basic science. AFR 200-2 / 80-17 explicitly mention natural phenomena as a point of investigating UFO's -- obviously not invading enemy aircraft.

First of all, any scientific interest in the UFO problem was secondary to the problem of removing the false alarms caused by UFOs. THAT'S why they studied UFOs. The main interests of the UFO program (and the CIA) were:

1. Identify any hostile flying objects approaching or already inside our airspace in time to do something about them.
2. Identify the causes of false alarms and eliminate them before they cause a nuclear war.
3. Prevent an overload of communications channels like the one that occurred in July 1952 in the wake of the Newport News and Washington National sightings.
4. Expect that the enemy could use UFOs to either clog

communications channels, or to disguise a real attack.

5. Foil enemy intelligence gathering methods.

Do you really think their investigation of UFOs was altruistic?
Or were they more concerned with preventing nuclear war?

@
@Larry & List,

@My COMMENTS.

@Brad

@In a message dated 1/13/00 10:22:06 AM, lrobins@indiana.edu writes:

@<<

@I revved up my research engines last night and have some more
@details on a few cases we have been discussing. Rather than
@clutter the system with many posts, I decided to combine them
@into a single email.

@PANEL METER PHOTO:

@I found the photo of the panel meter I had mentioned earlier.
@Unfortunately, it has no caption. But you can find it in:

@Flying Saucers Pictorial

@@(C) 1967 Real Magazine

@COMMENTS: What are you talking about here? I recall nothing about any
@"panel meter."

It was in the discussion of Hynek's photos taken in the air. This
picture is the lighted shape of the cutout of an illuminated
round-mount panel meter with 90 degree needle deflection range.
It is like those found on WWII equipment. Nothing but the lighted

shape shows in the photo. It looks a lot like the Hybek object.

@LAKENHEATH/BENTWATERS:

@Brad:

@I was not referring to the part of this case where the object went
@under the airplane when I said that a part of the case might be
@caused by a 2nd/3rd trip echo and a meteor.

@I was referring to the part where an object streaked westbound
@(only on RADAR) and was seen for only two blips east of the
@Bentwaters station and two blips west, covering a total of 66
@miles. This might have been the result of two separate meteors
@and 2nd/3rd trip echoes.

@COMMENTS: I'm not familiar with any instance of only 4 blips on
@a radar UFO fast-track that night at Bentwaters. There was one
@fast-track with 9 blips in 16 seconds.

It is referred to in Sagan and Page's "UFOs, A Scientific
Debate." The object is referred to have appeared for only the
time of three sweeps.

@The object that flew under the plane is the only part of the
@sighting that I consider really unexplained. Jenny Randles blows
@the lid off of the rest of the case in her book "UFOs: Danger In
@the Air." (Hey Jenny, I finally got a copy!)

@COMMENTS: I don't have the book but from what I know her Venom crew
@interviews have logs showing their intercepts occurred around 2-3 AM whereas
@the intercept reported to the Condon Committee by USAF controller Forrest
@Perkins and later confirmed by RAF controller F. H. C. Wimbledon occurred
@around 12 midnight, hence were two different unrelated interception episodes.

Either that, or somebody goofed on reporting the time.

MORE COMMENTS: What's the context, who wrote it (Menzel?), what page? This is just plain erroneous info, wherever it came from. I've read all of the military reports and later witness reports. No one reported a fast-track of just 3 blips (that's not the 4 you previously cited). You can't tell with 3 blips that they aren't just three coincidental AP targets (anomalous propagation, false returns from ground clutter or whatever). Four blips in a row on one line equally spaced would probably be too much to be a coincidence for AP.

MORE COMMENTS: Don't think so, Randles has log book entries showing the Venoms took off at something like 2:40 and 3 AM (if I recall the exact times correctly, I might not; it was certainly around 2-3 AM). Wimbledon and Perkins worked different shifts at different bases as air controllers with only 12 midnight overlapping between them and they (independently) reported 12 midnight as the approximate time of the Venom intercept with the startling UFO maneuvers.

MORE COMMENTS: What's the context, who wrote it (Menzel?), what page? This is just plain erroneous info, wherever it came from. I've read all of the military reports and later witness reports. No one reported a fast-track of just 3 blips (that's not the 4 you previously cited). You can't tell with 3 blips that they aren't just three coincidental AP targets (anomalous propagation, false returns from ground clutter or whatever). Four blips in a row on one line equally spaced would probably be too much to be a coincidence for AP.

- >

MORE COMMENTS: Don't think so, Randles has log book entries showing the Venoms took off at something like 2:40 and 3 AM (if I recall the exact times correctly, I might not; it was certainly around 2-3 AM). Wimbledon and Perkins worked different shifts at different bases as air controllers with only 12 midnight overlapping between them and they (independently) reported 12 midnight as the approximate time of the Venom intercept with the startling UFO maneuvers.

List only please

Maybe the information in

<http://setiathome.ssl.berkeley.edu/sciencepaper.html>

could help in this discussion. Here is an excerpt:

"Because an extraterrestrial civilisation's signal has unknown bandwidth and time scale (eg: the signal may be pulsed, continuous, wide or narrow band), the software searches for signals at 15 octave space bandwidths ranging from 0.075 Hz to 1220 Hz, and time scales from 0.8 mS to 13.4 seconds. The rest frame of another civilisation's transmitter is also unknown (eg: their transmitter may be on a planet that is rotating and revolving) so extraterrestrial signals are likely to be drifting in frequency with respect to the observatory's topocentric reference frame. Because the reference frame is unknown, the client software examines 6761 different doppler acceleration frames of rest (dubbed "chirp rates"), ranging from -10Hz/sec to +10Hz/sec."

It probably needs it -- how about me writing to Borman in Las Cruces? I expect he's answer me since he liked the historical paper I did about five years ago on the GT-7 rendezvous (I think it's on a link from the ufomind page on me).

Subject: Re: Re: Re: Gemini-7 bogeyMessage-id: <22.f45b28.25b77de2@aol.com>

Hi Jim,

Are there interviews and debriefings from 1965-6? It's always preferable to get the earliest most nearly contemporaneous data -- look at what's happened with Roswell after 30-50+ years of sci fi movies, Hangar 18, then Roswell books, movies, TV series, etc. Maybe hold off on writing Borman until some early data can be used for intelligent (or semi-intelligent) questions. What about Lovell? Is he still around? (He was asked the following during a March 1997 forum of the National Space Society, so he sounds like good skeptic material: "Have you seen/do you believe in the existence of UFOs or other signs of intelligent extraterrestrial life? [LOVELL:] There are no UFO's around or on the earth. I beleive [sic] there is life in the universe.")

The confounded thing about these unidentified satellite cases is getting a reliable indication of the orbital inclination, which could tell you if it's from the astronaut's own spacecraft or help narrow down leads to other satellites and space debris. As I say, certainly there is essentially ZERO Strangeness (unexplainability) here except that the "bogey" was not expected for dinner. Maybe Borman will reveal that the "bogey" zapped his brain with mind-altering radiation. That would turn it into a High Strangeness case.

Brad

@you previously cited). You can't tell with 3 blips that they
@aren't just three coincidental AP targets (anomalous
@propagation, false returns from ground clutter or whatever).
@Four blips in a row on one line equally spaced would probably be
@too much to be a coincidence for AP.

Fencepost error: It takes 4 posts to hold up a fence 3 rails
long.

Did 4 blips occur with three sweeps in between, or did three
blips occur with two sweeps in between? The report said "three
sweeps" and figured the time on that basis. There has to be one
more blip than the number of intervening sweeps used to figure
the time. (Either that, or Klass made a mistake).

McDonald refers to it in Sagan and Page, but the 3 sweep value
actually comes from Klass' "UFOs Identified."

@> @The object that flew under the plane is the only part of the

@>

@> Either that, or somebody goofed on reporting the time.

@MORE COMMENTS: Don't think so, Randles has log book entries
@showing the Venoms took off at something like 2:40 and 3 AM (if
@I recall the exact times correctly, I might not; it was
@certainly around 2-3 AM). Wimbledon and Perkins worked
@different shifts at different bases as air controllers with only
@12 midnight overlapping between them and they (independently)
@reported 12 midnight as the approximate time of the Venom
@intercept with the startling UFO maneuvers.

The mystery deepens:

Were there really 4 Venom chases? Maybe Jenny can clarify this.

This case has more twists and turns in it than a mountain road. I
now possess 5 different accounts of it, with very few matching
parts between the accounts.

@MORE COMMENTS: Larry you know perfectly well I gave you the
@1825 GMT/UT/Z time and Sept 13 date again and again and again,
@so why don't you look it up in our E-mail or List messages first
@before wasting time? It's as if you hope I will give up so you
@will get in the last word with your point left standing and
@unrefuted by anyone.

@I hope we don't have to argue over the fact that 1825 GMT would
@still be the same day in Houston time (1:25 PM CDT) Sept 13,
@1966, NOT Sept 12.

Definitely no argument over that! And now that I have the time
again, I can see that part of the 14th (not the 12th) was on the
Earth at that time.

I can't read your old messages (I can read everyone else's). The
trouble is that your line-length is wa-a-ay too long for our
emailer (each paragraph gets stored as a single line somehow),
and once I have read the message, it is stored by our email
software in a way that I can't read it again without editing the
entire message. We have a 78 character line length limit.

I have to log off of the emailer (losing any editing I have
already done) and log in to the web searcher (they're on two
separate mainframes, by decree of the administration here) to
look up the postings on the page. Then the line length problem
shows up as an extremely wide page, which I have to constantly
shuttle back and forth to read. Changing the settings on my
browser doesn't help.

Caveat Emailor

@MORE COMMENTS: We've been over this already in previous @postings. Conspiracy theorists typically cannot explain why @their scenarios even make sense from the "selfish" perspective @of the supposedly sinister agencies they have depicted (e.g., @they can never explain why the CIA would be so angry as to @assassinate JFK, over what??? and risking their whole Agency @getting abolished if caught, again for what???? at least the @Soviets and Cubans had some powerful ideological motive, the @Mafia had vindictive motives, etc., and even then there were @countervailing motives).

@NORAD had (and still has) a perfectly feasible procedure to use @instead of your coverup scenario endangering astronaut lives, @and it's the standard procedure they do use which is to describe @satellite/space object encounters with manned NASA missions @under very banal uninformative NORAD space object catalog @numbers.

OK. Do you have documentation that this is actually what NORAD did? If so, I will accept it.

My whole scenario was not a theory to explain the whole sighting, but a possibility that was first suggested to me by another person. But I do think that it is likely the military had motives other than just the preservation of the astronauts.

And my scenario never said they endangered the lives of the astronauts. You assumed that. My theory assumes:

1. That the correct figures were given to NASA, but NOT the public.
2. Either NASA or NORAD substituted only the NAME of the Proton 3 in the public release.

Anything else was a misunderstanding between what I intended to say and what you thought I said.

We seem to read different meanings into the same sentence. I constantly find you misunderstanding what I wrote, and it seems that sometimes I misunderstand you. This means that I am going to have to be extra careful to make sure that my meanings are clear. These might be regional differences in the English language (I tend to use our local usages).

For instance, we use "hide" to refer to concealing the identity

of something as well as to refer to physically concealing the object itself. It is common usage here. You tried to say that I "changed my story," when all I did was substitute one equivalent word (on our usage here) for another to clarify what I meant in the first place.

It would also be informative to describe the way I look at UFO cases:

First I brainstorm, trying to think of ALL possibilities, no matter how remote. The list I gave on Cash-Landrum was one of these. I threw them out there to bounce them off of the rest of the list members. They weren't intended as attempts to debunk at any cost, but to spark some thoughts.

Then I weed through the possibilities so generated. For example, if a UFO shows some of the characteristics of a fire balloon, AND shows no characteristic contrary to the properties of a fire balloon, then I give serious thought to fire balloons as a possible explanation.

I give very little credence to estimates by witnesses of actual size, distance, speed, or altitude, unless more definite evidence (Example: It went in front of the water tower, but behind that barn up the road.) backs up such claims. This is NOT an impeachment of the character of witnesses. Rather, it is a reality of the limitations of the human perception system.

I also look for:

Witnesses who should have seen the object, but didn't. Such data can be quite enlightening.

Possibilities where multiple causes overlap in the visual fields of the witnesses to produce strange effects.

I assign a probable explanation to a UFO case where one, and only one, explanation fits the case well.

I assign a possible explanation to a UFO case when one explanation fits, but not very well, or if more than one explanation fits the case.

@> @Apollo 12, 11/14/69: The tumbling, flashing object was a piece of
@> @the booster, probably ejected when the service module separated
@> @from the S4-B. The astronauts made a joke with ground control

@> @about it being a UFO.

This was from Story.

@> @The doors from the S4-B were seen from the ground by an amateur
@> @astronomer with a telescope. _One UFO publication_ confused this
@> @case with the booster piece sighting above, attributing BOTH to
@> @the doors.

@MORE COMMENTS: As best as I can recall the S-IVB separation was
@roughly a day prior to the first sighting of the flashing light
@by Apollo 12 astronauts. The S-IVB itself was injected into a
@trajectory designed to get it out of the way of the Apollo 12
@spacecraft, again for SAFETY reasons.

Right, but not until after LEM extraction.

@Again, a low relative velocity for space debris cannot change in
@deep space -- there's no air resistance to speak of, no
@propulsion system to maneuver with. VERY ROUGHLY speaking, an
@object separated at S-IVB separation would have had roughly a
@day to get to where it was seen by the Apollo astronauts then
@another day of being observed with no significant diminution (or
@increase) in brightness or distance being reported. Yet the
@distance for separation debris should have about doubled --
@linear increase of distance with time as time doubled -- so the
@brightness had to have diminished by 4x (inverse square law) but
@no such dimming was reported. If it was not debris released at
@stage separation but released later, the situation is MUCH
@WORSE. For example, if the object had been released, say, 1
@hour before the astronauts saw it, then after 24 more hours the
@distance would have increased linearly by 24x, resulting in a
@factor 576x dimming of brightness, which was obviously not the
@case. This argument is very soft and not conclusive but it is
@interesting.

What if something fell off the S4-B (or the spacecraft) just as
it stopped firing for Translunar Injection, or just at the start
of the trim burn? That gives much more time. The S4-B stays with
the spacecraft until after LEM extraction. One possibility is a
piece of ice shed from the fuselage of the S4-B. The trim would
have given the ice and the spacecraft slightly different
velocities. The ice would not have been visible until it, the
sun, and the spacecraft were lined up just right for it to
reflect the sun onto the spacecraft once per rotation.

(Obviously, an object does not "fall" off a spacecraft, but it
can become detached.)

@And the flashing light is still low or zero Strangeness, it's
@unidentifiability is due to location (wrong place, wrong time),
@NOT due to wild accelerations, there was NO firing of death rays
@at the Apollo, NO "missing time," NO EM Effects on the Apollo
@capsule, NO physical traces, etc. etc.

I Agree 100 percent with that!!!

Anything in a really different inclination would zip by their windows in milliseconds. One degree difference of plane is about 400 ft/sec in crossing velocity.

-----Original Message-----

From: Larry Robinson S/AP/EIS Kinesiology <lrobin@indiana.edu>Date: 19 January 2000 21:26
Subject: Re: Lakenheath

Hi,

I have for some months been working on an attempt to sort out the confusing situation regarding the British testimony on this case - especially the sightings / non sightings by venom crews during the August 1956 events.

UFOIN is preparing a detailed report based on this work which has involved three of the four crew and Freddie Wimbledon in an effort to resolve this.

I have found no evidence as yet that there were earlier scrambles - making four airborne venoms all told. But this is not completely impossible given the extent of the difference between the Condon stories and the stories told me first hand by the venom crews. Whilst there are many similarities there are such differences that it is at times hard to perceive them as the same case. But then - as we know - UFOlogy often transforms a case across time and legend into more than it was. So it is important to ascertain the truth about this otherwise impressive case. That's what I've been trying to do (to frankly little more than jeers from Updates for not coming out now and prematurely debating the matter).

So far as I have been able to establish that the crews that I spoke with appear to be the ones referenced by the Condon report. That report was based on second hand testimony years later and is already known to be wrong in several respects so it is not hard to imagine that further confusion arose with regards to the aircrew. These guys had never spoken publicly till I met them in 1996.

I don't want to pre-empt the full report that UFOIN aims to bring out some time this Spring. Especially as there are still a few things to check out. It will go on the net when we do. On UFO Updates I have been attacked by several people claiming I mislead the UFO community regarding the testimony of this air crew - which I most certainly have not done. What I have said (eg in Something in the Air) is what they told me.

They base this spurious assertion on the fact that they've seen a couple of minutes highly edited from a long interview I did with two of the crew (at Lakenheath) when I filmed for a TV documentary that I wrote for the BBC. This programme was not about the case and included it only in reference to

Public Record Office files. So it never had the remit to resolve conflict over the evidence and makes no effort to do so.

These people have not seen the full interview data and don't seem to understand this critical difference. The report aims to put it all properly into context for the UFO community so that people can judge from the full facts for themselves and after the absurd reaction on UFO Updates I have decided to limit what I say in case it is misinterpreted again.

What I can say is that the crews I talked with definitely had no visual sighting - despite stupid attempts on Updates to try to infer otherwise. The 'cat and mouse' story - if indeed it does refer to these two venom crews - seems to have come about because they flew towards a stationary radar target and then right past it. One moment it was ahead of them, the next behind, but this did not happen because the UFO moved to their rear at great speed but because the aircraft was travelling so fast it was almost instantly on the other side of the non moving target.

There is also some confusion over the use of BST and GMT which could resolve any problems over the timing that right now are a confusion. The reference to 2 am for the start of the scramble is what the air crews log books say. The two navigators have retained these.

I have to say that Wimbledon believes there was a visual contact that night - but he had never had direct communication with the crews. He was in an RAF bunker controlling the operation. The venoms were vectored onto target by USAF ATC. The air crew I have met are adamant there was no visual contact.

As such - unless there were two earlier venoms whose stories form the basis for those in the Condon report - there is a huge discrepancy between the USAF version in Condon and that told by the actual witnesses.

No references exist so far to four venoms being launched and the crews I met definitely spoke to the USAF on the night extensively. As such it is hard to imagine why the source that spoke to Condon would have failed to mention that two other venoms were also vectored onto the UFO after the first ones and also picked up clear radar targets (as all the crew told me they did). This omission of reference suggests again we are talking about the same two venoms and a USAF misinterpretation of what they said. But it may not be. There may still be two other venom crews 'out there'.

As you can see this is a complex issue and is one reason I want to get this full report together before entering into a debate on the matter. Especially after the fiasco on Updates last year. So I want to leave it at that for now.

Once the UFOIN report is complete I'll let you know and we can discuss it happily as long as you like then.

Best wishes,

Jenny Randles

From: bruce maccabee <brumac@compuserve.com>
Subject: GT-11 STRANGER DURATION

>

Anything in a really different inclination would zip by their windows in milliseconds. One degree difference of plane is about 400 ft/sec in crossing velocity.

<

Well, perhaps a bit of an "anti-exaggeration"... or "minimization?" The sighting duration would be not milliseconds but hundreds of milliseconds to seconds. If the orbital speed were, say, 5 miles per second, the limiting case would be satellites approaching one another on the same orbit but opposite directions. The rate of closure would be 10 mps. If the astronauts could see a satellite at 10 miles, and if they could look directly forward as well as directly backward they could see it from 10 miles out for 1 sec as it zipped past and then for another sec as it disappeared in the distance. If they could only see it for 5 miles then 1 sec would be the largest sighting time. Obviously if they could only see only a fraction of the flight path past them because of window limitations or whatever, then they would see it for less than 1 sec, or more like tenths of seconds (hundreds of milliseconds).

This is what makes the GT 11 case so interesting, because they saw it for many, many seconds indicating a very low crossing speed. Considering that Conrad and Gordon had time to initially see the object(s), to discuss it, to decide to photograph, get the camera, set f stop, etc and take 4 pictures (only two of which show the object(s)), the minimum estimated time is 20 sec and the maximum is about 1 minute. It was first seen to the left and moving toward their front, finally disappearing "below them". Keep in mind that the thick window in the conical shaped forward part of the cabin restricted their field of view to about 40 degrees up-down or left-right (forward- back).

The spacing of blob images in the photos plays an important role in assessing how the "other" moved. The size of a blob depends

upon exposure level of the film. Hence the actual size of a brightly reflecting object or light source is smaller than the size calculated from geometric projection using the "camera equation": object size/object distance = image size/focal length. However, the spacing between definitely separated images is not affected by brightness. Therefore it "means something" to say that the maximum spacing between blob images in the first photo that shows the object is 0.25 mm and the maximum spacing between blobs in the second photo is about 0.37 mm. Note that each photo shows several blobs and that the relative orientation in the second photo is not the same as in the first photo, indicating either rotation of a single large body or relative reorientation of several small reflective objects (no "structure" is seen, only overexposed blobs and partially exposed "corona" around the blob images.... this is similar to photos of known reflective objects illuminated by the sun).

In the first photo, then, the angular size is $.25/38 = .0066$ radians or 6.6 ft at 1000 ft. In the second photo the angular size is about 0.0097 radians.

Considering that known satellites with "wings" (solar arrays) have dimensions measured in the tens of feet, one calculates for an upper bound of 30 ft (I don't know that there was a satellite with a 30 ft wingspan) a distance of $30/.0066 = 4,500$ ft or $30/.0097 = 3,100$ ft. These are distances assuming a satellite's maximum dimension was perpendicular to the line of sight. If it were not perpendicular, then the actual size of the satellite would be larger than 30 ft. Also, since this is the spacing between the centers of overexposed light blobs, the calculation actually assumes the center to center spacing of highly reflective portions of the assumed satellite are separated by 30 ft (or more, if not perpendicular to the Line of sight).

MAIN POINT: if a man-made satellite, then it was less than a mile away when photographed.

Considering that the photo shows the antenna on the front of the spacecraft, the object(s) was nearly in front of the spacecraft when the photos were taken. That means that the distance from the object(s) to the plane of the orbit of the G-11 was much less than a mile at the time of the photos. (Had the photos been taken perpendicular to the direction of GT-11 travel the object(s) would have been several thousand feet to about a mile from the orbital plane and the object(s) would have appeared to pass behind, rather than ahead of, the GT-11.)

Using an estimate of 20 degrees from straight ahead at the time of the photos, and a radial distance of 4,000 ft (assuming man-made sized satellite) the distance from the GT-11 orbital plane would have been about $4000 \sin 20 =$ about 1,400 ft. Assume it took ten seconds to reach the orbital plane, then its (perpendicular component of) crossing speed was about 140 ft/sec . Considering that at 4.83 miles per second (290 mi/min orbital speed) the GT-11 would have travelled about 48 miles along it's orbit and the object(s) would have traveled 1400 ft toward (perpendicular) to the GT-11 orbit, the angle between the path of the stranger and the GT-11 orbit would have been about $1400/(48 \times 5280)$ 0.0055 radians or about 0.3 degrees.

Now, the calculation just presented shows that the angle between orbital planes of the object(s) and the GT-11 was very small. Exactly how small depends upon the assumptions used for calculating the distance to the object(s) and the time of observation.

But, one would think that if NORAD had been aware of a satellite on an orbit that would allow it to pass within a mile of the GT-11 NORAD would have alerted NASA.
(If it was a top secret satellite why take the chance that the astronauts might see it and report it... and even photograph it....?)

From: RB47Expert@aol.com
Subject: Re: LakenheathMessage-id: <97.f8ea26.25b8e11a@aol.com>

Hi Jenny,

You'll recall we corresponded about this issue of the Venom intercept in the Lakenheath 1956 case privately in April 1999 and again on this UFO Research List in Aug 1999. I investigated and analyzed the case with the Condon Committee physicist Gordon Thayer, Peter Sturrock, Philip Klass and Stanton Friedman back in 1979-80. I edited Thayer's article on the case for Ron Story's 1980 Encyclopedia of UFO's. And in 1998 I discovered a long overlooked height-finding effect in the Bentwaters radar data which supports the ground and air visual observers' reports of a high-speed East-West target streaking over the base and under the C-47 aircraft at 4,000 feet.

The case easily divides into an early Bentwaters phase from about 9:30 PM to midnight on Aug 13, 1956, and a later Lakenheath phase from about 12 midnight to 3:30 AM on Aug 14. The Venom intercept relates mainly to the Lakenheath phase on the 14th and doesn't really affect the Bentwaters phase on the 13th.

It is still unclear to me that your interviews of Venom crew involved in an intercept around 2-3 AM, who reportedly had NO visual UFO contact and NO "cat and mouse" tail chase, were the same ones involved in the Venom intercept at around 11:45 PM-12 Midnight who DID reportedly describe visual UFO contact (according to the USAF report of Aug 31, 1956) and the "cat and mouse" tail chase (according to the USAF Lakenheath controller Forrest Perkins and RAF Neatishead controller Freddie Wimbledon).

I was told, and I relayed this to you last year, that your BBC documentary segment makes reference to "Ivan Logan's log book which documents that Brady's flight took off first at 0200 on 14 August." And apparently it lasted 55 minutes.

And as I pointed out to you last year Perkins' 4-12 shift ended at midnight and Wimbledon's shift began at 11 PM, reported by both completely independent of each other, yet the only overlap is at the 11-12 time that both report for the Venom intercept, again independent of each other. This seems to doubly reinforce the approximately 12 midnight time for the Venom intercept.

I was not aware of your UFO UpDates exchanges last year. I've stayed away from UFO UpDates because of the excessive amount of vitriol.

I look forward to your upcoming report and hope it helps clear up the confusion. But I must point out the main confusion really concerns the later Lakenheath phase on the 14th and not as much on the Bentwaters phase on the 13th.

I have a few more COMMENTS (below).

Regards,

Brad Sparks

>

> I have found no evidence as yet that there were earlier scrambles

COMMENTS: Actually there was a T-33 scramble at 9:30 PM from the 512th FIS at Bentwaters. Again, as I pointed out above, the independent Perkins and Wimbledon accounts state the Venom intercept with the UFO tail chase occurred near 12 Midnight and their controller shifts only overlapped at about that time. Whereas your Venom crew members' logbooks point to 2-3 AM.

- making

> four airborne venoms all told. But this is not completely impossible given

> the extent of the difference between the Condon stories and the stories told

> me first hand by the venom crews.

COMMENTS: There is also contemporaneous USAF documentation on Aug 31, 1956, reporting fighter intercept near Lakenheath with visual UFO contact.

Whilst there are many similarities there

> are such differences that it is at times hard to perceive them as the same

> case. But then - as we know - UFOlogy often transforms a case across time

>

- > So far as I have been able to establish that the crews that I spoke with
- > appear to be the ones referenced by the Condon report. That report was based
- > on second hand testimony years later

COMMENTS: Forrest Perkins' testimony to the Condon Committee as to his own actions as Lakenheath RATCC controller is FIRST-HAND. His testimony about his 4-12 shift and the approximate 11:45 PM - 12 Midnight time of the Venom intercept he was PERSONALLY involved in is also FIRST-HAND. It still might be in error, it was reported in Feb 1968, or 11 years after the fact. But it's closer in time than your Venom pilots in 1996, which is almost 40 years later. So is Wimbledon's testimony in 1979.

and is already known to be wrong in

- > the other side of the non moving target.
- >
- > There is also some confusion over the use of BST and GMT which could resolve
- > any problems over the timing that right now are a confusion.

COMMENTS: Possible confusion over BST and GMT, which I was the first to suggest in this case back in 1980, can only account for a 1 hour error and still does not seem to account for a 2-3-hour error in the times reported for the Venom intercepts.

The reference

- > to 2 am for the start of the scramble is what the air crews log books say.
- > The two navigators have retained these.
- >
- > I have to say that Wimbledon believes there was a visual contact that
- > night

COMMENTS: The USAF report in 1956 also reports visual UFO contact by the interceptor.

- but he had never had direct communication with the crews. He was in

- > and also picked up clear radar targets (as all the crew told me they did).

COMMENTS: The "source that spoke to Condon [Committee]" was Forrest Perkins, the USAF air traffic controller, whose shift ended at 12 Midnight. That's why Perkins would have failed to mention a later and less interesting Venom intercept at around 2-3 AM, by then he'd gone home.

UFO radar contacts at Lakenheath continued till 3:30 AM. Unfortunately the poor USAF documentation gives no TIMES for most of the events in this Lakenheath phase on the 14th.

Subject: Re: GT-11 STRANGER DURATIONMessage-id:
<b9.4c54ac.25b8e378@aol.com>

Hi Bruce,

These are good points. Distance from any terrestrial satellite had to be less than a mile or two, given the measured angular size on film.

I wish I had my case files. I seem to recall the duration may have been about 5 minutes due to the object's disappearance in the earth's shadow (if I recall this correctly). First sighted at 1825 GMT, shadow boundary at 1830.

Too bad we don't have a camera exposure time as an upper limit to object motion might be measurable. Also if we had time between photos.

Brad

Astronaut time estimate 30 sec min to 2 min max, considering that they chatted about it before deciding to take pictures.

>Too bad we don't have a camera exposure time as an upper limit to object motion might be >measurable. Also if we had time between photos.

<

According to the records the Hasselblad was set for 1/250. Exposure adjustment was strictly limited to f stop change. Hence negligible smear due to motion of object (camera appeared steady based on antenna image.)

Measurement of the spacing between the object and the antenna image would give an estimate of the change in distance IF the antenna image were sharp. HOWEVER, unfortunately the antenna image is hugely overexposed and you can't really see the antenna (except a little bit at the bottom) because it is covered up by the overexposure "corona" which has a very "soft" or diffuse edge. Best estimate is that the separation is about 28 mm in both photos.

This could be interpreted as meaning that there was NO relative motion toward the GT-11 orbit between these two photos. However, estimated error bounds on the measurements wouldn't preclude an image shift as large as 0.4 mm. The angle between the antenna and the object(s) was about $\arctan(28/38) = 36.4$ degrees (since the focal length was 38 mm).

NOTE THE IN MY PREVIOUS MESSAGE I used 20 as an estimate of the angle between straight ahead and the direction to the object(s).

I wrote:

>Using an estimate of 20 degrees from straight ahead at the time of the >photos, and a radial distance of 4,000 ft (assuming man-made sized >satellite) the distance from the GT-11 orbital plane would have been >about $4000 \sin 20 =$ about 1,400 ft. >and the GT-11 orbit would have been about $1400/(48 \times 5280)$
> 0.0055 radians or about 0.3 degrees.

When I wrote this I was trying to recall over years the angle between the antenna and the objects. I didn't have the data immediately available. Now I do. The angle between the sighting line to the object(s) and to the antenna is about 36 degrees. However, this is not the angle between the object(s) and straight ahead because the antenna was to the right of straight ahead. Unfortunately I do not have a scale drawing of the GT spacecraft so I have to guess from a photo that perhaps the antenna was about 5 ft ahead of the windows and the windows were offset from the centerline by about 1 ft. (Note that the yaw angle was zero so the centerline of the spacecraft lay along the direction of motion. also the roll angle was 0 so the windows and antenna were on the "upper side" away from the earth. Also the pitch angle was very close to zero.) Thus from the window to the antenna was a line $\arctan(1/5) = 11$ degrees to the right of straight ahead. If this is correct, then the angle between the object(s) and the orbital plane (straight ahead) was actually $36 - 11 = 25$ degrees to the left of straight ahead at the time of the photos. (If anyone on this list has a design drawing of the GT 11 with its antenna, the actual angle can be determined.) The main point here is that my guess of 20 degrees was in the ballpark.

Conrad saw the object(s) out the left window. In a conversation writer Lloyd Mallan in 1969 Conrad recalled, "it came from our left and went across us and down below us. In other words, it came into view in the left window, flew out in front of us and then we lost it when it sort of dropped down in front of us." In a conversation with Dr. James Harder in 1976 he said that it crossed in front and possibly slightly below, but he did not recall seeing it out the right window. His suggested explanation for this was that they were heading into darkness and, because the object(s) was ahead of the GT-11 it would go into darkness first. Hence it could have disappeared simply because it was no longer reflecting sunlight.

(I have not tried to determine exactly how far ahead was the "terminator" where an object at the GT-11 altitude would pass into shadow.

This "new" information supports my previous contention that the object(s) was traveling very close to the orbit of the GT-11 and, if it were a satellite in orbit, its orbital plane was tilted from the GT-11 orbital plane by only a fraction of a degree. This raises the question of why NORAD wouldn't have tracked this other satellite at some time during one of the GT 11 orbits.

Note that a .1 degree difference in orbital planes, when projected to the maximum distance between satellites (assuming the same orbital altitude) is $0.00174 \text{ radians} \times (\text{earth radius} + \text{orbital altitude}) = 0.00174 \times (6378 + 225) = 11.4 \text{ km}$. Thus if the object(s) was in an orbit at an altitude within a couple of miles of the GT 11 and in the same sort of nearly circular orbit, then its period was about the same and it would have been no farther than a dozen km from the GT 11 as it passed over the United States about 22 minutes (1/4 of the 90 minute orbit time) earlier (satellite and object(s) traveling roughly eastward).

@> @caused by a 2nd/3rd trip echo and a meteor.

@> @I was refering to the part where an object streaked westbound
@> @ (only on RADAR) and was seen for only two blips east of the
@> @Bentwaters station and two blips west, covering a total of 66
@> @miles. This might have been the result of two separate meteors
@> @and 2nd/3rd trip echoes.

@> @COMMENTS: I'm not familiar with any instance of only 4 blips on
@> @a radar UFO fast-track that night at Bentwaters. There was one
@> @fast-track with 9 blips in 16 seconds.

@> It is referred to in Sagan and Page's "UFOs, A Scientific
@> Debate." The object is referred to have appeared for only the
@> time of three sweeps.

@MORE COMMENTS: What's the context, who wrote it (Menzel?), what
@page? This is just plain erroneous info, wherever it came from.
@I've read all of the military reports and later witness reports.
@No one reported a fast-track of just 3 blips (that's not the 4
@you previously cited). You can't tell with 3 blips that they
@aren't just three coincidental AP targets (anomalous
@propagation, false returns from ground clutter or whatever).
@Four blips in a row on one line equally spaced would probably be
@too much to be a coincidence for AP.

Fencepost error: It takes 4 posts to hold up a fence 3 rails
long.

Did 4 blips occur with three sweeps in between, or did three
blips occur with two sweeps in between? The report said "three
sweeps" and figured the time on that basis. There has to be one
more blip than the number of intervening sweeps used to figure
the time. (Either that, or Klass made a mistake).

McDonald refers to it in Sagan and Page, but the 3 sweep value
actually comes from Klass' "UFOs Identified."

STILL MORE COMMENTS: Apparently there is an error as to the radar sweep
rate. I recall the original USAF reports from Aug 1956 give 2 seconds as the
sweep rotation period. Klass apparently assumed a 4-second period for the

16-second total fast-track, supposedly making 4 sweeps (actually it's 5 and also 5 blips). The technical data for the MPN-11 should settle this (I doubt airport search radars would have sweep periods as slow as 4 seconds).

@> @The object that flew under the plane is the only part of the
@> @sighting that I consider really unexplained. Jenny Randles blows
@> @the lid off of the rest of the case in her book "UFOs: Danger In
@> @the Air." (Hey Jenny, I finally got a copy!)
@>
@> @COMMENTS: I don't have the book but from what I know her Venom crew
@> @interviews have logs showing their intercepts occurred around 2-3 AM
whereas
@> @the intercept reported to the Condon Committee by USAF controller Forrest
@> @Perkins and later confirmed by RAF controller F. H. C. Wimbledon occurred
@> @around 12 midnight, hence were two different unrelated interception
episodes.
@>
@> Either that, or somebody goofed on reporting the time.

@MORE COMMENTS: Don't think so, Randles has log book entries
@showing the Venoms took off at something like 2:40 and 3 AM (if
@I recall the exact times correctly, I might not; it was
@certainly around 2-3 AM). Wimbledon and Perkins worked
@different shifts at different bases as air controllers with only
@12 midnight overlapping between them and they (independently)
@reported 12 midnight as the approximate time of the Venom
@intercept with the startling UFO maneuvers.

The mystery deepens:

Were there really 4 Venom chases? Maybe Jenny can clarify this.

STILL MORE COMMENTS: See my posting to Jenny on the List earlier.

This case has more twists and turns in it than a mountain road. I
now possess 5 different accounts of it, with very few matching
parts between the accounts.

STILL MORE COMMENTS: The confusion mainly concerns the Lakenheath phase
of
the case on the 14th of August 1956, when the USAF reports give virtually no
chronological data or witness names/reports. There is much less confusion
about the Bentwaters phase on the 13th, for which we have timed and named
witness reports (still some confusion but much less than for the later
events).

@MORE COMMENTS: Larry you know perfectly well I gave you the
@1825 GMT/UT/Z time and Sept 13 date again and again and again,

@so why don't you look it up in our E-mail or List messages first
@before wasting time? It's as if you hope I will give up so you
@will get in the last word with your point left standing and
@unrefuted by anyone.

@I hope we don't have to argue over the fact that 1825 GMT would
@still be the same day in Houston time (1:25 PM CDT) Sept 13,
@1966, NOT Sept 12.

Definitely no argument over that! And now that I have the time
again, I can see that part of the 14th (not the 12th) was on the
Earth at that time.

I can't read your old messages (I can read everyone else's). The
trouble is that your line-length is wa-a-ay too long for our
emailer (each paragraph gets stored as a single line somehow),
and once I have read the message, it is stored by our email
software in a way that I can't read it again without editing the
entire message. We have a 78 character line length limit.

I have to log off of the emailer (losing any editing I have
already done) and log in to the web searcher (they're on two
separate mainframes, by decree of the administration here) to
look up the postings on the page. Then the line length problem
shows up as an extremely wide page, which I have to constantly
shuttle back and forth to read. Changing the settings on my
browser doesn't help.

Caveat Emailor

@MORE COMMENTS: We've been over this already in previous
@postings. Conspiracy theorists typically cannot explain why
@their scenarios even make sense from the "selfish" perspective
@of the supposedly sinister agencies they have depicted (e.g.,
@they can never explain why the CIA would be so angry as to
@assassinate JFK, over what??? and risking their whole Agency
@getting abolished if caught, again for what???? at least the
@Soviets and Cubans had some powerful ideological motive, the
@Mafia had vindictive motives, etc., and even then there were
@countervailing motives).

@NORAD had (and still has) a perfectly feasible procedure to use
@instead of your coverup scenario endangering astronaut lives,
@and it's the standard procedure they do use which is to describe
@satellite/space object encounters with manned NASA missions
@under very banal uninformative NORAD space object catalog
@numbers.

OK. Do you have documentation that this is actually what NORAD
did? If so, I will accept it.

STILL MORE COMMENTS: As I've said before, it's in the Condon Report, and it's in books on the history of reconnaissance satellites.

My whole scenario was not a theory to explain the whole sighting, but a possibility that was first suggested to me by another person. But I do think that it is likely the military had motives other than just the preservation of the astronauts.

And my scenario never said they endangered the lives of the astronauts. You assumed that. My theory assumes:

1. That the correct figures were given to NASA, but NOT the public.
2. Either NASA or NORAD substituted only the NAME of the Proton 3 in the public release.

STILL MORE COMMENTS: This is inconsistent. If the "only" substitution or change of info on the public release was the "NAME" of the satellite, then the other info would be correct, including the figures. But in No. 1 you say the public was given false figures, too, meaning the entire encounter with the Gemini 11 was falsified. In that case why choose the Proton 3 satellite to take the place of the supposed hypothetical spy sat and draw so much unwanted media attention to a sneak look at a secret Soviet satellite? Why not falsify ALL the info with a boring uninteresting piece of space debris, instead of the mysterious Proton 3, and let the reporters yawn and move on to other things?

Anything else was a misunderstanding between what I intended to say and what you thought I said.

We seem to read different meanings into the same sentence. I constantly find you misunderstanding what I wrote, and it seems that sometimes I misunderstand you. This means that I am going to have to be extra careful to make sure that my meanings are clear. These might be regional differences in the English language (I tend to use our local usages).

STILL MORE COMMENTS: Or these might be violations of definitions in English dictionaries.

For instance, we use "hide" to refer to concealing the identity of something as well as to refer to physically concealing the object itself. It is common usage here. You tried to say that I "changed my story," when all I did was substitute one equivalent

word (on our usage here) for another to clarify what I meant in the first place.

It would also be informative to describe the way I look at UFO cases:

First I brainstorm, trying to think of ALL possibilities, no matter how remote. The list I gave on Cash-Landrum was one of these. I threw them out there to bounce them off of the rest of the list members. They weren't intended as attempts to debunk at any cost, but to spark some thoughts.

Then I weed through the possibilities so generated. For example, if a UFO shows some of the characteristics of a fire balloon, AND shows no characteristic contrary to the properties of a fire balloon, then I give serious thought to fire balloons as a possible explanation.

I give very little credence to estimates by witnesses of actual size, distance, speed, or altitude, unless more definite evidence (Example: It went in front of the water tower, but behind that barn up the road.) backs up such claims. This is NOT an impeachment of the character of witnesses. Rather, it is a reality of the limitations of the human perception system.

I also look for:

Witnesses who should have seen the object, but didn't. Such data can be quite enlightening.

Possibilities where multiple causes overlap in the visual fields of the witnesses to produce strange effects.

I assign a probable explanation to a UFO case where one, and only one, explanation fits the case well.

I assign a possible explanation to a UFO case when one explanation fits, but not very well, or if more than one explanation fits the case.

@> @Apollo 12, 11/14/69: The tumbling, flashing object was a piece of
@> @the booster, probably ejected when the service module separated
@> @from the S4-B. The astronauts made a joke with ground control
@> @about it being a UFO.

This was from Story.

@> @The doors from the S4-B were seen from the ground by an amateur
@> @astronomer with a telescope. _One UFO publication_ confused this
@> @case with the booster piece sighting above, attributing BOTH to
@> @the doors.

@MORE COMMENTS: As best as I can recall the S-IVB separation was
@roughly a day prior to the first sighting of the flashing light
@by Apollo 12 astronauts. The S-IVB itself was injected into a
@trajectory designed to get it out of the way of the Apollo 12
@spacecraft, again for SAFETY reasons.

Right, but not until after LEM extraction.

STILL MORE COMMENTS: Correction: I think it may have been the Apollo that
carried out the evasion maneuver to increase the separation from the S-IVB.
I don't have my old files to double-check.

@Again, a low relative velocity for space debris cannot change in
@deep space -- there's no air resistance to speak of, no
@propulsion system to maneuver with. VERY ROUGHLY speaking, an
@object separated at S-IVB separation would have had roughly a
@day to get to where it was seen by the Apollo astronauts then
@another day of being observed with no significant diminution (or
@increase) in brightness or distance being reported. Yet the
@distance for separation debris should have about doubled --
@linear increase of distance with time as time doubled -- so the
@brightness had to have diminished by 4x (inverse square law) but
@no such dimming was reported. If it was not debris released at
@stage separation but released later, the situation is MUCH
@WORSE. For example, if the object had been released, say, 1
@hour before the astronauts saw it, then after 24 more hours the
@distance would have increased linearly by 24x, resulting in a
@factor 576x dimming of brightness, which was obviously not the
@case. This argument is very soft and not conclusive but it is
@interesting.

What if something fell off the S4-B (or the spacecraft) just as
it stopped firing for Translunar Injection, or just at the start
of the trim burn? That gives much more time.

STILL MORE COMMENTS: Impossible to get much more time, since the S-IVB
evasive maneuver was done several hours after launch -- to get much more time
than the one day or so till the flashing light appeared the debris would have
had to "fall off" almost BEFORE LAUNCH!

The S4-B stays with the spacecraft until after LEM extraction. One possibility is a piece of ice shed from the fuselage of the S4-B. The trim would have given the ice and the spacecraft slightly different velocities. The ice would not have been visible until it, the sun, and the spacecraft were lined up just right for it to reflect the sun onto the spacecraft once per rotation.

(Obviously, an object does not "fall" off a spacecraft, but it can become detached.)

@And the flashing light is still low or zero Strangeness, it's
@unidentifiability is due to location (wrong place, wrong time),
@NOT due to wild accelerations, there was NO firing of death rays
@at the Apollo, NO "missing time," NO EM Effects on the Apollo
@capsule, NO physical traces, etc. etc.

I Agree 100 percent with that!!!

Subject: Re: GT-11 STRANGER DURATION
Message-id: <d8.ed6c35.25b96dae@aol.com>

Bruce,

Thanks for the helpful measurements, info and calculations. I did calculate the terminator entry time as approximately 1830 GMT. Thanks for the interview data from astronaut Conrad which confirms my recollection that there was an observation suggesting the object disappeared into the shadow. If so, the total sighting duration was about 5 minutes. The object was sighted shortly after passing out of comm range of Ascension island at 1824 GMT, and the time is given as 27h43m post-launch or 1825 GMT in Richard Underwood's photo data recorded by the astronauts.

If we had a reliable time estimate between photos or at least a minimum time we could set a better upper bound for angular velocity. As it is your figures indicate no apparent angular motion between photos to within say +/- 1 deg roughly, and if 20 seconds was the interval between photos then maximum angular velocity was 0.05 deg/sec. If a mile away the orbital inclination could not be more than about 0.1 deg different from the Gemini 11's 28.83-deg inclination.

Of course we can't entirely eliminate the possibility it was a small piece of debris from the Gemini 11 itself. Given the measured photographic angular size of roughly 1/100 radian, a 1 inch piece of debris or ice would have been 10 feet away, or a 6-inch object would have been 50-60 feet away.

Brad

at 1830.

Astronaut time estimate 30 sec min to 2 min max, considering that they chatted about it before deciding to take pictures.

>Too bad we don't have a camera exposure time as an upper limit to object motion might be >measurable. Also if we had time between photos.

<

According to the records the Hasselblad was set for 1/250. Exposure adjustment was strictly

limited to f stop change. Hence negligible smear due to motion of object (camera appeared steady based on antenna image.)

Measurement of the spacing between the object and the antenna image would give an estimate of the change in distance IF the antenna image were sharp.

HOWEVER, unfortunately the antenna image is hugely overexposed and you can't really see the antenna (except a little bit at the bottom) because it is covered up by the overexposure "corona" which has a very "soft" or diffuse edge. Best estimate is that the separation is about 28 mm in both photos.

This could be interpreted as meaning that there was NO relative motion toward the GT-11 orbit between these two photos. However, estimated error bounds on the measurements wouldn't preclude an image shift as large as 0.4 mm. The angle between the antenna and the object(s) was about $\arctan(28/38) = 36.4$ degrees (since the focal length was 38 mm).

NOTE THE IN MY PREVIOUS MESSAGE I used 20 as an estimate of the angle

between straight ahead and the direction to the object(s).

I wrote:

>Using an estimate of 20 degrees from straight ahead at the time of the
>photos, and a radial distance of 4,000 ft (assuming man-made sized
>satellite) the distance from the GT-11 orbital plane would have been
>about $4000 \sin 20 =$ about 1,400 ft. Assume it took ten seconds to
>reach the orbital plane, then its (perpendicular component of)
>crossing speed was about 140 ft/sec . Considering that at
>4.83 miles per second (290 mi/min orbital speed) the GT-11
>would have travelled about 48 miles along it's orbit and the
>object(s) would have traveled 1400 ft toward (perpendicular)
t>o the GT-11 orbit, the angle between the path of the stranger
>and the GT-11 orbit would have been about $1400/(48 \times 5280)$
> 0.0055 radians or about 0.3 degrees.

When I wrote this I was trying to recall over years the angle between the antenna and the objects. I didn't have the data immediately available. Now I do. The angle between the sighting line to the object(s) and to the antenna is about 36 degrees. However, this is not the angle between the object(s) and straight ahead because the antenna was to the right of straight ahead.

Unfortunately I do not have a scale drawing of the GT spacecraft so I have to guess from a photo that perhaps the antenna was about 5 ft ahead of the windows and

the windows were offset

from the centerline by about 1 ft. (Note that the yaw angle was zero so

the centerline of the

spacecraft lay along the direction of motion. also the roll angle was 0

so the windows and

antenna were on the "upper side" away from the earth. Also the pitch

angle was very close to zero.) Thus from the window to the antenna was

a line $\arctan(1/5) = 11$ degrees to the right of straight ahead. If this

is correct, then the angle between the object(s) and the orbital plane

(straight ahead) was actually $36 - 11 = 25$ degrees to the left of straight

ahead at the time of the photos. (If anyone on this list has a design

drawing of the GT 11 with its antenna, the actual angle can be determined.)

The main point here is that my guess of 20 degrees was in the ballpark.

Conrad saw the object(s) out the left window. In a conversation writer

Lloyd Mallan in 1969 Conrad recalled, "it came from ou left and went

across us and down below us. IN other words, it came into view in the left

window, flew out in front of us an then we lost it when it sort of dropped

down in front of us." In a conversation with Dr. James Harder in 1976 he

said that it crossed in front and possibly slightly below, but he did not

recall seeing it out the right window. His suggested explanation for this

was that they were heading into darkness and, because th object(s) was

ahead of the GT-11 it would go into darkness first. Hence it could have

disappeared simply because it was no longer reflecting sunlight.

(I have not tried to determine exactly how far ahead was the "terminator"

where an object at the GT-11 altitude would pass into shadow.

This "new" information supports my previous contention that the object(s) was traveling very close to the orbit of th GT-11 and, if it were a satellite in orbit, it's orbital plane was tilted from the GT-11 orbital plane by only a fraction of a degree. This raises the question of why NORAD woldn' have tracked this other satellite at some time during one of the GT 11 orbits.

Note that a .1 degree difference in orbital planes, when projected to the maximum distance between satellites (assuming the same orbital altitude) is $0.00174 \text{ radians} \times (\text{earth radius} + \text{orbital altitude}) = 0.00174 \times (6378 + 225) = 11.4 \text{ km}$. Thus if the object(s) was in an orbit at an altitude within a couple of miles of the GT 11 and in the same sort of nearly circular orbit, then it's period was about the same and it would have been no farther than a dozen km from the GT 11 as it passed over the United States about 22 minutes (1/4 of the 90 minute orbit time) earlier (satellite and object(s) traveling roughly eastward).

@Subject: Re: Lakenheath

Maybe I can help clear this up. I suggested that there might have been 4 Venoms. After looking at the data I have, I now realize that I am in error. Looking at the chronology of the events shows what happened (sort of - I still can't resolve the differences between the flight crew accounts and the other accounts on the order of the flights).

According to the Condon Report (C), Klass (K), and McDonald (M), I was able to piece together the following chronology (only Lakenheath):

GMT BST Event

2255 2355 First Lakenheath visual sighting.

0010 0110 First Lakenheath Radar sighting. The call for the Venom scramble was made at this time.

0040 0140 The Venom first appeared on Lakenheath RADAR. (C)

0100 0200 The Venom was vectored into the first target. The pilot (the one who has not been found) saw a white light. Both light and target were lost. (K,M)

? ? The Venom was vectored into the second target. This was the supposed "cat and mouse" sequence.

0200* 0300* The first Venom chase ended and the second Venom took off. It returned to base without finding anything. The reported times in the logs fits this second flight.

* Approx time.

Actually, if Perkins, in the excitement, stayed on after his shift ended (wouldn't you?), and if the navigator of the first Venom got the time wrong (when he got around to filling out the log), then everything fits.

@
@Hi Jenny,

@You'll recall we corresponded about this issue of the Venom
@intercept in the Lakenheath 1956 case privately in April 1999
@and again on this UFO Research List in Aug 1999. I investigated
@and analyzed the case with the Condon Committee physicist Gordon
@Thayer, Peter Sturrock, Philip Klass and Stanton Friedman back
@in 1979-80. I edited Thayer's article on the case for Ron
@Story's 1980 Encyclopedia of UFO's. And in 1998 I discovered a
@long overlooked height-finding effect in the Bentwaters radar
@data which supports the ground and air visual observers' reports
@of a high-speed East-West target streaking over the base and
@under the C-47 aircraft at 4,000 feet.

@The case easily divides into an early Bentwaters phase from
@about 9:30 PM to midnight on Aug 13, 1956, and a later
@Lakenheath phase from about 12 midnight to 3:30 AM on Aug 14.
@The Venom intercept relates mainly to the Lakenheath phase on
@the 14th and doesn't really affect the Bentwaters phase on the
@13th.

@It is still unclear to me that your interviews of Venom crew
@involved in an intercept around 2-3 AM, who reportedly had NO
@visual UFO contact and NO "cat and mouse" tail chase, were the
@same ones involved in the Venom intercept at around 11:45 PM-12
@Midnight who DID reportedly describe visual UFO contact
@(according to the USAF report of Aug 31, 1956) and the "cat and
@mouse" tail chase (according to the USAF Lakenheath controller
@Forrest Perkins and RAF Neatishead controller Freddie
@Wimbledon).

@I was told, and I relayed this to you last year, that your BBC
@documentary segment makes reference to "Ivan Logan's log book
@which documents that Brady's flight took off first at 0200 on 14
@August." And apparently it lasted 55 minutes.

@And as I pointed out to you last year Perkins' 4-12 shift ended
@at midnight and Wimbledon's shift began at 11 PM, reported by
@both completely independent of each other, yet the only overlap
@is at the 11-12 time that both report for the Venom intercept,

@again independent of each other. This seems to doubly reinforce
@the approximately 12 midnight time for the Venom intercept.

The question might revolve around whether, in the heat of the chase, Perkins stayed beyond the end of his shift until the crisis was over.

Question: Do air controllers change shifts in the middle of a rapidly developing crisis, or does the controller who already has the picture continue until the crisis is over (or until it stabilizes enough for the other controller to have the complete picture)?

Or, since they started up another display, could Perkins and the other controller each have worked one display? This might be a subject to inquire about with the controller who came on shift at the time (if he is still alive and can be found).

@> Hi,

@> I have for some months been working on an attempt to sort out the confusing
@> situation regarding the British testimony on this case - especially the
@> sightings / non sightings by venom crews during the August 1956 events.

@> UFOIN is preparing a detailed report based on this work which has involved
@> three of the four crew and Freddie Wimbledon in an effort to resolve this.

@> I have found no evidence as yet that there were earlier scrambles

@COMMENTS: Actually there was a T-33 scramble at 9:30 PM from
@the 512th FIS at Bentwaters. Again, as I pointed out above, the
@independent Perkins and Wimbledon accounts state the Venom
@intercept with the UFO tail chase occurred near 12 Midnight and
@their controller shifts only overlapped at about that time.
@Whereas your Venom crew members' logbooks point to 2-3 AM.

According to Klass and McDonald, the T-33s were already flying at the time on another mission, and were diverted to search for the UFOs. They were not scrambled (The military term "scramble" refers to starting up planes and getting them off the ground as quickly as possible). I also doubt that they would scramble a T-33, which is only a pilot training jet.

@- making

@> four airborne venoms all told. But this is not completely impossible given
@> the extent of the difference between the Condon stories and the stories told

@> me first hand by the venom crews.

@COMMENTS: There is also contemporaneous USAF documentation on
@Aug 31, 1956, reporting fighter intercept near Lakenheath with
@visual UFO contact.

(snip)

@> So far as I have been able to establish that the crews that I spoke with
@> appear to be the ones referenced by the Condon report. That report was based
@> on second hand testimony years later

@COMMENTS: Forrest Perkins' testimony to the Condon Committee as
@to his own actions as Lakenheath RATCC controller is FIRST-HAND.
@His testimony about his 4-12 shift and the approximate 11:45 PM
@- 12 Midnight time of the Venom intercept he was PERSONALLY
@involved in is also FIRST-HAND. It still might be in error, it
@was reported in Feb 1968, or 11 years after the fact. But it's
@closer in time than your Venom pilots in 1996, which is almost
@40 years later. So is Wimbledon's testimony in 1979.

@and is already known to be wrong in
@> several respects so it is not hard to imagine that further confusion arose
@> with regards to the aircrew. These guys had never spoken publicly till I met
@> them in 1996.

(snip)

@> What I can say is that the crews I talked with definitely had no visual
@> sighting - despite stupid attempts on Updates to try to infer otherwise. The
@> 'cat and mouse' story - if indeed it does refer to these two venom crews -
@> seems to have come about because they flew towards a stationary radar target
@> and then right past it. One moment it was ahead of them, the next behind,
@> but this did not happen because the UFO moved to their rear at great speed
@> but because the aircraft was traveling so fast it was almost instantly on
@> the other side of the non moving target.

@> There is also some confusion over the use of BST and GMT which could resolve
@> any problems over the timing that right now are a confusion.

@COMMENTS: Possible confusion over BST and GMT, which I was the
@first to suggest in this case back in 1980, can only account for
@a 1 hour error and still does not seem to account for a 2-3-hour
@error in the times reported for the Venom intercepts.

See timetable above. Also, it has been my experience whenever two
times are in use that time zone conversion errors happen in both

directions.

I live near the junction of three different time zones. One time zone is on Central time, and advances to Daylight time in the summer. Another time zone is on Eastern time and also advances to Daylight time in the summer. The time zone I live in stays on Eastern time without advancing in the summer. Conversion errors occur quite frequently (some people never get it right).

These mistakes occur:

1. A slow-time value is mistakenly reported as being in fast-time.
2. A fast-time value is mistakenly reported as being in slow-time.
3. An hour is mistakenly subtracted (instead of being added) to convert slow-time to fast-time.
4. An hour is mistakenly added (instead of being subtracted) to convert fast-time to slow-time.
5. A slow-time value is mistakenly converted from fast-time to slow-time.
6. A fast-time value is mistakenly converted from slow-time to fast-time.
7. A time is reported, without any information as to whether it is slow-time or fast-time.
8. During the time change, a clock is changed in the wrong direction.*
9. Forgetting to make the change.*
10. Forgetting which two zones are synchronized at which time of year.*
11. Dealing with equipment that assumes that all time zones make the change to and from Daylight time.*

* Not a possible factor in the Lakenheath case.

(These errors are excellent reasons to get rid of the time change twice a year everywhere. Now that we have television, it makes very little difference in energy consumption.)

It seems fitting that the time changes here occur in the weeks

containing April Fools Day and Halloween.

So if the time reported is 1:00, it could really be 12:00 or 2:00. And if two people mishandled the information, it might even be 11:00 or 3:00.

@The reference

@> to 2 am for the start of the scramble is what the air crews log books say.

@> The two navigators have retained these.

@> I have to say that Wimbledon believes there was a visual contact that

@> night

@COMMENTS: The USAF report in 1956 also reports visual UFO

@contact by the interceptor.

@- but he had never had direct communication with the crews. He was in

@> an RAF bunker controlling the operation. The venoms were vectored onto

@> target by USAF ATC. The air crew I have met are adamant there was no visual

@> contact.

@> As such - unless there were two earlier venoms whose stories form the basis

@> for those in the Condon report - there is a huge discrepancy between the

@> USAF version in Condon and that told by the actual witnesses.

@> No references exist so far to four venoms being launched and the crews I met

@> definitely spoke to the USAF on the night extensively. As such it is hard to

@> imagine why the source that spoke to Condon would have failed to mention

@> that two other venoms were also vectored onto the UFO after the first ones

@> and also picked up clear radar targets (as all the crew told me they did).

@COMMENTS: The "source that spoke to Condon [Committee]" was

@Forrest Perkins, the USAF air traffic controller, whose shift

@ended at 12 Midnight. That's why Perkins would have failed to

@mention a later and less interesting Venom intercept at around

@2-3 AM, by then he'd gone home.

@UFO radar contacts at Lakenheath continued till 3:30 AM.

@Unfortunately the poor USAF documentation gives no TIMES for

@most of the events in this Lakenheath phase on the 14th.

@> This omission of reference suggests again we are talking about the same two

@> venoms and a USAF misinterpretation of what they said. But it may not be.

@> There may still be two other venom crews 'out there'.

@> As you can see this is a complex issue and is one reason I want to get this

@> full report together before entering into a debate on the matter. Especially
@> after the fiasco on Updates last year. So I want to leave it at that for
@> now.

@> Once the UFOIN report is complete I'll let you know and we can discuss it
@> happily as long as you like then.

@> Best wishes,

@> Jenny Randles

Other questions to ask (remote possibilities, but must be looked for):

- Had someone not come on duty on time?
- Were records fudged to cover up shift swapping or late arrivals?
- Was a log filled in much later than when it was supposed to have been done?

@

@@> It is referred to in Sagan and Page's "UFOs, A Scientific

@@> Debate." The object is referred to have appeared for only the

@@> time of three sweeps.

@

@@@MORE COMMENTS: What's the context, who wrote it (Menzel?), what

@@@page? This is just plain erroneous info, wherever it came from.

@@@I've read all of the military reports and later witness reports.

@@@No one reported a fast-track of just 3 blips (that's not the 4

@@@you previously cited). You can't tell with 3 blips that they

@@@aren't just three coincidental AP targets (anomalous

@@@propagation, false returns from ground clutter or whatever).

@@@Four blips in a row on one line equally spaced would probably be

@@@too much to be a coincidence for AP.

@

@

@Fencepost error: It takes 4 posts to hold up a fence 3 rails

@long.

@

@Did 4 blips occur with three sweeps in between, or did three

@blips occur with two sweeps in between? The report said "three @sweeps" and figured the time on that basis. There has to be one @more blip than the number of intervening sweeps used to figure @the time. (Either that, or Klass made a mistake).

@

@McDonald refers to it in Sagan and Page, but the 3 sweep value @actually comes from Klass' "UFOs Identified."

@STILL MORE COMMENTS: Apparently there is an error as to the @radar sweep rate. I recall the original USAF reports from Aug @1956 give 2 seconds as the sweep rotation period. Klass @apparently assumed a 4-second period for the 16-second total @fast-track, supposedly making 4 sweeps (actually it's 5 and also @5 blips). The technical data for the MPN-11 should settle this @ (I doubt airport search radars would have sweep periods as slow @as 4 seconds).

The number of sweep-times used to calculate the time MUST be one less than the total number of blips. That is a mathematical fact that can not be refuted. It would look like this timewise:

* s-w-e-e-p * s-w-e-e-p * s-w-e-e-p * s-w-e-e-p *

* = blip

If the numbers were the same, which end does the other sweep belong in, and why should it be added in?

Parts of a sweep time must be added or subtracted because the end blip is not in the same place as the beginning blip's location.

If the object crossed the entire scope from one edge to the other (beginning and ending blips 180 degrees apart), it would look like:

* s-w-e-e-p * halfsweep * s-w-e-e-p * s-w-e-e-p *

or

* s-w-e-e-p * s-w-e-e-p * halfsweep * s-w-e-e-p *

or

* s-w-e-e-p * 1.5 sweep * s-w-e-e-p * s-w-e-e-p *

or

* s-w-e-e-p * s-w-e-e-p * 1.5 sweep * s-w-e-e-p *

or

* s-w-e-e-p * .75 sweep * .75 sweep * s-w-e-e-p *

Giving 3.5 sweep times for 5 blips (or 4.5 sweep times for 5 blips, if the object flies into the dead cone over the RADAR set for one sweep).

Our air traffic RADAR at Indianapolis International uses a 15-second sweep time. Ground control uses a 2-second sweep on a short range set. A display is provided in the lobby so travelers can watch the RADAR while waiting for their flight.

(snip)

@STILL MORE COMMENTS: The confusion mainly concerns the Lakenheath phase of

@the case on the 14th of August 1956, when the USAF reports give virtually no @chronological data or witness names/reports. There is much less confusion @about the Bentwaters phase on the 13th, for which we have timed and named @witness reports (still some confusion but much less than for the later @events).

@OK. Do you have documentation that this is actually what NORAD @did? If so, I will accept it.

@STILL MORE COMMENTS: As I've said before, it's in the Condon Report, and @it's in books on the history of reconnaissance satellites.

@My whole scenario was not a theory to explain the whole sighting, @but a possibility that was first suggested to me by another @person. But I do think that it is likely the military had motives @other than just the preservation of the astronauts.

@And my scenario never said they endangered the lives of the @astronauts. You assumed that. My theory assumes:

@1. That the correct figures were given to NASA, but NOT the @public.

@2. Either NASA or NORAD substituted only the NAME of the @Proton 3 in the public release.

@STILL MORE COMMENTS: This is inconsistent. If the "only" substitution or

@change of info on the public release was the "NAME" of the satellite, then
@the other info would be correct, including the figures. But in No. 1 you say
@the public was given false figures, too, meaning the entire encounter with
@the Gemini 11 was falsified.

That's not what I said. I said that figures were NOT GIVEN
to the public. I will try once more:

1. Correct figures were given to NASA by NORAD.
2. The substituted NAME was released to the press (and public).
3. NOTHING ELSE changed hands at the time.

@In that case why choose the Proton 3 satellite to take the place
@of the supposed hypothetical spy sat and draw so much unwanted
@media attention to a sneak look at a secret Soviet satellite?
@Why not falsify ALL the info with a boring uninteresting piece
@of space debris, instead of the mysterious Proton 3, and let the
@reporters yawn and move on to other things?

Maybe they chose it because it was "close enough," and because it
was about to meet its fiery end. The reporters seemed satisfied
with just the name. Reporters are like that sometimes; they want
names for things, not just ID numbers. Apparently nobody
bothered to look up the data until much later.

Remember that journalists are typically not mathematicians. They
would have needed a physicist or an astronomer to interpret the
numbers if they did have them. There were no pocket calculators,
desktops, laptops, satellite finding software packages, or
websites then. Computer time was very expensive. (Try explaining
THOSE expense-account items to your editor.) I had just bought my
first slide-rule that year.

@Anything else was a misunderstanding between what I intended to
@say and what you thought I said.

@We seem to read different meanings into the same sentence. I
@constantly find you misunderstanding what I wrote, and it seems
@that sometimes I misunderstand you. This means that I am going to
@have to be extra careful to make sure that my meanings are clear.
@These might be regional differences in the English language (I
@tend to use our local usages).

@STILL MORE COMMENTS: Or these might be violations of @definitions in English dictionaries.

Language is not a static unchanging thing. It changes over time and over distance. That's why dictionaries are constantly being updated, and why a British dictionary is not very useful in the US without notes concerning regional usages.

The following is just a small list of words that have received changed or added meanings within the past 150 years:

record, gay, welfare, gate, calculator, squeeze, milk, truck, card, hash, joint, bogey, merge, curb, free, hide, hello, stall, elevator, computer, tank, pillbox, tape, list, live, broadcast, catcher, call, calorie, cover, park, interchange, strike, plane, flap, home, basket, mouse, tube, star, film, mixer, gig, meter, sex, speaker, pickup, semi, resort, drive, key, crayon, sub, volume, shift, sale, dossier, code, cloverleaf, pork, loophole, burger, shake, ticket, squib, graphic, screen, cat, hip, antenna remote, signal, shot, mask

(snip)

@For instance, we use "hide" to refer to concealing the identity @of something as well as to refer to physically concealing the @object or event itself. It is common usage here. You tried to @say that I "changed my story," when all I did was substitute one @equivalent word (in our usage here) for another to clarify what @I meant in the first place.

This change in usage (hide) came about here as a result of the Watergate scandal. Newsmen use it almost exclusively now.

I saw this on a sign. It was fastened to a 6 foot high chain-link fence. Tell me what it means:

GO OUTSIDE FENCE TO GET SHOT

This was on a traffic sign in Georgia:

BUMP HANDICAPPED PEDESTRIANS 5 MPH

Here's another sign that appeared in my building:

TRASH CAN REFUSE TO BE HAULED AWAY

(snip)

@STILL MORE COMMENTS: Correction: I think it may have been the Apollo that
@carried out the evasion maneuver to increase the separation from the S-IVB.
@I don't have my old files to double-check.

@What if something fell off the S4-B (or the spacecraft) just as
@it stopped firing for Translunar Injection, or just at the start
@of the trim burn? That gives much more time.

@

@STILL MORE COMMENTS: Impossible to get much more time, since the S-IVB
@evasive maneuver was done several hours after launch -- to get much more time
@than the one day or so till the flashing light appeared the debris would have
@had to "fall off" almost BEFORE LAUNCH!

When did the LEM extraction occur on that flight?

When did the evasive maneuver take place?

Did the evasive maneuver involve firing engines on the
spacecraft, on the S4-B, or both? (I know they fired the S4-B
engine to crash it on the moon, but this appears to be separate
from that.)

Could that maneuver have resulted in nearly identical
trajectories, but different locations along them, for the debris
and the spacecraft? Think about it:

* If they deflected their course sideways, it would change
their orbit, and they wouldn't end up at the moon.

* If they sped up and stayed faster, or if they slowed down and
remained slower, it would change their orbit, and they wouldn't
end up at the moon.

* The most likely scenario is that they slowed down for a while,
then sped up again to resume their original trajectory. This
would put the debris at a constant distance ahead of them in
the translunar orbit, since it DIDN'T slow down and then speed
up.

- >
- >
- > The number of sweep-times used to calculate the time MUST be one
- > less than the total number of blips. That is a mathematical fact
- > that can not be refuted.

FURTHER COMMENTS: We're not talking about sweep TIMES but SWEEPS. Each blip is created by a sweep of the radar and it does NOT take all the time for the radar antenna to rotate around one full turn to do so, but just a fraction of a second. If there are 5 blips, there are 5 sweeps, and 4 sweep-times or antenna rotations in between.

It would look like this timewise:

FURTHER COMMENTS: The MPN-11A at Bentwaters was a GCA (ground
 controlled approach) radar not a regional traffic control radar such as yours at
 Indianapolis apparently. A 15-second or even 4-second gap in controlling the
 approach of an incoming aircraft might not be too comfortable.

 > Maybe they chose it because it was "close enough,"

FURTHER COMMENTS: The Proton 3 was 5,000+ km away, NOT "close" at all. There was surely some boring object much closer to the Gemini 11 that could have been chosen for a deception on the public instead of substituting an attention-attracting secret Soviet Proton 3 satellite for a supposed secret US spy sat. Or even more simply the alleged spy sat (assuming there was even one involved in this story, it's all your fantasy scenario) could have been described as a boring space object of nondescript function implying debris, and the orbital parameters could have been "fuzzed" up to lessen any precision in estimating the "classified" orbital data (just like early releases of spy sat photos were "fuzzed" up to not reveal full capability and resolution). Thus, if a spy sat was cataloged as NORAD Object 1234, and that object was predicted to pass the Gemini 11 at say 1827 GMT at 234 km (to give arbitrary numbers purely for illustration), this could have been "fuzzed" up by rounding!

!

to 1830 GMT at 200 km, or some such. There are lots of alternatives to the idea that there was a Secret Spy Sat that passed close to the Gemini 11 but got covered up with the Proton 3 label because calling it by a nondescript catalog number such as "Object 1234" would reveal something (in fact it would reveal nothing and calling it Object XXXX or whatever would have been excellent cover, requiring no subterfuge of deliberate mislabeling with the Proton 3).

and because it

- >
- > When did the evasive maneuver take place?

FURTHER COMMENTS: The S-IVB attitude thruster fired in the evasive maneuver about 4h25m after launch to get it away from the Apollo which had done the LM docking and separation maneuver an hour earlier at about 3h28m. It was about 10 ft/sec so you can see that in one day the S-IVB would have been 864,000 feet (about 164 miles) away from the Apollo and BEHIND it in the negative velocity vector direction, and barely visible if visible at all at that distance. However, the S-IVB was later fired out of plane in a so-called "slingshot" maneuver to take it into solar orbit instead of a free-return-to-earth trajectory. I can't find out right off exactly when that occurred and with what delta-V (change in velocity) but I recall it was minutes later or at most an hour or two later (as on later flights where I can more easily find the info). It certainly didn't lessen the separation distance to the Apollo but changed its direction slightly, increasing its radial distance from the Ap!

!
ollo's velocity vector trajectory line.

FURTHER COMMENTS: NASA didn't put the "debris" back in FRONT of the Apollo!!! All separation maneuvers were done to put S-IVB and SLA panels BEHIND and AWAY from the Apollo.

of
debris from the Gemini 11 itself. Given the measured photographic angular
size of roughly 1/100 radian, a 1 inch piece of debris or ice would have
been
10 feet away, or a 6-inch object would have been 50-60 feet away.
<

Well, this would be a piece that was somewhat ahead of (as well as to the
left
of) the GT-11 capsule and, in a sense, returning to the capsule. That is,
it was seen to approach the orbit. I can imagine debris traveling in
parallel
(along the orbit) or moving away from the capsule, but returning to the
orbit from
some distance away (or crossing the orbit but starteding from distance
away)
seems unlikely.

Status:

Reading Kevin Randle's "Scientific Ufology" I learned that Mr. Heflin recovered his negatives a few years ago, after almost 30 years!. Amazing!

Does anybody know the circumstances around this "recovery"?

Mr. Randle also suggested that we can now examine them and finally reach a conclusion. Has it been done? If not (I have not heard anything about it), why not?

Finally, along the years I have come across several references questioning the computer analysis of the defunct GSW, even to the point of suggesting tampering with the evidence to explain it! Would anybody in the list care to comment?

Sincerely,
Luis R. González Manso

Subject: Re: Rex Heflin's 1965 photosX-Status:

Hi Luis,

Supposedly Heflin's Polaroids (not "negatives") suddenly showed up in his mailbox without explanation. Ann Druffel has them and has a California State University, Northridge, chemist analyzing it. The local newspaper, Orange County Register (formerly Santa Ana Register) reported a witness who said Heflin's photos were circulating as fakes in 1965 before they went public. A civil engineer of Irvine, Calif., told the OC Register his analysis of the sun's shadows in the photos prove a hoax.

The suspected GSW tampering came about when Bruce Maccabee sent copy negatives of the Heflin photos to Spaulding ("GSW") two decades ago and Spaulding suddenly announced he had found a thread in the photos. But when Bruce tracked this story down he found it was a scratch on the copy negative of one of the 4 photos (not on any of the others) that wasn't on it when he gave it to Spaulding (other copies show no such line or scratch).

In general the "GSW" photoanalyses were bad, as exemplified by Spaulding insisting he could determine whether a UFO photo was a hoax or genuine by measuring the UFO's "thickness" (in feet or inches) by "computer analysis." But this was pseudoscience -- he was confusing his day job of inspecting computer enhancements of x-ray radiographs of jet engine parts with visible-light photography of UFO's. No UFO witness has an X-ray machine to beam through a UFO when taking pictures of it.

Brad Sparks

Reading Kevin Randle's "Scientific Ufology" I learned that Mr. Heflin recovered his negatives a few years ago, after almost 30 years!. Amazing!

Does anybody know the circumstances around this "recovery"?

Mr. Randle also suggested that we can now examine them and finally reach a conclusion. Has it been done? If not (I have not heard anything about it), why not?

Finally, along the years I have come across several references questioning
teh computer analysis of the defunct GSW, even to the point of suggesting
tampering with the evidence to explain it! Would anybody in the list care to
comment?

Sincerely,

Luis R. González Manso

Subject: Re: GT-11 STRANGER DURATIONStatus:

Hi Bruce,

Well there's two issues here: (1) Debris in similar orbits will cross back and forth over the satellite's path twice each orbit. (2) Debris that is decaying ahead of the main satellite because it has higher drag coefficient will move ahead of the satellite because of the "orbital paradox." One can't make any rigid rules about the altitude of the debris (i.e., one can't say it must be lower) because of ellipticity of orbits -- one can't tell which part of which orbit is being compared. If orbits were perfectly circular then the debris should be lower.

been

10 feet away, or a 6-inch object would have been 50-60 feet away.

<

Well, this would be a piece that was somewhat ahead of (as well as to the
left

of) the GT-11 capsule and, in a sense, returning to the capsule. That is,

it was seen to approach the orbit. I can imagine debris traveling in
parallel

(along the orbit) or moving away from the capsule, but returning to the orbit from some distance away (or crossing the orbit but starteding from distance away) seems unlikely.

<

Yup!

If pieces of debris they must have been small enough to avoid radar
detection

near the GT 11. If they had been large pieces perhaps NORAD would have
detected

them and simply used "debris" as the explanation rather than the Proton 3.

Note, by the way (for those unfamiliar with the sighting details), the
astronauts reported

that the object(s) flashed or pulsated in brightness. The astronauts
compared it to

looking at some large object a considerable distance away (they estimated
50 miles)

that was rotating. Hence they accepted the Proton 3 explanation (they
were not

aware of the "distance/direction problem").

Subject: Re: LakenheathStatus:

Larry,

I first suggested a time standard error back in 1980, but it is speculative. I haven't found conclusive evidence for it. My theory was that the Lakenheath times reported as GMT or Z in the USAF docs from 1956 were really BST and should be moved backwards to start the UFO radar targets at 11:10 PM so that it fit controller Forrest Perkins' shift ending at 12 Midnight and would have the Venom intercept at about 11:45 PM. In that case the Venoms at 2-3 AM could not possibly be the same ones. However, supposing Perkins' memory was completely wrong about his shift and the timing of the intercept and that the 1956 USAF report was in error in its implication that the intercept was soon after 0010 hours (it actually doesn't explicitly say what time the intercept occurred), we MIGHT suppose that Jenny's Venoms at 2-3 AM were the correct ones and that the disappearance of radar targets soon after 0330 fits the scenario, but that would leave 2 hours unaccounted for from about 12 to 2.

This could all be resolved by obtained detailed British records that surely must exist in official files, which presumably contain the radar logs.

I also theorized that the three Bentwaters fast-track UFO's with similar E-W patterns at 9:30, 10 and 10:55 PM were really one and the same event at 9:55 PM with a 25-min error on one report, and a time standard 1-hr error on the other, and a 5-min roundoff on the third, since each were reported by different radar operators interviewed two weeks after the fact and some might have checked records and others recalled from memory.

BTW, the T-33 was not just "a pilot training jet" as if it was ridiculous to imagine scrambling it for an intercept, as I pointed out it belonged to the 512th FIGHTER INTERCEPTOR Squadron at Bentwaters (actually it was diverted rather than scrambled but no matter). (I assume it was only one jet with two crew members rather than 2 jets, and that the official record is ambiguous on the point.)

@From: RB47Expert@aol.com
@@To: UFORL@listbot.com
@Subject: Re: Lakenheath

Maybe I can help clear this up. I suggested that there might have been 4 Venoms. After looking at the data I have, I now realize that I am in error. Looking at the chronology of the events shows what happened (sort of - I still can't resolve the differences between the flight crew accounts and the other accounts on the order of the flights).

According to the Condon Report (C), Klass (K), and McDonald (M), I was able to piece together the following chronology (only Lakenheath):

GMT BST Event

2255 2355 First Lakenheath visual sighting.

0010 0110 First Lakenheath Radar sighting. The call for the Venom scramble was made at this time.

0040 0140 The Venom first appeared on Lakenheath RADAR. (C)

0100 0200 The Venom was vectored into the first target. The pilot (the one who has not been found) saw a white light. Both light and target were lost. (K,M)

? ? The Venom was vectored into the second target. This was the supposed "cat and mouse" sequence.

0200* 0300* The first Venom chase ended and the second Venom took off. It returned to base without finding anything. The reported times in the logs fits this second flight.

* Approx time.

Actually, if Perkins, in the excitement, stayed on after his shift ended (wouldn't you?), and if the navigator of the first Venom got the time wrong (when he got around to filling out the log), then everything fits.

@
@Hi Jenny,

@You'll recall we corresponded about this issue of the Venom
@intercept in the Lakenheath 1956 case privately in April 1999
@and again on this UFO Research List in Aug 1999. I investigated
@and analyzed the case with the Condon Committee physicist Gordon
@Thayer, Peter Sturrock, Philip Klass and Stanton Friedman back
@in 1979-80. I edited Thayer's article on the case for Ron
@Story's 1980 Encyclopedia of UFO's. And in 1998 I discovered a
@long overlooked height-finding effect in the Bentwaters radar
@data which supports the ground and air visual observers' reports
@of a high-speed East-West target streaking over the base and
@under the C-47 aircraft at 4,000 feet.

@The case easily divides into an early Bentwaters phase from
@about 9:30 PM to midnight on Aug 13, 1956, and a later
@Lakenheath phase from about 12 midnight to 3:30 AM on Aug 14.
@The Venom intercept relates mainly to the Lakenheath phase on
@the 14th and doesn't really affect the Bentwaters phase on the
@13th.

@It is still unclear to me that your interviews of Venom crew
@involved in an intercept around 2-3 AM, who reportedly had NO
@visual UFO contact and NO "cat and mouse" tail chase, were the
@same ones involved in the Venom intercept at around 11:45 PM-12
@Midnight who DID reportedly describe visual UFO contact
@(according to the USAF report of Aug 31, 1956) and the "cat and
@mouse" tail chase (according to the USAF Lakenheath controller
@Forrest Perkins and RAF Neatishead controller Freddie
@Wimbledon).

@I was told, and I relayed this to you last year, that your BBC
@documentary segment makes reference to "Ivan Logan's log book
@which documents that Brady's flight took off first at 0200 on 14
@August." And apparently it lasted 55 minutes.

@And as I pointed out to you last year Perkins' 4-12 shift ended
@at midnight and Wimbledon's shift began at 11 PM, reported by
@both completely independent of each other, yet the only overlap
@is at the 11-12 time that both report for the Venom intercept,
@again independent of each other. This seems to doubly reinforce
@the approximately 12 midnight time for the Venom intercept.

The question might revolve around whether, in the heat of the
chase, Perkins stayed beyond the end of his shift until the
crisis was over.

Question: Do air controllers change shifts in the middle of a
rapidly developing crisis, or does the controller who already has
the picture continue until the crisis is over (or until it
stabilizes enough for the other controller to have the complete

picture)?

Or, since they started up another display, could Perkins and the other controller each have worked one display? This might be a subject to inquire about with the controller who came on shift at the time (if he is still alive and can be found).

@> Hi,

@> I have for some months been working on an attempt to sort out the confusing
@> situation regarding the British testimony on this case - especially the
@> sightings / non sightings by venom crews during the August 1956 events.

@> UFOIN is preparing a detailed report based on this work which has involved
@> three of the four crew and Freddie Wimbledon in an effort to resolve this.

@> I have found no evidence as yet that there were earlier scrambles

@COMMENTS: Actually there was a T-33 scramble at 9:30 PM from
@the 512th FIS at Bentwaters. Again, as I pointed out above, the
@independent Perkins and Wimbledon accounts state the Venom
@intercept with the UFO tail chase occurred near 12 Midnight and
@their controller shifts only overlapped at about that time.
@Whereas your Venom crew members' logbooks point to 2-3 AM.

According to Klass and McDonald, the T-33s were already flying at the time on another mission, and were diverted to search for the UFOs. They were not scrambled (The military term "scramble" refers to starting up planes and getting them off the ground as quickly as possible). I also doubt that they would scramble a T-33, which is only a pilot training jet.

@- making

@> four airborne venoms all told. But this is not completely impossible given
@> the extent of the difference between the Condon stories and the stories
told

@> me first hand by the venom crews.

@COMMENTS: There is also contemporaneous USAF documentation on
@Aug 31, 1956, reporting fighter intercept near Lakenheath with
@visual UFO contact.

(snip)

@> So far as I have been able to establish that the crews that I spoke with
@> appear to be the ones referenced by the Condon report. That report was
based

@> on second hand testimony years later

@COMMENTS: Forrest Perkins' testimony to the Condon Committee as
@to his own actions as Lakenheath RATCC controller is FIRST-HAND.
@His testimony about his 4-12 shift and the approximate 11:45 PM
@- 12 Midnight time of the Venom intercept he was PERSONALLY
@involved in is also FIRST-HAND. It still might be in error, it
@was reported in Feb 1968, or 11 years after the fact. But it's
@closer in time than your Venom pilots in 1996, which is almost
@40 years later. So is Wimbledon's testimony in 1979.

@and is already known to be wrong in
@> several respects so it is not hard to imagine that further confusion arose
@> with regards to the aircrew. These guys had never spoken publicly till I
met
@> them in 1996.

(snip)

@> What I can say is that the crews I talked with definitely had no visual
@> sighting - despite stupid attempts on Updates to try to infer otherwise.
The
@> 'cat and mouse' story - if indeed it does refer to these two venom crews -
@> seems to have come about because they flew towards a stationary radar
target
@> and then right past it. One moment it was ahead of them, the next behind,
@> but this did not happen because the UFO moved to their rear at great speed
@> but because the aircraft was traveling so fast it was almost instantly on
@> the other side of the non moving target.

@> There is also some confusion over the use of BST and GMT which could
resolve
@> any problems over the timing that right now are a confusion.

@COMMENTS: Possible confusion over BST and GMT, which I was the
@first to suggest in this case back in 1980, can only account for
@a 1 hour error and still does not seem to account for a 2-3-hour
@error in the times reported for the Venom intercepts.

See timetable above. Also, it has been my experience whenever two
times are in use that time zone conversion errors happen in both
directions.

I live near the junction of three different time zones. One time
zone is on Central time, and advances to Daylight time in the
summer. Another time zone is on Eastern time and also advances to
Daylight time in the summer. The time zone I live in stays on

Eastern time without advancing in the summer. Conversion errors occur quite frequently (some people never get it right).

These mistakes occur:

1. A slow-time value is mistakenly reported as being in fast-time.
2. A fast-time value is mistakenly reported as being in slow-time.
3. An hour is mistakenly subtracted (instead of being added) to convert slow-time to fast-time.
4. An hour is mistakenly added (instead of being subtracted) to convert fast-time to slow-time.
5. A slow-time value is mistakenly converted from fast-time to slow-time.
6. A fast-time value is mistakenly converted from slow-time to fast-time.
7. A time is reported, without any information as to whether it is slow-time or fast-time.
8. During the time change, a clock is changed in the wrong direction.*
9. Forgetting to make the change.*
10. Forgetting which two zones are synchronized at which time of year.*
11. Dealing with equipment that assumes that all time zones make the change to and from Daylight time.*

* Not a possible factor in the Lakenheath case.

(These errors are excellent reasons to get rid of the time change twice a year everywhere. Now that we have television, it makes very little difference in energy consumption.)

It seems fitting that the time changes here occur in the weeks containing April Fools Day and Halloween.

So if the time reported is 1:00, it could really be 12:00 or 2:00. And if two people mishandled the information, it might even be 11:00 or 3:00.

@The reference

@> to 2 am for the start of the scramble is what the air crews log books say.

@> The two navigators have retained these.

@> I have to say that Wimbledon believes there was a visual contact that

@> night

@COMMENTS: The USAF report in 1956 also reports visual UFO

@contact by the interceptor.

@- but he had never had direct communication with the crews. He was in

@> an RAF bunker controlling the operation. The venoms were vectored onto

@> target by USAF ATC. The air crew I have met are adamant there was no visual

@> contact.

@> As such - unless there were two earlier venoms whose stories form the basis

@> for those in the Condon report - there is a huge discrepancy between the

@> USAF version in Condon and that told by the actual witnesses.

@> No references exist so far to four venoms being launched and the crews I met

@> definitely spoke to the USAF on the night extensively. As such it is hard to

@> imagine why the source that spoke to Condon would have failed to mention

@> that two other venoms were also vectored onto the UFO after the first ones

@> and also picked up clear radar targets (as all the crew told me they did).

@COMMENTS: The "source that spoke to Condon [Committee]" was

@Forrest Perkins, the USAF air traffic controller, whose shift

@ended at 12 Midnight. That's why Perkins would have failed to

@mention a later and less interesting Venom intercept at around

@2-3 AM, by then he'd gone home.

@UFO radar contacts at Lakenheath continued till 3:30 AM.

@Unfortunately the poor USAF documentation gives no TIMES for

@most of the events in this Lakenheath phase on the 14th.

@> This omission of reference suggests again we are talking about the same two

@> venoms and a USAF misinterpretation of what they said. But it may not be.

@> There may still be two other venom crews 'out there'.

@> As you can see this is a complex issue and is one reason I want to get this

@> full report together before entering into a debate on the matter.

Especially

@> after the fiasco on Updates last year. So I want to leave it at that for

@> now.

@> Once the UFOIN report is complete I'll let you know and we can discuss it
@> happily as long as you like then.

@> Best wishes,

@> Jenny Randles

Other questions to ask (remote possibilities, but must be looked for):

- Had someone not come on duty on time?
- Were records fudged to cover up shift swapping or late arrivals?
- Was a log filled in much later than when it was supposed to have been done?

Hi,

Wish it were that easy. Aside from the Official Secrets Act that makes it next to impossible to gain access to UK data on such things the MoD position on this case is clear. I have asked several written questions on it and they categorically deny having any records. They argue (correctly) that Air Ministry UFO files were destroyed routinely pre a government decision at the time of the 1967 wave. This means virtually nothing is on file pre 1962 - although there are bits and pieces (eg Operation Mainbrace records).

Whilst making my 1996 BBC TV documentary (Britains Secret UFO Files) I spent days at the Public Record Office and talking to MoD personnel both on and off camera. I followed much of this up for my 1998 book 'Something in the Air'.

What did I find? Basically that the case created a furore in Whitehall at the time and was clearly recalled. That many files probably were created and are likely out there somewhere as part of the other departments that study UFOs. But Nick Pope tells me these just dont exist. Consequently, if hes right the 56 files were all destroyed long ago.
I am not convinced of that.

In my study of PRO files I found only one reference to the Lakenheath case. In a briefing memo to a minister who was answering questions in parliament on radar cases (dated May 1957) it cites three cases that had just occurred in the past 12 months. I discuss all of these in a chapter in my book. One was the southern Scotland April 57 case (the only one to make a public disclosure at the time due to the creation of a civil defence alert that could not be covered up). The other two were Lakenheath/Bentwaters and the Solent radar-visual (an equally good - if not better - case - this time in daylight - and which I only discovered about five years ago when one retired RAF officer came to me) This event happened in the same month (Aug 56) and we again have good data on this (interviews with two of the air crew involved and the log book of one).

The PRO note that I traced in the files expresses delight that these two cases were hidden from the public. Although we know for absolute certainty that both occurred there are no records on either whatsoever at the PRO save this tiny reference in a memo.

I even had the squadron archivist of the Solent daylight case check the files. There was a mass of data about the squadrom and the air crew involved in the sighting and various events around the date of the sighting - such as a royal visit - that the aircrew had previously recalled. But the reports on the UFO incident are all AWOL.

To me this suggests they actually exist and were put in a file thats beyond the remit of the UKs 30 year rule. This would mean MOD UFO files going to the PRO 30 years later but if any sensitive files are located elsewhere that department could be covered by one of the many exclusions to the 30 year rule ensuring no public release for up to 100 years.

However, Nick Pope says theres no other such location for these files to have gone and so no such missing files seem likely. Which means the MOD claim that they must have been destroyed is the only other option. Again whilst I respect his views I am not convinced.

However, a senior MoD figure (Ralph Noyes) told me in 1984 that he had seen gun camera film from an August 1956 incident when he became head of an MOD

department in 1968. This date is after the time when the MoD supposedly destroyed the UFO records of this era. Hence if it existed then but doesn't now - where is it?

Nick Pope (who had a much lower security clearance at the MoD) (his rank was equivalent to captain whereas Noyes was air commodore) was shown no such footage in 1991 when he got his well known job. He suggests the film maybe deteriorated during the intervening 23 years and was junked - but even if so there has to be a hard copy of analysis data etc.

The footage BTW is daylight film and so far more likely to be from the second August 56 case (the one over the Solent) than from the Lakenheath/Bentwaters affair.

There's more on all this in 'Something in the Air'.

So believe me I've looked into this question of tracing MOD records very closely. But we have no Freedom of Information Act to apply here.

Best wishes,

Jenny

Subject: Re: LakenheathStatus:

Hi Jenny,

Thank you for your exposition on the document situation in Britain. I thought there was a recently passed law in the UK that is similar to the Freedom of Information Act in the US. Maybe you can fill me in on this.

As I understand it, the government has a trick of nomenclature on records and files such as UFO records and files. When they say that a file was routinely destroyed X years ago what they really mean is that a special duplicate file organized for convenience by subject matter was destroyed NOT that ALL copies of the records making up the file were destroyed everywhere in government (a practical impossibility anyway unless part of a small numbered Top Secret series). NOR does it mean that all similar subject-organized files elsewhere were destroyed.

Typically, there are numbers of chronological serial files in which all incoming documents are filed on all subjects, not just UFO's, and these exist for HQ offices and major commands, but usually has to be higher than squadron level. For example, although Roswell AFB's cable traffic for 1946-9 was destroyed, copies exist elsewhere wherever something was sent to Roswell or received from Roswell by major commands -- at least one such "destroyed" document has been retrieved in this way through the determined efforts of Bob Todd.

There are two additional reasons why the Lakenheath UFO files should exist elsewhere: (a) Increased sensitivity of Lakenheath activities due to the nuclear weapons accident on July 31, 1956, (b) Increased sensitivity of Lakenheath activities due to July 1956 placement, albeit temporary, of the first U-2 / Aquatone squadron by arrangement with the Chief of MI-6.

So I think your intuition is correct that the Lakenheath-Bentwaters UFO files do exist somewhere.

Sincerely,

Brad Sparks

Hi,

Wish it were that easy. Aside from the Official Secrets Act that makes it next to impossible to gain access to UK data on such things the MoD position on this case is clear. I have asked several written questions on it and they categorically deny having any records. They argue (correctly) that Air Ministry UFO files were destroyed routinely pre a government decision at the time of the 1967 wave. This means virtually nothing is on file pre 1962 - although there are bits and pieces (eg Operation Mainbrace records).

Whilst making my 1996 BBC TV documentary (Britains Secret UFO Files) I spent days at the Public Record Office and talking to MoD personnel both on and off camera. I followed much of this up for my 1998 book 'Something in the Air'.

What did I find? Basically that the case created a furore in Whitehall at the time and was clearly recalled. That many files probably were created and are likely out there somewhere as part of the other departments that study UFOs. But Nick Pope tells me these just dont exist. Consequently, if hes

right the 56 files were all destroyed long ago.

I am not convinced of that.

In my study of PRO files I found only one reference to the Lakenheath case.

In a briefing memo to a minister who was answering questions in parliament on radar cases (dated May 1957) it cites three cases that had just occurred in the past 12 months. I discuss all of these in a chapter in my book. One was the southern Scotland April 57 case (the only one to make a public disclosure at the time due to the creation of a civil defence alert that could not be covered up). The other two were Lakenheath/Bentwaters and the Solent radar-visual (an equally good - if not better - case - this time in daylight - and which I only discovered about five years ago when one retired RAF officer came to me) This event happened in the same month (Aug 56) and we again have good data on this (interviews with two of the air crew involved and the log book of one).

The PRO note that I traced in the files expresses delight that these two cases were hidden from the public. Although we know for absolute certainty that both occurred there are no records on either whatsoever at the PRO save this tiny reference in a memo.

I even had the squadron archivist of the Solent daylight case check the files. There was a mass of data about the squadron and the air crew involved in the sighting and various events around the date of the sighting - such as a royal visit - that the aircrew had previously recalled. But the reports on the UFO incident are all AWOL.

To me this suggests they actually exist and were put in a file that's beyond the remit of the UK's 30 year rule. This would mean MOD UFO files going to the PRO 30 years later but if any sensitive files are located elsewhere that department could be covered by one of the many exclusions to the 30 year rule ensuring no public release for up to 100 years.

However, Nick Pope says there's no other such location for these files to have gone and so no such missing files seem likely. Which means the MOD claim that they must have been destroyed is the only other option. Again whilst I respect his views I am not convinced.

Hi,

The current year in parliament includes a Freedom of Information bill. But it has yet to be debated, let alone to pass. If it does this will not come into effect for maybe a year. Many are dissatisfied with its half heartedness.

The bill is less than complete. It has numerous exclusions regarding MOD data and is really intended to free up simple admin and health data that UK citizens don't have access to right now. There is reasonable doubt that it will make much difference to the UFO evidence - certainly older records (that they will deny exist) and any in unknown departments (such as, I believe, the really interesting military UFO encounters) which will be excluded pretty much as now even from having to admit they exist.

There was a press story in November about the MoD releasing UFO records before the 30 year rule as a pre-empt of this act. It made the net but I posted a warning about this then. Study has borne my caution out. Investigation has revealed it was really kite flying not a hard decision. Some post 1969 (latest currently available MoD cases) may appear. In fact some already have. But there's no planned mass release and the bits and pieces we get are very disappointing as none involve any investigation and are trivial. The MOD files released are bereft of any significant cases and the ones I know exist and have looked for are not on file. To me this is virtual proof that Pope is wrong and the best cases get sucked into an other place where they are immune from release and the lesser stuff is put onto the PRO creating the public impression UFOs are not very interesting.

Investigation into cases - when it happens at all - occurs beyond the remit of Air Staff 2A in even standard cases - via departments like the DSTI and DI 55 (see my book 'MIB' for more on the UK MOD structure here) (published

in the US as 'The truth behind the MIB' by St Martins Press)

Its unlikely any FOI act is going to have the same impact as in the US by releasing thousands of files but until its debated, altered and introduced in its final form we wont know.

Mind you the Venom crews that I spoke with re Lakenheath were not really debriefed and were given no indication of MOD interest at the time. Until I spoke to them they had no idea about most of the dimensions to this case. Nobody at the MoD ever left them feeling this was a big deal. Indeed they commented that on the night the USAF were far more excited than the RAF ever were.

Nor is this the first occasion such minimal response has been reported to me. 'Something in the Air' also discusses another missing case (ie no files) followed up by me via first hand sources - an experimental test flight of a Canberra over Boscombe Down that had a radar visual encounter in daylight. Despite the sensitivity of that case the man on board, who became a Wing Commander and leading RAF radar technical expert, says the MOD were only interested in being told the UFO wasnt a Soviet jet. When they were assured that there was no way this was possible their only other interest was to strip and rebuild the radar and make sure it worked perfectly (as it did). There was virtually no official interest or debriefing shown in the disk like object they saw.

Its interesting that I have found this so often as it matches some USAF comments from the early days about 'lack of topside enquiries' and leaves you wondering why so little official interest was shown in the matter. The Wing Commander had to dig deep to discover there was a top secret UFO project in 1953 at RAF Farnbrough and was told it was leaning towards the ETH as an answer for UFOs. But no data whatsoever from here or official trace of the existence of this project has otherwise emerged.

Best wishes,

Jenny

@> @
@>
@> The number of sweep-times used to calculate the time MUST be one
@> less than the total number of blips. That is a mathematical fact
@> that can not be refuted.

@FURTHER COMMENTS: We're not talking about sweep TIMES but
@SWEEPS. Each blip is created by a sweep of the radar and it
@does NOT take all the time for the radar antenna to rotate
@around one full turn to do so, but just a fraction of a second.
@If there are 5 blips, there are 5 sweeps, and 4 sweep-times or
@antenna rotations in between.

No, but to calculate the time taken by the object to cross the

scope, you have to subtract the unused portion of the first and last sweeps. That's what is confusing. The text said the object was observed in the time of only three sweeps, and then the velocity was calculated ON THAT BASIS. So one of these possibilities MUST be true:

- * 3 blips were observed, and the speed (since it crossed the scope) was calculated from the distanced covered and 1.5 sweep times.

- * 4 blips were observed, and the speed was calculated from 2.5 sweep times.

- * An error was made, because the speed was calculated from 3 sweep times.

@FURTHER COMMENTS: The MPN-11A at Bentwaters was a GCA (ground @controlled approach) radar not a regional traffic control radar @such as yours at Indianapolis apparently. A 15-second or even @4-second gap in controlling the approach of an incoming aircraft @might not be too comfortable.

Three kinds of RADAR are used at airports:

ASR - Airport Surveillance RADAR: These typically have a 15 second sweep and a 60 mile range.

GCA - Ground Controlled Approach: These are faster, having a 2 or 4 second sweep and a 25 mile range.

MLS - Microwave Landing System: These only cover a small sector, covering the glide slope of a landing aircraft. They have a .5 or 1 second dual oscillating sweep and a short (10 -- 15 mile) range.

@>

@> @And my scenario never said they endangered the lives of the

@> @astronauts. You assumed that. My theory assumes:

@>

@> @1. That the correct figures were given to NASA, but NOT the

@> @public.

@>

@> @2. Either NASA or NORAD substituted only the NAME of the

@> @Proton 3 in the public release.

@>

@> @STILL MORE COMMENTS: This is inconsistent. If the "only" substitution or

@> @change of info on the public release was the "NAME" of the satellite, then

@> @the other info would be correct, including the figures. But in No. 1 you say

@> @the public was given false figures, too, meaning the entire encounter with

@> @the Gemini 11 was falsified.

@>

@>

@> That's not what I said. I said that figures were NOT GIVEN

@> to the public. I will try once more:

@>

@> 1. Correct figures were given to NASA by NORAD.

@FURTHER COMMENTS: This isn't what you originally said, just
@look above -- you originally said "but NOT the public."

But they mean the same to me: The correct figures were given to NASA. The correct figures were not given to the public. It says nothing about any incorrect figures being given to the public. I intended to say (what line three clarifies below) that no figures of any kind would have given to the public at that time.

@> 2. The substituted NAME was released to the press (and public).

@>

@> 3. NOTHING ELSE changed hands at the time.

@>@STILL MORE COMMENTS: Correction: I think it may have been

@>@the Apollo that carried out the evasion maneuver to increase

@>@the separation from the S-IVB. I don't have my old files to

@>@double-check.

@> When did the LEM extraction occur on that flight?

@>

@> When did the evasive maneuver take place?

@FURTHER COMMENTS: The S-IVB attitude thruster fired in the

@evasive maneuver about 4h25m after launch to get it away from

@the Apollo which had done the LM docking and separation maneuver

@an hour earlier at about 3h28m. It was about 10 ft/sec so you

@can see that in one day the S-IVB would have been 864,000 feet

@(about 164 miles) away from the Apollo and BEHIND it in the

@negative velocity vector direction, and barely visible if

@visible at all at that distance. However, the S-IVB was later

@fired out of plane in a so-called "slinghot" maneuver to take it

@into solar orbit instead of a free-return-to-earth trajectory. I

@can't find out right off exactly when that occurred and with
@what delta-V (change in velocity) but I recall it was minutes
@later or at most an hour or two later (as on later flights where
@I can more easily find the info). It certainly didn't lessen
@the separation distance to the Apollo but changed its direction
@slightly, increasing its radial distance from the Apollo's
@velocity vector trajectory line.

@> Did the evasive maneuver involve firing engines on the
@> spacecraft, on the S4-B, or both? (I know they fired the S4-B
@> engine to crash it on the moon, but this appears to be separate
@> from that.)

@>
@> Could that maneuver have resulted in nearly identical
@> trajectories, but different locations along them, for the debris
@> and the spacecraft? Think about it:

@>
@> * If they deflected their course sideways, it would change
@> their orbit, and they wouldn't end up at the moon.

@>
@> * If they sped up and stayed faster, or if they slowed down and
@> remained slower, it would change their orbit, and they wouldn't
@> end up at the moon.

@>
@> * The most likely scenario is that they slowed down for a while,
@> then sped up again to resume their original trajectory. This
@> would put the debris at a constant distance ahead of them in
@> the translunar orbit, since it DIDN'T slow down and then speed
@> up.

@FURTHER COMMENTS: NASA didn't put the "debris" back in FRONT of
@the Apollo!!! All separation maneuvers were done to put S-IVB
@and SLA panels BEHIND and AWAY from the Apollo.

I was thinking that: The spacecraft had slowed down temporarily
during the maneuvering to extract the LEM and get the S-4B out of
the way, then speeded up to regain the correct orbit. The debris
would have kept going and ended out in front.

They don't want any debris that is actually in the translunar
orbit to be behind the Apollo. That's the most dangerous place.
They would want any debris in the same orbit to be out in front,
so the Lunar Orbit Insertion burn wouldn't cause the debris to
catch up to the spacecraft from behind and strike it with force.
Since they can't change the orbit of the debris once it falls
off, they would have to move the spacecraft to be behind it.

Actually, the S-4B stage separation maneuver slowed the S-4B down
a little (while separation debris, ice, and any other debris that
had already fallen off kept going). Then the LEM docking maneuver

slowed everything down a little more. Then LEM extraction speeds up the spacecraft while slowing down the S-4B. So the order of objects passing a given point in space become: Initial debris, SM, CM, LEM, S-4B, doors (doors in different orbits).

The S-4B was not sent into solar orbit. Those were always aimed to crash into the moon in a predetermined place, for experiments using the seismographs that were placed on the moon by each Surveyor and Apollo mission. That's how they found out that the structure of the moon is different from the structure of Earth.

In Lovell's book, one of the reasons Apollo 13 had communications problems was that the LEM was designed to use the same frequency the S-4B telemetry was on. Normally the LEM wouldn't have been powered up until after the S-4B had crashed. One of the purposes of that telemetry was to determine the exact time of impact for the seismology experiment. Once that crash happened, the communications problem was gone. But if the S-4B had been sent into solar orbit, the communications problem would have persisted.

@Well, this would be a piece that was somewhat ahead of (as well
@as to the left of) the GT-11 capsule and, in a sense, returning
@to the capsule. That is. it was seen to approach the orbit. I
@can imagine debris traveling in parallel (along the orbit) or
@moving away from the capsule, but returning to the orbit from
@some distance away (or crossing the orbit but starteding from
@distance away) seems unlikely.

Several thoughts about the above:

The physics of space trajectory indicate that all objects in space are in orbits. The ones that don't stay up there just have orbits that happen to intersect with the planet or it's atmosphere.

All Earth orbits have the center of mass of Earth at one focus of the elliptical trajectory.

The paths of two objects in different orbits at the same altitude and with like eccentricities will cross each other twice per orbit. Since they have the same period, one of the objects will repeatedly cross back and forth in front of the other. In nearly equatorial orbits, one object will be north of the other for half of the orbit, and south of the other for the other half.

So when spacemen jettison something, they have to throw it into an orbit with a different period, or it will come back to them.

The photo I have of the Gemini 11 UFO shows a structured craft. Under magnification, it looks like a collection of detailed pipes and spheres, in front of fuzzy-looking sausage-shaped objects.

It almost looks like a satellite with thrusters doing a maneuvering burn, with the white sausages being the exhaust. But the shape of the exhaust is wrong.

I do not know how accurate the photo is, since it was in the same crummy magazine the panel meter photo was in (Hint: most of the photos were taken by Adamski and Fry, and some of the photos were repeated two or three times).

@Subject: Rex Heflin's 1965 photos
@
@@
@Reading Kevin Randle's "Scientific Ufology" I learned that Mr. Heflin
@recovered his negatives a few years ago, after almost 30 years!. Amazing!
@
@Does anybody know the circumstances around this "recovery"?
@
@Mr. Randle also suggested that we can now examine them and finally reach a
@conclusions. Has it been done? If not (I have not heard anything about it),
@why not?
@
@Finally, along the years I have come across several references questioning
@the computer analysis of the defunct GSW, even to the point of suggesting
@tampering with the evidence to explain it! Would anybody in the list care to
@comment?

If he recovered the photos, who did he recover them from?

I have a copy of one of the GSW edge-enhancement photos. It was enhanced to show vertical edges. It definitely shows a supporting thread. Focus anomalies in the original photos also rule out a distant object. The UFO is in better focus than anything showing in the background. This means that the camera was focused at much less than infinity.

Almost all UFO photos should be focused at infinity, because the object is usually farther away than 20 feet.

But the McMinnville photos were edge-enhanced by GSW to show horizontal lines, a direction that would not show a vertical string if it had been there. I have never seen them enhanced in the vertical direction.

@Sincerely,
@Luis R. González Manso

Hey! It's hard enough struggling through this stuff without your fallible memory messing up our information, guy! The first S4B lunar impact was Apollo-13.

Many of your speculations -- it seems logical to me so it must be true -- are off base, and not helpful.

I'm in the same situation and pointing fingers at myself as well -- Bruce and Brad have a GOOD case on the closeness of WHATEVER it was that was photographed on Apollo12.

So let's thrash this out and achieve a new level of proper awareness of what really -- not what we remember, or wished had -- happened on these flights. I am indebted to those who have the patience to dive into the details to straighten others, me among them, out.

@From: RB47Expert@aol.com
@@To: UFORL@listbot.com
@Subject: Re: Lakenheath

@
@Larry,

@I first suggested a time standard error back in 1980, but it is
@speculative. I haven't found conclusive evidence for it. My
@theory was that the Lakenheath times reported as GMT or Z in the
@USAF docs from 1956 were really BST and should be moved
@backwards to start the UFO radar targets at 11:10 PM so that it
@fit controller Forrest Perkins' shift ending at 12 Midnight and
@would have the Venom intercept at about 11:45 PM. In that case
@the Venoms at 2-3 AM could not possibly be the same ones.
@However, supposing Perkins' memory was completely wrong about
@his shift and the timing of the intercept and that the 1956 USAF
@report was in error in its implication that the intercept was
@soon after 0010 hours (it actually doesn't explicitly say what
@time the intercept occurred), we MIGHT suppose that Jenny's
@Venoms at 2-3 AM were the correct ones and that the
@disappearance of radar targets soon after at 0330 fits the
@scenario, but that would leave 2 hours unaccounted for from
@about 12 to 2.

According to other accounts, it was almost an hour before a Venom
arrived on scene after the scramble request was ordered.

That makes sense, especially since all of the accounts I have
conflict in other ways as well. I am now adding your work and
Jenny's to my look at this mess. I independently thought of it,
but have now found your work (now that I know where to look for
it - I have too many UFO books).

@This could all be resolved by obtained detailed British records
@that surely must exist in official files, which presumably
@contain the radar logs.

@I also theorized that the three Bentwaters fast-track UFO's with @similar E-W patterns at 9:30, 10 and 10:55 PM were really one @and the same event at 9:55 PM with a 25-min error on one report, @and a time standard 1-hr error on the other, and a 5-min @roundoff on the third, since each were reported by different @radar operators interviewed two weeks after the fact and some @might have checked records and others recalled from memory.

That's a possibility!

@BTW, the T-33 was not just "a pilot training jet" as if it was @ridiculous to imagine scrambling it for an intercept, as I @pointed out it belonged to the 512th FIGHTER INTERCEPTOR @Squadron at Bentwaters (actually it was diverted rather than @scrambled but no matter). (I assume it was only one jet with @two crew members rather than 2 jets, and that the official @record is ambiguous on the point.)

All of the T-series are trainers. That's what the "T" stands for, just as "B" stands for "bomber," "C" stands for "cargo," "F" stands for "fighter," and "P" stands for "pursuit" (later replaced by "F").

The trainers are fully armed aircraft. The difference is that the T series is designed to be much more forgiving of pilot errors than the other series. They also have dual controls. They are not quite as fast, and not as maneuverable, but can handle such tasks as identifying aircraft and forcing down unarmed planes. The T-33 was designed to get pilots already trained on propeller planes into flying jets, not for first-time fliers.

These T-series planes are also the personal planes used by some high ranking officers to travel from base to base. James Lovell had one, as he reports in his book.

In this case, either the jet was flying from one base to another, or the instructor took the controls for the search. Given the time it took for the scrambled jet to get into the air (later that night), it makes sense that the T-33, already flying, could go take a look. If something was there that was too big for the T-33 to handle, the other jets could then be scrambled.

We also have to remember that (according to Jenny's book "UFO: Danger in the Air" -- the US title for "Something in the Air") the pilots had been chasing RADAR anomalies over the North Sea for months. The only difference was that this one was over land.

According to Spencer & Evans' book "Phenomenon, 40 years of Flying Saucers," the Venom pilot kept switching frequencies to communicate with both Lakenheath and Neatishead. So each base had different accounts of the event, because each received only half of the messages. The Lakenheath controller did not know that he was no longer controlling the intercept.

When that ended, the Neatishead controller, unaware of continuing UFO activity (the pilot had switched back to Lakenheath), had cancelled the request for the second fighter. It was ordered to return to base shortly after takeoff.

Chronology according to "Phenomenon"

2345 Neatishead made the request for the Venom. Two phone calls were made.

2350 the Venom was airborne at 2355. The Venom had to take off into the wind, away from Lakenheath.

2352 Venom entered Lakenheath control zone. Another account gives this time as 0040.

2354 Pilot switches to Neatishead frequency without telling Lakenheath. Perkins continues to give headings to the Venom, unaware that the pilot does not hear him.

2400 Pilot has visual contact with white light. Cat and mouse chase begins. Neatishead requests second Venom. Another account gives this time as 0100.

2405 Neatishead loses the target. Lakenheath still has target, and pilot gets vectors from them.

2410 First Venom breaks off, second is arriving. Neatishead, thinking the incident is over, cancels the call for the second Venom. Both controller shifts are in the control center for a while.

Points to ponder:

Bentwaters had the MPN-11A RADAR, which is a GCA with a fast sweep (one source says 4 sec, another says 2).

Lakenheath was using a CPS-5, which is an ASR with a 15 second sweep rate This was the scope Perkins used.

Lakenheath also had a CPN-4 which we have no information on other than it did show the objects the Venom chased. Perkins had to phone the operator of the CPN-4, who had not noticed the objects before the call.

One question is: How did the Lakenheath controllers know which object was the jet and which was the UFO? They didn't have transponder or height finder capability.

The Venom had no tail RADAR, so it had to rely on the controller for information when the object was behind it.

If the Bentwaters RADAR has either a sweep rate of 4 s or 2 s, then the plotting of the speed and time of an object crossing the scope could never be 16 seconds, since the sweep would be on opposite sides of the scope for the first and last blip.

An error was made by measuring the distance and then dividing by the number of blips, but no time difference was included for the time the sweep takes to get from one side of the scope to the other.

A fencepost error also may have occurred, because the object is there for one less sweep time than the number of blips (the first one takes no time at all).

Fencepost error: Forgetting that a straight fence needs a number of posts that is one more than the number of rails.

One time, I asked my students (I used to tutor math) how many posts I needed to hold up a ten-rail-long fence. I got the following answers: 5, 8, 9, 10, 11, 12, 15, and 20. The correct answer is 11. The most common answer was 10.

Subject: Re: Re: Astronauts, panelStatus:

Thanks Jim!

I was just about to go into a laborious process of documenting the fact the S-IVB on Apollo 12 went into solar orbit and only in the later missions was it sent to impact the moon -- after missions had left seismographic packages on the moon.

It's a sorting out process and we have a ways to go on Apollo 12, where the problem is the flashing light's forward position and long period of seeming pacing. On Gemini 11 it seems fairly clear it's going to be difficult finding evidence that's decisive as to whether it was a small piece of debris say 6 inches in size at about 50 feet distance just out of the astronauts' stereoscopic vision range (so they couldn't tell the distance by looking) or if we can trust their impression that it was some satellite 50 miles away. The issue may come down to whether there are any visual cues in space beyond the 30-foot limit of human-eye stereoscopy and accommodation (focus) which could justify Conrad's and Gordon's 50-mile impression (or maybe it was just Conrad). On earth there are some distance cues from atmospheric haze, placement or ordinary objects, etc. And even if it was a satellite or space object perhaps 1/2 mile away it could still be space debris, albeit fairly large (abo!

!
!

ut 25 feet at that distance as measured on the photos).

We know that 90%+ of UFO cases turn out to have conventional explanations. So we know the same is likely for astronaut UFO cases though an argument could be made that space is such a radically different environment than on earth that we can't compare. Nevertheless, there have been a few dozen astronaut UFO cases reported or claimed and out of those only a few remain unexplained, so that's roughly a 80-90% proportion right there.

And most importantly, astronaut UFO cases are EXTREMELY LOW STRANGENESS. They are like distant Nocturnal Lights cases except we have more technical data in some cases, and/or we have photos. We don't have EM effects, radiation burns, psychic messages, fantastic accelerations and wild corner turns, clear saucer shapes with antennas or portfoles, etc. I think UFOlogists forget this fact too easily and grasp at the sensational witness qualifications and exotic setting.

Brad

COMMENTS: I already commented on this in an earlier posting. The so-called "thread" is a SCRATCH that suddenly showed up AFTER Bruce Maccabee lent the copy negatives to Spaulding / GSW. Bruce can tell more about this. I have not heard that the purported "thread" shows up on the original Polaroids and it doesn't show up on other early copies made from them.

Focus anomalies in the original photos also rule out a

- > distant object. The UFO is in better focus than anything showing
- > in the background. This means that the camera was focused at much

COMMENTS: I think this is egregiously mistaken. Spaulding's whole program was designed to try to "find" vertical lines. I bet there are published papers discussing these efforts on McMinnville. Bruce Maccabee arranged for the "GSW" scans so he can discuss this in more depth than I can.

- > @antenna rotations in between.
- >
- > No, but to calculate the time taken by the object to cross the
- > scope, you have to subtract the unused portion of the first and
- > last sweeps. That's what is confusing.

STILL FURTHER COMMENTS: Larry you need to bone up on radar fundamentals. This is getting tedious. It doesn't take a FULL SWEEP rotation OR even a HALF SWEEP to illuminate a target on the FIRST BLIP. It takes as I said just a fraction of a second. Then the time intervals from then on are determined by the sweep durations and the target's movement.

When a radar operator sees the FIRST BLIP he typically has no consciousness or awareness of any time interval prior to that, no time for the radar antenna to rotate around once. If a radar beam has a 1-degree width and a 2-second sweep rate, then it illuminates a target for $1/360$ of 2 seconds, or about 6 milliseconds -- a FRACTION OF A SECOND. Only then does the radar operator wait about two seconds (SWEEP TIME) and expect to see the blip near where it was the first time and then check the distance moved to determine speed (or the radar computer will calculate it for him).

So if the radar operator sees 5 blips in succession there have been 5 sweeps of the radar antenna and 4 sweep intervals in between, NOT 6 intervals, NOT 5.5 or 4.5 or whatever as suggested by you (below).

The text said the object

- > was observed in the time of only three sweeps, and then the
- > velocity was calculated ON THAT BASIS. So one of these
- > possibilities MUST be true:
- >
- > * 3 blips were observed, and the speed (since it crossed the

 >
 > GCA - Ground Controlled Approach: These are faster, having a 2 or
 > 4 second sweep and a 25 mile range.
 <SNIP>

STILL FURTHER COMMENTS: Thanks for proving my point about the GCA radar at Bentwaters that it makes more sense that it had a 2-second sweep time than the 15-second time you were originally citing to me from your Indianapolis radar as if it should apply to Bentwaters (which quote you've omitted above evidently to avoid embarrassment).

STILL FURTHER COMMENTS: Jim Oberg has already corrected you on wasting time speculating about space program facts instead of just finding out. I already told you in which direction the separation maneuvers were done to separate the Apollo from the S-IVB and the S-IVB's SLA Panels -- which info I obtained directly from NASA engineers and from official NASA documents -- and now you try to argue with NASA on the alleged danger of their methods. Quite obviously NASA mission planners didn't want the astronauts trying to rotate the S-IVB stage nor did they want the Apollo -- which was already positioned FORWARD ahead of LOWER STAGES such as the Saturn third stage (S-IVB) -- to have to maneuver around to get behind the S-IVB.

When Lunar Orbit Insertion took place more than 3 days later (some 79 hours later) the S-IVB and the four SLA Panels should have been very roughly at least a quarter to a HALF LUNAR DIAMETER behind and away from the Apollo 12 astronauts. By the time this debris could catch up with the Apollo -- now having shot away around a sharp curve into lunar orbit -- the astronauts would have had a good percentage of the moon between them and the debris which then harmlessly sped by into solar orbit.

> @>
> @> The number of sweep-times used to calculate the time MUST be one
> @> less than the total number of blips. That is a mathematical fact
> @> that can not be refuted.
>
> @FURTHER COMMENTS: We're not talking about sweep TIMES but
> @SWEEPS. Each blip is created by a sweep of the radar and it
> @does NOT take all the time for the radar antenna to rotate
> @around one full turn to do so, but just a fraction of a second.

- > @If there are 5 blips, there are 5 sweeps, and 4 sweep-times or
- > @antenna rotations in between.
- >
- > No, but to calculate the time taken by the object to cross the
- > scope, you have to subtract the unused portion of the first and
- > last sweeps. That's what is confusing.

STILL FURTHER COMMENTS: Larry you need to bone up on radar fundamentals. This is getting tedious. It doesn't take a FULL SWEEP rotation OR even a HALF SWEEP to illuminate a target on the FIRST BLIP. It takes as I said just a fraction of a second. Then the time intervals from then on are determined by the sweep durations and the target's movement.

When a radar operator sees the FIRST BLIP he typically has no consciousness or awareness of any time interval prior to that, no time for the radar antenna to rotate around once. If a radar beam has a 1-degree width and a 2-second sweep rate, then it illuminates a target for $1/360$ of 2 seconds, or about 6 milliseconds -- a FRACTION OF A SECOND. Only then does the radar operator wait about two seconds (SWEEP TIME) and expect to see the blip near where it was the first time and then check the distance moved to determine speed (or the radar computer will calculate it for him).

So if the radar operator sees 5 blips in succession there have been 5 sweeps of the radar antenna and 4 sweep intervals in between, NOT 6 intervals, NOT 5.5 or 4.5 or whatever as suggested by you (below).

The text said the object

- > was observed in the time of only three sweeps, and then the
- > velocity was calculated ON THAT BASIS. So one of these
- > possibilities MUST be true:
- >
- > * 3 blips were observed, and the speed (since it crossed the
- > scope) was calculated from the distanced covered and 1.5 sweep
- > times.
- >
- > * 4 blips were observed, and the speed was calculated from 2.5
- > sweep times.
- >
- > * An error was made, because the speed was calculated from 3
- > sweep times.

STILL FURTHER COMMENTS: This is all totally confused. See my comments preceding this.

- >
- >
- > @FURTHER COMMENTS: The MPN-11A at Bentwaters was a GCA (ground
- > @controlled approach) radar not a regional traffic control radar

> @such as yours at Indianapolis apparently. A 15-second or even
 > @4-second gap in controlling the approach of an incoming aircraft
 > @might not be too comfortable.
 >
 > Three kinds of RADAR are used at airports:
 >
 > ASR - Airport Surveillance RADAR: These typically have a 15
 > second sweep and a 60 mile range.
 >
 > GCA - Ground Controlled Approach: These are faster, having a 2 or
 > 4 second sweep and a 25 mile range.
 <SNIP>

STILL FURTHER COMMENTS: Thanks for proving my point about the GCA radar at Bentwaters that it makes more sense that it had a 2-second sweep time than the 15-second time you were originally citing to me from your Indianapolis radar as if it should apply to Bentwaters (which quote you've omitted above evidently to avoid embarrassment).

COMMENTS: Please note just to be clear that my 1980 work came in the form of editing Condon Committee radar analyst Gordon Thayer's article for Ron Story's

Encyclopedia of UFO's (Thayer approved of the edits). That's where I introduced the idea of a possible time standard error which Thayer had already hinted at in his 1971 AIAA article on the Lakenheath-Bentwaters case. (I also had extensive correspondence in 1979-early 80's with Sturrock, Thayer, Klass.)

and

- > Jenny's to my look at this mess. I independently thought of it,

- >
- > 2352 Venom entered Lakenheath control zone. Another account gives
- > this time as 0040.
- >
- > 2354 Pilot switches to Neatishead frequency without telling
- > Lakenheath. Perkins continues to give headings to the Venom,
- > unaware that the pilot does not hear him.
- >

- > 2400 Pilot has visual contact with white light. Cat and mouse
- > chase begins. Neatishead requests second Venom. Another account
- > gives this time as 0100.
- >
- > 2405 Neatishead loses the target. Lakenheath still has target,
- > and pilot gets vectors from them.
- >
- > 2410 First Venom breaks off, second is arriving. Neatishead,
- > thinking the incident is over, cancels the call for the second
- > Venom. Both controller shifts are in the control center for a
- > while.

COMMENTS: This is bizarre! Where did they get this exact chronology??? Don't they say? I've never seen it before. Is it pure speculation? If it's true then Jenny's Venoms are the wrong ones.

- > ****
- >

- > then the plotting of the speed and time of an object crossing the
- > scope could never be 16 seconds, since the sweep would be on
- > opposite sides of the scope for the first and last blip.

COMMENTS: The radar operator apparently forgot to make one of the sweep intervals a half-sweep (the one that crossed over from the east side to the west side of Bentwaters) when he reported a 16-second total duration, so I assumed the more conservative anti-UFO interpretation of the minimum number of blips as 9 and that

the total duration was 15 seconds, instead of assuming the operator meant 10 blips and 17 seconds.

- > An error was made by measuring the distance and then dividing by

Subject: Re: LakenheathStatus:

Hi Jenny,

Thanks for the helpful info on the British information law situation and the official UFO files. How many pages of Air Staff 2A files have been released would you estimate?

Brad Sparks

@
@@
@Thanks Jim!

@I was just about to go into a laborious process of documenting
@the fact the S-IVB on Apollo 12 went into solar orbit and only
@in the later missions was it sent to impact the moon -- after
@missions had left seismographic packages on the moon.

@It's a sorting out process and we have a ways to go on Apollo
@12, where the problem is the flashing light's forward position
@and long period of seeming pacing. On Gemini 11 it seems fairly
@clear it's going to be difficult finding evidence that's
@decisive as to whether it was a small piece of debris say 6
@inches in size at about 50 feet distance just out of the
@astronauts' stereoscopic vision range (so they couldn't tell the
@distance by looking) or if we can trust their impression that it
@was some satellite 50 miles away. The issue may come down to
@whether there are any visual cues in space beyond the 30-foot
@limit of human-eye stereoscopy and accommodation (focus) which
@could justify Conrad's and Gordon's 50-mile impression (or maybe
@it was just Conrad). On earth there are some distance cues from
@atmospheric haze, placement or ordinary objects, etc. And even
@if it was a satellite or space object perhaps 1/2 mile away it
@could still be space debris, albeit fairly large (about 25
@feet at that distance as measured on the photos).

@We know that 90%+ of UFO cases turn out to have conventional
@explanations. So we know the same is likely for astronaut UFO
@cases though an argument could be made that space is such a
@radically different environment than on earth that we can't
@compare. Nevertheless, there have been a few dozen astronaut
@UFO cases reported or claimed and out of those only a few remain
@unexplained, so that's roughly a 80-90% proportion right there.

@And most importantly, astronaut UFO cases are EXTREMELY LOW
@STRANGENESS. They are like distant Nocturnal Lights cases
@except we have more technical data in some cases, and/or we have
@photos. We don't have EM effects, radiation burns, psychic
@messages, fantastic accelerations and wild corner turns, clear
@saucer shapes with antennas or portfoles, etc. I think
@UFOlogists forget this fact too easily and grasp at the
@sensational witness qualifications and exotic setting.

Sorry. I actually got that out of an encyclopedia. I assumed that
what they wrote would be true. It was the truth, but it wasn't
the whole truth. On second look, the statement was not specific
to every flight. They said "The S-4B upper stage was not wasted,
but was deliberately crashed into the moon to create seismic
waves for an experiment." But they didn't say anything about any
S4Bs going into solar orbit instead, and they didn't say anything
about the crash always happening on every flight.

I realize that James is an expert on the subject (I just read the
Scientific American article - good show!), so the next time I
have a thought on these issues, I will bounce it off of him
first.

The photo I have of the Gemini 11 UFO shows a structured craft. Under magnification, it looks like a collection of detailed pipes and spheres, in front of fuzzy-looking sausage-shaped objects.

It almost looks like a satellite with thrusters doing a maneuvering burn, with the white sausages being the exhaust. But the shape of the exhaust is wrong.

<

I have positive transparencies made by BARA photo from the originals over 25 years ago. There are "blobs" and "coronas" which have a "structure

... but it would be a stretch to talk about "pipes and spheres". More like various points or small areas on an object (if it was AN object) that were very reflective and cause light to scatter sideways in the film (halation) and other parts of the object that reflected less light. There is a definite change in relative positions of the blobs in the second photo compared to the first.

There is a possibility that GSW/Spaulding actually hoaxed his analysis
after he had gone public claiming Heflin's photos were a hoax without
really being able to prove it in his INITIAL analysis.

As for the focus, the first photo is so well focused on distant objects
that

you can see the telephone poles and cars at the distance of the
Santa Ana Freeway, a mile or so away (if I recall correctly the
distance). Unfocused it is not! (I have copies..prints.. made from
excellent negatives of the originals.)

>Almost all UFO photos should be focused at infinity, because the

Agreed

>But the McMinnville photos were edge-enhanced by GSW to show

>string if it had been there. I have never seen them enhanced in
t>he vertical direction.>

Don't know what you mean. GSW enhanced in very direction
Also used "Laplacian" which looks for gradients in x and y
together so can pick up "off-angle" gradients. (used original negs)
Nathan at JPL looked for vertical lines... found none (using
original negatives)

@>@Reading Kevin Randle's "Scientific Ufology" I learned that Mr.
@>@Heflin recovered his negatives a few years ago, after almost
@>@30 years!. Amazing!

@> @Does anybody know the circumstances around this "recovery"?

@>@Mr. Randle also suggested that we can now examine them and
@>@finally reach a conclusion. Has it been done? If not (I have
@>@not heard anything about it), why not?

@>@Finally, along the years I have come across several references
@>@questioning the computer analysis of the defunct GSW, even
@>@to the point of suggesting tampering with the evidence to
@>@explain it! Would anybody in the list care to comment?

@> If he recovered the photos, who did he recover them from?

@> I have a copy of one of the GSW edge-enhancement photos. It was

@> enhanced to show vertical edges. It definitely shows a supporting
@> thread.

@COMMENTS: I already commented on this in an earlier posting.
@The so-called "thread" is a SCRATCH that suddenly showed up
@AFTER Bruce Maccabee lent the copy negatives to Spaulding / GSW.
@Bruce can tell more about this. I have not heard that the
@purported "thread" shows up on the original Polaroids and it
@doesn't show up on other early copies made from them.

Our postings "crossed in the mail." I launched mine before I
read yours. That line-length problem requires me to read the
postings in order, and respond to them as I come to them.
Otherwise, I have to spend an hour fixing the margins before I
can either read or respond to them. Could we keep our line
lengths under 70 characters?.

@>Focus anomalies in the original photos also rule out a
@>distant object. The UFO is in better focus than anything showing
@>in the background. This means that the camera was focused at much
@>less than infinity.

@COMMENTS: This is not true! You can see a truck in the extreme
@distance on one of the Heflin photos.

Yes, you can see a truck, but the focus of it is not as sharp as
the object focus. I would normally expect the focus of distant
objects to be as sharp as the UFO focus if the camera was really
set to infinity. But I do have a question on that: Was it a hot
day? And was the camera a fixed-focus camera?

@> Almost all UFO photos should be focused at infinity, because the
@> object is usually farther away than 20 feet.

@> But the McMinnville photos were edge-enhanced by GSW to show
@> horizontal lines, a direction that would not show a vertical
@> string if it had been there. I have never seen them enhanced in
@> the vertical direction.

@COMMENTS: I think this is egregiously mistaken. Spaulding's
@whole program was designed to try to "find" vertical lines. I
@bet there are published papers discussing these efforts on
@McMinnville. Bruce Maccabee arranged for the "GSW" scans so he
@can discuss this in more depth than I can.

You can tell which way the scan is running by looking at the
light and dark edges it leaves on objects. All of the copies of
the scans of the McMinnville Photos I have are scanned in the
horizontal direction, the same way the Villa photo held up by a

horizontal string was. The scan on the Heflin photo was perpendicular to those. One would imagine that they did the scans in both directions, but it is quite possible that the horizontal scan photo was the only one ever published. I would like to see the vertical scan photo if it is available.

@>@Sincerely,
@>@Luis R. González Manso

@> @> @
@> @> @STILL MORE COMMENTS (below)

@> @> The number of sweep-times used to calculate the time MUST be one
@> @> less than the total number of blips. That is a mathematical fact

@> @> that can not be refuted.

@> @FURTHER COMMENTS: We're not talking about sweep TIMES but
@> @SWEEPS. Each blip is created by a sweep of the radar and it
@> @does NOT take all the time for the radar antenna to rotate
@> @around one full turn to do so, but just a fraction of a second.
@> @If there are 5 blips, there are 5 sweeps, and 4 sweep-times or
@> @antenna rotations in between.

@> No, but to calculate the time taken by the object to cross the
@> scope, you have to subtract the unused portion of the first and
@> last sweeps. That's what is confusing.

@STILL FURTHER COMMENTS: Larry you need to bone up on radar
@fundamentals. This is getting tedious. It doesn't take a FULL
@SWEEP rotation OR even a HALF SWEEP to illuminate a target on
@the FIRST BLIP. It takes as I said just a fraction of a second.
@Then the time intervals from then on are determined by the sweep
@durations and the target's movement.

That's what I have been trying to say. I thought you were
counting sweeps as beginning at some arbitrary point (say
north) from what you wrote before, since you said the number of
sweeps was the same as the number of blips.

@When a radar operator sees the FIRST BLIP he typically has no
@consciousness or awareness of any time interval prior to that,
@no time for the radar antenna to rotate around once. If a radar
@beam has a 1-degree width and a 2-second sweep rate, then it
@illuminates a target for $1/360$ of 2 seconds, or about 6
@milliseconds -- a FRACTION OF A SECOND. Only then does the
@radar operator wait about two seconds (SWEEP TIME) and expect to
@see the blip near where it was the first time and then check the
@distance moved to determine speed (or the radar computer will
@calculate it for him).

@So if the radar operator sees 5 blips in succession there have
@been 5 sweeps of the radar antenna and 4 sweep intervals in
@between, NOT 6 intervals, NOT 5.5 or 4.5 or whatever as
@suggested by you (below).

RIGHT! But that's only IF the object stays in the SAME part of
the screen during the entire period it was tracked. If it goes
somewhere else, then the time is altered accordingly.

Look look at the geometry extreme case where the object crosses
directly over the RADAR site at low altitude and leaves at 180
degrees from where it started:

For the first half of the tracking period, as the object approaches the RADAR antenna, the blips are one sweep period apart. Do we agree on that?

As the object flies directly OVER the RADAR site, one of two things can happen:

1. The sweep catches it again after only HALF a rotation, since the object is now on the OTHER SIDE (180 degrees difference) of the station.
2. The sweep misses the object as it passes over the station, and catches it next 1.5 sweep periods later. That's the ONE rotation where the object was not visible, PLUS the HALF rotation because the object is now on the other side of the station.

(At high altitude, the sweep can miss the object for several rotations. These would have to be counted to arrive at an accurate speed estimate.)

For the last half of the tracking period, as the object departs from the RADAR antenna, the blips are one sweep period apart. I hope we agree on that?

So in case 1, The value $3/2$ must be subtracted from the total number of BLIPS to arrive at the true sweep multiplier. This is then multiplied by the sweep rate to get the true total time of the track.

In case 2, The value $1/2$ must be subtracted from the total number of BLIPS to arrive at the true sweep multiplier. This is then multiplied by the sweep rate to get the total time of the track.

This is true every time an object departs 180 degrees away from where it first appears. That includes the 3 high speed objects reported at Bentwaters.

Different corrections must be applied if the object departs at other angles relative to where it first appears, or passes to one side of the station. A difference occurs that depends not only on the angle, but on which side of the station the object passes.

If the object circles the station once and departs in the direction it came from, the time must be altered according to the direction the object circled the station. If the object circled the station in the direction the antenna is rotating in, then the number of blips needs no correction at all. If the object circled the station in the opposite direction, then 2 must be subtracted from the number of blips.

If the object circles the station twice, then 1 must be ADDED to the number of blips if it circled in the direction of antenna rotation, and 3 must be subtracted if it circles in the opposite direction.

My point is that these corrections were NOT done in any of the case reports I have read. In one of them, a time interval was even added in before the first blip.

@>

@> @FURTHER COMMENTS: The MPN-11A at Bentwaters was a GCA (ground
@> @controlled approach) radar not a regional traffic control radar
@> @such as yours at Indianapolis apparently. A 15-second or even
@> @4-second gap in controlling the approach of an incoming aircraft
@> @might not be too comfortable.

@>

@> Three kinds of RADAR are used at airports:

@>

@> ASR - Airport Surveillance RADAR: These typically have a 15
@> second sweep and a 60 mile range.

@>

@> GCA - Ground Controlled Approach: These are faster, having a 2 or
@> 4 second sweep and a 25 mile range.

@<SNIP>

@STILL FURTHER COMMENTS: Thanks for proving my point about the
@GCA radar at Bentwaters that it makes more sense that it had a
@2-second sweep time than the 15-second time you were originally
@citing to me from your Indianapolis radar as if it should apply
@to Bentwaters (which quote you've omitted above evidently to
@avoid embarrassment).

I was thinking of Lakenheath, not Bentwaters. And I cut the text
because my hard disk space is running low.

@> @> When did the LEM extraction occur on that flight?

@> @FURTHER COMMENTS: NASA didn't put the "debris" back in FRONT of
@> @the Apollo!!! All separation maneuvers were done to put S-IVB
@> @and SLA panels BEHIND and AWAY from the Apollo.

@> I was thinking that: The spacecraft had slowed down temporarily
@> during the maneuvering to extract the LEM and get the S-4B out of
@> the way, then speeded up to regain the correct orbit. The debris

@> would have kept going and ended out in front.

@> They don't want any debris that is actually in the translunar

@> In Lovell's book, one of the reasons Apollo 13 had communications
@> problems was that the LEM was designed to use the same frequency
@> the S-4B telemetry was on. Normally the LEM wouldn't have been
@> powered up until after the S-4B had crashed. One of the purposes
@> of that telemetry was to determine the exact time of impact for
@> the seismology experiment. Once that crash happened, the
@> communications problem was gone. But if the S-4B had been sent
@> into solar orbit, the communications problem would have
@> persisted.

@STILL FURTHER COMMENTS: Jim Oberg has already corrected you on
@wasting time speculating about space program facts instead of
@just finding out. I already told you in which direction the
@separation maneuvers were done to separate the Apollo from the
@S-IVB and the S-IVB's SLA Panels -- which info I obtained
@directly from NASA engineers and from official NASA documents --
@and now you try to argue with NASA on the alleged danger of
@their methods. Quite obviously NASA mission planners didn't
@want the astronauts trying to rotate the S-IVB stage nor did
@they want the Apollo -- which was already positioned FORWARD
@ahead of LOWER STAGES such as the Saturn third stage (S-IVB) --
@to have to maneuver around to get behind the S-IVB.

That works only if the separation gives some delta-v to the
separated objects so they are in DIFFERENT orbits that don't take
them to the moon alongside the Apollo does this work. That

applies perfectly to the panels and the S-4B, since they have sources of energy to give them delta-v. But the laws of physics tell me that the debris that falls off cannot be course-altered by any separation maneuver executed after the debris has already fallen off, unless the engine blast happens to hit it.

@When Lunar Orbit Insertion took place more than 3 days later
@(some 79 hours later) the S-IVB and the four SLA Panels should
@have been very roughly at least a quarter to a HALF LUNAR
@DIAMETER behind and away from the Apollo 12 astronauts.

Agreed! Those 5 items had energy sources that put them into different orbits. Now if each piece of floating space junk had an energy source, this would make sense. Unfortunately, pieces of ice don't come with rockets, explosives, or springs attached.

@By the time this debris could catch up with the Apollo -- now
@having shot away around a sharp curve into lunar orbit -- the
@astronauts would have had a good percentage of the moon between
@them and the debris which then harmlessly sped by into solar
@orbit.

Right! But all of the junk that was floating along with Apollo before the separation would still be there WITH Apollo, unless they made a course correction afterwards. And the LEM extraction maneuvers would have put the spacecraft slightly behind the junk lost before the maneuvers, which is the best place for it to be when the astronauts slow down into lunar orbit.

The above is not speculation, but pure physics.

James, Did the panels have enough energy to go into solar orbit by themselves, or did they go into an extremely large Earth orbit?

>>

>Hi Jenny,

>

>Thanks for the helpful info on the British information law situation and the official UFO files. How many pages of Air Staff 2A files have been released would you estimate?

>

>Brad Sparks

Hi,

Not counted and they are not 'released' as such - merely accessible at the PRO. You can do photocopies but you need to be selective. I doubt I've accessed more than a fraction of the stuff in the days I've spent there and Andy Roberts and Dave Clarke also only touched the surface of newly released files in a week long visit recently. New batches are released about this time every year via the 30 year rule.

One problem is that these files are scattered in many places. You need to do a thorough sweep to try to find them all - then order up likely files and just go through them. There is no master list of UFO relevant files and they are not on shelves you have to order them one by one and do a manual check. So its time consuming.

I am sure from what I have seen we are talking about several thousand sheets of paper now and hundreds more are added each year. But in terms of being any value they are frankly disappointing. They have little sign of any investigation or follow up and more often are just letters filed from members of the public reporting lights in the sky 30 years ago.

Occasional gems (like that reference to radar cases and Bentwaters) are very few and far between and not easy to spot as they tend to lurk in batches of files where you would not normally expect to go look.

Overall I'd have to say a half decent kiddies UFO spotting club would have at least as good a set of records as most of these.

One hilarious file I found came when Allen Hynek was visiting the UK in the mid sixties and had obviously used his Blue Book credentials to ask to meet his opposite number. The MoD quickly worked out that they didnt have one and what might have made a good scene in the sit com 'Yes Minister' ensued as they tried to fathom out who on earth they should send to meet Allen who might actually know what he was talking about! They even considered bringing in a BUFORA UFOlogist, to act on their behalf, but chickened out of that because it might have made it seem they were taking UFOs too seriously, and by the looks of it ended up doing nothing. Which pretty well sums up 40 years of MOD UFO Study from what I've seen.

Best wishes,

Jenny

The lunar fly-by may have given them enough to escape. Being in front or
behind was all the same in terms of safety -- space is REALLY REALLY REALLY
B-I-G and NASA had no concerns about running into them if they were in the
way. None. It was not a factor.

@> different accounts of the event, because each received only half
@> of the messages. The Lakenheath controller did not know that he
@> was no longer controlling the intercept.

@COMMENTS: How do they know this? Where are they getting their
@info from? I don't recall this in USAF controller Perkins' or
@RAF controller Wimbledon's testimony.

The article is written by Martin Lawrence Shough

I have the book in my hands as I write. The sources used are:

Report IR-56, written mostly by Training Sgt Whenry

Secret teletype BOI-485

Thayer "Optical and RADAR analysis of Field Cases", from Condon Report

A personal interview with the Neatishead GCI Chief Fighter Controller Oct 1986

McDonald "Science in Default" (in Sagan & Page "UFOs - A Scientific Debate")

Thayer: "UFO Encounter II" Astronautics & Aeronautics, Sep 1971

McDonald "UFOs over Lakenheath" Vol 16, 1970

[Don't look at me; that's what it says. No publication title included]

The following information is included:

Bentwaters had a GCA CPN-4 RADAR with a 4 second scan, range 25 to 30 mi, manned by Training Sgt Whenry.

2130 Airman John Vaccare estimated the transit time of the first object as 30 seconds

The T-33 was returning from a training mission and was asked to investigate. It had no RADAR.

Stf Sgt Lawrence S Wright was Bentwaters control tower shift supervisor, and was the one who reported a light low in east, later identified as Mars.

No meteor watchers saw the visual object seen from the C-47.

Bentwaters GCA alerted Lakenheath GCA, which alerted Sculthorpe RAF. Then either Lakenheath GCA or Sculthorpe notified Lakenheath ATC

Lakenheath ATC was manned by Training Sgt Forrest D Perkins, supervisor, along with 4 or 5 other controllers.

Perkins thinks the alert came from Sculthorpe (not Bentwaters), because it was routed through the Sculthorpe switchboard. It is 20 years before he realizes his mistake. He TELLS his controllers to watch for high-speed targets.

Lakenheath ATC scopes have various displayed ranges, each adjustable from 10 to 200 miles. MTI was on.

2255 One Lakenheath controller notices a stationary target 20 to 25 mi sw that MTI should have removed. Perkins calls Lakenheath GCA, who confirm target location. (in BOI-485)

2300 Target starts moving.

2310 Target ends up 20 mi nnw. Perkins alerts 7th Air Defense Command, 3rd Air Force Command, and his Air Force Comm Squadron Commander, and an RAF liason.

Targer alternately stops and starts.

2340 Decision made to intercept. Chief Fighter Controller Flight Lt FHC Wimbledon, GCI (Ground Controlled Intercept) Neatishead is notified.

@> 2345 Neatishead made the request for the Venom. Two phone calls @> were made to RAF Waterbeach.

@> 2350 the Venom was airborne at 2355. The Venom had to take of @> into the wind, away from Lakenheath.

\$ 2352 Venom entered Lakenheath control zone. Another account gives this time as 0040.

\$ 2356 Pilot switches to Neatishead frequency without telling Lakenheath. Perkins continues to give headings to the Venom, unaware that the pilot does not hear him.

@> 2400 Pilot has visual contact with white light. Cat and mouse @> chase begins. Neatishead requests second Venom.

(Another account of the sighting -- a different book -- gives this time as 0100.)

\$ 2405 Neatishead loses the target. Lakenheath still has target, and pilot gets vectors from them.

@> When that ended, the Neatishead controller, unaware of continuing @> UFO activity (the pilot had switched back to Lakenheath), had @> cancelled the request for the second fighter. It was ordered to

@> return to base shortly after takeoff.

2410 First RADAR operator transmits "Clearest target I've ever seen on RADAR." First Venom breaks off, second is arriving. Neatishead, thinking the incident is over, cancels the call for the second Venom. Both controller shifts are in the control center for a while.

@COMMENTS: This is bizarre! Where did they get this exact @chronology??? Don't they say? I've never seen it before. Is @it pure speculation? If it's true then Jenny's Venoms are the @wrong ones.

BOI-485?

I edited this to put a \$ by the places where the word "about" appears.

There you have it. Very interesting!

@> ****

@>

@> Points to ponder:

Source for the following is Condon Report:

@> Bentwaters had the MPN-11A RADAR, which is a GCA with a fast @> sweep (one source says 4 sec, another says 2).

@> Lakenheath was using a CPS-5, which is an ASR with a 15 @> second sweep rate This was the scope Perkins used.

@> Lakenheath also had a CPN-4 which we have no information on other @> than it did show the objects the Venom chased. Perkins had to @> phone the operator of the CPN-4, who had not noticed the objects @> before the call.

But "Phenomenon" says Bentwaters had a CPN-4. Were there two?

@> One question is: How did the Lakenheath controllers know which @> object was the jet and which was the UFO? They didn't have @> transponder or height finder capability.

@> The Venom had no tail RADAR, so it had to rely on the controller @> for information when the object was behind it.

@> If the Bentwaters RADAR has either a sweep rate of 4 s or 2 s, @> then the plotting of the speed and time of an object crossing the

@> scope could never be 16 seconds, since the sweep would be on
@> opposite sides of the scope for the first and last blip.

@COMMENTS: The radar operator apparently forgot to make one of
@the sweep intervals a half-sweep (the one that crossed over from
@the east side to the west side of Bentwaters) when he reported a
@16-second total duration, so I assumed the more conservative
@anti-UFO interpretation of the minimum number of blips as 9 and
@that the total duration was 15 seconds, instead of assuming the
@operator meant 10 blips and 17 seconds.

This was what I was saying over and over in the other posts. NOW
it's right!

But wouldn't the 17 second figure be more conservative,
indicating a slower speed?

Subject: Re: LakenheathStatus:

Larry,

All of the times from about 11 PM (2300 hrs) onward must be approximate reconstructions from Wimbledon's account (given in Oct 1986) and Perkin's in the Condon Report, AIAA etc., except the lone 0010 time in the Blue Book file. Thus we can't be absolutely sure it rules out Jenny's Venoms, though as I've said before it tends to do so.

I think there was some confusion between the CPN-4's 4-second sweep and the MPN-11A's 2-second rate by Klass among others. I don't know if there was another CPN-4 at Bentwaters (I don't have any of my files with copies of USAF docs to check).

It is more conservative to assume fewer blips and higher speed because it fits AP or meteors better. Only an ET-oriented mindset would think a higher speed must favor ETH ("farther beyond earth technology").

Brad

Subject: Re: LakenheathStatus:

Hi Jenny,

Thanks for the UKUFO overview.

Here in the US there are collections of several thousand pages of declassified US UFO documents available from govt agencies and private groups and individuals, including some on official and private websites.

The Hynek visitation flap is a funny story and I've read your account once before. But then again that's one group in MOD and there are other depts. In 1952, the CIA/OSI UFO Study Group had no trouble finding and speaking with their opposite numbers in the MI-6 scientific intelligence staff, I was told.

Brad

- > before the separation would still be there WITH Apollo, unless
- > they made a course correction afterwards.

NEW COMMENTS: Guess what? Mid-Course Correction-2 added about 64 ft/sec to Apollo 12's velocity over 26 hours after the separation from the S-IVB and ejection of the SLA Panels covering the Lunar Module, thus putting much more distance between them and the Apollo over the course of the next day (nearly 800 miles extra) during which the flashing light was observed. The light if it was a SLA Panel that somehow was still visible nearly a day after separation should have disappeared within a few hours of MCC-2. But not only did it not disappear but there was no obvious dimming or increase of distance reported either.

The same applies to any debris from the separation that came along with the Apollo. Since the debris had no propulsion system of its own, once the Apollo applied the MCC-2 velocity adjustment the debris would have been left behind, up to 800 miles away after a day.

And the LEM extraction

- > maneuvers would have put the spacecraft slightly behind the junk
- > lost before the maneuvers,

NEW COMMENTS: Wrong! The LM ejection springs added about 1 ft/sec to the Apollo 12 (docked CSM-LM) velocity putting it AHEAD of any such junk debris. In a day that would mean an added distance of roughly 10-15 miles, much too far away for small pieces under a foot in size to be visible. The distance situation was much worse for the S-IVB and the SLA Panels as already discussed.

which is the best place for it to be

- > when the astronauts slow down into lunar orbit.

NEW COMMENTS: Already refuted in my earlier comments about the Lunar Orbit Insertion burn swerving the Apollo well off to one side by a quarter to half lunar diameter while any such debris would continue on from that great distance.

- > The above is not speculation, but pure physics.
- >
- > James, Did the panels have enough energy to go into solar orbit
- > by themselves, or did they go into an extremely large Earth
- > orbit?
- >

NEW COMMENTS: The SLA Panels had been with the entire Apollo spacecraft when placed into a Free-Return Trajectory, set for return to the earth at 6:52 AM (EST) on Nov 21, 1969, at 2.4 N, 92 W, in case anything went wrong. However, the SLA Panel ejection by explosive bolts imparted a significant negative delta-V and I don't know the size of the effect after they reached the lunar vicinity (it doesn't matter much for estimating distances to Apollo 12 before that point). Possibly they went into solar orbit, or impacted on the moon, or returned to earth, or ended up in a high elliptical earth orbit.

@From: RB47Expert@aol.com
@@To: UFORL@listbot.com
@Subject: Re: Astronauts / Apollo 12

@NEW COMMENTS: Guess what? Mid-Course Correction-2 added about
@64 ft/sec to Apollo 12's velocity over 26 hours after the
@separation from the S-IVB and ejection of the SLA Panels
@covering the Lunar Module, thus putting much more distance
@between them and the Apollo over the course of the next day
@(nearly 800 miles extra) during which the flashing light was
@observed. The light if it was a SLA Panel that somehow was
@still visible nearly a day after separation should have
@disappeared within a few hours of MCC-2. But not only did it
@not disappear but there was no obvious dimming or increase of
@distance reported either.

I had long ago given up the possibility of the panels. They were
the objects seen from an Earth telescope, and one UFO publication
confused that with what the astronauts saw. My thinking was of
ice shed from the S-4B fuselage. This midcourse correction rules
that out, as long as there were no slowing effects on the S-4B
from the initial CSM separation from the S-4B and from the CSM
docking to the LM.

@The same applies to any debris from the separation that came
@along with the Apollo. Since the debris had no propulsion
@system of its own, once the Apollo applied the MCC-2 velocity
@adjustment the debris would have been left behind, up to 800
@miles away after a day.

@>And the LEM extraction maneuvers would have put the spacecraft
@>slightly behind the junk > lost before the maneuvers,

@NEW COMMENTS: Wrong! The LM ejection springs added about 1
@ft/sec to the Apollo 12 (docked CSM-LM) velocity putting it
@AHEAD of any such junk debris. In a day that would mean an
@added distance of roughly 10-15 miles, much too far away for

@small pieces under a foot in size to be visible. The distance
@situation was much worse for the S-IVB and the SLA Panels as
@already discussed.

What is the delta-v of the following maneuvers?

To the S-4B, caused by initial CSM separation from the S-4B

To the S-4B, caused by CSM-LM docking maneuver?

(I ask this now only for my own edification of the physics behind the maneuvers. I was thinking that both of these maneuvers applied forces that slowed the S-4B down, that the CSM was slower while docked to the S-4B than it was before, and the ejection speeded the CSM up again. This intervening time would have given the junk time to get ahead of the spacecraft if those two delta-v values were significant.)

...

@which is the best place for it to be
@> when the astronauts slow down into lunar orbit.

@NEW COMMENTS: Already refuted in my earlier comments about the
@Lunar Orbit Insertion burn swerving the Apollo well off to one
@side by a quarter to half lunar diameter while any such debris
@would continue on from that great distance.

I was thinking of stuff that was still right with Apollo when the burn occurred. But the midcourse correction took care of most of that. Theory discarded.

Subject: Origin of Term "Flying Saucers"Status:

LIST ONLY

Dear List Members,

I think I have reconstructed the origin of the term "flying saucers" and I would like to check it out with the esteemed and knowledgeable members of this List.

Apparently the term was coined and first used by the Twin Falls (Idaho) Times-News in the headline of a commentary item published on Friday morning, June 27, 1947, "THOSE FLYING SAUCERS," which speculated that the objects may be manmade or from Mars. Presumably the anonymous item was written by the newspaper's editor.

Subject: Re: Rex Heflin's 1965 photosX-Status:

Bruce Maccabee has largely answered these objections, pointing out the sharp focus of the Heflin photos, the fact that GSW scanned for lines/threads in all directions including vertical (on the McMinnville photos as well as Heflin), the fact that GSW may have hoaxed the Heflin images to try to prove they were hoaxed. He can address the other points.

My email system is set for 70 character lines so there's no more I can do on that.

@> @Subject: Rex Heflin's 1965 photos

@> @
@>@Reading Kevin Randle's "Scientific Ufology" I learned that Mr.
@>@Heflin recovered his negatives a few years ago, after almost
@>@30 years!. Amazing!

@> @Does anybody know the circumstances around this "recovery"?

@>@Mr. Randle also suggested that we can now examine them and

@>@finally reach a conclusions. Has it been done? If not (I have
@>@no heard anything about it), why not?

@>@Finally, along the years I have come across several references
@>@questioning teh computer analysis of the defunct GSW, even
@>@to the point of suggesting tampering with the evidence to
@>@explain it! Would anybody in the list care to comment?

@> If he recovered the photos, who did he recover them from?

@> I have a copy of one of the GSW edge-enhancement photos. It was
@> enhanced to show vertical edges. It definitely shows a supporting
@> thread.

@COMMENTS: I already commented on this in an earlier posting.
@The so-called "thread" is a SCRATCH that suddenly showed up
@AFTER Bruce Maccabee lent the copy negatives to Spaulding / GSW.
@Bruce can tell more about this. I have not heard that the
@purported "thread" shows up on the original Polaroids and it
@doesn't show up on other early copies made from them.

Our postings "crossed in the mail." I launched mine before I
read yours. That line-length problem requires me to read the
postings in order, and respond to them as I come to them.
Otherwise, I have to spend an hour fixing the margins before I
can either read or respond to them. Could we keep our line
lengths under 70 characters?.

@>Focus anomalies in the original photos also rule out a
@>distant object. The UFO is in better focus than anything showing
@>in the background. This means that the camera was focused at much
@>less than infinity.

@COMMENTS: This is not true! You can see a truck in the extreme
@distance on one of the Heflin photos.

Yes, you can see a truck, but the focus of it is not as sharp as
the object focus. I would normally expect the focus of distant
objects to be as sharp as the UFO focus if the camera was really
set to infinity. But I do have a question on that: Was it a hot
day? And was the camera a fixed-focus camera?

@> Almost all UFO photos should be focused at infinity, because the
@> object is usually farther away than 20 feet.

@> But the McMinnville photos were edge-enhanced by GSW to show
@> horizontal lines, a direction that would not show a vertical
@> string if it had been there. I have never seen them enhanced in
@> the vertical direction.

@COMMENTS: I think this is egregiously mistaken. Spaulding's
@whole program was designed to try to "find" vertical lines. I
@bet there are published papers discussing these efforts on
@McMinnville. Bruce Maccabee arranged for the "GSW" scans so he
@can discuss this in more depth than I can.

You can tell which way the scan is running by looking at the
light and dark edges it leaves on objects. All of the copies of
the scans of the McMinnville Photos I have are scanned in the
horizontal direction, the same way the Villa photo held up by a
horizontal string was. The scan on the Heflin photo was
perpendicular to those. One would imagine that they did the scans
in both directions, but it is quite possible that the horizontal
scan photo was the only one ever published. I would like to see
the vertical scan photo if it is available.

@>@Sincerely,
@>@Luis R. González Manso

@not disappear but there was no obvious dimming or increase of
@distance reported either.

I had long ago given up the possibility of the panels. They were
the objects seen from an Earth telescope, and one UFO publication
confused that with what the astronauts saw.

ADDED COMMENTS: I never saw any confirmation that European observatories
saw
the Apollo 12 SLA Panels. Maybe they did but I'd want better evidence than
UFO buffs' rumor reporting in Saga magazine.

My thinking was of
ice shed from the S-4B fuselage. This midcourse correction rules
that out, as long as there were no slowing effects on the S-4B
from the initial CSM separation from the S-4B and from the CSM
docking to the LM.

ADDED COMMENTS: The separation distance between S-IVB and Apollo 12 would be INCREASED if the S-IVB was slowed relative to the Apollo.

@The same applies to any debris from the separation that came @along with the Apollo. Since the debris had no propulsion @system of its own, once the Apollo applied the MCC-2 velocity @adjustment the debris would have been left behind, up to 800 @miles away after a day.

@>And the LEM extraction maneuvers would have put the spacecraft @>slightly behind the junk > lost before the maneuvers,

@NEW COMMENTS: Wrong! The LM ejection springs added about 1 @ft/sec to the Apollo 12 (docked CSM-LM) velocity putting it @AHEAD of any such junk debris. In a day that would mean an @added distance of roughly 10-15 miles, much too far away for @small pieces under a foot in size to be visible. The distance @situation was much worse for the S-IVB and the SLA Panels as @already discussed.

What is the delta-v of the following maneuvers?

To the S-4B, caused by initial CSM separation from the S-4B

To the S-4B, caused by CSM-LM docking maneuver?

(I ask this now only for my own edification of the physics behind the maneuvers. I was thinking that both of these maneuvers applied forces that slowed the S-4B down, that the CSM was slower while docked to the S-4B than it was before, and the ejection speeded the CSM up again. This intervening time would have given the junk time to get ahead of the spacecraft if those two delta-v values were significant.)

ADDED COMMENTS: No matter how you cut it, any such debris theory runs into the confounding problem of the 64 ft/sec mid-course correction and other maneuvers leaving the debris "in the dust" so to speak in minutes or a few hours so that the debris would not even be visible. If the CSM projected some debris away and ahead of it during the S-IVB separation and LM docking, if the debris wasn't imparted with a delta-V within say 0.1 ft/sec of the 1 ft/sec delta-V of the LM spring release (i.e., +1.1 ft/sec) then the projected debris would not be close enough to be visible a day later when the flashing light was first seen by the Apollo 12 astronauts. And then it should have been visible SOONER than a day later especially when it would have been enormously brighter the first few hours after separation, and it should have disappeared QUICKLY after the 64 ft/sec MCC-2 instead of remaining visible for a day afterward.

...

@which is the best place for it to be
@> when the astronauts slow down into lunar orbit.

@NEW COMMENTS: Already refuted in my earlier comments about the
@Lunar Orbit Insertion burn swerving the Apollo well off to one

Well, be careful since the window viewing time for the crew is another factor
on when they first spotted it. In the early hours of the flight, watching
Earth may have been all they did at the window. When did the CSM go to BBQ
mode with the slow rotation?

Any rocket system with hypergolics has the capacity of generated snowflakes
from slow leaks or sloppy shut-downs. It's an interesting thought that the
flasher might have been only a few hundred feet away, not a hundred miles or
more.

Still, flashing SLA panels should be easily visible at a range of 300-500
miles, if tumbling right. If not tumbling right, they wouldn't be, so that
may be why ALL weren't seen. Don't forget, also, we're only talking about
half the sky here, the sky visible from the shadowed windows.

Subject: Re: Re: Astronauts / Apollo 12Status:

Hi Jim,

Good points especially about the need for tumbling of the SLA Panels which would attract attention and make sure they weren't "edge on" and thus less visible (also one SLA Panel was ejected at a higher velocity than the others apparently so that one would never have been seen again for sure). I read all 40,000 pages of Apollo ground-air transcripts and debriefings to try to find the greatest distance a SLA Panel was ever seen, among other things, and I don't think I found anything greater than about 100 miles, a bit farther for the S-IVB (maybe I missed something or remember wrong; I have none of my files to review). But this is consistent with Roach's findings for Gemini that the maximum distance a 4-meter object could be seen was 122 km (76 mi). I don't have the info on when Apollo 12 went into BBQ mode, I'm guessing it was after MCC-1 about 11-12 hrs GET. The MCC-2 would have left any close-by "snowflake" in the (space) dust.

Brad

But this is consistent with Roach's findings for Gemini that the maximum distance a 4-meter object could be seen was 122 km (76 mi).>>

I never could figure out where Roach was getting his "space operations" facts. I regularly watch 4-meter space objects naked eye from my backyard at ranges of 300-500 km. So do thousands of other amateur satellite watchers.

Re the SLA panel, it's a lot bigger and brighter than the jettisoned Hubble solar array, and people watch THAT at ranges up to 1000 km routinely. And through ATMOSPHERE.

So I'm very dubious about these alleged 'upper limits' on visibility.

Now, we'd have to ask what stellar magnitude the astronauts reported seeing stars at, and from a darkside window with a minute or two of adaptation, I'd guess well dimmer than 2, maybe 3-4.

Subject: Re: Re: Astronauts / Apollo 12Status:

Hi Jim,

No doubt the theoretical visibility should have been greater but there were problems with visibility through spacecraft windows, interior lighting and glare, dark adaptation, exterior sunlight, debris, etc., and the visual environment is not the same as from a backyard with no windows. Just look at the mess with figuring out what McDivitt really did or did not see on Gemini 4 when his eyes were bothered.

I don't recall ever reading that any Apollo/Gemini/Mercury astronaut ever succeeded in even coming close to the limiting magnitude for seeing stars from earth of mag. +6.

John,

Project Silver Bug was one of several classified discplane programmes undertaken by Avro-Canada during the 1950s.

Also known as Project Y2, it was a USAF funded scheme to build a Mach 3.5 interceptor. Just how far the work progressed remains unknown.

Unlike the silly MJ-12 nonsense, Project Silver Bug existed, although it had relatively little to do with the later hovercraft called Avrocar.

The latest edition of "Nature" carries an article in which a possible source of ball lightning is proposed. In a interview on the Radio 4 Today programme the author (whose name escapes me) outlined the process.

The gist of it is that lightning strikes the ground and vapourises water and soil at the point of strike. This is charged and erupts from the ground to float around in the air.

he was asked about the ball lightning in aircraft (not covered in the article) and proposed a similar process, but with the aircraft structure being involved. Hmmmm...

I'll get a hold of the article and provide fuller details.

Hi Bill and the list

This prompts the next question. The documents I've read state that Silver Bug was a supersonic disc powered by conventional jet engines. Is this correct?

Cheers

Subject: Kenneth Arnould and the Ho-IX
In-Mime-Version: 1.0
Status:

Hi All

Looking through a book on WW2 Nazi aircraft I came across drawing of the Horten Ho-IX flying-wing design which flew in 1944. It was a crescent shape and it looked very like the shape that Kenneth Arnold drew after his famous sighting. The Ho-IX was shipped to US and is it possible the US was test flying a Ho-IX derivative (or several) on the day that Arnold made his report?

Horten also had a design for a parabola design, which looks even more like the shape Arnold drew.

For more info and pictures on these designs look at
http://www.nurflugel.com/Nurflugel/Horten_Nurflugels/horten_nurflugels.html

Cheers

Chris and List Members,

Firstly, apologies that due to other commitments I've regrettably been unable to respond to much mail for a while and it's only now I can.

Although I've older mail requiring attention, I noticed this interesting topic.

>I'll get a hold of the article and provide fuller details.

Chris, I see the article is available on-line at:

<http://www.nature.com/server-java/Propub/nature/403519A0.frameset?context=toc>

[this URL might 'wrap around']

James.

P. S. Now having access to a scanner again, I'll copy later today the 'amateur SETI' article previously mentioned and which a few folks asked about, on and off the list.

I'll provide more details shortly.

Status:

John,

Re: Your question about Silver Bug Propulsion

There were many different engine designs considered by Avro-Canada for their various flying disc studies - starting with Project Y and ended with the WS-606A - Supersonic Application.

Propulsion systems included conventional radially dispersed turbojets (Vipers) and a disc shaped radial flow gas turbine which might be considered as a flattened out jet engine - very unusual spec and most interesting. P.1794 used an even higher performance turbo-ramjet system expected to provide performance as high as Mach 4 at 100,000 ft alt, - very exotic! No electrogravitics though!

Ref your mention of the Hortens and interest in the MMUFO area, have you seen Tim Matthews's book?

John,

I've researched this in the past and couldn't find any indications of same.

If I recall, there is conversely clear evidence that no Horten aircraft were captured in sufficiently airworthy condition. I'll need to check this.

The similarity to Arnold's description is striking though, as is of course a comparison to some contemporary Northrop designs - which again, seem to have been ruled out as suspects for definite reasons.

As you note, it requires nine aircraft to explain Arnold's account. They would also have to display those distinctive flight characteristics he described - especially that resemblance to the tail of a Chinese kite, or a whip being snapped.

There's only one formation I know of which is factually consistent with that and it has nothing to do with aircraft, never mind alien craft.

I'm sure Arnold didn't see nine new and unfamiliar 'jet aircraft', as he believed. Strictly, he claimed there were eight of one design and an object which varied from the others. However, the one he much later stated was different, is depicted to be exactly the same as all the objects he described in the first place.

It's another aspect which might raise questions about Arnold being the most reliable of witnesses.

The only possibility I could think of which might explain one type of aerial object, eight of a slightly different kind and all flying in a formation which resembled a kite's tail, was if the one object was an aircraft, trailing 8 artefacts.

Maybe the military were testing the capability of a new radar - either their own or a captured device - and the artefacts were metallic reflectors, or similar.

That could make some sense, except... Arnold portrays the objects as having independent control and actually in two separate formations.

Perhaps someone who does believe the objects were nine alien spacecraft, can rationalise what the answer may be if their belief was mistaken.

Assuming these weren't nine ET voyagers and as they almost certainly couldn't have been aircraft, what else would _conceivably_ be travelling as Arnold describes, in that area?

The bottom line is that an ET hypothesis relies on Arnold's judgements being perfect. Remember, the subsequently calculated airspeed was based entirely on his sole perceptions of distance and the objects size.

On top of this perilous pinnacle, sits the bulk of UFO lore.

James.

The one taken to the US is now housed in the Smithsonian which got it after the US military had finished with it. Now what they did is another matter but I would guess the Smithsonian would know

>Maybe the military were testing the capability of a new
>radar - either their own or a captured device - and the

Good though and one that needs investigating

>That could make some sense, except... Arnold portrays the
>objects as having independent control and actually in two
>separate formations.

If they were towed targets (for a lack of a better word) the vortex from the towing a/c would cause them to move about. Pilots who carry out air-to-air refueling employing the probe and basket method used by the RAF (amongst others) describe the motion as trying to mate with rolling doughnut (except they don't quite put this way :-)) If they were towed from the wingtips of an a/c they could appear to be two separate

formations. Keep in mind that no one was doing (publicly anyway AFAIK) air-to-air refuelling by this method in 1947 so it would be a very unusual sight.

Anyway food for thought.

Calculation of airspeed had nothing to do with estimated size. Did have "something" to do with estimated distance and measured time. Distance was estimated based on Arnold's claim that the objects went "in and out" of mountain peaks or seemed to dip down behind a peak.... which was 20 or so miles from the airplane at the time.
Do observations such as this require Arnold to be "perfect?"
This requires a definition of "perfect". If he claimed 102 seconds of time, could he have been off by 1 sec, or 10 seconds, or 100 seconds?
What precision is required for "perfection."

Now, it is certainly true that if Arnold was WRONG in his claimed observation that the objects were as far away as the mountain ranges then the estimates of size and speed could be wrong since both are basically proportional to the assumed distance.

On the other hand, your preferred alternate hypothesis ALSO REQUIRES an assumption about distance which, when combined with an assumption about speed (and size) leads one to conclude that it would have been DIFFICULT for Arnold to NOT recognize what they were.....

HORTON DISCS DISGUISED AS PELICANS FLYING AT

I have to agree with James (for once). Although anything is possible my only question is

1. Why test 9? One would have been sufficient risk
2. Why over a rugged but visible part of Washington when there is a lot of open, flat, isolated areas close by (east).
3. After all these years, wouldn't it be easy to find out some facts by now. I've had sources digging into Boeing and Whidbey Island Naval Airfield testing at that time, but to no avail.

I won't say I am 100% in favor of alien craft, and there could be some logic to it all. I do admit the Horton design does look similiar.

Cute Bruce.....very cute!

Not much evidence of advanced German aircraft such as the Ho-IX being flown in the US in the postwar era. No doubt a spot of "not invented here" combined with the "We beat them so they can't be that good". Anyway there were plenty US flying wings on the go courtesy of Jack Northrop. Haven't we been down this road already?

Also, any-one who wants to see film of a Vought V-173 in flight might like to have a look at the DD Video "Crusader"

Subject: Re: Ball lightning explained
charset=ISO-8859-1
Content-Disposition: inline
Status:

Hi list,

Here's the text from the BBC news site which gives an easy-to-follow summary of the new ball lightning research. I think it's a bit easier to follow than the Nature piece, unless you're a Physics PhD.

Two New Zealand scientists think they can explain one of the great mysteries of the natural world - ball lightning. These bright, hovering spheres of light seen during thunderstorms have been reported as far back as the Middle Ages. They can be as small as tennis balls or as big as beach balls. They can be white, yellow, orange or blue and have been said to pass through windows and walls. Some people have even claimed to see ball lightning pass through aeroplanes. But despite numerous theories and attempts to recreate the phenomenon in a laboratory, ball lightning has remained an enigma to modern science. Now, John Abrahamson and James Dinniss, from the University of Canterbury, NZ, have put forward the theory that these ethereal objects are nothing more than burning particles of silicon. Their experiments show that when ordinary forked lightning hits the ground, mineral grains in the soil can be converted into tiny particles of silicon and its compounds with oxygen and carbon. Burning fluff balls These particles, less than a tenth of a micrometre (millionth of a metre) in size, then link up into chains. The filaments then cluster together into light, fluffy balls that are carried aloft by air currents. The silicon particles are very reactive and burn relatively slowly, emitting light as they do so. "Lightning penetrates below the surface of the soil and heats a certain portion of it to quite high temperatures, so that it vaporises," Dr Abrahamson told

the
BBC.

"And then, when the lightning strike has finished, the vapour is free to erupt,

to appear above the ground in the form of a ball.

"The jet of hot gas will be very much the same as the jet coming out of one's

mouth when one blows a smoke ring - it forms a little re-circulating vortex and

it's quite self-contained."

The scientists' model predicted that heating above a given starting temperature

would lead to an explosive end for a fluffy ball, whereas with a lower starting

temperature the ball would melt and fade away.

Because the ball would become visible only over the latter part of its lifetime,

it would appear to materialise out of thin air after a lightning strike.

One theoretical umbrella

And Dr Abrahamson believes their theory will even explain how ball lightning

passes through windows and walls.

"Most, especially old, houses have cracks around their windows and cracks near

doors," he says.

"The network of silicon filaments should be very flexible and move wherever air

moves. So if air can get through a crack as a draught, the ball should be able

to squeeze through, and then rearrange itself on the other side."

Unfortunately, the researchers have not been able to generate ball lightning in

the laboratory. But Dr Graham Hubler, of the United States Naval Research Laboratory, who has taken a keen interest in lightning balls, says the research

has much promise.

"I have followed the theories that have come out over the years, and few can

explain all of the features of ball lightning. This one, however, unifies an

awful lot of the properties of ball lightning under one theoretical umbrella, so

I think it stands a very good chance of perhaps being correct.

"It's not necessarily the whole story, or even the story, but the nice thing

about it is that it can be tested experimentally. Then we'll know whether this

theory has any merit in the future."

Both Dr Hubler (hubler@ccs.nrl.navy.mil) and Dr Abrahamson

(j.abrahamson@cape.canterbury.ac.nz) are keen to hear from anyone who has

pictures or video footage of ball lightning.

Would this happen to be the type of plane that appeared in
"Raiders of the Lost Ark?"

I used to have a model of a US flying wing that had pusher
propellers, an ovoid fuselage, and an almost round vertical
stabilizer at the end of each wing. But I forget the designation.
Does anyone remember this?

No, Ho-IX was a lot smaller and was jet powered. I think that the a/c
used in "Raiders" was based upon the 1939 Messerschmitt Me P.08.01 design.
The transport version was to be capable of lifting a tank. AFAIK it was
never built.

Cheers

Not quite true, Bell built a V-G test bed (I can't remember the name of it
for the life of me) from a captured Messerschmitt design. The wings could
not "swing" in flight and had to be put at the appropriate angle prior to
flight, but it did prove that V-G would work. This was about the sametime
as Barnes-Wallis was designing his V-G "Swallow".

I find it hard to believe that the US didn't test any captured German a/c,
especially those that used a similar technology as the ones Jack Northrop
was working on.

Cheers

I think you mean the Bell X-5 which was based on the Messerschmitt P.1101.

The Northrop X-4 was also partly based on German design and the DeHavilland
DH 108 Swallow.

Although it's hard to imagine nowadays, European a/c and jet engine design
was well ahead of the US in those days. Rocket engine design goes without
saying.

Don't get me started on the Miles M52 v Bell X-1 sound barrier scam :)

Best

Hi John,

Regarding Tim Matthews's book, which is called UFO Revelation, I would suggest you look up his book on Amazon (US) which carries a fair number of reviews.

Tim Matthews has made a few enemies to date, so bear in mind that some of the comments are no more than bitchy attacks on him.

Probably the best thing to do, is to go into one of the bigger book stores and have a look through a copy.

Hope this helps,

Bill

X-Status:

The Messerschmidt P.1101 was taken to the US but was not flown as its wing spars were badly corroded and the wooden skins detaching. It was then used as a mock up for the Bell X-5 swing wing research aircraft. This was offered to the USAF as a fighter, but was rejected as being inferior to the F-86. (source: Secret Aircraft Designs of the Third Reich, Myhra)

Aircraft such as the Ar 234, Me 262 and Me 163 were flown by the Allies after the war,(see "Wings of the Luftwaffe" by Eric Brown) but I doubt any of the exotica like the Ho 229, (whose all wing design was falling from favour for the same reasons as Northrop's ie lack of stability) were flown. Perhaps this was due to the prototypes being sabotaged or damaged, the engines were not in best condition and the only people who could maintain them were not best pleased at having to do so.

Now, now lads, calm down and please take off those rose tinted specs. I try to maintain an objective view of this stuff. I used to be fired up by the "We wuz robbed" view of aviation history, but a rummage through the archives and a blah with the blokes involved broadens the mind.

The UK was skint, the defence budget was too big and if you'd like to read up on the subject may I suggest "Project Cancelled" by Derek Wood then straight after read "Breach of Promise" by Clive Ponting. (This is a history of the Wilson Government, but it covers defence and aircraft policy) Another factor was the ever changing threat and ever changing commitments (rather like today in a way).

The UK was not alone in scrapping advanced aircraft projects, the US scrapped the CL-400, the XF-103, Dynasoar and the XB-70. Aerospace ideas in the 50s and 60s advanced faster than the companies and the technology, especially materials, could keep pace with. Whatever happened to the nuclear turbojet? Great idea but not practical. Same goes for VTOL airliners.

Consider Germany, Eugen Sanger's 1944 concept for a M3+ orbital bomber still hasn't been realised. No M3+ aircraft at all now.

Fascinating stuff, but may I suggest it is beyond the scope of the UFORL? Perhaps not? Cue flames.

Tinted glasses and mind expansion certainly conjures up the 60s Chris, but
let's widen our aviation time frame :)

>The UK was skint, the defence budget was too big and if you'd like to read

That wasn't my point Chris & Project Cancelled is all but impossible to
get - I've had it ordered from three sources for around a year now !

I'd love to hear why we didn't >sell< the data for the a/c we couldn't
afford to the US, and to be put straight on the following :

Did Bell engineers/designers come over to the UK and were they given total
access to the M-52 plans and the entire design team ?

In return did the US not say Miles engineers/designers would be given the
same access and
co-operation to the Bell X-1 ?

When the Miles guys turned up, did the US not renege on all their promises ?
Were the Miles guys not told that they would not be given any access on
grounds of NatSec ?

If this is true - and IIRC it came from the senior M-52 designer - it was a
very dirty trick.

Complete the following sentence :

A rocket powered M1 a/c is better than an airbreathing M1 a/c because...

>The UK was not alone in scrapping advanced aircraft projects, the US
scrapped the CL-400, >the XF-103, Dynasoar and the XB-70. Aerospace ideas in
the 50s and 60s advanced faster >than the companies and the technology,
especially materials, could keep pace with.

(edit)

Agree completely - BUT, as the first three of the examples you cite above were beyond the available technology of their time, they don't come into the same category as the M-52/X-1.

>Fascinating stuff, but may I suggest it is beyond the scope of the UFORL? Perhaps not? Cue >flames.

Agree that it's not exactly appropriate

Best

D

I've just finished Ray Fowlers (out of print) book Interplanetary Visitors and was struck by the number of sightings that were of close, apparantly physical objects, that followed people or hovered near people and buildings. There are a number of similar events for the New York area for the same time frame... around the 1960's. But those kind of sightings in large numbers dissappeared by the 70's. Any suggestions as to why that might be?

@Now, now lads, calm down and please take off those rose tinted
@specs. I try to maintain an objective view of this stuff. I used
@to be fired up by the "We wuz robbed" view of aviation history,
@but a rummage through the archives and a blah with the blokes
@involved broadens the mind.

@The UK was skint, the defence budget was too big and if you'd
@like to read up on the subject may I suggest "Project Cancelled"
@by Derek Wood then straight after read "Breach of Promise" by
@Clive Ponting. (This is a history of the Wilson Government, but
@it covers defence and aircraft policy) Another factor was the
@ever changing threat and ever changing commitments (rather like
@today in a way).

@The UK was not alone in scrapping advanced aircraft projects,
@the US scrapped the CL-400, the XF-103, Dynasoar and the XB-70.
@Aerospace ideas in the 50s and 60s advanced faster than the
@companies and the technology, especially materials, could keep
@pace with. Whatever happened to the nuclear turbojet? Great idea
@but not practical. Same goes for VTOL airliners.

@Consider Germany, Eugen Sanger's 1944 concept for a M3+ orbital
@bomber still hasn't been realised. No M3+ aircraft at all now.

@Fascinating stuff, but may I suggest it is beyond the scope of
@the UFORL? Perhaps not? Cue flames.

@Chris

I had an uncle at Wright-Patterson, and he gave me the story on
the scrapping of both the YB-49 and the XB-70:

The YB-49 had a fatal flaw. If the plane got into a steep bank,

it simply fell, sideways. The small vertical stabilizers it had were not enough to overcome the sideways fall, nor were they enough to turn the plane back to flying forward. And the engines were not powerful enough to keep air flowing over the ailerons. so the pilot couldn't bank back.

The XB-70 had both structural and aerodynamic faults. Unforeseen stresses of maneuvering caused the vertical stabilizers to come off. The plane also could easily get into an unrecoverable spin. Turbulence from a fighter escort made it quite unstable.

The nuclear turbojet died because it couldn't lift the shielding necessary to protect the ground and air crews.

@Larry Clark

I have several theories:

1. Many of the drawings in Fowler's book match the description of an advertizing plane perfectly. Seen edge-on, they look mysterious. See Allen Hendry's UFO Investigator's Handbook.

2. Many of them are not beyond the capabilities of fire balloons. I have records of over 1000 confessed fire balloon launches in the sixties, many in the northeast. I suspect there are many more that were not confessed. Among them are:

1965-1967: Many fire balloons were launched over the area northeast of Boston, Massachusetts by teens. Sightings were made in Wenham, Beverly, and Salem.

March 1966: A group of teens sent up hundreds over San Gabriel, California in the span of a little over a month.

March 9 and 16, 1966: A group of students sent up hundreds on consecutive Saturday nights in Westport Connecticut. These were surplus weather balloons with flares attached.

December 3, 1966: A police sighting was caused by fire balloons launched by youths in Belmont, California.

Over a span of several months in 1967, Walla Walla Washington was treated to a repeating show of fire balloons. Again, teenagers were responsible.

April Fools Day, 1967, Boulder, Colorado: Students sent up 4 fire balloons to test human perception in UFO cases. The result is Condon Report case 18. Most of the witnesses grossly overestimated the size and distance.

April-May 1967: After the landing case there, South Hill Virginia was treated to several flights of fire balloons, courtesy of local high school students.

In September, 1967, pranksters admitted sending over 50 fire balloons into the skies over Sharon, Pennsylvania.

December 1967: The Condon committee investigated another case of a fire balloon at Castle Rock, Colorado.

March 1968: Another flurry of fire balloons was launched over Sacramento, California by teens.

March 25, 1968: Metuchen NJ got it's turn, when pranksters sent up a flight of fire balloons.

This flurry started after a science magazine gave details of construction. It ended after the Condon Report identified several sightings as fire balloons, and police started cracking down on the devices as fire hazards.

They returned in 1973 after the Pascagoula case. One 1973 case in Indiana was identified after a sport fisherman caught the UFO with his fishline.

Bruce,

The question is simply whether Kenneth Arnold could have been mistaken in his perceptions. There's nothing `alien' about a formation of objects which can be evidenced, in increasing, factual substance, to have the same distinctive flight characteristics as a formation of birds.

Arnold didn't think he was witnessing nine, non-earthly vehicles; the primary reason there was any mystery at all was because of his claims about the `jets' airspeed. That's what initially caught the media's attention.

However, it was dependent on Arnold not being mistaken about the objects' size and their distance from him.

Although it's appreciated that the airspeed calculation itself was based on estimated distance and measured time, how large the objects were believed to be is relevant as this was a major factor in Arnold's overall perceptions.

Size does matter.

I understood this 'peak' which the objects were thought to have disappeared behind was found to be an anomaly, as Martin Kottmeyer explained in his article, 'Resolving Arnold':

"The absence of a large population of corroborative witnesses near Mount Rainier seems sufficient grounds for wondering if the event was much more localized than Arnold surmised. A critical look at the distance estimate is both warranted and necessary".

"What of distances closer than Mount Rainier's vicinity? It has been pointed out that Arnold spoke of the objects having "swerved in and out of the high mountain peaks." This would seem to put a lower limit to the distance if one could first determine which peaks they swung around and if they were broad enough to have a transit time to regard the observation as secure. Arnold was slightly more specific in later recountings of the event. In *The Coming of the Saucers* he said they momentarily disappeared "behind a jagged peak that juts out from Mount Rainier proper. In his memoir for the First International UFO Congress he says, "When they turned length-wise or flat-wise to me they were very thin and they actually disappeared from sight behind a projection on Mount Rainier in the snowfield. These are not exactly the same thing, but they give a fair indication of what to look for on the geological survey maps.

Arnold estimated the crafts were at an altitude of 9,200 feet plus or minus 1,000. The task at hand is thus to locate some feature extending above the 8,200 foot level. This yields a neat little surprise. There are no such peaks between Mount Rainier and Mount Adams.

The closest thing I could find was Pyramid Peak which stands only 6,937 feet tall in front of Mount Rainier's base. There is a sharp little projection called Little Tacoma which sticks out around the 10,000 foot level, but it is on the wrong side of the mountain to be seen from

Arnold's flight path. It would be badly stretching things to suggest he got either his position or altitude that far wrong.

Normally one prefers early accounts to later ones, but the Congress memoir may provide the clue to what happened here. When the object turned flatwise, the optical thickness likely dropped below the half minute resolution limit and briefly dropped from sight. The rough surface of the mountain provided opportunities for an illusory correlation of the disappearance to some feature of the mountain. The disappearance seemed to be caused by an intervening feature where none in fact existed. With no firm lower distance estimate, the way is opened for the objects being closer to Arnold than he had surmised".

Martin's full article can be seen at:

<http://www.reall.org/newsletter/v05/n06/resolving-arnold-part-1.html>

<http://www.reall.org/newsletter/v05/n07/resolving-arnold-part-2.html>

[These URLs might `wrap around']

How could Arnold have been deceived and never realised what he was truly observing - arguably the same situation as with his 20-25, 2-3 feet diameter, brass-coloured objects that flew like ducks, but also `flew too fast'.

How would I know.

I do know that the evidence which can show several, specific, correlations between Arnold's reported observations and that of a formation of White Pelicans has become really quite considerable and has, privately, now even been recognised by a number of `ufologists' as such.

Remember, a comparative formation of nine such birds were witnessed in that area - they were rarely seen in this part of the north-west - within a week of Arnold's sighting and mistaken by an airline crew to be `big round discs', before they eventually realised what the objects were.

If they had never made the identification, we would unquestionably had another, `major' sighting of flying discs, which would be proclaimed as `proof' of Arnold's flying saucer story!

You have to laugh at the irony of that...

The objective is to understand what lies behind the 'UFO' phenomena. Everything has an explanation and if it's not of ET origin, then it's likely to fall into one of the known, explainable 'UFO' categories.

I would have thought by now it was comprehended that Arnold's nine, unidentified objects were somewhat unique 'craft' and in fact bore little resemblance to the misconstrued 'flying saucer' popularisation.

That should save us wasting a lot of time on 'flying saucers' in the first place. Which is of course equally true, even if Arnold was privileged to have witnessed the galactically renowned 'Silver Crescent' formation flyers.

James.

@Geeeezzzzzz:
@You might want to read the book.....

I have it. Where do you think I got the info?

While Fowler is better than a lot of UFO researchers, he still makes the same mistake that most of the others make: He takes witness estimates of size, distance, speed, or altitude as concrete facts, not the very rough guesses they are.

The fact is that NOBODY can know enough through visual observation alone to tell the size, distance, speed, or altitude of an object (especially at night), unless:

1. The witness knows the identity of the object, and thus its true size.
2. The object is closer than 30 feet, where binocular convergence gives the distance.
3. The object flies in front of AND behind objects at known distances (this reduces the possible range of distances). This includes an overcast sky if the ceiling height is known.
4. The object casts a shadow in a known location, or gives off light that casts shadows. Both pinpoint its location if analyzed right.
5. The object is reflected in a window, a lake, or some other flat specular surface that can be used to triangulate.
6. Multiple witnesses see the object from different locations.

Two caveats:

A: Each individual witness estimate is still just as inaccurate.

B: Care must be made to synchronize (in time) the witness accounts of direction.

6. The witness uses instruments to measure distance. One caveat:

A: If RADAR is the instrument, the RADAR target may not have the same cause that the visual stimulus has.

I have some cases in my files where the witness estimate of size was off by 8 orders of magnitude.

...

Fire balloons are not identified for the following reasons:

1. The witness never heard of fire balloons.
2. The witness perceives it to be much larger and farther away than it is.
3. Because of the antics the lighted portion can perform, the witness assumes that only an intelligently controlled vehicle can be the cause of the sighting.

...

I have documentation on all of the fire balloon cases I listed. In each case, the balloon launchers admitted their actions to police or the press. These fall into two categories:

In most of the cases, the fire balloons were sent up for the explicit purpose of starting a UFO scare. All of the cases where multiple objects were observed fit this category. The publicity of the Condon Committee may have caused the large number of these pranks (Let's see if we can fool the scientists!).

In the few remaining cases, the purpose of launching a fire balloon was to observe wind direction at different altitudes (which was the scientific purpose given in the science magazine article). In most of these cases, only one fire balloon was launched at a time. A feature of these cases is that the balloon launcher had no idea of the trouble it would cause others.

...

One source of confusion about advertizing planes is the lack of knowledge by many investigators of the existence of THREE different kinds of ad planes:

Type 1: This plane pulls one or more banners during the daytime. It can give rise to unusually-shaped objects that are usually darker than the sky.

Type 2: This plane flies at night. It has an electric sign hung from wingtip to wingtip. The sign is a rectangular grid of light bulbs, suspended by a wire mesh. Dot-matrix letters appear at one wingtip, and travel across to the other. Seen from a distance, this sign gives a unique "rotating saucer with portholes" effect. Often the red navigation light on the top of the plane appears as a light on top of a "dome."

Example case: 10/12/61 Indianapolis, Indiana: Comentator Frank Edwards saw a "rotating sphere with lighted portholes" moving slowly over the city. That same night, I was at a nearby drive-in theater, and I saw it too (with the same initial impression). It scared me, until it got close enough that I could actually read the sign. Instead of reporting a UFO, we went to the "Autorama" car show it was advertizing. I didn't realize that these were the same event until 1996, when I found the date of his sighting in a book.

Night ad planes target drive-in theaters and fairgrounds when they are open.

Type 3: This plane flies at night, pulling an electric sign behind it. It has a rectangular grid of bulbs held together by a wire mesh, but this time, the letters appear close to the tail of the plane, and move backwards away from the plane. This is sometimes seen as a "rocket emitting sparks."

Example case: 3/13/61 North Island, San Diego, California: A shower of sparks, as though coming from a firework, seemed to be propelling a rocketlike object as it flew slowly around the area.

Larry,
if you have dates for all or most of these launchings and how many balloons
were launched it would seem possible to make a statistical connection
between the launch of a balloon and the probability of its being REPORTED
as a UFO.

In particular, one would like to know the dates and times of launch and
then
look for sightings that occurred in the same area and within minutes (or
up to an hour?) after launch. I realize that not all sightings are
available
for analysis. However, Larry Hatch has a database of about 17,000 sightings
which can be searched by time and date and location.

Also, there is the Project Blue Book Unidentifieds data base compiled by
Don Berliner. And there are other such catalogues (not available to me)
that
could be searched.

Subject: Re: Kenneth Arnold and KottmeyerStatus:

James,

Kottmeyer is flat wrong about Little Tahoma peak supposedly not being visible from Arnold's position. I have the topographic maps and it clearly is visible from the town of Mineral and several miles eastward.

The Little Tahoma is clearly the peak jutting out from Rainier that Arnold saw the objects fly behind. Arnold stressed that the objects were at about his level when they passed Rainier. He also said that the "plateau" he had been searching to find the remains of the downed C-46 was at around this 9,000-10,000-foot level and that is the "plateau" from which the peak juttred out and which the objects flew behind. He emphasized that the objects were within about 1,000 feet of his 9,500-foot altitude level when they passed Rainier and he specifically mentions the objects were at 10,000 feet in his earlier interviews. Since he had minutes earlier combed this altitude level of Rainier he certainly was familiar with that terrain.

Arnold estimated the distance to the objects as 23 miles when they passed Rainier. He was about 15-17 miles from Rainier.* That again puts the objects BEHIND Rainier and well beyond the distance at which birds could be visible.

Brad Sparks

(*Mineral is 22 miles from Rainier's summit. Arnold had flown for about 2-1/2 to 3-1/2 minutes east of Mineral at about 2 miles per minute speed.)

In a message dated 2/8/00 5:57:17 AM, J.Easton@btinternet.com writes:

Bruce,

The question is simply whether Kenneth Arnold could have

been mistaken in his perceptions. There's nothing `alien' about a formation of objects which can be evidenced, in increasing, factual substance, to have the same distinctive flight characteristics as a formation of birds.

Arnold didn't think he was witnessing nine, non-earthly vehicles; the primary reason there was any mystery at all was because of his claims about the `jets' airspeed. That's what initially caught the media's attention.

However, it was dependent on Arnold not being mistaken about the objects' size and their distance from him.

Although it's appreciated that the airspeed calculation itself was based on estimated distance and measured time, how large the objects were believed to be is relevant as this was a major factor in Arnold's overall perceptions.

Size does matter.

I understood this `peak' which the objects were thought to have disappeared behind was found to be an anomaly, as Martin Kottmeyer explained in his article, 'Resolving Arnold':

"The absence of a large population of corroborative witnesses near Mount Rainier seems sufficient grounds for wondering if the event was much more localized than Arnold

surmised. A critical look at the distance estimate is both warranted and necessary".

"What of distances closer than Mount Rainier's vicinity? It has been pointed out that Arnold spoke of the objects having "swerved in and out of the high mountain peaks." This would seem to put a lower limit to the distance if one could first determine which peaks they swung around and if they were broad enough to have a transit time to regard the observation as secure. Arnold was slightly more specific in later recountings of the event. In *The Coming of the Saucers* he said they momentarily disappeared "behind a jagged peak that juts out from Mount Rainier proper. In his memoir for the First International UFO Congress he says, "When they turned length-wise or flat-wise to me they were very thin and they actually disappeared from sight behind a projection on Mount Rainier in the snowfield. These are not exactly the same thing, but they give a fair indication of what to look for on the geological survey maps.

Arnold estimated the crafts were at an altitude of 9,200 feet plus or minus 1,000. The task at hand is thus to locate some feature extending above the 8,200 foot level. This yields a neat little surprise. There are no such peaks between Mount Rainier and Mount Adams.

The closest thing I could find was Pyramid Peak which stands only 6,937 feet tall in front of Mount Rainier's base. There is a sharp little projection called Little Tacoma which sticks out around the 10,000 foot level, but it is on the wrong side of the mountain to be seen from Arnold's flight path. It would be badly stretching things to suggest he got either his position or altitude that far wrong.

Normally one prefers early accounts to later ones, but the Congress memoir may provide the clue to what happened here. When the object turned flatwise, the optical thickness likely dropped below the half minute resolution limit and briefly dropped from sight. The rough surface of the mountain provided opportunities for an illusory correlation of the disappearance to some feature of the mountain. The disappearance seemed to be caused by an intervening feature where none in fact existed. With no firm lower distance estimate, the way is opened for the objects being closer to Arnold than he had surmised".

Martin's full article can be seen at:

<http://www.reall.org/newsletter/v05/n06/resolving-arnold-part-1.html>

<http://www.reall.org/newsletter/v05/n07/resolving-arnold->

part-2.html

[These URLs might `wrap around']

How could Arnold have been deceived and never realised what he was truly observing - arguably the same situation as with his 20-25, 2-3 feet diameter, brass-coloured objects that flew like ducks, but also `flew too fast'.

How would I know.

I do know that the evidence which can show several, specific, correlations between Arnold's reported observations and that of a formation of White Pelicans has become really quite considerable and has, privately, now even been recognised by a number of `ufologists' as such.

Remember, a comparative formation of nine such birds were witnessed in that area - they were rarely seen in this part of the north-west - within a week of Arnold's sighting and mistaken by an airline crew to be `big round discs', before they eventually realised what the objects were.

If they had never made the identification, we would unquestionably had another, `major' sighting of flying discs, which would be proclaimed as `proof' of Arnold's flying saucer story!

You have to laugh at the irony of that...

The objective is to understand what lies behind the `UFO' phenomena. Everything has an explanation and if it's not of ET origin, then it's likely to fall into one of the known, explainable `UFO' categories.

I would have thought by now it was comprehended that Arnold's nine, unidentified objects were somewhat unique `craft' and in fact bore little resemblance to the misconstrued `flying saucer' popularisation.

That should save us wasting a lot of time on `flying saucers' in the first place. Which is of course equally true, even if Arnold was privileged to have witnessed the galactically renowned 'Silver Crescent' formation flyers.

James.

@(not available to me) that could be searched.

Sounds very interesting. I will get what I can, although most of
the accounts I have indicate only that the balloons were launched
over a given period, with no specific dates. Remember that in
most of these cases, children launched the balloons, and they
didn't keep records. In the Westport case, and the Condon cases,
the given launchings were the only ones made. I am also tracking
down a case at Caltech where students launched gas balloons with
railroad flares and fins.

Hi:

May I politely suggest you read the book. Most of the accounts are of close encounters, not 'lights in the sky'. Some indicate EM effects. A generic list of ways that witnesses report things imprecisely is not a valid response to specific reports.

Regards,

Larry Clark

A video from Gulf Breeze shows the shadow on trees about 7000 ft away.

I made a positive ID on a case brought to NICAP over 20 years ago... professors and others at U Delaware had had a sighting one evening and taken photos of the strange craft rotating and rolling through the sky. Under high magnification photos showed the letters EET made up of tiny dots. Checked with local airports and found sign plane had been up that night BINGO. This sighting was reported in the NICAP publication.

NO NO NO NO NO NO..... a thou,,...well, 999 times no (I get tired of
1000 times)....

You still don't get it.

The question is NOT "simply where KA could have been mistaken

The question is ALSO whether or not any particular explanation makes
ANY SENSE IN THE CONTEXT OF THE SIGHTING.

As you say further on in your post every sighting must have an explanation
and if the explanation isn't sort of "out of this world" then it must be
in some way conventional.

OK. I'll buy that. BUT.... each proposed explanation (and there have
been

a bakers dozen for the Arnold sighting) must be, at the very least,
SELF CONSISTENT. A conventional phenomenon must obey conventional
physics, etc.

The "prosaic explanations" much beloved of debunkers are perfect examples
of WHERE SCIENTISTS WENT WRONG in evaluating UFO sightings.
It is well and good to propose explanations, but they must be TESTED.

Your particular preferred explanation needs TESTING to prove it is
self-consistent. It is not sufficient
to point out that there are some similarities between flying birds and
"flying
saucers." If you propose birds you must prove there is no glaring
inconsistency.

In my paper entitled Prosaic Explanations, the Failure of UFO Skepticism,
I have discussed the Arnold case (a shortened version recently published in
INFINITE ENERGY magazine). A small portion is repeated here for
convenience:

.....

Consider now the number of explanations that have been offered for

the Arnold sighting: secret US aircraft (Arnold and other witnesses), secret Soviet aircraft (US Air Force Intelligence), quirks of eyesight (Blakeslee), motes in the eye, reflections in glass (Nelson), ordinary aircraft (Hynek), blasts of snow (Menzel), haze reflection (Menzel), mirage (Menzel), orographic clouds (Menzel), wave clouds in motion (Menzel), water drops on the windshield (Menzel), birds/geese/pelicans (Kottmeyer/Easton), and meteors (Klass/Davidson). With this dozen or so available explanations, surely the Arnold sighting has been explained.

NOT!

The complete Arnold sighting and an in-depth discussion of the failed prosaic explanations are available from this author via email (brumac@compuserve.com).

@

@@

@Hi:

@May I politely suggest you read the book. Most of the accounts are of close
@encounters, not 'lights in the sky'. Some indicate EM effects. A generic
@list of ways that witnesses report things imprecisely is not a valid
@response to specific reports.

I am thinking close encounter too, with the object being closer (and smaller) than the witnesses realized. Unless an unknown object seen against the night sky is closer than 30 feet, there is absolutely no way the witness can tell how large it is or how far away it is without other clues provided by the surroundings or special equipment. The human body does not possess the equipment to make the measurement otherwise.

Most witnesses to fire balloons estimate that they are at least the size of a car.

Of course, the big problem with EM effects is linking them to the UFO -- especially if the witness did not notice the UFO until after the EM effect manifested itself. Coincidence rears its ugly head too many times in these cases.

Let's look at that Westport Connecticut case again:

3/9/66, 3/16/66, and 3/23/66: Students sent up flights of surplus weather balloons with railroad flares attached on two dates, and got one balloon off before the police caught them on the last date.

The following descriptions were recorded:

* An oval with rays or spokes on the sides.

- * A blinking red light (think about that one for a minute)
- * A humming red object.
- * An assemblage of red lights.
- * One was reported to have landed.
- * One focused a searchlight on the ground.

Now another case, at Pasadena California:

In the first week of April, 1966, Caltech students rigged balloons from polyethylene sheeting, filled them with helium, and attached iron rods with fins and colored railroad flares. These were released on 4 different nights (not identified). People all over the Los Angeles basin reported the objects, including these reports:

- * Colors were variously reported as red, orange, white, green, and blue. (red, yellow, and green flares were used.)
- * Many reported effects like revolving police lights.
- * An odor of perfume was reported by several witnesses.
- * One woman reported a cube of 4 fireballs.
- * One witness reported that a light plane shot down one of the UFOs.

As the balloons rose, the fins made the railroad flares rotate. A Caltech employee witnesses the last launch, and turned in the students.

Source for both sets of reports: "Official Guide to UFOs" (C) 1967 Science and Mechanics Publishing Co.

Now, to the Fowler book. IF we ignore the estimates by witnesses of size and distance as highly inaccurate (which they must be if no aids were used), then the following cases are probably fire balloons:

64-4, 64-12, 64-13, 64-20, 65-1, 65-22, 65-24, 65-30, 65-37, 66-2, 66-4, 66-9, 66-11, 66-16A, 66-16B, 66-18, 66-22, 66-23, 66-26B, 66-33, 66-36, 66-51, 66-53, 67-8, 67-9, 67-11, 67-13, 67-15, 67-17, 67-18, 67-24, 67-28, 67-34, 67-35, 67-36, 67-37,

67-40, 67-44A, 67-55, 67-57, 67-61, 67-66B, 68-2, 68-3, 68-8, 68-26, 68-27, 68-34, 68-44, 68-48, 68-54, 68-62, 69-9, 70-10, 71-8, 72-2, 72-4, 72-16

In 64-12, 66-23, 66-53, 67-9, 67-13, 67-15, and 67-18, the classic motion of a fire balloon is a dead giveaway.

In 66-53, the streetlights probably went out because the fire balloon gave off enough light to trigger the photocell to shut them off. Identified fire balloons have been known to turn off automatic barn lights too.

In 67-9, the ejected object was probably a candle that fell from its support.

In 69-9, the wind probably moved both the snow and the balloon.

More cases are possibly fire balloons, but there is not enough detail to know.

These cases are probably Advertizing planes:

64-10A, 64-10B, 65-41, 66-24, 66-28, 66-45, 67-66C

Case 66-45 could not easily be anything else. The description matches perfectly words made of letters, with spaces between the letters and words, as seen on edge.

Other cases are possibly ad planes.

Case 67-14 is obviously a tow target.

In case 66-3A, the marks match those left by an arm-lift truck when it spreads out its stability pads.

Case 71-11 matches a hot-air balloon sold by Edmund Scientific.

Case 67-54 is probably a specular sun reflection off of an airplane, expanded by halation in the eye.

@Regards,
@Larry Clark

Larry R.,

You mention a great many cases by number and claim that EM effects may not be connected to the appearance of "UFO's" that are really fire balloons because "Coincidence rears its ugly head too many times in these cases." Yet you did not cite a single such EM case caused by a fire balloon "coincidence."

I also notice that you're now slipping in instances of prank HELIUM weather balloon launches with "railroad flares" attached which are not the same as FIRE BALLOONS. Please note that FIRE BALLOONS have insufficient lift to raise a typically 7-lb railroad flare (up to 50 lbs with railroad spike), a fact Phil Klass failed to realize in his discussion of the Seattle sightings of 1968 allegedly caused by railroad flares miraculously "attached" to flimsy fire balloons (UFOs Explained 1976, p. 32).

3/9/66, 3/16/66, and 3/23/66: Students sent up flights of surplus weather balloons with railroad flares attached on two dates, and got one balloon off before the police caught them on the last date.

The following descriptions were recorded:

- * An oval with rays or spokes on the sides.
- * A blinking red light (think about that one for a minute)
- * A humming red object.
- * An assemblage of red lights.
- * One was reported to have landed.
- * One focused a searchlight on the ground.

Now another case, at Pasadena California:

In the first week of April, 1966, Caltech students rigged balloons from polyethylene sheeting, filled them with helium, and attached iron rods with fins and colored railroad flares. These were released on 4 different nights (not identified). People all over the Los Angeles basin reported the objects, including these reports:

- * Colors were variously reported as red, orange, white, green, and blue. (red, yellow, and green flares were used.)
- * Many reported effects like revolving police lights.
- * An odor of perfume was reported by several witnesses.
- * One woman reported a cube of 4 fireballs.
- * One witness reported that a light plane shot down one of the UFOs.

As the balloons rose, the fins made the railroad flares rotate. A Caltech employee witnesses the last launch, and turned in the

students.

Source for both sets of reports: "Official Guide to UFOs" (C)
1967 Science and Mechanics Publishing Co.

Now, to the Fowler book. IF we ignore the estimates by witnesses of size and distance as highly inaccurate (which they must be if no aids were used), then the following cases are probably fire balloons:

64-4, 64-12, 64-13, 64-20, 65-1, 65-22, 65-24, 65-30, 65-37, 66-2, 66-4, 66-9, 66-11, 66-16A, 66-16B, 66-18, 66-22, 66-23, 66-26B, 66-33, 66-36, 66-51, 66-53, 67-8, 67-9, 67-11, 67-13, 67-15, 67-17, 67-18, 67-24, 67-28, 67-34, 67-35, 67-36, 67-37, 67-40, 67-44A, 67-55, 67-57, 67-61, 67-66B, 68-2, 68-3, 68-8, 68-26, 68-27, 68-34, 68-44, 68-48, 68-54, 68-62, 69-9, 70-10, 71-8, 72-2, 72-4, 72-16

In 64-12, 66-23, 66-53, 67-9, 67-13, 67-15, and 67-18, the classic motion of a fire balloon is a dead giveaway.

In 66-53, the streetlights probably went out because the fire balloon gave off enough light to trigger the photocell to shut them off. Identified fire balloons have been known to turn off automatic barn lights too.

In 67-9, the ejected object was probably a candle that fell from its support.

In 69-9, the wind probably moved both the snow and the balloon.

More cases are possibly fire balloons, but there is not enough detail to know.

These cases are probably Advertizing planes:

64-10A, 64-10B, 65-41, 66-24, 66-28, 66-45, 67-66C

Case 66-45 could not easily be anything else. The description matches perfectly words made of letters, with spaces between the letters and words, as seen on edge.

Other cases are possibly ad planes.

Case 67-14 is obviously a tow target.

In case 66-3A, the marks match those left by an arm-lift truck when it spreads out its stability pads.

Case 71-11 matches a hot-air balloon sold by Edmund Scientific.

Case 67-54 is probably a specular sun reflection off of an airplane, expanded by halation in the eye.

Subject: Re: Change in sightingsStatus:

Larry R.,

You mention a great many cases by number and claim that EM effects may not be connected to the appearance of "UFO's" that are really fire balloons because "Coincidence rears its ugly head too many times in these cases." Yet you did not cite a single such EM case caused by a fire balloon "coincidence."

I also notice that you're now slipping in instances of prank HELIUM weather balloon launches with "railroad flares" attached which are not the same as FIRE BALLOONS. Please note that FIRE BALLOONS have insufficient lift to raise a typically 7-lb railroad flare (up to 50 lbs with railroad spike), a fact Phil Klass failed to realize in his discussion of the Seattle sightings of 1968 allegedly caused by railroad flares miraculously "attached" to flimsy fire balloons (UFOs Explained 1976, p. 32).

Brad Sparks

@Subject: Re: Change in sightings

@

@@

@Hi:

@May I politely suggest you read the book. Most of the accounts are of close

@encounters, not 'lights in the sky'. Some indicate EM effects. A generic

@list of ways that witnesses report things imprecisely is not a valid

@response to specific reports.

I am thinking close encounter too, with the object being closer (and smaller) than the witnesses realized. Unless an unknown object seen against the night sky is closer than 30 feet, there is absolutely no way the witness can tell how large it is or how far away it is without other clues provided by the surroundings or special equipment. The human body does not possess the equipment to make the measurement otherwise.

Most witnesses to fire balloons estimate that they are at least the size of a car.

Of course, the big problem with EM effects is linking them to the UFO -- especially if the witness did not notice the UFO until after the EM effect manifested itself. Coincidence rears its ugly head too many times in these cases.

Let's look at that Westport Connecticut case again:

3/9/66, 3/16/66, and 3/23/66: Students sent up flights of surplus weather balloons with railroad flares attached on two dates, and got one balloon off before the police caught them on the last date.

The following descriptions were recorded:

- * An oval with rays or spokes on the sides.
- * A blinking red light (think about that one for a minute)
- * A humming red object.
- * An assemblage of red lights.
- * One was reported to have landed.
- * One focused a searchlight on the ground.

Now another case, at Pasadena California:

In the first week of April, 1966, Caltech students rigged balloons from polyethylene sheeting, filled them with helium, and attached iron rods with fins and colored railroad flares. These were released on 4 different nights (not identified). People all over the Los Angeles basin reported the objects, including these reports:

- * Colors were variously reported as red, orange, white, green, and blue. (red, yellow, and green flares were used.)
- * Many reported effects like revolving police lights.
- * An odor of perfume was reported by several witnesses.
- * One woman reported a cube of 4 fireballs.
- * One witness reported that a light plane shot down one of the UFOs.

As the balloons rose, the fins made the railroad flares rotate. A Caltech employee witnesses the last launch, and turned in the

students.

Source for both sets of reports: "Official Guide to UFOs" (C)
1967 Science and Mechanics Publishing Co.

Now, to the Fowler book. IF we ignore the estimates by witnesses of size and distance as highly inaccurate (which they must be if no aids were used), then the following cases are probably fire balloons:

64-4, 64-12, 64-13, 64-20, 65-1, 65-22, 65-24, 65-30, 65-37,
66-2, 66-4, 66-9, 66-11, 66-16A, 66-16B, 66-18, 66-22, 66-23,
66-26B, 66-33, 66-36, 66-51, 66-53, 67-8, 67-9, 67-11, 67-13,
67-15, 67-17, 67-18, 67-24, 67-28, 67-34, 67-35, 67-36, 67-37,
67-40, 67-44A, 67-55, 67-57, 67-61, 67-66B, 68-2, 68-3, 68-8,
68-26, 68-27, 68-34, 68-44, 68-48, 68-54, 68-62, 69-9, 70-10,
71-8, 72-2, 72-4, 72-16

In 64-12, 66-23, 66-53, 67-9, 67-13, 67-15, and 67-18, the classic motion of a fire balloon is a dead giveaway.

In 66-53, the streetlights probably went out because the fire balloon gave off enough light to trigger the photocell to shut them off. Identified fire balloons have been known to turn off automatic barn lights too.

In 67-9, the ejected object was probably a candle that fell from its support.

@> balloon was to observe wind direction at different altitudes
@> (which was the scientific purpose given in the science magazine
@> article). In most of these cases, only one fire balloon was
@> launched at a time. A feature of these cases is that the balloon
@> launcher had no idea of the trouble it would cause others.
@>
@> ...
@>
@> One source of confusion about advertizing planes is the lack of
@> knowledge by many investigators of the existence of THREE
@> different kinds of ad planes:
@>
@> Type 1: This plane pulls one or more banners during the daytime.
@> It can give rise to unusually-shaped objects that are usually
@> darker than the sky.
@>
@>
@> Type 2: This plane flies at night. It has an electric sign hung
@> from wingtip to wingtip. The sign is a rectangular grid of light
@> bulbs, suspended by a wire mesh. Dot-matrix letters appear at one
@> wingtip, and travel across to the other. Seen from a distance,
@> this sign gives a unique "rotating saucer with portholes" effect.
@> Often the red navigation light on the top of the plane appears as
@> a light on top of a "dome."
@>
@> Example case: 10/12/61 Indianapolis, Indiana: Comentator Frank
@> Edwards saw a "rotating sphere with lighted portholes" moving
@> slowly over the city. That same night, I was at a nearby drive-in
@> theater, and I saw it too (with the same initial impression). It
@> scared me, until it got close enough that I could actually read
@> the sign. Instead of reporting a UFO, we went to the "Autorama"
@> car show it was advertizing. I didn't realize that these were the
@> same event until 1996, when I found the date of his sighting in
@> a book.
@>
@> Night ad planes target drive-in theaters and fairgrounds when
@> they are open.
@>
@>
@> Type 3: This plane flies at night, pulling an electric sign
@> behind it. It has a rectangular grid of bulbs held together by a

@> wire mesh, but this time, the letters appear close to the tail of
 @> the plane, and move backwards away from the plane. This is
 @> sometimes seen as a "rocket emitting sparks."
 @>
 @> Example case: 3/13/61 North Island, San Diego, California: A
 @> shower of sparks, as though coming from a firework, seemed to be
 @> propelling a rocketlike object as it flew slowly around the area.

Status:

Hi:

This discussion is pointless. Witnesses described structured objects coming overhead at the height of telephone lines and you pointing out that people misjudge the size of balloons at a distance.....

Hello List,

I'd like to query the group for a book titled UFO Sightings, Landings, and Abductions-The Documented Evidence by Yurko Bondarchuk. I've found this book at Amazon.com for a whopping \$60 US! Is anyone here aware of any other source for this out of print book, or would have a copy they're willing to sell? Any help would be greatly appreciated.

Thanks,
Todd Lemire

Brad,

Presumably this is the same peak which Kottmeyer calls 'Little Tacoma'?

I have a detailed map of Mt. Rainier and surrounding area and can see where 'Little Tahoma' is located.

It's a long way though from where Arnold seems to place the observation, as Kottmeyer also noted.

>Arnold estimated the distance to the objects as 23 miles when
>they passed Rainier. He was about 15-17 miles from Rainier.*
>That again puts the objects BEHIND Rainier and well beyond the
>distance at which birds could be visible.

>(*Mineral is 22 miles from Rainier's summit. Arnold had flown
>for about 2-1/2 to 3-1/2 minutes east of Mineral at about 2
>miles per minute speed.)

In that important early radio interview, which gave us a detailed, verbatim record, Arnold stated:

"I was approximately 25 to 28 miles from Mt. Rainier, I climbed back up to 9200 feet and I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier. I, at first, thought they were geese because it flew like geese, but it was going so fast that I immediately changed my mind and decided it was a bunch of new jet planes in formation".

How could the objects be crossing "the face of Mt. Rainier", yet also be travelling behind the mountain?

Bill Bequette's 'Pendleton, Oregon East Oregonian' newspaper article of June 26, 1947, claims:

"The Boise flyer said they flew on the west sides of Rainier and Adams, adding that he believed this would make it more difficult for them to be seen from the ground".

If the objects had passed behind Mt. Rainier, wouldn't they have flown down the mountain's eastern side?

Additionally, The 'Norman, Oklahoma Transcript' of 26 June reported:

"Arnold said the strange aircraft were skittering across the southwest slope of Mount Rainier when he first sighted them".

And the 'Oregon Journal' of 27 June wrote:

"Arnold, general manager and owner of the Great Western Fire Control Company, said he first saw the objects when they flashed in the sun low over the slopes of Mt. Rainier".

"Then I saw them, weaving and ducking in and out as they came south not more than 500 feet over the plateau'."

However, the 'Chicago Daily Tribune' of 25 June quoted Arnold as explaining:

"The first thing I noticed was a series of flashes in my eyes as if a mirror was reflecting sunlight at me. I saw the flashes were coming from a series of objects that were traveling incredibly fast. They were silvery and shiny and seemed to be shaped like a pie plate. What startled me most at this point was that I could not find any tails on them.

I counted nine of them as they disappeared behind the peak of Mount Rainier".

I've mentioned this latter comment before and asked how it could all be reconciled.

An important point which this leads nicely into is Arnold's initial explanation of how he first became aware of the objects due to bright flashes. At no time, so far as I can see, in these formative accounts does he claim the flashes reflected on his

aircraft, or that the objects were at a great distance when first noticed.

For example, from that radio interview:

"I was approximately 25 to 28 miles from Mt. Rainier, I climbed back up to 9200 feet and I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier".

Bequette's article:

"Mr. Arnold reported he was flying east at 2:50 p.m. Tuesday toward Mt. Rainier when the objects appeared directly in front of him 25-30 miles away at about 10,000 feet altitude.

[...]

When first sighted, he thought the objects were snow geese.

'But geese don't fly that high -- and, anyway, what would geese be doing going south for this time of year?'"

The 'Norman, Oklahoma Transcript':

"Arnold said the strange aircraft were skittering across the southwest slope of Mount Rainier when he first sighted them".

The 'Oregon Journal':

"Arnold, general manager and owner of the Great Western Fire Control Company, said he first saw the objects when they flashed in the sun low over the slopes of Mt. Rainier".

'Then I saw them, weaving and ducking in and out as they came south not more than 500 feet over the plateau'.

However, by the time his book was published and in an account which is often referenced, Arnold claimed:

"It was during this search and while making a turn of 180 degrees over Mineral, Washington, at approximately 9200 feet altitude, that a tremendously bright flash lit up the surfaces of my aircraft. I was startled. I thought I was very close to collision with some other aircraft whose approach I had not noted. I spent the next twenty to thirty seconds urgently searching the sky all around--to the sides, above and below me--in an attempt to determine where the flash of light had come from. The only actual

plane I saw was a DC-4 far to my left and rear, apparently on its San Francisco to Seattle run. My momentary explanation to myself was that some lieutenant in a P-51 had given me a buzz job across my nose and that hit was the sun reflecting from the surface of his wings as he passed that had caused the flash.

Before I had time to collect my thoughts or to find any close aircraft, the flash happened again. This time I caught the direction from which it had come. I observed, far to my left and to the north, a formation of very bright objects coming from the vicinity of Mount Baker, flying very close to the mountain tops and traveling at tremendous speed.

At first I couldn't make out their shapes as they were still at a distance of over a hundred miles. I could see the formation was going to pass directly in front of me, as it was flying at approximately 170 degrees. I watched as these objects rapidly neared the snow border of Mount Rainier, all the time thinking to myself that I was observing a whole formation of jets. In group count, such as I have used in counting cattle and game from the air, they numbered nine. They were flying diagonally in an echelon formation with a larger gap in their echelon between the first four and the last five".

Arnold now states that the surfaces of his aircraft were lit-up by objects which, some thirty seconds later and travelling at well over 1000 mph in his direction, were still more than a hundred miles away. Yet, he still at first rationalised these could have been birds, probably geese?

Why would Arnold even begin to suspect these could be birds of any kind, if the actual circumstances were as portrayed here?

Re both aspects - where the nine objects were first observed and the route they travelled, can you maybe set out what you think actually happened, at the time?

James.

John,

I didn't entirely write off the possibility that Arnold's nine
objects were an aircraft towing some large 'reflectors'.

Aside from offering an explanation for the formation's 'kite
tail' appearance, it could also equate with the "fluttering"
motion he mentioned.

I've recently come across some little-known material re the
story. It's a letter dated 5 August, 1956 from Maurene Chenowith
to Isabel Davis, following the former's interview with Arnold.

Chenowith notes how Arnold has given up on his investigations
into 'flying saucers', although he still believes in their
existence.

She writes:

"On his own sightings he has seen saucers five separate times and
he has made movies of them. One flew under him at Mt. Lassen and

he got a movie of that. He says the movies are good. In his original sighting, a fact that he didn't mention was that one of the nine was slightly larger than the other eight".

However, in his book, Arnold claims, "I proceeded to gather my scattered wits together, got back in my airplane, and took off for Pendleton, Oregon. I remembered that I had forgotten to mention the fact that one of these craft looked different from the rest, was darker and of a slightly different shape...".

Was it merely slightly larger, or was it only different in shape, or both?

It's a question which I'm surprised was never resolved before Arnold's recent death. I'm sure he would have been able to clarify this.

That aside, I was advised of some allegedly 'secret' test flights which could have been related to Arnold's sighting.

You know how this goes - someone claims to have inside info which they can't substantiate...

Standard ufology. ;)

Still, I've never revealed this before and although it must be considered cautiously, I see no reason not to publish the story. As I should really obtain permission before stating the source, I won't disclose their identity. It was someone that I didn't know at all.

They wrote:

Hi,

I was not there in person, one of the men I have worked with awhile back was. He was stationed at Edwards AFB and also at White Sands. They were performing radar testing on some of the German captured aircraft about the right time. There were several vehicles, one was of the Horten IX/GO 229 type. They spent a couple of months doing the tests and the aircraft were flown to another base for some other testing he did not know about. He just performed the radar signature and heat signature testing. All of which is still is classified. He stated there were several unusual aircraft there, and very little detail were offered to the radar tracking and testing crew. Some of the aircraft caused serious problems with their equipment. Where they were transferred to is unknown. He was only involved with a couple. But there were several teams doing the tests at the time. I did

some extensive reading up on the Horten IX/GO and was surprised it was so much alike the Arnold drawing. I would suspect his speed estimates were not correct during his sighting...".

[...]

You might also secure a copy of: "Winged Wonders" The Story of the Flying Wings. by E.T. Wooldridge ISBN 0-87474-966-2 second printing in 1985 by the Smithsonian Institution Press Washington, D.C. On pages 70 through 75, the secret Project P 12 is also shown, with many other rare photos.

[End]

As Edwards and White Sands are a long way from the Cascades, I can't see how there could even feasibly be a connection.

The only contemporary army air base I'm aware of in the region of Arnold's sighting was Moses Lake Army Air Base, now Larson AFB, which was involved in classified work on Boeing's B-47 Stratojet and the B-50.

It would be interesting to know if anyone is aware of other bases which could, theoretically, have had test flights operating in the area of Arnold's sighting.

Again, I doubt there's any connection, however, no harm in looking at what they were involved with that time.

What conceivably could have a connection is 'Project P12' - this is a most interesting angle which comes back to our 'Nurflugels'.

My understanding is that 'Project P12' relates to the 'Messerschmitt Me-163 Komet', which was, intriguingly, a 'tailless aircraft' and does resemble Arnold's later sketch.

More than that, on further reflection, it's real close - see:

http://209.162.216.75/Nurflugel/Lippisch_Nurflugels/me163b/me163b-v2a.jpg

[This URL may 'wrap around']

Being a 'rocket powered' aircraft, it would, again theoretically, also further equate with what Arnold described.

I also understand that the Me-163's intended successor, the Messerschmitt P.1111, was a "turbojet-powered fighter" and that

after the end of WWII, possibly some Me-163's found their way to the US.

I also note from an online query that - "Allied troops overran the Oberrammergau workshops on April 29, 1945 and shortly thereafter took possession of all files relating to the P.1112. It is no coincidence that the U.S. Navy Chance Vought F7U-1 'Cutlass' wing shows features of the P.1112, since Waldemar Voigt soon found employment with that firm after the war".

Maybe this needs to be looked into some more.

Does anyone has a copy of 'Winged Wonders'?

James.

Subject: Re: Re:Kenneth Arnould and the Ho-IXStatus:

James,

An important new piece of evidence in the Arnold case may help to resolve this question at least. See COMMENTS below.

Any interview material on Arnold is of importance so I would greatly appreciate it if you could post a copy or supply a copy of the Chenowith (Chenoweth?) 1956 interview.

Brad

In a message dated 2/11/00 8:29:31 PM, voyager@ukonline.co.uk writes:

James.

COMMENTS: Mark Rodeghier, CUFOS director, just confirmed on Wednesday that the light-gray hand drawing on the front cover of IUR for March/April 1995 is an early Arnold drawing in pencil on file at CUFOS, done on an envelope of his Great Western company possibly in the late 40's or early 50's. I had been inquiring around about the drawing and had separately found out from Pierre Lagrange that he had found an envelope at CUFOS with an Arnold drawing -- which turned out to be the IUR cover.

This Arnold drawing is the only known Arnold drawing of the objects' flight path. It also includes drawings of the objects' shapes (which are known however from his letter to the AAF, newspaper articles, etc.). But this drawing seems to be the only one where Arnold draws both the singular object and the shape of the remaining 8 so that they may be compared.

It turns out the bat-shaped singular object is about 15-20% wider than the manta-shaped other eight objects, and that is the longest dimension. However, the bat-shape is also about 40% shorter, too. So perhaps Arnold had difficulty deciding in his mind what to say about the relative sizes because it depended on which dimension.

I will respond to your other post later today.

Content-Disposition: inline
Status:

For the edification of those who may be new to the list I present here the beginning of the Arnold sighting as written in my MUFON Symposium paper (1997) and earlier printed in the IUR:

Note the differentiation between what was in the book vs what was in the letter to the Air Force,

which James did not mention in his recent post.

I should point out that in responding to immediate questions by reporters a witness is not as likely to

give accurate and complete answers as he would be when writing a letter and has a chance to think about what he is saying. Hence, I find the newspaper and radio interviews interesting and corroborative, but not necessarily as accurate as what is in his letter to the Air Force.

.....
ABSTRACT FROM PAPER:

WHAT WAS HE DOING BEFORE THE SIGHTING?

According to Mr. Arnold, at 2:00 PM, June 24, 1947 he took off from Chehalis, in the state of Washington, in his small plane after completing a business trip (he sold and installed fire fighting equipment). He planned to spend about an hour searching for a lost C-46 Marine transport plane that had crashed in the mountains west-southwest of Mt. Rainier. (There was a \$5,000 reward for finding the plane.) After searching for about an hour and not finding anything he turned east toward his next destination, Yakima, Washington. He was near Mineral, Washington, about 22 miles west-southwest of Mt. Rainier and Yakima was about 80 miles ahead of him along a flight path that would take him just about 12 miles south of peak of Mt. Rainier. He levelled out onto his new flight path he was at approximately a 9,200 ft altitude. His sighting began within a minute or two of the turn. Sentences and paragraphs taken from his Air Force letter (ref. 11) are preceded by (L) and statements from his book (ref. 10) are preceded by (B). As you read the following story please keep in mind that this is history. It actually happened!

THE SIGHTING BEGINS

(L) "The air was so smooth that day that it was a real pleasure flying and, as most pilots do, when the air is smooth and they are flying at a higher altitude, I trimmed out my airplane in the direction of Yakima, which was almost directly east of my position and simply sat in my plane

observing the sky and terrain. There was a DC-4 to the left and to the rear of me approximately fifteen miles distance, and I should judge, at 14,000 ft. elevation.

COMMENT: The time was about 3:00 PM and the sun was just slightly to the southwest of being directly overhead (azimuth 230 deg, elevation 60 deg.; this was only two days after the summer solstice). It is important to notice how Arnold's attention was first drawn to the presence of strange flying objects because his initial observation rules out any explanation that is based on things in the sky which are not shiny (reflective, like a mirror) such as, for example, birds. It also rules out atmospheric effects. Also, keep in mind the general geometry of this sighting. The objects traveled almost due south along a path that took them just west of Mt. Rainier. Their travel path from about the location of Rainier to several miles south of Rainier was essentially perpendicular to Arnold's eastward line of sight. This was at the time they were closest to Arnold.

(L) "The sky and air was as clear as crystal. I hadn't flown more than two or three minutes on my course when a bright flash of light reflected on my airplane. It startled me as I thought I was too close to some other aircraft. (B) I spent the next twenty to thirty seconds urgently searching the sky all around - to the sides and above and below me - in an attempt to determine where the flash of light had come from. The only actual plane I saw was a DC-4 far to my left and rear, apparently on its San Francisco to Seattle run. My momentary explanation to myself was that some lieutenant in a P-51 had given me a buzz job across my nose and that it was sun reflecting off his wings as he passed that had caused the flash. Before I had time to collect my thoughts or to find a close aircraft, the flash happened again. This time I caught the direction from which it had come. I observed, far to my left and to the north, a formation of very bright objects coming from the vicinity of Mt. Baker, flying very close to the mountain tops and traveling at tremendous speed. (L) I observed a chain of nine peculiar looking aircraft flying from north to south at approximately 9,500 ft elevation and going, seemingly, in a definite direction of about 170 degrees.

COMMENT: Mt. Baker (altitude, 10,000 ft) is about 130 miles north of Mt. Rainier. Even if the objects were not as far away as Mt. Baker the flashes must have been very bright to be visible over a great distance. (If the path of the objects as estimated by Arnold, 170 degrees azimuth, is projected northward from Mt. Rainier, his sighting line to Mt. Baker crosses the projected path about 50 miles from his plane, which is a more likely distance for his initial observation of the flashes.) This suggests that the flashes were reflections of sunlight from mirror-like (specular) surfaces, i.e., a polished metal surfaces. Sunlight flashes could be visible over distances as great as a hundred miles under clear atmospheric conditions. Anything less would be invisible over such a distance in the bright sky. Since the sun was at an elevation of about 60 deg, some portion of the object's surface must have been momentarily at an angle of

about 60 deg. to the horizontal in order to cause a reflected sun ray to travel nearly horizontally in the atmosphere from the object to Arnold's plane.

DESCRIPTION AND TIMING THE FLIGHT BETWEEN POINTS

(B) "At first I couldn't make out their shapes as they were still at a distance of over a hundred miles. I could see that the formation was going to fly in front of me. I watched as these objects approached the snow border of Mt. Rainier, thinking all the time that I was observing a whole formation of jets. In group count that I have used in counting cattle and game from the air, they numbered nine. They were flying diagonally in echelon formation with a larger gap in their echelon between the first four and last five. What startled me the most was the fact that I could not find any tails on them. I felt sure that, being jets, they had tails, but figured they must be camouflaged in some way so that my eyesight could not perceive them. I knew that the Air Force was very artful in the knowledge and use of camouflage. I observed the objects' outlines plainly as they flipped and flashed against the snow and also against the sky.

(L) Anyhow, I discovered that this was where the reflection had come from, as two or three of them every few seconds would dip or change course slightly, just enough for the sun to strike them at an angle that reflected brightly on my plane.

(B) As they were traveling perpendicular to my path I was in an excellent position to clock their speed and I determined to make an attempt to do so. (L) I had two definite points I could clock them by. (Note: by this he means Mt. Rainier and Mt. Adams, about 47 miles to the south). The air was so clear that it was very easy to see the objects and determine their approximate shape and size at almost fifty miles that day. I remember distinctly that my sweep second hand on my eight day clock, which is located on the instrument panel, read one minute to 3 PM as the first object of this formation passed the southern edge of Mt. Rainier.

(L) I watched these objects with great interest as I had never before observed airplanes flying so close to the mountain tops, flying directly south to southeast down the hog's back of a mountain range. I would estimate their elevation could have varied a thousand feet one way or the other up or down, but they were pretty much on the horizon to me which would indicate that they were near the same elevation as me. They flew like many times I have observed geese to fly in a rather diagonal chain-like line as if they were linked together. They seemed to hold a definite direction but rather swerved in and out of the high mountain peaks. I could quite accurately determine their pathway due to the fact that there were several high peaks a little this side of them as well as higher peaks on the other side of their pathway.

.....

Note the reference to a flash "on his plane" as written in his letter to the Air Force only a month or so after the event.... long before there was any book!

I should add this note, a propos of the present discussion about the flight track and whether or not they went behind "Little Tahoma" or "Little Tacoma" or whatever. I have looked for such a peak on a top map and have not found it labelled. I do find Anvil Rock (9584 ft). which is somewhat to the east of the peak of Rainier. Anyway, I have to "agree" with James..... Arnold could not determine exactly how far away the objects were. However, were as James suggests that Arnold couldn't tell the difference between 1 mile and 20 miles, I suggest that Arnold could not distinguish between, say 20 miles and 25 miles. The point is that he couldn't be certain they were flying a perfectly straight path southward at 170 degrees. That's what it appeared to him, but if they were weaving in and out of mountain peaks, as he suggested, then their distance from him could have been changing by several miles. Hence, they might have flown on the west side of Rainier, close to the mountain, and then moved somewhat eastward as they continued their flight south,. Perhaps they went on the far side of Anvil Rock (I can't be sure of this from my highly compressed topo map).

A second point. I have pointed out previously that the altitude of the mountains south of Rainier lies in the range 5000-7000 ft. Hence 2-4000 ft below Arnold's presumed altitude (9200 according to his instruments which might have been off by several hundred feet at least). I have also pointed out that the depression angle of a several thousand foot altitude difference over 20 miles is only a couple of degrees... an angle so small as to be difficult to distinguish from horizontal... "the horizon".... in other words the objects may have been several thousand feet lower than Arnold at 20 miles distance and have appeared to him, to be about at his altitude (he admits their altitude could have been 1000 ft either way, my suggestion is that they were perhaps 2000 ft lower).

A third point. Having said that he could have been off by several thousand feet in their altitude, I would now have to point out that their altitude could have changed. (In fact Arnold's testimony implies this.) Hence they might have been at about 10,000 ft as they passed Rainier and then dropped downward several thousand feet to "swerve in and out of the mountain peaks" south of Rainier.

Note that if these were True UFOs we don't know what they could have done. If they were pelicans, as James has suggested, then their flight path is considerably restricted by their own flight capabilities and characteristics (flapping wings, size, top speed-- assuming they could fly at top speed at 9000 ft, etc.)..... Oh uh, here I go again.....

All this speculation about top secret research craft of the Air Force is amusing considering that J. Edgar Hoover of tgh FBI was assured by General George Shulgen of AF intelligence, in August, 1947, that there were no secret aircraft development projects that could account for the numerous sghings of flying saucers. It is reasonable to presume that this also applied to Arnold's sighting since what he saw fell under the general classification of "flying saucers." Shulgen sent a letter to Hoover after checking with the AF director of research.

Brad,

This interview was posted to the 'Project-1947' mailing list by Jerome
Clarke on 2 July, 1997.

There's actually very little therein about Arnold's sighting, it deals more
with the Dahl/Tacoma case and other 'contactee' stories.

As it strictly requires permission to repost in full, if you still want a
copy please let me know.

>Mark Rodeghier, CUFOS director, just confirmed on Wednesday that the
>light-gray hand drawing on the front cover of IUR for March/April 1995 is
>an early Arnold drawing in pencil on file at CUFOS, done on an envelope of

>path. It also includes drawings of the objects' shapes (which are known
>however from his letter to the AAF, newspaper articles, etc.). But this
>drawing seems to be the only one where Arnold draws both the singular
>object and the shape of the remaining 8 so that they may be compared.

Is it possible to scan this material and make a copy available?

It would be of great interest to finally see and understand what Arnold
believed he witnessed!

James.

James,

If you can't repost the Chenowith letter please send it to me by private E-mail, if you would, thank you. I can't scan and post the IUR cover for obvious copyright reasons, and the Arnold drawing is partially cropped on it in any event. But I am to receive a full photocopy of the drawing through the kind assistance of Mark Rodeghier of CUFOFOS. I'll ask him if I can post it as well, giving IUR/CUFOS credit for first publication.

Bruce,

Couldn't agree more. It's a point I've made in the past - surely if the US military knew what was responsible for 'flying saucer' reports they wouldn't have wasted so much resources looking for an explanation and allowed the hysteria to continue.

However, if Arnold's sighting was related to a secret test flight, it presumes that someone did spot that likely connection and was prepared to possibly compromise the project's secrecy by revealing its existence. Maybe those directly involved were fearful of being reprimanded, or worse, for what could be considered a dreadful blunder. Not only had a secret flight been noticed, it was the focus of national media attention.

They may have decided it was best to just forget about it - who cares if everyone was suddenly seeing 'flying saucers'!

In fact, they might one day be applauded for such an astute 'cover up'.

Conversely, wouldn't this rapidly have reached a point where those who knew the truth could never reveal it - nobody expected that the hysteria would persist, let alone grow to effectively world-wide proportions and that the US gummit would waste so much time and money.

Who would subsequently and too late, 'own up' under these circumstances?

You could kiss your career goodbye and that's probably not the only thing.

Can we take it you also accept the US had no evidence of any 'alien spacecraft', at this time, and consequently there wasn't one (or is it two) involved in the 'Roswell' case.

Doubtless Shulgen would also have told Hoover about this.

James.

Subject: Re: Kenneth Arnold and KottmeyerStatus:

Hi Bruce,

Thanks for posting the primary source material, especially excerpts of Arnold's letter to the AAF of ca. July 8-10, 1947, which is only two weeks after the sighting, not even a month, so it is important early information.

Little Tahoma Peak, 11,138 ft, is clearly marked on my USGS topo maps, the 7.5-minute Mt. Rainier East quadrangle, and the 15-minute Mt. Rainier quadrangle. According to the online USGS Geographic Names Information System it is located at 46-50-59 N, 121-42-40 W. Again, let me reiterate that Kottmeyer is wrong in saying Little Tahoma was not visible from Arnold's position.

Arnold's only known drawing of the flight path (on the cover of the Mar/Apr 95 IUR with Part 2 of your "Arnold Phenomenon" article) shows it in heavy pencil line somewhat jagged. The path starts with a very thin, short line segment just 5 mm long which overlays the right edge of Mt. Rainier and indicates the path comes from BEHIND Mt. Rainier. (This establishes the minimum distance as at least Arnold's 15-17-mile distance to Mt. Rainier, and makes it impossible to be birds.) It is a well-known artistic convention known to many laypersons to indicate the presence of objects behind other objects in a drawing by the use of THIN or LIGHT or DOTTED lines. The objects' flight path in Arnold's drawing does NOT CROSS IN FRONT OF MT. RAINIER.

Arnold insisted that the objects maintained a "constant" heading or "definite direction of about 170 degrees" at about "right angles" to his own eastward heading towards Yakima when the objects were in the vicinity of Mt. Rainier and beyond. This is not consistent with circling around the front of Mt. Rainier which requires a very discrepant 120-deg heading in order to reach Goat Ridge and destroys the 170-deg heading from there onward.

Arnold's flight-path drawing also shows the path line with a "10000" label indicating it was at 10,000 feet, which was the approximate height of the objects that Arnold insisted upon in his early interviews, and evidently TOO HIGH for pelicans or geese or other birds to maintain in level flight. The flight-path line is clearly high above the rugged ridge which is marked with "5 mi" for the length, which Arnold later identified as Goat Ridge, very roughly at 5,000-7,000 feet. The flight path is also level overall at 10,000 feet, as Arnold always maintained (except for a rise at the very end past Mt. Adams which he mentioned in 1952, but cannot be determined from the IUR cover which is cropped), and does not have any sharp drops or rises, certainly not down to 5,000-7,000 feet.

Brad

In a message dated 2/12/00 1:20:59 PM, brumac@compuserve.com writes:

<<

For the edification of those who may be new to the list I present here the

beginning of theArnold

sighting as written in my MUFON Symposium paper (1997) and earlier printed
in the IUR:

Note the differentiation between what was in the book vs what was in the
letter to the Air Force,

which James did not mention in his recent post.

I should point out that in responding to immediate questions by reporters a
witness is not as likely to

give accurate and complete answers as he would be when writing a letter and
has a chance to think about what he is saying. Hence, I find the newspaper
and radio interviews interesting and corroborative, but not necessarily as
accurate as what is in his letter to the Air Force.

.....

ABSTRACT FROM PAPER:

WHAT WAS HE DOING BEFORE THE SIGHTING?

According to Mr. Arnold, at 2:00 PM, June 24, 1947 he took off from
Chehalis, in the state of Washington, in his small plane after completing a
business trip (he sold and installed fire fighting equipment). He planned
to spend about an hour searching for a lost C-46 Marine transport plane
that had crashed in the mountains west-southwest of Mt. Rainier. (There

was a \$5,000 reward for finding the plane.) After searching for about an hour and not finding anything he turned east toward his next destination, Yakima, Washington. He was near Mineral, Washington, about 22 miles west-southwest of Mt. Rainier and Yakima was about 80 miles ahead of him along a flight path that would take him just about 12 miles south of peak of Mt. Rainier. He levelled out onto his new flight path he was at approximately a 9,200 ft altitude. His sighting began within a minute or two of the turn. Sentences and paragraphs taken from his Air Force letter (ref. 11) are preceded by (L) and statements from his book (ref. 10) are preceded by (B). As you read the following story please keep in mind that this is history. It actually happened!

THE SIGHTING BEGINS

(L) "The air was so smooth that day that it was a real pleasure flying and, as most pilots do, when the air is smooth and they are flying at a higher altitude, I trimmed out my airplane in the direction of Yakima, which was almost directly east of my position and simply sat in my plane observing the sky and terrain. There was a DC-4 to the left and to the rear of me approximately fifteen miles distance, and I should judge, at 14,000 ft. elevation.

COMMENT: The time was about 3:00 PM and the sun was just slightly to the southwest of being directly overhead (azimuth 230 deg, elevation 60 deg.; this was only two days after the summer solstice). It is important to notice how Arnold's attention was first drawn to the presence of strange

flying objects because his initial observation rules out any explanation that is based on things in the sky which are not shiny (reflective, like a mirror) such as, for example, birds. It also rules out atmospheric effects. Also, keep in mind the general geometry of this sighting. The objects traveled almost due south along a path that took them just west of Mt. Rainier. Their travel path from about the location of Rainier to several miles south of Rainier was essentially perpendicular to Arnold's eastward line of sight. This was at the time they were closest to Arnold.

(L) "The sky and air was as clear as crystal. I hadn't flown more than two or three minutes on my course when a bright flash of light reflected on my airplane. It startled me as I thought I was too close to some other aircraft. (B) I spent the next twenty to thirty seconds urgently searching the sky all around - to the sides and above and below me - in an attempt to determine where the flash of light had come from. The only actual plane I saw was a DC-4 far to my left and rear, apparently on its San Francisco to Seattle run. My momentary explanation to myself was that some lieutenant in a P-51 had given me a buzz job across my nose and that it was sun reflecting off his wings as he passed that had caused the flash. Before I had time to collect my thoughts or to find a close aircraft, the flash happened again. This time I caught the direction from which it had come. I observed, far to my left and to the north, a formation of very bright objects coming from the vicinity of Mt. Baker, flying very close to the mountain tops and traveling at tremendous speed. (L) I observed a chain of nine peculiar looking aircraft flying from north

to south at approximately 9,500 ft elevation and going, seemingly, in a definite direction of about 170 degrees.

COMMENT: Mt. Baker (altitude, 10,000 ft) is about 130 miles north of Mt. Rainier. Even if the objects were not as far away as Mt. Baker the flashes must have been very bright to be visible over a great distance. (If the path of the objects as estimated by Arnold, 170 degrees azimuth, is projected northward from Mt. Rainier, his sighting line to Mt. Baker crosses the projected path about 50 miles from his plane, which is a more likely distance for his initial observation of the flashes.) This suggests that the flashes were reflections of sunlight from mirror-like (specular) surfaces, i.e., a polished metal surfaces. Sunlight flashes could be visible over distances as great as a hundred miles under clear atmospheric conditions. Anything less would be invisible over such a distance in the bright sky. Since the sun was at an elevation of about 60 deg, some portion of the object's surface must have been momentarily at an angle of about 60 deg. to the horizontal in order to cause a reflected sun ray to travel nearly horizontally in the atmosphere from the object to Arnold's plane.

DESCRIPTION AND TIMING THE FLIGHT BETWEEN POINTS

(B) "At first I couldn't make out their shapes as they were still at a distance of over a hundred miles. I could see that the formation was going to fly in front of me. I watched as these objects approached the

snow border of Mt. Rainier, thinking all the time that I was observing a whole formation of jets. In group count that I have used in counting cattle and game from the air, they numbered nine. They were flying diagonally in echelon formation with a larger gap in their echelon between the first four and last five. What startled me the most was the fact that I could not find any tails on them. I felt sure that, being jets, they had tails, but figured they must be camouflaged in some way so that my eyesight could not perceive them. I knew that the Air Force was very artful in the knowledge and use of camouflage. I observed the objects' outlines plainly as they flipped and flashed against the snow and also against the sky.

(L) Anyhow, I discovered that this was where the reflection had come from, as two or three of them every few seconds would dip or change course slightly, just enough for the sun to strike them at an angle that reflected brightly on my plane.

(B) As they were traveling perpendicular to my path I was in an excellent position to clock their speed and I determined to make an attempt to do so. (L) I had two definite points I could clock them by. (Note: by this he means Mt. Rainier and Mt. Adams, about 47 miles to the south). The air was so clear that it was very easy to see the objects and determine their approximate shape and size at almost fifty miles that day. I remember distinctly that my sweep second hand on my eight day clock, which is located on the instrument panel, read one minute to 3 PM as the first object of this formation passed the southern edge of Mt. Rainier.

(L) I watched these objects with great interest as I had never before observed airplanes flying so close to the mountain tops, flying

directly south to southeast down the hog's back of a mountain range. I would estimate their elevation could have varied a thousand feet one way or the other up or down, but they were pretty much on the horizon to me which would indicate that they were near the same elevation as me. They flew like many times I have observed geese to fly in a rather diagonal chain-like line as if they were linked together. They seemed to hold a definite direction but rather swerved in and out of the high mountain peaks. I could quite accurately determine their pathway due to the fact that there were several high peaks a little this side of them as well as higher peaks on the other side of their pathway.

.....

Note the reference to a flash "on his plane" as written in his letter to the Air Force only a month or so after the event.... long before there was any book!

I should add this note, a propos of the present discussion about the flight track and whether or not they went behind "Little Tahoma" or "Little Tacoma" or whatever. I have looked for such a peak on a top map and have not found it labelled. I do find Anvil Rock (9584 ft). which is somewhat to the east of the peak of Rainier. Anyway, I have to "agree" with James..... Arnold could not determine exactly how far away the objects were. However, were as James suggests that Arnold couldn't tell the difference between 1 mile and 20 miles, I suggest that Arnold could not distinguish between, say 20 miles and

25 miles. The point is that he couldn't be certain they were flying a perfectly straight path southward at 170 degrees. That's what it appeared to him, but if they were weaving in and out of mountain peaks, as he suggested, then their distance from him could have been changing by several miles. Hence, they might have flown on the west side of Rainier, close to the mountain, and then moved somewhat eastward as they continued their flight south,. Perhaps they went on the far side of Anvil Rock (I can't be sure of this from my highly compressed topo map).

A second point. I have pointed out previously that the altitude of the mountains south of Rainier lies in the range 5000-7000 ft. Hence 2-4000 ft below Arnold's presumed altitude (9200 according to his instruments which might have been off by several hundred feet at least). I have also pointed out that the depression angle of a several thousand foot altitude difference over 20 miles is only a couple of degrees... an angle so small as to be difficult to distinguish from horizontal... "the horizon".... in other words the objects may have been several thousand feet lower than Arnold at 20 miles distance and have appeared to him, to be about at his altitude (he admits their altitude could have been 1000 ft either way, my suggestion is that they were perhaps 2000 ft lower).

A third point. Having said that he could have been off by several thousand feet in their altitude, I would now have to point out that their altitude could have changed. (In fact Arnold's testimony implies this.) Hence they might have been at about 10,000 ft as they passed Rainier and then dropped downward several thousand feet to "swerve in and out of the

mountain peaks" south of Rainier.

Note that if these were True UFOs we don't know what they could have done.

If they were pelicans, as James has suggested, then their flight path is

considerably restricted by their own flight capabilities and

characteristics (flapping wings, size, top speed-- assuming they could fly

at top speed at 9000 ft, etc.)..... Oh uh, here I go again.....

Regarding you comments on the secret flight idea:

The idea that someone let Arnold's saucer sighting to remain unexplained in order to cover up a secret flight presupposes that there could have been such a flight.

I ... and gather others on this list.... d not buy the idea that there would have been

9 somewhat circular (8 of one type and 1 of another) top secret aircraft flying around

in the state of Washington, near Mt Rainier , where any Tom, Dick or Kenneth

could see them and spill the secret beans to the press (and thence to the Soviets).

Secret aircraft tend to be confined to secret areas.... unless they can fly so high and fast

as be hard to see (e.g., U-2).

>

Can we take it you also accept the US had no evidence of any 'alien spacecraft', at this time, and consequently there wasn't one (or is it two) involved in the 'Roswell' case.

Doubtless Shulgen would also have told Hoover about this.

<

Not doubtless. Hoover had no need to know about "real" crashed discs.... despite his

statement that he should have access to "all discs recovered"... in order to carry out

the investigation of "ash can covers, toilet seats and whatnot" (quoted from an Air

Force document), i.e., investigation of the hoax sightings and searching for evidence

of communist subversion, which is what the AF asked the FBI to do.

Hi,

Well, I was involved in this case virtually from the start. I have met Alan often. In fact I spoke to him only a couple of weeks ago.

I wrote his initial story up at great length in 'The Pennine UFO Mystery' in close consultation with him in 1983 (indeed this brought special branch attention since I sent him cassette tapes to check over and someone, somewhere found this out). I then told the story of what happened next (police harrassment etc that he faced) in 'Death by Supernatural Causes?' in 1988. A new version of this (its completely rewritten with new data and different cases) is to appear this spring as 'Supernatural Causes?' More info on the Godfrey case gathered post 1988 is in there.

In answer to your question. I have no doubt Alan is sincere. There is very little question a UFO was seen that night. Alan was not the only witness. The other sightings all interlock. The UFO was a rotating, swirling dome shape and possibly a UAP. It created physical effects. In the wave that surrounded it (and included the death of Zigmund Adamski a few hundred yards away that Alan was pilloried over later more than his own encounter) there were clear EM effects in evidence.

As for the abduction scenario. Thats a different matter. The doctors who regressed him told me they thought he was recalling a real memory. Alan himself has never been sure. There was a nine month gap between sighting and

hypnosis during which Alan read UFO literature and thinks this could have been influential. He has never developed a certain conscious recall and did not even recall the memory after hypnosis until he saw the video footage.

Personally, I have always respected Alan and his candid sincerity over this. It is also true that he has a classic 'track record' from seeing what I call 'psychic toys' as a child through a number of apparitional and mini time lapse experiences as he grew up. This led to several doctors suspecting either narcolepsy or temporal lobe epilepsy.

During the shameful lengthy attempts by the West Yorkshire Police to discredit him (full story in Death by Supernatural Causes) he was shunted to many doctors. I have seen the documentation and other evidence Alan gathered. Its powerful stuff. None found any trace of these medical conditions and one doctor said the senior officers who tried to find a way to get rid of him should come and see a psychiatrist.

Alan was forced out of the police via a series of petty acts that beggar belief. The police even raided his retirement party!

If you dont know this full story 'Supernatural Causes' will open your eyes if you read it this spring as this is a case of far more than just a copper who saw a UFO.

Best wishes,

Jenny Randles

Hi,

Interesting case, interesting guy - I wouldn't like to tell him he didn't see a UFO!

But there are a few anomalies with the case which intrigue-

* Two other 'UFOs' were seen that night in the same *general* area. Yes. But there is nothing to connect those two with each other, never mind what PC Godfrey saw.

* Watch the regression video (widely bootlegged despite Harry Harris trying to prevent it). Godfrey's reactions give no doubt he is under the 'fluence. But right at the beginning, when he is describing what he saw he says, 'It's a bus, it's a bus, it's not a bus.'

* Now, that might just mean he at first confused a huge, hovering, rotating object with a bus. As you do.

* On the other hand - and coming at things from a misperception angle, as I tend to - what if he *had* seen a bus and then had a 'UFO moment' - as thousands of other witnesses of radical misperceptions have done?

* The event took place outside a mill which worked shifts. It took place at (from memory) 5.30am (ish) - when buses would have been bringing/taking people to/from the factory. And stone me if it wasn't more or less next to a bus stop!

* Couple that with the fact that throughout the encounter it seems no other witness saw anything - on a relatively busy trans-pennine road, at a time when factories in the area were starting up.

* I hasten to add that I'm certainly *not* claiming Godfrey saw a bus - just that that particular angle has never been explained as I don't think anyone checked the bus time tables at the time.

* The 'Adamski' death was I think, further away from the Godfrey event site than Jenny suggests.

* In 1988 I was teaching a local authority folklore evening class and who should be flicking ink pellets from the back but the Chief Inspector

of the local force at the time of the Godfrey event. He said- and I must emphasise that this is me repeating what I was told *not* my personal beliefs - that if ever anything 'like that' was going to happen it would have happened to Alan Godfrey.

* If it walks like a bus and talks like a bus.....

* I also know, professionally and from school, one of the three police officers who saw one of the other UFOs that night. They are in no doubt they saw something extremely unusual and that it headed off in the *general* direction of where PC Godfrey was.

* As I said, interesting case, interesting guy.

Happy - if slightly mischevious -Trails

Andy

>never mind what PC Godfrey saw.

Not strictly true. The three sightings all occurred within a small moorland area within 3 miles of Todmorden. They all occurred within a period of about 30 minutes of each other. They were all reported independently. Each reported a bright light coloured blue/white and two referred to swirling images or rotations. There are in fact more connections between these sightings than in many independently witnessed cases. However, it is true that only Alan Godfrey saw anything substantial.

To be honest the testimony of three other police officers on the moors looking for missing motorcycles is partly reminiscent of venus (which was bright in the sky at the time). But having talked to them I doubt that's what they saw. Although it's not impossible that coupled with a temperature inversion it might be this (there was a major clearing weather system sweeping through creating boundary layer distortions). Odds are it was more given Alan's sighting, which it is virtually impossible to fit with venus (he was driving in the opposite direction)

But I think if you study the sightings from around 5 am they do appear to relate to the same basic phenomenon - except in Alan's case it went a lot further.

I don't think so Andy. You need to follow his full testimony to see this

sentence in context. Despite what you say this WAS checked. There was one works bus due through. It in fact passed through the town and was seen by another PC checking shops. It passed him before Alan drove past . Indeed Alan recalled later seeing it himself before he went onto Burnley Road.

The bus was in fact a West Yorkshire PTE workers bus taking early morning drivers to take charge of the first service buses of the day. These had not yet started because that bus had yet to deliver the drivers for services which began at around 5.30.

Besides which Alan stopped his car, picked up an accident sketch pad, propped it against the windscreen and drew the 'bus' dead in front. We reconstructed this on site and it took about 2 minutes. Aside from the improbability of a bus stopping that long with so few people about its a rather lengthy 'UFO moment' and I just dont buy someone mistaking a bus for something far stranger for such a long time.

Besides which Alan was adamant he was within a very short distance, had a perfect view and could see much detail (including the roadside bushes being blown by the rotational vortex). Not to mention the rather curious coincidence that Alan would see a bus and freak out (despite telling us he saw that same bus often on patrol) and within a couple of hours of his experience on just that day two other groups of witnesses see a UFO in the same area at the same time in circumstances where there is no reasonable prospect they too saw a bus and got fooled.

See above. Sounds plausible But it didnt check out.

>

>* Couple that with the fact that throughout the encounter it seems
>no other witness saw anything - on a relatively busy trans-pennine

Untrue, one driver from Cliviger DID see something on the same road and report it around breakfast time long before Alan's story was public knowledge. And traffic at 5 am on that road in 1980 was not massive. We were there several times late at night and it was not exactly humming. At 5 am it would have been even quieter.

>* I hasten to add that I'm certainly *not* claiming Godfrey

See above. MUFORA did.

Half a mile or so.

>* In 1988 I was teaching a local authority folklore evening class and

>have happened to Alan Godfrey.

See my comments about the appalling attitude and actions of the West Yorkshire Police to Alan. I don't know if Andy has seen or heard the evidence Alan accrued (some of it was watertight I promise). I did study all this and I would not trust anything told about Alan by his colleagues in its light. They had a vested interest in shutting him up over the Adamski death (not I think because Adamski was murdered by aliens but simply because they botched the case and Alan uncovered key things that never made it to the inquest). His and a key witness statement got lost. Again details are in 'Supernatural Causes'. I have had access to the complete inquest transcripts and Alan's own police statement books. They are illuminating.

As I said this case is a lot deeper than meets the eye irrespective of the abduction (which I don't think was an alien kidnap - it was a dream/fantasy based on Blakes Seven and Buck Rogers in the 25th Century - the clues are obvious from the hypnosis sessions). I think Alan saw a UAP that triggered an altered state/dream due to a latent tendency he clearly had from his earlier experiences caused by something akin to narcolepsy. That's my opinion only, of course. The UAP created physical effects (it swirl dried the road surface for instance) and was seen in its true form (at a greater distance) by the others who basically just observed a light.

The Adamski affair was a coincidence but Alan's association with that - his refusal to bury the cock ups - and the unfortunate high profile that his close encounter brought - made him a huge embarrassment to the police who in effect engineered his departure in shameful ways.

>* If it walks like a bus and talks like a bus.....

But in this case Andy it doesn't. You are basing a conclusion on a fraction of the evidence. I've seen a lot more than I suspect you have and I think that theory is too simplistic to fit the facts.

Best wishes,

Jenny

Brad,

Thank you for explaining this fascinating development.

It's maybe, as we shall see, presumptuous to take this evidence as being unequivocal and justifying any impossibilities.

>It is a well-known artistic convention known to many laypersons to indicate
>the presence of objects behind other objects in a drawing by the use of
>THIN or LIGHT or DOTTED lines. The objects' flight path in Arnold's
>drawing does NOT CROSS IN FRONT OF MT. RAINIER.

In conjunction with Arnold's accounts which were noted, it emphasises the question I asked - how can this all be reconciled.

Arnold clearly stated the objects flew down the western side of Mt. Rainier. Wouldn't they have flown down the eastern side if passing behind the mountain?

>Arnold insisted that the objects maintained a "constant" heading or
>"definite direction of about 170 degrees" at about "right angles" to his
>own eastward heading towards Yakima when the objects were in the vicinity
>of Mt. Rainier and beyond. This is not consistent with circling around the
>front of Mt. Rainier which requires a very discrepant 120-deg heading in
>order to reach Goat Ridge and destroys the 170-deg heading from there
>onward.

Yet, Arnold claimed in that early radio interview, "I could see them against the snow, of course, on Mt. Rainier".

How could he, if they went behind the mountain?

At the speed he believed the objects to be travelling and given his location, how could they have passed behind the mountain and still have been visible with the mountain as a backdrop?

>Arnold's flight-path drawing also shows the path line with a "10000" label
>indicating it was at 10,000 feet, which was the approximate height of the
>objects that Arnold insisted upon in his early interviews, and evidently
>TOO HIGH for pelicans or geese or other birds to maintain in level flight.

As I confirmed on the 'UFO UpDates list, way back in November 1997:

"Incidentally, on Kottmeyer's belief that 9200 feet is an unlikely altitude for geese to be flying, perhaps worth considering, for ease of reference, the information at URL:

<http://lucky.innet.com/~brad/geese.html>

which states:

"An Eagle may rise at least to the height of 17,000 feet, for it is there just visible. Flocks of Storks and Geese may mount still higher..."

And that "AIP bird hazards" at URL:

<http://www.tc.gc.ca/aviation/aerodrme/birdstke/info/images/geese/gespring.gif>

[this URL might 'wrap around']

shows the "spring migration route" for geese indicates a hazard "UP TO 12,000 FEET".

[End]

I can easily add further references from ornithological sources, e.g.:

"A flock of whooper swans was observed migrating at a height of 8,800 meters (28,871 feet).....".

There's absolutely no question it's a fact that birds are not limited by an altitude of 10,000 feet, or even close.

Consider also the potential significance of that 'New Westminster British Columbian' article dated 12 July, 1947 which reported:

"Capt. Gordon Moore disclosed that he and his co-pilot, Vern Kesler were saucer-hunting last Wednesday on a regular flight between here and Portland, Ore. Kesler was sure he had seen some flying saucers on July 2, and the pilots were armed with movie cameras and binoculars for another encounter.

'Suddenly we spotted nine big round disks weaving northward two thousand feet below us,' Moore related.

'We investigated and found they were real all right --- real pelicans'."

What altitude would this 'Northwest Airlines' plane probably have been flying at?

Their "nine big round disks weaving northward" were only a stated two thousand feet beneath them...

I look forward to some rationalisation of the questions asked by the apparent variance in Arnold's accounts.

James.

Subject: Reading List for HighSchool Seniors?
Status:

Greetings List,

I'd like to get a few opinions from the members here. I will be giving a presentation to a high school class next month and I'd like to develop a list of 10 books that would be a good introductory list of reading material on the subject of ufos, abductions, crop circles, etc., for high school seniors. I'd like to encompass general coverage of the topic with a very good readability index. Your help would be greatly appreciated.

Thanks,
Todd Lemire

>and makes it impossible to be birds.)

Brad,

Thank you for explaining this fascinating development.

It's maybe, as we shall see, presumptuous to take this evidence as being

unequivocal and justifying any impossibilities.

COMMENTS: Sorry about my hasty wording. What I meant to say was that IF the Arnold drawing is correct then birds could not be visible at the indicated distance of at least 15-17 miles and hence the bird explanation would be impossible.

>It is a well-known artistic convention known to many laypersons to indicate
>the presence of objects behind other objects in a drawing by the use of
>THIN or LIGHT or DOTTED lines. The objects' flight path in Arnold's
>drawing does NOT CROSS IN FRONT OF MT. RAINIER.

In conjunction with Arnold's accounts which were noted, it emphasises the question I asked - how can this all be reconciled.

Arnold clearly stated the objects flew down the western side of Mt. Rainier.

Wouldn't they have flown down the eastern side if passing behind the mountain?

COMMENTS: You are right to ask the questions and I'm sorry to say they're not easily reconciled and seemingly totally inconsistent. The question of the objects' flight path as either east or west of Mt. Rainier I think accounts for why there has evidently NEVER been a MAP of the objects' flight path ever PUBLISHED, not by Arnold who reportedly drew one right after the incident or anyone else (except for a sketchy all but worthless one in FSR in 1987). The contradictions in Arnold's accounts have frustrated attempts to map the flight path.

And it is NOT THE ONLY CONTRADICTION in his testimony, there are many other facets in contradiction -- (1) WHAT he FIRST saw or drew his attention (2) WHERE he was when he FIRST saw the objects and WHERE the objects were (3) what he first thought they were, (4) the objects' shape(s) (5) whether he used a stopwatch, wristwatch or instrument panel clock to do his famous timing (6) the objects' altitude and whether they dipped down in among the peaks of Goat Ridge between Rainier and Adams. Etc. etc.

>Arnold insisted that the objects maintained a "constant" heading or
>"definite direction of about 170 degrees" at about "right angles" to his
>own eastward heading towards Yakima when the objects were in the vicinity
>of Mt. Rainier and beyond. This is not consistent with circling around the
>front of Mt. Rainier which requires a very discrepant 120-deg heading in
>order to reach Goat Ridge and destroys the 170-deg heading from there
>onward.

Yet, Arnold claimed in that early radio interview, "I could see them against the snow, of course, on Mt. Rainier".

How could he, if they went behind the mountain?

At the speed he believed the objects to be travelling and given his location, how could they have passed behind the mountain and still have been visible with the mountain as a backdrop?

COMMENTS: See above. Excellent points.

>Arnold's flight-path drawing also shows the path line with a "10000" label
>indicating it was at 10,000 feet, which was the approximate height of the
>objects that Arnold insisted upon in his early interviews, and evidently
>TOO HIGH for pelicans or geese or other birds to maintain in level flight.

As I confirmed on the 'UFO UpDates list, way back in November 1997:

"Incidentally, on Kottmeyer's belief that 9200 feet is an unlikely altitude for geese to be flying, perhaps worth considering, for ease of reference, the information at URL:

<http://lucky.innet.com/~brad/geese.html>

which states:

"An Eagle may rise at least to the height of 17,000 feet, for it is there just visible. Flocks of Storks and Geese may mount still higher..."

COMMENTS: Please note carefully what I said: "TOO HIGH for ... birds to MAINTAIN in LEVEL flight." They can RISE or SOAR on a ballistic arc to higher altitudes but cannot sustain those altitudes in constant level flight.

And that "AIP bird hazards" at URL:

<http://www.tc.gc.ca/aviation/aerodrme/birdstke/info/images/geese/gespring.gif>

[this URL might 'wrap around']

shows the "spring migration route" for geese indicates a hazard "UP TO 12,000 FEET".

[End]

I can easily add further references from ornithological sources, e.g.:

"A flock of whooper swans was observed migrating at a height of 8,800 meters (28,871 feet).....".

There's absolutely no question it's a fact that birds are not limited by an

altitude of 10,000 feet, or even close.

This sounds familiar. Back in March 93 I was on a job in a Hampshire forest. Not much going on, so we had a barbeque. As you do. We started discussing ABCs ("Alien Big Cats - large felines seen in the UK) and other odd stuff when one of the blokes (John Hampson or Hampton, I don't have my paperwork with me as I'm up North.) started to talk about a UFO he had seen, a triangle to be precise. (he didn't know me or of my interest in them). I asked him a load of questions and he asked me what my interest was. I told him, so he said "What do you make of this then?" and told me the Alan Godfrey story and the Adamski business (If I recall rightly it was a body with no spine stuck on top of a pile of coal. Definitely body swerve time for Chris)

I think he knew Alan Godfrey and didn't doubt his story one bit. This bloke John lived in or near the village of Todmorden, which he said was a "hotspot" for UFOs. I was intrigued by the triangle but dismissed the rest of this story as bollocks as a) I knew nothing about UFOs b) wasn't particularly interested in people having their spines whipped out.

Is this also the story told in Paul Devereaux's "Earthlight Revelation"?

here's the sighting from my files if anyone is interested:

snip -- Triangular array of lights near Todmorden, Lancashire, 2100 hrs, early spring 1993. Definitely a plane, the witness stated that the aircraft was fairly low, heading towards the south east. One unusual aspect of this sighting was that "the jet noise came from the plane, there was no lag". What the witness meant was that low flying jets are normally seen "ahead" of where the jet noise is apparently being generated. The witness was familiar with the regular aircraft movements in the area and considered this to be unusual enough to merit mentioning. --snip

He also added that there was a lot of night-time helicopter activity in the area.

Hope this helps

Chris

Subject: Re: Kenneth Arnold and KottmeyerStatus:

Bruce,

With N at 12 o'clock from Mt. Rainier, Little Tahoma Peak is at 3:11 o'clock (azimuth 95.4 degs).

Mt. Rainier: 46-51-10 N, 121-45-31 W
Little Tahoma: 46-50-59 N, 121-42-40 W

Anvil Peak would be almost directly in front of Little Tahoma depending on Arnold's exact position.

Brad

Subject: Re: Alan Godfrey's Close Encounter

>>

>

>This sounds familiar. (he) told me the Alan Godfrey story and the Adamski business (If I recall rightly it was a body with no spine stuck on top of a pile of coal. Definitely body swerve time for Chris)

This sounds like a case of the legend outgrowing the reality. Adamski was a coal miner with some heart trouble (which ultimately was the reason for his death). He disappeared in the middle of the day some 30 miles from Todmorden (which is in West Yorkshire BTW - not Lancashire - although its very near the border - and village is stretching the description - its a small town). Adamski was going to buy food from a corner shop in a district of Wakefield where he lived, was seen by a neighbour who chatted with him on route. Then five days later he turned up dead on top of a pile of coal beside the Tod railway station. He had a burn on his back and neck that was covered in a (never identified) substance. His face had a pain/fear expression (there was dispute over which - as if he had a heart attack the visual expression can resemble fear as the coroner advised us).

The stuff about a missing spine is utter twaddle. I've never heard it before but I've studied the autopsy report and corresponded with the coroner and this just aint true - although the coroner was (and remains) quite baffled by this case and has been prepared to publicly entertain the possibility of a UFO link more than once - which is definitely not the norm for coroners!

No link between Adamski and Todmorden was ever established. He died from a heart attack quite clearly. The burn had occurred probably 24 hours earlier and was not directly responsible. But huge questions remain - like where he had been for 5 days. This was never established despite three inquests.

Alan Godfrey and a colleague were the two officers called to the coal yard to see the body when it was found. Alan established basic facts from witnesses and did a preliminary search for clues before the CID got there and found that a reliable witness had seen the coal heap at a time seemingly later established by the autopsy to be after Adamski's death. His body was not there then. This at least made it debatable that he had been put on the heap after his death - not crawled up there and died (as the inquest later surmised).

During the three inquests neither Godfrey nor this witness were ever called to give evidence and their statements disappeared from the case file in the five months between the death (in June), the staging of the three inquests (until the autumn) and Godfrey's close encounter nearby (in November).

So there are mysteries about the death of Adamski and the fact that there were numerous electrically charged UFOs seen locally at that time (in one case they seem to have caused street lights to go out) is another factor our research established. A sighting very near the coal yard also occurred the night before the body was found. But linking UFOs to the death itself has always been purely circumstantial. Even though you might argue that there are some fairly interesting circumstances.

Whilst at the time I first told this story (in FSR and Fate) I got a lot of abuse for trying to suggest a UFO murdered somebody (clearly ridiculous) it was then not known by most people that there were hidden depths to this affair. Unfortunately I was sworn to withhold quite a bit that I knew because Alan was still a serving police officer.

Harry Harris, the lawyer who worked on the case with our local Manchester group, had befriended him, and was also keen to try to arrange the sale of Alan's story to a big budget movie. When he was forced out by the police I held back out of respect to Alan as he deserved this chance - and it nearly came off (I believe he and Harry did deals in America and even signed contracts).

As most of you know I don't associate with Harris at all so I've kept out of this in recent years. In the end (I believe) the movie fell foul of the American audience wanting to recast it in Pittsburgh, or somewhere they could attach to! And Fire in the Sky scuppered the market anyhow. But the story was used as the basis for an episode of the TV series 'Heartbeat' about five years ago in which one of the cast was abducted from his patrol car (Alan and Harris consulted with the TV company I gather).

The same show (a huge long running hit series for non UK viewers - although it is shown in many overseas countries) also based an episode in 1998 on another of our investigations from the area (as described in detail in 'The Pennine UFO Mystery' - the book I wrote with Alan's aid in 1983).

This recent episode also clearly included elements of the Adamski death. In that episode a UFO was seen regularly over the hills of the fictional village, it was a silent swooping light scaring farmers. One of the police officers tracked and solved it in a remarkable way - as a gliding cargo plane from Scotland. At the same time a mysterious body turned up nearby - with unusual burns. In the plot these were eventually proven to have been caused by an electric fire! Would that Adamski's death had proved so easy to resolve.

There can be absolutely no doubt that this episode was in essence ripped off from our own investigations into the Godfrey/Adamski case as written up in

'The Pennine UFO Mystery' since much of that episode describes highly strange events I don't think ever duplicated elsewhere. They did not even change the origin of the cargo plane (which was indeed Glasgow). Needless to say Yorkshire TV (programme makers) told me - when I protested - that they think the writer 'read about it somewhere' but he doesn't recall where.

So in one way or another this case has had a major cultural impact in the UK, but I think you might see it in a new light come this spring as I'm reporting a number of new things I have discovered from first hand investigations in 'Supernatural Causes?'

>

>I think he knew Alan Godfrey and didn't doubt his story one bit. This bloke John lived or near the village of Todmorden, which he said was a "hotspot" for UFOs.

As you will see I can tell a lot more in 'Supernatural Causes?' about surrounding events and that is true. In fact the very first episode of the TV show I worked on - 'Strange But True?' (made in 1993) was chosen by us to be about the Todmorden/Bacup hotspot. I spent several days in the area researching that programme and cases tumbled out wherever you looked.

Much of that never went on screen. But you'll get the gist from 'Supernatural Causes?'

I did some stats for the show and by far this area has generated more close encounters than anywhere else in the UK. The (usually very interesting) cases that fill my chapter on the Adamski death amply demonstrate that.

I think this whole Adamski/Godfrey/Todmorden affair is one of the most intriguing cases I have ever been involved with. It fired me more than anything because of its location (I was born and raised in Bacup - a very similar mill town just across the moors from Todmorden, about 5 miles away over the Lancashire border). This whole area is awash with UFO activity and locals call this region 'UFO Alley'. Indeed Bacup has just set up the UK's first 'UFO Shop' to promote plans by local businessmen and tourist agencies to create a museum and resources centre locally. There is nowhere in the UK that as a consequence of UFO activity is more appropriate than my home town (read into that what you will!)

You may recall the TV series 'Juliet Bravo' about a small town Pennine police station. This ran for years in the 1970's / early 1980's and is still shown today in repeats on satellite TV (UK Gold). It was filmed on location by the BBC in the Bacup/Todmorden area and the police station used in the fictional town is in fact the real one in Bacup a few hundred yards from the new UFO centre. At least one episode featured UFOs in the plot.

If you want a visual and cultural feel of what this area was like circa 1980 around the time of the Adamski/Godfrey incidents then watch a few episodes of Juliet Bravo.

Also bear in mind that the period November/December 1980 (during which both this Todmorden abduction and Rendlesham Forest occurred) was filled with several other impressive cases that are less well known. This is one of Britains most significant ever waves.

Best wishes,

Jenny Randles

@Subject: Re: Change in sightings

@
@Larry R.,

@You mention a great many cases by number and claim that EM effects may not be
@connected to the appearance of "UFO's" that are really fire balloons because
@"Coincidence rears its ugly head too many times in these cases." Yet you did
@not cite a single such EM case caused by a fire balloon "coincidence."

I will do so later (the book is not here with me).

@I also notice that you're now slipping in instances of prank
@HELIUM weather balloon launches with "railroad flares" attached
@which are not the same as FIRE BALLOONS. Please note that FIRE
@BALLOONS have insufficient lift to raise a typically 7-lb
@railroad flare (up to 50 lbs with railroad spike), a fact Phil
@Klass failed to realize in his discussion of the Seattle
@sightings of 1968 allegedly caused by railroad flares
@miraculously "attached" to flimsy fire balloons (UFOs Explained
@1976, p. 32).

Not really. I consider both in the same class of objects.

The small type 2 fire balloon (made of a suit bag) could not
raise a railroad flare. Since the type 1 (with a larger tissue
paper envelope) was able to lift its "engine" (a paper cup full
of tallow with multiple wicks), a large enough envelope (say the
bag my couch came wrapped in) could conceivably lift an engine
made of a highway flare. A website (<http://www.overflite.com/>)
gives the mathematics of calculating a fire balloon, as well as a
manual for constructing a new version.

One also has to realize that the highway emergency flares sold in
the US the 60s were also called "railroad" flares by many people.
I used to have some made by "Railroad Signal Co." They had a

picture of the old US round R+R traffic sign on the tube. So this may be a case of the "Kleenex" linguistic striking again. Those flares were smaller and much lighter. Many came with a little plastic stand instead of a spike. I once had a 15 minute flare that was 5/8 of an inch in diameter and 6 inches long. The largest ones weighed much less than my 5 pound hammer.

IN ORDER TO FURTHER ILLUMINATE ALL "discrepancies"
I HAVE SCANNED THE IUR cover showing Arnol'ds sketch.
See Attached.

Brad wrote

>Arnold's only known drawing of the flight path (on the cover of the
Mar/Apr
5 IUR with Part 2 of your "Arnold Phenomenon" article) shows it in heavy
pencil line somewhat jagged. The path starts with a very thin, short line
>segment just 5 mm long which overlays the right edge of Mt. Rainier and
>indicates the path comes from BEHIND Mt. Rainier. (This establishes the
>minimum distance as at least Arnold's 15-17-mile distance to Mt. Rainier,
>and makes it impossible to be birds.)

Brad,

(James)

Thank you for explaining this fascinating development.
It's maybe, as we shall see, presumptuous to take this evidence as being
unequivocal and justifying any impossibilities.

COMMENTS: Sorry about my hasty wording. What I meant to say was that IF
the
Arnold drawing is correct then birds could not be visible at the indicated
distance of at least 15-17 miles and hence the bird explanation would be
impossible.

>It is a well-known artistic convention known to many laypersons to
indicate
>the presence of objects behind other objects in a drawing by the use of
>THIN or LIGHT or DOTTED lines. The objects' flight path in Arnold's
>drawing does NOT CROSS IN FRONT OF MT. RAINIER.

In conjunction with Arnold's accounts which were noted, it emphasises the
question I asked - how can this all be reconciled.

Arnold clearly stated the objects flew down the western side of Mt.
Rainier.

Wouldn't they have flown down the eastern side if passing behind the
mountain?

COMMENTS: You are right to ask the questions and I'm sorry to say they're
not easily reconciled and seemingly totally inconsistent. The question of

the objects' flight path as either east or west of Mt. Rainier I think accounts for why there has evidently NEVER been a MAP of the objects' flight path ever PUBLISHED, not by Arnold who reportedly drew one right after the incident or anyone else (except for a sketchy all but worthless one in FSR in 1987). The contradictions in Arnold's accounts have frustrated attempts to map the flight path.

.....

With all due respect to argument based on "common sense" or assumptions, the fact is that we were not present when he made his drawing means that we don't know the context. I look at this and immediately note the extreme compression of the distance between Rainier and Adams.... which indicates to me that he was not attempting to be dimensionally correct. I also find a short, thin line ON TOP OF the drawing of the mountain, then a short gap and then a HEAVY LINE with some "hand vibration wiggles" all the way to Mt. Adams and crossing Mt. Adams, ending in some dashes.. This to me suggests that he was not particularly concerned with drawing the track before and while passing Mt. Rainier, but rather was primarily interested in illustrating how the flight path appeared relative to other peaks south of Rainier. He has the 5 mi ridgeline exaggerated in length relative to the spacing of the mountains and clearly shows the objects above the ridgeline.

Now, one can sit and puzzle over this for hours. He has A-B... unfortunately we don't see where B was, possibly covered by artist's sketch of crescent saucer. B was probably Mt. Adams. A - B 1 min, 42 seconds. He has 1800 arrow 1200.... could refer to his calculation that it was (nearly) 1800 mph which he arbitrarily reduced to 1200 mph in case of error on his part in timing or measuring. "Black... if 400 ft" means ?

We have plenty of verbal and written testimony that says the objects were on the west side of Rainier as they went past Rainier, and that they actually went behind SOMETHING (some peak) after they passed the southern flank of Rainier.... or something like that. Hence I

think that the lack of a line crossing Rainier in this drawing de NOT mean that all the testimony was wrong and they, in fact, flew on the east side of Rainier.

>And it is NOT THE ONLY CONTRADICTION in his testimony, there are many other

>facets in contradiction -- (1) WHAT he FIRST saw or drew his attention (2)

>WHERE he was when he FIRST saw the objects and WHERE the objects were (3)

>what he first thought they were, (4) the objects' shape(s) (5) whether he

>used a stopwatch, wristwatch or instrument panel clock to do his famous

>timing (6) the objects' altitude and whether they dipped down in among the

>peaks of Goat Ridge between Rainier and Adams. Etc. etc. >

<

Begins to sound like the Grudge determination that the report was so replete with errors that it was not worth analyzing!

HAHAHAHAHA... we have regressed to the summer of 1949 (when Grudge report was finished)

>COMMENTS: Please note carefully what I said: "TOO HIGH for
>... birds to MAINTAIN in LEVEL flight." They can RISE or
>SOAR on a ballistic arc to higher altitudes but cannot
>sustain those altitudes in constant level flight.

Brad,

A number of bird species must be able to sustain those altitudes in constant level flight, or they would have great difficulty migrating.

Remember, the Pacific North-west ornithologists suggested that the flight characteristics of Arnold's nine objects were remarkably similar to _migrating_, non, or failed-breeder, south-bound white pelicans.

If they couldn't maintain a constant height of some 10,000 feet, they would have been migrating straight into Mt Rainier!

The following extracts are from an informative treatise, 'Migration of Birds - Altitude of Flight Migration':

"The factors regulating the heights of bird migration are not clear. High-altitude flight may be used to locate familiar landmarks, fly over fog or clouds, surmount physical barriers, gain advantage of a following wind, or maintain a better physiological balance.

[...]

At one time students of bird migration believed normal migratory movements took place at heights above 15,000 feet. They reasoned, somewhat uncertainly, that flying became easier as altitude was gained. It has now been shown, through comprehensive radar studies, that 95 percent of the migratory movements occur at less than 10,000 feet, and the bulk of the movements occur under 3,000 feet.

However, birds can and do fly well over 15,000 feet without apparent ill effects.

[...]

Bird flight at 20,000 feet, where less than half the oxygen is present than at sea level, is impressive if only because the work is achieved by living muscle tissue. A Himalayan mountain climber at 16,000 feet was rather amazed when a flock of geese flew north 2 miles over his head honking as they went (Swan 1970). At 20,000 feet a man has a hard time talking and running or other rapid movements are out of the question; but those geese were probably flying at 27,000 feet and even calling while they traveled at this tremendous height.

Accurate observations on the altitude of migratory flights is scanty, although altimeter observations from airplanes and radar are becoming more frequent in the literature. An example is the report of a mallard struck by a commercial airliner at 21,000 feet over the Nevada desert (Manville 1963). It is, of course, obvious that some birds must cross mountain ranges during migration and attain great altitudes".

[End]

This will hopefully be seen to confirm that Arnold's nine objects could certainly have been birds - especially large and formidable flyers - in relatively constant, level flight at that altitude.

For information, the writer continues:

"Numerous observations have come from the Himalayas (Geroudet 1954; Swan 1970). Observers at 14,000 feet recorded storks and cranes flying so high that they could be seen only through field glasses. In the same area large vultures were seen soaring at 25,000 feet and an eagle carcass was found at 26,000 feet. The expedition to Mt. Everest in 1952 found skeletons of a pintail and a black-tailed godwit at 16,400 feet on Khumbu Glacier (Geroudet 1954). Bar-headed geese have been observed flying over the highest peaks (29,000+ feet) even though a 10,000-foot pass was nearby. Probably 30 or more species regularly cross these high passes (Swan 1970).

[...]

For most small birds the favored altitude appears to be

between 500 and 1,000 feet (Bellrose 1971), but radar studies have found some nocturnal migrants (probably shorebirds) over the ocean were at 15,000 or even 20,000 feet (Lack 1960b; Nisbet 1963b; Richardson 1972).

[...]

Cranes were once recorded at an altitude of 15,000 feet..."
[End]

And so on...

Your other comments, appreciated for their objectivity,
I need to think about some more.

So far as I can see, the more Arnold's story is
investigated, the more our pivotal 'UFO' evidence falls
apart.

James.

@Subject: Reading List for HighSchool Seniors?
@
@@
@Greetings List,
@
@I'd like to get a few opinions from the members here. I will be
@giving a presentation to a high school class next month and I'd
@like to develop a list of 10 books that would be a good
@introductory list of reading material on the subject of ufos,
@abductions, crop circles, etc., for high school seniors. I'd like
@to encompass general coverage of the topic with a very good
@readability index. Your help would be greatly appreciated.

Unfortunately, most of the UFO books available today are of the type that seeks to exploit the mysteries, rather than to shed light on them. This list shows the UFO phenomenon from several different angles:

I am typing these titles from memory. Some may not be exact:

1. Allen Hendry "The UFO Investigator's Handbook" (a must)
2. Jenny Randles "UFOs: Danger in the Air" or "Something in the Air" (alternate titles)
3. Sagan and Page "UFOs - A Scientific Debate"
4. Philip Klass "UFOs Explained" **
5. Edward Ruppelt "The Report on Unidentified Flying Objects"
6. John Fuller "Incident at Exeter"

7. John Spencer "Encyclopedia of UFOs" *
8. Peter Brookesmith "UFOs - The Complete Sightings" *
9. Peter Brookesmith "UFOs - The Government Files"
10. Otto Binder "What we Really Know about Flying Saucers"

* Beware, at least one photo is not the original

** Not "UFOs Identified," which ties too much of the phenomenon to one theory which doesn't quite measure up

Supplementary list (for those who want to investigate UFO sightings):

A. Any good book on criminology which includes principles and techniques for gathering and interpreting physical evidence and testimony

B. Any good book on human perception -- Lack of knowledge in this area is quite evident in many case reports

C. Any good physics book -- Knowledge of the properties of matter, motion, and wave propagation are also essential knowledge

D. A book on logical argument.

E. Field guides (books with photos of all different kinds) on these subjects:

Aircraft

Unorthodox aircraft

Insects

Birds

Kites

Ground animals (identifying tracks)

F. The video: "A&E Investigative Reports: Bringing UFOs Down to Earth"

G. Website: <http://php.indiana.edu/~lrobbins/ufopage.htm>

H. A book on photography

I. The Condon Report

@Thanks,
@Todd Lemire
@--

@ "When you have eliminated the impossible, whatever remains,
@however improbable, must be the truth."

@Sherlock Holmes

The above is true only if ALL other possibilities have been
eliminated. So the question then becomes "What have we not
yet thought of?"

Subject: Re: Kenneth Arnold and KottmeyerStatus: O

James,

Thanks for the helpful info on bird altitudes. I knew I should not have "dotted out" the words "pelicans or geese or other birds" from my statement and instantly regretted it right after I hit "Send." Your references do not show that pelicans can sustain altitudes of 10,000 feet, but certain species of geese in Central Asia can and do. The question then becomes what are the altitude capabilities for sustained level flight of species of birds in the Mt. Rainier region. Your references quoted don't say.

And I note your first source (no author, date, publisher, page no.) does state it has long been a misconception that normal migratory flights occur above 15,000 feet but that "comprehensive radar studies" show this to be dead wrong, that "95 percent

of the migratory movements occur at less than 10,000 feet, and the bulk of the movements occur under 3,000 feet." This would suggest that many ornithology texts may still have the erroneous high altitude misconception.

Brad,

A number of bird species must be able to sustain those altitudes in constant level flight, or they would have great difficulty migrating.

Remember, the Pacific North-west ornithologists suggested that the flight characteristics of Arnold's nine objects were remarkably similar to _migrating_, non, or failed-breeder, south-bound white pelicans.

If they couldn't maintain a constant height of some 10,000 feet, they would have been migrating straight into Mt Rainier!

The following extracts are from an informative treatise, 'Migration of Birds - Altitude of Flight Migration':

"The factors regulating the heights of bird migration are not clear. High-altitude flight may be used to locate familiar landmarks, fly over fog or clouds, surmount physical barriers, gain advantage of a following wind, or maintain a better physiological balance.

[...]

At one time students of bird migration believed normal migratory movements took place at heights above 15,000 feet. They reasoned, somewhat uncertainly, that flying

became easier as altitude was gained. It has now been shown, through comprehensive radar studies, that 95 percent of the migratory movements occur at less than 10,000 feet, and the bulk of the movements occur under 3,000 feet. However, birds can and do fly well over 15,000 feet without apparent ill effects.

[...]

Bird flight at 20,000 feet, where less than half the oxygen is present than at sea level, is impressive if only because the work is achieved by living muscle tissue. A Himalayan mountain climber at 16,000 feet was rather amazed when a flock of geese flew north 2 miles over his head honking as they went (Swan 1970). At 20,000 feet a man has a hard time talking and running or other rapid movements are out of the question; but those geese were probably flying at 27,000 feet and even calling while they traveled at this tremendous height.

Accurate observations on the altitude of migratory flights is scanty, although altimeter observations from airplanes and radar are becoming more frequent in the literature. An example is the report of a mallard struck by a commercial airliner at 21,000 feet over the Nevada desert (Manville 1963). It is, of course, obvious that some birds must cross mountain ranges during migration and attain great

altitudes".

[End]

This will hopefully be seen to confirm that Arnold's nine objects could certainly have been birds - especially large and formidable flyers - in relatively constant, level flight at that altitude.

For information, the writer continues:

"Numerous observations have come from the Himalayas (Geroudet 1954; Swan 1970). Observers at 14,000 feet recorded storks and cranes flying so high that they could be seen only through field glasses. In the same area large vultures were seen soaring at 25,000 feet and an eagle carcass was found at 26,000 feet. The expedition to Mt. Everest in 1952 found skeletons of a pintail and a black-tailed godwit at 16,400 feet on Khumbu Glacier (Geroudet 1954). Bar-headed geese have been observed flying over the highest peaks (29,000+ feet) even though a 10,000-foot pass was nearby. Probably 30 or more species regularly cross these high passes (Swan 1970).

[...]

For most small birds the favored altitude appears to be between 500 and 1,000 feet (Bellrose 1971), but radar

studies have found some nocturnal migrants (probably shorebirds) over the ocean were at 15,000 or even 20,000 feet (Lack 1960b; Nisbet 1963b; Richardson 1972).

[...]

Cranes were once recorded at an altitude of 15,000 feet..."

[End]

And so on...

Your other comments, appreciated for their objectivity,
I need to think about some more.

So far as I can see, the more Arnold's story is investigated, the more our pivotal 'UFO' evidence falls apart.

James.

A look must be made at the specular reflections of sunlight that Kenneth Arnold saw during the sighting.

1. The sun was at 230 degrees azimuth, 60 degrees elevation (Polar angular coordinates: [230, 60]). For all practical purposes, these numbers were the same for both Arnold and the UFOs.
2. The UFOs, according to Arnold's account and the relative locations of Arnold's plane and the mountains, were first seen at about [10, 0] from Arnold's plane. That places Arnold at [190, 0] from the UFOs.
3. That means the normal (perpendicular) to the reflecting surface must be at [210, 30] at the instant of the flash.
4. The reported UFO heading is [170, 0].
5. This makes the normal of the reflecting surface at [40, 30] from the nose of the unidentified aircraft. This means that a specular plane, tilted 60 degrees from horizontal and oriented at 50 degrees away from the longitudinal axis of the aircraft was reflecting sunlight.
6. In order for any aerodynamic part of the UFOs to have reflected this light, the objects would have had to have exhibited some non-aerodynamic flight.
7. One possibility is that an angled, but flat cockpit window could have reflected the flash.
8. The cone of light that leaves the specular surface subtends the same angle in space that the sun's "disk" subtends in the sky.

We also have to realize these facts about the state of aviation at the time of the sighting:

A. Most flying was VFR back then. Pilots had to be alert for the presence of other aircraft to avoid collisions.

B. There was very little RADAR coverage for air traffic control. Instead, ground visual spotters (strategically placed) gave information to controllers by special telephone links or by radio.

C. Each airport knew about only the flights that it controlled.

D. Each of three branches of aviation (military, commercial, and private) knew very little about flights in the other two branches.

E. CAB (now FAA) flight plan files did not include many military flights.

F. The separate branches of the service also did not know of each other's flights.

So finding out "what aircraft were in the ares" was a very difficult job.

Subject: Re: Kenneth Arnold and KottmeyerStatus:

Hi Bruce,

Your attached scan of the IUR cover was not attached.

Quick COMMENTS below.

Brad

In a message dated 2/14/00 8:47:28 AM, brumac@compuserve.com writes:

<<

IN ORDER TO FURTHER ILLUMINATE ALL "discrepancies"

I HAVE SCANNED THE IUR cover showing Arnol'ds sketch.

See Attached.

Brad wrote

>Arnold's only known drawing of the flight path (on the cover of the

Mar/Apr

5 IUR with Part 2 of your "Arnold Phenomenon" article) shows it in heavy pencil line somewhat jagged. The path starts with a very thin, short line

>segment just 5 mm long which overlays the right edge of Mt. Rainier and

>indicates the path comes from BEHIND Mt. Rainier. (This establishes the

>minimum distance as at least Arnold's 15-17-mile distance to Mt. Rainier,

>and makes it impossible to be birds.)

Brad,

(James)

Thank you for explaining this fascinating development.

It's maybe, as we shall see, presumptuous to take this evidence as being unequivocal and justifying any impossibilities.

COMMENTS: Sorry about my hasty wording. What I meant to say was that IF the

Arnold drawing is correct then birds could not be visible at the indicated distance of at least 15-17 miles and hence the bird explanation would be impossible.

>It is a well-known artistic convention known to many laypersons to indicate

>the presence of objects behind other objects in a drawing by the use of

>THIN or LIGHT or DOTTED lines. The objects' flight path in Arnold's

>drawing does NOT CROSS IN FRONT OF MT. RAINIER.

In conjunction with Arnold's accounts which were noted, it emphasises the question I asked - how can this all be reconciled.

Arnold clearly stated the objects flew down the western side of Mt. Rainier.

Wouldn't they have flown down the eastern side if passing behind the mountain?

COMMENTS: You are right to ask the questions and I'm sorry to say they're not easily reconciled and seemingly totally inconsistent. The question of the objects' flight path as either east or west of Mt. Rainier I think accounts for why there has evidently NEVER been a MAP of the objects' flight

path ever PUBLISHED, not by Arnold who reportedly drew one right after the incident or anyone else (except for a sketchy all but worthless one in FSR in 1987). The contradictions in Arnold's accounts have frustrated attempts to map the flight path.

.....

With all due respect to argument based on "common sense" or assumptions, the fact is that we were not present when he made his drawing means that we don't know the context. I look at this and immediately note the extreme compression of the distance between Rainier and Adams.... which indicates to me that he was not attempting to be dimensionally correct.

COMMENTS: Since Arnold drew this on an envelope he would have been forced to compress the horizontal scale in order to fit the scene onto his limited drawing space. I now believe it is likely that Arnold made this drawing in late June 1947 when he was still asserting the objects' altitude was 10,000 feet, and before he settled on 9,500 feet, and at a time when he would recount how he reduced his 1800 mph calculation down to 1200 mph (figures given on the envelope and which also appear in one of his first interviews, for the Chicago Tribune, on June 25, 1947, published the next morning).

[Bruce]

I also find a short, thin line ON TOP OF the drawing of the mountain,

COMMENTS: As I said this short thin line over the right edge of Mt. Rainier leading into the heavy line of the objects' flight path between Rainier and Adams "is a well-known artistic convention known to many laypersons to indicate the presence of objects behind other objects in a drawing by the use of THIN or LIGHT or DOTTED lines."

I also note that this thin horizontal line is continued first by another thin

line that CURVES DOWN into the heavy flight-path line. This is also an artistic convention indicating that the objects had come OUT FROM BEHIND ANOTHER OBJECT (Mt. Rainier's right edge in this case). Please note that the artistic convention for coming out FROM IN FRONT of the object (Rainier) would have been a CURVE UPWARD into the heavy line.

then a

short gap and

then a HEAVY LINE with some "hand vibration wiggles" all the way to Mt.

Adams and

crossing Mt. Adams, ending in some dashes.. This to me suggests that he was

not particularly concerned with drawing the track before and while passing

Mt. Rainier,

but rather was primarily interested in illustrating how the flight path

appeared relative

to other peaks south of Rainier.

COMMENTS: Arnold spends a lot of time drawing in plateau and ridge lines in the FRONT of Mt. Rainier so if the objects had flown in FRONT of Rainier he would have drawn them in as he did with the other otherwise unnecessary detail of the FRONT of the mountain, instead of using two separate artistic styles to represent the objects coming from out BEHIND Rainier.

He has the 5 mi ridgeline exaggerated in

length

relative to the spacing of the mountains and clearly shows the objects above

the ridgeline.

COMMENTS: Again, as I said above, Arnold was forced to compress the horizontal scale to fit it all on an envelope. Agreed that Arnold shows the objects above the ridge line (which he later identified as Goat Ridge).

Now, one can sit and puzzle over this for hours. He has A-B...

unfortunately we don't see

where B was, possibly covered by artists sketch of crescent saucer. B was probably Mt.

Adams.

COMMENTS: Or possibly "B" is cut off at the right edge of the IUR cover. Hopefully we'll know soon because Mark Rodeghier of CUFOS has promised to send me a complete copy.

A - B 1 min, 42 seconds. He has 1800 arrow 1200.... could

refer to his

calculation that is was (nearly) 1800 mph which h arbitrarily reduced to

1200 mph in case of

error on his part in timing or measuring. "Black... if 400 ft" means

?

We have plenty of verbal and written testimony that says the objects were

on the west side

of Rainier as they went past Rainier, and that they actually went behind

SOMETHING (some

peak) after they passed the southern flank of Rainier.... or something

like that.

COMMENTS: Virtually every interview of Arnold or account written by Arnold that mentions objects in front of Mt. Rainier ALSO says inconsistently that (a) they went BEHIND Rainier AND/OR (b) the distance figure he gives to the objects puts them BEHIND Rainier. So there is plenty of testimony that the objects flew to the EAST of Rainier, as well as graphic representation by Arnold showing the same.

The Chicago Tribune interviewed Arnold in depth on the afternoon of June 25, 1947, right after the initial AP story hit the wires. In it, Arnold is QUOTED VERBATIM (NOT PARAPHRASED) in the first person as follows, and the amount of detail even in this short excerpt indicates it was an independent IN DEPTH interview and so differing in wording as to not at all be reliant on the Pendleton East Oregonian/AP interview or be a mere copy:

"The first thing I noticed was a series of flashes in my eyes as if a mirror was reflecting sunlight at me.... I saw the flashes were coming from a series of objects that were traveling incredibly fast. They were silvery and shiny and seemed to be shaped like a pie plate.

"I counted nine of them as they DISAPPEARED BEHIND the PEAK of MOUNT RANIER [Rainier]. Their speed was apparently so great I decided to clock them. I took out my watch and checked off one minute and 42 seconds from the time they passed Mount Ranier [Rainier] until they reached the peak of Mount Adams, 50 miles to the south. All told the objects remained in my view slightly less than two minutes from the time I first noticed them."

This is only about half of the verbatim quotes of Arnold, there is more in paraphrase from Arnold, and the whole story is about 5 times the length of what I quoted above.

Hence I

think that the lack of a line crossing Rainier in this drawing de NOT mean that all the testimony

was wrong and they, in fact, flew on the east suide of Rainier.

>And it is NOT THE ONLY CONTRADICTION in his testimony, there are many other

>facets in contradiction -- (1) WHAT he FIRST saw or drew his attention (2)

>WHERE he was when he FIRST saw the objects and WHERE the objects were (3)

>what he first thought they were, (4) the objects' shape(s) (5) whether he

>used a stopwatch, wristwatch or instrument panel clock to do his famous
>timing (6) the objects' altitude and whether they dipped down in among the
>peaks of Goat Ridge between Rainier and Adams. Etc. etc. >

<

Begins to sound like the Grudge determination that the report was so replete
with
errors that it was not worth analyzing!

HAHAHAHAHA... we have regressed to the summer of 1949 (when Grudge report
was
finished)

COMMENTS: Grudge didn't resolve the discrepancies, only used them to try to
discredit the whole story. Here we're obviously still analyzing the account.
I didn't say I was completely unable to resolve the contradictions, only
that it was difficult. I can resolve Contradictions 1-5 based on Arnold's
propensity for SIMPLIFICATION of his story, plus possible confusion
especially on No. 1. No. 6 can't really be explained by SIMPLIFICATION, but
perhaps by confusion, it's a tough one.

@
@Brad

NO NO NO!

I'm saying that the OBJECTS may have had cockpit windows. They made specular reflections of sunlight at this odd angle relative to their flight path. A specular reflection off of the top surface (as some have speculated) would have required that the object simultaneously roll to the right and pitch down (or roll to the right and yaw left).

@Hi:

@This discussion is pointless. Witnesses described structured
@objects coming overhead at the height of telephone lines and you
@pointing out that people misjudge the size of balloons at a
@distance.....

I did NOT say the balloons were at a distance. On the contrary, I
said that the balloons were CLOSER than the witnesses imagined.
And fire balloons do look like structured objects.

Q: How do you know that the witness description of the distance
is accurate?

A: You don't. The witnesses don't know how accurate their
description is either, although they don't know it.

See my page for the reason why:

<http://php.indiana.edu/~lrobin/ufopercp.htm>

If one doesn't understand the science of perception, one can make
BIG mistakes.

Note the lack of garbage in this message. When hitting the reply button, clean up the response to include only the text to which you are replying and that will eliminate some of the wasted bandwidth.

Another option would be to go to the settings in your email client and set it to NOT include the text of a message to which you are replying. This makes it difficult to respond to points directly, so it may not be the best solution for some.

Steve

HAHAHAHAHA

Round and Round we go.
Now Larry trumps in (after this argument has been going on, in various
phases, over a time period of over 3 years.....; most recent phase over
the
last year... the "pelican phase")

Obviously the assumption of actual aircraft with flat segments of windows
solves, to some extent, the bright flash problem that sort of.....
well,.....
just didn't sound like you'd get from birds..... even from bird eyeballs
optimally
illuminated by the sun :).

So,,,,,, now we regress to the Hynek position as of 1948:
misidentified
military aircraft..... which, of course, were not traveling at 1700 m,ph
so must
have been closer (similar to birds, but not as close as birds since the
aircraft are bigger.... a lot bigger). One wonders if fire balloons

played a role in the Arnold sighting.....

Here we see the skeleton of the Larry Robinson solution
(or suggestion):

>7. One possibility is that an angled, but flat cockpit window
>could have reflected the flash.

>8. The cone of light that leaves the specular surface subtends
t>he same angle in space that the sun's "disk" subtends in the
>sky.

>We also have to realize these facts about the state of aviation
>at the time of the sighting:

A>. Most flying was VFR back then. Pilots had to be alert for the
>presence of other aircraft to avoid collisions.

>B. There was very little RADAR coverage for air traffic control.
Instead, ground visual spotters (strategically placed) gave
information to controllers by special telephone links or by
radio.

>C. Each airport knew about only the flights that it controlled.

>D. Each of three branches of aviation (military, commercial, and
private) knew very little about flights in the other two
branches.

>E. CAB (now FAA) flight plan files did not include many military
flights.

>F. The separate branches of the service also did not know of each
other's flights.

>So finding out "what aircraft were in the ares" was a very
difficult job.

<

HERE IS THE SOLUTION OFFERED BY HYNEK 52 years ago

Dr. Hynek was the first scientist to try to explain Arnold's sighting. Hynek used some details of the observation and an assumption about Arnold's visual acuity to calculate an approximate size of the objects. He obtained a large size (two thousand feet long, one hundred feet thick). He could not accept this size as reasonable so he decided to ignore Arnold's claim that the objects went in and out of the mountain peaks south of Mt. Rainier. By ignoring this statement (essentially implying Arnold had made a mistake in the observation) Hynek was able to assume that the objects were much closer. Hynek decided that Arnold saw large airplanes and he then estimated that the distance was only about six miles. This shorter distance reduced the calculated speed to about 400 mph. Since this speed was within the capability of military aircraft Hynek identified the objects as "aircraft," thereby also ignoring Arnold's description of the objects.

(This explanation also assumes Arnold could not recognize large aircraft at 6 miles.).

Fire balloons? :) :) :) :) Military? Maybe....

But I seem to recall some rather strange private aircraft
appearing around that time. I'm trying to find info on them.

CAUTION: These are only speculations, thrown out as seeds of
thought for the taking. I haven't found the data yet:

- I seem to recall a little one-man canard with a pusher
propeller and wingtip vertical stabilizers, but I am not sure of
the year.

- There were still quite a few Bee Gees around. That stunt plane
was just a wing, a short fuselage, and a very small vertical
stabilizer behind the fuselage. You can see one in the movie "The
Rocketeer."

- I am still looking for that military flying wing with pusher
propellers.

Have you ever wondered how the light airplanes get from the
manufacturer to the dealer? You guessed it, they fly them. Many
times they fly in convoys, with another plane to take the pilots
back. I used to know a guy who did nothing but deliver airplanes
for a living.

Would there be any records of flights taking a group of planes
from one air show to the next? Or would that have been one of the
items lost in the anti-annals of VFR?

Hello Larry,

Thank you for your reply to my request. Unfortunately I was informed today that the principal of the school where we were to have our presentation just informed us and the teacher that the subject of ufology wasn't appropriate for the classroom.....these are not his exact quotes as I didn't talk directly too him, but from what I understand he's very close minded. Anyway, I'm still developing a suggested reading list for high school students and your recommendations below will be put to good use.

Thanks again,
Todd Lemire

To List:

I have uploaded to my web site a highly detailed map of Mt Rainier and surrounding area, in which I have highlighted 'Little Tahoma' peak.

It's a large file - 475k and can be seen at:

<http://web.ukonline.co.uk/voyager/rainier.jpg>

Courtesy of Bruce, I have also uploaded a copy of the IUR sketch, at:

http://web.ukonline.co.uk/voyager/arn_draw.jpg

In view of the copyright concerns, please consider this as 'List Only' and not to be republished either in print or on another web site - basically, anywhere else.

Unless stated otherwise, it's assumed to be obvious that Arnold's sketch didn't include the darker and larger drawings of nine objects and these were added to the cover. They're not representative of what he described - there was only one 'crescent' and nothing which resembled a banana.

This is great though - here is Arnold confirming and illustrating the difference between those two types of objects he believed were observed and also further demonstrating the 'side-on' view.

Overall, more like 'flying clam shells' than 'flying saucers'.

Just curious - I recall seeing something which _might be_ similar to the 'clam shell' depicted. Isn't there an unusual sketch related to 'Night Siege [maybe on the cover?], by Imbrogno and others, which looks something like that?

Other comments re Arnold's sketch I'll address separately.

James.

Flying clamshells sound like Vought XF-5Us or V-137s, which were circular with horizontal stabilisers at the rear, rendering a classic cam shell shape as seen on a Shell oil logo (or pecten as a palaeontologist would describe it)

The XF-5U never flew and the V-137 stayed on the eastern US.

Eh, Bill?

As you can see I'm sticking to aircraft matters, wouldn't like to link anything.

Chris.

Hi Guys

Hi all

This a repost from another list. It deals with the TIER III project.
It makes interesting reading.

John

At any rate, the program was sucessful beyond most expectations, but was also unbeleivably expensive. Not only was the production aircraft to be the size and shape of a B-2 (Lockheed's design patent: <http://www.patents.ibm.com/details?pn=USD0382851__> choose "View Images" - it takes a minute but is well worth it) - but cost at least as much as a B-2.

The aircraft was large, triangular, could loiter at near-zero groundspeed, and apparently was used as a testbed for optical camouflage ("star camo"). It seems highly likely that this is the "stealth blimp". While Popular Mechanics is well known for it's wonderful "artist's conceptions" and investigative reporting ("AREA 51 MOVED TO UTAH"), the logistics of testing a "stealth blimp" in the configuration described, especially at Groom Dry Lake, are quite prohibitive. Even if the majority of it's lift was not derived from a gas such as helium, it would require huge amounts of helium or hydrogen in some form, not to mention the many other forms of ground support that a blimp of that size and configuration would require- and nothing resembling that has ever been seen at Groom Lake (or Green River/Dugway, for that matter). The winds at Groom Lake would be a problem, and making a "blimp" stealthy to IR would be non-trivial due to the heat capacity of hydrogen or helium (take your pick).

@
@Flying clamshells sound like Vought XF-5Us or V-137s, which were
@circular with horizontal stabilisers at the rear, rendering a
@classic cam shell shape as seen on a Shell oil logo (or pecten
@as a palaeontologist would describe it)

Shell Oil's logo is a scallop.

@The XF-5U never flew and the V-137 stayed on the eastern US.

If the XF-5U never flew, then how did I come into possession of a
photo of one in flight?

Actually, ONE was made, and it did get off the ground, but with
the wrong engines in it.

Does anyone know where I can get a peek at a photo of the
V-137?

By the way, AMC has been periodically running an old documentary
on a "promising new airliner design." It was based on the YB-49
flying wing!

@Eh, Bill?

@As you can see I'm sticking to aircraft matters, wouldn't like
@to link anything.

@Chris.

Subject: Radio Activity that doesn't leave traces?
Status:

Hello List members,

I'd like to get some feedback here on something I recently read in "Situation Red" by Leonard Stringfield. On pg. 228 of the paperback edition he speaks of a sighting that occurred in Beallsville Ohio on March, 19, 1968 that involved a "beam of light" that set a boy's jacket on fire. Civil Defense Director Ward Strikling combed the area with a Geiger Counter and found no radiation. He states however that, "there are types of radioactivity that leave no detectable traces." What types of radiation, "leave no detectable traces"? Is he implying undetectable only to the geiger counter, or COMPLETELY undetectable? As anyone here familiar with this case?

Thanks in advance,
Todd Lemire

--

"We would rather, I suspect, fear the unknown than convert it to the known. What we may fear more deeply than the unknown itself is the prospect of actually knowing it. Happily for all of us there are people like yourself who refuse to be bound by such mass refusal of reality, who are not afraid to seek and learn."

Subject: Re: Radio Activity that doesn't leave traces?Status:

Todd,

X-rays and gamma rays generally induce no radioactivity so they are essentially "undetectable" (actually if rock crystal is irradiated then thermoluminescence might reveal the exposure). Neutrons and heavy charged particles such as alpha radiation do induce radioactivity which can be detected by Geiger counters etc. if above the background level.

Are you referring to the 1950's Popular Science newsreel program that the History Channel keeps repeating? It's one that highlights the new "Flying Wing" and its bright future in both military and commercial aviation, and goes to show how difficult it can be to project the future of technology. It's really quite amusing to see some of the innovations that they felt were in our future, including a magnetic holder that would allow the stewardess to secure her tray table in place while she distributed drinks to "heighten the spirits" of the passengers on the (imaginary) commercial flight.

Re: The Vought Pancake and Skimmer.

Larry

If you actually have a genuine photograph of the XF5U-1 in flight I would really like to see it. This will re-write aviation history.

The only flyable XF5U-1 was broken up in 1947 on crazy Navy orders having never undertaken more than ground trials. It was due to be taken to Muroc, but this never happened.

As I recall, two XF5U-1 Skimmers were built at Bridgeport and one was used for destructive static tests.

There were plans to re-engine the XF5U-1, but props were the ongoing source of trouble and these were changed several times.

Chris may correct me on this point, but the longest flight V-173 ever made was to Long Island for an air show in about 1943.

You should find pictures of V-173 if you scout around the Net.

My own belief is that the early Vought discplanes lead to several more advanced jet/turboprop prototypes which remain secret and this has been endorsed by former Vought engineer Tom Smith, who I've written about in several publications.

But a Vought discplane connection to the Arnold Sighting? Not very likely in my opinion!

@ UFO UpDates - Toronto <updates@sympatico.ca>
@Subject: Radio Activity that doesn't leave traces?

@
@Hello List members,

@I'd like to get some feedback here on something I recently read
@in "Situation Red" by Leonard Stringfield. On pg. 228 of the
@paperback edition he speaks of a sighting that occurred in
@Beallsville Ohio on March, 19, 1968 that involved a "beam of
@light" that set a boy's jacket on fire. Civil Defense Director
@Ward Strikling combed the area with a Geiger Counter and found no
@radiation. He states however that, "there are types of
@radioactivity that leave no detectable traces." What types of
@radiation, "leave no detectable traces"?

Red light is a form of "radiation" and usually leaves no
detectable trace that it ever shone on something (unless a plant
grew while receiving daily doses). But it is not a form of
radioactivity. Yet if it is strong enough (a LASER beam), it can
damage an eye.

Alpha radiation (a form of radioactivity) is usually too weak to
do any transmuting, so once the radiation stops, the irradiated
area is free of added radioactivity. Gamma rays and neutrons are
the sources of radiation that usually leave the irradiated
material radioactive. Beta sources are somewhere in between,
depending on the type.

@Is he implying undetectable only to the geiger counter, or
@COMPLETELY undetectable? As anyone here familiar with this case?

I just read about it in one of Lorenzen's books. I will look at
it again tonight. (Actually, I just read two similar cases, and
I'm not sure which one this is).

Infrared is quite capable of setting a jacket on fire, but is totally undetectable on a geiger counter. In fact, it might be hard to tell if something was set on fire by infrared or by some other source of heat (such as a flame).

Another possibility of an "undetectable" beam is focused sunlight, which can set things on fire. (By undetectable, I mean that its presence cannot be detected by instruments later, like some forms of radioactivity can.) Unless there are signs of places where a focused beam charred spots, there would be no indication of the source of ignition unless the focusing apparatus is found.

What bothers me is that a person off to one side claimed to have seen the beam of light. Even a LASER beam is invisible to a person off to the side (I just fired one yesterday), unless fog or dust makes it visible. I can think of only two objects that can set a fire at a distance and show a visible beam of light to an observer to one side. One is a flame thrower. The other? Hang onto that until I have a chance to review the case.

"LASER" beams seen on TV sci-fi shows are special effects added to the film or video, usually through the use of computers. They are generated specifically so the audience can see the "shot." In a real laboratory, a laser beam is made visible with talcum powder, dry ice fog, or smoke (usually incense or tobacco) when the need arises.

At rock concerts, usually the crowd raises enough dust to make the beams visible.

Does your report of the case have the time of day of the sighting?

@Thanks in advance,

@Todd Lemire

It's the same one, but I just realized that we don't get the
History Channel on our cable here. The newsreel is also played on
AMC. I recognized the description you gave, and it is Popular
Science. It does have some real footage of the plane in flight.

I have some footage of the crash too, but I can't find it. The
plane got into a steep bank, and just fell sideways out of
control (Not enough vertical stabilizer on it).

This might help in understanding the possibilities re Arnold's observations:

In his letter to the Air Force, he wrote:

"The more I observed these objects the more upset I became, as I am accustomed and familiar with most all objects flying whether I am close to the ground or at higher altitudes. I observed the chain of these objects passing another high snow-covered ridge in between Mt. Rainier and Mt. Adams and as, the first one was passing the south crest of this ridge the last object was entering the northern crest of the ridge.

As I was flying in the direction of this particular ridge, I measured it and found it to be approximately five miles so I could safely assume that the chain of these saucer like objects were at least five miles long. I could quite accurately determine their pathway due to the fact that there were several high peaks that were a little this side of them as well as higher peaks on the other side of their pathway".

In his later book, Arnold explained:

"Even though they had a constant direction they swerved in and out of the high mountain peaks which are found on the hogsback of the Cascade mountains between Mount Rainier and Mount Adams. I determined my distance from their pathway to be in the vicinity of twenty-three miles because I knew where I was and they revealed their true position by disappearing from my sight momentarily behind a jagged peak that juts out from the base of Mount Rainier proper. Considering that I was flying all this time in the direction of their formation, this determination can be only approximately, but it is not too far off.

Between Mount Rainier and Mount Adams there is a very high plateau with quite definite north and south edges. Part of this chain-like formation actually dipped below the near edge. As the first unit of these craft cleared the southernmost edge of this background, the last of the formation was just entering the northern edge. I later flew over this plateau in my plane and came to a close approximation that this whole formation of craft, whatever they were, formed a chain in the neighborhood of five miles long".

In his essay 'How It All Began', from the 'Proceedings of the First International UFO Congress' Arnold states:

"They continued flying between Mount Rainier and Mount Adams over the high, rough terrain named 'Goat Ridge,' which is approximately five miles long".

Does anyone have a map which shows Goat Ridge in relation to Mt Rainier and Mt Adams?

There is some information about Goat Ridge and maps online at:

http://www.fs.fed.us/gpnf/trails/nsc/n_00095.htm

<http://www.fs.fed.us/gpnf/trails/nsc/maps/n42.htm>

<http://www.fs.fed.us/gpnf/trails/nsc/maps/n06.htm>

Can anyone post a copy of the full statement which Arnold presented at that 'UFO Congress'?

James.

I suspect it is more complicated than this, but it would be possible to
set a jacket on fire with a sufficiently strong laser beam. A beam
with many kilowatts per square cm could do it. The beam would not
penetrate the jacket, just heat the outer surface to ignition.

The comments about X rays and gamma rays leaving "no trace" are
basically correct, but in this context think that if either x rays or
gamma rays in a beam were strong enough to set a jacket on fire
anyone inside the jacket would also be "cooked".

One of my criticisms of UFO researchers is the somewhat nit picking attitude and introspective view of many involved in the field. While I respect much of the detailed work done in this field, I find that those outside the field find this the main obstacle to taking the field seriously. Is it any wonder UFO researchers are seen as being anoraks?

James and I were using familiar objects and shapes (eg clamshells and Shell logos to describe some shapes. While I welcome a more scientific approach, I have to be suspicious of the this approach generating more noise than signal.

There now follows a response in the style of a "scientific" UFO researcher.

Pecten is a scallop. Shell trade under the name Pecten in some markets. I doubt James was being particularly pedantic in his use of the term "clamshell", but rather, as I was, using a descriptive term "scallop" for a flattened dome shape with a squared trailing edge. Personally I would only refer to doors as being "clamshell". But I won't labour the point.

Perhaps to be accurate, a brachiopod such as Herbertella would be a better description, as brachiopods are symmetrical in plan view, unlike bivalves, such as pecten, which are asymmetrical (the Shell logo is stylised).

So, since most aircraft are symmetrical (The Blohmm und Voss BV 141 being an example of an asymmetrical aircraft) in plan view, to be accurate we should perhaps be referring to brachiopod shell shapes when describing flying objects. Ah, the wonders of a mis-spent youth studying invertebrate palaeontology. Please excuse my not using italics or under-lining for the names.

Silly? Very. So perhaps it's time to get the eye back on the ball.

I think I'll get my coat.

Chris

PS I'd like to see this photo of the XF-5U in flight (even with the different engines, turbojets I presume?).

@@If you actually have a genuine photograph of the XF5U-1 in flight I

@@would really like to see it. This will re-write aviation history.

@SORRRRY! What I have is a photo of the V-173 in flight, but it
@is LABELED as the XF-5U. So every time I said XF-5U, I guess I
@really meant the V-173. The websites I found just cleared that
@up.

A photo identical to the one I have can be found at:

www.flug-revue.rotor.com/FRTypen/Frfothis/v-173.jpg

I also did a categorization of flying wings produced in this
country, to see if any of them matched Arnold's description:

Arup S1, S2, S3, and S4 1935: These disk shaped aircraft were
very similar to the V-173 flapjack, but had a single central

propeller. These planes were sold for aerial advertizing purposes, with the ad painted on the bottom of the disk. I have a photo of one somewhere.

Could Arnold have seen some of these? They were private planes.

Northrop N-1M 1940: Wing with 2 pusher propellers. One built - still exists.

Vought V-173 1942: The flapjack had two large tractor propellers. It could hover by pointing the nose straight up (this was years before the helicopter). The top speed was disappointing. Charles Lindbergh flew one.

Northrop N-9M 1942: Wing with pusher propellers. Four built. 1/3 scale mockup of the B-35. One still exists (I have seen it).

Northrop MX-324 1944: World's first manned rocket plane. One built and flown.

Northrop XP-79B 1945: Rocket/jet wing. Looks a lot like Arnold's sketch of the "sickle shaped" object, but only one was built, and it crashed on its first flight.

A german HO-VI Flying parabola was given to Northrop after WW-II.

Northrop B-35 1946: Four engine 172 ft wide flying wing with 4 sets of counterrotating pusher propellers. Three built. Others were partially completed and converted to the YB-49 series. Lost contract to the B-36.

Northrop YB-49 1947: Eight turbojets inside the wing. Two built, both crashed.

Northrop YRB-49 1948: Four turbojets inside the wing, and two more in nacelles hung below the wing. Intended for reconnaissance. One built and flew.

Northrop XP-56: One engine turned concentric counter-rotating pusher propellers in this flying wing fighter. Obsoleted by jets by the time it flew.

Northrop JB-1: Small jet bomber flying wing with two engines.

Could that "mystery plane" in a photo sent through UFORL have been a Northrop YF-17 or a Northrop YF-22? Both had slanted tail surfaces like the Beechcraft Bonanza.

Hello Larry and thanks for the feedback,

The time of sighting was "shortly after 8:30pm". Also mentioned within this report was that the "light beam" came out of a big tube that moved from side to side until it "came" to the boy and a "beam of light shot out". There was also some other force behind this light as it "hit the upper part of his arm, knocking him to the ground." I wouldn't think there would be enough (or any) force behind a light beam. Maybe a "plasma" beam yes, but a light beam?

Subject: Re: Radio Activity that doesn't leave traces?Status:

Hi Todd,

The assumption that the beam imparted a force is just that: an assumption. Just as any effort to dispute whether or not it was or was not a laser beam, and whether it could be visible (as if we know the aerial particulate concentration at the site!) is based on assumption once again. If the beam generated or imparted an electric shock that could have made it APPEAR to have imparted a force when in reality it created a physiological reaction of muscle contraction etc. which SEEMED to be from an imparted force. Any plasma beam powerful enough to impart a force sufficient to knock over a human body would in fact fry the person.

Hope this helps.

Brad

@Hello List members,
@
@I'd like to get some feedback here on something I recently read
@in "Situation Red" by Leonard Stringfield. On pg. 228 of the
@paperback edition he speaks of a sighting that occurred in
@Beallsville Ohio on March, 19, 1968 that involved a "beam of
@light" that set a boy's jacket on fire. Civil Defense Director
@Ward Strikling combed the area with a Geiger Counter and found no
@radiation. He states however that, "there are types of
@radioactivity that leave no detectable traces." What types of
@radiation, "leave no detectable traces"? Is he implying
@undetectable only to the geiger counter, or COMPLETELY
@undetectable? As anyone here familiar with this case?
@
@Thanks in advance,
@Todd Lemire
@--
@"We would rather, I suspect, fear the unknown than convert it to
@the known. What we may fear more deeply than the unknown itself
@is the prospect of actually knowing it. Happily for all of us
@there are people like yourself who refuse to be bound by such
@mass refusal of reality, who are not afraid to seek and learn."
@
@Coral Lorenzen : Flying Saucers - The Startling Evidence of The
@Invasion from Outer Space

The case appears in Coral and Jim Lorenzen's "UFOs, The Whole Story" (Signet 1969) in the chapter "Accidents."

A brief synopsis:

3/19/68 8:30 pm Beallsville Ohio:

The water pipe had frozen in the trailer 12-year-old Gregory Wells and his mother lived in, so Gregory was sent to his grandmother's house next door for water. He saw a red, football-shaped object with four red lights in the direction of two trees which were about 150 feet away. Gregory stopped to watch it.

A tube-like projection on the bottom of the object rotated until it pointed at Gregory. Gregory became frightened and started to run, while still looking at the object. At that point, a "red beam" flashed out of the object, struck Gregory on the back of the upper arm, and knocked him down. His jacket started burning, and Gregory screamed for his mother.

Mrs Wells and the grandmother both ran outside. They used the water he had collected to put out the fire. Both women saw the object. After a total of 10 minutes of duration, the object FADED OUT.

Gregory had second degree burns (blisters) on his arm, the largest about the size of a half dollar.

The object was seen again at 9:00 pm by a young girl in the neighborhood. She had also seen it two days earlier.

Some puzzling thoughts:

1. It is inconceivable that a beam of radiation could knock someone down without also doing some very serious damage. I have never heard of even a LASER being able to move a large object except by vaporizing a large part of it and using the gas pressure to move the rest.
2. How a "beam of light" could be seen by a person whose eyes were not IN the beam remains a mystery, unless there was a lot of dust in the air.
3. The object faded out, rather than disappearing in the distance.
4. 20 minutes after the object had faded out, the same object (or another one) was seen nearby.

Therefore, I propose several possible alternatives, in order of most likely to least likely:

Scenario 1: Some kids in the neighborhood launched some fire balloons over a period of several days in an attempt to cause some UFO sightings. They got the idea to make one of their balloons more "fantastic" by attaching a small skyrocket to this particular balloon. The fuse was arranged to be ignited when one of the candles burned down enough (there are other known cases where this trick was used).

But the firework proved too heavy, and the balloon flew very close to the ground. Gregory was the unwitting victim of their prank. When the firework ignited, it broke away from the balloon. Gregory was right in the path of the projectile. It's exhaust would look like a "red beam" to any Star Trek fan. After the rocket struck Gregory, it probably had enough fuel left to remove itself from the area. Other balloons caused the 9:00 sighting and the one on the 17th.

Scenario 2A: Gregory was secretly launching fire balloons. Some flaming wax dripped from the already flying balloon onto his jacket. Gregory concocted the part about the ray to keep from getting in trouble with the mother and grandmother. This does not explain the 9:00 sighting, unless at least one time was reported wrong.

Scenario 2B: Same, except that the story was made up to keep Gregory from getting in trouble with the fire department or the police.

Scenario 3: Gregory was burned in an act of child abuse. The UFO story was fabricated to satisfy the authorities. The sighting on the 17th may have suggested the idea for the story, or it may have been a fabrication generated by the report.

In the cases of scenarios 1 and 2, the accident would have caused a sudden cessation of UFO reports in the area. News of the accident would make it possible that the pranksters could get into real trouble if caught (scenario 1). Alternately, Gregory may have learned his lesson the hard way (scenario 2). In either case, no more fire balloons would be launched.

On the other hand, either a "real UFO" or scenario 3 would cause the number of UFO sightings to rise, as pranksters take advantage of the sudden publicity of UFOs burning people in the area.

Subject: Re: Radio Activity/BeallsvilleStatus:

Larry,

The problems with a fire balloon launching a skyrocket are:

(a) The reaction force of the rocket launch would have ripped the flimsy balloon apart, so it would NOT have remained visible for about another 10 minutes.

(b) The fuse ignition as a result of a candle burning down to the end would mean the candles were close to the end -- and again would not have another 10 minutes or so left.

(c) It is extraordinary that a skyrocket randomly fired without guidance would have struck Gregory from such a great distance as 150 feet. If it was 15 feet, it is more within the realm of possibility. Although witnesses are notoriously bad at estimating distance especially without distance cues, here there were close-encounter known landmarks (two trees) to provide distance cues.)

Does anyone have a map which shows Goat Ridge in relation to Mt Rainier and Mt Adams?

There is some information about Goat Ridge and maps online at:

oN A "HUGE" aeronautical map that shows 40.6 miles between the peak of Rainier and the peak of Adams I find the "Goat Rocks " in an irregular area about 15 to 30 miles from the peak of Mt Rainier and at an azimuth around 140 . There is no designation "Goat Ridge". However there does appear to be a ridge running from about 15 to about 20 miles at azimuth 140 which has a peak about 6700 at its southern end. This "ridge" is within the Goat Rocks area.

Can anyone post a copy of the full statement which Arnold presented at that 'UFO Congress'?

<

Here is a transcript of the germane portion of the tape of Arnold's speech at the First International UFO Congress in Chicago, ILL, held on or about June 24, 1977.

He starts by describing himself and flying and his business, etc. He spends some time talking about the dangers of his search for the Marine Transport. Clearly he had been flying around Rainier for some time before his "famous flight". This makes complete nonsense of Menzels' claims that Arnold misidentified weather phenomena such as fast moving clouds of snow, etc. from Mt. Rainier.

I gather from what he said that he flew westward while dropping in altitude in order to view the southeastward, southern and southwestward flank of Rainier.

"As I came out below on this first sweep I passed over a little community of Mineral Washington, the pine trees there, and knew pretty much where I was. I made a turn at probably 2000 ft over Mineral, Washington and started climbing back slowly but steadily climbing, to gain sufficient altitude to go back on the high plateau again for another pass at this mountain. As I was making this turn and, of course flying directly toward Mt. Rainier, at about 9200 ft elevation... it was a beautiful day, in fact the plane was very stable, I didn't have to fight controls or weather or anything... a tremendous flash appeared in the sky and it lit up my whole aircraft, even it seem the cockpit of the airplane and I was rather startled. I thought I hadn't seen a plane that was very close to me, or possibly it had been a military plane that had dove over my nose and the reflection of the afternoon sun against his wing surfaces had caused the flash. Now this just, in less than one tenth of a second, I think, went through my mind. I looked all around below me and looked ahead of me. And then the flash came again and, uh, this very, very bright flash, it was almost like an arc light, was coming from a group of objects far up to th north of Mt. Rainier, in the area of Mt. Baker, which is almost in a lie with Mt. Rainier and Mt. Adams. I observed a chain of very, very peculiar aircraft approaching Mt. Rainier very rapidly ,,, I think I described them like the tail of a chinese kite. They seemed to be in an echelon formation However, in getting a look at them against the sky and against the snow of Mt. Rainier as they approached. I just couldn't discern any tails on them, and I had never, never observed an aircraft without a tail. Particularly these were of fairly large size and there was nine of them in number. I was good at counting things like this because I flew missions counting antelope, sheep , cattle, whatnt in the course of my lifetime, and the first craft... I kept searching for their tails. I was quite surprised that I couldn't find their tails. I was aware that the military was very clever at camouflage and I was, of course assuming all the time that these were military craft or at least military missiles. I was puzzled because the fomation of their echelon travel which was at 170 degrees, which is south, from north to south, following very closely to

the Cascade Range, their formation as I observed it seemed to the first craft was at a higher elevation than all the rest of craft, which, of course, is not conventional ,military formation at all, in either this country or Russia or Germany or anything that I had ever heard of before. So I just assumed, in a flash, that they were some new type of miliary missile or jet and possibly remote controlled. They didn't fly like airplanes actually. This brilliant flash that came from their surfaces, which I assumed was from the sun reflection at first, would pulsate and they would flutter like this and sail. and they seemed to fly just as readily on edge as they did on a level. As I mentioned before they seemed like they were linked together in a sort of diagonal chain-like formation, similar to geese, but, uh (chuckle) they were not geese. I was very puzzled about that. However, I made a special

note, they were all independent. Individually they were flying on their own,. but every once in a while one of them would give off a flash like this and gain a little more altitude or deviate just a little bit from the echelon formation. And this went periodically on among the.. alternately, I should say, not in regular rhythm particularly,..., among all the nine craft I was observing. When they approached Mt. Rainier's north edge, I could see they were to the west of Mt. Rainier, to me, which was a very good observation from my standpoint, because I was at right angles to them,. I determined that if they were missiles or whatever they were I was goig to clock their speed, or make an attempt to clock their speed. Now, around airports most pilots are always arguing about the speed of military craft, they're always arguing about the speed of their own planes. And I just thought, oh , it's a beautiful day and I've got a beautiful viewpoint here and I'm going to clock their speed even though I was closer to Mt. Rainier than to Mt. Adams, which was directly to the south and in their line of flight. I was going to clock their speed with my 24 hour clock which has a big sweep second hand on my instrument panel. As the first one, putting its nose out of the southern edge of the snowfield of

Mt. Rainier, my sweep second hand was just approaching, if I remember it correctly, about one minute to three. I think it was just going over the three.

And they kept, of course flying and...in between Mt Rainier and Mt Adams there

is quite a lot of rough, high terrain, it's been named for many years goat ridge.

I don't know why. Supposedly because it is very rough and very steep.

But this goat ridge, as I later flew it, is approximately 5 miles long. Is in a

line similar to this. I was approaching Mt. Rainier. I realized that my attempt

to lock their speed absolutely accurately would have been hopeless because I was rapidly approaching Mt. Rainier at 9200 ft at about a hundred miles an

hour, steadily climbing myself and of course they were passing from north to south and, uh, anyhow, what took place was that, as the first one was passing

this goat ridge... as the first one actually passed the end of goat ridge the

last one seemed to enter above the goat ridge. I made a guess that the formation of these peculiar aircraft was approximately 5 miles long. Now this estimation is purely an estimation because the goat ridge is quite irregular. It isn't running at exactly 170 degrees. But I was getting some

kind of a judgement as to how long the formation was. These craft seemed to

be climbing a little bit as they were following this 170 degree heading and

I knew that I was on a level with them because they were on a horizon with me, so my altimeter showed a little over 92 hundred feet, so they were flying at an elevation of about 92 hundred, probably a little less or a little

more as they sort of undulated, if you want to call it that, as they flew.

As the... to be quite sure, as the last of this echelon formation of these strange aircraft actually passed Mount Adams, and to the best of my judgement were above a little bit, some of them, the head one was a little above Mt. Adams, I looked at my sweep second hand, and they had covered that distance of about 50 miles in a minute and 42 seconds. I didn't really,

I knew they were flying really fast. I knew they were faster than our P-51's,

or any planes I knew of militarily speaking. However, I didn't really try

to figure out how many miles they were going.. Somehow I had a rather unusual feeling about it. Because of their size, and I judged their size to be probably, a hundred feet, their wingspan a hundred feet in diameter. And, of course, I was very puzzled by the fact that they didn't have tails. But I got a good look at their image on the snow,. Now, when they gave off this flash they would appear to be round. When they turned lengthwise or

flatwise to me they were very, very thin. And actually they disappeared behind a sharp projection on Mt. Rainier in the snow field to my eyesight. And, since I knew approximately where I was, flying of course toward the mountain, I knew where they had passed. I thought my judgement and my clocking could be within reasonable limits as to about how fast they were going.

As They were going past this goat ridge the second from the last one seemed, it was not reflecting and it seemed to turn its rear end toward me. I guess that's the best expression I can use. And I could see that it was a

very wraith-like looking thing, but it wasn't round at all. And the other ones

gave me the impression they were rather like a tadpole. If you've ever seen a tadpole they have a little sort of a peak at their rear.

But I couldn't quite positively determine if they were all the same design as this one I particularly noticed or whether they were ... Actually this one

was a little larger, it seemed a little darker in color than the others and its

wingspan seemed a little bit lighter. Of course a leader of a group of craft of this kind would, of course, you would assume would probably be the first ship. This was second from the last one and the last ship I couldn't see too well because he was fluttering and jerking very rapidly. The way that they performed was that, if there was a human being in them, they would have been made into hamburger at the first turn because they were going very fast and very erratically and they could change their direction almost instantly and it would have been awfully hard. The centrifugal must have been terrific, if there were human beings on them. This is the reason that gave me the impression that they must robotically guided missiles.

Anyhow I sort of lost interest in my search mission and I decided that maybe I ought to go to Yakima and report it. Now in my craft in order to save weight so I can make high altitude take offs with it on short airfields

I don't carry a lot of radio gear. I just had a small, little radio that I could

contact the control tower with. I didn't need expensive and elaborate gear and so I couldn't very well call Seattle tower, I couldn't call Takoma tower

or McCord or anything. I just kept flying on the way they had traveled across the Cascade range and on to Yakima.

I felt positive in my own mind as I was continuing my flight to Yakima the forest observatories which run up and down the Cascades just couldn't possibly have missed seeing them because they were large and very distinct and there was quite a formation of them,

However, I later found out that they had observed them but they had given their report not to the press or not to the public but of course to their superiors which, everything ends up eventually, I guess, in the Pentagon. I don't know.

So I landed at Yakima and I knew the pilots there. Al Baxter was the

general manager of Central Aircraft. He was an examiner as well, and I explained this all to him and I said they didn't have any tails and I told him the approximate size and I mentioned the tremendous speed and acceleration they had and the seemingly effortless way they flew. And he was really quite puzzled. We had been friends for a long time and he knew that I wouldn't make such a report unless it was absolutely true. Many of the helicopter pilots in the area had come in that afternoon and one of them mentioned, Well, Ken, I think you saw some of those guided missiles from Moses lake. I said I never heard of guided missiles from Moses Lake. I thought, well maybe that's what it is. And I felt satisfied that that's probably what they were.

(Goes on to say he made the 35 minute flight from Yakima to Pendleton Oregon, There were people at the airport. His story had preceeded him. While flying he had figured the speed. He had measured the distance and minimum 39 miles distance in the time he measured. He got speeds above 1200 miles an hour. Says he stopped at Pendleton because he thought he should tell the FBI. He thought they could possibly be from Russia. Of course, no one had seen circular aircraft. So at Pendleton he went to the FBI office but it was locked. So he went to the newspaper office and told the guy there he wanted to see the FBI. The news[a]er man wanted to know what the story was. He had charts with him and described it to the newspaper man. Before the evening was over Arnold was beseiged and asked all types of questions. Many of th newspapermen would ask a bunch of questions, get a few andwsers and rush away to filetheir stories. Many of the stories ended up very distorted. These stories were reported in th press and then not too log after there were other reports. Before the night was over I had call from London,. religious groups,. etc.... Arnold thought maybe military took this way to introduce a new technology.

Arnold said he had never read anything about strange things in the sky, other then "sightings" in the Bible. After 3 days in Pendleton and getting no sleep and after all the sightings coming in he decided he was the only person in the whole damn town! "They must live a very interesting life" (laughter).

Bruce & James,

Goat Ridge is marked on my USGS 15-minute topographic map of the area between Rainier and Adams. I'll get you the coordinates when I get home. I don't have the maps with me.

Bruce, can you E-mail the complete transcript? An edited version was published in the Proceedings book in 1980, but for cross-comparison I'd like to see the verbatim transcript.

Brad

Hello Larry and Brad,

I've got to agree with Brad on this one Larry although your explanation is "somewhat feasible", by very small odds, as shown by Brad. It was mentioned in my reference that the jacket was taken to the Ohio Bureau of Criminal Investigation in London for analysis and they found no evidence of radioactivity. It would seem a high probability, but I'm making an assumption here, that evidence of "gun-powder" or similar projectile residue would have been found on the jacket and/or around the second degree burn on the boys arm, had this actually been a projectile, correct? I would also assume there to be some evidence of wax also in the same locations, if this were the cause of the boys burns. Were flame retardant materials in use at this time? What material was the jacket made of? These questions would be very important to determining the effects of fire upon the jacket, and his underlying clothes and arm.

Also, how would you explain the "big tube" that came out from the bottom and moved from side to side? This apparent tube and its moving implies some type of intelligent control was displayed. There was also mention of electromagnetic interference to a television set and adverse uncontrollable barking from the grandmothers dog, along with a nearby streetlight that went out (another possible electromagnetic interference). There are too many unknowns in the publication I have....it would be necessary to see the hospital report, along with the test results on the jacket. Also the reference I have mentions the boy "rolling around on the ground screaming in fright" after being struck with the light...it doesn't mention any "water" being involved. Do we have a better source reference for this case?

Respectfully learning,
Todd Lemire

Subject: Arnold Case/Goat RidgeStatus:

Bruce,

Goat Ridge is labeled on my Mt. Adams 15-minute USGS topo map but extends off the top of the map into the Mt. Rainier map where it isn't labeled. The 1750-meter level (5741 ft) runs approximately N-S from 46-29 to 46-32 N along 121-30 W.

Brad

Bruce,

I believe that's the ridge we are looking for and I see that Brad has now substantiated the probability.

>Here is a transcript of the germane portion of the tape of
>Arnold's speech at the First International UFO Congress in
>Chicago, ILL, held on or about June 24, 1977.

Although I have seen extracts from this, I hadn't located a source with so much of the full transcript.

I'm grateful to you for providing same, this could now be important evidence when considered in its entirety and the context of all that's previously been discussed.

Arnold's nine objects could not possibly have come down the west side of the mountain and also passed behind 'Little Tahoma' peak unless they took a considerable detour. It's way to the east of Mt Rainier and the objects surely had to travel east, behind the mountain, to also have passed behind this pinnacle.

I can't see any reason why 'Little Tahoma' is actually a candidate for the 'peak' which Arnold thought the objects momentarily disappeared behind and it looks like Martin Kottmeyer may have been correct in his conclusion:

"Arnold estimated the crafts were at an altitude of 9,200 feet plus or minus 1,000. The task at hand is thus to locate some feature extending above the 8,200 foot level. This yields a neat little surprise. There are no such peaks between Mount Rainier and Mount Adams. The closest thing I could find was Pyramid Peak which stands only 6,937 feet tall in front of Mount Rainier's base. There is a sharp little projection called Little Tacoma

which sticks out around the 10,000 foot level, but it is on the wrong side of the mountain to be seen from Arnold's flight path. It would be badly stretching things to suggest he got either his position or altitude that far wrong".

Overall, it seems to confirm that the 'peak' Arnold refers to was either another one on the western side and which had sufficient height to account for the believed, momentary disappearance, or, Arnold's objects could not have passed behind a peak which was so tall and they must have been at a lower altitude than he surmised. This is of course assuming they went behind a prominent landmark at all and that Arnold wasn't mistaken, perhaps only losing sight of the objects momentarily as they travelled in front of one. As Kottmeyer noted, 'Pyramid Peak' might be a candidate on the Western side, however, that must prove the nine objects were at a lower altitude than Arnold surmised.

Aside from this presumably prominent peak as the name implies, what else is there?

In both his formative radio interview and letter to the Air force, Arnold didn't mention the apparent disappearance behind a landmark as a factor in perceived distance, however, it must be noted that this did feature in Bequette's 26 June newspaper report:

"He said he could estimate the distance of the objects better because an intervening peak once blocked his view of them. He found the peak was 25 miles away, he related".

If Arnold did state he later discovered the peak was some 25 miles away and given that Bequette also writes, "Mr. Arnold reported he was flying east at 2:50 p.m. Tuesday toward Mt. Rainier when the objects appeared directly in front of him 25-30 miles away at about 10,000 feet altitude", then how to reconcile this?

Although there are a couple of high peaks on the western side of Mt. Rainier - 'St. Andrews Rock' and 'Pt. Success' - these are almost on the summit and not compatible with Arnold's claim, from his book, that it was a "jagged peak which juts out from the base of Mount Rainier proper".

We're left guessing and Kottmeyer's suggestion of 'Pyramid Peak' seems a likely source.

Comments welcome.

>Clearly he had been flying around Rainier for some time before
>his "famous flight". This makes complete nonsense of Menzels'
>claims that Arnold misidentified weather phenomena such as fast
>moving clouds of snow, etc. from Mt. Rainier.

Absolutely, Menzel's desperation to explain Arnold's sighting is obvious.

>"I made a turn at probably 2000 ft over Mineral, Washington and
>started climbing back slowly but steadily climbing, to gain
>sufficient altitude to go back on the high plateau again for
>another pass at this mountain. As I was making this turn and, of
>course flying directly toward Mt. Rainier, at about 9200 ft
>elevation... it was a beautiful day, in fact the plane was very
>stable, I didn't have to fight controls or weather or anything".

How do we equate this with his letter to the Air Force, in which Arnold states he was heading in the direction of Yakima and had been on this course for "2 or 3 minutes" when the sighting occurred?

However, this version is relatively consistent with that given in his book:

"It was during this search and while making a turn of 180 degrees over Mineral, Washington, at approximately 9200 feet altitude, that a tremendously bright flash lit up the surfaces of my aircraft".

As I've pointed out before in relation to the letter and book accounts, if the sighting occurred when he was making that turn, it's a completely different perspective and places Arnold in a different location than if he had been flying in an easterly direction for some 2-3 minutes after the turn over Mineral.

>"I observed a chain of very, very peculiar aircraft approaching
>Mt. Rainier very rapidly... I think I described them like the
>tail of a Chinese kite. They seemed to be in an echelon
>formation However, in getting a look at them against the sky and
>against the snow of Mt. Rainier as they approached..."

As we have noted, if the nine objects were visible against Mt. Rainier then, surely, they must have been flying down the western side of the mountain.

>"However, in getting a look at them against the sky and against
>the snow of Mt. Rainier as they approached".

Once more, Arnold indicates the objects came down the Western side of the mountain, otherwise, how could he have seen them against the Mountain?

>"When they approached Mt. Rainier's north edge, I could see they
>were to the west of Mt. Rainier, to me, which was a very good
>observation from my standpoint".

That's quite definite.

I'll leave aside for now some other responses to Brad's recent postings and this transcript; there's enough to contemplate at the moment.

>"...and they would flutter like this and sail".

>"This was second from the last one and the last ship I couldn't
>see too well because he was fluttering and jerking very
>rapidly...".

Arnold's nine objects in echelon formation and which flew like a kite tail, certainly seemed to exhibit a lot of fluttering.

James.

<

It would not be badly stretching things to suggest that he got the altitude wrong. as pointed out in my long paper on Arnold, the depression angle to the tops of the peaks south of Mt Rainier was only about 2 degrees. Arnold believed that the objects were at his altitude because they appeared to him to be "on the horizon". But under the circumstances it would be difficult if not impossible to determine the exact horizon (the plane that cut through his altitude and also "cut through" all the mountain sides ahead of him). Therefore I cut him some slack: the objects were within 3000 ft of his altitude. This would place them low enough to be blocked by some peak. This might even be a shallow peak on the southwest side of Rainier, a peak that could best be determined by a PHOTOGRAPH... if anyone has some of Rainier. Perhaps there are photos posted on the web somewhere? Is there a Rainier site?

>Rocks area.

Bruce,

I believe that's the ridge we are looking for and I see that Brad
has now substantiated the probability.

COMMENTS: I don't think it's the same ridge. The actual marked "Goat Ridge" on the USGS topo map is within the Goat Rocks Wilderness but it is about 25 miles south-southeast of the summit of Mt. Rainier at azimuth 151, not 15-20 miles away at azimuth 140 true.

Of course, if the objects passed Pyramid Peak or an even more remote minor bump way down the SW slope from Mt. Rainier, the azimuth from there to Goat Ridge is about 142 true or less. Whereas Arnold estimated the objects'

flight path as he understood it from plotting on his map as well as from his observations as about 170 degrees (assumed true rather than magnetic, but it's unspecified). In trying to understand what Arnold thought of the circumstances of his sighting, it seems hard to believe he could make such a huge error in plotting on the map if he had really traced the objects from the SW slope of Rainier to Goat Ridge. And it is WORSE if we use Bruce's ridge, which would be at an azimuth of 125 or less.

But if Arnold plotted the objects on his map from about 6 miles BEHIND Little Tahoma (if Arnold was 15 miles to Rainier as I'd previously posted) southward to Goat Ridge the azimuth is then . . . well, I'm embarrassed to point this out but, it would be exactly 170 degs true. Ooops! That's what Arnold said was the estimated heading of the objects, 170 degs.

>Here is a transcript of the germane portion of the tape of
>Arnold's speech at the First International UFO Congress in
>Chicago, ILL, held on or about June 24, 1977.

Although I have seen extracts from this, I hadn't located a source with so much of the full transcript.

I'm grateful to you for providing same, this could now be important evidence when considered in its entirety and the context of all that's previously been discussed.

COMMENTS: Yes, Bruce did excellent work on very short notice in transcribing this 1977 tape of Arnold.

Arnold's nine objects could not possibly have come down the west side of the mountain and also passed behind 'Little Tahoma' peak unless they took a considerable detour. It's way to the east of Mt Rainier and the objects surely had to travel east, behind the mountain, to also have passed behind this pinnacle.

COMMENTS: Agreed. But of course, if the objects went on the west side of Rainier then they could not possibly head at almost due South at 170 degs as Arnold estimated from his map work and observations and reach Goat Ridge at about azimuth 125 degs or less. That's 45 degrees off.

I can't see any reason why 'Little Tahoma' is actually a candidate for the 'peak' which Arnold thought the objects momentarily disappeared behind and it looks like Martin Kottmeyer may have been correct in his conclusion:

COMMENTS: Well, let's see, aside from the reasons I previously posted (which I will list again), we just saw several additional new ones above:

(1) Arnold stated in his second known interview, with the Chicago Tribune on the afternoon of June 25, 1947: "I counted nine of them as they disappeared behind the peak of Mount Ranier [Rainier]."

(2) Other interviews also mention a disappearance behind a specific jagged "peak" or "cleft" of Rainier which appears to have been the very prominent 11,000-foot Little Tahoma two miles east of Rainier's summit, since McDonald, Kottmeyer, Maccabee and others could not find a suitable 9,000+ ft peak to the SW of Rainier fitting the 9,000-10,000-foot altitude of the objects, but only minor 6,000-foot peaks.

(3) Arnold's BEST ESTIMATE of the distance to the objects was 23 miles and from a position several miles east of Mineral, Wash., where he was roughly 15 miles from the peak of Mt. Rainier. Thus the objects must have been about 8 miles behind Rainier's peak or 6 miles behind Little Tahoma.

(4) A flight path by the objects on the west side of Rainier, passing in front of the SW slopes, would have to head at 125 degs or less to reach Goat Ridge, contrary to Arnold's 170-deg course plotted on his map and seen by him to be at about right angles to his eastward course when the objects were near Rainier.

(5) A flight path of the objects behind Rainier, on the east side, some 6 miles behind Little Tahoma, would head on a course of 170 degrees to reach Goat Ridge -- exactly in agreement with Arnold's 170-degree course for the objects.

(6) The objects could not fly on a 170 heading and between the 6,000 foot peaks on the SW slope without slamming into the 8,000-9,000-foot level of Rainier first.

(7) Arnold's only known drawing of the objects' flight path shows them coming out from BEHIND Rainier's south edge and never crossing in front (see IUR cover Mar/Apr 95). The drawing was probably done in late June 1947.

"Arnold estimated the crafts were at an altitude of 9,200 feet plus or minus 1,000. The task at hand is thus to locate some feature extending above the 8,200 foot level. This yields a neat little surprise. There are no such peaks between Mount Rainier and Mount Adams. The closest thing I could find was Pyramid Peak which stands only 6,937 feet tall in front of Mount Rainier's base. There is a sharp little projection called Little Tacoma which sticks out around the 10,000 foot level, but it is on the wrong side of the mountain to be seen from Arnold's flight path. It would be badly stretching things to suggest he got either his position or altitude that far wrong".

Overall, it seems to confirm that the 'peak' Arnold refers to was either another one on the western side and which had sufficient height to account for the believed, momentary disappearance, or, Arnold's objects could not have passed behind a peak which was so tall and they must have been at a lower altitude than he surmised. This is of course assuming they went behind a prominent landmark at all and that Arnold wasn't mistaken,

COMMENTS: And by the same token perhaps Arnold was mistaken about the objects crossing in FRONT of the mountain. We can't resolve anything without some solid grounds and solid facts.

perhaps only

losing sight of the objects momentarily as they travelled in front of one. As Kottmeyer noted, 'Pyramid Peak' might be a candidate on the Western side, however, that must prove the nine objects were at a lower altitude than Arnold surmised.

Aside from this presumably prominent peak as the name implies, what else is there?

COMMENTS: Look at a topo map, it's NOT "prominent" at all. Little Tahoma Peak is "prominent."

In both his formative radio interview and letter to the Air force, Arnold didn't mention the apparent disappearance behind a landmark as a factor in perceived distance, however, it must be noted that this did feature in Bequette's 26 June newspaper report:

"He said he could estimate the distance of the objects better because an intervening peak once blocked his view of them. He found the peak was 25 miles away, he related".

If Arnold did state he later discovered the peak was some 25 miles away and given that Bequette also writes, "Mr. Arnold reported he was flying east at 2:50 p.m. Tuesday toward Mt. Rainier when the objects appeared directly in front of him 25-30 miles away at about 10,000 feet altitude", then how to reconcile this?

COMMENTS: These were NOT Arnold's BEST estimates but his very FIRST initial estimates given in his first press interview after landing (published by Bequette the next day June 26, 1947). They are not adequate to identify the terrain.

Although there are a couple of high peaks on the western side of Mt. Rainier - 'St. Andrews Rock' and 'Pt. Success' - these are almost on the summit and not compatible with Arnold's claim, from his book, that it was a "jagged peak which juts out from the base of Mount Rainier proper".

We're left guessing and Kottmeyer's suggestion of 'Pyramid Peak' seems a likely source.

Comments welcome.

COMMENTS: McDonald suggested to Arnold in Nov 1966 a peak on the SW slope of Rainier and went through several possibilities by mail and over the phone, namely Pyramid Peak (6937 ft), Crystal Mtn. (6306 ft), and Iron Mtn. (6283 ft), but rejected them all because they were too low. Arnold was not sure it was on the SW slope either, only that it "probably" was. McDonald suggested lower altitudes to Arnold but apparently Arnold didn't agree and McDonald summarized the data later as the objects flying at 9,000 feet and CLIMBING still higher to 13,000 feet -- a new detail from Arnold never before pinned down (climbing was briefly mentioned before by Arnold, but clashed with other statements of constant elevation which McDonald mentioned to him).

- >Clearly he had been flying around Rainier for some time before
- >his "famous flight". This makes complete nonsense of Menzels'
- >claims that Arnold misidentified weather phenomena such as fast
- >moving clouds of snow, etc. from Mt. Rainier.

Absolutely, Menzel's desperation to explain Arnold's sighting is obvious.

COMMENTS: It also makes mincemeat out of efforts to place the objects at a lower altitude such as 5,000-6,000 feet. Arnold was familiar with the geography of Mt. Rainier and specifically at the elevation of the objects, his aircraft during the sighting and the downed C-46 he was searching for, i.e., the plateau at around 8,000-10,000+ feet. McDonald went through that exercise with Arnold (as I mentioned above) of trying to lower the height without success and concluded the objects climbed from 9,000 to 13,000 feet.

>"I made a turn at probably 2000 ft over Mineral, Washington and
>started climbing back slowly but steadily climbing, to gain
>sufficient altitude to go back on the high plateau again for
>another pass at this mountain. As I was making this turn and, of
>course flying directly toward Mt. Rainier, at about 9200 ft
>elevation... it was a beautiful day, in fact the plane was very
>stable, I didn't have to fight controls or weather or anything".

How do we equate this with his letter to the Air Force, in which Arnold states he was heading in the direction of Yakima and had been on this course for "2 or 3 minutes" when the sighting occurred?

COMMENTS: It depends on how much of the flight path eastward that Arnold considered PART of the turn. The important point is that Arnold estimated 2-3 minutes FROM MINERAL, Wash., before the first flash, then another 20-30 seconds to the next while he searched the sky, then a certain amount of time for the objects to reach the vicinity of Mt. Rainier. Thus he was several miles E of Mineral when the objects were near Rainier. (And if he was circling for another round of searching for the C-46 crash on Rainier's SW slopes why would he travel farther WEST of Mineral which was nowhere near Rainier instead of EAST which was towards Rainier?)

However, this version is relatively consistent with that given in

his book:

"It was during this search and while making a turn of 180 degrees over Mineral, Washington, at approximately 9200 feet altitude, that a tremendously bright flash lit up the surfaces of my aircraft".

As I've pointed out before in relation to the letter and book accounts, if the sighting occurred when he was making that turn, it's a completely different perspective and places Arnold in a different location than if he had been flying in an easterly direction for some 2-3 minutes after the turn over Mineral.

COMMENTS: This 1952 version is simply incomplete, it omits both Arnold's CLIMB and the EASTWARD course at the end or after the completion of the turn, and it's possible that it was due to editing by his coauthor Ray Palmer.

>"I observed a chain of very, very peculiar aircraft approaching

>Mt. Rainier very rapidly... I think I described them like the

>tail of a Chinese kite. They seemed to be in an echelon

>formation However, in getting a look at them against the sky and

>against the snow of Mt. Rainier as they approached...".

COMMENTS: There is a very strange disjointed quality to Arnold's recounting of the whole Rainier phase of the sighting (aside from even the contradictory early accounts where he says the objects FIRST appeared directly in front of him and the mountain, instead of far to the north and to his left seen against the sky).

Arnold loves to tell of the flashing objects rapidly "APPROACHING" the "north edge" or "snow border" of Mt. Rainier. But he NEVER says he saw the objects CROSS the "north edge" of Rainier and THEN PASS in FRONT of it as one would logically expect, in logical chronological sequence. NEVER!!! It's very disjointed as if he was confused about the order or even the occurrence of

the events. Supposedly that's when he got his BEST LOOK AT THE OBJECTS' SHAPE so we would expect that important topic to be covered NEXT in order (but there are other accounts suggesting it was when seen against the snow of Goat Ridge or even distant Mt. Adams, so it's confused). Yet he doesn't do that.

And one would also expect Arnold to say that after the objects started crossing in front of Mt. Rainier that he had difficulty seeing them against the bright white sunlit snow. But he NEVER says that! He never comments on how the brilliant white or shiny, mirror-bright, silvery objects must have virtually disappeared when seen against the brilliant white snow of the mountains -- unless, of course, he never actually saw them against the snow, only assumed he must have in an after-the-fact "rationalized memory." As for the "thin black lines" against the snow when seen ON-EDGE, they were about 5 pixels wide or long in the direction of travel but 1/11 to 1/20 of that in thickness -- or less than resolvable by the human eye (0.25 to 0.4 pixels is by definition not resolved). Traveling at high speed it's questionable whether they could be seen by the human eye when on edge.

As we have noted, if the nine objects were visible against Mt.

Rainier then, surely, they must have been flying down the western side of the mountain.

>"However, in getting a look at them against the sky and against
>the snow of Mt. Rainier as they approached".

Once more, Arnold indicates the objects came down the Western side of the mountain, otherwise, how could he have seen them against the Mountain?

COMMENTS: This 1977 account 30 years after the fact is contradicted by Arnold's second known interview the DAY AFTER, on June 25, 1947, when he stated: "I counted nine of them as they disappeared behind the peak of Mount Ranier [Rainier]." And it's contradicted by the other 6 points of evidence for passage BEHIND Rainier which I listed above, including Arnold's DRAWING showing no such crossing in front of Rainier.

I would feel more comfortable with your view if in most EARLY accounts or in ANY account at any date Arnold had said he saw in logical order (1) the

objects cross the north edge of Rainier, then (2) pass in front of the mountain snowfields, and then (3) discuss the objects' shapes and difficulty in seeing them against the snow. Instead we have to pull comments from different parts of his accounts as if it was an uncertain afterthought.

And it would be nice if Arnold had made a DRAWING showing the objects cross in front of Rainier instead of showing them coming from behind, using two artistic conventions.

>"When they approached Mt. Rainier's north edge, I could see they
>were to the west of Mt. Rainier, to me, which was a very good
>observation from my standpoint".

That's quite definite.

COMMENTS: Arnold's DRAWING showing the objects coming out from BEHIND Rainier and never in front, is also quite "definite." A picture is worth a thousand words. And the problem here is as I said above Arnold discusses the objects "APPROACHING" the "north edge" but NOT CROSSING that edge. Only by crossing in FRONT of the mountain can Arnold see they were to the west of the mountain but he never says that!

Let's just have a simple statement by Arnold at ANY TIME like this: "After they crossed Mt. Rainier's north edge and passed in front of the mountain I could see they were to the west of Mt. Rainier." Even better if he could identify the features on Rainier the objects supposedly passed. The fact he NEVER says this is very strange. He is the one who chose to discuss "north edges" of mountains -- but only in regards to the "approach" of the objects, not their passage, and that is quite peculiar. It suggests that he got confused as to the events from that point on so he would leave the sequence vague and digress a lot haphazardly.

I'll leave aside for now some other responses to Brad's recent postings and this transcript; there's enough to contemplate at the moment.

>"...and they would flutter like this and sail".

>"This was second from the last one and the last ship I couldn't

>see too well because he was fluttering and jerking very

>rapidly...".

Arnold's nine objects in echelon formation and which flew like a

kite tail, certainly seemed to exhibit a lot of fluttering.

James.

OK GUYS, this is getting out of hand. All we have to work with is testimony.

No "HARD FACTS". However, we are nit picking it into oblivion. Before long some people here will be agreeing with Project Grudge: the report is so full of errors it isn't worth analysis!! HAHAHHA :)

Anyway, let's look again:

Date: Tue, 22 Feb 2000 04:16:38 EST
Subject: Re: Kenneth Arnold and KottmeyerStatus:

Bruce,

You hit on something that I had just found out from Joel Carpenter yesterday -- a problem with climb rates. Joel got the specs on the Call-Air A-2, Arnold's model, and found the climb rate was 750 ft/min and therefore a 5,400-foot climb should have taken at least 7 minutes, probably at a ground speed of 90 mph (there was about a 22 mph tail wind from the WNW azimuth 300 which Joel included). Mineral is at 1770 ft MSL so 2,000 feet above that would be 3770 feet and the climb was to 9200 ft.

Therefore a turn and 5,400ft climb begun over Mineral would have put Arnold roughly 10 miles E of Mineral or more, which is quite possible. But Arnold recalled taking only 2-3 minutes (AAF letter). Such a time estimate might not be very accurate yet one would expect an experienced pilot such as Arnold to know how long such a climb would take.

So my guess is Arnold may have been mistaken in his altitude above Mineral. Bruce, can you recheck the tape to see if it is crystal clear that he said 2,000 feet? Phonetically maybe it could have been "ten" or "three" thousand that he said. If 10,000 ft it couldn't have been a climb and that doesn't make sense. And 3,000 ft doesn't help much, cuts it down to 6 minutes but Joel points out that the climb rate might have been less, depending on the weather and the altitude (the specs were for climb rate at 6,000 ft so it may not be much of a factor).

By the way, Arnold called it a 360-deg turn in his AAF letter (ca July 8-10, 1947), but a 180-deg turn in *Coming of the Saucers* (1952) and in the published version of the Fate conference (1980). But your tape transcript does not give the angle of turn and the published proceedings omits the 2,000-foot height above Mineral. I will check with Jerry Clark about the editing of the conference tapes. I can imagine an editor omitting details ("wraith-like" was also omitted) but I can't imagine how they could fill in details without input from Arnold -- unless they got the 180-degs from *Coming of the Saucers*.

Bruce you misunderstand my "complaint." I complained that Arnold goes through an orderly, chronological sequence UP TO the "approach" of the objects to the "north edge" or "snow border" of Mt. Rainier -- words that Arnold chose to focus on -- THEN suddenly defies all natural logical expectations and does NOT then say the objects CROSSED this "north edge" or "snow border" of Rainier and PASSED in FRONT of the "snowfields" of the mountain and he DOESN'T _THEN_ DESCRIBE HOW THEY LOOKED against the snow --

he only brings that up later, vaguely. In fact, in the 1977 tape Arnold makes the weird comment that he could tell the objects flew on the west side of Rainier because they "APPROACHED" the "north edge" of Rainier, when

actually he could only tell that after they CROSSED the "north edge" and PASSED in FRONT of the mountain -- which he NEVER SAYS (and he may have gotten two shots at wording this right in editing the 1977 tape for 1980 publication, as well as 30+ years to do so).

This strange lapse on Arnold's part can't be excused on the basis that nothing important happened while the objects supposedly crossed the front of Rainier because this CLOSEST distance SHOULD have been when Arnold saw MOST CLEARLY the SHAPES of the objects and therefore SHOULD be when he gives his MOST DETAILED DESCRIPTION, the importance of which he and indeed the nation stressed so much -- if indeed he really saw this in front of Rainier (he vaguely suggests the sky, Goat Ridge and Mt. Adams for this crucially important observation in the various accounts).

Psychologically this is exceedingly strange. Arnold's systematic and consistent avoidance over 30+ years of giving a straightforward sequential linear account of the crucially important alleged crossing of the objects in front of Mt. Rainier -- EVER -- is suggestive of DOUBT, UNCERTAINTY, CONFUSION. When you combine it with Arnold's DRAWING showing no such frontal crossing but rather the objects coming out from BEHIND Rainier, it is very suggestive.

In fact, this whole time when the objects passed Mt. Rainier is a BIG GAP or void in Arnold's story. Suddenly we get essentially no details of what happened except scattered afterthoughts and digressions. It's as if there was NOTHING TO REPORT -- because they were out of sight then, and in later confused recountings he tried to fill the gap in an awkward way. If Little Tahoma was the "snow-based cleft" or "jagged peak" or "sharp projection" of Rainier that Arnold variously mentioned, then the objects must have reappeared in the gap between Mt. Rainier's summit and Little Tahoma, then disappeared behind Little Tahoma. As I pointed out in the last posting, only by passing BEHIND Rainier and Little Tahoma could the objects head on a 170 course to reach Goat Ridge as Arnold consistently reported. Passing in FRONT of Rainier would force a heading of 125 degs or less to reach Goat Ridge.

As for what Arnold should have said had the objects passed BEHIND Rainier he told the Chicago Tribune "I counted nine of them as they disappeared behind the peak of Mount Ranier [Rainier]." So Arnold used the disappearance to count them, "one by one" in your words, as they vanished behind the north edge. And that's when he decided to CLOCK them, too, as he says next, "Their speed was apparently so great I decided to clock them." In the 1977 tape it is when the objects "approached" the "north edge" of Rainier that Arnold decided to CLOCK them, not while they were supposedly in front of Rainier. In other words, it was while they were still in sight or just after they disappeared.

Another strange thing is Arnold's remark in the 1977 tape about seeing the

objects' "image against the snow." What is an "image"? Isn't an image a REFLECTION? In his 1947 letter to the AAF Arnold says he saw the objects against the snow as they "APPROACHED Mt. Rainier" rather than as they passed in front. How is that possible? This suggests that when the objects flashed intensely bright that there was a specular reflection of the flash image against the snow or glacier ice of the face or front of Mt. Rainier. So it is not only possible for the objects to be seen by their "IMAGE" or REFLECTIONS on the FRONT of Mt. Rainier even though they all passed to the east or BEHIND Rainier, but Arnold actually SAYS SO.

Bruce, is there any way to get a power output or illuminance estimate from Arnold's descriptions of arc light brightness?

Brad

@@(c) It is extraordinary that a skyrocket randomly fired without
@guidance would have struck Gregory from such a great distance as
@150 feet. If it was 15 feet, it is more within the realm of
@possibility. Although witnesses are notoriously bad at
@estimating distance especially without distance cues, here there
@were close-encounter known landmarks (two trees) to provide
@distance cues.)

If that had happened, this would be nothing but a "lights in the
sky" case.

There is NOTHING (other than guesses by witnesses) to indicate
that the trees and the balloon were the same distance. Unless
the trees were in the SAME central vision field as the object at
the SAME time, the balloon could have been as close as 30 feet.

WHY DO UFO INVESTIGATORS CONTINUE TO TAKE AS ABSOLUTE FACT THE CRUDE ATTEMPTS BY WITNESSES TO GUESS THE SIZE AND DISTANCE OF AN UNKNOWN OBJECT? In the case of a fire balloon, both distance and size are usually grossly overestimated, usually by at least a factor of 20. Witnesses who estimate the size of a UFO tend to choose a size in the range of 20 to 100 feet.

Cases in point:

* Condon case 18; 4/1/67, Boulder CO: One witness chose a length of 75 feet. The balloons are about 1.5 feet wide by 4 feet high, but usually the upper end is not visible. Invariably, the objects were either interpreted as large objects, or lights on larger objects.

* Condon case 45; 12/67, Castle Rock CO also shows the same effect.

* The 4/7/66 Pasadena CA case involving flare balloons also produced size descriptions much larger than the size of the flame from a highway flare.

Also, was that "distance measurement" made at the time of the "ray firing," or after the adults came out (when the balloon could have moved farther away)?

Arnold says:

"As I came out below on this first sweep I passed over a little community of Mineral Washington, in the pine trees there, and I knew pretty much where I was. I took and made a turn at probably 2000 ft over Mineral Washington and started climbing back slowly but steadily, climbing to gain the altitude to go back on the high plateau again for another pass at this mountain."

Except for some ums and uhs this is what Arnold said. Very clear. Now, then, does the altimeter read AMSL (above mean sea level) or "above the ground". I bet that his 2000 ft meant 2000 above sea level because previously he had been talking about how close to the ground one had to fly, very carefully, in order to do a good search. In other words, he may have been only several hundred feet above ground as he began his turn. Incidentally, it seems possible that he did a complete turn plus 180 while climbing.

Note that there was no accurate timing BEFORE the objects passed Rainier. Up to that point Arnold knew that he had been flying for about an hour.

POINT: he did not give the impression of being in a rush to carry out the next pass at the mountain. Furthermore, he had like 20 miles from Mineral to Rainier, a distance over which to climb from (I believe) 2000 AMSL to 9200 AMSL. To go 20 miles at 100 mph would take about 12 minutes, time to climb 9000 ft. This raises the question of whether or not he was actually BELOW 9200 when he saw the objects OR... if he did most of his climb while turning near Mineral....

I would presume, by the way, that he looked at his altimeter during the sighting so that he, in fact, was at about 9200 during the sighting, so that leaves us with the question of exactly how he got there.

@Hello Larry and Brad,

@I've got to agree with Brad on this one Larry although your
@explanation is "somewhat feasible", by very small odds, as shown
@by Brad. It was mentioned in my reference that the jacket was
@taken to the Ohio Bureau of Criminal Investigation in London for
@analysis and they found no evidence of radioactivity. It would
@seem a high probability, but I'm making an assumption here, that
@evidence of "gun-powder" or similar projectile residue would have
@been found on the jacket and/or around the second degree burn on
@the boys arm, had this actually been a projectile, correct?

Assuming (of course) that they tested for it. Since the testimony
indicated a "ray," the question becomes whether or not the
investigators tested for other causes. Since no gunshot was
reported, would the officials have had the insight to test for
gunpowder or other propellants used in fireworks?

@would also assume there to be some evidence of wax also in the
@same locations, if this were the cause of the boys burns. Were
@flame retardant materials in use at this time? What material was
@the jacket made of? These questions would be very important to

@determining the effects of fire upon the jacket, and his
@underlying clothes and arm.

Fire retardants were just beginning to be introduced into children's clothing (mostly sleepwear) at the time. It was a few years after this that the Tris investigation for carcinogenic effects started.

@Also, how would you explain the "big tube" that came out from the
@bottom and moved from side to side? This apparent tube and its
@moving implies some type of intelligent control was displayed.

Where do you get that? The whole balloon could have been rotating randomly in response to variations in the wind (as any child who has lost a gas balloon could tell you). The tube would be the head of the rocket itself, plus a straw to hold the tail. If they overestimated the distance and size, the "tube" looks bigger too.

@There was also mention of electromagnetic interference to a
@television set

Would this have even been considered unusual except that a UFO sighting occurred at the same time?

@and adverse uncontrollable barking from the grandmothers dog,

Which also occurs in confirmed fire balloon cases -- and in cases where someone is injured where no UFO is involved.

@along with a nearby streetlight that went out (another possible
@electromagnetic interference).

This is also a known effect of fire balloon cases. The photocell sees the (close) fire balloon, and the light shuts itself off, thinking the sun came up. I don't know how many cases I have in my files where automatic lights shut themselves down in the presence of a luminous UFO, but there are quite a few.

@There are too many unknowns in the publication I have....it
@would be necessary to see the hospital report, along with the
@test results on the jacket. Also the reference I have mentions
@the boy "rolling around on the ground screaming in fright" after
@being struck with the light...it doesn't mention any "water"
@being involved. Do we have a better source reference for this
@case?

All I have is the Lorenzen book, published the year after it happened. One would wonder what the local newspaper archives have on the case (assuming that UFO buffs haven't stolen them).

Sometimes a search of those archives provides a resolution of the case known locally, but not generally. Many times, this is how I have found out the identity of Indiana cases. Since the UFO mystery makes the front page, but the solution is usually tucked into the community affairs section, it takes some digging.

The hospital report is confidential by law.

@Respectfully learning,

@Todd Lemire

Subject: Re: Radio Activity/BeallsvilleStatus:

The distance of 150 feet was not to a UFO high in the sky but down at ground level between two trees where there were Close Encounter-type visual cues for determining distance from the surrounding environment. Let's see what detailed investigative reports have to say on it.

You can't narrow the probability the way you did -- the whole point of my calculation was to determine both (a) the probability of hitting the boy from 150 ft (or from 15 ft for comparison) in terms of up/down random "aim" AND (b) the probability of a skyrocket tube happening to be pointing at the boy in the first place. You're trying to "fudge" the figures by arbitrarily reducing (b). You might as well just say the probability is 1 in 1 "because it did hit the boy." This reminds me of those calculations of the chance that any one person in a city will happen to show up in a movie theater which are supposedly "refuted" by showing that Betty Smith DID show up, etc.

Assuming that the fuse had been put at the bottom of the candle and not in the middle.

@(c) It is extraordinary that a skyrocket randomly fired without
@guidance would have struck Gregory from such a great distance as
@150 feet. If it was 15 feet, it is more within the realm of
@possibility. Although witnesses are notoriously bad at
@estimating distance especially without distance cues, here there
@were close-encounter known landmarks (two trees) to provide
@distance cues.)

If that had happened, this would be nothing but a "lights in the sky" case.

There is NOTHING (other than guesses by witnesses) to indicate that the trees and the balloon were the same distance. Unless the trees were in the SAME central vision field as the object at the SAME time, the balloon could have been as close as 30 feet.

WHY DO UFO INVESTIGATORS CONTINUE TO TAKE AS ABSOLUTE FACT THE
CRUDE ATTEMPTS BY WITNESSES TO GUESS THE SIZE AND DISTANCE
OF AN

UNKNOWN OBJECT? In the case of a fire balloon, both distance and size are usually grossly overestimated, usually by at least a factor of 20. Witnesses who estimate the size of a UFO tend to choose a size in the range of 20 to 100 feet.

Cases in point:

* Condon case 18; 4/1/67, Boulder CO: One witness chose a length of 75 feet. The balloons are about 1.5 feet wide by 4 feet high, but usually the upper end is not visible. Invariably, the objects were either interpreted as large objects, or lights on larger objects.

* Condon case 45; 12/67, Castle Rock CO also shows the same effect.

* The 4/7/66 Pasadena CA case involving flare balloons also produced size descriptions much larger than the size of the flame from a highway flare.

Also, was that "distance measurement" made at the time of the "ray firing," or after the adults came out (when the balloon could have moved farther away)?

Subject: Re: Kenneth Arnold and KottmeyerStatus:

Bruce,

These are very good questions. So the tape is very clear when it has Arnold saying "two thousand feet"? Not "ten thousand" or "three thousand"? It looks like you've redone the transcription of this portion because you've added the word "took" and changed punctuation, different typos.

If 2,000 ft was ASL and Mineral was at 1770 ft, then he would have been only 230 feet above the town and that's assuming his altimeter was sufficiently accurate on an absolute scale to be sure -- it sounds dangerous, especially given the height of the trees and terrain irregularities. That's why I would say 2,000 ft above Mineral's 1770 ft. Arnold may not have based this on looking at his altimeter (which of course would only should altitude ASL) but on his "eyeballing" his height above ground.

Brad

In a message dated 2/22/00 8:18:38 AM, brumac@compuserve.com writes:

<<

Arnold says:

"As I came out below on this first sweep I passed over a little community of Mineral Washingto, in the pine trees there, and I knew pretty muh where I was. I took and made a turn at probably 2000 ft over Mineral Washington and started climbing back clowly but steadily, climbing to gain the altitude t go back on th high plateau again for another pass at this mountain."

Except for some ums and uhs this is what Arnold said. Very clear.

Now, then , does the altimeter read AMSL (above mean sea level) or "above the ground". I bet that his

2000 ft meant 2000 above sea level because previously he had been talking

about how close to the ground one had to fly, very carefully, in order to do a good search. In other words, he may have been only several hundred feet above ground as he began his turn.

Incidentally, it seems possible that he did a complete turn plus 180 while climbing.

Note that there was no accurate timing BEFORE the objects passed Rainier.

Up to that point

Arnold knew that he had been flying for about an hour.

POINT: he did not give the impression of being in a rush to carry out the next pass at the mountain.

Furthermore, he had like 20 miles from Mineral to Rainier, a distance over which to climb from

(I believe) 2000 AMSL to 9200 AMSL. To go 20 miles at 100 mph would take about 12 minutes,

time to climb 9000 ft. This raises the question of whether or not he was actually BELOW 9200 when he saw the objects OR... if he did most of his climb while turning near Mineral....

I would presume, by the way, that he looked at his altimeter during the sighting so that he, in fact, was

at about 9200 during the sighting, so that leaves us with the question of exactly how he got there.

@You can't narrow the probability the way you did -- the whole
@point of my calculation was to determine both (a) the
@probability of hitting the boy from 150 ft (or from 15 ft for
@comparison) in terms of up/down random "aim" AND (b) the
@probability of a skyrocket tube happening to be pointing at the
@boy in the first place. You're trying to "fudge" the figures by
@arbitrarily reducing (b). You might as well just say the
@probability is 1 in 1 "because it did hit the boy." This reminds
@me of those calculations of the chance that any one person in a
@city will happen to show up in a movie theater which are
@supposedly "refuted" by showing that Betty Smith DID show up,
@etc.

You certainly can if you have additional information about the stochastic event before it happens. The testimony said that the tube WAS SEEN to be pointed at Gregory BEFORE the rocket (or ray) fired. This establishes that it was NOT pointing in some other direction (except possibly directly away from him). It also says that the "beam" came out of the tube. I have not "arbitrarily" reduced (b), but taken its position from witness testimony.

This is a case of conditional or Bayes probability, the probability of event X, given that event Y is known to have occurred. In this case, event X is that the rocket (or ray) struck Gregory, and event Y is that the rocket (or ray gun) was pointed at Gregory before it fired. The testimony establishes that event Y is true. Of course, the unknown is whether it was a

rocket or not.

So it is absurd to calculate the probability that the rocket went at angles 90 degrees away from Gregory when it was seen to be pointing at him. If the rocket had been pointing 90 degrees away from Gregory, then he wouldn't have said that the tube was pointing toward him. What Brad did was to calculate the probability of A, given that B is unknown.

I used to teach classes in probability, so I ought to know what I am talking about.

Of course, there is the additional factor that, if Gregory had not been struck, we probably would never heard about the case. What's the probability that (A) the case would have been reported, given that (B) the rocket missed hitting Gregory. Probability factors like this one also distort all of the statistics pertaining to UFOs, since low strangeness events are less likely to be reported.

@@down at ground level between two trees where there were Close
@@Encounter-type visual cues for determining distance from the
@@surrounding environment. Let's see what detailed investigative
@@reports have to say on it.

The question on this revolves entirely around whether the UFO was close enough (in the visual field) to either of the trees for the eyes to keep both in the central vision area (the fovea, where objects are in perfect focus). If they were farther apart, the eyes would automatically adjust, destroying any attempt at measuring with parallax.

Perspective vision does not work unless the object is actually touching a continuous surface. So an object up in the sky can't be located by perspective (but too many people see the sky as a surface, and try anyway). Also, if the object didn't pass behind anything, then overlap cannot be used to find the minimum distance.

Without simultaneous parallactic vision and without perspective or overlap, accurate binocular vision has a maximum range of only 30 feet (1.67 1982 Ford E-150 vans, for those of you who like odd measurements). So the object could have come as close as that and

still appeared to have been near the trees (at 150 feet, or 8.33
1982 Ford E-150 vans) to the witnesses.

Regarding my discussion of "Brad's Complaint" (not quite the same as Portnoys's):

>Bruce you misunderstand my "complaint." I complained that Arnold goes through an orderly, chronological sequence UP TO the "approach" of the objects to the "north edge" or "snow border" of Mt. Rainier -- words that Arnold chose to focus on -- THEN suddenly defies all natural logical expectations and does NOT then say the objects CROSSED this "north edge" or

"snow border" of Rainier and PASSED in FRONT of the "snowfields" of the mountain and he DOESN'T _THEN_ DESCRIBE HOW THEY LOOKED against the snow --

he only brings that up later, vaguely. In fact, in the 1977 tape Arnold makes the weird comment that he could tell the objects flew on the west side

of Rainier because they "APPROACHED" the "north edge" of Rainier, when actually he could only tell that after they CROSSED the "north edge" and PASSED in FRONT of the mountain -- which he NEVER SAYS (and he may have gotten two shots at wording this right in editing the 1977 tape for 1980 publication, as well as 30+ years to do so).

This strange lapse on Arnold's part can't be excused on the basis that nothing important happened while the objects supposedly crossed the front of

Rainier because this CLOSEST distance SHOULD have been when Arnold saw MOST

CLEARLY the SHAPES of the objects and therefore SHOULD be when he gives his

MOST DETAILED DESCRIPTION, the importance of which he and indeed the nation

<

It is difficult for me to imagine that he wouldn't mention the objects disappearing behind Mt. Rainier if they did so (and then he wouldn't know where they were going until the first reappeared.)

On the other hand, it is not difficult for me to believe that Arnold didn't

consider
it important to explicitly state that h saw them travel past Rainier on his
side of the
mountain because I believe Arnold assumed that any reader/listener to his
story would logically INFER the truth (that the objects passed on the west
side)
from Arnold's statements about seeing them against the snow, about them
being
on the west side, etc. I think his statement about "disappearing behind"
Mt. Rainier was
actually a confusion of the main mountain with whatever smaller peak he
claimed
to have seen them pass behind,

I still think this is making an Extinct Volcano out of a Mole Hill.

At any rate, I don't see what we could do about it now. Only one person was
there...
Arnold... and all we have to go on is what he said about it.... whether or
not
it makes complete and logical sense.
As I have said before, one is offered the choice of deciding the report is
so
replete with "errors" as not to warrant careful analysis, or one can take
more or less at face value what Arnold said.

It is amusing to imagine how the "disappears behind Mt. Rainier"
interpretation
would "blow up" the pelican explanation.

However, if one assumes that they did not pass behind Rainier but
nevertheless passed behind SOMETHING (some peak) as ARnold's
statement implies, then once again the "pelicanization" of Arnold's
sighting
is for the birds.

For those pelicanists out there slaving over this nitpicking I again
issue the eternal challenge:

DRAW A MAP showing the track of th pelicans and the track of Arnold's
plane and convince me that it could have appeared to him as if the
pelicans were first seen far to the north of rainier and last seen passing
Mt. Adams, while he flew merily along at about 100 mph.

Brad,

Yes, Arnold may not have been accurate in his perceptions.

We are dealing with an extraordinary claim and the most likely,
rational explanations have to be eliminated first of all.

Noting all of your comments, some responses:

>Let's just have a simple statement by Arnold at ANY TIME like
>this: "After they crossed Mt. Rainier's north edge and passed in
>front of the mountain I could see they were to the west of Mt.
>Rainier."

Assuming the verbatim accounts and the earliest ones are most
reliable, if we recap what Arnold said in that early radio
interview:

"...I was approximately 25 to 28 miles from Mt. Rainier, I
climbed back up to 9200 feet and I noticed to the left of me a
chain which looked to me like the tail of a Chinese kite, kind of
weaving and going at a terrific speed across the face of Mt.
Rainier. I, at first, thought they were geese because it flew

like geese, but it was going so fast that I immediately changed my mind and decided it was a bunch of new jet planes in formation. Well, as the planes come to the edge of Mt. Rainier flying at about 160 degrees south, I thought I would clock them...".

Clearly from this, the nine objects passed "across the face of Mt. Rainier".

I had considered that even if the objects had gone behind, they would still strictly have 'crossed the face' of Mt. Rainier, however, Arnold surely wouldn't have described events as he does unless he meant their path was in front of the mountain.

In which case, I would have to take this as the definitive clarification and confirmation.

Arnold also noted in his interview, "I could see them against the snow, of course, on Mt. Rainier".

Supporting evidence comes from the following:

"The Boise flyer said they flew on the west sides of Rainier and Adams, adding that he believed this would make it more difficult for them to be seen from the ground".

['Pendleton, Oregon East Oregonian', June 26]

"Arnold said the strange aircraft were skittering across the southwest slope of Mount Rainier when he first sighted them".

['Norman, Oklahoma Transcript', June 26]

"Arnold, general manager and owner of the Great Western Fire Control Company, said he first saw the objects when they flashed in the sun low over the slopes of Mt. Rainier".

['Oregon Journal', June 27, 1947]

Also, in his letter to the Air Force Arnold stated, "These objects being quite far away, I was unable for a few seconds to make out their shape or their formation. Very shortly they approached Mt. Rainier, and I observed their outline against the snow quite plainly".

>COMMENTS: McDonald suggested to Arnold in Nov 1966 a peak on
>the SW slope of Rainier and went through several possibilities
>by mail and over the phone, namely Pyramid Peak (6937 ft),
>Crystal Mtn. (6306 ft), and Iron Mtn. (6283 ft), but rejected

>them all because they were too low. Arnold was not sure it was
>on the SW slope either, only that it "probably" was. McDonald
>suggested lower altitudes to Arnold but apparently Arnold didn't
>agree and McDonald summarized the data later as the objects
>flying at 9,000 feet and CLIMBING still higher to 13,000 feet --
>a new detail from Arnold never before pinned down (climbing was
>briefly mentioned before by Arnold, but clashed with other
>statements of constant elevation which McDonald mentioned to
>him).

What may be crucial is determining the height of those Goat Ridge peaks. Arnold detailed how the nine objects appeared to frequently go _down_ into the canyons there.

I believe we will find there's unequivocal evidence that the objects never climbed as McDonald suggested.

The 'peak' which these objects disappeared behind is, so far as I'm aware, detailed only in Arnold's book:

"Even though they had a constant direction they swerved in and out of the high mountain peaks which are found on the hogsback of the Cascade mountains between Mount Rainier and Mount Adams. I determined my distance from their pathway to be in the vicinity of twenty-three miles because I knew where I was and they revealed their true position by disappearing from my sight momentarily behind a jagged peak that juts out from the base of Mount Rainier proper".

As now seems evident, this could not have been 'Little Tahoma' if the objects flew on the mountain's western side. Also, surely 'Little Tahoma' isn't a peak which 'juts out from the base of Mount Rainier proper', it's high up on the mountain. This is appreciably inconsistent.

Is there maybe a clue in the other published and important source of Arnold's reference to a 'peak', Bill Bequette's newspaper report:

"He said he could estimate the distance of the objects better because an intervening peak once blocked his view of them. He found the peak was 25 miles away, he related".

This isn't verbatim, however if it was an _intervening_ peak and the objects, as seems definite, flew on the western side, then it must have been between Arnold and the mountain.

There's a fundamental point here; to use any visible peak as a relatively accurate distance marker, Arnold absolutely must have known where this landmark was approximately located. It's not

permissible that, at the time, Arnold estimated the distance based on a 'peak' which only afterwards he 'found' was 'x' miles away.

Whilst we can accept he had forgotten, surprising to learn from the interesting addition - which I've seen for the first time - of McDonald's discussion with Arnold about it's location, that Arnold was comprehensively unable to identify this landmark.

Considering further, why would a peak actually have been of help; if these objects flew behind the mountain, then he would know for certain their approximate distance was at least further than the mountain and the fact they then also went behind a peak on the mountain wouldn't really tell him any more.

Arnold relates how he perceived the objects 'disappeared momentarily' behind a jagged peak. If they had flown behind Mt. Rainier and this carried them beyond 'Little Tahoma', nothing would have been so fleeting, the objects would already have been out of sight for a time behind the mountain.

There's considerable evidence why the path of those nine objects was between Arnold and Mt. Rainier and the 'peak' must therefore have been located somewhere in-between, perhaps on the base of Mt Rainier as he said.

Reiterating...

>Let's just have a simple statement by Arnold at ANY TIME like
>this: "After they crossed Mt. Rainier's north edge and passed in
>front of the mountain I could see they were to the west of Mt.
>Rainier."

Now we have the transcript of Arnold's conference speech, he recalls, "When they approached Mt. Rainier's north edge, I could see they were to the west of Mt. Rainier, to me, which was a very good observation from my standpoint...".

Here we have a literal confirmation they were to the west when approaching Mt. Rainier's north edge and we also have several references which indicates they must have passed across the western face. If "to the west of Mt. Rainier" as "they approached Mt. Rainier's north edge", how could they have travelled east, behind the mountain and their flight path have been so direct as Arnold claimed?

>Arnold's only known drawing of the objects' flight path shows
>them coming out from BEHIND Rainier's south edge and never

>crossing in front (see IUR cover Mar/Apr 95). The drawing was
>probably done in late June 1.

Arnold's sketch is unfortunately ambiguous. You could say that he's depicting the line of flight originating behind Mt. Rainier, however, it could be seen as indicating the path from Mt. Rainier. That's what was significant - Arnold is illustrating the factors which led to his calculation of airspeed. At the bottom right, he notes the time taken to travel from "A-B", as Arnold perceived matters, was "1:42".

The smaller 'peak' which is apparently drawn by Arnold - to the south of Mt. Rainier - could that be Arnold attempting to show the relative position of our illusive peak?

Although I understand and do appreciate why you consider 'they'll be coming 'round the mountain' - and as we know Arnold was quoted (how accurately we don't know) as saying so - the overall evidence unquestionably indicates otherwise.

Conversely, how do you explain all that evidence away?

We eventually have to reach a conclusion and there's apparently only two options; either Arnold believed the nine objects took a pathway behind Mt. Rainier and all his contrary references have to be rationalised before being discarded, or, they are the accurate scenario and proof that his altitude estimates were incorrect. Maybe more than just that.

>Even better if he could identify the features on Rainier the
>objects supposedly passed. The fact he NEVER says this is very
>strange. He is the one who chose to discuss "north edges" of
>mountains -- but only in regards to the "approach" of the
>objects, not their passage, and that is quite peculiar. It
>suggests that he got confused as to the events from that point
>on so he would leave the sequence vague and digress a lot
>haphazardly.

The answer may be that this phase was of minor importance. It's what happened from the time he clocked the objects - that's the aspect everyone had focused on.

Picking up on a response to Bruce, you wrote:

>This strange lapse on Arnold's part can't be excused on the
>basis that nothing important happened while the objects
>supposedly crossed the front of Rainier because this CLOSEST

>distance SHOULD have been when Arnold saw MOST CLEARLY the
>SHAPES of the objects and therefore SHOULD be when he gives his
>MOST DETAILED DESCRIPTION, the importance of which he and indeed
>the nation stressed so much -- if indeed he really saw this in
>front of Rainier (he vaguely suggests the sky, Goat Ridge and
>Mt. Adams for this crucially important observation in the
>various accounts).

What about Arnold's statement in his letter to the Air Force:

"I am making a drawing to the best of my ability, which I am including, as to the shape I observed these objects to be as they passed the snow covered ridges as well as Mt. Rainier".

Could this be taken as the confirmation you're querying?

Some helpful photographs of Mt. Rainier can be found at:

<http://www.mind.net/dlmark/pages/crainier.htm>

Subject: Re: Radio Activity/BeallsvilleStatus:

Larry,

Bayesian probability doesn't apply here. If it did, then the probability of the boy getting hit (event X) when it is known that the "ray gun" did point towards him (event Y) is 1 in 1 which is not what I'm talking about.

What I'm talking about is the probability -- IF we DIDN'T know that the "ray gun" had pointed directly at the boy -- of a random fire balloon contraption with a skyrocket on a fuse rotating anywhere on a 360-degree axis and with a possible aim variance vertically of say 1/4 radian up or down from the horizon. Those chances calculate out to about 1 in 7,000.

Brad

Bruce, is there any way to get a power output or illuminance estimate from Arnold's descriptions of arc light brightness?

<

In other references he had directly or indirectly compared the brightness to a flash of sunlight. It must have been startling enough to make him look for a nearby plane that had just zoomed by while reflecting the sunlight from bare metal onto his airplane.

He talked of being able to see the flashes from a distance comparable to the distance to Mt. Baker.

(FROM MY MAGNUM ARNOLD OPUS published in the MUFON Symp, July 1997)
L=Air Force letter; B = Book

(L) "The sky and air was as clear as crystal. I hadn't flown more than two or three minutes on my course when a bright flash of light reflected on my airplane. It startled me as I thought I was too close to some other aircraft. (B) I spent the next twenty to thirty seconds urgently searching the sky all around - to the sides and above and below me - in an attempt to determine where the flash of light had come from. The only actual plane I saw was a DC-4 far to my left and rear, apparently on its San Francisco to Seattle run. My momentary explanation to myself was that some lieutenant in a P-51 had given me a buzz job across my nose and that it was sun reflecting off his wings as he passed that had caused the flash. Before I had time to collect my thoughts or to find a close aircraft, the flash happened again. This time I caught the direction from which it had come. I observed, far to my left and to the north, a formation of very bright objects coming from the vicinity of Mt. Baker, flying very close to the mountain tops and traveling at tremendous speed. (L) I observed a chain of nine peculiar looking aircraft flying from north to south at approximately 9,500 ft elevation and going, seemingly, in a definite direction of about 170 degrees.

COMMENT: Mt. Baker (altitude, 10,000 ft) is about 130 miles north of Mt. Rainier. Even if the objects were not as far away as Mt. Baker the flashes must have been very bright to be visible over a great distance. (If the

path of the objects as estimated by Arnold, 170 degrees azimuth, is projected northward from Mt. Rainier, his sighting line to Mt. Baker crosses the projected path about 50 miles from his plane, which is a more likely distance for his initial observation of the flashes.) This suggests that the flashes were reflections of sunlight from mirror-like (specular) surfaces, i.e., a polished metal surfaces. Sunlight flashes could be visible over distances as great as a hundred miles under clear atmospheric conditions. Anything less would be invisible over such a distance in the bright sky. Since the sun was at an elevation of about 60 deg, some portion of the object's surface must have been momentarily at an angle of about 60 deg. to the horizontal in order to cause a reflected sun ray to travel nearly horizontally in the atmosphere from the object to Arnold's plane.

The above points out that the 170 azimuth projected northward (from the WEST side of

Rainier) crosses the sighting line from an estimated location of the plane toward Mt Baker

at a location about 50 miles from the plane.

This meant that the reflection or whatever had to be VERY bright. to be visible looking directly at it

, to say nothing of how bright it would have had to be to appear to light up his plane.

Now we have Arnold comparing the flashes with arc lights.

It is a no brainer, by the way, to say I have never heard of a pelican brightness/reflectivity

being compared to an arc light. Perhaps James can dig up an ornithologist who would\

make such a comparison... but at any rate said pelican would be no more than a mile away;

(Is this getting silly or what? Any explanation in a storm?)

Now let's address the question by Brad:

Many years ago (several hundred at least) I spent HOURS, DAY, MONTHS, YEARS trying

to understand the meaning of the brightness values in the Trent photos. As a consequence I

read references which provided the typical illumination on a surface for various

conditions of weather and solar elevation. There are SO MANY indeterminate factors

in calculations one might do that it makes no sense to spend hours here trying to do an

"Accurate" calculation.

There are two somewhat different estimates possible. The first is based on Arnold's

claim that the object "lit up" his plane. That is, the surface of the

plane, like inside of the cockpit, actually gets brighter momentarily. The second is based on Arnold looking directly at the light and it appears brighter than the sky and hence is visible against the sky background. It doesn't take much thought to realize that the second method provides a lower bound to the brightness. This is because when viewed directly the light is "competing" with only a small "area" (solid angle) of the sky brightness, whereas the light on a surface is the integral of illumination from all portions of the sky so the light (of small angular size) is "competing" with the whole sky brightness, or at least a sizeable portion.

Method 1: assume that the light from the object(s) which HIT the PLANE, was twice that of the ambient light (sunlight plus skylight),. That is, the flash increased the illumination of the inside of his plane. Now, Arnold was flying eastward..I ASSUME!!!!... so the direct sunlight into the cockpit was blocked.... maybe (don't know exactly what the cockpit looked like) What was coming into the cockpit was ambient skylight. According to a reference I have in "Full Daylight" not direct sunlight a typical illuminance on a surface would be $1\text{E}4 \text{ lm/m}^2$ (10,000 lumens per square meter). Note that there is a lumen to watts conversion which is based on the response of the eye. Since the eye was the detector here we may as well use "eyeball units" of illumination on a surface. If the light hitting Arnold's plane was twice this, $2 \times \text{E}4 \text{ lm/m}^2$, then we could calculate the source intensity if we knew its distance from $E = I/R^2$ where E is the "illuminance on the surface" ($2\text{E}4 \text{ lm/m}^2$), I is the source intensity (lm/steradian) and R is the range. Just pick a distance, say 50 miles or about $80 \text{ km} = 80,000\text{m}$. Hence $I = 2\text{E}4 \text{ times } (8\text{E}4)^2 = 1.3\text{E}14 \text{ lm/steradian}$. I don't know the brightness of a welding arc. However, a "xenon short arc" lamp gives off about $8\text{E}4 \text{ lm/steradian}$. POINT: whatever it was it was BRIGHT and Arnold's comparison with an arc is understandable. Of course, if the objects were at a different range, the calculated intensity would be different according to the inverse square law ($E R^2 = I$).

NOW COMPARE WITH SOLAR REFLECTION (this is copied from a message last Sept.

25,

which includes a message from 1997!). This related to the second method mentioned

above based on directly viewing the light and observing that it can be seen against the sky.

Consider the brightness of a flash of light from a mirror surface 100 ft in diameter at 100,000 ft (19 miles simple approximations to true size and distance). As I have pointed out before, reflection of the sun from a FLAT

mirror is like looking directly at (a piece of) the sun. If the angular size of the mirror is larger than that of the sun (say 0.008 radians approx), then you will see the

WHOLE brightness of the sun (if 100% reflective). If the mirror is smaller

in angular size, then you see a fraction of the sun's brightness given by (ignoring diffraction effects important for really small reflectors) $(D_{\text{mirror}})^2 / (D_{\text{sun}})^2$. In this case I pick $D_{\text{mirror}} = 100/100000 = 0.001$ rad

(1 milliradian or 1 mr). The sun is about 8 mr. Hence the brightness of a

FLAT (circular) reflector of 1 mr angular size (oriented correctly to give a

reflection, of course) is $(1/8)^2 = 1/64$. The sun is so bright that even 1/64th of

its brightness is brighter than the surrounding sky.

I posted the following message way back in November 1997 (yes, this argument has been going on a LONG time) (edited slightly to make it relevant to today):

ASSUME the initial sighting by Arnold was when the objects were 50 miles away. He said he could see the light flash on his plane. At this

point it is necessary to determine what Arnold meant by a "flash on his plane" Was it so bright that he actually saw light reflected off his plane and then into his eye?

I doubt it since this was full daylight and the objects were very distant.

On the other hand, if meant that light was reflected TOWARD his airplane and the light entered his eye directly it could be quite bright IF THE OBJECTS REFLECTED LIKE MIRRORS, which is what Arnold seemed to imply. When you look at a mirror reflecting the sun you are actually looking

at the sun(!), just from a different direction than directly toward the sun.

If the angular size of the mirror is smaller than the sun's angular size (i.e., less than about 8 milliradians or about 1/2 degree), then you are looking at a piece of the sun. Suppose we imagine a roughly circular object sufficiently flat and shiny to appear as a mirror and let its diameter be 80 ft. Then at 50 miles the angle is 0.3 milliradians. The fraction of the sun which this small angle represents is about $(0.3 \text{ mr}/8 \text{ mr})^2 = 0.0014$. (Squared because it is the area of the mirror divided by the area of the sun's disc that determines the reflected solar "flux.") So you get roughly 0.14% of the sun's light \being reflected (0.00014).

(Note: no spherical divergence here since the surface was assumed to be flat; if a curved surface then the fraction must be reduced somewhat. However, diffraction effects will introduce some divergence.)

Now, the solar disc is about 1 to 2×10^5 times brighter than the sky (for experts: $B = \text{luminance} = (1 \text{ to } 2) \times 10^9 \text{ cd/m}^2$ for sun, and $B = 1 \times 10^4 \text{ cd/m}^2$ for bright sky near the horizon; these numbers change with atmospheric conditions and the elevation of the sun and are approximate.

$E\#$ represents 10 raised to a power, $10^{\#}$; $\text{cd} = \text{candle} = \text{lumen/m}^2$).

Hence 0.0014 of the solar disc is still more than a hundred times brighter than the sky. Although one does not know the exact conditions of sky brightness, nor the exact reflectivities of these objects, this calculation does suggest that the reflection would be easy to see even over a distance of 50 miles.

.....

If one assumes the surface was curved, all bets are off as far as calculating is concerned without knowledge of the radius of curvature. However, that fact that Arnold reported these flashes at a distance so great that he couldn't see the objects themselves implies that the curvature was not great (the radius of curvature was large).

BOTTOM LINE: comparison with an arc implies great brightness. Reflection of the sun could SEEM that bright even if from a distance. I have seen solar reflections from metal and (apparently) car windows while flying in airplanes at tens of thousands of feet altitude. A car window reflection (about 8% of sunlight reflected) can be surprisingly bright.

Hope this sheds further illumination on this problem

On my web site, there's a useful little map showing the relationship between the main landmarks in Arnold's story, i.e., Ashford, Mineral, Mt. Baker, Mt. Rainier, Mt. Adams and Yakima.

It looks like the graphic of Mt. Rainier may be attempting to show the relative position of Little Tahoma (Tacoma) peak. See:

<http://web.ukonline.co.uk/voyager/rainier.gif>

Also worth noting are the following online images:

`View over the lower Emmons glacier toward Little Tahoma' and `Yawning crevasse with Little Tahoma below':

<http://members.tripod.com/~Schryer/1998/rainier.html>

`Mt. Rainier, Washington':

<http://www.geocities.com/Yosemite/1985/rainier.html>

Including, `View of Mt. Rainier from the Goat Rocks Wilderness'.

An `Armchair Tour of Mount Rainier' [click on any highlighted `tour stop' for probably the best selection of photographs]:

<http://vulcan.wr.usgs.gov/Volcanoes/Rainier/ArmchairTour/frametwork.html>

Taken from Goat Rock, there's a terrific panoramic view showing both Mt. Adams and Mt Rainier at:

<http://www.halcyon.com/cliffsan/goatrocks/goatpan.html>

If I'm not mistake, `Little Tahoma (or Tacoma)' can be prominently seen here, on the eastern slope of Mt. Rainier.

Further information about Goat Ridge, which is located in the 'Goat Rocks Wilderness' can be found at:

http://www.fs.fed.us/gpnf/trails/nsc/n_00095.htm

http://svinet2.fs.fed.us/gpnf/wilderness/wi_grock.htm

It's confirmed, "A 105,600-acre alpine wonderland, the Goat Rocks Wilderness is a portion of the volcanic Cascade Mountain Range in southwestern Washington between Mount Rainier and Mount Adams. The Goat Rocks are remnants of a large volcano, extinct for some two million years. This ancient volcano once towered over the landscape at more than 12,000 feet in elevation, but has since eroded into several peaks averaging around 8,000 feet".

I've located Goat Rocks and specifically Goat Ridge in a detailed USGS topographic map and the bookmark is:

<http://mapserver2.esri.com/cgi-bin/sure.adol?r=y&f=c&c=-121.505374,46.492006&p=2&m=0&cd=p&g=-121.76000000,46.85270000&a=Mt%2e+Rainier%2c+Washington&MAP.x=195&MAP.y=169>

@
@Larry,

@Bayesian probability doesn't apply here. If it did, then the
@probability of the boy getting hit (event X) when it is known
@that the "ray gun" did point towards him (event Y) is 1 in 1
@which is not what I'm talking about.

@What I'm talking about is the probability -- IF we DIDN'T know
@that the "ray gun" had pointed directly at the boy -- of a
@random fire balloon contraption with a skyrocket on a fuse
@rotating anywhere on a 360-degree axis and with a possible aim
@variance vertically of say 1/4 radian up or down from the
@horizon. Those chances calculate out to about 1 in 7,000.

Actually, that distills down to being the probability that the
"tube" pointed at Gregory, doesn't it? In that case, Gregory's
motions (he was carrying water, remember) become a factor in the
calculations:

One factor is that the rocket actually went off when it did. If
the balloon was rotating at a constant rate, then your figure
applies (assuming that the balloon really was 150 feet away,
which has not been shown). Of course, the balloon may not have
been rotating at a constant rate (which would happen if a leak
existed in the bag at a certain point), but swinging back and
forth (due to slight variations in air currents). In that case,
the tube would have wavered slowly back and forth.

The fact that Gregory stopped and looked at the object, waited
until the tube pointed right at him, then ran away from the
object once that happened, actually changes the calculations. If
he had kept going on his intended path (and if the object really
was a fire balloon with a bottle rocket), he would not have been

hit. So the event is not as stochastic as it seems to be, but becomes a case of "artificial stupidity." Gregory stood there UNTIL the tube pointed at him. This greatly increased the probability that he was hit by making him a target for a longer period of time.

I once did something "artificially stupid" like that. I was walking in a small wooded city park. Suddenly, I heard a sound like firecrackers going off. I stopped and listened to hear what it was. The sound stopped. I waited for about 20 seconds, and heard nothing. I then continued my walk, and I am glad that I did so. Not 10 seconds after I had started moving, the sound resumed. A large tree came crashing down, bringing power lines down right where I had been standing. What's the probability that the tree would wait at least 25 seconds before continuing to break?

Assuming that the object WAS a fire balloon with a bottle rocket, the lack of knowledge of the true identity of the object also may have caused Gregory to do the wrong thing, increasing his probability of being hit. If he had known that it was a fire balloon with a rocket, he could have logically run at right angles to the direction the tube was pointing. But because he assumed it was a weapon under intelligent control, he ran directly away from it, staying in the aim of the rocket.

What I had calculated was the rough probability that the rocket would actually make a hit, given that the tube was pointed at Gregory. But actually the probability curve of nearby strikes would be Gaussian, not the linear calculation I made. Likewise, Brad's calculation of vertical deviation assumes a sawtooth motion of the sway of the balloon, not the sine motion that actually occurs.

Subject: Re: Kenneth Arnold and KottmeyerStatus:

James,

I'm glad you confirmed the fact with your research that Little Tahoma Peak is "THE" most prominent conspicuous subsidiary peak of Mt. Rainier, one that literally sticks out like a sore thumb in photos and maps. In fact, it is so obvious that one would have to wonder how Arnold could miss it -- if he did. But of course he didn't.

And I'm happy you confirmed the existence of Goat Ridge located exactly where I put it. Your coordinates were approximately 46.49 N, 121.5 W. Mine were not decimals but degs-mins 46-29 to 32 (or about 46.48 to 46.53 decimal) North latitude and 121-30 (or 121.5 decimal) West longitude.

Now if you would just confirm that ONLY by passing to the EAST and BEHIND Little Tahoma and Mt. Rainier in general could the objects have reached Goat Ridge on the 170-degree heading that Arnold derived from HIS MAPPING. Please note that we're NOT TALKING ABOUT ARNOLD'S OBSERVATIONAL ABILITIES TO ESTIMATE COURSE HEADINGS by looking at the objects in flight. We're talking about what Arnold RECONSTRUCTED ON HIS MAP -- rightly or wrongly -- after the fact as he struggled to make sense of where he was located and where the objects were located. Whether it agreed with what he observed is a SEPARATE ISSUE. My point here is that HE THOUGHT the objects had passed BEHIND Rainier/Little Tahoma when he did his MAP CHARTING and NOT IN FRONT of Rainier, otherwise he could not possibly have derived a 170 heading. He would have gotten a 125 heading or even less for a heading from the west or front of Rainier to Goat Ridge, the location of which you now agree with me on.

The tiny little ridgeline bumps that McDonald went over with Arnold on the phone in a 1-1/2 hour call on Nov 19, 1966, have the problem that they are virtually INVISIBLE. Try to find any photos where you can spot them. Plus I've now discovered that McDonald's topo map was SERIOUSLY IN ERROR -- the map that Arnold with leading questions "sort of" agreed with and ended up agreeing with a nonexistent "mountain"!!!! One of the three ridge bumps that McDonald got Arnold to tentatively list as possible candidates for the "peak" the objects passed behind, was a so-called "Crystal Mtn. (6306 ft)" about 3/4 mile south of Pyramid Peak. Well it DOESN'T EXIST. The current USGS 7.5 minute topo map of Mt. Rainier West of 1971 does not give the feature a name and shows that its height is 5568 feet NOT 6306 feet and it is actually part of the Pyramid Peak ridgeline (there is no peak at about 6300 ft anywhere in that area). It is only about 100 feet wide (at the defining 5520-ft contour) and the virtually nonexistent saddle behind it is less than 48 feet deep. Not enough room for a 100-foot wide spaceship to hide behind at half a mile per second for more than 0.04 second!!!

As for Arnold's alleged statements saying the objects flew in front of Rainier I will just note that these exact statements were defective in other ways besides the passing-in-front which suggest gross error all around.

By the way, speaking of crossing in front of Mt. Rainier at about the 6,000-foot level of the "jagged peaks" in FRONT of Rainier that you are forced to accept, your birds have a major and severe problem here: Rainier is at least 15 miles wide at the 6,000-foot contour level and quite possibly there is NO SKY TO BE SEEN at that level for 100 miles to the north, especially with Arnold looking down from 9200 feet. There is also NO SKY at 6,000 feet for birds to be seen against in crossing from Rainier to the Goat Rocks Wilderness because the Nisqually River has higher elevations in the foreground and background from Arnold's direction. At bird speeds of 30-50 mph tops, it would have taken BIRDS at least 18-30 MINUTES to CROSS THE FACE

OF MT. RAINIER, then to appear towards Goat Ridge to the east-southeast of the face. Even at the 9,000-foot level if you try to put the birds that high and abandon Arnold's "jagged peak" they flew behind, Rainier is still 5-1/2 miles across (from Ptarmigan Ridge to Anvil Rock) and it would take birds 7-11 MINUTES TO CROSS THE FACE OF MT. RAINIER to get over to Goat Ridge's direction. Moreover, with Arnold flying at about 120 mph eastward, the birds could NEVER ACTUALLY HAVE MADE IT across Mt. Rainier's face from his position in the aircraft. At some point the birds would actually APPEAR TO FLY BACKWARDS from Arnold's plane with respect to the Mt. Rainier background, as Arnold reached a point south-southwest or south of Rainier, overtaking them.

Brad

On my web site, there's a useful little map showing the relationship between the main landmarks in Arnold's story, i.e., Ashford, Mineral, Mt. Baker, Mt. Rainier, Mt. Adams and Yakima.

It looks like the graphic of Mt. Rainier may be attempting to show the relative position of Little Tahoma (Tacoma)

peak. See:

<http://web.ukonline.co.uk/voyager/rainier.gif>

Also worth noting are the following online images:

`View over the lower Emmons glacier toward Little Tahoma'

and `Yawning crevasse with Little Tahoma below':

<http://members.tripod.com/~Schryer/1998/rainier.html>

`Mt. Rainier, Washington':

<http://www.geocities.com/Yosemite/1985/rainier.html>

Including, `View of Mt. Rainier from the Goat Rocks
Wilderness'.

An `Armchair Tour of Mount Rainier' [click on any
highlighted `tour stop' for probably the best selection of
photographs]:

[http://vulcan.wr.usgs.gov/Volcanoes/Rainier/ArmchairTour/fr
amework.html](http://vulcan.wr.usgs.gov/Volcanoes/Rainier/ArmchairTour/frame-work.html)

Taken from Goat Rock, there's a terrific panoramic view
showing both Mt. Adams and Mt Rainier at:

<http://www.halcyon.com/cliffsan/goatrocks/goatpan.html>

If I'm not mistake, 'Little Tahoma (or Tacoma)' can be prominently seen here, on the eastern slope of Mt. Rainier.

Further information about Goat Ridge, which is located in the 'Goat Rocks Wilderness' can be found at:

http://www.fs.fed.us/gpnf/trails/nsc/n_00095.htm

http://svinet2.fs.fed.us/gpnf/wilderness/wi_grock.htm

It's confirmed, "A 105,600-acre alpine wonderland, the Goat Rocks Wilderness is a portion of the volcanic Cascade Mountain Range in southwestern Washington between Mount Rainier and Mount Adams. The Goat Rocks are remnants of a large volcano, extinct for some two million years. This ancient volcano once towered over the landscape at more than 12,000 feet in elevation, but has since eroded into several peaks averaging around 8,000 feet".

I've located Goat Rocks and specifically Goat Ridge in a detailed USGS topographic map and the bookmark is:

Well, yes.... if the birds had been as far away as Mt. Rainier, it would
have taken them
many minutes to cross the face. However, it makes no sense to talk about
\
Arnold seeing birds 20 some miles away (if visible at all they would be
dots).

However, 5 miles at 20 miles is angularly equivalent to about 0.5 miles at
2 miles (acceptable bird distance?) and the birds could fly half a mile
in several minutes.

It is true that at some point Arnold would have crossed the flight path or
the birds
if he was flying east as they were flying south. If he crossed before
they arrived then
the sighting line to them would rotate around to his left. If he crossed
after they passed the crossing "point" then his sighting line would have

rapidly rotated wround to the right. In either case his last view of them would have been BEHIND (him) as he would have left them in the dust (atmospheric dust, of course)

- > It is difficult for me to imagine that he wouldn't mention the objects
- > disappearing
- > behind Mt . Rainier if they did so (and then h wouldn't know where they were
- > going
- > until the first reappeared.)

COMMENTS: Point (1) of my 7 Points posted the other day is that Arnold DID say they "disappeared behind Mt. Rainier." He told the Chicago Tribune in his SECOND KNOWN INTERVIEW after his landing that, the afternoon of June 25, 1947: "I counted nine of them as they DISAPPEARED BEHIND the peak of Mount Ranier [Rainier]."

- > On the other hand, it is not difficult for me to believe that Arnold didn't
- > consider
- > it important to explicitly state that h saw them travel past Rainier on his
- > side of the
- > mountain

COMMENTS: I addressed this point before you even wrote this and it's in my posting quoted above this. I wrote:

- > This strange lapse on Arnold's part can't be excused on the basis that
- > nothing important happened while the objects supposedly crossed the front of
- > Rainier because this CLOSEST distance SHOULD have been when Arnold saw MOST
- > CLEARLY the SHAPES of the objects and therefore SHOULD be when he gives his
- > MOST DETAILED DESCRIPTION, the importance of which he and indeed the nation [stressed so much -- if indeed he really saw this in front of Rainier].

- because I believe Arnold assumed that any reader/listener to his
- > story would logically INFER the truth (that the objects passed on the west
 - > side)
 - > from Arnold's statements abou seeing them against the snow, about them
 - > being
 - > on the west side, etc.

COMMENTS: You're trying to make excuses for why Arnold NEVER ONCE in 30+ years gave an orderly, sequential account of seeing the flash, then seeing the objects approach Mt. Rainier in a straight line, and then seeing the objects cross over in front of Mt. Rainier (if they did) where he should have gotten his best look at them from the closest distance. All his statements about seeing the objects on the west of the mountain, seeing their shapes as supposedly seen against the snow, etc., come from LATER AFTERTHOUGHTS and DIGRESSIONS in every single blasted one of his

accounts! He tells us they "APPROACHED" the "north edge" of Mt. Rainier but then doesn't take the next step of saying they passed or crossed that very same "north edge."

It's as if the passage of Mt. Rainier was a BLANK GAP in his story because the objects had DISAPPEARED BEHIND the mountain. He rambles around later trying to fill the awkward gap retroactively.

I think his statement about "disappearing behind"

- > Mt. Rainier was
- > actually a confusion of the main mountain with whatever smaller peak he
- > claimed
- > to have seen them pass behind,

COMMENTS: You're admitting Arnold suffered from "confusion" in this aspect of his story. I would contend the confusion was in a different sense.

- > I still think this is making an Extinct Volcano out of a Mole Hill.
- >
- > At any rate, I don't see what we could do about it now. Only one person was
- > there...
- > Arnold... and all we have to go on is what he said about it.... whether or
- > not
- > it makes complete and logical sense.
- > As I have said before, one is offered the choice of deciding the report is
- > so
- > replete with "errors" as not to warrant careful analysis,

COMMENTS: Actually I think we're making progress in understanding the event by minutely analyzing it -- which is the OPPOSITE of DISCARDING it as not worth analyzing as you like to point out Project Grudge did in 1949.

or one can take

- > more or less at face value what Arnold said.

COMMENTS: The problem is WHICH story of Arnold's should we take at "face value"? :) Behind the mountain or in front? A 180 or 360 turn over Mineral? First seen in front of the mountain or first seen far to the north? First thought geese or first thought an aircraft in near-collision? Clocked with a stop watch, wristwatch or his instrument panel clock? Saucer-shaped, or bat-shaped, or tadpole-shaped, or wraith-like, or a half moon? Above the ridge or swerving in and out? At 9,000 feet, or 9,500, or 10,000, or perhaps 6,000 feet? Constant elevation or climbing? Flying towards Mt. Rainier, or Yakima, or Goat Ridge? Flying parallel to the objects or at right angles? Continued his search for the crashed C-46 for 15-20 minutes after the sighting or

dropped it in his excitement and eagerness to report? He changed his story a lot and that should tell us something.

I can't resolve these contradictions by using Arnold's statements "at face value" because there are "face value" statements for all of them. But I think I can resolve most, if not eventually all, of them by careful ANALYSIS such as we've been doing here.

- > It is amusing to imagine how the "disappears behind Mt. Rainier"
- > interpretation
- > would "blow up" the pelican explanation.

COMMENTS: Exactly my point in beginning this whole line of argument. Birds would be invisible at such a distance (23+ miles).

- > However, if one assumes that they did not pass behind Rainier but
- > nevertheless passed behind SOMETHING (some peak) as ARnold's
- > statement implies, then once again the "pelicanization" of Arnold's
- > sighting
- > is for the birds.

COMMENTS: Though closer, birds would still be essentially invisible at this distance (roughly 15 miles).

- > For those pelicanists out there slavering over this nitpicking I again
- > issue the eternal challenge:
- >
- > DRAW A MAP showing the track of th pelicans and the track of Arnold's
- > plane and convince me that it could have appeared to him as if the
- > pelicans were first seen far to the north of rainier and last seen passing
- > Mt. Adams, while he flew merily along at about 100 mph.

COMMENTS: Arnold's speed with the 22 mph tail wind from 300 was about 120 mph.

But the bird theorists need birds speeding along at 300+ mph in order to cross the face of Mt. Rainier in 3 minutes or less at 6,000 feet (or at nearly Arnold's speed, 110 mph, if at Rainier's narrower 9,000-foot level).

Subject: Arnold/Light OutputStatus:

Bruce,

Thank you for this excellent analysis. However you lost me when you used "E" for both powers of ten notation and for $E = I/R^2$ where E is the "illuminance on the surface" ($2E4 \text{ lm/m}^2$).

Brad

Brad,

So far as I was aware, Arnold deduced a 170 degree heading at the time, not afterwards. That's what he says in the 3 main documented sources - interview, letter and book, respectively:

"Well, as the planes come to the edge of Mt. Rainier flying at about 160 degrees south, I thought I would clock them..."

"I observed a chain of nine peculiar looking aircraft flying from north to south at approximately 9,500 foot elevation and going, seemingly, in a definite direction of about 170 degrees".

"I could see the formation was going to pass directly in front of me, as it was flying at approximately 170 degrees".

>As for Arnold's alleged statements saying the objects flew in
>front of Rainier I will just note that these exact statements
>were defective in other ways besides the passing-in-front which
>suggest gross error all around.

Evan accepted as a fundamental acknowledgement, that's still an understatement and a half.

It's a sweeping dismissal of Arnold's testimony, from the time of that formative radio interview right through to the 'UFO symposium', i.e., again respectively:

"I could see them against the snow, of course, on Mt. Rainier..."

"Very shortly they approached Mt. Rainier, and I observed their outline against the snow quite plainly".

"I watched as these objects rapidly neared the snow border of

Mount Rainier...

I observed the objects' outlines plainly as they flipped and flashed along against the snow and also against the sky".

"However, in getting a look at them against the sky and against the snow of Mt. Rainier as they approached. I just couldn't discern any tails on them..."

In order for Arnold to have fantasised a recollection to this extent, he would be an alarmingly unreliable witness. Where do you draw that line?

It also doesn't answer the central question of why he would have referred to those objects "disappearing from my sight momentarily behind a jagged peak", when they simply must already have been out of sight behind the mountain.

That makes no sense.

What Arnold clearly portrays is a situation where the objects were perceived to be lost from sight behind a landmark and only briefly.

Also, where's the logic in Arnold discussing with McDonald which 'peak' it was, yet never clarifying the objects actually travelled behind the mountain and the candidates being suggested were impossible.

That makes no sense either.

Aside from which, Arnold's apparent confirmation that the objects flew westwards between his location and Mt. Rainier has previously been taken as important evidence substantiating his extraordinary tale. For example, as Bruce Maccabee stated in his 1986 MUFON presentation on this case, "He watched the flashing objects closely and, as they flew past Mt. Rainier, he determined from their silhouettes against the snow that they had a generally crescent shape".

Of the two options which had become evident, can you really be comfortable with a scenario which depicts Arnold as it does. The alternative - that it's not possible to reconcile his stated perceptions with the factual possibilities - may be unpalatable, however, is it any more so than dismissing what is undeniably consistent witness testimony?

>By the way, speaking of crossing in front of Mt. Rainier at
>about the 6,000-foot level of the "jagged peaks" in FRONT of

>Rainier that you are forced to accept, your birds have a major
>and severe problem here:

Comments noted; I suspect our large, reflective, echelon formation birds, comprehensively proven to resemble key aspects of Arnold's stated and distinctive flight characteristics (plus having a nearby, contemporary documented sighting of nine such artefacts mistaken for 'flying discs', already 'in the bag'), are content to sit this out for the moment. ;)

First of all, what has to be resolved to support any premise that Arnold's nine artefacts were probably/possibly not terrestrial, is some consistency in agreeing the actual occurrence which is to be 'challenged'.

There's a further question re Arnold's claims about those reflections being so bright, a story which seems to have grown in the telling. In the radio interview conducted just afterwards, he stated:

"I was approximately 25 to 28 miles from Mt. Rainier, I climbed back up to 9200 feet and I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier. I, at first, thought they were geese because it flew like geese, but it was going so fast that I immediately changed my mind and decided it was a bunch of new jet planes in formation".

Curiously, Arnold doesn't mention anything about a 'brilliant flash', however, he does initially confirm a critical aspect which has still to be addressed. It's also mentioned in other sources that at first he considered the nine objects to be geese, although, just perhaps crucially, clearly never realising that there were other, eminently more suitable candidates.

Arnold only changed his mind about birds due to the objects' apparent airspeed and, according to a newspaper report, because it wouldn't make sense for birds to be flying south at that time of year (which would be mistaken).

If, as later recounted, the flash(es) of light 'lit up his aircraft' and from a distance of over a hundred miles (I don't think so) etc., then why would he ever have surmised the nine objects might be geese?

Can we perhaps deduce that either, Arnold attributed exceptional reflective capabilities to geese, or the reflections were, in fact, not inconsistent with birds.

James.

Subject: REBUTTAL/Kenneth Arnold and Kottmeyer
Status:

James,

My COMMENTS in response (below). But let me point out that you completely dodge my conveniently numbered 7 Points of evidence that Arnold's objects passed BEHIND Mt. Rainier which now can be extended to 8 or 9 Points. You answer a few without referring to the numbering which would reveal that you are evading the others. So let me repeat my points as extended and slightly reordered:

EVIDENCE THAT ARNOLD'S OBJECTS PASSED BEHIND MT. RAINIER

- (1) EARLY INTERVIEW: Arnold stated in his second known and second earliest interview, with the Chicago Tribune on the afternoon of June 25, 1947: "I counted nine of them as they DISAPPEARED BEHIND the peak of Mount Ranier [Rainier]."
- (2) ARNOLD DRAWING: Arnold's ONLY KNOWN drawing of the objects' flight path shows them coming out from BEHIND Rainier's south edge and NEVER CROSSING IN FRONT, using two different standard artistic conventions (short light line showing path behind mountain, then line curved from behind away from mountain). (See IUR cover Mar/Apr 95.) The drawing was probably done in late June 1947.
- (3) OTHER ARNOLD STATEMENTS: Other statements by Arnold also mention a disappearance behind a specific jagged "peak" or "cleft" of Rainier which appears to have been Rainier's most prominent subsidiary peak, the well-known 11,000-foot Little Tahoma Peak two miles east of Rainier's summit, since McDonald, Kottmeyer, Maccabee and others could not find a suitable 9,000+ ft peak in the SW FRONT of Rainier fitting the 9,000-10,000-foot altitude of the objects, but only minor 6,000-foot peaks.
- (4) DISTANCE: Arnold's BEST ESTIMATE of the distance to the objects was 23 miles and from a position several miles east of Mineral, Wash., where he was roughly 15 miles from the peak of Mt. Rainier. Thus the objects must have been about 8 miles BEHIND Rainier's peak or 6 miles BEHIND Little Tahoma.
- (5) FRONT = WRONG HEADING: A flight path by the objects on the west side of Rainier, passing in FRONT of the SW slopes, would have to head at 125 degs or less to reach Goat Ridge, contrary to Arnold's 170-deg course plotted on his map. An experienced mountain pilot such as Arnold would instantly spot such an enormous 45 degree angle difference.
- (6) BEHIND = RIGHT HEADING: A flight path of the objects BEHIND Rainier, on the east side, some 6 miles behind Little Tahoma, would head on a course of 170 degrees to reach Goat Ridge -- exactly in agreement with Arnold's 170-degree course for the objects.

(7) SLAMMING INTO RAINIER: The objects could not fly on a 170 heading and between the 6,000 foot peaks on the southwestern FRONT slope of Rainier without slamming into the 8,000-9,000-foot level of Rainier first.

(8) STRANGE GAP IN STORY: Arnold NEVER once tells his story of seeing the objects to the north of Mt. Rainier, then approaching in a line to Rainier, then CROSSING in FRONT of Rainier, and then observing the objects' peculiar SHAPES from this CLOSEST DISTANCE, as one would logically expect. Arnold gets to the point of "APPROACHING the north edge of Rainier" and then fails to have the objects cross in front. He later has afterthoughts and digressions about objects in front and seeing their shapes but not in chronological narrative order.

(9) NO SKY BACKGROUND IF IN FRONT: If Arnold's objects flew behind some minor 6,000-foot bump in the FRONT slopes of Mt. Rainier his depression angle from his plane at 9,200+ feet would prevent him from EVER seeing the objects against the SKY at that altitude, even though Arnold reported seeing the objects against the sky both before and after Mt. Rainier. This is contrary to Arnold's accounts and his only known DRAWING of the objects' flight path.

(10) NO "CLOCKING" POSSIBLE IF IN FRONT: If Arnold's objects flew behind some minor 6,000-foot bump in the FRONT slopes of Mt. Rainier his depression angle from his plane would not only prevent him from seeing the objects against the SKY but by doing so would also have prevented him from seeing a SKY edge of Mt. Rainier to BEGIN HIS FAMOUS "CLOCKING" of the objects' speed. This clashes with all of Arnold's accounts and his only known DRAWING of the flight path.

>less. That's 45 degrees off.

Brad,

Yes, Arnold may not have been accurate in his perceptions.

COMMENTS: I'm not talking about Arnold's PERCEPTIONS of an exact 170 heading but his MAPPING of a 170 heading for the objects as he labored over his aeronautical charts moments after he landed and in the days and weeks to come. I'm trying to determine what he THOUGHT was the objects' flight path from Mt. Rainier to Mt. Adams over which he did his famous timing which in turn was the subject of nationwide controversy and in the headlines everywhere. We KNOW from numerous accounts that Arnold went over these maps exhaustively and considered every possibility even those he knew to be WRONG (measuring from the "very base" of the mountains "far below the snow line") in order to test the strength of his calculations. I won't belabor you with long boring quotations of Arnold recounting this as you know what I'm talking about.

When Arnold drew the line for the objects' flight path on his aeronautical sectional chart, running from Mt. Rainier to Goat Ridge to Mt. Adams, in order to measure his famous 47-mile speed course, as an experienced mountain pilot whose life depended on ACCURATELY PLOTTING COURSES through treacherous mountains, he would have seen instantly by "eyeballing" it the difference between a 170 course from BEHIND Rainier/Little Tahoma heading and a 125 course from in FRONT of Rainier near Pyramid Peak. It's a 45 degree angle difference. Arnold would not even have to measure it to see that it was way off by 45 degrees.

And another problem mentioned in my last posting is that a 125 heading from in FRONT of Rainier near some 6,000-foot stub has NO STARTING POINT for his "clocking." There is NO EDGE of Rainier with the SKY at that level as there IS NO SKY at that height from Arnold's altitude. The terrain merges into jumbled features that continue without a sky break. This is contrary to Arnold's accounts and his only known DRAWING of the objects' flight path.

And finally, if the objects were down so low at 6,000 feet then Arnold at 9,200 feet (or more) would have about a 3-degree DEPRESSION ANGLE looking down on them and against increasingly lower and lower terrain levels. He would NEVER HAVE ANY SKY as background to the objects at that angle looking in ANY DIRECTION WHATSOEVER, north, south, east or west. And the closer he was (i.e., if to birds) the steeper the angle would be. This is contrary to Arnold's accounts and his only known DRAWING of the flight path. Think about it!

[Easton]

We are dealing with an extraordinary claim and the most likely,

rational explanations have to be eliminated first of all.

Noting all of your comments, some responses:

>Let's just have a simple statement by Arnold at ANY TIME like
>this: "After they crossed Mt. Rainier's north edge and passed in
>front of the mountain I could see they were to the west of Mt.
>Rainier."

Assuming the verbatim accounts and the earliest ones are most reliable, if we recap what Arnold said in that early radio interview:

"...I was approximately 25 to 28 miles from Mt. Rainier, I climbed back up to 9200 feet and I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier. I, at first, thought they were geese because it flew like geese, but it was going so fast that I immediately changed my mind and decided it was a bunch of new jet planes in formation. Well, as the planes come to the edge of Mt. Rainier flying at about 160 degrees south, I thought I would clock them..."

Clearly from this, the nine objects passed "across the face of Mt. Rainier".

COMMENTS: This radio interview account is already seriously contradictory of Arnold's other statements before and after in that he puts his first sighting of the objects as already "across the face of Mt. Rainier" and NOT to the north of Rainier. Obviously then he doesn't recount seeing the objects to the north of Rainier and then passing the north edge in front of the mountain. I am going to repeat my draft of the "simple statement" that we NEVER read from Arnold in any form:

>Let's just have a simple statement by Arnold at ANY TIME like
>this: "After they crossed Mt. Rainier's north edge and passed in
>front of the mountain I could see they were to the west of Mt.
>Rainier."

By the way, birds don't go at "terrific speed."

[Easton]

I had considered that even if the objects had gone behind, they would still strictly have 'crossed the face' of Mt. Rainier, however, Arnold surely wouldn't have described events as he does unless he meant their path was in front of the mountain.

In which case, I would have to take this as the definitive

clarification and confirmation.

COMMENTS: Not definitive when so totally contradictory to Arnold's other statements both as to seeing the objects "DISAPPEARING BEHIND the peak" of Mt. Rainier (Chicago Tribune the DAY BEFORE the KWRC radio interview) and as to WHEN HE FIRST SAW THEM (in most other statements he says he FIRST saw them far to the north of Mt. Rainier up towards Mt. Baker, etc., and didn't FIRST see them supposedly crossing the face of Rainier). And if a picture is worth a thousand words then Arnold's DRAWING of apparently late June 1947 showing NO CROSSING IN FRONT, but objects coming out from BEHIND, also flatly contradicts this interpretation.

[Easton]

Arnold also noted in his interview, "I could see them against the snow, of course, on Mt. Rainier".

COMMENTS: As I posted yesterday, Arnold reported seeing "IMAGES" of the objects "against the snow" or somehow seeing them against the snow when only "approaching" the mountain and not in front, indicating that what he was seeing was "IMAGE" REFLECTIONS of the objects' intense FLASHES from off the FRONTAL glacier faces of Mt. Rainier, which your web links say has something like 68 glaciers in all.

[Easton]

Supporting evidence comes from the following:

"The Boise flyer said they flew on the west sides of Rainier and Adams, adding that he believed this would make it more difficult for them to be seen from the ground".

['Pendleton, Oregon East Oregonian', June 26]

COMMENTS: This is newspaper's HEARSAY PARAPHRASE and NOT a DIRECT QUOTE of Arnold. This is directly contradicted by Arnold in DIRECT QUOTE on the SAME AFTERNOON as the Pendleton East Oregonian interview, when in his second earliest known interview he told the Chicago Tribune, "I counted nine of them as they DISAPPEARED BEHIND the peak of Mt. Ranier [Rainier]."

Again, if a picture is worth a thousand words then Arnold's DRAWING of apparently late June 1947 showing NO CROSSING IN FRONT, but objects coming out from BEHIND, also flatly contradicts this hearsay paraphrasing.

[Easton]

"Arnold said the strange aircraft were skittering across the

southwest slope of Mount Rainier when he first sighted them".

['Norman, Oklahoma Transcript', June 26]

"Arnold, general manager and owner of the Great Western Fire Control Company, said he first saw the objects when they flashed in the sun low over the slopes of Mt. Rainier".

['Oregon Journal', June 27, 1947]

COMMENTS: Again these news stories patently contradict most other Arnold accounts that he FIRST sighted the objects far to the north of Rainier and that they were at a high altitude of 9,000 to 10,000 feet, not "LOW over the slopes." And these again are newspapers' HEARSAY PARAPHRASES and NOT DIRECT QUOTES of Arnold. These are directly contradicted by Arnold in DIRECT QUOTE 1-2 DAYS BEFORE the UP dispatch (printed in the Oklahoma paper) and the AP dispatch (printed in the Portland paper), when in his second earliest known interview he told the Chicago Tribune he counted the objects as they "DISAPPEARED BEHIND the peak of Mt. Ranier [Rainier]."

Once again, Arnold's DRAWING of apparently late June 1947 showing NO CROSSING IN FRONT, but objects coming out from BEHIND, also flatly contradicts these hearsay paraphrasings.

[Easton]

Also, in his letter to the Air Force Arnold stated, "These objects being quite far away, I was unable for a few seconds to make out their shape or their formation. Very shortly they approached Mt. Rainier, and I observed their outline against the snow quite plainly".

COMMENTS: I've already covered this in my comments on "IMAGE" REFLECTIONS and the STRANGE GAP in Arnold's account (see above).

>COMMENTS: McDonald suggested to Arnold in Nov 1966 a peak on
>the SW slope of Rainier and went through several possibilities
>by mail and over the phone, namely Pyramid Peak (6937 ft),
>Crystal Mtn. (6306 ft), and Iron Mtn. (6283 ft), but rejected
>them all because they were too low. Arnold was not sure it was
>on the SW slope either, only that it "probably" was. McDonald
>suggested lower altitudes to Arnold but apparently Arnold didn't
>agree and McDonald summarized the data later as the objects
>flying at 9,000 feet and CLIMBING still higher to 13,000 feet --
>a new detail from Arnold never before pinned down (climbing was
>briefly mentioned before by Arnold, but clashed with other
>statements of constant elevation which McDonald mentioned to

>him).

What may be crucial is determining the height of those Goat Ridge peaks. Arnold detailed how the nine objects appeared to frequently go _down_ into the canyons there.

COMMENTS: Please note my previous correction that “Crystal Mtn.” Is a MAP ERROR and NONEXISTENT as a 6,306-foot peak.

Here you are suggesting what is “crucial” is that the height of Goat Ridge is about the same as the height of the objects before they reached Goat Ridge, when they were near Mt. Rainier, based on Arnold insisting the objects maintained constant, level height (or constant till starting to climb).

Goat Ridge is at roughly 5,000 to 7,000 feet, which is much too low. My Points 9 and 10 directly contradict the notion that the objects could have dipped down so low in among the peaks of Goat Ridge, and my Points 3 and 7 indirectly argue against such low altitudes for the objects. If the objects were at 6,000 feet and maintained only constant (or even increasing) altitude throughout the sighting as Arnold insisted then Arnold could NEVER have seen them against a SKY background and never have seen them cross Rainier’s edge into the SKY so he could TIME their flight.

Most importantly, Arnold’s one and only DRAWING of the scene shows the objects’ flight path HIGH ABOVE Goat Ridge (unmistakably identified by a “5 mi” length marking) and clearly marked as at 10,000 feet altitude. This would be 3,000 to 5,000 feet ABOVE Goat Ridge. Arnold’s drawing does not even come close to having the objects’ near the top of Goat Ridge.

[Easton]

I believe we will find there's unequivocal evidence that the objects never climbed as McDonald suggested.

COMMENTS: It was ARNOLD who STATED to McDonald that the objects climbed from 9,000 to 13,000 feet, not some “suggestion” by McDonald on his own. McDonald spent a lot of time and effort trying to FORCE Arnold DOWN on the altitude, without success. Arnold mentioned the climb in previous accounts.

What is this “unequivocal evidence”?

[Easton]

The 'peak' which these objects disappeared behind is, so far as I'm aware, detailed only in Arnold's book:

COMMENTS: Arnold also details this peak in his 1977 Fate lecture transcribed recently by Bruce as you’ve seen posted here (but also published by Fate in 1980 in edited version): “...actually they disappeared behind a sharp projection on Mt. Rainier in the snow field to my eyesight.”

And in your quote from Arnold's 1952 book (below) you miss entirely his earlier reference several paragraphs before where he says he STARTED his CLOCKING "when the first craft of this formation jetted to the southward from the SNOW-BASED CLEFT of Mount Rainier." This indicates that the peak was on the RIGHT EDGE of Rainier and NOT in the MIDDLE FRONT of the mountain.

[Easton quoting Arnold]

"Even though they had a constant direction they swerved in and out of the high mountain peaks which are found on the hogsback of the Cascade mountains between Mount Rainier and Mount Adams. I determined my distance from their pathway to be in the vicinity of twenty-three miles because I knew where I was and they revealed their true position by disappearing from my sight momentarily behind a jagged peak that juts out from the base of Mount Rainier proper".

As now seems evident, this could not have been 'Little Tahoma' if the objects flew on the mountain's western side. Also, surely 'Little Tahoma' isn't a peak which 'juts out from the base of Mount Rainier proper', it's high up on the mountain. This is appreciably inconsistent.

COMMENTS: You dodged my original 7 Points against the objects flying on the west or FRONT side of Rainier When Arnold referred to the "jagged peak" or "snow-BASED cleft" of Rainier in his 1952 book he was evidently referring to the "plateau" from which Rainier's summit rises, at about 9,000+ feet, the same plateau he searched for the downed Marine C-46 minutes before his sighting. As you've now recognized after researching Rainier and its environs, Little Tahoma is the most prominent secondary peak jutting out from Rainier's base.

[Easton]

Is there maybe a clue in the other published and important source of Arnold's reference to a 'peak', Bill Bequette's newspaper report:

"He said he could estimate the distance of the objects better because an intervening peak once blocked his view of them. He found the peak was 25 miles away, he related".

This isn't verbatim,

COMMENTS: That's right, it's not a direct quote but a newspaperman's rushed first interview and constitutes HEARSAY PARAPHRASE.

[Easton]

however if it was an _intervening_ peak and

the objects, as seems definite, flew on the western side, then it must have been between Arnold and the mountain.

COMMENTS: This reporter's hearsay paraphrase is ambiguous and his word choice "intervening" is never used by Arnold himself. Was the peak "intervening" between RAINIER and Arnold, or between the OBJECTS and Arnold? Again, I have 10 Points against this interpretation.

[Easton]

There's a fundamental point here; to use any visible peak as a relatively accurate distance marker, Arnold absolutely must have known where this landmark was approximately located. It's not permissible that, at the time, Arnold estimated the distance based on a 'peak' which only afterwards he 'found' was 'x' miles away.

Whilst we can accept he had forgotten, surprising to learn from the interesting addition - which I've seen for the first time - of McDonald's discussion with Arnold about it's location, that Arnold was comprehensively unable to identify this landmark.

Considering further, why would a peak actually have been of help; if these objects flew behind the mountain, then he would know for certain their approximate distance was at least further than the mountain and the fact they then also went behind a peak on the mountain wouldn't really tell him any more.

COMMENTS: Little Tahoma was 2 miles FURTHER BEHIND Rainier's summit so it would set the lower limit of the distance.

[Easton]

Arnold relates how he perceived the objects 'disappeared momentarily' behind a jagged peak. If they had flown behind Mt. Rainier and this carried them beyond 'Little Tahoma', nothing would have been so fleeting, the objects would already have been out of sight for a time behind the mountain.

COMMENTS: There is an obvious GAP between Rainier's summit and Little Tahoma with a saddle in between. The objects must have REAPPEARED in the gap then disappeared again behind Little Tahoma. I already mentioned this in an earlier posting.

[Easton]

There's considerable evidence why the path of those nine objects was between Arnold and Mt. Rainier and the 'peak' must therefore have been located somewhere in-between, perhaps on the base of Mt Rainier as he said.

COMMENTS: There are 10 maybe now 11 Points against this interpretation.

[Easton]

Reiterating...

>Let's just have a simple statement by Arnold at ANY TIME like
>this: "After they crossed Mt. Rainier's north edge and passed in
>front of the mountain I could see they were to the west of Mt.
>Rainier."

Now we have the transcript of Arnold's conference speech, he recalls, "When they approached Mt. Rainier's north edge, I could see they were to the west of Mt. Rainier, to me, which was a very good observation from my standpoint...".

COMMENTS: Re-read what I wrote. The Fate conference quote says nothing about "AFTER" crossing Rainier's north edge and incongruously asserts that when they were merely "APPROACHING" the "north edge" he could see they were to the West or FRONT of Rainier which is impossible. They had to have PASSED IN FRONT of the mountain for him to see that, not merely been "APPROACHING." I've made this point before and it's wearisome to have to repeat it. This is where Arnold himself talks about approaching the "north edge" of Rainier but then never says the objects crossed that edge. Again I have 10 or 11 Points against this, including Arnold's DRAWING, etc.

[Easton]

Here we have a literal confirmation they were to the west when approaching Mt. Rainier's north edge and we also have several references which indicates they must have passed across the western face. If "to the west of Mt. Rainier" as "they approached Mt. Rainier's north edge", how could they have travelled east, behind the mountain and their flight path have been so direct as Arnold claimed?

COMMENTS: See above. Arnold's statement is literally incongruous or impossible.

>Arnold's only known drawing of the objects' flight path shows
>them coming out from BEHIND Rainier's south edge and never
>crossing in front (see IUR cover Mar/Apr 95). The drawing was
>probably done in late June 1.

Arnold's sketch is unfortunately ambiguous. You could say that he's depicting the line of flight originating behind Mt. Rainier, however, it could be seen as indicating the path from Mt. Rainier. That's what was significant - Arnold is illustrating the

factors which led to his calculation of airspeed. At the bottom right, he notes the time taken to travel from "A-B", as Arnold perceived matters, was "1:42".

COMMENTS: If Arnold was merely showing A-B the “clocking” course then he wouldn’t have lines indicating the objects came from BEHIND Rainier, BEFORE he STARTED CLOCKING. Also, marking the objects’ 10,000-foot altitude and the 5-mile length of Goat Ridge were irrelevant to his clocking, yet he marked them anyway, so he was not limiting his drawing to an explanation of the clocking.

[Easton]

The smaller 'peak' which is apparently drawn by Arnold - to the south of Mt. Rainier - could that be Arnold attempting to show the relative position of our illusive peak?

COMMENTS: Possibly. But it is well below the level of the objects, though perhaps he didn’t intend to draw it to scale and proper relation vertically. It does resemble Little Tahoma and it’s on the RIGHT EDGE which is totally inconsistent with Pyramid Peak etc. in the MIDDLE FRONT of Rainier.

[Easton]

Although I understand and do appreciate why you consider 'they'll be coming 'round the mountain' - and as we know Arnold was quoted (how accurately we don't know) as saying so - the overall evidence unquestionably indicates otherwise.

Conversely, how do you explain all that evidence away?

COMMENTS: See above and see my 10 Points.

[Easton]

We eventually have to reach a conclusion and there's apparently only two options; either Arnold believed the nine objects took a pathway behind Mt. Rainier and all his contrary references have to be rationalised before being discarded, or, they are the accurate scenario and proof that his altitude estimates were incorrect. Maybe more than just that.

COMMENTS: You are admitting that the FRONTAL scenario requires that Arnold’s high altitude estimates be incorrect and the low altitude 6,000-foot level must be correct. Then Arnold would NEVER SEE SKY and NEVER SEE A RAINIER EDGE for his clocking, etc. See my 10 Points.

>Even better if he could identify the features on Rainier the

>objects supposedly passed. The fact he NEVER says this is very
>strange. He is the one who chose to discuss "north edges" of
>mountains -- but only in regards to the "approach" of the
>objects, not their passage, and that is quite peculiar. It
>suggests that he got confused as to the events from that point
>on so he would leave the sequence vague and digress a lot
>haphazardly.

The answer may be that this phase was of minor importance. It's what happened from the time he clocked the objects - that's the aspect everyone had focused on.

COMMENTS: I refute this "minor importance" notion in my next paragraph you respond to (below). This phase had to be of MAJOR IMPORTANCE for seeing the objects' SHAPES at CLOSEST APPROACH.

[Easton]

Picking up on a response to Bruce, you wrote:

>This strange lapse on Arnold's part can't be excused on the
>basis that nothing important happened while the objects
>supposedly crossed the front of Rainier because this CLOSEST
>distance SHOULD have been when Arnold saw MOST CLEARLY the
>SHAPES of the objects and therefore SHOULD be when he gives his
>MOST DETAILED DESCRIPTION, the importance of which he and indeed
>the nation stressed so much -- if indeed he really saw this in
>front of Rainier (he vaguely suggests the sky, Goat Ridge and
>Mt. Adams for this crucially important observation in the
>various accounts).

What about Arnold's statement in his letter to the Air Force:

"I am making a drawing to the best of my ability, which I am including, as to the shape I observed these objects to be as they passed the snow covered ridges as well as Mt. Rainier".

Could this be taken as the confirmation you're querying?

COMMENTS: Arnold literally says "PASSED" the ridges and Mt. Rainier NOT "PASSED IN FRONT OF." Can't he just make the simple statement? The objects could "pass" ABOVE or BEHIND too, and in fact they DID.

[Easton]

Some helpful photographs of Mt. Rainier can be found at:

30 fire balloons were sent up in the evening on December 3, 1966,
one at a time (although several were simultaneously in the air at
times).

<

Neither Don Berliner's list of unexplained Blue Book sightings
nor Larry Hatch's collection of over 16000 sightings has anything
for Dec 3, 1966 in California or anywhere else.

However, both of these are selected lists... high strangeness,
"above average" probability of being unexplained.
The more complete CUFOS catalogue or the complete Blue Book
catalogue might have something (with some suggested explanation).

Anyone have access to either of those?

@Subject: REBUTTAL/Kenneth Arnold and Kottmeyer

@
@James,

@My COMMENTS in response (below). But let me point out that you
@completely dodge my conveniently numbered 7 Points of evidence
@that Arnold's objects passed BEHIND Mt. Rainier which now can be
@extended to 8 or 9 Points. You answer a few without referring
@to the numbering which would reveal that you are evading the
@others. So let me repeat my points as extended and slightly
@reordered:

@EVIDENCE THAT ARNOLD'S OBJECTS PASSED BEHIND MT. RAINIER

@(1) EARLY INTERVIEW: Arnold stated in his second known and
@second earliest interview, with the Chicago Tribune on the
@afternoon of June 25, 1947: "I counted nine of them as they
@DISAPPEARED BEHIND the peak of Mount Ranier [Rainier]."

@(2) ARNOLD DRAWING: Arnold's ONLY KNOWN drawing of the
@objects' flight path shows them coming out from BEHIND Rainier's
@south edge and NEVER CROSSING IN FRONT, using two different
@standard artistic conventions (short light line showing path
@behind mountain, then line curved from behind away from
@mountain). (See IUR cover Mar/Apr 95.) The drawing was
@probably done in late June 1947.

I can't tell anything that critical from the crude drawing posted
(from the IUR cover). It looks like it had been hastily made on
an envelope resting on somebody's knee to me. The question
becomes: Why was the drawing made? Was it made to preserve the
sighting in Arnold's mind, or was it drawn to show someone else
the details of the sighting?

@(3) OTHER ARNOLD STATEMENTS: Other statements by Arnold also @mention a disappearance behind a specific jagged "peak" or @ "cleft" of Rainier which appears to have been Rainier's most @prominent subsidiary peak, the well-known 11,000-foot Little @Tahoma Peak two miles east of Rainier's summit, since McDonald, @Kottmeyer, Maccabee and others could not find a suitable 9,000+ @ft peak in the SW FRONT of Rainier fitting the 9,000-10,000-foot @altitude of the objects, but only minor 6,000-foot peaks.

@(4) DISTANCE: Arnold's BEST ESTIMATE of the distance to the @objects was 23 miles and from a position several miles east of @Mineral, Wash., where he was roughly 15 miles from the peak of @Mt. Rainier. Thus the objects must have been about 8 miles @BEHIND Rainier's peak or 6 miles BEHIND Little Tahoma.

This estimate was based on Arnold's guess that the objects were really aircraft. If the objects were not really in the size range of an airplane, then the estimate is worthless. But if the objects really did fly behind Little Tahoma, then that puts a lower bound on the distance.

Is it possible for pelicans to disappear while traversing in front of two mountains? Only if they present such a low contrast that they can't be seen.

@(5) FRONT = WRONG HEADING: A flight path by the objects on the @west side of Rainier, passing in FRONT of the SW slopes, would @have to head at 125 degs or less to reach Goat Ridge, contrary @to Arnold's 170-deg course plotted on his map. An experienced @mountain pilot such as Arnold would instantly spot such an @enormous 45 degree angle difference.

This is again assuming that the objects were AT the distance of Goat Ridge, and not closer. Which is then based on the assumption that the objects were aircraft-sized.

@(6) BEHIND = RIGHT HEADING: A flight path of the objects @BEHIND Rainier, on the east side, some 6 miles behind Little @Tahoma, would head on a course of 170 degrees to reach Goat @Ridge -- exactly in agreement with Arnold's 170-degree course @for the objects.

Ditto.

@(7) SLAMMING INTO RAINIER: The objects could not fly on a 170 @heading and between the 6,000 foot peaks on the southwestern @FRONT slope of Rainier without slamming into the @8,000-9,000-foot level of Rainier first.

@(8) STRANGE GAP IN STORY: Arnold NEVER once tells his story of

@seeing the objects to the north of Mt. Rainier, then approaching
@in a line to Rainier, then CROSSING in FRONT of Rainier, and
@then observing the objects' peculiar SHAPES from this CLOSEST
@DISTANCE, as one would logically expect. Arnold gets to the
@point of "APPROACHING the north edge of Rainier" and then fails
@to have the objects cross in front. He later has afterthoughts
@and digressions about objects in front and seeing their shapes
@but not in chronological narrative order.

Another possibility is that the objects presented a very low
contrast against the mountain, and were thus indistinct during
this period.

Another possibility is that Arnold couldn't keep his story
straight.

@(9) NO SKY BACKGROUND IF IN FRONT: If Arnold's objects fle
@behind some minor 6,000-foot bump in the FRONT slopes of Mt.
@Rainier his depression angle from his plane at 9,200+ feet would
@prevent him from EVER seeing the objects against the SKY at that
@altitude, even though Arnold reported seeing the objects against
@the sky both before and after Mt. Rainier. This is contrary to
@Arnold's accounts and his only known DRAWING of the objects'
@flight path.

@(10) NO "CLOCKING" POSSIBLE IF IN FRONT: If Arnold's objects
@flew behind some minor 6,000-foot bump in the FRONT slopes of
@Mt. Rainier his depression angle from his plane would not only
@prevent him from seeing the objects against the SKY but by doing
@so would also have prevented him from seeing a SKY edge of Mt.
@Rainier to BEGIN HIS FAMOUS "CLOCKING" of the objects' speed.
@This clashes with all of Arnold's accounts and his only known
@DRAWING of the flight path.

OOPS! How was Arnold able to START the clocking exactly when they
crossed the edge of the mountain if he couldn't SEE them until
they got there? Not only would he not know exactly where they
would come out from behind the mountain, he could not even know
that they WOULD come from behind it. So the clocking is
improbable if they went behind, because Arnold would be wondering
if they would reappear instead of getting ready to clock them.

@Supporting evidence comes from the following:

@ "The Boise flyer said they flew on the west sides of Rainier and
@Adams, adding that he believed this would make it more difficult
@for them to be seen from the ground".

@['Pendleton, Oregon East Oregonian', June 26]

@[Easton]

@ "Arnold said the strange aircraft were skittering across the
@ southwest slope of Mount Rainier when he first sighted them".

@['Norman, Oklahoma Transcript', June 26]

@ "Arnold, general manager and owner of the Great Western Fire
@ Control Company, said he first saw the objects when they flashed
@ in the sun low over the slopes of Mt. Rainier".

@['Oregon Journal', June 27, 1947]

@COMMENTS: Again these news stories patently contradict most
@ other Arnold accounts that he FIRST sighted the objects far to
@ the north of Rainier and that they were at a high altitude of
@ 9,000 to 10,000 feet, not "LOW over the slopes." And these again
@ are newspapers' HEARSAY PARAPHRASES and NOT DIRECT QUOTES of
@ Arnold. These are directly contradicted by Arnold in DIRECT
@ QUOTE 1-2 DAYS BEFORE the UP dispatch (printed in the Oklahoma
@ paper) and the AP dispatch (printed in the Portland paper), when
@ in his second earliest known interview he told the Chicago
@ Tribune he counted the objects as they "DISAPPEARED BEHIND the
@ peak of Mt. Ranier [Rainier]."

@Once again, Arnold's DRAWING of apparently late June 1947
@ showing NO CROSSING IN FRONT, but objects coming out from
@ BEHIND, also flatly contradicts these hearsay paraphrasings.

@[Easton]

@Also, in his letter to the Air Force Arnold stated, "These
@ objects being quite far away, I was unable for a few seconds to
@ make out their shape or their formation. Very shortly they
@ approached Mt. Rainier, and I observed their outline against the
@ snow quite plainly".

@COMMENTS: I've already covered this in my comments on "IMAGE"
@ REFLECTIONS and the STRANGE GAP in Arnold's account (see above).

@The 'peak' which these objects disappeared behind is, so far as
@ I'm aware, detailed only in Arnold's book:

@COMMENTS: Arnold also details this peak in his 1977 Fate
@ lecture transcribed recently by Bruce as you've seen posted here
@ (but also published by Fate in 1980 in edited version):
@ "...actually they disappeared behind a sharp projection on Mt.
@ Rainier in the snow field to my eyesight."

@And in your quote from Arnold's 1952 book (below) you miss
@ entirely his earlier reference several paragraphs before where

@he says he STARTED his CLOCKING “when the first craft of this
@formation jetted to the southward from the SNOW-BASED CLEFT of
@Mount Rainier.” This indicates that the peak was on the RIGHT
@EDGE of Rainier and NOT in the MIDDLE FRONT of the mountain.

@[Easton quoting Arnold]
@"Even though they had a constant direction they swerved in and
@out of the high mountain peaks which are found on the hogsback of
@the Cascade mountains between Mount Rainier and Mount Adams. I
@determined my distance from their pathway to be in the vicinity
@of twenty-three miles because I knew where I was and they
@revealed their true position by disappearing from my sight
@momentarily behind a jagged peak that juts out from the base of
@Mount Rainier proper".

@COMMENTS: There are 10 maybe now 11 Points against this interpretation.

@COMMENTS: If Arnold was merely showing A-B the “clocking”
@course then he wouldn’t have lines indicating the objects came
@from BEHIND Rainier, BEFORE he STARTED CLOCKING. Also, marking
@the objects’ 10,000-foot altitude and the 5-mile length of Goat
@Ridge were irrelevant to his clocking, yet he marked them
@anyway, so he was not limiting his drawing to an explanation of
@the clocking.

@[Easton]
@The smaller 'peak' which is apparently drawn by Arnold - to the
@south of Mt. Rainier - could that be Arnold attempting to show
@the relative position of our illusive peak?

@COMMENTS: Possibly. But it is well below the level of the
@objects, though perhaps he didn’t intend to draw it to scale and
@proper relation vertically. It does resemble Little Tahoma and
@it’s on the RIGHT EDGE which is totally inconsistent with
@Pyramid Peak etc. in the MIDDLE FRONT of Rainier.

@COMMENTS: I refute this “minor importance” notion in my next
@paragraph you respond to (below). This phase had to be of MAJOR
@IMPORTANCE for seeing the objects’ SHAPES at CLOSEST APPROACH.

@What about Arnold's statement in his letter to the Air Force:

@"I am making a drawing to the best of my ability, which I am
@including, as to the shape I observed these objects to be as they
@passed the snow covered ridges as well as Mt. Rainier".

@Could this be taken as the confirmation you're querying?

@COMMENTS: Arnold literally says "PASSED" the ridges and Mt. Rainier NOT "PASSED IN FRONT OF." Can't he just make the simple statement? The objects could "pass" ABOVE or BEHIND too, and in fact they DID.

It's almost as if Arnold told different stories to different people. Now the questions are:

- * Why did all of these reporters come up with the same mistakes?
- * Was someone acting as a spokesman for Arnold?
- * Why are Arnold's descriptions of what happened so vague as to not include language stating whether the objects flew in front of or behind Mt. Rainier?
- * If Arnold made a report and a drawing for the Air Force, why wasn't it specific regarding the flight path of the objects?

These are symptoms of fabrication. It seems as though it was not important to Arnold whether the objects went in front of or behind the mountain. Let's see now:

- * He was busy trying to figure out what they were.
- * He had time to observe them and try to discern the shapes.
- * He had time to measure the angular size by comparing them to a Dzus fastener on his cockpit cowling (something most witnesses don't even think of at the time of the sighting).
- * And, of course, he was also still flying his plane.

-- all of this while he was timing them???

These other details were important to Arnold, but the important detail of whether the objects passed in front of or behind Mt. Rainier is mentioned rarely, and some of those rare instances are possibly in conflict with each other.

It almost smells like that purveyor of picuniarly promulgated prevaricating nonprosaic prose, Ray Palmer, made the whole thing up and fed it to Arnold. There was a similar story in a tabloid book that appeared some time before the sighting. The cover of that 'bloid is pictured in one of Brookesmith's books.

This is the only solution that doesn't require us to use eight 1942 Vought V-173s and a wrecked 1945 Northrop XP-79B, all purloined from the east coast, supported by extraterrestrial fire

balloons, and powered by hypnotized 170-degree-oriented
supersonic pelicans with sonic boom arrestors on their feet.

Hi Larry.....The above came from Leonard Stringfield's "Situation Red" as quoted by the boy, "I stopped", Gregory recalled. "I wanted to run or scream, but suddenly a big tube came out of the bottom, which moved from side to side until it came to me, and a beam of light shot out." I wonder if Dr. James McDonald's interviews with the Beasville residents are available anywhere?

@Hi Larry.....The above came from Leonard Stringfield's "Situation

@Red" as quoted by the boy, "I stopped", Gregory recalled. "I
@wanted to run or scream, but suddenly a big tube came out of the
@bottom, which moved from side to side until it came to me, and a
@beam of light shot out." I wonder if Dr. James McDonald's
@interviews with the Beasville residents are available anywhere?

This is different from the account I have, which states that the
boy watched the object with curiosity until the tube pointed
directly at him. Only then did he become frightened. Also, it
says that he noticed the tube "coming out" of the object (no
"suddenly"), which could refer to it simply sticking out of the
object (the way a water pipe "comes out" of the wall to connect
to a sink) as well as suddenly appearing from inside something
(as a car "comes out" of a garage).

I have also seen similar language misunderstood by authors of
sensational UFO books to indicate that cars started themselves
back up again WITHOUT THE USE OF THE STARTER after a UFO
encounter. The original witness statement said that the car
"restarted easily" after the UFO had left.

I suggest that somebody needs to check the local newspaper morgue
on this one to get a more firsthand account.

REGARDING BRAD's NINE or ten or eleven POINTS:

Well, BLOW ME DOWN, you lubbers! This is getting complicated!

[Brad Wrote]

EVIDENCE THAT ARNOLDS OBJECTS PASSED BEHIND MT. RAINIER

(1) EARLY INTERVIEW: Arnold stated in his second known and second earliest interview, with the Chicago Tribune on the afternoon of June 25, 1947: "I counted nine of them as they DISAPPEARED BEHIND the peak of Mount Ranier [Rainier]."

[Bruce] this is an interview.... requires "off the cuff" split second reponses to questions posed by a reporter who is trying for a story and not necessarily for accuracy. We don't know exactly what Arnold said... only what the reporter wrote... and reporters are NOTORIOUS for writing their own interpretations of what was said, as opposed to what was said. Even quotes are not necessarily "quotes." Compare, for example the tape recorded statement (first radio interview)

.

Well, about 2:15 I took off from Chehalis, Washington, en route to Yakima, and, of course, every time that any of us fly over the country near Mt. Rainier, we spend an hour or two in search of the Marine plane that's never been found that they believe is in the snow someplace southwest of that particular area. That area is located at about, it's elevation is about 10,000 foot, and I had made one sweep in close to Mt. Rainier and down one of the canyons and was dragging it for any types of objects that might prove to be the Marine ship, uh, and as I come out of the canyon there, was about 15 minutes, I was approximately 25 to 28 miles from Mt. Rainier, I climbed back up to 9200 feet and I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier.

.....

[Bruce] note that in the "heat of the moment" he didn't even mention flashing or seeing them north of Rainier, but rather jumped immediately to the "chain" description and "going at a terrific

speed across the face of Mt, Rainier. "
No reporter's messing up the quote here. This is "raw Arnold."

.....
I, at first, thought they were geese because it flew like geese, but it was going so fast that I immediately changed my mind and decided it was a bunch of new jet planes in formation. Well, as the plane come to the edge of Mt. Rainier flying at about 160 degrees south, I thought I would clock them because it was such a clear day, and I didn't know where their destination was, but due to the fact that I had Mt. Saint Helens and Mt. Adams to clock them by, I just thought I'd see just how fast they were going, since among pilots we argue about speed so much.

.....
[Bruce] He finally gets around to mention the flashing WHY DIDN'T HE SAY THAT HE SAW THEM FLASHING NORTH OF RAINIER? Heat of the moment... what seemed most important is what he said... didn't have time for complete details....

.....
And, they seemed to flip and flash in the sun, just like a mirror, and, in fact, I happened to be in an angle from the sun that seemed to hit the tops of these peculiar looking things in such a way that it almost blinded you when you looked at them through your plexiglass windshield. Well, uh, I uh, it was about one minute to three when I started clocking them on my sweep second hand clock, and as I kept looking at them, I kept looking for their tails, and they didn't have any tail. I thought, well, maybe something's wrong with my eyes and I turned the plane around and opened the window, and looked out the window, and sure enough, I couldn't find any tails on 'em. And, uh, the whole, our observation of these particular ships, didn't last more than about two and a half minutes and I could see them only plainly when they seemed to tip their wing, or whatever it was, and the sun flashed on them. They looked something like a pie plate that was cut in half with a sort of a convex triangle in the rear.

.....
.....HE DOESN'T SAY HOW HE WAS ABLE TO SEE THE SHAPE, doesn't say anything about them being thin when seen on edge, doesn't say "against the snow" (but see below)....

.....
Now, I thought, well, that maybe they're jet planes with just the tails painted green or brown or something, and I didn't think too much of it, but kept on watching them. They didn't fly in a conventional formation that's taught in our army,

.....
.....NOTE WELL WHAT HE SAYS NEXT!.....
they seemed to kind of weave in and out right above the mountaintops, and I would say that they even went down into the canyons in several instances, oh, probably a hundred feet, but I could see them against the snow, of

course, on Mt. Rainier and against the snow on Mt. Adams as they were flashing, and against a high ridge that happens to lay in between Mt. Rainier and Mt. Adams.

.....SOUNDS AS IF he could see them against snow at several locations, the side of Rainier being one of them.....

But when I observed the tail end of the last one passing Mt. Adams, and I was at an angle near Mt. Rainier from it, but I looked at my watch and it showed one minute and 42 seconds. Well, I felt that was pretty fast and I didn't stop to think what the distance was between the two mountains. Well, I landed at Yakima, Washington, and Al Baxter was there to greet me and he said
...[unintelligible]...

And, he told me, I guess I better change my brand

[Brad wrote]

(2) ARNOLD DRAWING: Arnold's ONLY KNOWN drawing of the objects' flight path shows them coming out from BEHIND Rainier's south edge and NEVER CROSSING IN FRONT, using two different standard artistic conventions (short light line showing path behind mountain, then line curved from behind away from mountain). (See IUR cover Mar/Apr 95.) The drawing was probably done in late June 1947.

[Bruce] His drawing isn't complete. The drawing (as it appears on IUR at least) doesn't show their flight track to the left (north) of Rainier. Why didn't he draw the track approaching Rainier?

Certainly this would have emphasized their disappearance behind Rainier if he had

drawn the track at the left of Rainier, and then at the right, but not crossing Rainier.

Had they gone behind Rainier they would have been not visible for 10 or more seconds

depending upon the altitude (width of the mountain changes with altitude).

POINT: the drawing is not complete so inferring something from what is left out of the

drawing is a "risky" business.

(3) OTHER ARNOLD STATEMENTS: Other statements by Arnold also mention a disappearance behind a specific jagged "peak" or "cleft" of Rainier which appears to have been Rainier's most prominent subsidiary peak, the well-known 11,000-foot Little Tahoma Peak two miles east of Rainier's summit, since McDonald, Kottmeyer, Maccabee and others could not find a suitable 9,000+ ft peak in the SW FRONT of Rainier fitting the 9,000-10,000-foot altitude of the objects, but only minor 6,000-foot peaks.

[Bruce] This is the reason that I have argued Arnold could have been

mistaken in thinking they were at his altitude.

(4) DISTANCE: Arnold's BEST ESTIMATE of the distance to the objects was 23 miles and from a position several miles east of Mineral, Wash., where he was roughly 15 miles from the peak of Mt. Rainier. Thus the objects must have been about 8 miles BEHIND Rainier's peak or 6 miles BEHIND Little Tahoma.

[Bruce] This distance number must have been determined after Arnold landed, using his best guess as to where he was during the sighting and his best guess as to the location of the flight track. We have tacitly assumed that he was east of Mineral. But who really knows just how far west of Mineral he may have gone during his turn? He may have been farther west-southwest of Rainier than you have estimated.

(5) FRONT = WRONG HEADING: A flight path by the objects on the west side of Rainier, passing in FRONT of the SW slopes, would have to head at 125 degrees or less to reach Goat Ridge, contrary to Arnold's 170-deg course plotted on his map. An experienced mountain pilot such as Arnold would instantly spot such an enormous 45 degree angle difference.

[Bruce] You appear to be assuming they traveled DIRECTLY OVER Goat Ridge. However, Arnold could not have determined exactly how close to goat ridge they were unless they actually disappeared behind peaks of goat ridge. They could have been higher than the goat ridge and closer to Arnold by several miles and still APPEAR TO ARNOLD to be over goat ridge. Since he would have been twenty some miles from goat ridge it wouldn't have made much difference to his estimate of the length of the chain (= approximate length of goat ridge = 5 miles) if the objects had been several miles WEST of goat ridge and flying along a NOMINALLY STRAIGHT (but not necessarily exactly straight) trajectory of NOMINALLY 170 degrees (but might have been 10 degrees plus or minus).

(6) BEHIND = RIGHT HEADING: A flight path of the objects BEHIND Rainier, on the east side, some 6 miles behind Little Tahoma, would head on a course of 170 degrees to reach Goat Ridge -- exactly in agreement with Arnold's 170-degree course for the objects.

[Bruce] Again, this assumes they flew actually over GR, whereas from Arnold's perspective it would have appeared the same if they flew several miles west of GR.

(7) SLAMMING INTO RAINIER: The objects could not fly on a 170 heading and between the 6,000 foot peaks on the southwestern FRONT slope of Rainier without slamming into the 8,000-9,000-foot level of Rainier first.

[Bruce] Perhaps their flight track was not a straight but only nominally 170 degrees (160 in the above radio comment).

(8) STRANGE GAP IN STORY: Arnold NEVER once tells his story of seeing the objects to the north of Mt. Rainier, then approaching in a line to Rainier, then CROSSING in FRONT of Rainier, and then observing the objects peculiar SHAPES from this CLOSEST DISTANCE, as one would logically expect. Arnold gets to the point of APPROACHING the north edge of Rainier and then fails to have the objects cross in front. He later has afterthoughts and digressions about objects in front and seeing their shapes but not in chronological narrative order.

[Bruce] There would, to my way of thinking, be an even STRANGER gap in the story if Arnold had not mentioned their disappearance behind Rainier (lasting 10 sec or more) but had thought to mention the VERY BRIEF disappearance behind some peak in the vicinity of (south of) Rainier.

(9) NO SKY BACKGROUND IF IN FRONT: If Arnolds objects flew behind some minor 6,000-foot bump in the FRONT slopes of Mt. Rainier his depression angle from his plane at 9,200+ feet would prevent him from EVER seeing the objects against the SKY at that altitude, even though Arnold reported seeing the objects against the sky both before and after Mt. Rainier. This is contrary to Arnolds accounts and his only known DRAWING of the objects flight path.

[Bruce] He clearly says over and over that he saw them against the snow. If he saw them against the snow of Rainier, then h had 10 seconds or more to view them. For any other peak, including Little Tacoma, if he saw them against the snow it would have been a fleeting glance. If he saw them against the snow of Goat Ridge, then they were a lot lower. I couldn't find a statement about him seeing them "against the sky" in his letter to the AF.

(10) NO CLOCKING POSSIBLE IF IN FRONT: If Arnolds objects flew behind some minor 6,000-foot bump in the FRONT slopes of Mt. Rainier his depression angle from his plane would not only prevent him from seeing the objects against the SKY but by doing so would also have prevented him from seeing a SKY edge of Mt. Rainier to BEGIN HIS FAMOUS CLOCKING of the objects speed. This clashes with all of Arnolds accounts and his only known DRAWING of the flight path.

[Bruce] I find it more difficult to imagine him timing them if they disappeared behind Rainier.

After they disappearance he wouldn't have known where they were. IN fact, the total sighting to that point would have been of nine shiny objects approaching Rainier and then, one by one, disappearing. No doubt he would have been struck by their oddity, but he wouldn't have known where they were going. It would take extreme "prescience" to say to himself, while they were not visible, "I'm going to time these new planes. I'll note the time as soon as they reappear." How would he have known they would reappear? It's more likely that if they had reappeared and continued their southward flight he would have started timing somewhat after the first one reappeared.

He wrote (AF letter)"I remember distinctly that my sweep second hand on my eight day clock, which is located on the instrument panel, read one minute to 3 PM as the first object of this formation passed the southern edge of Mt. Rainier."

This suggests to me that he was watching his clock as the first one approached the southern edge of the mountain and was thus able to determine when, to the second, it passed the southern edge. If he hadn't been able to see it (behind Rainier) he wouldn't have known when to watch the clock.

(continuing with the previous post BRAD wrote:

>And finally, if the objects were down so low at 6,000 feet then Arnold at 9,200 feet (or more) would have >about a 3-degree DEPRESSION ANGLE looking down on them and against increasingly lower and >lower terrain levels. He would NEVER HAVE ANY SKY as background to the objects at that angle l>ooking in ANY DIRECTION WHATSOEVER, north, south, east or west. And the closer he was (i.e., if t>o birds) the steeper the angle would be. This is contrary to Arnolds accounts and his only known >DRAWING of the flight path. Think about it!

How many quotes or statements are there about seeing them against the sky? In the meantime, James Easton has summarized many statements about this event. Worthwhile to combine them here:

[Easton]

>Assuming the verbatim accounts and the earliest ones are most
>reliable, if we recap what Arnold said in that early radio
>interview:

>"...I was approximately 25 to 28 miles from Mt. Rainier, I
>climbed back up to 9200 feet and I noticed to the left of me a
>chain which looked to me like the tail of a Chinese kite, kind of
>weaving and going at a terrific speed across the face of Mt.

>Rainier. I, at first, thought they were geese because it flew
>like geese, but it was going so fast that I immediately changed
>my mind and decided it was a bunch of new jet planes in
>formation. Well, as the planes come to the edge of Mt. Rainier
f>lying at about 160 degrees south, I thought I would clock
t>hem...".

>Clearly from this, the nine objects passed "across the face of
>Mt. Rainier".

[Brad]

>COMMENTS: This radio interview account is already seriously contradictory
of Arnolds other >statements before and after in that he puts his first
sighting of the objects as already across the face of >Mt. Rainier and NOT
to the north of Rainier.

[BRuce]

Yes... the radio interview, like all interviews, is "seriously
contradictory BUT AT LEAST we don't have "the truth" as filtered through a
reporter. INstead, we see here the naturally tendency of a
non-professional raconteur to jump back and forth in time as elements of
the story of varying importance are recalled. The FACT that he jumped
back and forth does not mean that any of his
statements (sentences) if incorrect, although it may appear out of temporal
context. Of course,. witnesses are known to MAKE MISTAKES themselves in
their statements and then sometimes they
retract their mistakes and essentially change the story in doing so.

[Brad]

> Obviously then he doesnt recount seeing the objects to the north of
Rainier and then passing the >north edge in front of the mountain. I am
going to repeat my draft of the simple statement that we >NEVER read from
Arnold in any form:

>Let's just have a simple statement by Arnold at ANY TIME like
>this: "After they crossed Mt. Rainier's north edge and passed in
>front of the mountain I could see they were to the west of Mt.
>Rainier."

[Bruce]

Similarly, we never read an explicit statement of the form "Oh , I
forgot to mention, besides disappearing (very briefly) behind a small peak
south (or southeast) of Rainier, they also happened to disappear (for many
seconds) behind Rainier itself."

>[Easton]

>I had considered that even if the objects had gone behind, they
>would still strictly have 'crossed the face' of Mt. Rainier,
>however, Arnold surely wouldn't have described events as he does
>unless he meant their path was in front of the mountain.

>In which case, I would have to take this as the definitive
>clarification and confirmation.

>COMMENTS: Not definitive when so totally contradictory to Arnolds other
statements both as to >seeing the objects DISAPPEARING BEHIND the peak of
Mt. Rainier (Chicago Tribune

[Bruce]a reporter's version of what Arnold said? (with or without quotes)

>the DAY >BEFORE the KWRC radio interview

[Bruce]is this the interview quoted above?

>) and as to WHEN HE FIRST SAW THEM (in most other >statements he says he
FIRST saw them far t>o the north of Mt. Rainier up towards Mt. Baker, etc.,
and >didnt FIRST see them supposedly crossing >the face of Rainier). And
if a picture is worth a thousand >words then Arnolds DRAWING of >apparently
late June 1947 showing NO CROSSING IN FRONT, but >objects coming out from
>BEHIND, also flatly contradicts this interpretation. >

[Bruce]And the picture doesn't show them approaching either. Does that
mean they didn't approach?

>[Easton]

>Arnold also noted in his interview, "I could see them against the
>snow, of course, on Mt. Rainier".

>COMMENTS: As I posted yesterday, Arnold reported seeing IMAGES of the
objects against the >snow or somehow seeing them against the snow when only
approaching the mountain and not in f>ront, indicating that what he was
seeing was IMAGE REFLECTIONS of the objects intense FLASHES f>rom off the
FRONTAL glacier faces of Mt. Rainier, which your web links say has
something like 68 >glaciers in all.

I don't buy this. Such a strained interpretation (seeing images reflected
from th snow) is only necessary if one rejects the idea that they passed
between Arnold and the mountain.

Seeing flashes of light reflected from the snow sounds like a stretch to
me. Snow is a
highly diffuse reflector (with a high albedo). Ice can reflect like a
mirror ... but one would need
flat surfaces to reflect an "image" ...

>[Easton]

>Supporting evidence comes from the following:

>"The Boise flyer said they flew on the west sides of Rainier and
>Adams, adding that he believed this would make it more difficult
>for them to be seen from the ground".

>['Pendleton, Oregon East Oregonian', June 26]

[Brad]

>COMMENTS: This is newspapers HEARSAY PARAPHRASE and NOT a DIRECT QUOTE of

>Arnold. This is directly contradicted by Arnold in DIRECT QUOTE on the SAME AFTERNOON as the >Pendleton East Oregonian interview, when in his second earliest known interview he told the Chicago >Tribune, I counted nine of them as they DISAPPEARED BEHIND the peak of Mt. Ranier [Rainier].
>

[Bruce} OK. Let's stick to sources in which there was nothing "between" Arnold and his statement:
tape recorded quotes, letter to the Air Force and book (anything else?)

[Brad]

>Again, if a picture is worth a thousand words then Arnolds DRAWING of apparently late June 1947 >showing NO CROSSING IN FRONT, but objects coming out from BEHIND, also flatly contradicts this >hearsay paraphrasing.

YES, but we don't hear Arnold describing what he was illustrating in this drawing. Perhaps this drawing is only worth a few hundred words.

>[Easton]

>"Arnold said the strange aircraft were skittering across the
>southwest slope of Mount Rainier when he first sighted them".

>['Norman, Oklahoma Transcript', June 26]

>"Arnold, general manager and owner of the Great Western Fire
>Control Company, said he first saw the objects when they flashed
i>n the sun low over the slopes of Mt. Rainier".

>['Oregon Journal', June 27, 1947]

>COMMENTS: Again these news stories patently contradict most other Arnold accounts that he FIRST >sighted the objects far to the north of Rainier and that they were at a high altitude of 9,000 to 10,000 >feet, not LOW over the slopes. And these again are newspapers HEARSAY PARAPHRASES and >NOT DIRECT QUOTES of Arnold. These are directly contradicted by Arnold in DIRECT QUOTE 1-2 >DAYS BEFORE the UP dispatch (printed in the Oklahoma paper) and the AP dispatch (printed in the >Portland paper), when in his second earliest known interview he told the Chicago Tribune he counted >the objects as they DISAPPEARED BEHIND the peak of Mt. Ranier [Rainier].
>

>Once again, Arnolds DRAWING of apparently late June 1947 showing NO CROSSING IN FRONT, >but objects coming out from BEHIND, also flatly contradicts these hearsay paraphrasings.

This is the "battle of the quotes". Where is the TRUE ARNOLD?

>[Easton]

>Also, in his letter to the Air Force Arnold stated, "These
>objects being quite far away, I was unable for a few seconds to
>make out their shape or their formation. Very shortly they
>approached Mt. Rainier, and I observed their outline against the
>snow quite plainly".

>COMMENTS: Ive already covered this in my comments on IMAGE
REFLECTIONS
and the >STRANGE GAP in Arnolds account (see above).

I don't buy the "image reflections" argument. Here we have "unfiltered
Arnold" speaking
(writing). Certainly sounds to me as is he assumes the reader will draw
the conclusion
that the objects passed between him and Rainier.

>COMMENTS: McDonald suggested to Arnold in Nov 1966 a peak on
>the SW slope of Rainier and went through several possibilities
>by mail and over the phone, namely Pyramid Peak (6937 ft),
>Crystal Mtn. (6306 ft), and Iron Mtn. (6283 ft), but rejected
>them all because they were too low. Arnold was not sure it was
>on the SW slope either, only that it "probably" was. McDonald
>suggested lower altitudes to Arnold but apparently Arnold didn't
>agree and McDonald summarized the data later as the objects
>flying at 9,000 feet and CLIMBING still higher to 13,000 feet --
>a new detail from Arnold never before pinned down (climbing was
>briefly mentioned before by Arnold, but clashed with other
>statements of constant elevation which McDonald mentioned to
>him).

[Easton]

>What may be crucial is determining the height of those Goat Ridge
>peaks. Arnold detailed how the nine objects appeared to
>frequently go _down_ into the canyons there.

[Brad]

>COMMENTS: Please note my previous correction that Crystal Mtn. Is a MAP
ERROR and >NONEXISTENT as a 6,306-foot peak.

>Here you are suggesting what is crucial is that the height of Goat Ridge
is about the same as the >height of the objects before they reached Goat
Ridge, when they were near Mt. Rainier, based on >Arnold insisting the
objects maintained constant, level height (or constant till starting to
climb). >>

>Goat Ridge is at roughly 5,000 to 7,000 feet, which is much too low. My
Points 9 and 10 directly >contradict the notion that the objects could have

dipped down so low in among the peaks of Goat >Ridge, and my Points 3 and 7 indirectly argue against such low altitudes for the objects. If the objects >were at 6,000 feet and maintained only constant (or even increasing) altitude throughout the sighting >as Arnold insisted then Arnold could NEVER have seen them against a SKY background and never >have seen them cross Rainiers edge into the SKY so he could TIME their flight.
>

[Bruce] I don't buy that last "never". Arnold could have determined when the objects passed the southern edge of Rainier without needing the sky background. In fact, one can imagine him watching the second hand of his clock and also watching the lead object approach the southern edge of Mt Rainier, regardless of the altitude (if above the mountains to the west) and starting the timing as the first one passed the edge of Rainier. Surely he could distinguish the southern edge of Rainier against the much farther backdrop of the mountains east of Rainier.

>Most importantly, Arnolds one and only DRAWING of the scene shows the objects flight path HIGH >ABOVE Goat Ridge (unmistakably identified by a 5 mi length marking) and clearly marked as at >10,000 feet altitude. This would be 3,000 to 5,000 feet ABOVE Goat Ridge. Arnolds drawing does not >even come close to having the objects near the top of Goat Ridge.

Yes, above Goat Ridge on the drawing..... assuming that the drawing was, indeed, accurate in tat regard..... although it clearly is not to scale.

(SNIP THE REST OF THE DISCUSSON because I haven't\got time to comment on everything.

I see no compelling evidence to believe that the objects passed on the east side of Rainier and then went behing Little Tahoma peak.

Regarding "Brad's Complaint"

[Bruce].....because I believe Arnold assumed that any reader/listener to his
> story would logically INFER the truth (that the objects passed on the west
> side) from Arnold's statements about seeing them against the snow, about them
> being on the west side, etc.

[Brad]
>COMMENTS: You're trying to make excuses for why Arnold NEVER ONCE in 30+
years gave an >orderly, sequential account of seeing the flash, then seeing the objects approach Mt. Rainier in a >straight line, and then seeing the objects cross over in front of Mt. Rainier (if they did) where he should >have gotten his best look at them from the closest distance.

Yes, absolutely, I am trying to "excuse" Arnold for his oversight. I am arguing that Arnold didn't feel it necessary to say explicitly "They crossed in front of Mt. Rainier" or words to that effect because he assumed, tacitly or explicitly, that the listeners/readers would make what I believe to be the CORRECT inference based on all the "clues" he had given, clues that have been summarized here ad nauseum.

[Brad]
> All his statements about seeing the objects on the west of the mountain, seeing their shapes as >supposedly seen against the snow, etc., come from LATER AFTERTHOUGHTS and >DIGRESSIONS in every single blasted one of his accounts! He tells us they "APPROACHED" the >"north edge" of Mt. Rainier but then doesn't take the next step of saying they passed or crossed that >very same "north edge."

>It's as if the passage of Mt. Rainier was a BLANK GAP in his story because the objects had >DISAPPEARED BEHIND the mountain. He rambles around later trying to fill the awkward gap >retroactively.

[Bruce]
>>I think his statement about "disappearing behind"

>> Mt. Rainier was actually a confusion of the main mountain with whatever smaller peak he
>> claimed to have seen them pass behind,

>COMMENTS: You're admitting Arnold suffered from "confusion" in this aspect of his story. I would >contend the confusion was in a different sense.

I admit that his STORY suffers confusion, coming, as it does, from numerous different sources under varying circumstances. I believe that ARNOLD HIMSELF was not confused as to whether or not they passed between him and Rainier or on the other side.

I think the problem has arisen because no one interviewed him in detail, making him recall "second by second" what happened. Instead, he was free to recite the history as he saw fit at the time. Certainly as far as the press reports are concerned (as opposed to his Air Force letter or the book), he was asked to come up with a version of the story on the spur of the moment, knowing that he couldn't take time to explain carefully all the details. However, if, in an interview, he says "I saw them approaching Mt. Rainier from the north" and then a few sentences later (or perhaps the next sentence) he says, "I could see their shape against the snow banks", he would logically believe that the listener could infer that the objects were between him and Rainier.

[Bruce]

>> I still think this is making an Extinct Volcano out of a Mole Hill.
>> > At any rate, I don't see what we could do about it now. Only one person was
>> there...> Arnold... and all we have to go on is what he said about it....
whether or
>> not it makes complete and logical sense.> As I have said before,
>one is offered the choice of deciding the report is so
>> replete with "errors" as not to warrant careful analysis,

[Brad]

>COMMENTS: Actually I think we're making progress in understanding the event by minutely >analyzing it -- which is the OPPOSITE of DISCARDING it as not worth analyzing as you like to point out >Project Grudge did in 1949.

[Bruce]

>or one can take
>> more or less at face value what Arnold said.>

[Brad]

>COMMENTS: The problem is WHICH story of Arnold's should we take at "face value"? :) Behind the >mountain or in front? A 180 or 360 turn over Mineral? First seen in front of the mountain or first seen far to the north? First thought geese or first thought an aircraft in near-collision?

Clocked with a stop >watch, wristwatch or his instrument panel clock? Saucer-shaped, or bat-shaped, or tadpole-shaped, >or wraith-like, or a half moon? Above the ridge or swerving in and out? At 9,000 feet, or 9,500, or >10,000, or perhaps 6,000 feet? Constant elevation or climbing? Flying towards Mt. Rainier, or Yakima, >or Goat Ridge? Flying parallel to the objects or at right angles? Continued his search for the crashed >C-46 for 15-20 minutes after the sighting or dropped it in his excitement and eagerness to report? He >changed his story a lot and that should tell us something. >

>I can't resolve these contradictions by using Arnold's statements "at face value" because there are >"face value" statements for all of them. But I think I can resolve most, if not eventually all, of them by >careful ANALYSIS such as we've been doing here.

[Bruce]

I think these varying statements are a result of the "spur of the moment " comments requested from Arnold during the various interviews. Anyone who has worked with stories of events as told under varying circumstances by witnesses (during different interviews, etc.) knows that the story "wanders about" a "hard core" of events. The analyst has to come up with the most common or self-consistent version to determine what happened.

I think everyone here would agree that Arnold saw SOME NUMBER (9) or objects which HE CONSIDERED STRANGE (could not identify as birds, planes or superment) which flew GENERALLY SOUTHWARD in the VICINITY OF MT> RAINIER and were last seen APPARENTLY IN THE ' VICINITY OF MT. ADAMS. Arnold was FLYING IN HIS PLANE at the time and FACING GENERALLY EASTWARD. He was SOMEWHERE RELATIVELY NEAR MINERAL WASHINGTON at the time. He CLOCKED THE TIME IT TOOK FOR THEM TO APPEAR TO BE NEAR RAINIER and then to travel southward to APPEAR TO BE NEAR ADAMS. His attention was first attracted to them by a FLASH OF LIGHT from the direction of these objects (we assume they were objects and not fig newtons of his imagination :)). Anything else we can agree on?

> It is amusing to imagine how the "disappears behind Mt. Rainier" > interpretation would "blow up" the pelican explanation.

[Brad]

COMMENTS: Exactly my point in beginning this whole line of argument. Birds would be invisible at such a distance (23+ miles).

[Bruce]

- > However, if one assumes that they did not pass behind Rainier but
- > nevertheless passed behind SOMETHING (some peak) as ARnold's
- > statement implies, then once again the "pelicanization" of Arnold's
- > sighting is for the birds.

[Brad]

COMMENTS: Though closer, birds would still be essentially invisible at this distance (roughly 15 miles).

[Bruce]

- > For those pelicanists out there slavering over this nitpicking I again
- > issue the eternal challenge:
- >
- > DRAW A MAP showing the track of th pelicans and the track of Arnold's
- > plane and convince me that it could have appeared to him as if the
- > pelicans were first seen far to the north of rainier and last seen
- passing
- > Mt. Adams, while he flew merily along at about 100 mph.

[Brad]

COMMENTS: Arnold's speed with the 22 mph tail wind from 300 was about 120 mph.

- >But the bird theorists need birds speeding along at 300+ mph in order to
- cross the face of Mt. Rainier i>n 3 minutes or less at 6,000 feet (or at
- nearly Arnold's speed, 110 mph, if at Rainier's narrower >9,000-foot
- level).
- <

Of course, the tail wind for Arnold would also affect the flight track of the birds,
so the closing speed of Arnold's plane on the flight track of the birds would
still be about 100 mph (if arnold was flying at 100 mph air speed)

IF THEY DISAPPEARED BEHIND RAINIER and were going 1700 mph or nearly 30 miles per minute, at an altitude where the width of Rainier was 5 miles, then it would have taken about 10 seconds for them to pass behind the mountain. At lower altitudes it wuld have taken some seconds longer. Clearly enough time for Arnold to realize they passed BEHIND Rainier. However, Arnold did not say they passed behind Rainier, INstead he referred to them passing behind what had to be a much smaller (less wide) peak adjacent to (on the southern flank of?) Rainier. Seems odd that he would call attention to what would have been a much more brief disappearance behind some small peak other than Rainier if they had passed behind Rainier itself,.

JAMES WROTE, regarding flashing:

>There's a further question re Arnold's claims about those
>reflections being so bright, a story which seems to have grown in
>the telling. In the radio interview conducted just afterwards, he
>stated:

>"I was approximately 25 to 28 miles from Mt. Rainier, I climbed
>back up to 9200 feet and I noticed to the left of me a chain
>which looked to me like the tail of a Chinese kite, kind of
>weaving and going at a terrific speed across the face of Mt.
>Rainier. I, at first, thought they were geese because it flew
>like geese, but it was going so fast that I immediately changed
>my mind and decided it was a bunch of new jet planes in
formation".

>Curiously, Arnold doesn't mention anything about a 'brilliant
flash', however, he does initially confirm a critical aspect
>which has still to be addressed. It's also mentioned in other
>sources that at first he considered the nine objects to be geese,
>although, just perhaps crucially, clearly never realising that
there were other, eminently more suitable candidates.

JAMES!!!! TCH TCH. you didn't read any farther in the radio
interview, you bad boy. Read on to where Arnold says:::

[Arnold]

"Well, as the plane come to the edge of Mt. Rainier flying at about 160
degrees south, I thought I would clock them because it was such a clear
day, and I didn't know where their destination was, but due to the fact
that I had Mt. Saint Helens and Mt. Adams to clock them by, I just thought
I'd see just how fast they were going, since among pilots we argue about
speed so much. And, they seemed to flip and flash in the sun, just like a
mirror, and, in fact, I happened to be in an angle from the sun that seemed
to hit the tops of these peculiar looking things in such a way that it
almost blinded you when you looked at them through your plexiglass
windshield."

WOW!! Sounds like those Polished Silver Pelicans we see flying around
Washington
DC all the time (looking to scoop up money in their beaks).

>Arnold only changed his mind about birds due to the objects'
>apparent airspeed and, according to a newspaper report, because
>it wouldn't make sense for birds to be flying south at that time
>of year (which would be mistaken).

ONLY? Are you a mind reader? Arnold gave different reasons at different times... and probably he thinking wasn't totally linear at the time this sighting was happening..... but clearly it wouldn't take a lot of thought for him to realize that birds don't give off mirror-like (see above) reflections of the sun. He may have briefly entertained the bird explanation because of a similarity in flight pattern, but clearly reflectivity would have argued against the birds.

>If, as later recounted, the flash(es) of light 'lit up his
>aircraft' and from a distance of over a hundred miles (I don't
think so) etc., then why would he ever have surmised the nine
>objects might be geese?

Hynek's "Escalation of Hypotheses" : when confronted with something totally unknown the witness attempts to connect it with known objects, rejecting first one and then another known until one is left with the unknown. In this case, Arnold rejected birds in favor of new aircraft.

>Can we perhaps deduce that either, Arnold attributed exceptional
>reflective capabilities to geese, or the reflections were, in
>fact, not inconsistent with birds.

Neither.... Arnold rejected birds.

Hi -

To help with the Arnold discussion, I posted part of the CAA Seattle Sectional Aeronautical Chart for the first half of 1947 at

<http://www.ufx.org/1947/seamap.htm>

This should be very close to, if not identical to, the one Arnold used to do his calculations.

The original is about a meter wide, so I had to scan it in sections and tile it together, and I made it huge so all the detail is visible. Warning, it's nearly 2 Megabytes, and may take 5 min or more to download at dialup speeds, but at least then you'll have your own copy and everyone will be playing on the same polo grounds.

If anyone would like a smaller file, or additional sections added to what's there, etc, please let me know.

Subject: Re: Kenneth Arnold and Kottmeyer
Status:

James,

Didn't I say in one of my posts that I was going to post in more detail on points (such as the flying-across-the-face reports), which I have now done in my "REBUTTAL" posting? I have already anticipated and answered ALL of your points in this posting, in my REBUTTAL posting. And yet you don't respond even when I've conveniently numbered the points -- I am now up to 10 Points of Evidence that Arnold's Objects Flew BEHIND Rainier and it will actually go to 11 or 12 I think. So I'm now forced to repeat portions of my REBUTTAL. Are you hoping that you can create enough confusion with so many posts flying back and forth that I will simply lose track of arguments already presented or even better for you that I am unable to present my clearest case?

So why are you nitpicking me here, now, when I said I was going to post further? You seem to be trying to take advantage of me when I was not ready, not yet prepared, and I don't think that's fair.

Moreover you have completely taken my comments out of context on Arnold's 170 course heading which he MAPPED. You deleted my entire paragraph in your response, which I will now have to repeat (below).

See my COMMENTS below.

Here again are my SUMMARIZED Points of Evidence, which I would hope you would respond to, AND INCLUDE MY DETAILED DISCUSSION from my postings and not nitpick the brief summaries presented.

12 POINTS OF EVIDENCE THAT ARNOLD'S OBJECTS PASSED BEHIND MT. RAINIER

(1) EARLY INTERVIEW: Arnold stated in his second known and second earliest interview, with the Chicago Tribune on the afternoon of June 25, 1947: "I counted nine of them as they DISAPPEARED BEHIND the peak of Mount Ranier [Rainier]."

(2) ARNOLD DRAWING: Arnold's ONLY KNOWN drawing of the objects' flight path shows them coming out from BEHIND Rainier's south edge and NEVER CROSSING IN FRONT, using two different standard artistic conventions (short light line

showing path behind mountain, then line curved from behind away from mountain). (See IUR cover Mar/Apr 95.) The drawing was probably done in late June 1947.

(3) OTHER ARNOLD STATEMENTS: Other statements by Arnold also mention a disappearance BEHIND a specific jagged "peak" or "cleft" of Rainier which appears to have been Rainier's most prominent subsidiary peak, the well-known 11,000-foot Little Tahoma Peak two miles east of Rainier's summit, since McDonald, Kottmeyer, Maccabee and others could not find a suitable 9,000+ ft peak in the SW FRONT of Rainier fitting the 9,000-10,000-foot altitude of the objects, but only minor 6,000-foot peaks.

(4) DISTANCE: Arnold's BEST ESTIMATE -- NOT his initial or most offhanded or impromptu GUESS -- of the distance to the objects was 23 miles and from a position several miles east of Mineral, Wash., where he was roughly 15 miles from the peak of Mt. Rainier. Thus the objects must have been about 8 miles BEHIND Rainier's peak or 6 miles BEHIND Little Tahoma.

(5) FRONT = WRONG HEADING: If the objects flew in FRONT of Rainier, to the west of the SW slopes, they would have to head at 125 degrees or less to reach Goat Ridge, contrary to Arnold's 170-deg course plotted on his MAP. An experienced mountain pilot such as Arnold would instantly spot such an enormous 45 degree angle difference ON HIS MAP.

(6) BEHIND = RIGHT HEADING: If the objects flew BEHIND Rainier, on the east side, some 6 miles behind Little Tahoma, they would head on a course of 170 degrees to reach Goat Ridge -- exactly in agreement with Arnold's 170-degree PLOTTED MAP course for the objects.

(7) SLAMMING INTO RAINIER: The objects could not fly level on a 170 heading between the 6,000 foot peaks on the southwestern FRONT slope of Rainier without having slammed into the 8,000-9,000-foot high slopes of Rainier first.

(8) STRANGE GAP IN STORY: Arnold NEVER ONCE in 30+ years gave an orderly, SEQUENTIAL chronological account of seeing the flash, THEN seeing the objects approach Mt. Rainier in a straight line, and THEN seeing the objects cross over in front of Mt. Rainier (if they did) where he should have gotten his CLOSEST look at them by his own account in later out-of-order comments (see Point 11 below, the objects should actually have blended in with the snow and disappeared, but Arnold never says that, he says that was his clearest look). All his statements about seeing the objects on the west of the mountain, DETAILING their SHAPES as supposedly seen against the snow, etc., come from

LATER AFTERTHOUGHTS and DIGRESSIONS in every case OUT OF CHRONOLOGICAL ORDER

or fast-forwarded. He tells us they "APPROACHED" the "north edge" of Mt. Rainier but then doesn't take the next step of saying they passed or crossed that very same "north edge."

It's as if the passage of Mt. Rainier was a BLANK GAP in his story because the objects had actually DISAPPEARED BEHIND the mountain so Arnold had nothing to report for this phase of the sighting until they REAPPEARED, evidently in the gap between Mt. Rainier's summit and Little Tahoma Peak. He rambles around later, out of order, trying to fill the awkward gap retroactively with afterthoughts and digressions about objects in front and seeing their shapes, suggesting CONFUSION as to the actual sequence of events and what actually occurred and when (see Point 12 about what Arnold actually saw "in front").

(9) NO SKY BACKGROUND IF IN FRONT: If Arnold's objects flew behind some minor 6,000-foot bump in the FRONT slopes of Mt. Rainier his depression angle from his plane at 9,200+ feet would prevent him from EVER seeing the objects against the SKY at that altitude, even though Arnold reported seeing the objects against the sky both before and after Mt. Rainier. This is contrary to Arnold's accounts and his only known DRAWING of the objects' flight path.

(10) NO "CLOCKING" POSSIBLE IF IN FRONT: If Arnold's objects flew behind some minor 6,000-foot bump in the FRONT slopes of Mt. Rainier his depression angle from his plane would not only prevent him from seeing the objects against the SKY but by doing so would also have prevented him from seeing a SKY edge of Mt. Rainier to BEGIN HIS FAMOUS "CLOCKING" of the objects' speed.

This clashes with all of Arnold's accounts and his only known DRAWING of the flight path.

(11) NO SNOW INVISIBILITY: Although Arnold claims to have seen the tiny "outlines" or shapes of the objects against the snow of mountains in the distance (at the limits of visual perception by the human eye), it is exceedingly strange that he never mentions the "extremely shiny," "intense blue-white," "nickel-plated," "silvery," "mirror-like" objects DISAPPEARING against a BRIGHT WHITE SNOW or METALLIC BLUE-WHITE GLACIER background of such mountains as Mt. Rainier. If such objects of so similar appearance to snow and glacier ice had actually passed in front of snow and glaciers they certainly would have BLENDED IN and disappeared. Or at least, Arnold should have commented on how difficult it was to see white or mirror-like objects against white snow -- but he NEVER did. This suggests that Arnold never did see the snow-white objects directly IN FRONT of the snow where they would have blended in and that the best explanation for his comments is they were due to confusion over observations of the objects' "IMAGE" REFLECTIONS on the snow when they were off to the sides of the mountains (see next point).

(12) "IMAGES" NOT OBJECTS IN FRONT: Arnold saw what he called "IMAGES" or REFLECTIONS of the objects off the faces of Rainier's snowfields or ice glaciers when the objects were off to the side of Rainier ("approaching" Rainier), not in front. Thus Arnold's reports of seeing objects against the snow or face of Rainier were actually the "IMAGES" of the objects from the sides before they disappeared BEHIND the mountain.

Brad

In a message dated 2/24/00 4:21:26 AM, voyager@ukonline.co.uk writes:

<<

Brad wrote:

>My point here is that HE THOUGHT the objects had passed BEHIND

Brad,

So far as I was aware, Arnold deduced a 170 degree heading at the time, not afterwards. That's what he says in the 3 main documented sources - interview, letter and book, respectively:

COMMENTS: You deleted my entire long paragraph on Arnold MAPPING the 170 course of the objects AFTER the sighting. Here is what I wrote to you yesterday, which you have chosen to delete, in taking of collage of my comments from several posts (and I went into still more detail in my REBUTTAL posting last night):

"Now if you would just confirm that ONLY by passing to the EAST and BEHIND Little Tahoma and Mt. Rainier in general could the objects have reached Goat

Ridge on the 170-degree heading that Arnold derived from HIS MAPPING. Please note that we're NOT TALKING ABOUT ARNOLD'S OBSERVATIONAL ABILITIES TO ESTIMATE COURSE HEADINGS by looking at the objects in flight. We're talking about what Arnold RECONSTRUCTED ON HIS MAP -- rightly or wrongly -- after the fact as he struggled to make sense of where he was located and where the objects were located. Whether it agreed with what he observed is a SEPARATE ISSUE. My point here is that HE THOUGHT the objects had passed BEHIND Rainier/Little Tahoma when he did his MAP CHARTING and NOT IN FRONT of Rainier, otherwise he could not possibly have derived a 170 heading. He would have gotten a 125 heading or even less for a heading from the west or front of Rainier to Goat Ridge, the location of which you now agree with me on."

You can certainly choose to separately discuss what Arnold may or may not have observed, or have been capable of observing, as to the compass direction of the objects' flight path during his sighting at about 3 PM on June 24, 1947, but when you are purporting to respond to someone's discussion of what Arnold did with his MAPPING of the objects' course on aeronautical charts from about 4 PM on June 24, 1947, onward it is simply common courtesy that you respond to that as a separate issue and not change the subject.

In my REBUTTAL this is Point 5. And I say in my REBUTTAL posting in more detail:

"I'm not talking about Arnold's PERCEPTIONS of an exact 170 heading but his MAPPING of a 170 heading for the objects as he labored over his aeronautical charts moments after he landed and in the days and weeks to come. I'm trying to determine what he THOUGHT was the objects' flight path from Mt. Rainier to Mt. Adams over which he did his famous timing which in turn was the subject of nationwide controversy and in the headlines everywhere. We KNOW from numerous accounts that Arnold went over these maps exhaustively and considered every possibility even those he knew to be WRONG (measuring from the "very base" of the mountains "far below the snow line") in order to test the strength of his calculations. I won't belabor you with long boring quotations of Arnold recounting this as you know what I'm talking about.

"When Arnold drew the line for the objects' flight path on his aeronautical sectional chart, running from Mt. Rainier to Goat Ridge to Mt. Adams, in order to measure his famous 47-mile speed course, as an experienced mountain pilot whose life depended on ACCURATELY PLOTTING COURSES through treacherous mountains, he would have seen instantly by "eyeballing" it the difference between a 170 course from BEHIND Rainier/Little Tahoma heading and a 125 course from in FRONT of Rainier near Pyramid Peak. It's a 45 degree angle difference. Arnold would not even have to measure it to see that it was way off by 45 degrees."

[Easton]

"Well, as the planes come to the edge of Mt. Rainier flying at about 160 degrees south, I thought I would clock them..."

"I observed a chain of nine peculiar looking aircraft flying from north to south at approximately 9,500 foot elevation and going, seemingly, in a definite direction of about 170 degrees".

"I could see the formation was going to pass directly in front of me, as it was flying at approximately 170 degrees".

COMMENTS: Although this is a separate issue from Arnold's MAP work, notice that in each of these statements it is not really clear that he came up with the 170 figure DURING the sighting. The DAY BEFORE the radio interview you quote, he told the Chicago Tribune the objects were "traveling almost due south" and didn't give a numerical heading. Nor did he give a numerical heading to the Pendleton East Oregonian in his very first interview the day before.

In fact, in his noontime June 26, 1947, radio interview you quote above, the figure was 160 degrees and the 170 figure came later as he poured over the MAP and refined his estimates (see his AAF letter ca July 8-10, 1947, you also quote next). His distance figures were also scattered in this early phase until he more precisely plotted positions and courses on a map (which he did with other pilots helping as he recounts).

>As for Arnold's alleged statements saying the objects flew in
>front of Rainier I will just note that these exact statements
>were defective in other ways besides the passing-in-front which
>suggest gross error all around.

Evan accepted as a fundamental acknowledgement, that's still an understatement and a half.

It's a sweeping dismissal of Arnold's testimony,

COMMENTS: No it isn't a "sweeping dismissal," you've taken snippets of my several postings out of context as I pointed out above. I deal with each one of Arnold's actual verbatim statements and alleged statements taken by reporters as hearsay paraphrases, in my REBUTTAL posting, so I am not going to repeat all of that here. And pointing to "gross error" isn't a "dismissal" -- again, I've dealt with each point and you should go to my REBUTTAL posting and deal with them there instead of generating more, useless prose here. And I think it behooves you to deal with each of MY 12 Points.

[Easton]
from the time of

that formative radio interview right through to the 'UFO
symposium', i.e., again respectively:

"I could see them against the snow, of course, on Mt.
Rainier...".

"Very shortly they approached Mt. Rainier, and I observed their
outline against the snow quite plainly".

"I watched as these objects rapidly neared the snow border of
Mount Rainier...

I observed the objects' outlines plainly as they flipped and
flashed along against the snow and also against the sky".

"However, in getting a look at them against the sky and against
the snow of Mt. Rainier as they approached. I just couldn't
discern any tails on them...".

In order for Arnold to have fantasised a recollection to this

extent, he would be an alarmingly unreliable witness. Where do

you draw _that_ line?

COMMENTS: When Bruce said we should take Arnold's statements more or less at face value I replied: "WHICH story of Arnold's should we take at 'face value'? :) Behind the mountain or in front? A 180 or 360 turn over Mineral? First seen in front of the mountain or first seen far to the north?

First thought geese or first thought an aircraft in near-collision? Clocked with a stop watch, wristwatch or his instrument panel clock? Saucer-shaped, or bat-shaped, or tadpole-shaped, or wraith-like, or a half moon? Above the ridge or swerving in and out? At 9,000 feet, or 9,500, or 10,000, or perhaps 6,000 feet? Constant elevation or climbing? Flying towards Mt. Rainier, or Yakima, or Goat Ridge? Flying parallel to the objects or at right angles? Continued his search for the crashed C-46 for 15-20 minutes after the sighting or dropped it in his excitement and eagerness to report? He changed his story a lot and that should tell us something."

I went on to say, as you know, since you have my posting on your List, "I can't resolve these contradictions by using Arnold's statements 'at face value' because there are 'face value' statements for all of them. But I think I can resolve most, if not eventually all, of them by careful ANALYSIS such as we've been doing here."

[Easton]

It also doesn't answer the central question of why he would have referred to those objects "disappearing from my sight momentarily behind a jagged peak", when they simply must already have been out of sight behind the mountain.

COMMENTS: See my Point 8. They disappeared behind the bulk of Mt. Rainier, then reappeared in the gap between Rainier and Little Tahoma Peak, then disappeared "momentarily" or briefly behind Little Tahoma. Arnold began his timing from this last marker.

[Easton]

That makes no sense.

What Arnold clearly portrays is a situation where the objects were perceived to be lost from sight behind a landmark and only

briefly.

Also, where's the logic in Arnold discussing with McDonald which 'peak' it was, yet never clarifying the objects actually travelled behind the mountain and the candidates being suggested were impossible.

COMMENTS: Nearly 20 years after the sighting, McDonald was unable to conclusively determine from Arnold even which direction from Mt. Rainier's summit this "peak" was to be found, the "S + W" being only deemed "probable" and none of the candidate peaks more than "might" be "possibles." Note that this is a far broader range of directions than merely "SW." South AND West could mean anywhere from SE to NW.

[Easton]

That makes no sense either.

Aside from which, Arnold's apparent confirmation that the objects flew westwards between his location and Mt. Rainier has previously been taken as important evidence substantiating his extraordinary tale. For example, as Bruce Maccabee stated in his 1986 MUFON presentation on this case, "He watched the flashing objects closely and, as they flew past Mt. Rainier, he determined from their silhouettes against the snow that they had a generally crescent shape".

Of the two options which had become evident, can you really be comfortable with a scenario which depicts Arnold as it does. The alternative - that it's not possible to reconcile his stated perceptions with the factual possibilities - may be unpalatable,

however, is it any more so than dismissing what is undeniably consistent witness testimony?

COMMENTS: Undeniably consistent witness testimony? Like "I counted nine of them as they disappeared behind the peak of Mt. [Rainier]" -- or was it in front? A 180 or 360 turn over Mineral? First seen in front of the mountain or first seen far to the north? First thought geese or first thought an aircraft in near-collision? Clocked with a stop watch, wristwatch or his instrument panel clock? Saucer-shaped, or bat-shaped, or tadpole-shaped, or wraith-like, or a half moon? Above the ridge or swerving in and out? At 9,000 feet, or 9,500, or 10,000, or perhaps 6,000 feet? Constant elevation or climbing? Flying towards Mt. Rainier, or Yakima, or Goat Ridge? Flying parallel to the objects or at right angles? Continued his search for the crashed C-46 for 15-20 minutes after the sighting or dropped it in his excitement and eagerness to report?

Again, you misrepresent my views, as I never dismissed consistent testimony and I've striven to reconcile inconsistent testimony.

>By the way, speaking of crossing in front of Mt. Rainier at
>about the 6,000-foot level of the "jagged peaks" in FRONT of
>Rainier that you are forced to accept, your birds have a major
>and severe problem here:

Comments noted;

COMMENTS: But you DELETED most of my comments so readers can't see what I said! And no one can see what it is you're not answering. I pointed out that:

"Rainier is at least 15 miles wide at the 6,000-foot contour level and ... there is NO SKY TO BE SEEN at that level for 100 miles to the north, especially with Arnold looking down from 9200 feet. There is also NO SKY at 6,000 feet for birds to be seen against in crossing from Rainier to the Goat Rocks Wilderness because the Nisqually River has higher elevations in the foreground and background from Arnold's direction. At bird speeds of 30-50 mph tops, it would have taken BIRDS at least 18-30 MINUTES to CROSS THE FACE

OF MT. RAINIER, then to appear towards Goat Ridge to the east-southeast of the face. Even at the 9,000-foot level if you try to put the birds that high and abandon Arnold's "jagged peak" they flew behind, Rainier is still 5-1/2 miles across (from Ptarmigan Ridge to Anvil Rock) and it would take birds

7-11 MINUTES TO CROSS THE FACE OF MT. RAINIER to get over to Goat Ridge's direction. Moreover, with Arnold flying at about 120 mph eastward, the birds could NEVER ACTUALLY HAVE MADE IT across Mt. Rainier's face from his position in the aircraft. At some point the birds would actually APPEAR TO FLY BACKWARDS from Arnold's plane with respect to the Mt. Rainier background, as Arnold reached a point south-southwest or south of Rainier, overtaking them."

[Easton]

I suspect our large, reflective, echelon

formation birds, comprehensively proven to resemble key aspects

of Arnold's stated and distinctive flight characteristics

COMMENTS: As I said before, birds do not match Arnold's objects in: (1) EXTREME BRIGHTNESS, (2) HIGH SPEED, (3) WIDE RANGE OF DIRECTIONS SEEN (DRAW A MAP!!!) and (4) EXTREME DISTANCE/SIZE (which is why we're arguing so much over the BEHIND Rainier/FRONT of Rainier issue).

[Easton]

(plus

having a nearby, contemporary documented sighting of nine such

artefacts mistaken for 'flying discs', already 'in the bag'), are

content to sit this out for the moment. ;)

COMMENTS: But you've ALWAYS "sat this out" on the 4 issues (above) and only started addressing the first one about brightness.

[Easton]

First of all, what has to be resolved to support any premise that

Arnold's nine artefacts were probably/possibly not terrestrial,

is some consistency in agreeing the actual occurrence which is to

be 'challenged'.

There's a further question re Arnold's claims about those

reflections being so bright, a story which seems to have grown in the telling. In the radio interview conducted just afterwards, he stated:

"I was approximately 25 to 28 miles from Mt. Rainier, I climbed back up to 9200 feet and I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier. I, at first, thought they were geese because it flew like geese, but it was going so fast that I immediately changed my mind and decided it was a bunch of new jet planes in formation".

Curiously, Arnold doesn't mention anything about a 'brilliant flash',

COMMENTS: This was Arnold's first live radio interview and can't be taken to be his BEST and COMPLETE account. The DAY BEFORE the radio interview, In his very first interview, with the Pendleton East Oregonian, on June 25, 1947, which was published the next day, it was reported with both paraphrase and direct verbatim quotes:

"The Boise man ... described the objects as ... so shiny they reflected the SUN like a mirror. He said the reflection was SO BRILLIANT that it BLINDED him "as if someone had started an ARC LIGHT in front of my eyes." "

Arnold told the Chicago Tribune the same afternoon, June 25:

"The first thing I noticed was a series of FLASHES in my eyes as if a MIRROR was reflecting SUNLIGHT at me. I saw the FLASHES were coming from a series of objects that were traveling incredibly fast. They were silvery and shiny and seemed to be shaped like a pie plate."

[Easton]
however, he does initially confirm a critical aspect

which has still to be addressed. It's also mentioned in other sources that at first he considered the nine objects to be geese, although, just perhaps crucially, clearly never realising that there were other, eminently more suitable candidates.

Arnold only changed his mind about birds due to the objects' apparent airspeed and, according to a newspaper report, because it wouldn't make sense for birds to be flying south at that time of year (which would be mistaken).

If, as later recounted, the flash(es) of light 'lit up his aircraft' and from a distance of over a hundred miles (I don't think so) etc., then why would he ever had surmised the nine objects might be geese?

Can we perhaps deduce that either, Arnold attributed exceptional reflective capabilities to geese, or the reflections were, in fact, not inconsistent with birds.

James.

COMMENTS: The best explanation appears to be that Arnold compared the objects' FLIGHT PATTERN with geese, NOT their PHYSICAL APPEARANCE or configuration.

Thank you for this excellent analysis. However you lost me when you used "E" for both powers of ten notation and for $E = I/R^2$ where E is the "illuminance on the surface" ($2E4 \text{ lm/m}^2$).

<

Oops. Sorry. "Tradition" requires illuminance to be E (lumens/cm²) whereas luminance (brightness) is B (lumens/cm²/steradian) and luminous intensity is I (lumens/steradians).

I could have used $1e2$ with e representing 10, but that, traditionally, is the natural base, e (2.71828).

Anyway, hope you figured it out!

Incidentally, for whatever its worth, in reviewing what I wrote I noted that I defined candle as lm/m^2 where it should have been lm/sr .

Joel,

This would be helpful. Unfortunately, I'm unable to download any image!

Although the data is being transferred, when complete, nothing appears on screen.

Even if I download directly as a file, it's not saving an image - same with Netscape and Explorer.

James.

- > I can't tell anything that critical from the crude drawing posted
- > (from the IUR cover). It looks like it had been hastily made on
- > an envelope resting on somebody's knee to me.

MORE COMMENTS: Arnold's ONLY KNOWN DRAWING of the flight path does not look so "hastily" made to me: He has captions for 10,000-ft altitude, 5-mile length, A-B marked (I have to get the complete drawing to see where "B" appears, only a portion appears on IUR's cover), calculations of speed, three sets of terrain features for Mt. Rainier, Goat Ridge and Mt. Adams, and of course the flight path wiggly line itself showing by its unevenness the variation of the objects' motion/path.

If anything, this drawing looks more carefully done than the shape sketches he sent the AAF, and one wonders (as you ask below) why he didn't supply such a drawing to the AAF? Why didn't he supply a MAP? There has NEVER been a MAP drawn by ANYONE and published or made available (except a worthless sketch in FSR 1984, and except an outline Bruce Maccabee posted). Yet we know Arnold drew a map and there is even a news photo of him with it (in the Idaho Statesman one edition but not all for June 28, 1947).

The question

- > @BEHIND Rainier's peak or 6 miles BEHIND Little Tahoma.
- >
- > This estimate was based on Arnold's guess that the objects were
- > really aircraft.

MORE COMMENTS: No it wasn't -- you refute yourself in your next sentence about terrain setting a "lower bound" (see below). See my revised 12 Points where I anticipated this objection in advance. Arnold said over and over again his distance

estimates were based on passing behind terrain features. His distance estimates were refined as he worked over the MAP PLOTS in the days after his sighting. He NEVER said he estimated the objects' distance using guesswork as to SIZE.

Notice for example he said the objects APPEARED smaller than the DC-4 he saw at about 15 miles but were farther away, at 23 miles. The actual figures from his comparisons show he calculated the size to distance ratios accurately and wasn't GUESSING at SIZE or something he couldn't possibly determine without distance data. The furthest engines on the DC-4 to which he compared the objects' width are separated by 65 feet (data thanks to Joel Carpenter, correcting earlier 60-ft figure of Bruce Maccabee). If at 23 miles instead of 15 miles this would be 99.7 feet approximately. He estimated the objects' width at 100 feet -- representing an EXACTLY CORRECT CALCULATION and scaling of angular size to the nearest foot.

If the objects were not really in the size range

- > of an airplane, then the estimate is worthless. But if the
- > objects really did fly behind Little Tahoma, then that puts a
- > lower bound on the distance.
- >
- > Is it possible for pelicans to disappear while traversing in

- > @enormous 45 degree angle difference.
- >
- > This is again assuming that the objects were AT the distance of
- > Goat Ridge, and not closer. Which is then based on the assumption
- > that the objects were aircraft-sized.

MORE COMMENTS: My argument is NOT about where the objects actually flew but where Arnold THOUGHT they flew when he PLOTTED IT ON HIS MAP -- I say explicitly that it is "contrary to Arnold's 170-deg course plotted on his map." It is NOT based on guessing the size of the objects or the quality of his visual observation abilities, but on his drawing and mapping skills on an aeronautical chart a few feet in front of him, and whether he can "eyeball" a 45-degree deviation without even having to measure it with a protractor or compass.

- > @ (6) BEHIND = RIGHT HEADING: A flight path of the objects

- > @but not in chronological narrative order.
- >
- > Another possibility is that the objects presented a very low
- > contrast against the mountain, and were thus indistinct during
- > this period.

MORE COMMENTS: See my 12 Points. The mirror-like or "intense blue-white" objects SHOULD have been INVISIBLE or nearly so IF actually in FRONT of the snow but Arnold claimed he "clearly" saw their shapes against the sky and the snow at CLOSEST APPROACH which would have been near Mt. Rainier. The Rainier phase of his story is when in the sequence of his narrative, CONFUSION suddenly enters in from then on.

- > Another possibility is that Arnold couldn't keep his story
- > straight.
- >
- > @ (9) NO SKY BACKGROUND IF IN FRONT: If Arnold's objects fle

- > @Mt. Rainier his depression angle from his plane would not only
- > @prevent him from seeing the objects against the SKY but by doing
- > @so would also have prevented him from seeing a SKY edge of Mt.
- > @Rainier to BEGIN HIS FAMOUS "CLOCKING" of the objects' speed.
- > @This clashes with all of Arnold's accounts and his only known
- > @DRAWING of the flight path.

- >
- > OOPS! How was Arnold able to START the clocking exactly when they
- > crossed the edge of the mountain if he couldn't SEE them until
- > they got there?

MORE COMMENTS: I thought it understood from comments in previous postings that the objects would have reappeared in the gap between Mt. Rainier's summit and Little Tahoma Peak then disappeared again but very briefly, behind the latter, and that's when he started his renowned "timing." I already anticipated this and revised the point in my 12 Points before you posted this.

- Not only would he not know exactly where they
- > would come out from behind the mountain, he could not even know
 - > that they WOULD come from behind it. So the clocking is
 - > improbable if they went behind, because Arnold would be wondering
 - > if they would reappear instead of getting ready to clock them.

MORE COMMENTS: I'm soon going to post a response to Bruce on this, but let me just say we're forgetting something important here: We keep referring to these 9 objects as if they were ONE OBJECT at ONE SPATIAL POSITION. They weren't. Arnold estimated the 9 objects were spread out over a 5-mile length horizontally and also were spread vertically with the first object highest and the remainder progressively lower. At the 10,000-foot level Rainier is only 4 miles wide so a 5-mile chain of 9 objects would NEVER COMPLETELY DISAPPEAR BEHIND MT. RAINIER, but would always have at least one object visible at one end of the chain or the other.

Moreover, Arnold had watched these objects travel in a constant-heading line from far to the north and he could easily project forward their simple LINEAR PATH to estimate when objects passing behind Rainier would reappear -- especially if there was always an object visible at one end of the chain as a "visual place holder" or reminder of where the entire chain must be located EVEN WHEN INVISIBLE AND BEHIND MT. RAINIER. Comprene?

- > It's almost as if Arnold told different stories to different
- > people. Now the questions are:
- >
- > * Why did all of these reporters come up with the same mistakes?
- >
- > * Was someone acting as a spokesman for Arnold?

MORE COMMENTS: How much was simply due to normal variation of human memory and perceptual limitations? Some of the problem testimony comes from Arnold in his own writings or in recorded interviews.

- > * Why are Arnold's descriptions of what happened so vague as to
- > not include language stating whether the objects flew in front of
- > or behind Mt. Rainier?

MORE COMMENTS: This confusion sets in at the point when the objects "approach" Rainier. It is also likely that after the linear progression reached Rainier the visual field simply got more complicated with some objects disappearing others reappearing, some flashing, others fading, etc., and Arnold's brain simply got overloaded as to the fine points of sequence, location, etc.

- > * If Arnold made a report and a drawing for the Air Force, why
- > wasn't it specific regarding the flight path of the objects?

MORE COMMENTS: Excellent question!

- > These are symptoms of fabrication.

MORE COMMENTS: Further down you suggest that it might have been a TOTAL fabrication. But a better explanation is simply CONFUSION OF DETAILS.

It seems as though it was not

- > important to Arnold whether the objects went in front of or
- > behind the mountain. Let's see now:
- >
- > * He was busy trying to figure out what they were.
- >
- > * He had time to observe them and try to discern the shapes.
- >
- > * He had time to measure the angular size by comparing them to a
- > Dzus fastener on his cockpit cowling (something most witnesses
- > don't even think of at the time of the sighting).
- >
- > * And, of course, he was also still flying his plane.
- >
- > -- all of this while he was timing them???

- >
- > These other details were important to Arnold, but the important
- > detail of whether the objects passed in front of or behind Mt.
- > Rainier is mentioned rarely, and some of those rare instances are
- > possibly in conflict with each other.

MORE COMMENTS: I think you'll find that passage behind/front is mentioned almost as frequently as the timing and angular size/actual size because these depended on the distance. He was apparently challenged on the distance determination and sounds defensive about it in some of the interviews. Maybe that forced him to try to remember details better than he possibly could.

- > It almost smells like that purveyor of picuniarly promulgated
- > prevaricating nonprosaic prose, Ray Palmer, made the whole thing
- > up and fed it to Arnold. There was a similar story in a tabloid
- > book that appeared some time before the sighting. The cover of
- > that 'bloid is pictured in one of Brookesmith's books.

MORE COMMENTS: If this is your only evidence of a Palmer-Arnold conspiracy to fabricate the whole story then you need to substantiate it at the very minimum by going over the allegedly similar story in fine detail to show how similar to Arnold's it was.

- > This is the only solution that doesn't require us to use eight

- >
- > I can't tell anything that critical from the crude drawing posted
- > (from the IUR cover). It looks like it had been hastily made on
- > an envelope resting on somebody's knee to me.

MORE COMMENTS: Arnold's ONLY KNOWN DRAWING of the flight path does not look so "hastily" made to me: He has captions for 10,000-ft altitude, 5-mile length, A-B marked (I have to get the complete drawing to see where "B" appears, only a portion appears on IUR's cover), calculations of speed, three sets of terrain features for Mt. Rainier, Goat Ridge and Mt. Adams, and of course the flight path wiggly line itself showing by its unevenness the variation of the objects' motion/path.

If anything, this drawing looks more carefully done than the shape sketches he sent the AAF, and one wonders (as you ask below) why he didn't supply such a drawing to the AAF? Why didn't he supply a MAP? There has NEVER been a MAP drawn by ANYONE and published or made available (except a worthless sketch in FSR 1984, and except an outline Bruce Maccabee posted). Yet we know Arnold drew a map and there is even a news photo of him with it (in the Idaho Statesman one edition but not all for June 28, 1947).

The question

- > becomes: Why was the drawing made? Was it made to preserve the
- > sighting in Arnold's mind, or was it drawn to show someone else
- > the details of the sighting?
- >
- > @(3) OTHER ARNOLD STATEMENTS: Other statements by Arnold also

- > @BEHIND Rainier's peak or 6 miles BEHIND Little Tahoma.
- >
- > This estimate was based on Arnold's guess that the objects were
- > really aircraft.

MORE COMMENTS: No it wasn't -- you refute yourself in your next sentence about terrain setting a "lower bound" (see below). See my revised 12 Points where I anticipated this objection in advance. Arnold said over and over again his distance

estimates were based on passing behind terrain features. His distance estimates were refined as he worked over the MAP PLOTS in the days after his sighting. He NEVER said he estimated the objects' distance using guesswork as to SIZE.

Notice for example he said the objects APPEARED smaller than the DC-4 he saw at about 15 miles but were farther away, at 23 miles. The actual figures from his comparisons show he calculated the size to distance ratios accurately and wasn't GUESSING at SIZE or something he couldn't possibly determine without distance data. The furthest engines on the DC-4 to which he compared the objects' width are separated by 65 feet (data thanks to Joel Carpenter, correcting earlier 60-ft figure of Bruce Maccabee). If at 23 miles instead of 15 miles this would be 99.7 feet approximately. He estimated the objects' width at 100 feet -- representing an EXACTLY CORRECT CALCULATION and scaling of angular size to the nearest foot.

If the objects were not really in the size range

- > of an airplane, then the estimate is worthless. But if the
- > objects really did fly behind Little Tahoma, then that puts a
- > lower bound on the distance.
- >
- > Is it possible for pelicans to disappear while traversing in
- > front of two mountains? Only if they present such a low contrast
- > that they can't be seen.
- >
- > @ (5) FRONT = WRONG HEADING: A flight path by the objects on the

- > @enormous 45 degree angle difference.
- >
- > This is again assuming that the objects were AT the distance of
- > Goat Ridge, and not closer. Which is then based on the assumption
- > that the objects were aircraft-sized.

MORE COMMENTS: My argument is NOT about where the objects actually flew but where Arnold THOUGHT they flew when he PLOTTED IT ON HIS MAP -- I say explicitly that it is "contrary to Arnold's 170-deg course plotted on his map." It is NOT based on guessing the size of the objects or the quality of his visual observation abilities, but on his drawing and mapping skills on an aeronautical chart a few feet in front of him, and whether he can "eyeball" a 45-degree deviation without even having to measure it with a protractor or compass.

- > @ (6) BEHIND = RIGHT HEADING: A flight path of the objects

- > @but not in chronological narrative order.
- >
- > Another possibility is that the objects presented a very low
- > contrast against the mountain, and were thus indistinct during
- > this period.

MORE COMMENTS: See my 12 Points. The mirror-like or "intense blue-white" objects SHOULD have been INVISIBLE or nearly so IF actually in FRONT of the snow but Arnold claimed he "clearly" saw their shapes against the sky and the snow at CLOSEST APPROACH which would have been near Mt. Rainier. The Rainier phase of his story is when in the sequence of his narrative, CONFUSION suddenly enters in from then on.

- > Another possibility is that Arnold couldn't keep his story

- > @Mt. Rainier his depression angle from his plane would not only
- > @prevent him from seeing the objects against the SKY but by doing
- > @so would also have prevented him from seeing a SKY edge of Mt.
- > @Rainier to BEGIN HIS FAMOUS "CLOCKING" of the objects' speed.
- > @This clashes with all of Arnold's accounts and his only known
- > @DRAWING of the flight path.

- >
- > OOPS! How was Arnold able to START the clocking exactly when they
- > crossed the edge of the mountain if he couldn't SEE them until
- > they got there?

MORE COMMENTS: I thought it understood from comments in previous postings that the objects would have reappeared in the gap between Mt. Rainier's summit and Little Tahoma Peak then disappeared again but very briefly, behind the latter, and that's when he started his renowned "timing." I already anticipated this and revised the point in my 12 Points before you posted this.

- Not only would he not know exactly where they
- > would come out from behind the mountain, he could not even know
 - > that they WOULD come from behind it. So the clocking is
 - > improbable if they went behind, because Arnold would be wondering
 - > if they would reappear instead of getting ready to clock them.

MORE COMMENTS: I'm soon going to post a response to Bruce on this, but let me just say we're forgetting something important here: We keep referring to these 9 objects as if they were ONE OBJECT at ONE SPATIAL POSITION. They weren't. Arnold estimated the 9 objects were spread out over a 5-mile length horizontally and also were spread vertically with the first object highest and the remainder progressively lower. At the 10,000-foot level Rainier is only 4 miles wide so a 5-mile chain of 9 objects would NEVER COMPLETELY DISAPPEAR BEHIND MT. RAINIER, but would always have at least one object visible at one end of the chain or the other.

Moreover, Arnold had watched these objects travel in a constant-heading line from far to the north and he could easily project forward their simple LINEAR PATH to estimate when objects passing behind Rainier would reappear -- especially if there was always an object visible at one end of the chain as a "visual place holder" or reminder of where the entire chain must be located EVEN WHEN INVISIBLE AND BEHIND MT. RAINIER. Comprene?

OK, I cut the file size down a few hundred kb -- if it doesn't work now,
please contact me privately and I'll try sending it as a file attachment.

>DISAPPEARED BEHIND the peak of Mount Ranier [Rainier]."

Brad,

I didn't 'duck' this issue, I pointed it out!

Yes an anomaly, however it has to be seen in the context that
it's is a _reported_ comment, could easily be a misunderstanding
about the objects (apparently) disappearing behind a 'peak' and
most importantly, Arnold seemingly never referred to this
fundamental aspect elsewhere.

The reported quote is: "I counted nine of them as they
disappeared behind the peak of Mount Rainier".

Could Arnold actually have said, "I counted nine of them as they
disappeared behind a peak on Mount Rainier".

That would be consistent with Arnold's trustworthy, verbatim
accounts.

>(2) ARNOLD DRAWING: Arnold's ONLY KNOWN drawing of the
>objects' flight path shows them coming out from BEHIND Rainier's
>south edge and NEVER CROSSING IN FRONT, using two different
>standard artistic conventions (short light line showing path
>behind mountain, then line curved from behind away from
>mountain). (See IUR cover Mar/Apr 95.) The drawing was
>probably done in late June 1947.

As I did respond, the drawing is ambiguous (what it be too much to ask for something that wasn't) and open to different interpretations. I also explained that I did appreciate why you thought this might be supportive of your supposition.

>(3) OTHER ARNOLD STATEMENTS: Other statements by Arnold also
>mention a disappearance behind a specific jagged "peak" or
>"cleft" of Rainier which appears to have been Rainier's most
>prominent subsidiary peak, the well-known 11,000-foot Little
>Tahoma Peak two miles east of Rainier's summit, since McDonald,
>Kottmeyer, Maccabee and others could not find a suitable 9,000+
>ft peak in the SW FRONT of Rainier fitting the 9,000-10,000-foot
>altitude of the objects, but only minor 6,000-foot peaks.

Even in Bequette's article, where it's mentioned, "He said he could estimate the distance of the objects better because an intervening peak once blocked his view of them. He found the peak was 25 miles away, he related", this is immediately followed by the reported confirmation, "The Boise flyer said they flew on the west sides of Rainier and Adams, adding that he believed this would make it more difficult for them to be seen from the ground".

Contrary to your point here, there seems to be no evidential reason why the 'peak' Arnold mentions is 'Little Tahoma'. If this is the only 'jagged peak' which could 'fit' by altering much of Arnold's consistent testimony, that alone should perhaps indicate it doesn't correspond.

>.(4) DISTANCE: Arnold's BEST ESTIMATE of the distance to the
>objects was 23 miles and from a position several miles east of
>Mineral, Wash., where he was roughly 15 miles from the peak of
>Mt. Rainier. Thus the objects must have been about 8 miles
>BEHIND Rainier's peak or 6 miles BEHIND Little Tahoma.

Agreed, that could equate, however, there's also the possibility that Arnold believed the nine objects momentarily passed behind a completely different peak, perhaps to the south of Mt. Rainier.

It seems impossible to determine when Arnold decided the objects were so far distant.

>(5) FRONT = WRONG HEADING: A flight path by the objects on the
>west side of Rainier, passing in FRONT of the SW slopes, would
>have to head at 125 degs or less to reach Goat Ridge, contrary
>to Arnold's 170-deg course plotted on his map. An experienced

>mountain pilot such as Arnold would instantly spot such an
>enormous 45 degree angle difference.

That's obviously conjecture. We could equally say that such an experienced pilot wouldn't normally have multiple sightings of 'flying saucers', especially also being bewildered by 25-30, 2-3 ft objects which resembled ducks but apparently flew too fast.

On the point of Arnold's continual sightings, I have located an online source of the 'Excerpts from an August 5, 1956, letter to Isabel L. Davis from Maurene Chenoweth', at:

<http://home.worldonline.nl/~karel/ufo/news/articles/0375.html>

Following an interview with Arnold, the writer notes:

"On his own sightings he has seen saucers five separate times and he has made movies of them. One flew under him at Mt. Lassen and he got a movie of that".

>(6) BEHIND = RIGHT HEADING: A flight path of the objects
>BEHIND Rainier, on the east side, some 6 miles behind Little
>Tahoma, would head on a course of 170 degrees to reach Goat
>Ridge -- exactly in agreement with Arnold's 170-degree course
>for the objects.

It would tend to substantiate some basis for an extraordinary event... if the considerable, overall evidence didn't indicate otherwise.

>(7) SLAMMING INTO RAINIER: The objects could not fly on a 170
>heading and between the 6,000 foot peaks on the southwestern
>FRONT slope of Rainier without slamming into the 8,000-9,000-
>foot level of Rainier first.

Well, yes, which might suggest the circumstances you are reluctant to accept and which are frequently evidenced, may be the true explanation.

As you can hopefully see, far from 'conveniently dodging' the points you raised they have largely been addressed and in essence, your scenario can only be viable by abandoning what was previously endorsed - in support of the premise these nine objects could be ET spacecraft- as potential proof.

It's comparable to a jigsaw; your key piece can perhaps be made to 'fit', but when we look at the overall picture, it clearly doesn't match corresponding pieces of the puzzle.

If that's what you are prepared to accept, it can only be acknowledged and should be appreciated you have set out the reasons why.

Incidentally, it isn't contended that a formation of birds, no matter how large and reflective, would be a conceivable candidate if the nine objects were truly so far distant as you surmise.

Yet, were those nine, brightly reflective, echelon flying, fluttering and sailing artefacts really so far away as Arnold believed and if so, why the apparent dilemma in easily confirming this.

James.

Subject: Arnold /Kottmeyer/"Complaint"Status:

Bruce,

I'm very glad you brought up the issue of how many seconds Arnold's objects would have been behind Mt. Rainier because it points up the fact that they ALL would NOT have DISAPPEARED if they passed BEHIND Rainier.

We keep forgetting something important here: We keep referring to these 9 objects as if they were ONE OBJECT at ONE SPATIAL POSITION. They weren't. Arnold estimated the 9 objects were spread out over a 5-mile length horizontally and also were spread vertically with the first object highest and the remainder progressively lower. At the 10,000-foot level Rainier is only 4 miles wide so a 5-mile chain of 9 objects would NEVER COMPLETELY DISAPPEAR BEHIND MT. RAINIER, but would always have at least one object visible at one end of the chain or the other.

Moreover, Arnold had watched these objects travel in a constant-heading line from far to the north and he could easily project forward their simple LINEAR PATH to estimate when objects passing behind Rainier would reappear -- especially if there was always an object visible at one end of the chain as a "visual place holder" or reminder of where the entire chain must be located EVEN WHEN INVISIBLE AND BEHIND MT. RAINIER.

Some MORE COMMENTS briefly.

Brad

 >
 > I admit that his STORY suffers confusion, coming, as it does, from numerous
 > different
 > sources under varying circumstances.

MORE COMMENTS: I think you hit the nail on the head here. Suddenly at the point where the objects APPROACH Mt. Rainier Arnold's story starts getting sequentially CONFUSED. But it isn't because his story comes from different sources -- Arnold's story suffers this confusion upon proximity to Mt. Rainier when he himself did the writing under no pressure or compulsion from reporters putting him on the spot for instant answers. In some cases Arnold's confused account -- always confused at this same place in the story -- comes YEARS LATER as in his 1952 book or in his 1977 lecture, revised and published in 1980.

I believe that ARNOLD HIMSELF was

- > not confused
- > as to whether or not they passed between him and Rainier or on the other
- > side.
- > I think the problem has arisen because no one interviewed him in detail,
- > making him recall
- > "second by second" what happened. Instead, he was free to recite the
- > history as he saw fit
- > at the time. Certainly as far as the press reports are concerned (as
- > opposed to his Air Force
- > letter or the book), he was asked to come up with a version of the story on
- > the spur of the moment, knowing that he couldn't take time to explain
- > carefully all the details. HOWEVER, if, in an interview,
- > he says "I saw them approaching Mt. Rainier from the north" and then a few
- > sentences later (or perhaps the next sentence) he says, "I could see their
- > shape against the snow banks" , he would logically believe that the
- > listener could infer that the objects were between him and Rainier.

MORE COMMENTS: But Arnold makes this same mental calculation of what his readers or listeners would "logically" infer EVERY SINGLE TIME he told and retold his story over 30+ years!!!! And flying in front of the mountain contradicts his direct statement to the Chicago Tribune, his ONE AND ONLY DRAWING of flight path, his mapping of the 23-mile distance, his mapping of the 170 course to Goat Ridge, etc. etc., I have listed 12 Points on this.

 > with the most
 > common or self-consistent version to determine what happened.

MORE COMMENTS: Certainly SOME of these discrepancies can be accounted for
 by spur-of-the-moment statements, e.g., his distance estimates as he further refined
 them. Trying to resolve the discrepancies is why we're analyzing the case.

> I think everyone here would agree that Arnold saw SOME NUMBER (9) or

LARRY ROBINSON WROTE in response to "Brad's Complaint"
and "12 Monkeys"..oops, . I mean 12 reasons,

>

I>t's almost as if Arnold told different stories to different
>people.

Probably did tell different DETAILS of the same story to
different reporter, but he certainly told the "core story"
to all of them

> Now the questions are:

>* Why did all of these reporters come up with the same mistakes?

Reporters write what they believe they have heard (at least the honest
ones do)..... but this may not be what the witness said or at least
not what the witness meant to say. Rarely does a reporter ask
sufficiently perceptive questions, but even if the reporter does
do good job and get a complete story, the compression of the
story to make it fit a 3 second news bite or whatever, like the
disinterest of the editor, causes the final version to be "divergent"
from the witness' statement. Can't even trust a quote.

>* Was someone acting as a spokesman for Arnold?

Nah, forget this. (We even have Arnold on tape.)

>* Why are Arnold's descriptions of what happened so vague as to
>not include language stating whether the objects flew in front of
>or behind Mt. Rainier?

He certainly made statements many times and many ways that
would indicate he knew which side of the mountain they were on
and furthermore, it appears that he assumed the listener/reader
would make the correct inference that he saw them silhouetted
against the side of the mountain.

As you pointed out in a section of your response not reproduced
here, how would he have known when to start clocking if
he hadn't been able to see them traveling past the west side
of Rainier?

>* If Arnold made a report and a drawing for the Air Force, why

>wasn't it specific regarding the flight path of the objects?

Read the stuff that has been posted. HE said he could see them against the side of the mountain (snow).

>These are symptoms of fabrication. It seems as though it was not important to Arnold whether the objects went in front of or behind the mountain. Let's see now:

Don't be fooled by this argument raised by Brad. There is no indication that Arnold fabricated anything.

>* He was busy trying to figure out what they were.

Yes.

>* He had time to observe them and try to discern the shapes.

Yes.

>* He had time to measure the angular size by comparing them to a Dzus fastener on his cockpit cowling (something most witnesses don't even think of at the time of the sighting).

Yes and yes

>* And, of course, he was also still flying his plane.

Yes.

>-- all of this while he was timing them???

Yes. No big deal. all he had to do was note the time when the first one passed the southern edge of Rainier. Then he could spend time watching, turning his plane and rolling down his window, etc. for the next minute or so as they flew toward Mt. Adams.

>These other details were important to Arnold, but the important detail of whether the objects passed in front of or behind Mt. Rainier is mentioned rarely, and some of those rare instances are possibly in conflict with each other.

>It almost smells like that purveyor of picuniarly promulgated prevaricating nonprosaic prose, Ray Palmer, made the whole thing up and fed it to Arnold. There was a similar story in a tabloid book that appeared some time before the sighting. The cover of that 'bloid is pictured in one of Brookesmith's books.

This idea is complete garbage.

>This is the only solution that doesn't require us to use eight 1942 Vought V-173s and a wrecked 1945 Northrop XP-79B, all purloined from the east coast, supported by extraterrestrial fire balloons, and powered by hypnotized 170-degree-oriented supersonic pelicans with sonic boom arrestors on their feet. >

You forgot that the pelicans were riding on Klassic Low Altitude Meteors (that's how they got their fantastic speed)

Nitpick:

Yes, 65 ft, but arniold wasn't looking directly north at the plane fling away from him.

There was some angle/perspective shortening of the spacing between the engines.

I'll stick with my 60 ft as the projected spacing in Arnold's direction.

This is of course

only a rough guess of the angle (80 degrees) that goes into the cosine correction.

MORE COMMENTS: I thought it understood from comments in previous postings that the objects would have reappeared in the gap between Mt. Rainier's summit and Little Tahoma Peak then disappeared again but very briefly, behind the latter, and that's when he started his renowned "timing." I already anticipated this and revised the point in my 12 Points before you posted this.

<

He'd have to be quick since he could only see them in the gap for a second or two before they disappear behind the smaller peak and reappear in another second.

Message text written by "UFO Research List"

>MORE COMMENTS: I'm soon going to post a response to Bruce on this, but let me just say we're forgetting something important here: We keep referring to these 9 objects as if they were ONE OBJECT at ONE SPATIAL POSITION. They weren't. Arnold estimated the 9 objects were spread out over a 5-mile length horizontally and also were spread vertically with the first object highest and the remainder progressively lower. At the 10,000-foot level Rainier is only 4 miles wide so a 5-mile chain of 9 objects would NEVER COMPLETELY DISAPPEAR BEHIND MT. RAINIER, but would always have at least one object visible at one end of the chain or the other.

Moreover, Arnold had watched these objects travel in a constant-heading line from far to the north and he could easily project forward their simple LINEAR PATH to estimate when objects passing behind Rainier would reappear -- especially if there was always an object visible at one end of the chain as a "visual place holder" or reminder of where the entire chain must be located EVEN WHEN INVISIBLE AND BEHIND MT. RAINIER. Comprendre?
<

Well, this is a guess. We don't know that Arnold would have assumed that the objects would continue along a straight (nominally) path simply from seeing them approach the mountain. For all h knew they could suddenly make an eastward turn and "disappear."

In fact, it probably was not until after they passed Rainier that he got a good idea of the direction of flight.

Even if their altitude was high enough so that the last one was still visible at the left when the first one appeared at the right side of the mountain

does not mean that he would have known when to be ready to start clocking them.

Had he started clocking when the SECOND one appeared from behind the mountain your argument would be better.... but still not convincing to me,

Just to let you know, it worked for me Joel, using Netscape 4.7,
but I'm hooked up via a cable modem, so that could be a big
difference.

@> @James,

@> @ (2) ARNOLD DRAWING: Arnold's ONLY KNOWN drawing of the
@> @objects' flight path shows them coming out from BEHIND Rainier's
@> @south edge and NEVER CROSSING IN FRONT, using two different
@> @standard artistic conventions (short light line showing path
@> @behind mountain, then line curved from behind away from
@> @mountain). (See IUR cover Mar/Apr 95.) The drawing was
@> @probably done in late June 1947.

@> I can't tell anything that critical from the crude drawing posted
@> (from the IUR cover). It looks like it had been hastily made on
@> an envelope resting on somebody's knee to me.

@MORE COMMENTS: Arnold's ONLY KNOWN DRAWING of the flight path
@does not look so "hastily" made to me: He has captions for
@10,000-ft altitude, 5-mile length, A-B marked (I have to get the
@complete drawing to see where "B" appears, only a portion
@appears on IUR's cover), calculations of speed, three sets of
@terrain features for Mt. Rainier, Goat Ridge and Mt. Adams, and
@of course the flight path wiggly line itself showing by its
@unevenness the variation of the objects' motion/path.

@If anything, this drawing looks more carefully done than the
@shape sketches he sent the AAF, and one wonders (as you ask
@below) why he didn't supply such a drawing to the AAF? Why
@didn't he supply a MAP? There has NEVER been a MAP drawn by
@ANYONE and published or made available (except a worthless
@sketch in FSR 1984, and except an outline Bruce Maccabee
@posted). Yet we know Arnold drew a map and there is even a news
@photo of him with it (in the Idaho Statesman one edition but not
@all for June 28, 1947).

It would be impossible to make a map, without knowing actual
distance, which he did not have.

@>The question
@> becomes: Why was the drawing made? Was it made to preserve the
@> sighting in Arnold's mind, or was it drawn to show someone else
@> the details of the sighting?

@> @ (4) DISTANCE: Arnold's BEST ESTIMATE of the distance to the
@> @objects was 23 miles and from a position several miles east of
@> @Mineral, Wash., where he was roughly 15 miles from the peak of
@> @Mt. Rainier. Thus the objects must have been about 8 miles
@> @BEHIND Rainier's peak or 6 miles BEHIND Little Tahoma.

@> This estimate was based on Arnold's guess that the objects were
@> really aircraft.

@MORE COMMENTS: No it wasn't -- you refute yourself in your next
@sentence about terrain setting a "lower bound" (see below). See
@my revised 12 Points where I anticipated this objection in
@advance. Arnold said over and over again his distance estimates
@were based on passing behind terrain features. His distance
@estimates were refined as he worked over the MAP PLOTS in the
@days after his sighting. He NEVER said he estimated the
@objects' distance using guesswork as to SIZE.

@Notice for example he said the objects APPEARED smaller than the

@DC-4 he saw at about 15 miles but were farther away, at 23 @miles. The actual figures from his comparisons show he @calculated the size to distance ratios accurately and wasn't @GUESSING at SIZE or something he couldn't possibly determine @without distance data. The furthest engines on the DC-4 to @which he compared the objects' width are separated by 65 feet @ (data thanks to Joel Carpenter, correcting earlier 60-ft figure @of Bruce Maccabee). If at 23 miles instead of 15 miles this @would be 99.7 feet approximately. He estimated the objects' @width at 100 feet -- representing an EXACTLY CORRECT CALCULATION @and scaling of angular size to the nearest foot.

But there is NO way he could have known any distance, except IF the objects really went behind Little Tahoma. (and it has not been conclusively shown, given that we now have a direct statement from Arnold that the objects passed in front of Mt. Rainier -- see Bruce's last post). So as it stands now, the objects went in front of Mr. Rainier, and then essed around to go behind Little Tahoma, on a constant 170 degree heading???? :P

@> If the objects were not really in the size range @> of an airplane, then the estimate is worthless. But if the @> objects really did fly behind Little Tahoma, then that puts a @> lower bound on the distance.

@> Is it possible for pelicans to disappear while traversing in @> front of two mountains? Only if they present such a low contrast @> that they can't be seen.

@> @ (5) FRONT = WRONG HEADING: A flight path by the objects on the @> @west side of Rainier, passing in FRONT of the SW slopes, would @> @have to head at 125 degs or less to reach Goat Ridge, contrary @> @to Arnold's 170-deg course plotted on his map. An experienced @> @mountain pilot such as Arnold would instantly spot such an @> @enormous 45 degree angle difference.

@> This is again assuming that the objects were AT the distance of @> Goat Ridge, and not closer. Which is then based on the assumption @> that the objects were aircraft-sized.

@MORE COMMENTS: My argument is NOT about where the objects @actually flew but where Arnold THOUGHT they flew when he PLOTTED @IT ON HIS MAP -- I say explicitly that it is "contrary to @Arnold's 170-deg course plotted on his map." It is NOT based on @guessing the size of the objects or the quality of his visual @observation abilities, but on his drawing and mapping skills on @an aeronautical chart a few feet in front of him, and whether he @can "eyeball" a 45-degree deviation without even having to @measure it with a protractor or compass.

But that entire truth is based on the assumption that the objects were really over goat ridge (impossible to show without sophisticated instruments, or a shadow) and really went behind Little Tahoma peak (which contradicts other testimony if a constant 170 degree heading is assumed).

@> @ (8) STRANGE GAP IN STORY: Arnold NEVER once tells his story of
@> @ seeing the objects to the north of Mt. Rainier, then approaching
@> @ in a line to Rainier, then CROSSING in FRONT of Rainier, and
@> @ then observing the objects' peculiar SHAPES from this CLOSEST
@> @ DISTANCE, as one would logically expect. Arnold gets to the
@> @ point of "APPROACHING the north edge of Rainier" and then fails
@> @ to have the objects cross in front. He later has afterthoughts
@> @ and digressions about objects in front and seeing their shapes
@> @ but not in chronological narrative order.

@> Another possibility is that the objects presented a very low
@> contrast against the mountain, and were thus indistinct during
@> this period.

@ MORE COMMENTS: See my 12 Points. The mirror-like or "intense
@ blue-white" objects SHOULD have been INVISIBLE or nearly so IF
@ actually in FRONT of the snow but Arnold claimed he "clearly"
@ saw their shapes against the sky and the snow at CLOSEST
@ APPROACH which would have been near Mt. Rainier. The Rainier
@ phase of his story is when in the sequence of his narrative,
@ CONFUSION suddenly enters in from then on.

@> Another possibility is that Arnold couldn't keep his story
@> straight.

@> @ (9) NO SKY BACKGROUND IF IN FRONT: If Arnold's objects flew
@> @ behind some minor 6,000-foot bump in the FRONT slopes of Mt.
@> @ Rainier his depression angle from his plane at 9,200+ feet would
@> @ prevent him from EVER seeing the objects against the SKY at that
@> @ altitude, even though Arnold reported seeing the objects against
@> @ the sky both before and after Mt. Rainier. This is contrary to
@> @ Arnold's accounts and his only known DRAWING of the objects'
@> @ flight path.

According to the testimony Bruce just introduced, Arnold said he saw them against the snow. Now, who do we believe, Arnold, or Arnold?

@> @ (10) NO "CLOCKING" POSSIBLE IF IN FRONT: If Arnold's objects
@> @ flew behind some minor 6,000-foot bump in the FRONT slopes of
@> @ Mt. Rainier his depression angle from his plane would not only
@> @ prevent him from seeing the objects against the SKY but by doing
@> @ so would also have prevented him from seeing a SKY edge of Mt.
@> @ Rainier to BEGIN HIS FAMOUS "CLOCKING" of the objects' speed.

@> @This clashes with all of Arnold's accounts and his only known
@> @DRAWING of the flight path.

@> OOPS! How was Arnold able to START the clocking exactly when they
@> crossed the edge of the mountain if he couldn't SEE them until
@> they got there?

@MORE COMMENTS: I thought it understood from comments in
@previous postings that the objects would have reappeared in the
@gap between Mt. Rainier's summit and Little Tahoma Peak then
@disappeared again but very briefly, behind the latter, and
@that's when he started his renowned "timing." I already
@anticipated this and revised the point in my 12 Points before
@you posted this.

Your 12 points did not arrive until after I made my posting.
They were not there when I shut down last night, but appeared
this morning when I connected. There appears to be some delays in
the system, because I don't get my own posting copies until about
an hour after I post them.

I reiterate that once I read your posts, I can't read them again
unless I reply to them, because the lines become too long to fit
the 80 column screen (each paragraph becomes a single line).
There is something weird in your email program that doesn't put
proper line breaks in the text where the lines end. I don't have
any problem with anyone else's posts.

I gather that the timing did not start until the objects appeared
from behind Little Tahoma, then. This is, of course, assuming
that Arnold was wrong when he said that the objects crossed the
face of Mt. Rainier.

@> Not only would he not know exactly where they
@> would come out from behind the mountain, he could not even know
@> that they WOULD come from behind it. So the clocking is
@> improbable if they went behind, because Arnold would be wondering
@> if they would reappear instead of getting ready to clock them.

@MORE COMMENTS: I'm soon going to post a response to Bruce on
@this, but let me just say we're forgetting something important
@here: We keep referring to these 9 objects as if they were ONE
@OBJECT at ONE SPATIAL POSITION. They weren't. Arnold estimated
@the 9 objects were spread out over a 5-mile length horizontally
@and also were spread vertically with the first object highest
@and the remainder progressively lower. At the 10,000-foot level
@Rainier is only 4 miles wide so a 5-mile chain of 9 objects
@would NEVER COMPLETELY DISAPPEAR BEHIND MT. RAINIER, but would
@always have at least one object visible at one end of the chain
@or the other.

And just what did Arnold use to measure this 5 mile figure with?
If you say the mountain, then that assumes that the objects were
at the same distance as the mountain.

@Moreover, Arnold had watched these objects travel in a
@constant-heading line from far to the north and he could easily
@project forward their simple LINEAR PATH to estimate when
@objects passing behind Rainier would reappear -- especially if
@there was always an object visible at one end of the chain as a
@"visual place holder" or reminder of where the entire chain must
@be located EVEN WHEN INVISIBLE AND BEHIND MT. RAINIER.
@Comprende?

Only if Arnold lied when he said he saw them cross the face of
Mt. Rainier.

@> It's almost as if Arnold told different stories to different
@> people. Now the questions are:

@> * Why did all of these reporters come up with the same mistakes?

@> * Was someone acting as a spokesman for Arnold?

@MORE COMMENTS: How much was simply due to normal variation of
@human memory and perceptual limitations? Some of the problem
@testimony comes from Arnold in his own writings or in recorded
@interviews.

I should think that an important detail like which side of the
mountain the objects passed on would not be a "variation of human
memory -- unless Arnold was parroting a story which did not
include that little detail -- or unless the objects were
invisible at times due to low contrast.

Will the real Kenneth Arnold please stand up?

@> * Why are Arnold's descriptions of what happened so vague as to
@> not include language stating whether the objects flew in front of
@> or behind Mt. Rainier?

@MORE COMMENTS: This confusion sets in at the point when the
@objects "approach" Rainier. It is also likely that after the
@linear progression reached Rainier the visual field simply got
@more complicated with some objects disappearing others
@reappearing, some flashing, others fading, etc., and Arnold's
@brain simply got overloaded as to the fine points of sequence,
@location, etc.

@> * If Arnold made a report and a drawing for the Air Force, why

@> wasn't it specific regarding the flight path of the objects?

@MORE COMMENTS: Excellent question!

@> These are symptoms of fabrication.

@MORE COMMENTS: Further down you suggest that it might have been
@a TOTAL fabrication. But a better explanation is simply
@CONFUSION OF DETAILS.

That makes sense! In the auto accident I got into, I had completely forgotten that there had been a third vehicle (a large van which was waiting to turn left) between me and the car that hit my front bumper from behind. It hid my vehicle from the other driver until it was too late. It was only the next day (after the report was made) that I realized what had really happened.

But now that I know the truth, I stick to it.

Apparently, there are only three conclusions possible (unless somebody comes up with one that I didn't think of):

1. Arnold was unsure which side of the mountain and Little Tahoma the objects went on, due to conflicting perceptual clues.
2. His publisher paid him more to change some details, and he got confused between what he really saw and what he was supposed to say (The HAL syndrome?).
3. Arnold was reciting a story given to him by others, probably for picuniary purposes.

@> It seems as though it was not
@> important to Arnold whether the objects went in front of or
@> behind the mountain. Let's see now:

@> * He was busy trying to figure out what they were.

@> * He had time to observe them and try to discern the shapes.

@> * He had time to measure the angular size by comparing them to a
@> Dzus fastener on his cockpit cowling (something most witnesses
@> don't even think of at the time of the sighting).

@> * And, of course, he was also still flying his plane.

@>

@> -- all of this while he was timing them???

@>

@> These other details were important to Arnold, but the important
@> detail of whether the objects passed in front of or behind Mt.
@> Rainier is mentioned rarely, and some of those rare instances are
@> possibly in conflict with each other.

@MORE COMMENTS: I think you'll find that passage behind/front is
@mentioned almost as frequently as the timing and angular
@size/actual size because these depended on the distance. He was
@apparently challenged on the distance determination and sounds
@defensive about it in some of the interviews. Maybe that forced
@him to try to remember details better than he possibly could.

@> It almost smells like that purveyor of picuniarly promulgated
@> prevaricating nonprosaic prose, Ray Palmer, made the whole thing
@> up and fed it to Arnold. There was a similar story in a tabloid
@> book that appeared some time before the sighting. The cover of
@> that 'bloid is pictured in one of Brookesmith's books.

@MORE COMMENTS: If this is your only evidence of a Palmer-Arnold
@conspiracy to fabricate the whole story then you need to
@substantiate it at the very minimum by going over the allegedly
@similar story in fine detail to show how similar to Arnold's it
@was.

True. Anybody got a copy I can borrow? I certainly don't have the
cash to buy what would today be considered a very rare book. If
you want "evidence," just look at all of the OTHER stuff Palmer
published.

Actually, I was just saying that this is starting to look as
likely as all of the other theories that deepend on contradictory
testimony and inferences.

So which Arnold do we believe?

I just thought of two more (neither is very probable, but they
are distinct possibilities):

4. Arnold was hypnotized (party hypnosis was starting to become
popular then) and given a fantastic story as a post-hypnotic
suggestion. The variable parts of the story are the portions the
hypnotist didn't supply.

5. Arnold is one of those people who has defective memory.

Is it possible that there's a hidden assumption about the "formation" of the objects -- that they were in a line?

A military-style "echelon formation" from the WWII period, IIRC, means a literal staircase pattern away from a leader. A couple of examples shown at

<http://www.ufx.org/1947/formations.htm>

The P-80s are down and back from the leader (as Arnold's objects were, IIRC) and the little trainers are up and back from the leader. In both cases there is some lateral spread in addition to the length of the formation. Arnold described the objects as being in a line (I think this would be called "in trail" in military formations), but what if they really were in a very wide echelon formation and passed on BOTH sides of the peak? This is shown in the lower sketch on the page above. At the range Arnold was, perspective could have reduced the apparent width of the formation. This could also explain the "snaking between peaks" phenomenon -- if the objects were flying spread out laterally, it doesn't require them to follow the leader in snaking through the peaks like a supersonic conga line -- some could go behind a peak, some stay in front, etc...

Also, for reference, here's the Tacoma News Tribune article about the recovery of the crashed C-46 at the 10,000 ft level of Rainer's SW slope on 25 July -

<http://www.ufx.org/1947/c46recov.htm>

Another example of strange activity in the sky that could be taken for a UFO.

Tonight around 2000hrs GMT I watched an odd satellite pass overhead in an almost due North track. It caught my attention because it flashed quite brightly, not quite Venus intensity but bright all the same. As I watched it it grew faint and disappeared over about 5 seconds, brighter for one second, faded, flashed, faded over 5 seconds again, brightened for 1 second and continued this behavior until it disappeared behind the houses after about 30 seconds.

Approx ground position is 52deg 30' N 01deg 09' W

Was this a tumbling satellite or was it a one of the Iridium constellation? Or was it something else.

Chris

> >DISAPPEARED BEHIND the peak of Mount Ranier [Rainier]."
>
>
> Brad,
>
> I didn't 'duck' this issue, I pointed it out!

MORE COMMENTS: I know you did and I had said above "You answer a few without referring to the numbering which would reveal that you are evading the others."

> Yes an anomaly, however it has to be seen in the context that
> it's is a _reported_ comment, could easily be a misunderstanding

MORE COMMENTS: In other words, it's a MISQUOTE -- credited to benefit the FRONT-OF-RAINIER interpretation. What about "misunderstandings" or misquotations that benefit the BEHIND-RAINIER interpretation?

- > about the objects (apparently) disappearing behind a 'peak' and
- > most importantly, Arnold seemingly never referred to this
- > fundamental aspect elsewhere.

MORE COMMENTS: Except that Arnold in effect referred to this in his DRAWING, his BEST DISTANCE estimate, his 170 COURSE PLOT ON HIS MAP, etc. etc. See my REVISED 14-15 Points forthcoming soon. The quote is consistent with the overwhelming mass of data and the only possible reconstruction of Arnold's MAPPING of the flight path. Again see my 14-15 Points coming soon.

If this had been a reporter's PARAPHRASE, not using direct quotation marks, I'd granted you a very possible misunderstanding. But this was a VERBATIM quote of Arnold in his second known interview, done for the Chicago Tribune on the first afternoon he ever spoke to reporters about his sighting, and thus before a lot of possible media or publicity contamination of his story (it's not a number he could refine through plotting on a map, in which "later is better" because of Arnold's own research of his sighting, so the earliest account is very important).

The Chicago Tribune was a world-class reputable newspaper on the scale of the NY Times, and much less likely to misquote than some podunk paper in the boonies. It had broken major stories in the recent past such as the breaking of the Japanese codes in 1944 (which resulted in Gen George C. Marshall sending the Top Secret Sept 1944 letter to Thomas Dewey pleading with him not to publicize the exposure further). The Tribune evidently spoke with Arnold at length by phone and probably got hold of him before other newspapers and wire services (after seeing the Pendleton East Oregonian's initial wire sent over AP). If I'm not mistaken, the Chicago Tribune was the most prominent newspaper ever to interview Arnold about his sighting.

It is also the ONLY KNOWN QUOTE describing his METHOD OF COUNTING the 9 objects (years later he would say he was "good" at counting cattle from the air but didn't say HOW he did his counting) -- watching them disappear one by one BEHIND Mt. Rainier. Shall we throw that out too (or rephrase it to our liking) because we don't seem to find it repeated again?

- > The reported quote is: "I counted nine of them as they
- > disappeared behind the peak of Mount Rainier".
- >
- > Could Arnold actually have said, "I counted nine of them as they
- > disappeared behind a peak on Mount Rainier".
- >
- > That would be consistent with Arnold's trustworthy, verbatim
- > accounts.
- >
- >

> >(2) ARNOLD DRAWING: Arnold's ONLY KNOWN drawing of the
 > >objects' flight path shows them coming out from BEHIND Rainier's
 > >south edge and NEVER CROSSING IN FRONT, using two different
 > >standard artistic conventions (short light line showing path
 > >behind mountain, then line curved from behind away from
 > >mountain). (See IUR cover Mar/Apr 95.) The drawing was
 > >probably done in late June 1947.
 >
 > As I did respond, the drawing is ambiguous (what it be too much
 > to ask for something that wasn't) and open to different
 > interpretations. I also explained that I did appreciate why you
 > thought this might be supportive of your supposition.

MORE COMMENTS: Isn't it convenient that there isn't any drawing by Arnold showing the objects crossing the front face of Mt. Rainier? The only drawing shows the objects coming from out BEHIND the mountain.

>
 > >(3) OTHER ARNOLD STATEMENTS: Other statements by Arnold also
 > >mention a disappearance behind a specific jagged "peak" or
 > >"cleft" of Rainier which appears to have been Rainier's most
 > >prominent subsidiary peak, the well-known 11,000-foot Little
 > >Tahoma Peak two miles east of Rainier's summit, since McDonald,
 > >Kottmeyer, Maccabee and others could not find a suitable 9,000+
 > >ft peak in the SW FRONT of Rainier fitting the 9,000-10,000-foot
 > >altitude of the objects, but only minor 6,000-foot peaks.
 >
 > Even in Bequette's article, where it's mentioned, "He said he
 > could estimate the distance of the objects better because an
 > intervening peak once blocked his view of them. He found the peak
 > was 25 miles away, he related", this is immediately followed by
 > the reported confirmation, "The Boise flyer said they flew on the
 > west sides of Rainier and Adams, adding that he believed this
 > would make it more difficult for them to be seen from the
 > ground".

MORE COMMENTS: I pointed out these are reporter's PARAPHRASES not VERBATIM QUOTES of Arnold. There is more room for error and misunderstanding since it represents what the REPORTER UNDERSTOOD rather than being precisely the words of the subject.

> Contrary to your point here, there seems to be no evidential
 > reason why the 'peak' Arnold mentions is 'Little Tahoma'.

MORE COMMENTS: You can't find any other suitable peaks can you? You admitted you can't, and that Little Tahoma is the most "conspicuous" subsidiary peak of Mt. Rainier.

One of my new Points of Evidence will be the telling fact that Little Tahoma Peak is the RIGHT EDGE of Mt. Rainier as seen from Arnold's position to the WSW, the RIGHT EDGE from which he started his FAMOUS "CLOCKING." If you scour a topo map you'll see there is no other possible RIGHT EDGE of Rainier but Little Tahoma Peak and its ridgeline (where on the ridge depends on what level from 9,000 to 10,000+ feet).

Let me anticipate in advance a suggestion about Anvil Rock, 9,584 ft, which is itself BEHIND Mt. Rainier (2 miles SE of Rainier's summit) and therefore doesn't solve the distance problem of the objects flying BEHIND Mt. Rainier. The much smaller Anvil Rock ridge is in fact overshadowed by the gigantic 11,138-ft Little Tahoma Peak/ridge behind it (also a 170 heading behind Anvil Rock would run smack into Mt. Rainier first). So you cannot avoid the fact Arnold saw Little Tahoma Peak and that it was an important landmark for him in his sighting.

In his 1952 account this seems to be the "snow-based cleft" and "jagged peak that juts out from the base of Mount Rainier proper."

If this

- > is the only 'jagged peak' which could 'fit' by altering much of
- > Arnold's consistent testimony, that alone should perhaps indicate
- > it doesn't correspond.
- >
- >
- > >.(4) DISTANCE: Arnold's BEST ESTIMATE of the distance to the

- > >for the objects.
- >
- > It would tend to substantiate some basis for an extraordinary
- > event... if the considerable, overall evidence didn't indicate
- > otherwise.

MORE COMMENTS: The "considerable, overall evidence" is that the objects passed BEHIND Mt. Rainier, and it now amounts to 14 or 15 Points of Evidence. You ignore the absolute fact in my previous point, Point 5, that a path in FRONT of Mt. Rainier results in a ridiculously way off 125-degree heading to Goat Ridge. Yet here in Point 6 we find that passing BEHIND Rainier/Little Tahoma at the DISTANCE INDICATED BY ARNOLD'S BEST ESTIMATE results in exactly the 170 heading that Arnold derived from his MAP.

- > >(7) SLAMMING INTO RAINIER: The objects could not fly on a 170
- > >heading and between the 6,000 foot peaks on the southwestern

- > >foot level of Rainier first.
- >
- > Well, yes, which might suggest the circumstances you are
- > reluctant to accept and which are frequently evidenced, may be
- > the true explanation.

MORE COMMENTS: But BIRDS have to be at about 15 miles away doing these steep dives to avoid slamming into Mt. Rainier's slopes, and we know that distance is impossible, birds are invisible, too high speed, etc.

- > As you can hopefully see, far from 'conveniently dodging' the

Subject: Re: Kenneth Arnold and KottmeyerStatus:

James,

You cut off the last 3 of my 10 Points of Evidence that Arnold's Objects Passed Behind Mt. Rainier without answering them and since then I've extended the list to 12 and will shortly extend further to 14-15 or more.

MORE COMMENTS below.

Brad

In a message dated Fri, 25 Feb 2000 3:15:56 AM Eastern Standard Time, "James Easton" <voyager@ukonline.co.uk> writes:

MORE COMMENTS: I know you did and I had said above "You answer a few without referring to the numbering which would reveal that you are evading the others."

> Yes an anomaly, however it has to be seen in the context that
> it's is a _reported_ comment, could easily be a misunderstanding

MORE COMMENTS: In other words, it's a MISQUOTE -- credited to benefit the FRONT-OF-RAINIER interpretation. What about "misunderstandings" or misquotations that benefit the BEHIND-RAINIER interpretation?

- > about the objects (apparently) disappearing behind a 'peak' and
- > most importantly, Arnold seemingly never referred to this
- > fundamental aspect elsewhere.

MORE COMMENTS: Except that Arnold in effect referred to this in his DRAWING, his BEST DISTANCE estimate, his 170 COURSE PLOT ON HIS MAP, etc. etc. See my REVISED 14-15 Points forthcoming soon. The quote is consistent with the overwhelming mass of data and the only possible reconstruction of Arnold's MAPPING of the flight path. Again see my 14-15 Points coming soon.

If this had been a reporter's PARAPHRASE, not using direct quotation marks, I'd granted you a very possible misunderstanding. But this was a VERBATIM quote of Arnold in his second known interview, done for the Chicago Tribune on the first afternoon he ever spoke to reporters about his sighting, and thus before a lot of possible media or publicity contamination of his story (it's not a number he could refine through plotting on a map, in which "later is better" because of Arnold's own research of his sighting, so the earliest account is very important).

The Chicago Tribune was a world-class reputable newspaper on the scale of the NY Times, and much less likely to misquote than some podunk paper in the boonies. It had broken major stories in the recent past such as the breaking of the Japanese codes in 1944 (which resulted in Gen George C. Marshall sending the Top Secret Sept 1944 letter to Thomas Dewey pleading with him not to publicize the exposure further). The Tribune evidently spoke with Arnold at length by phone and probably got hold of him before other newspapers and wire services (after seeing the Pendleton East Oregonian's initial wire sent over AP). If I'm not mistaken, the Chicago Tribune was the most prominent newspaper ever to interview Arnold about his sighting.

It is also the ONLY KNOWN QUOTE describing his METHOD OF COUNTING the 9 objects (years later he would say he was "good" at counting cattle from the air but didn't say HOW he did his counting) -- watching them disappear one by one BEHIND Mt. Rainier. Shall we throw that out too (or rephrase it to our liking) because we don't seem to find it repeated again?

- > The reported quote is: "I counted nine of them as they
- > disappeared behind the peak of Mount Rainier".
- >
- > Could Arnold actually have said, "I counted nine of them as they

 >
 > As I did respond, the drawing is ambiguous (what it be too much
 > to ask for something that wasn't) and open to different
 > interpretations. I also explained that I did appreciate why you
 > thought this might be supportive of your supposition.

MORE COMMENTS: Isn't it convenient that there isn't any drawing by Arnold showing the objects crossing the front face of Mt. Rainier? The only drawing shows the objects coming from out BEHIND the mountain.

>
 > >(3) OTHER ARNOLD STATEMENTS: Other statements by Arnold also
 > >mention a disappearance behind a specific jagged "peak" or

 > the reported confirmation, "The Boise flyer said they flew on the
 > west sides of Rainier and Adams, adding that he believed this
 > would make it more difficult for them to be seen from the
 > ground".

MORE COMMENTS: I pointed out these are reporter's PARAPHRASES not VERBATIM QUOTES of Arnold. There is more room for error and misunderstanding since it represents what the REPORTER UNDERSTOOD rather than being precisely the words of the subject.

> Contrary to your point here, there seems to be no evidential
 > reason why the 'peak' Arnold mentions is 'Little Tahoma'.

MORE COMMENTS: You can't find any other suitable peaks can you? You admitted you can't, and that Little Tahoma is the most "conspicuous" subsidiary peak of Mt. Rainier.

One of my new Points of Evidence will be the telling fact that Little Tahoma Peak is the RIGHT EDGE of Mt. Rainier as seen from Arnold's position to the WSW, the RIGHT EDGE from which he started his FAMOUS "CLOCKING." If you scour a topo map you'll see there is no other possible RIGHT EDGE of Rainier but Little Tahoma Peak and its ridgeline (where on the ridge depends on what level from 9,000 to 10,000+ feet).

Let me anticipate in advance a suggestion about Anvil Rock, 9,584 ft, which is itself BEHIND Mt. Rainier (2 miles SE of Rainier's summit) and therefore doesn't solve the distance problem of the objects flying BEHIND Mt. Rainier. The much smaller Anvil Rock ridge is in fact overshadowed by the gigantic 11,138-ft Little Tahoma Peak/ridge behind it (also a 170 heading behind Anvil Rock would run smack into Mt. Rainier first). So you cannot avoid the fact Arnold saw Little Tahoma Peak and that it was an important landmark for him in his sighting.

In his 1952 account this seems to be the "snow-based cleft" and "jagged peak that juts out from the base of Mount Rainier proper."

If this

- > is the only 'jagged peak' which could 'fit' by altering much of
- > Arnold's consistent testimony, that alone should perhaps indicate
- > it doesn't correspond.

Subject: Re: Arnold/DC-4 Engine SpreadStatus:

Bruce,

Ha! ha! Very funny. It should be possible to determine almost the exact angle by locating the flight path of the SF-Seattle flight of the DC-4. If your guess of the cosine 10-deg factor is close then:

$$\begin{aligned}(\cos 10) \times 65 \text{ ft} &= \\0.98 \times 65 \text{ ft} &= 64 \text{ ft (approx)}\end{aligned}$$

And the 23/15 scaling to the greater distance then makes it 98.2 ft instead of Arnold's 100 ft -- still pretty damn close!!!

Brad

Sounds like an iridium flare. I recently got wind of a case that
involved 2 sightings, by the same person, giving similar
descriptions as yours that occurred exactly a week apart at the
same time at roughly the same location. I wonder if this too is
a characteristic of iridium flares?

- >suggestion. The variable parts of the story are the portions the
- hypnotist didn't supply.

So far beyond the pale as to be unconsiderable.

- >5. Arnold is one of those people who has defective memory. >

Depending upon how one defines "defective" in quantitative terms (does anyone remember everything?... said person would probably go crazy), it is probably true that Arnold had a "defective" memory. Otherwise he could have recited exactly what happened second by second. so what?

My opinion: There is another possibility.

Arnold knew perfectly

well which side of Mt. Rainier they flew on.

They were west of Rainier and West of Goat Rocks(ridge) and low enough to pass behind one or more of the peaks south of the peak of Rainier.

According to my monster aero map which shows about 47 mi between th peaks of Rainier and Adams (I think I earlier erroneously wrote about 40 miles), the angle from the peak of Rainier to the peak of Adams is about 163 degrees, A straight line from Rainier peak to Adams peak passes about 5-6 miles west of the Goat Ridge.

Mineral is about 20 miles west and 9 miles south of Rainier (i.e., about 22 miles distance from Rainier).

If he had trimmed out his plane (flying straight) toward Yakima (80 miles away) by the time of this sighting, then he was flying at azimuth 95 degrees.

With a 20 mph tailwind (approx) and 100 mph IAS (indicated air speed), he was doing 120 mph or 2 mi/minute.

He was at about 9,200 ft. Therefore he had little chance of determining the distance of objects from him without the help of references. I think he was "confused" or uncertain in his mind afterward because he couldn't determine to his own satisfaction which SMALL peak they went behind.

He says they disappeared behind a peak, but he didn't say which one, because I don't think he knew.

However, if they had passed behind Rainier he would have known they passed behind a peak and wouldn't have been "confused."

In fact, that would have been one of his most important points of information as he told his story... THEY PASSED BEHIND RAINIER.... no confusion, every story would have been the same. His recorded testimony, unfilterer by reporters, would have included the statemetn "they passed behind Rainier."

If one imagines that the bjets DID NOT fly a perfectly straight track and that they were several thousand feet lower than Arnold then on can find a track that passes west of Rainier, bends to the east to an azimuth of about 135 degrees and passes a peak labeled as 6917 ft on my topo map (name not given). Then they could have turned more south to an azimuth of 170 degrees that woudl take them past the west side of Adams. They would pass about 3-5 miles west of Goat Ridge., which would have been about 25 miles east souhteast of Arnold as the objects passed.

Bottom line: I still find the "west side story" as the most plausible. (Gee, could write a Broadway show with a title like that!)

HAHA is right...

I should have said 340 degrees azimuth (20 degrees to the left of due north)

But of course we don't know how far behind the other airplane was. (probably not as much as 45 degrees behind)

Joel,

Thanks for bring this to notice, it seems to prove that a
'reverse echelon' formation was in use by the Air Force, contrary
to Arnold's stated belief.

>Arnold described the objects as being in a line (I think this
>would be called "in trail" in military formations), but what if
>they really were in a very wide echelon formation and passed on
>BOTH sides of the peak?

This is just splitting hairs. ;)

Clever idea and we can't say it isn't possible. However, it needs
to be considered in view of some new material I'll be revealing
shortly. It's an informed opinion about the almost certain
identity of 'Arnold's peak'.

If accepted as confirming a probable identification, this will
have important repercussions for our understanding of Arnold's
story.

>At the range Arnold was, perspective could have reduced the
>apparent width of the formation. This could also explain the
>"snaking between peaks" phenomenon -- if the objects were flying
>spread out laterally, it doesn't require them to follow the
>leader in snaking through the peaks like a supersonic conga line
>-- some could go behind a peak, some stay in front, etc...

What about the other distinctive flight characteristics Arnold
mentioned:

1. A fluttering and sailing motion.

2. The undulation and weaving, "similar to a Chinese kite [tail]
that I once saw blowing in the wind".

Can these be reconciled with aircraft, especially at high-speed?

I haven't been able to locate any comparative examples.

>Also, for reference, here's the Tacoma News Tribune article
>about the recovery of the crashed C-46...

That's appreciated, I know some people who will be interested in seeing this historical record.

James.

Subject: Re: Arnold Hidden assumptions?Status:

James & Joel,

Joel raises an interesting idea as to whether the formation might have been spread out horizontally rather than vertically so that some objects could have passed to the front and some to the back of Rainier. But Arnold always described the formation as linear in the direction of travel and about 5 miles long, measured with reference to the N-S edges of the ridge later identified as Goat Ridge, going all the way back to his first interviews on June 25, 1947. In *Coming of the Saucers* (1952) Arnold states that the formation traveled "from north to south" and passed over a plateau between Mt. Rainier and Mt. Adams "with quite definite north and south edges." "As the first unit of these craft cleared the southernmost edge of this background, the last of the formation was just entering the northern edge."

In the *Chicago Tribune* published the next day June 26, 1947, after the interview:

"He said he calculated the length of the air train at five miles by flying over to a mountain ridge behind which he had seen the lead object emerge about the time the tail object disappeared. This ridge proved to be five miles long, he said."

In the *Pendleton East Oregonian*, his very first interview (June 25), published on June 26, 1947:

"He said he "measured" the formation by a snow-covered ridge over which they passed and estimated the "train" was five miles long."

This makes it difficult to say the formation was horizontal rather than vertical.

As for James' "new material" he'll be "revealing" soon, "an informed opinion about the almost certain identity of 'Arnold's peak,' " if this is Jim McDonald's notes and letters with Arnold I already "revealed" that weeks ago.

I already discussed this in depth about how McDonald tried in Nov 1966 to get Arnold to identify the peak as on the SW of Rainier because McDonald could not identify anything at the 9,000-foot level. McDonald was unsure the SW was the right direction and ended up having Arnold indicate that "S + W" was only "probable" and three alleged "peaks" in the 6,000+ ft range were picked out as "might" "possibly" be candidates -- Pyramid Peak, Crystal Mtn and Iron Mtn. And I've now pointed out that one of the three is NONEXISTENT -- "Crystal Mtn." is a MAP ERROR. After extensive interviews and correspondence with Arnold, McDonald ended up rejecting the 6,000-ft altitude notion and asserting the objects were at 9,000 ft climbing to 13,000 ft.

Joel,

Thanks for bring this to notice, it seems to prove that a
'reverse echelon' formation was in use by the Air Force, contrary
to Arnold's stated belief.

>Arnold described the objects as being in a line (I think this
>would be called "in trail" in military formations), but what if
>they really were in a very wide echelon formation and passed on
>BOTH sides of the peak?

This is just splitting hairs. ;)

Clever idea and we can't say it isn't possible. However, it needs
to be considered in view of some new material I'll be revealing
shortly. It's an informed opinion about the almost certain
identity of 'Arnold's peak'.

If accepted as confirming a probable identification, this will

have important repercussions for our understanding of Arnold's story.

Brad,

Sorry, I had merely curtailed what was a lengthy reply and on the basis that, overall, relevant responses had already been made.

Taking up those other points:

>(8) STRANGE GAP IN STORY: Arnold NEVER ONCE in 30+ years gave an
>orderly, SEQUENTIAL chronological account of seeing the flash,
>THEN seeing the objects approach Mt. Rainier in a straight line,
>and THEN seeing the objects cross over in front of Mt. Rainier
>(if they did) where he should have gotten his CLOSEST look at
>them by his own account in later out-of-order comments (see
>Point 11 below, the objects should actually have blended in with
>the snow and disappeared, but Arnold never says that, he says
>that was his clearest look). All his statements about seeing the
>objects on the west of the mountain, DETAILING their SHAPES as
>supposedly seen against the snow, etc., come from LATER
>AFTERTHOUGHTS and DIGRESSIONS in every case OUT OF
>CHRONOLOGICAL ORDER or fast-forwarded. He tells us they "APPROACHED"
>the "north edge" of Mt. Rainier but then doesn't take the next step of
>saying they passed or crossed that very same "north edge."

There's no evidence of any 'afterthoughts' and he stated in that early radio interview how the objects went "across the face of Mt. Rainier".

I have provided several instances where Arnold clearly indicated, reportedly or verbatim, that the objects flew in front on Mt. Rainier and separately, on the mountain's westward side.

What more can be added.

I'll come back to your remaining points as necessary in due course, however, any specific reply is essentially covered in the following.

>MORE COMMENTS: In other words, it's a MISQUOTE -- credited to
>benefit the FRONT-OF-RAINIER interpretation. What about
>"misunderstandings" or misquotations that benefit the BEHIND-
>RAINIER interpretation?

The bottom line is that, as detailed, there's no difficulty in establishing an interpretation for the front-of-Rainier scenario; it's what Kenneth Arnold said in his radio interview, letter to the Air Force, book and even years later to the 'UFO Symposium'. Respectively:

"...going at a terrific speed across the face of Mt. Rainier. I could see them against the snow, of course, on Mt. Rainier..."

"Very shortly they approached Mt. Rainier, and I observed their outline against the snow quite plainly".

"I watched as these objects rapidly neared the snow border of Mount Rainier...
I observed the objects' outlines plainly as they flipped and flashed along against the snow and also against the sky".

"However, in getting a look at them against the sky and against the snow of Mt. Rainier as they approached..."

How can any one, let alone all, of these accounts be true if the objects' path took them east, behind the mountain.

When Arnold clarified, "I could see them against the snow, of course, on Mt. Rainier...", he means 'obviously'...'it goes without saying', etc.

>MORE COMMENTS: Except that Arnold in effect referred to this in
>his DRAWING, his BEST DISTANCE estimate, his 170 COURSE PLOT ON
>HIS MAP, etc. etc. See my REVISED 14-15 Points forthcoming
>soon. The quote is consistent with the overwhelming mass of
>data and the only possible reconstruction of Arnold's MAPPING of
>the flight path. Again see my 14-15 Points coming soon.

Arnold doesn't 'refer' to this in his drawing. If he had shown the objects' path as approaching the mountain, not continuing past it and re-appearing at the other side, _then_ he would be indicating what you believe.

>If this had been a reporter's PARAPHRASE, not using direct
>quotation marks, I'd granted you a very possible
>misunderstanding. But this was a VERBATIM quote of Arnold in his
>second known interview, done for the Chicago Tribune on the
>first afternoon he ever spoke to reporters about his sighting...

Appreciated and we can only note the anomalies which exist.

>MORE COMMENTS: Isn't it convenient that there isn't any drawing
>by Arnold showing the objects crossing the front face of Mt.
>Rainier? The only drawing shows the objects coming from out
>BEHIND the mountain.

It simply doesn't and what's that little line _on_ the mountain side, parallel to the pathway Arnold depicts. Could it be he's indicating the trajectory started from the western side as he reportedly claimed when explaining how that westward path might make it difficult for any corroborating ground observations - why would he have noted this, or Bequette fabricated this innocuous aspect? There's a small gap between his 'line' on the mountain and the rest of Arnold's depicted pathway, but there's also a small gap in the middle of his line drawing.

As I said, it's all open to interpretation and no more 'convenient' that there isn't in fact a drawing by Arnold which clearly shows an eastwards trajectory.

"When they approached Mt. Rainier's north edge, I could see they were to the west of Mt. Rainier, to me", Arnold told the symposium, adding to the overwhelming evidence - if Arnold can remotely be trusted as a witness.

>MORE COMMENTS: The "considerable, overall evidence" is that the
>objects passed BEHIND Mt. Rainier, and it now amounts to 14 or
>15 Points of Evidence. You ignore the absolute fact in my
>previous point, Point 5, that a path in FRONT of Mt. Rainier
>results in a ridiculously way off 125-degree heading to Goat
>Ridge. Yet here in Point 6 we find that passing BEHIND
>Rainier/Little Tahoma at the DISTANCE INDICATED BY ARNOLD'S BEST
>ESTIMATE results in exactly the 170 heading that Arnold derived
>from his MAP.

It's for proponents of Arnold's extraordinary and contradictory claims to justify the anomalies, if we're to accept any basis for the 'NINE ET spaceships' theory.

In his 'UFO symposium' speech, Arnold relates:

"When they turned lengthwise or flatwise to me they were very, very thin. And actually they disappeared behind a sharp projection on Mt. Rainier in the snow field to my eyesight. And, since I knew approximately where I was, flying of course toward the mountain, I knew where they had passed".

These nine unidentified objects were not just thin 'edge-on', they were extremely thin.

What a curious statement - "they disappeared behind a sharp projection on Mt. Rainier in the snow field to my eyesight". Is it merely coincidental he appends this to an explanation of how thin these objects were. Doesn't 'to my eyesight' imply Arnold is unsure if this was factual. Otherwise...why add that comment?

Again, Arnold also cites this apparently brief loss of observation as being a critical factor in determining distance, yet he never refers to the infinitely more obvious clue that they must have passed behind the mountain only moments before.

Even in his book, when he claimed:

"I determined my distance from their pathway to be in the vicinity of twenty-three miles because I knew where I was and they revealed their true position by disappearing from my sight momentarily behind a jagged peak that juts out from the base of Mount Rainier proper"

it asks the glaring question - why hadn't they revealed their position by disappearing behind the mountain?

>Let me anticipate in advance a suggestion about Anvil Rock,
>9,584 ft, which is itself BEHIND Mt. Rainier (2 miles SE of
>Rainier's summit) and therefore doesn't solve the distance
>problem of the objects flying BEHIND Mt. Rainier. The much
>smaller Anvil Rock ridge is in fact overshadowed by the gigantic
>11,138-ft Little Tahoma Peak/ridge behind it (also a 170 heading
>behind Anvil Rock would run smack into Mt. Rainier first). So
>you cannot avoid the fact Arnold saw Little Tahoma Peak and that
>it was an important landmark for him in his sighting.

Far from having any objections to 'Little Tahoma' being the peak Arnold refers to, I'm now satisfied that it's the most likely candidate (although we will of course never be sure).

Rather than speculate, I recently wrote to several sources who might be able to provide an expert opinion. Although I'm still awaiting a response from all but one, that reply seems to establish what I did suspect.

Without identifying it was Arnold's sighting, I essentially enquired of them all:

"I wondered if you could please offer an informed opinion

concerning a historical observation near Mt. Rainier.

I'm trying to locate what was described by an observer in the 1940s as, 'a jagged peak that juts out from the base of Mount Rainier proper'.

Having researched the locality from topographical maps, I'm still uncertain about the identity of this peak and what constitutes 'the base of Mount Rainier proper'.

An important clue could be that the writer was a pilot and made this observation from approximately over the town of Mineral and heading in the mountain's direction.

Therefore, the 'jagged peak' must be visible from that location to the west/southwest of Mt. Rainier".

Etc.

David Basset is a mountaineer and photographer with considerable experience of the locale and he confirms:

"The jagged peak you are referring to is clearly Little Tahoma. It is jagged because it is unglaciated and very steep. It rises from the base of Mt. Rainier on the East or Southeast side. You said the observation was taken from the west or southwest. This might be troubling because it is on the other side of the mountain, but rest assured, Little Tahoma is the peak. It stands out, being much higher than any other mountain close to Rainier".

Basset seems comfortable with the description 'juts out from the base' and he also explains why it is a recognisably jagged peak.

If any other responses argue against, I'll provide details.

Although there will no doubt be different conclusions, if we have reasonably determined the identity of 'Arnold's peak', it's a welcome development in maybe understanding the overall origins of our 'flying saucer' story.

In my experience, accumulated evidence will ultimately speak for itself and what we appear to have is a situation where Kenneth Arnold believed those nine puzzling, aerial objects flew down the wetswards side of Mt. Rainier and also perceived they passed behind Little Tahoma.

That's what the evidence demonstrably indicates, if not confirms.

These are mutually exclusive claims and can most obviously be

reconciled if Arnold was mistaken about the momentarily disappearance behind Little Tahoma.

The alternative is to dismiss Arnold's consistent and substantial testimony which 'doesn't fit'.

However, all of the evidence does 'fit' and reveals the door is now open for those nine unidentified artefacts being much closer than Arnold thought.

You will forgive my amusement that Bruce's ridicule of any conceivable bird explanation, taken in good humour, might have to be put on hold until Bruce figures out how he's apparently been living on the wrong side of the mountain for fifty years.

If Arnold's story didn't actually have the substance believed and if it were possible he misidentified a formation of nine birds, then when closely examined, some clues could yet emerge. He frequently indicated the objects flew in front of Rainier, yet also perceived them to have fleetingly passed what is apparently the far distant Little Tahoma and relied on this latter discernment as a reliable perspective marker.

As the evidence for all of these factors is comprehensive, the most palpable conclusion must be that it's unmistakably confirmation why Arnold's distance estimates are _demonstrably_ untrustworthy and arguably proven to be erroneous.

Establishing any 'extraordinary UFO' occurrence now requires a willingness to reject or ignore Arnold's testimony which doesn't 'fit' and selecting only those bits which are compatible with the proposed scenario.

I'm with those who are willing to accept all of Arnold's evidence in context.

As I'm sure Bruce recognises, if Little Tahoma is now resolved as Arnold's peak, this isn't compelling evidence for the ET hypothesis, it's an absolute disaster.

Will he now jump ship and support your 'east side story', necessarily abandoning what was previously believed and advocated as the true circumstances of Arnold's observations. Or will he acknowledge, 'Easton, we have a problem'. ;)

It's all subject of course to further developments and we might still hear from others I contacted - one is a local pilot who has frequently taken aerial photographs of the Cascade range.

James.

Subject: Re: Kenneth Arnold and KottmeyerStatus: O

James,

I appreciate your forthrightness in researching the issue of the "jagged peak" BEHIND which Arnold saw the objects traverse and finding a local expert (mountaineer/photographer David Basset) who declares -- as I had previously -- that it could ONLY be Little Tahoma Peak. And from Arnold's location Little Tahoma itself was BEHIND Mt. Rainier, off to the right.

This understanding and your acknowledgment that Arnold does indeed have contradictory testimony for BOTH the "east side story" (objects passed BEHIND Mt. Rainier) and the "west side story" (objects passed in FRONT of Rainier) affects your responses in the beginning of your message.

James I must thank you for continually bringing up issues you think may support your bird theory but which on further examination undermine the bird theory, and the most recent exchanges support great distances which exclude birds. I will point out several more such issues below.

Let me intersperse some NEW COMMENTS.

Brad

In a message dated 2/27/00 7:20:02 PM, voyager@ukonline.co.uk writes:

Brad,

Sorry, I had merely curtailed what was a lengthy reply and on the basis that, overall, relevant responses had already been made.

Taking up those other points:

- >(8) STRANGE GAP IN STORY: Arnold NEVER ONCE in 30+ years gave an
- >orderly, SEQUENTIAL chronological account of seeing the flash,
- >THEN seeing the objects approach Mt. Rainier in a straight line,
- >and THEN seeing the objects cross over in front of Mt. Rainier
- >(if they did) where he should have gotten his CLOSEST look at
- >them by his own account in later out-of-order comments (see
- >Point 11 below, the objects should actually have blended in with
- >the snow and disappeared, but Arnold never says that, he says
- >that was his clearest look). All his statements about seeing the
- >objects on the west of the mountain, DETAILING their SHAPES as
- >supposedly seen against the snow, etc., come from LATER
- >AFTERTHOUGHTS and DIGRESSIONS in every case OUT OF
- >CHRONOLOGICAL ORDER or fast-forwarded. He tells us they "APPROACHED"
- >the "north edge" of Mt. Rainier but then doesn't take the next step of
- >saying they passed or crossed that very same "north edge."

There's no evidence of any 'afterthoughts' and he stated in that early radio interview how the objects went "across the face of Mt. Rainier".

NEW COMMENTS: Well, you're omitting the first words of Arnold's statement and ignoring the words I put in CAPITAL letters in my Point 8 (above), my point being that Arnold never gave an:

- >orderly, SEQUENTIAL chronological account of seeing the flash,
- >THEN seeing the objects approach Mt. Rainier in a straight line,
- >and THEN seeing the objects cross over in front of Mt. Rainier

>(if they did)

In the KWRC radio interview Arnold has a severely truncated or erroneous account in which there ISN'T ANY "FLASH" and there ISN'T ANY OBJECTS APPROACHING RAINIER FROM THE NORTH -- the first two points in the sequence --

as well as no mention of crossing over in FRONT of Rainier. Instead Arnold says he "NOTICED to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier." (He then mentions he thought they were geese from flight pattern then jets.) So the objects SEEM to ALREADY be in FRONT of Rainier.

In Arnold's terse way, he may have compressed the approach from the north when he briefly mentioned "noticing to the left of me." But that's my whole point, his narrative starts out orderly and sequentially then suddenly gets vague, ambiguous, or CONFUSED at this point of reaching Mt. Rainier. There's NEVER any mention of CROSSING to the front of Rainier, and DETAILED DESCRIPTIONS of SHAPE -- which should belong to the objects' closest-approach to Arnold while passing Rainier -- only appear LATER in out-of-order digressions, where they don't belong chronologically.

In the radio interview, it is only AFTER he recounts his now-famous timing, i.e., after the objects had passed Mt. Adams and were DISAPPEARING or already gone, that Arnold mentions as an AFTERTHOUGHT or DIGRESSION that "They looked

something like a pie plate that was cut in half with a sort of a convex triangle in the rear" and that maybe they were jets with tails not visible.

I consider it an AFTERTHOUGHT because it belongs with his first discussion of geese and jets when supposedly going "across the face of Mt. Rainier." Yet he NEVER brings up the SHAPE at that point -- the point where the objects are supposedly crossing Rainier. Why? He does this again and again in EVERY one of his extended narratives.

[Easton]

I have provided several instances where Arnold clearly indicated,

reportedly or verbatim, that the objects flew in front on Mt.

Rainier and separately, on the mountain's westward side.

What more can be added.

NEW COMMENTS: In each case you cite, as I state in my Point 8, Arnold DIGRESSES OUT-OF-ORDER or CONTRADICTS himself in the same statement, or

confusingly truncates his account. And this CONFUSION sets in at the point when the objects reach Mt. Rainier.

[Easton]

I'll come back to your remaining points as necessary in due course, however, any specific reply is essentially covered in the following.

>MORE COMMENTS: In other words, it's a MISQUOTE -- credited to
>benefit the FRONT-OF-RAINIER interpretation. What about
>"misunderstandings" or misquotations that benefit the BEHIND-
>RAINIER interpretation?

The bottom line is that, as detailed, there's no difficulty in establishing an interpretation for the front-of-Rainier scenario;

NEW COMMENTS: But you now admit that there are flat contradictions with Arnold's statements of the objects passing BEHIND Rainier/Little Tahoma.

[Easton]

it's what Kenneth Arnold said in his radio interview, letter to the Air Force, book and even years later to the 'UFO Symposium'.

Respectively:

"...going at a terrific speed across the face of Mt. Rainier.

I could see them against the snow, of course, on Mt. Rainier...".

NEW COMMENTS: We just saw (above) that this quote omits the preceding words by Arnold which contradict the overwhelming bulk of his statements from BEFORE this radio interview and for years AFTER that he FIRST saw a FLASH of light, then saw OBJECTS APPROACHING RAINIER. And the DAY BEFORE he told the Chicago Tribune:

"I counted nine of them as they disappeared BEHIND Mt. [Rainier]."

[Easton quoting Arnold]

"Very shortly they approached Mt. Rainier, and I observed their outline against the snow quite plainly".

NEW COMMENTS: Why doesn't Arnold just say "Very shortly they PASSED IN FRONT

of Mt. Rainier, and I then observed their SHAPES" etc. etc.? Who cares about just "approaching" if that's all he's going to say about the approach maneuver? And Arnold keeps doing this EVERY time in his recountings. Why? I can see how once or twice it could just have been an awkward phrasing or some such, but to CONSISTENTLY avoid straightforward sequential narration in logical order in every single account year after year even while using different words or phrases to convey the SAME CONFUSING VAGUENESS is just strange.

As I've pointed out before, in my Point 12, Arnold seems to be saying he saw "IMAGES" of the objects before they even reached Mt. Rainier, when they were to the side "approaching" and the "image" was seen against the snow.

[Easton quoting Arnold]

"I watched as these objects rapidly neared the snow border of Mount Rainier...

I observed the objects' outlines plainly as they flipped and flashed along against the snow and also against the sky".

NEW COMMENTS: Arnold contradicts himself later in this same statement when he says the objects disappeared "BEHIND a jagged peak that juts out from the base of Mount Rainier proper," which you now agree must be Little Tahoma Peak which itself was BEHIND the summit of Rainier.

There are 5 sentences omitted in between your two excerpts from Arnold's letter to the AAF -- proving my point again that logically connected details are not presented logically but confusingly. Once again, Arnold has the objects "rapidly near[ing] the SNOW BORDER of Mount Rainier" but he seems incapable of just saying they REACHED that "BORDER" -- or better yet just skip even mentioning the IRRELEVANT "NEARING" and IRRELEVANT "BORDER" and just say they rapidly PASSED IN FRONT OF RAINIER and he saw their SHAPES against the snow and those SHAPES were XYZ. Arnold seems obsessed with the

"approaching" of the mountain and with the mountain's edges or borders against the skyline and that's when everything becomes confused.

Why doesn't Arnold tell us all about his good look at the SHAPES at this point where it is relevant to his discussion of his thought they might be jets with tails camouflaged (within the 5 omitted sentences)? Yet he actually more or less skips SHAPE entirely.

[Easton quoting Arnold]

"However, in getting a look at them against the sky and against the snow of Mt. Rainier as they approached..."

NEW COMMENTS: How could Arnold see them "against snow of Mt. Rainier" if they were still "APPROACHING"? Many sentences later the objects are still "approaching" the "north edge" of Mt. Rainier -- and hadn't reached it yet in his narrative -- and still later he mentions he had gotten a "good look" at their "IMAGE against the snow." Apparently Arnold was seeing image REFLECTIONS of the objects against the Rainier glaciers when they were still approaching off to the side of the mountain.

Again, this is contradicted within the same statement when Arnold refers to the objects disappearing "BEHIND a sharp projection on Mount Rainier in the snowfield" -- which again you agree now must be Little Tahoma BEHIND Rainier.

[Easton]

How can any one, let alone all, of these accounts be true if the objects' path took them east, behind the mountain.

NEW COMMENTS: Good question. In nearly every case Arnold also states the objects flew BEHIND or east of Rainier. I've pointed in some cases to ambiguities suggesting image reflections were seen on the glaciers of Rainier.

[Easton]

When Arnold clarified, "I could see them against the snow, of course, on Mt. Rainier...", he means 'obviously'...'it goes without saying', etc.

>MORE COMMENTS: Except that Arnold in effect referred to this in

>his DRAWING, his BEST DISTANCE estimate, his 170 COURSE PLOT ON
>HIS MAP, etc. etc. See my REVISED 14-15 Points forthcoming
>soon. The quote is consistent with the overwhelming mass of
>data and the only possible reconstruction of Arnold's MAPPING of
>the flight path. Again see my 14-15 Points coming soon.

Arnold doesn't 'refer' to this in his drawing. If he had shown
the objects' path as approaching the mountain, not continuing
past it and re-appearing at the other side, _then_ he would be
indicating what you believe.

NEW COMMENTS: Well, Arnold doesn't show the objects flying in FRONT of
Rainier. He has them coming out from BEHIND on the right side.

>If this had been a reporter's PARAPHRASE, not using direct
>quotation marks, I'd granted you a very possible
>misunderstanding. But this was a VERBATIM quote of Arnold in his
>second known interview, done for the Chicago Tribune on the
>first afternoon he ever spoke to reporters about his sighting...

Appreciated and we can only note the anomalies which exist.

NEW COMMENTS: These "anomalies" are very serious contradictions, often
within the same account, where Arnold has the objects flying a N-S straight
course both in FRONT and BEHIND Mt. Rainier, with no course change ever
mentioned, but the N-S heading continued on to Mt. Adams.

>MORE COMMENTS: Isn't it convenient that there isn't any drawing
>by Arnold showing the objects crossing the front face of Mt.
>Rainier? The only drawing shows the objects coming from out

>BEHIND the mountain.

It simply doesn't and what's that little line _on_ the mountain

side, parallel to the pathway Arnold depicts.

NEW COMMENTS: That short thin line I've pointed out repeatedly is an artists' convention meaning the object came from behind another object. Everyone is familiar with how artists depict objects behind other objects -- the hidden object is usually indicated by lighter lines, or dotted lines. When there is MOVEMENT of a HIDDEN object that comes out from behind the visible object, this is often represented by a short light line on top of the VISIBLE OBJECT (indicating the hidden object is still BEHIND it at this point in its motion) that transforms into a HEAVY LINE of visibility where the hidden object becomes visible. Another convention is to curve the line DOWNWARDS a short distance before transforming into the main heavy line -- this is more of a cartoonists' style. Arnold's DRAWING shows BOTH CONVENTIONS indicating objects emerging from BEHIND Mt. Rainier.

[Easton]

Could it be he's

indicating the trajectory started from the western side as he

reportedly claimed when explaining how that westward path might

make it difficult for any corroborating ground observations - why

would he have noted this, or Bequette fabricated this innocuous

aspect?

NEW COMMENTS: Here is one of those points I thanked you for at the beginning, which on consideration supports the opposite view. Yes, Bill Bequette PARAPHRASES Arnold as saying, in his very first interview: "The Boise flyer said they flew on the WEST sides of Rainier and Adams, adding that he believed this would make it MORE DIFFICULT for them to be SEEN FROM THE GROUND."

Arnold or the reporter must have gotten "WEST" and "EAST" confused. LOOK AT A MAP. The WEST side flight path would take the objects almost DIRECTLY OVER

the main habitations of Mt. Rainier -- the towns of Longmire, Paradise and Packwood. The EAST side flight path goes over a barren region with NO TOWNS AT ALL all the way down to Mt. Adams and beyond. Look at a map. The west side course has towns. The east side course has no towns.

[Easton]

There's a small gap between his 'line' on the mountain

and the rest of Arnold's depicted pathway, but there's also a small gap in the middle of his line drawing.

As I said, it's all open to interpretation and no more

'convenient' that there isn't in fact a drawing by Arnold which clearly shows an eastwards trajectory.

"When they approached Mt. Rainier's north edge, I could see they were to the west of Mt. Rainier, to me", Arnold told the symposium, adding to the overwhelming evidence - if Arnold can remotely be trusted as a witness.

NEW COMMENTS: I already answered this in prior postings. Arnold could not see the objects were to the WEST of Rainier when they were still APPROACHING and not yet in FRONT of the mountain (if they ever did come in front, and Arnold contradicted himself on this issue). The logical statement would have been to say that he could see they were to the west when he saw them pass in front of the north edge, not merely approach that edge. This otherwise illogical statement suggests Arnold saw "image" reflections of the objects on the sides edges of the mountain and got confused.

>MORE COMMENTS: The "considerable, overall evidence" is that the

>objects passed BEHIND Mt. Rainier, and it now amounts to 14 or

>15 Points of Evidence. You ignore the absolute fact in my

>previous point, Point 5, that a path in FRONT of Mt. Rainier

>results in a ridiculously way off 125-degree heading to Goat

>Ridge. Yet here in Point 6 we find that passing BEHIND

>Rainier/Little Tahoma at the DISTANCE INDICATED BY ARNOLD'S BEST

>ESTIMATE results in exactly the 170 heading that Arnold derived

>from his MAP.

It's for proponents of Arnold's extraordinary and contradictory claims to justify the anomalies, if we're to accept any basis for the 'NINE ET spaceships' theory.

NEW COMMENTS: I'm not a proponent of an ET spaceship theory so I have no such standard to meet.

[Easton]

In his 'UFO symposium' speech, Arnold relates:

"When they turned lengthwise or flatwise to me they were very, very thin. And actually they disappeared behind a sharp projection on Mt. Rainier in the snow field to my eyesight. And, since I knew approximately where I was, flying of course toward the mountain, I knew where they had passed".

These nine unidentified objects were not just thin 'edge-on', they were extremely thin.

What a curious statement - "they disappeared behind a sharp projection on Mt. Rainier in the snow field to my eyesight". Is it merely coincidental he appends this to an explanation of how thin these objects were. Doesn't 'to my eyesight' imply Arnold is unsure if this was factual. Otherwise...why add that comment?

NEW COMMENTS: These are excellent questions and it is a curious remark. You are now trying to get into Arnold's thinking. Arnold's admission of visual difficulties here is linked to their total disappearance by occultation because both were concerned with the SAME SUBJECT, the visibility of the objects.

However, if you would like to entertain the question of visual difficulties here, then I would bring up once more my Point 11 -- NO SNOW INVISIBILITY. It is extremely strange that Arnold didn't report difficulty seeing the WHITE or MIRROR-LIKE objects against WHITE SNOW. Instead he just says it was difficult to see them when seen on-edge. This suggests he wasn't reporting factual observations but mental reconstructions of what he THOUGHT he should have seen, but didn't think through this reconstruction very clearly. I suggest all he saw on Rainier were bright flash reflections on glaciers.

Please note too that WHITE BIRDS should also have been virtually INVISIBLE when seen against the WHITE SNOW of Mt. Rainier and other mountains.

[Easton]

Again, Arnold also cites this apparently brief loss of observation as being a critical factor in determining distance, yet he never refers to the infinitely more obvious clue that they must have passed behind the mountain only moments before.

NEW COMMENTS: The passage behind Little Tahoma marked the BEGINNING of his famous "CLOCKING" -- so the DISTANCE here was more RELEVANT as well as more localized for determining distance (or a lower bound to distance) than the much larger bulk of Rainier's cone.

Even in his book, when he claimed:

"I determined my distance from their pathway to be in the vicinity of twenty-three miles because I knew where I was and they revealed their true position by disappearing from my sight momentarily behind a jagged peak that juts out from the base of Mount Rainier proper"

it asks the glaring question - why hadn't they revealed their position by disappearing behind the mountain?

NEW COMMENTS: See above. The passage behind Little Tahoma position was where he started the clocking, NOT the bulk of Mt. Rainier where the objects first disappeared. In plotting this on a map Arnold would see the distance to Little Tahoma was more relevant for plotting where his line of sight crossed the objects' flight path line.

>Let me anticipate in advance a suggestion about Anvil Rock,
>9,584 ft, which is itself BEHIND Mt. Rainier (2 miles SE of
>Rainier's summit) and therefore doesn't solve the distance
>problem of the objects flying BEHIND Mt. Rainier. The much
>smaller Anvil Rock ridge is in fact overshadowed by the gigantic
>11,138-ft Little Tahoma Peak/ridge behind it (also a 170 heading
>behind Anvil Rock would run smack into Mt. Rainier first). So
>you cannot avoid the fact Arnold saw Little Tahoma Peak and that
>it was an important landmark for him in his sighting.

Far from having any objections to 'Little Tahoma' being the peak
Arnold refers to, I'm now satisfied that it's the most likely
candidate (although we will of course never be sure).

Rather than speculate, I recently wrote to several sources who
might be able to provide an expert opinion. Although I'm still
awaiting a response from all but one, that reply seems to
establish what I did suspect.

Without identifying it was Arnold's sighting, I essentially
enquired of them all:

"I wondered if you could please offer an informed opinion concerning a historical observation near Mt. Rainier.

I'm trying to locate what was described by an observer in the 1940s as, 'a jagged peak that juts out from the base of Mount Rainier proper'.

Having researched the locality from topographical maps, I'm still uncertain about the identity of this peak and what constitutes 'the base of Mount Rainier proper'.

An important clue could be that the writer was a pilot and made this observation from approximately over the town of Mineral and heading in the mountain's direction.

Therefore, the 'jagged peak' must be visible from that location to the west/southwest of Mt. Rainier".

Etc.

David Basset is a mountaineer and photographer with considerable experience of the locale and he confirms:

"The jagged peak you are referring to is clearly Little Tahoma.

It is jagged because it is unglaciated and very steep. It rises from the base of Mt. Rainier on the East or Southeast side. You said the observation was taken from the west or southwest. This might be troubling because it is on the other side of the mountain, but rest assured, Little Tahoma is the peak. It stands

out, being much higher than any other mountain close to Rainier".

Basset seems comfortable with the description 'juts out from the base' and he also explains why it is a recognisably jagged peak.

If any other responses argue against, I'll provide details.

Although there will no doubt be different conclusions, if we have reasonably determined the identity of 'Arnold's peak', it's a welcome development in maybe understanding the overall origins of our 'flying saucer' story.

In my experience, accumulated evidence will ultimately speak for itself and what we appear to have is a situation where Kenneth Arnold believed those nine puzzling, aerial objects flew down the wetswards side of Mt. Rainier and also perceived they passed behind Little Tahoma.

That's what the evidence demonstrably indicates, if not confirms.

These are mutually exclusive claims and can most obviously be reconciled if Arnold was mistaken about the momentarily disappearance behind Little Tahoma.

NEW COMMENTS: It is not completely mutually exclusive because side glacier reflections of the objects that Arnold alludes to would appear to be on the front sides (but not the front middle) of the mountain. The most evidence, now 15-16 Points, favors the EAST side and that Arnold was mistaken in some of his confused comments about objects passing in the front or WEST side of Rainier.

[Easton]

The alternative is to dismiss Arnold's consistent and substantial testimony which 'doesn't fit'.

NEW COMMENTS: I've pointed out in detail that Arnold's testimony is NOT "CONSISTENT." So no one is dismissing "CONSISTENT" testimony at all. We're having to reconstruct what are the correct parts of Arnold's INCONSISTENT testimony and we disagree as to which is erroneous and which is correct.

[Easton]

However, all of the evidence does 'fit' and reveals the door is now open for those nine unidentified artefacts being much closer than Arnold thought.

You will forgive my amusement that Bruce's ridicule of any conceivable bird explanation, taken in good humour, might have to be put on hold until Bruce figures out how he's apparently been living on the wrong side of the mountain for fifty years.

If Arnold's story didn't actually have the substance believed and if it were possible he misidentified a formation of nine birds, then when closely examined, some clues could yet emerge. He frequently indicated the objects flew in front of Rainier, yet also perceived them to have fleetingly passed what is apparently the far distant Little Tahoma and relied on this latter discernment as a reliable perspective marker.

As the evidence for all of these factors is comprehensive, the most palpable conclusion must be that it's unmistakably

confirmation why Arnold's distance estimates are _demonstrably_
untrustworthy and arguably proven to be erroneous.

NEW COMMENTS: If Arnold's distance estimates are LOWER BOUNDS which he chose to accept CONSERVATIVELY to be AT those lower limits (because it minimizes the seemingly excessive speed of aircraft if that was what the objects were) then they are ACCURATE if based on occultations by landmarks such as mountains at known distance (Rainier/.Little Tahoma).

[Easton]

Establishing any 'extraordinary UFO' occurrence now requires a willingness to reject or ignore Arnold's testimony which doesn't 'fit' and selecting only those bits which are compatible with the proposed scenario.

I'm with those who are willing to accept all of Arnold's evidence in context.

As I'm sure Bruce recognises, if Little Tahoma is now resolved as Arnold's peak, this isn't compelling evidence for the ET hypothesis, it's an absolute disaster.

NEW COMMENTS: Sorry, I don't support an ET explanation. How is it an "absolute disaster" if it is admitted that the objects were more distant than Little Tahoma Peak? I don't understand.

[Easton]

Will he now jump ship and support your 'east side story', necessarily abandoning what was previously believed and advocated as the true circumstances of Arnold's observations. Or will he acknowledge, 'Easton, we have a problem'. ;)

It's all subject of course to further developments and we might still hear from others I contacted - one is a local pilot who has frequently taken aerial photographs of the Cascade range.

James.

NEW COMMENTS: I am grateful for your fresh research into the geography of the Rainier area and look forward to further developments. My 15-16 Points are in preparation.

@Subject: UFO? not UFO?

@
@Another example of strange activity in the sky that could be
@taken for a UFO.

@Tonight around 2000hrs GMT I watched an odd satellite pass
@overhead in an almost due North track. It caught my attention
@because it flashed quite brightly, not quite Venus intensity but
@bright all the same. As I watched it it grew faint and
@disappeared over about 5 seconds, brighter for one second,
@faded, flashed, faded over 5 seconds again, brightened for 1
@second and continued this behavior until it disappeared behind
@the houses after about 30 seconds.

@Approx ground position is 52deg 30' N 01deg 09' W

@Was this a tumbling satellite or was it a one of the Iridium
@constellation? Or was it something else.

This sounds like a rotating satellite with solar panels, or flat faces on the body, either of which happened to reflect sunlight in your direction. The complete cycle of flash, disappear, bright, fade would be one rotation. The time is correct for a satellite sighting.

Many satellites rotate on purpose, including Explorer 1, the first US satellite. There are at least 3 reasons satellites are rotated:

1. Stability during orbital insertion - The first satellites used clusters of solid rockets for the upper stages. Spinning evened out any differences in impulse of the various rockets.
2. Gyroscopic stability during use - the spin axis can be pointed precisely in space and it will stay there.

3. Passive thermal control - The satellite can be made a lot cheaper if a "barbecue roll" is used to expose all of the surfaces alternately to the sun and the cold of space. Otherwise, a heat distribution system must be added to protect the electronics.

@>@Apparently, there are only three conclusions possible (unless
@>@somebody comes up with one that I didn't think of):
@
@>@1. Arnold was unsure which side of the mountain and Little Tahoma
@>@the objects went on, due to conflicting perceptual clues.
@
@See below
@
@>@2. His publisher paid him more to change some details, and he got
@>@confused between what he really saw and what he was supposed to
@>@say (The HAL syndrome?).
@
@Arnold had reported his sighting LONG before there was a publisher.
@ (Garbage explanation)

That depends on which account you read. One account I read has Ray Palmer involved within a week. Another says that Arnold knew Palmer before the sighting. (I will dig the references up and report back). I don't mean his 1950 book, but a magazine article.

@>@3. Arnold was reciting a story given to him by others, probably
@>@for picuniary purposes.

@No others ever appeared. Another garbage explanation.

I don't mean other witnesses, I mean others wanting to make money off of a fake mystery. I was listing possibilities, not probabilities.

@>I just thought of two more (neither is very probable, but they
@are distinct possibilities):

@>4. Arnold was hypnotized (party hypnosis was starting to become
@>popular then) and given a fantastic story as a post-hypnotic
@>suggestion. The variable parts of the story are the portions the
@hypnotist didn't supply.

@So far beyond the pale as to be unconsiderable.

Really? I have two cases in my files where this is exactly what
happened.

@>5. Arnold is one of those people who has defective memory. >

@Depending upon how one defines "defective" in quantitative
@terms (does anyone remember everything?... said person would
@probably go crazy), it is probably true that Arnold had a "defective"
@memory. Otherwise he could have recited exactly what happened
@second by second. so what?

I am referring to the kind where, depending on their mental state
at the moment, people will give different accounts of an
incident. People with bipolar disorders, for example, tend to do
this (I am in no way implying that Arnold was bipolar, but just
using an example that I have witnessed this in myself).

@My opinion: There is another possibility. Arnold knew
@perfectly well which side of Mt. Rainier they flew on. They
@were west of Rainier and West of Goat Rocks(ridge) and low
@enough to pass behind one or more of the peaks south of the peak
@of Rainier.

@According to my monster aero map which shows about 47 mi between
@th peaks of Rainier and Adams (I think I earlier erroneously
@wrote about 40 miles), the angle from the peak of Rainier to the
@peak of Adams is about 163 degrees, A straight line from Rainier
@peak to Adams peak passes about 5-6 miles west of the Goat
@Ridge. Mineral is about 20 miles west and 9 miles south of
@Rainier (i.e., about 22 miles distance from Rainier). If he had
@trimmed out his plane (flying straight) toward Yakima (80 miles
@away) by the time of this sighting, then he was flying at
@azimuth 95 degrees.

@With a 20 mph tailwind (approx) and 100 mph IAS (indicated air
@speed), he was doing 120 mph or 2 mi/minute.

@He was at about 9,200 ft. Therefore he had little chance of
@determining the distance of objects from him without the help of
@references. I think he was "confused" or uncertain in his mind
@afterward because he couldn't determine to his own satisfaction
@which SMALL peak they went behind. He says they disappeared
@behind a peak, but he didn't say which one, because I don't

@think he knew. However, if they had passed behind Rainier he @would have known they passed behind a peak and wouldn't have @been "confused." In fact, that would have been one of his most @important points of information as he told his story... THEY @PASSED BEHIND RAINIER.... no confusion, every story would have @been the same. His recorded testimony, unfilterer by reporters, @would have included the statemetn "they passed behind Rainier."

@If one imagines that the bjets DID NOT fly a perfectly straight @track and that they were several thousand feet lower than Arnold @then on can find a track that passes west of Rainier, bends to @the east to an azimuth of about 135 degrees and passes a peak @labeled as 6917 ft on my topo map (name not given). Then they @could have turned more south to an azimuth of 170 degrees that @would take them past the west side of Adams. They would pass @about 3-5 miles west of Goat Ridge, which would have been abou @25 miles east southeast of Arnold as the objects passed.

@Bottom line: I still find the "west side story" as the most @plausible. (Gee, could write a Broadway show with a @title like that!)

This makes sense, and also brings in some other thoughts:

1. There is always the possibility that a change in weather made his altimeter off (or that he set it wrong), and he was lower than he thought.
2. If the flashes were as bright and often as Arnold said, his vision might have had time to accommodate to them. Certainly, he would have been experiencing the after-effect spots of the flashes (especially if he had looked directly at them). Both of these effects then would have reduced the dynamic range of his vision, maybe to the point where he couldn't distinguish low contrasts. In that case, maybe the objects didn't go behind anything, but just disappeared against the background.
3. One might think from the above that the objects themselves might have been after-effect spots from the flashes. The flaw in this is that they would not have presented the perspective needed to present images that appeared smaller, closer together, and at a different angle as they receded in the distance.
4. Could halation effects have distorted the images of conventional planes? I once saw a DC-3 which was turned into a "large silver blimp" by sun halation. It appeared to be three times as thick as the fuselage of the DC-3 actually was. Halation also tends to make things more convex, because each point in the image projected on the retina has a circle of scattering around it. I also have a reflective kite that "expands" by halation in

bright sunlight.

It appears that this is devolving into a "psychic contest" in which
we try to penetrate the mind of a dead man long before he
was dead. Before long, will be discussing the meaning of "is?"
Seriously, the excruciating detailed analysis of what

Arnold "must have been thinking" or what he "must have been seeing" based on "clues" in what he said is similar to what I have seen and experienced with "Klassic Debunking." If th witness' story has a few inconsistencies, then pick it apart and leave it for the vultures (probably not pelicans) to pick at the bones.

<http://wilstar.net/midi/ghostriders.htm>

Ghost Riders in the Sky

An old cowpoke went riding one dark and windy day,
Up on a ridge he rested as he went along his way,
When all at once a mighty herd of red-eyed cows he saw,
A-plowing through the ragged skies and up a cloudy draw.
Yi-pee-yi-ay, Yi-pee-yi-oh, Ghost Riders in the sky.

.
Their brands were still on fire and their hooves were made of steel,
Their horns were black and shiny and their hot breath he could feel,
A bolt of fear went through him as they thundered through the sky,
For he saw the riders coming hard and heard their mournful cry.
Yi-pee-yi-ay, Yi-pee-yi-oh, Ghost Riders in the sky.

Their faces gaunt, their eyes were blurred, their shirts were soaked with
sweat,
They're riding hard to catch that herd but they ain't got 'em yet.
They have to ride forever on that range up in the sky,
On horses breathing fire, as they ride I hear them cry.
Yi-pee-yi-ay, Yi-pee-yi-oh, Ghost Riders in the sky.

.
The riders loped on by him and he heard one call his name,
"If you want to save your hide and soul a-ridin on this range,
Then cowboy change your ways today or with us you will ride,
Trying to catch the devil's herd across the endless sky."

Yi-pee-yi-ay, Yi-pee-yi-oh, Ghost Riders in the sky.

;)

This might help to confirm the exact sequence of events Arnold related in the two main accounts, his letter to the Air Force [L] and later book [B].

They seem to be, in direct sequence as published, significantly comparable and discrepancies noted, still set the story in context.

Brad might care to consider whether this does emphasize that Arnold did in fact explain how the puzzling objects were initially seen to approach Mt. Rainier, then passed in front of the mountain where their shape was first determined and that Arnold consequently decided he would attempt a calculation of their airspeed.

[L] I made a 360 degree turn to the right and above the little city of Mineral, starting again toward Mt. Rainier. I climbed back up to an altitude of approximately 9,200 feet.

I trimmed out my airplane in the direction of Yakima, Washington, which was almost directly east of my position and simply sat in my plane observing the sky and the terrain.

There was a DC-4 to the left and to the rear of me approximately fifteen miles distance, and I should judge, at 14,000 foot elevation.

The sky and air was clear as crystal. I hadn't flown more than two or three minutes on my course when a bright flash reflected on my airplane.

I looked to the left and the north of Mt. Rainier where I observed a chain of nine peculiar looking aircraft flying from north to south at approximately 9,500 foot elevation and going, seemingly, in a definite direction of about 170 degrees.

They were approaching Mt. Rainier very rapidly, and I merely assumed they were jet planes. Anyhow, I discovered that this was where the reflection had come from, as two or three of them every few seconds would dip or change their course slightly, just enough for the sun to strike them at an angle that reflected brightly on my plane.

[B] It was during this search and while making a turn of 180

degrees over Mineral, Washington, at approximately 9200 feet altitude, that a tremendously bright flash lit up the surfaces of my aircraft. I was startled. I thought I was very close to collision with some other aircraft whose approach I had not noted. I spent the next twenty to thirty seconds urgently searching the sky all around--to the sides, above and below me--in an attempt to determine where the flash of light had come from. The only actual plane I saw was a DC-4 far to my left and rear, apparently on its San Francisco to Seattle run. My momentary explanation to myself was that some lieutenant in a P-51 had given me a buzz job across my nose and that hit was the sun reflecting from the surface of his wings as he passed that had caused the flash.

Before I had time to collect my thoughts or to find any close aircraft, the flash happened again. This time I caught the direction from which it had come. I observed, far to my left and to the north, a formation of very bright objects coming from the vicinity of Mount Baker, flying very close to the mountain tops and traveling at tremendous speed.

[L] These objects being quite far away, I was unable for a few seconds to make out their shape or their formation.

[B] At first I couldn't make out their shapes as they were still at a distance of over a hundred miles. I could see the formation was going to pass directly in front of me, as it was flying at approximately 170 degrees. I watched as these objects rapidly neared the snow border of Mount Rainier, all the time thinking to myself that I was observing a whole formation of jets. In group count, such as I have used in counting cattle and game from the air, they numbered nine. They were flying diagonally in an echelon formation with a larger gap in their echelon between the first four and the last five.

[L] I thought it was very peculiar that I couldn't find their tails but assumed they were some type of jet plane.

[B] What startled me most at this point was the fact that I could not find any tails on them.

[L] Very shortly they approached Mt. Rainier, and I observed their outline against the snow quite plainly.

[B] I observed the objects' outlines plainly as they flipped and flashed along against the snow and also against the sky.

[L] I was determined to clock their speed, as I had two definite points I could clock them by; the air was so clear that it was very easy to see objects and determine their approximate shape and size at almost fifty miles that day.

[B] Since this formation of craft was at almost right angles to me and was traveling from north to south, I was in an excellent position to clock their speed. I determined to make an attempt to do so.

[L] I remember distinctly that my sweep second hand on my eight day clock, which is located on my instrument panel, read one minute to 3 P.M. as the first object of this formation passed the southern edge of Mt. Rainier. I watched these objects with great interest as I had never before observed

[B] It was a beautiful sunny afternoon and the giant bulks of both Mount Rainier and Mount Adams made perfect markers.

I recall that when the first craft of this formation jetted to the southward from the snow-based cleft of Mount Rainier my second hand was approaching the top of my hour dial and the time was within a few seconds to one minute of three.

[L] I watched these objects with great interest as I had never before observed airplanes flying so close to the mountain tops, flying directly south to southeast down the hog's back of a mountain range. I would estimate their elevation could have varied a thousand feet one way or another up or down, but they were pretty much on the horizon to me which would indicate they were near the same elevation as I was.

They flew like many times I have observed geese to fly in a rather diagonal chain-like line as if they were linked together. They seemed to hold a definite direction but rather swerved in and out of the high mountain peaks. Their speed at the time did not impress me particularly, because I knew that our army and air forces had planes that went very fast.

What kept bothering me as I watched them flip and flash in the sun right along their path was the fact that I couldn't make out any tail on them, and I am sure that any pilot would justify more than a second look at such a plane.

[B] I was fascinated by this formation of aircraft. They didn't fly like any aircraft I had ever seen before. In the first place, their echelon formation was backward from that practiced by our

Air Force. The elevation of the first craft was greater than that of the last. They flew in a definite formation, but erratically. As I described them at the time, their flight was like speed boats on rough water or similar to the tail of a Chinese kite that I once saw blowing in the wind. Or maybe it would be best to describe their flight characteristics as very similar to a formation of geese, in a rather diagonal chain-like line, as if they were linked together. As I put it to newsmen in Pendleton, Oregon, they flew like a saucer would if you skipped it across the water.

[L] I observed them quite plainly, and I estimate my distance from them, which was almost at right angles, to be between twenty to twenty-five miles. I knew they must be very large to observe their shape at that distance, even on as clear a day as it was that Tuesday. In fact I compared a zeus [spelling? - James] fastener or cowl tool I had in my pocket with them - holding it up on them and holding it up on the DC-4 - that I could observe at quite a distance to my left, and they seemed smaller than the DC-4; but, I should judge their span would have been as wide as the furthest engines on each side of the fuselage of the DC-4.

[B] Another characteristic of these craft that made a tremendous impression on me was how they fluttered and sailed, tipping their wings alternately and emitting those very bright blue-white flashes from their surfaces. At the time I did not get the impression that these flashes were emitted by them, but rather that it was the sun's reflection from the extremely highly polished surface of their wings.

Even though they had a constant direction they swerved in and out of the high mountain peaks which are found on the hogsback of the Cascade mountains between Mount Rainier and Mount Adams. I determined my distance from their pathway to be in the vicinity of twenty-three miles because I knew where I was and they revealed their true position by disappearing from my sight momentarily behind a jagged peak that juts out from the base of Mount Rainier proper. Considering that I was flying all this time in the direction of their formation, this determination can be only approximately, but it is not too far off.

[L] The more I observed these objects the more upset I became, as I am accustomed and familiar with most all objects flying whether I am close to the ground or at higher altitudes. I observed the chain of these objects passing another high snow-covered ridge in between Mt. Rainier and Mt. Adams and as the first one was passing the south crest of this ridge the last object was

entering the northern crest of the ridge.

As I was flying in the direction of this particular ridge, I measured it and found it to be approximately five miles so I could safely assume that the chain of these saucer like objects were at least five miles long. I could quite accurately determine their pathway due to the fact that there were several high peaks that were a little this side of them as well as higher peaks on the other side of their pathway.

[B] Between Mount Rainier and Mount Adams there is a very high plateau with quite definite north and south edges. Part of this chain-like formation actually dipped below the near edge. As the first unit of these craft cleared the southernmost edge of this background, the last of the formation was just entering the northern edge. I later flew over this plateau in my plane and came to a close approximation that this whole formation of craft, whatever they were, formed a chain in the neighborhood of five miles long.

[L] As the last unit of this formation passed the southern most high snow-covered crest of Mt. Adams, I looked at my sweep second hand and it showed that they had travelled the distance in one minute and forty-two seconds. Even at the time this timing did not upset me as I felt confident after I would land there would be some explanation of what I saw.

[B] As the last of this group of objects sped past and seemed to gather altitude at a point beyond the southernmost crest of Mount Adams, I glanced at the sweep second hand of my instrument clock. As closely as I could determine, this strange formation of aircraft had covered the distance between Mount Rainier to the north and Mount Adams to the south in one minute and forty-two seconds.

[L] A number of news men and experts suggested that I might have been seeing reflections or even a mirage. This I know to be absolutely false, as I observed these objects not only through the glass of my airplane but turned my airplane sideways where I could open my window and observe them with a completely unobstructed view. (Without sun glasses)

[...]

I continued my search for the marine plane for another fifteen or twenty minutes and while searching for this marine plane, what I had just observed kept going through my mind. I became more disturbed, so after taking a last look at Tieton Reservoir I

headed for Yakima.

[B] I can say honestly that I was amazed, thinking all the time: what will these aeronautical engineers dream up next? Although readily explaining it all in this way in my mind, I definitely did have an eerie feeling about the whole experience. I tried to focus my mind on a continued search for the downed C-46 which had crashed some months earlier with thirty-two Marines aboard, but somehow the \$5,000 didn't seem important. I wanted to get on to Yakima and tell some of the boys what I had seen.

[L] I did not accurately measure the distance between these two mountains until I landed at Pendleton, Oregon..."

[B] It was about four o'clock in the afternoon when I landed at Yakima and went straight to Al Baxter, general manager of Central Aircraft. I met him in his outer office and rather breathlessly asked to see him in private. He dropped whatever it was he was doing and in his private office I related the story of my observation and drew him pictures of what I had seen.

[...]

I proceeded to gather my scattered wits together, got back in my airplane, and took off for Pendleton, Oregon. I remembered that I had forgotten to mention the fact that one of these craft looked different from the rest, was darker and of a slightly different shape, and that I hadn't told the Yakima boys that I had clocked the speed of this formation within fairly accurate limits. While flying to Pendleton I took my map from its snap holder on the extreme edge of my instrument panel, grabbed a ruler, and began figuring mathematically miles per hour. Figuring and flying my airplane at the same time was a little confusing, and I thought my figures were wrong and that I had better wait until I landed at Pendleton to do some serious calculating.

[End]

James.

Be serious, Bruce, you know we're only concerned with important developments in understanding the stated evidence.

Psychics, dead men and 'Klassic debunking'... good gracious, if we didn't know better we might think you're finding some difficulty in reconciling a previous belief with what has become apparent.

What is your reconciliation of how 'Arnold's peak' is evidently the far distant, eastwards, Little Tahoma?

James.

Subject: Re: Kenneth Arnold and KottmeyerStatus:

James,

Look, Arnold's sighting ignited a firestorm of national if not worldwide controversy that has lasted to this very day nearly 53 years later. That controversy was at that time focused on two critical issues: SHAPE and SPEED of the nine strange objects. Arnold fully understood that.

Arnold justified his high SPEED numbers by documenting the distances involved and landmarks he used for his clocking.

But when it came to the SHAPE issue Arnold suddenly became very reticent. One has to plow through the bulk of his accounts to get to any detailed description of the objects -- if any (in some accounts he has NO DETAILED description of shape at all). One word references to seeing an "outline" against the snow is not a DETAILED description. It doesn't verify that "saucers" or a "bat-shapes" or "convex triangles" in the rear or whatever were seen. Those terms are given as AFTERTHOUGHTS or reluctant DIGRESSIONS later in some of Arnold's stories.

The SHAPE issue is capsulized in the very term "FLYING SAUCERS." Did Arnold see craft of unconventional design? What was their SHAPE if it wasn't round "saucers"? Arnold was asked this repeatedly, everywhere he went, probably by literally thousands of people. "Did you really see a flying saucer Mr. Arnold? What did they look like?"

Your effort to provide a synchronistic harmonization of two of Arnold's accounts -- sort of like harmonizing the Gospel accounts in the Bible -- still doesn't address what is MISSING or OUT-OF-ORDER.

As I've said before, Arnold fixates on the objects "NEARING RAPIDLY" or "APPROACHING" the "SNOW BORDER" or "RIGHT EDGE" of Mt. Rainier which is really irrelevant to much of anything. But he can't bring himself to tell us the objects CROSSED the "snow border" or "north edge" that he draws so much attention to in his various accounts.

What this suggests is that Arnold was clear on what happened up to the time the objects approached Mt. Rainier and got confused from that point on.

What I would have expected Arnold to say, if the objects had flown in FRONT or WEST of Rainier, was something like this: "I saw a bright flash. I saw it coming from nine shiny objects moving in a line from the north heading towards Mt. Rainier in the south. They approached Mt. Rainier's north edge and crossed in front where I had great difficulty seeing them against the snow because they were so shiny and mirror-like they just reflected the snow when flying flat horizontal. When they tipped over and flashed intense blue-white light they actually disappeared against the blue-white snow and glacier ice and I couldn't make out their shapes at all. Only when they were against the sky again, now at their closest distance, could I make out their

shapes which were XYZ. That's when I started clocking them, as they passed Rainier and the jagged peak, Little Tahoma." etc. etc. Instead, Arnold doesn't discuss SHAPE till later and claims inexplicably that he got his BEST view of t!

!

he SHAPE when the objects FLASHED INTENSE LIGHT as they flipped "against the snow" when in fact that's when they should have DISAPPEARED.

Brad

Subject: Re: Kenneth Arnold and KottmeyerStatus: O

James,

Look, Arnold's sighting ignited a firestorm of national if not worldwide controversy that has lasted to this very day nearly 53 years later. That controversy was at that time focused on two critical issues: SHAPE and SPEED of the nine strange objects. Arnold fully understood that.

Arnold justified his high SPEED numbers by documenting the distances involved and landmarks he used for his clocking.

But when it came to the SHAPE issue Arnold suddenly became very reticent. One has to plow through the bulk of his accounts to get to any detailed description of the objects -- if any (in some accounts he has NO DETAILED description of shape at all). One word references to seeing an "outline" against the snow is not a DETAILED description. It doesn't verify that "saucers" or a "bat-shapes" or "convex triangles" in the rear or whatever were seen. Those terms are given as AFTERTHOUGHTS or reluctant DIGRESSIONS later in some of Arnold's stories.

The SHAPE issue is capsulized in the very term "FLYING SAUCERS." Did Arnold see craft of unconventional design? What was their SHAPE if it wasn't round "saucers"? Arnold was asked this repeatedly, everywhere he went, probably by literally thousands of people. "Did you really see a flying saucer Mr. Arnold? What did they look like?"

Your effort to provide a synchronistic harmonization of two of Arnold's accounts -- sort of like harmonizing the Gospel accounts in the Bible -- still doesn't address what is MISSING or OUT-OF-ORDER.

As I've said before, Arnold fixates on the objects "NEARING RAPIDLY" or "APPROACHING" the "SNOW BORDER" or "RIGHT EDGE" of Mt. Rainier which is really irrelevant to much of anything. But he can't bring himself to tell us the objects CROSSED the "snow border" or "north edge" that he draws so much attention to in his various accounts.

What this suggests is that Arnold was clear on what happened up to the time the objects approached Mt. Rainier and got confused from that point on.

What I would have expected Arnold to say, if the objects had flown in FRONT or WEST of Rainier, was something like this: "I saw a bright flash. I saw it coming from nine shiny objects moving in a line from the north heading towards Mt. Rainier in the south. They approached Mt. Rainier's north edge and crossed in front where I had great difficulty seeing them against the snow because they were so shiny and mirror-like they just reflected the snow when flying flat horizontal. When they tipped over and flashed intense blue-white light they actually disappeared against the blue-white snow and glacier ice and I couldn't make out their shapes at all. Only when they were against the sky again, now at their closest distance, could I make out their

shapes which were XYZ. That's when I started clocking them, as they passed Rainier and the jagged peak, Little Tahoma." etc. etc. Instead, Arnold doesn't discuss SHAPE till later and claims inexplicably that he got his BEST view of t!

!
he SHAPE when the objects FLASHED INTENSE LIGHT as they flipped "against the snow" when in fact that's when they should have DISAPPEARED.

Subject: Re: Kenneth Arnold and KottmeyerStatus: O

Bruce,

Actually we're making considerable progress. In view of the importance of the Arnold phenomenon in establishing UFOlogy it is amazing that probably 95% or more of the analysis and investigation of Arnold's sighting over the last 50+ years has occurred only in the last year or two.

Now we even have Mr. Pelican himself conceding that Arnold must have meant the objects passed behind Little Tahoma. That makes the distance 20+ miles and an impossibility for birds.

Look, even the FBI has "profilers" to try to get inside the heads of top suspects. CIA has long employed "psychological profilers" to try to anticipate what world leaders might do. Hynek himself suggested the Rhodes case of July 1947 should be subjected to a thorough investigation to "reenact the crime" (Hynek's words). UFOlogy should do no less in the case of the event that launched the whole controversy.

Brad

List members,

In Chapter 15, titled "The Radiation Story", of Ruppelt's "The Report on Unidentified Objects", he speaks of a two physicists who had set up some equipment to detect background radiation, and either inadvertently or on purpose discovered a significant increase in radiation in relation to the presence of a UFO. This later developed into what Ruppelt termed "the mineral club" which was a group of scientists and investigators performing these same "radiation correlations/detections". Does anyone know if these scientists, or "the mineral clubs", identities were ever unveiled? This chapter also mentions some graduate astronomy students who performed similar detection outings, but with less "desirable equipment. Any ideas on obtaining more information, background, locations, and/or references to the material contained in this particular chapter (15) would be greatly appreciated.

Thanks in advance,
Todd Lemire

Subject: Radiation Story/Re: Question for the History Buffs HereStatus:

Hi Todd,

There are several memos in the Blue Book files dealing with various aspects of the so-called "Radiation Story" chapter in Ruppelt's book, not all of which meshes or confirms his account, and there are numerous discrepancies, major as well as minor. The Durant Memo of the Robertson Panel also briefly mentions the incidents. And there is some info in Ruppelt's papers. Names are usually blacked out in the BB files, which complicates things.

Unfortunately, I have none of my files here so I have to do this all from memory, except for Ruppelt's book, the Robertson Panel/Durant Memo and a portion of Ruppelt's papers. The UFO sighting details do not agree but without the copies of the actual records in front of me I won't be able to point out these, it's all too confusing.

Let me quickly go through Ruppelt's book:

The Fall 1949 incidents at some "unspecified place" in the US (p. 201) occurred in Oct/Nov 1949 at Mt. Palomar, the exact dates are in the report (Oct 23? Nov 7??). The two scientists (electronic engineers not "physicists" as you have it, Todd) were Dr. Gene L. Bloom and Dr. Joseph P. Maxfield of Point Loma Naval Electronics Laboratory, San Diego, Calif. They encountered George Adamski on the mountain and asked him to keep on the lookout for flying saucers. Adamski mentions the two by name in one of his books and Adamski is mentioned by name in the official ONR report.

These "two scientists" are NOT the same as the "two physicists" Ruppelt met in LA (p. 202) assuming Ruppelt actually met them there, thus accounting for your understandable confusion, Todd. I think Ruppelt actually met them in Albuquerque.

One of the two physicists was Homer Gittings of Los Alamos Scientific Laboratory. He is "the scientist" in Ruppelt's book (p. 203) and in Ruppelt's notes he is said to be an MS Physics (I looked him up in the 70's when I researched this but don't remember what I found). Gittings supposedly heard about the Mt. Palomar incidents from a friend in a letter (p. 203). I think the other was named "Clark" but I'm not sure, the name is blacked out.

Ruppelt claimed the report on the (Mt. Palomar) incidents went to "military authorities, but since the conclusion stated that no flying saucers were involved, the report went into some unknown file. Project Blue Book never got it." (p. 203) Well, the ONR report of Jan 1950 IS in Blue Book files and I think "Flying Saucers" or "Flying Discs" is in the title. I will discuss Ruppelt's alleged "borrowing" of the report (p. 207) further on.

Ruppelt claims that "some of the people who had made the original sightings"

(p. 203) or "these original investigators" (p. 204) from Pt. Loma NEL were working together with Homer Gittings at Los Alamos in 1950 (see p. 204, obviously I'm adding the identities). I can find no indication in Ruppelt's own papers or any official documents that anyone from Pt. Loma worked with Gittings at Los Alamos or had any connection at all. The biographies of Drs. Bloom and Maxfield show nothing of the sort.

Ruppelt claims they formed a "mineral club" (p. 204). In fact they formed the Los Alamos Bird Watchers Association (Durant Memo). Ruppelt claims they had no incidents from Late Summer 1950 until early Dec 1950. But the Durant Memo claims (based on Ruppelt's briefing of the Robertson Panel) that there were a "series of observations" from Aug 1950 to Jan 1951 when cosmic ray counters "behaved queerly." Ruppelt claims three more sightings with radiation increases into Feb 1951. I recall the Blue Book files have some of the recordings and possibly the dates.

I think the "two graduate astronomy students" (p. 205) are mentioned in Ruppelt's papers but not the portion I have here.

Ghost Riders in the Sky

An old cowpoke went riding one dark and windy day,
Up on a ridge he rested as he went along his way,
When all at once a mighty herd of red-eyed cows he saw,
A-plowing through the ragged skies and up a cloudy draw.
Yi-pee-yi-ay, Yi-pee-yi-oh, Ghost Riders in the sky.

<

HAHAHAHAHAHA

I presume Arnold would have loved it!

Status:

Hello List,

The clipping below may be of some assistance towards identification of sightings in the above mentioned areas. Thanks go out to Jonathan McDowell Harvard-Smithsonian Center for Astrophysics Newsletter for this information.

The ASTRO-E X-ray astronomy satellite was launched on Feb 10. However, the first stage of the M-V launch vehicle (serial M-V-4) went off course. An anomalous vibration was detected 25 seconds after launch. At 41 seconds ceramic heat shields in the first stage nozzle apparently broke and fell off, and thrust vector control on the nozzle was lost.

Stage 1 separated at 1 min 15 s; stage 2 separated at 3 min 38 s. The third stage burn completed at 5 min 21s. Last signals from M-V-4 were received at 20 min after launch; the payload probably separated from the third stage at 23 min.

Although the upper stages were able to fire and make some correction to the trajectory, ASTRO-E ended up with a perigee of only 80 km and an apogee of 410 km. It may have reentered on the first orbit at around 0230-0300UTC somewhere between East Africa and Tibet or western China (depending on the altitude at injection); Space Command don't seemed to have cataloged any objects from the launch.

Getting back to seriousness, here's some more data to crank into the calculations...

I don't like to post copyright material, but three pages on Arnold's plane are (temporarily) at

<http://www.ufx.org/1947/arnold.htm>

His plane was a Call-Air model A-2, one of only 20 built. The lead photo is actually Arnold's second plane.

The mysterious "zeus fastener" that he used to measure the objects is at

<http://www.ufx.org/1947/dzus.htm>

This is from a 1948 book, but they haven't changed a bit in over 50 years -- the current Dzus catalog is at

<http://www.dzus.com/default.html>

No telling which particular type of fastener it was, there were several styles of heads. The funny thing is that if you look closely at the cowling of his plane it didn't seem to use flush Dzus fasteners in any case -- it seems to have big external latches. ???

Of course, if they were birds a mile or two away in front of him and they were seen "on edge" passing the Little Tahoma, peak and temporarily disappearing, we would have to ask the pelicanists to explain why they birds would , one by one (if that happened) have timed their wing flapping just right so that they would all seem to disappear (get too thin to see) just as they passed (from Arnold's perspective) Little Tahoma . We would also have to ask why, if they got thin enough to seem to disappear as they passed Little Tahoma, they didn't also seem to disappear numerous times as they flew past the much larger Mt. Rainier. Birds do, after all, fly with a rhythmic or "oscillatory" manner, repeating the wing flap sequence over and over.

>Establishing any 'extraordinary UFO' occurrence now requires a

>'fit' and selecting only those bits which are compatible with
>the proposed scenario.

Actually, this was always true. Go right back to Hynek who rejected Arnold's distance estimate. This is, of course, the technique of the "gentle explainer" as well as that of the "nasty debunker." The main difference between these two is how much or and which bits of information are rejected in order to make an explanation work.

>I'm with those who are willing to accept all of Arnold's

>Tahoma is now resolved as Arnold's peak, this isn't compelling
>evidence for the ET hypothesis, it's an absolute disaster.

Nah. Unless you assume Arnold saw nothing, it isn't a complete disaster. One still has to decide what it was he saw... could it be a conventional phenomenon? Could it have been ordinary aircraft at 6 miles as Hynek claimed? Could he have failed to recognize such aircraft after looking carefully for recognizable details for nearly two minutes? I doubt it. And the bird explanation still fails the MAP TEST.

>Will he now jump ship and support your 'east side story',
>necessarily abandoning what was previously believed and
>advocated as the true circumstances of Arnold's observations. Or
>will he acknowledge, 'Easton, we have a problem'. ;)

Of course I won't jump to the "East Side Story." No Broadway musical there! Nor will I jump into the pouch of a pelican. However, the pterodactyl theory has yet to be disproved.

>It's all subject of course to further developments and we might
>still hear from others I contacted - one is a local pilot who
>has frequently taken aerial photographs of the Cascade range.

One problem with your question is that it doesn't seem to allow your respondents to speculate on what peak there might be south of Mt. Rainier along the "hogback range" or whatever that the objects could have passed behind had they been, as I suspect, LOWER than Arnold by several thousand feet. Arnold did refer to them dipping down into the canyons a hundred feet or so. (

*LIST ONLY *

This is the second list posting from Bruce.

As the appended graphics files are too large for inclusion here, I've uploaded them to my web site and they can be viewed at:

http://web.ukonline.co.uk/voyager/orb_fig1.jpg

to

http://web.ukonline.co.uk/voyager/orb_fig7.jpg

[i.e., orb_fig2.jpg, orb_fig3.jpg etc.]

Thanks for this interesting research, Bruce.

It's noted as 'list only' until you say otherwise.

James.

Subject: ORBS

From: bruce maccabee <brumac@compuserve.com>

Date: Tue, 29 Feb 2000 12:49:27 -0500

OK research list.

Here's some real research on a topic of present interest (to some).

FLASH PHOTOGRAPHY OF PROXIMATE PARTICULATE MATTER

by Bruce Maccabee

(c) 2000 by Bruce Maccabee

In recent years a number of people have reported finding anomalous circular images, often called "orbs," in photos taken at night with a flash, under seemingly ordinary conditions. The photos have been taken both outdoors and indoors. These photos were not taken under "conventional UFO," conditions, i.e., there were no strange lights or objects visible to the photographer. These images first turned up in photos taken for various reasons other than to photograph "orbs," i.e., photos of home scenes,

outdoor scenery at night, etc. Subsequently numerous photographers have simply taken pictures "into the dark," even though they didn't see anything that could make orb images, in order to find out if "orbs" would appear in the photos. (Note: I should point out that there have been numerous photos of unusual lights at night which were seen at the time of the photos and which have also been called orbs. Photos such as these are not the subject of this discussion. The subject of this discussion is orb images which appear in photos taken when there was no observed cause for them.)

The images discussed here are rather diffuse or "transparent" areas of the film that are generally slightly brighter, but sometimes much brighter, than the (generally dark) background. For many cameras the orb images are round, but for at least one type (Polaroid Model 600) the shape is nearly rectangular. Figure 1 shows an example of such images in a flash photograph of an outdoor nighttime scene. If one examines the dim circular images carefully one sees that they have a bluish tint. Images such as these appear at random locations in photos. Similar images obtained by other investigators can be found at:

www.orbsite.com.

Photos have been taken at many different geographic locations. Some outdoor locations produce more, perhaps many more, of these images than other locations. Therefore the occurrence of these images raise the following questions: (a) what are they or what causes these images, (b) why do they occur in some locations and not (or rarely) in others, and (c) why are they (apparently) a recent photographic phenomenon? The investigation reported here has provided answers to these questions.

This investigation was prompted by several correspondents who reported to me that they had found these round images in their own digital photos. They had not seen anything when the photos were taken, yet here were the distinct, reasonably bright round images. They asked for my comments on their photos and photos of others.

My first impression upon seeing images such as these (see Figure 1 for example) was that they were unfocused images of small, bright reflectors of light. However, I could not prove that there were such reflectors present at the times of the photos. The photographers didn't see anything. At the same time, an alternative hypothesis presented itself. So far as I knew, the first photos in which these images appeared, or at least the first in which they were noticed, were flash photos that had been taken with consumer-grade digital cameras. This raised the question of whether or not these images were some sort of strange

artifact of the digital camera like some unexpected light leak. (More recently similar images have turned up in flash photos taken with recycleable cameras, such as the one used to take Figure 1. Other photographers have found similar images in photos taken with 35 mm cameras.) On the other hand, if the cause did not lie with the camera, then it must be something outside the camera. Perhaps the flash had illuminated something very small that was close to the lens. Perhaps a few small flying insects happened to be close to the camera lens when the flash went off. This hypothesis (tiny insects very close to the camera and lit by the flash) seemed acceptable for photos taken when such insects would be present (outdoors in the spring, summer, fall) but not when such insects would unlikely be present (very cold weather, e.g., winter, or inside buildings).

Since I did not have a digital camera (they have been quite expensive until recently) I was not able to do any experiments myself to determine whether or not these anomalous images could be an artifact of the camera and so there the matter rested until recently when a correspondent reported finding some images in digital photos he had taken inside his house using a new Olympus camera. He was worried that his new camera had some sort of strange defect. He wrote, "The (anomalous images) look like lens flares, but there appear to be too many of them, and they don't seem to be in the right position for lens flares." He offered to send me some of his pictures and wanted to ask my advise as to whether or not he should return the camera.

He emailed the pictures to me and I, too, was puzzled. They showed scenes in a house where insects would not likely be flying around close to the camera lens. About the only thing I could do was suggest some experiments to determine whether or not these images were caused by something outside the camera or inside the camera. One of the experiments was to take flash pictures with his hand over the lens to block light. This would test whether or not the images were coming from inside the camera, as, for example if there were some bizarre hole in the camera structure that would allow light to leak directly from the flash to the film. For comparison I asked him to take pictures in some area where there were no surfaces to reflect light, for example, outdoors where the nearest object was far away. I pointed out that if he got anomalous images when his hand was not on the lens and got no such images when his hand was on the lens then the anomalous images were coming from light reflectors outside the camera. The correspondent noted that there was a bright metal ring around the lens aperture and thought that perhaps that might cause some unexpected images. I suggested that he cover it with black tape. To my suggestion that there might have been tiny reflective particles in front of the camera he replied,

The tiny, shining objects idea is an interesting one. Most Christmases, my kids make various things with glitter, which they bring home. This stuff sheds into the carpet and can be quite difficult to get out. I believe this could be the explanation for the (anomalous images which appear to be silhouetted against) the carpet.

I'll take some repeated shots from the same position and see if they move--if not, then we've got the explanation for those, at least. As for the 'floating' (images), perhaps some minute particles of glitter can float on air currents--but would they stay around for a year? Again, some sequence shots might help here, too.

It is clear from what he wrote that he thought the anomalous images that appeared silhouetted against the rug might have been caused by bright reflections from tiny pieces of reflective material - glitter - on the rug. He also wondered whether or not floating glitter could explain the images which appeared to be above the rug, e.g., silhouetted against the walls or ceiling. I did not believe that "Christmas glitter" in the rug or floating in the air would explain the images, but I didn't know what would.

About a month and a half later he wrote again and this time supplied the first good suggestion as to the source of the anomalous round images:

I have followed the experiments you suggested, as well as done a few of my own. I can definitely state that the (images) are the result of the illumination of dust particles in the air by camera flash. I was able to produce a (picture) image with hundreds of (round images) by having the kids run around for several minutes on an unvacuumed carpet! Most of the dust particles seem to be intrafocal, although even those at greater distances can produce quite a convincing small (image). I borrowed a professional flash, which fires several times a second, and was amazed at just how much 'junk' is stirred up in the home environment by ordinary activity. I could see hundreds of quite brilliantly-illuminated particles with my eyes.

When I read the above I knew that what the correspondent said was perfectly logical. I already knew that reflective particles so tiny that they could not normally be seen by the naked eye could make circular, defocused images if they were close enough to the lens. What I didn't know was the nature of these particles. The correspondent supplied that answer.

By extension, one can infer that pollen grains and aerosol particles can also cause such images. These types of particulate

matter are also floating in the atmosphere at various concentrations that depend upon the geographic location, whether inside or outside a building, the time of year, the temperature, wind, etc. For example, near a wooded area small particles from plants and trees could float in the air at higher concentrations than in areas where there are no trees or plants. Fine dirt particles, such as from a road or dry, sandy area, can be stirred up by wind or human activities (automobiles) and could be suspended in the air for considerable amounts of time and be transported over considerable distances. This could explain the geographic dependence of the phenomenon. Of course the photographer would not normally notice these particles during the time of the flash because the photographer would be looking through the viewfinder. Even with a single lens reflex camera (that allows the photographer to look through the lens) the photographer would not see the particles during the time of the flash because the "reflex mirror" within the camera moves to a location that blocks the view through the camera while the photo is being taken.

After reading what my correspondent wrote I decided to carry out my own experiments. Figure 1 shows the result of one particular experiment. Figure 2 shows how one can be fooled into thinking that an "anomalous source" of the anomalous image is far from the camera lens. The arrow points toward a small, bluish disk that appears to be partially occulted (blocked) by the archway structure. If one were to assume that the image was actually caused by an object on the far side of the structure, about 20 feet away, then one could calculate that the object was several inches in diameter. However, the object which caused that image was actually only a dust grain close to the camera and the apparent blockage of the image by the structure is an illusion. The faint bluish image can be seen at the right side of the vertical support of the arch because it is silhouetted against perfect blackness. The portion of the circular image that overlaps the structural member cannot be detected because its low brightness was overwhelmed by that of the structure.

Figure 1 shows only a portion of the complete outdoor photo of anomalous images. Photo 3 shows the complete photo. Very obvious in the upper left corner is a whitish cloud or "jumble" of circular images, some resembling soap bubbles, some resembling white discs and others being the circular, diffuse or transparent "anomalous images" of varying sizes and brightnesses. This cloud is actually a large "puff" of spackle dust (dust from dry spackling compound that I had sanded off a wall I was repairing) that I blew into the air a few inches in front of the camera just before taking the flash picture with a Kodak "throw away" camera. By the time of the flash some of the particles had drifted to the right and appear silhouetted against the archway, automobile,

ground and (dark) sky. The date of the photo was January 13, 2000, and the location was in Maryland, so there was no pollen or dust in the atmosphere other than the spackle dust.

In examining this picture one finds many of the characteristics of typical "anomalous circular images." Most are faint and bluish in color but some are bright white. The diameters range from very small up to some maximum size.

Figure 4 shows an indoor picture with lots of anomalous images, including some elongated images that seem to indicate downward motion of the reflective particles during the duration of the flash. This was taken with a Model 600 Polaroid so the elongation is a result of the shape of the aperture and does not indicate motion during the short time of the flash. The astute observer will be able to find several dozen anomalous images in this photo which was created by holding the camera about one inch above the floor, by hitting the rug with one hand and then quickly taking the flash picture with the other hand. The presence of dust in the atmosphere near the floor after the rug had been hit was verified by using the very bright beam from a slide projector to provide constant illumination of the atmosphere just above the rug. This illumination is sufficiently bright to make visible tiny dust particles in the air. (Evidently one could test for the presence of dust and pollen at any geographical location by shining a powerful beam of light through the atmosphere.)

One may conclude from these experiments that at least some and perhaps many (all?) of the anomalous circular (and other shaped) images which have been reported in to appear only in flash pictures recent years are, in fact, images caused by tiny reflective particles which float in the air (or perhaps insects flying past the lens). But this raises the above-mentioned question, why haven't they been noticed before, i. e. in previous decades? My answer, which must be considered as conjecture, divides into two parts. The first part is that there probably have been anomalous images of this sort in pictures before, but they were few and far between and considered to be merely occasional film flaws. The second part of my answer is that the newer photographic equipment is somewhat different from that available in previous decades in (at least) two ways. The first is the proximity of the flash unit to the lens, on the small cameras especially, being only 2 -3 inches away, whereas in decades past the flash units were typically 5 or more inches from the lens. The second is the greater distance over which flash pictures can be taken, a result of increased film sensitivity or "speed" (ISO 400 or 800 film in recycleable cameras, for example) or use of a "focal plane detector array" (the charge coupled device - CCD - which, in a digital camera or videocamera, plays

the role of film) and a result of increased brightness of the flash itself. The overall increase in sensitivity and flash brightness results in images of objects up to 30 ft from the camera, whereas in the past one was lucky to get a good flash picture at 20 ft (or even as low as 10 ft). The decreased distance between the flash and the lens means that the edge of the illuminated volume of space in front of the camera (or the edge of the "beam" from the flash) passes very close to the lens. Experiments with a recycleable camera showed that there was useable flash illumination at a distance of only 2 cm from the lens. Hence any particulate matter that happens to be within a few cm of the lens will be more brightly lit nowadays than it would have been in decades past. It is my conjecture that this combination of the particulate matter close to the lens being more brightly lit and the film (or CCD) being more sensitive in the present decade than it was in past decades accounts for the "newness" of this phenomenon.

ORB EXPERIMENTS

(A) IMAGE SIZE AND BRIGHTNESS

The four illustrations already discussed show orb images created by photographing dust in the air. In order to get an idea of what the object (dust particle) size and distance has to do with the sizes of the orb images, experiments were conducted using tiny glass spheres with a size distribution ranging from about 30 to about 150 microns (0.003 to .015 cm), with the peak of the distribution at about 100 microns. These tiny hollow spheres were dense enough to fall downward but slowly. Using a recycleable camera (approximately a 3 mm diameter lens aperture, 31 mm focal length, hence an f/10 system) and a meter stick to determine the distance from the lens, a large number of spheres was dropped above the camera field of view and then flash photographed as they fell. Figure 5 shows the results of three such experiments. The top picture was taken with the spheres in the distance range 8 - 10 cm from the lens, the middle picture with the spheres about 25 cm from the lens and the bottom picture with the spheres about 40 cm from the lens. In the middle and bottom pictures a few stray sphere images that were closer can be seen at the left (indicated by lines). The diameters of the circular images in the top picture are roughly 1-1.3 mm, in the middle picture roughly 0.25 mm and in the bottom picture roughly 0.15 mm. These sizes are roughly independent of the sizes of the spheres themselves (this is not geometric imaging; see below).

Generally one can say that the closer the spheres, the larger and brighter are the images. This is to be expected although I have not been able to determine a quantitative relationship. Qualitatively one knows that the reflected light that reaches the

film plane and makes an image is proportional to the illumination reaching the object (which depends upon the optical power output of the flash multiplied by the "radiation pattern" factor), to the reflectivity of the object, to area of the lens aperture and to the inverse fourth power of the distance (just as with radar - inverse square out to the target and inverse square back to the receiver). The inverse fourth power with distance means that the image brightness (actually the image exposure, which is the product of the optical power per unit area within the image multiplied by the exposure time) changes rapidly with distance of the reflective object. On the other hand, the image size also decreases with increasing distance, almost in the inverse proportional to distance (even though the object is too close for to be focused) so the image area is approximately proportional to the inverse square of the distance. Therefore the combination of the inverse fourth power decrease of illumination on the image with the inverse square shrinkage of the image area means that the exposure (proportional to the power per unit area) decreases only as the inverse square of the distance. Both the overall decrease in image size and brightness with increasing distance is evident in Figure 5. However, distance alone does not explain the brightness variation. The image brightness is also affected by the object size and this means that a collection of different sized objects all at the same distance will make images approximately the same size but differing considerably in brightness. The size dependence of the brightness occurs because the amount of light reflected by one of these tiny objects is proportional to its "cross-sectional area," that is, to its diameter squared. In the case of these glass spheres there was a wide range in diameters and hence a wide range in image brightnesses even for spheres at nominally the same distance.

(B) FLASH DURATION

The shape of an image of a moving object is determined by the object shape itself as modified by motion during the exposure time. Hence, if a perfectly circular light or steady intensity moved in a straight line a distance 3 times its own diameter during the exposure time the resulting image would be elongated, 4 times as long as it is wide, with rounded ends. (Why not 3 times its own width? Draw a circle on a piece of paper. It has some diameter, d . Now imagine sliding the circle to the right by the distance d , and then another distance d and then once more. Now measure the distance from the far left to the far right boundary. It is $d + md$, where m is the number of displacements.) In the case of a constantly moving object with a constant velocity v perpendicular to the line of sight the length of the image is $d + vt$. (In the previous example vt was 3 times the diameter, $3d$, so we had $d+3d = 4d$.) (In the more general case

the length of the image is the integral of the component of velocity perpendicular to the sighting line over the time of the exposure.) Clearly the shorter the exposure time the smaller the motion "smear." In order to determine how much of the image shape might be due to motion it is necessary to know the exposure duration. This duration is determined by the shutter during ordinary non-flash photography and by the flash duration when a flash is used.

I set up an experiment to measure the shutter time (time during which the shutter is open), the flash duration and the synchronization between the shutter and flash of a recycleable camera. This experiment used a steady light illuminating the lens and a photodiode to measure the light transmitted. (Note: this experiment required partial destruction of the camera since I wanted to place the light source just behind the lens/aperture/shutter combination.) I operated the shutter several times without the flash and I also operated the shutter with flash. Figure 6 shows the results. The near-trapezoidal shape of the two "shutter graphs" at the left side is expected from the mechanics of the shutter: it opened quickly but not instantaneously, remained fully open for a period of time and then quickly closed. (The downward slope of the "top" of the shutter curve is not a result of the shutter starting to close slowly but rather an artifact - a capacitive effect - of the electronic circuitry.) According to the measurements the shutter was fully open for about 8 ms ($1/125$ of a second, which is a standard camera shutter time for general use). The illustration at the right side of the figure shows the shutter-time curve with the much shorter flash "spike" superimposed. (This was obtained by letting light from the flash reach the photodiode.) Notice that the flash began about 3.5 milliseconds after the shutter started to open and hence about 1.7 ms after the shutter was completely open.

Figure 7 illustrates the time dependence of the flash intensity for the recycleable camera and also for the Polaroid Model 600. The amplitudes of the two flash intensities were about the same, but obviously the Polaroid flash was shorter. For the recycleable camera the flash intensity reached its peak very, very quickly (about 30 microseconds) and then the flash brightness decayed (approximately exponentially) over the next millisecond. The effective duration of the flash was about 300-500 microseconds (depending upon how one wants to quantitatively define "effective duration"). When photos are taken in the dark the only source of light is the flash and hence the flash duration determines the exposure time. (In normal non-flash daylight shots the shutter determines the exposure time.) This is an "effective shutter time" of $1/2000$ to $1/3000$ of a second. An object moving several meters per second or millimeters per

millisecond will be quite effectively "stopped" in its motion by such a short shutter. By "stopping the motion" is meant having such a short exposure that the image hardly moves during the exposure. For example, if a tiny object were to move perpendicular to the line of sight at 1 meter per second at a distance of 10 cm from the camera lens its angular rate would be $(100 \text{ cm/sec})/(10 \text{ cm}) = 10 \text{ rad/sec}$. For a 3 cm focal length this transfers to an image velocity of 30 cm/sec. In $1/3000$ of a second the image would move $30 \times (1/3000) = 0.01 \text{ cm} = 0.1 \text{ mm}$. At the same time, these experiments suggest that the image diameter for a tiny object 10 cm from the lens (of the recycleable type of camera) would be a bit over 1 mm (see above). Hence the motion smear would be a small fraction of the image size and the image would be nearly circular. Objects moving more slowly than 1 m sec or objects at greater distance would create even less smear. (However, objects at greater distance also make smaller images so for constant sized objects at the same velocity but at varying distances the percentage of the image which is smear could be constant.) In the case of the glass spheres used in these experiments the velocities were in the range of several to ten centimeters per second rather than a meter per second so the motion smear is not detectable.

CONCLUSION: ORBS OR DUST

A considerable "mythology" has developed over the last few years about the nature of these strange orb images, with some people attributing them to "creatures" or intelligent entities from some other reality that are penetrating our reality. This mythology has resulted from the failure of the initial "orbists" to find reasonable explanations for the images. Of course, I cannot state positively that every anomalous image of the basic orb type (nothing was seen when the flash photo was taken and the image is a small, "transparent" circle or disc) was caused by a reflection of light from a tiny object close to the camera. However, it seems to be a "good guess" that many or most of them are.

James.

Excerpts from an August 5, 1956, letter to Isabel L. Davis from Maurene Chenoweth:

This is my interview with Kenneth Arnold. In the first place, I am sure he has definitely soured on saucers. He still believes in them all right but personally he's through investigating. There seems to be several reasons for this, he was worn out with all the govern- ment investigators (Army, Navy, Marine Intelligence, plus the FBI and finally the Income Tax Bureau who soaked him \$4800.00 which seemed to be the final straw) plus the fact that he had spent 12,000 of his own money with no tangible result. He is not at all uptodate on the activity. Hadn't even heard of Rup pelt's book....

On his own sightings he has seen saucers five separate times and he has made _movies_ of them. One flew under him at Mt. Lassen and he got a movie of that. He says the movies are good. In his original sighting, a fact that he didn't mention was that one of the nine was slightly larger than the other eight.

About the Tacoma affair. He said there is no possibility that this could be a hoax unless someone is able to read his mind because no one knew that he was going to Tacoma. Dahl, he said, was a big awkward lumberjack type who "Didn't have enough imagination to imagine a ham sandwich if it was held out at arm's length." Chris- man [sic] was a different sort; he seemed "to be running around muddying up the water." Neither of the men have ever been heard of since the episode and the military intelligence people check with Arnold at frequent intervals trying to discover if they've got in touch with him.

The metal recovered at Tacoma was of two types, a shiny very heavy brass type rough on one side and smooth on the other. This they spread out on the floor and it made a circle as if it had been the lining of a tube. The other type was an aluminum type metal with a square rivet in it. The government men took every

scrap of this metal, grubbing around on the floor to get every single sliver. Arnold says he's kicked himself that he didn't have the foresight enough to mail a couple of pieces home. But he didn't....

Now for the new material he gave me after he finally loosened up. The most intriguing and the newest from my viewpoint are the little eleven-inch men. He gave me two most unusual stories. The first is from Mrs. Ellen Jorenson [sic; Jonerson], Cambe [sic; Canby], Oregon. She is a graduate of the U. of Oregon, an intelligent woman. She was in her front yard one day when she saw this little men "About as high as a milk bottle" come out of the weeds next door. At first she thought he was a baby, saw him from the back first, and she wondered what crazy woman let a child that size out by itself. Then he turned around and she saw that he was a fully matured little man, dressed in some sort of a one piece uniform. He walked around in front of her and marched under their Dodge car and disappeared.

The second little man story is told by a Basque sheep- herder and occurred in rough country -- the Owyhee River breaks, I believe - - in Oregon. He was bringing a bunch of horses across the desert and pastured them in a certain place in the canyon and had just settled down for the night when something spooked his horses. He knew he'd have to chase them all over the canyon the next morning and he got up to see what sort of a deal he had to handle. He walked along the trail when he suddenly saw two men. He thought they were two ridges away from him, outlined against the sky[,] but as he came up the trail he saw that they were actually on a rock right on the trail. They were about "As high as a jackrabbit" fully clothed and talking briskly to each other. When they saw him they ran around the rock and he thinks they disappeared in the ground.

There is a third little man story that is the most interesting of all from a straight story standpoint. There is a prospector in Boise named George Ogden. Jack Simplot grubstakes him. Well, he was in the back country near the Boise River when he noticed that his groceries were being swiped every night. One morning he woke up and found a lot of little footprints around the grub box. He drew a large circle around the footprints and stuck a stick in the center of it just to indicate that he knew what was swiping his grub. The next morning when he woke up, one of his own footprints was encircled the same way with a stick in the middle of it! Also at night he hears the most tremendous activity as if a "dozen road crews had moved in and were working at top speed" but when he gets up in the morning nothing has changed. Arnold says he's a queer sort of a duck but I think his story is entertaining. My Boise family is going to try to dig him up but I doubt if he'll talk to me. Those kind of guys need a man to

loosen them up.

Now for a human type contact story. It was in 1948 [sic; March 28, 1950] and it happened to a Samuel Eaton Thompson of Centralia[,] Washington. He was a big strapping guy who had worked for the Union Pacific railroad for 22 years. He took a trip up into the mountains, the road washed out ahead of him and he had to turn to an old logging road and on this he found a landed saucer. He went in it and here is one place of my reporting falls down because I forgot to ask Arnold how he said he communicated with these people because communicate he did. The saucer was from Venus and was a ten-family ship. He said as he approached it the air was warmed and when he got inside it was warm enough so that no one wore clothes. There were men, women and children aboard the ship. There were controls opposite each other and all the people aboard knew about running it was that if they pushed one set of controls they went to Venus and if they pushed another set they went to earth. They said the ship was an inherited one. (Nice inheriting, huh?) Thompson went with them on a three-day trip and then the ship landed within two blocks of his home. The only proof of his story is that on March 29-31 of that year the people of Centralia were seeing these tremendously bright lights.... [Arnold] tried to trip the man up in every way. The only lead he got was when he asked him how the Venusians relieved themselves. Thompson said he didn't know, that in the whole three days they didn't do anything about it. Arnold said it might have been a psychic experience but the man hardly seemed the type and Arnold went over to his house and found absolutely no science fiction material. The man was packing to leave and has since disappeared completely. One investigator told Arnold that the man was committed to an insane asylum but Arnold said the investigator was not to be depended on....

Another landing story but no contact that's known, at least. This happened in Boise in 1950. Three disks landed early one morning out in the field where the CAA control tower is. Ed Jones[,] the chief meteorologist at the time[,] told this to Arnold. It is substantiated by a nearby ranch woman. Her husband had gone into town to get a new type of brooder pen and when she saw these three round disk-shaped things she thought they were the new brooder pens. The fastest planes rushed the highest of intelligence people from Mitchell Field to investigate this one but no word of it got out in the papers.

In 1950 also there was a reported landing at Cascade. The disk was said to have come down in a slough and a pilot flew a P-51 from Boise to investigate. The thing was gone when he got there but he flew over the spot. When he started to come back he found the left aileron wouldn't work; the right would but not the left, and Arnold says that is a physical impossibility. He managed to

fly on to Boise and then by golly, the thing reversed itself, the left tworced and not the right. He radioed for emergency landing instructions and just as he was about to set down, the whole thing straightened itself out. When he landed they went over the whole ship and there was absolutely nothing wrong with it....

[Comment by Jerome Clark: Chenoweth has some of the details of the Thompson contact claim wrong. For a full account, see my *The Emergence of a Phenomenon*, pp. 295-97.]

Some subscribers may be unaware of this recent case and how it seems to relate to the numerous comparative reports we have discussed.

Yet again, we have claimed sightings of a 'massive', silent/almost silent [perhaps a slight 'hum'?], low altitude, slow moving, triangular-shaped object with white lights at each apex and a central red light.

In this case, there were several claimed witnesses, including local police officers and there's an on-line summary at:

<http://home.fuse.net/ufo/missouri99.html>

The referenced NIDS site is important as it contains detailed testimonies and sketches - see:

http://www.accessnv.com/nids/news/illinois_contents.html

Comments welcome.

James.

REgarding this Arnold interview material"

>Excerpts from an August 5, 1956, letter to Isabel L. Davis from
>Maurene Chenowith:

>This is my interview with Kenneth Arnold. In the first place, I
>am sure he has definitely soured on saucers. He still believes in
>them all right but personally he's through investigating. There
>seems to be several reasons for this, he was worn out with all
>the govern- ment investigators (Army, Navy, Marine Intelligence,
>plus the FBI and finally the Income Tax Bureau who soaked him
>\$4800.00 which seemed to be the final straw) plus the fact that
>he had spent 12,000 of his own money with no tangible result. He
>is not at all uptodate on the activity. Hadn't even heard of Rup
.pelt's book....

>On his own sightings he has seen saucers five separate times and
>he has made _movies_ of them. One flew under him at Mt. Lassen
>and he got a movie of that. He says the movies are good. In his
>original sighting, a fact that he didn't mention was that one of
t>he nine was slightly larger than the other eight.
><

I gather that there was no further info on Arnold's first sighting..??

Before directly replying to recent list mail, I wondered if we might be able to set some central issues in context.

Arnold timed the nine objects from a point where the first one seemingly passed Mt. Rainier until the last one appeared to pass the vicinity of Mt. Adams. An accurate timing would strictly be based on when the first object, not the last, was believed to have reached Mt. Adams.

If the objects were in a 'train' which covered the five miles Arnold perceived, what was their true airspeed - assuming all these factors were correct - from Mt. Rainier to the summit of Mt. Adams?

<

ALthough these questions seem to be directed toward Brad, I would point out that in my calculation of the speed based on 102 sec. I took the distance from the peak of Mt. Rainier to th peak of Mt. adams.... very close to 47 miles, and added 5 miles for the length of the chain (52 mi) and subtracted a couple of miles (to correct for the distance from the peak of the mountain to the "flank" where the timing, started a distance that could be off by a mile or more) and got 1764 mph.

If you simply use 47 miles you get 1658 mph.

Excellent report that solves a mystery.

There are several older UFO pictures that are probably bugs caught in a flash. These two come to mind:

@

@

@FLASH PHOTOGRAPHY OF PROXIMATE PARTICULATE MATTER

@by Bruce Maccabee

@(c) 2000 by Bruce Maccabee

@

@In recent years a number of people have reported finding

@anomalous circular images, often called "orbs," in photos taken

@at night with a flash, under seemingly ordinary conditions. The

@photos have been taken both outdoors and indoors. These photos

@were not taken under "conventional UFO," conditions, i.e., there

@were no strange lights or objects visible to the photographer.

@These images first turned up in photos taken for various reasons

@other than to photograph "orbs," i.e., photos of home scenes,

@outdoor scenery at night, etc. Subsequently numerous

@photographers have simply taken pictures "into the dark," even

@though they didn't see anything that could make orb images, in

@order to find out if "orbs" would appear in the photos. (Note:

@I should point out that there have been numerous photos of

@unusual lights at night which were seen at the time of the photos

@and which have also been called orbs. Photos such as these are

@not the subject of this discussion. The subject of this

@discussion is orb images which appear in photos taken when there

@was no observed cause for them.)

@

@The images discussed here are rather diffuse or "transparent"

@areas of the film that are generally slightly brighter, but

@sometimes much brighter, than the (generally dark) background.

@For many cameras the orb images are round, but for at least one

@type (Polaroid Model 600) the shape is nearly rectangular.

@Figure 1 shows an example of such images in a flash photograph of

@an outdoor nighttime scene. If one examines the dim circular

@images carefully one sees that they have a bluish tint. Images

@such as these appear at random locations in photos. Similar

@images obtained by other investigators can be found at:

@

@www.orbsite.com.

@

@Photos have been taken at many different geographic locations.

@Some outdoor locations produce more, perhaps many more, of these

@images than other locations. Therefore the occurrence of these

@images raise the following questions: (a) what are they or what
@causes these images, (b) why do they occur in some locations and
@not (or rarely) in others, and (c) why are they (apparently) a
@recent photographic phenomenon? The investigation reported here
@has provided answers to these questions.

@
@This investigation was prompted by several correspondents who
@reported to me that they had found these round images in their
@own digital photos. They had not seen anything when the photos
@were taken, yet here were the distinct, reasonably bright round
@images. They asked for my comments on their photos and photos of
@others.

@
@My first impression upon seeing images such as these (see Figure
@1 for example) was that they were unfocused images of small,
@bright reflectors of light. However, I could not prove that there
@were such reflectors present at the times of the photos. The
@photographers didn't see anything. At the same time, an
@alternative hypothesis presented itself. So far as I knew, the
@first photos in which these images appeared, or at least the
@first in which they were noticed, were flash photos that had been
@taken with consumer-grade digital cameras. This raised the
@question of whether or not these images were some sort of strange
@artifact of the digital camera like some unexpected light leak.
@(More recently similar images have turned up in flash photos
@taken with recycleable cameras, such as the one used to take
@Figure 1. Other photographers have found similar images in
@photos taken with 35 mm cameras.) On the other hand, if the
@cause did not lie with the camera, then it must be something
@outside the camera. Perhaps the flash had illuminated something
@very small that was close to the lens. Perhaps a few small
@flying insects happened to be close to the camera lens when the
@flash went off. This hypothesis (tiny insects very close to the
@camera and lit by the flash) seemed acceptable for photos taken
@when such insects would be present (outdoors in the spring,
@summer, fall) but not when such insects would unlikely be present
@(very cold weather,e.g., winter, or inside buildings).

@
@Since I did not have a digital camera (they have been quite
@expensive until recently) I was not able to do any experiments
@myself to determine whether or not these anomalous images could
@be an artifact of the camera and so there the matter rested until
@recently when a correspondent reported finding some images in
@digital photos he had taken inside his house using a new Olympus
@camera. He was worried that his new camera had some sort of
@strange defect. He wrote, "The (anomalous images) look like
@lens flares, but there appear to be too many of them, and they
@don't seem to be in the right position for lens flares." He
@offered to send me some of his pictures and wanted to ask my
@advise as to whether or not he should return the camera.

@

@He emailed the pictures to me and I, too, was puzzled. They
@showed scenes in a house where insects would not likely be flying
@around close to the camera lens. About the only thing I could do
@was suggest some experiments to determine whether or not these
@images were caused by something outside the camera or inside the
@camera. One of the experiments was to take flash pictures with
@his hand over the lens to block light. This would test whether
@or not the images were coming from inside the camera, as, for
@example if there were some bizarre hole in the camera structure
@that would allow light to leak directly from the flash to the
@film. For comparison I asked him to take pictures in some area
@where there were no surfaces to reflect light, for example,
@outdoors where the nearest object was far away. I pointed out
@that if he got anomalous images when his hand was not on the lens
@and got no such images when his hand was on the lens then the
@anomalous images were coming from light reflectors outside the
@camera. The correspondent noted that there was a bright metal
@ring around the lens aperture and thought that perhaps that might
@cause some unexpected images. I suggested that he cover it with
@black tape. To my suggestion that there might have been tiny
@reflective particles in front of the camera he replied,

@

@The tiny, shining objects idea is an interesting one. Most
@Christmases, my kids make various things with glitter, which they
@bring home. This stuff sheds into the carpet and can be quite
@difficult to get out. I believe this could be the explanation
@for the (anomalous images which appear to be silhouetted
@against) the carpet.

@

@I'll take some repeated shots from the same position and see if
@they move--if not, then we've got the explanation for those, at
@least. As for the 'floating' (images), perhaps some minute
@particles of glitter can float on air currents--but would they
@stay around for a year? Again, some sequence shots might help
@here, too.

@

@It is clear from what he wrote that he thought the anomalous
@images that appeared silhouetted against the rug might have been
@caused by bright reflections from tiny pieces of reflective
@material - glitter - on the rug. He also wondered whether or not
@floating glitter could explain the images which appeared to be
@above the rug, e.g., silhouetted against the walls or ceiling. I
@did not believe that "Christmas glitter" in the rug or floating
@in the air would explain the images, but I didn't know what
@would.

@

@About a month and a half later he wrote again and this time
@supplied the first good suggestion as to the source of the
@anomalous round images:

@

@I have followed the experiments you suggested, as well as done a few of my own. I can definitely state that the (images) are the result of the illumination of dust particles in the air by camera flash. I was able to produce a (picture) image with hundreds of (round images) by having the kids run around for several minutes on an unvacuumed carpet! Most of the dust particles seem to be intrafocal, although even those at greater distances can produce quite a convincing small (image). I borrowed a professional flash, which fires several times a second, and was amazed at just how much 'junk' is stirred up in the home environment by ordinary activity. I could see hundreds of quite brilliantly-illuminated particles with my eyes.

@

@When I read the above I knew that what the correspondent said was perfectly logical. I already knew that reflective particles so tiny that they could not normally be seen by the naked eye could make circular, defocused images if they were close enough to the lens. What I didn't know was the nature of these particles. The correspondent supplied that answer.

@

@By extension, one can infer that pollen grains and aerosol particles can also cause such images. These types of particulate matter are also floating in the atmosphere at various concentrations that depend upon the geographic location, whether inside or outside a building, the time of year, the temperature, wind, etc. For example, near a wooded area small particles from plants and trees could float in the air at higher concentrations than in areas where there are no trees or plants. Fine dirt particles, such as from a road or dry, sandy area, can be stirred up by wind or human activities (automobiles) and could be suspended in the air for considerable amounts of time and be transported over considerable distances. This could explain the geographic dependence of the phenomenon. Of course the photographer would not normally notice these particles during the time of the flash because the photographer would be looking through the viewfinder. Even with a single lens reflex camera (that allows the photographer to look through the lens) the photographer would not see the particles during the time of the flash because the "reflex mirror" within the camera moves to a location that blocks the view through the camera while the photo is being taken.

@

@After reading what my correspondent wrote I decided to carry out my own experiments. Figure 1 shows the result of one particular experiment. Figure 2 shows how one can be fooled into thinking that an "anomalous source" of the anomalous image is far from the camera lens. The arrow points toward a small, bluish disk that appears to be partially occulted (blocked) by the archway structure. If one were to assume that the image was actually

@caused by an object on the far side of the structure, about 20
@feet away, then one could calculate that the object was several
@inches in diameter. However, the object which caused that image
@was actually only a dust grain close to the camera and the
@apparent blockage of the image by the structure is an illusion.
@The faint bluish image can be seen at the right side of the
@vertical support of the arch because it is silhouetted against
@perfect blackness. The portion of the circular image that
@overlaps the structural member cannot be detected because its low
@brightness was overwhelmed by that of the structure.

@
@Figure 1 shows only a portion of the complete outdoor photo of
@anomalous images. Photo 3 shows the complete photo. Very
@obvious in the upper left corner is a whitish cloud or "jumble"
@of circular images, some resembling soap bubbles, some resembling
@white discs and others being the circular, diffuse or transparent
@"anomalous images" of varying sizes and brightnesses. This cloud
@is actually a large "puff" of spackle dust (dust from dry
@spackling compound that I had sanded off a wall I was repairing)
@that I blew into the air a few inches in front of the camera just
@before taking the flash picture with a Kodak "throw away" camera.
@By the time of the flash some of the particles had drifted to the
@right and appear silhouetted against the archway, automobile,
@ground and (dark) sky. The date of the photo was January 13,
@2000, and the location was in Maryland, so there was no pollen or
@dust in the atmosphere other than the spackle dust.

@
@In examining this picture one finds many of the characteristics
@of typical "anomalous circular images." Most are faint and
@bluish in color but some are bright white. The diameters range
@from very small up to some maximum size.

@
@Figure 4 shows an indoor picture with lots of anomalous images,
@including some elongated images that seem to indicate downward
@motion of the reflective particles during the duration of the
@flash. This was taken with a Model 600 Polaroid so the
@elongation is a result of the shape of the aperture and does not
@indicate motion during the short time of the flash. The astute
@observer will be able to find several dozen anomalous images in
@this photo which was created by holding the camera about one inch
@above the floor, by hitting the rug with one hand and then
@quickly taking the flash picture with the other hand. The
@presence of dust in the atmosphere near the floor after the rug
@had been hit was verified by using the very bright beam from a
@slide projector to provide constant illumination of the
@atmosphere just above the rug. This illumination is sufficiently
@bright to make visible tiny dust particles in the air.
@(Evidently one could test for the presence of dust and pollen at
@any geographical location by shining a powerful beam of light
@through the atmosphere.)

@

@One may conclude from these experiments that at least some and
@perhaps many (all?) of the anomalous circular (and other shaped)
@images which have been reported in to appear only in flash
@pictures recent years are, in fact, images caused by tiny
@reflective particles which float in the air (or perhaps insects
@flying past the lens). But this raises the above-mentioned
@question, why haven't they been noticed before, i. e. in previous
@decades? My answer, which must be considered as conjecture,
@divides into two parts. The first part is that there probably
@have been anomalous images of this sort in pictures before, but
@they were few and far between and considered to be merely
@occasional film flaws. The second part of my answer is that the
@newer photographic equipment is somewhat different from that
@available in previous decades in (at least) two ways. The first
@is the proximity of the flash unit to the lens, on the small
@cameras especially, being only 2 -3 inches away, whereas in
@decades past the flash units were typically 5 or more inches from
@the lens. The second is the greater distance over which flash
@pictures can be taken, a result of increased film sensitivity or
@"speed" (ISO 400 or 800 film in recycleable cameras, for example)
@or use of a "focal plane detector array" (the charge coupled
@device - CCD - which, in a digital camera or videocamera, plays
@the role of film) and a result of increased brightness of the
@flash itself. The overall increase in sensitivity and flash
@brightness results in images of objects up to 30 ft from the
@camera, whereas in the past one was lucky to get a good flash
@picture at 20 ft (or even as low as 10 ft). The decreased
@distance between the flash and the lens means that the edge of
@the illuminated volume of space in front of the camera (or the
@edge of the "beam" from the flash) passes very close to the lens.
@Experiments with a recycleable camera showed that there was
@useable flash illumination at a distance of only 2 cm from the
@lens. Hence any particulate matter that happens to be within a
@few cm of the lens will be more brightly lit nowadays than it
@would have been in decades past. It is my conjecture that this
@combination of the particular matter close to the lens being more
@brightly lit and the film (or CCD) being more sensitive in the
@present decade than it was in past decades accounts for the
@"newness" of this phenomenon.

@

@

@ORB EXPERIMENTS

@(A) IMAGE SIZE AND BRIGHTNESS

@

@The four illustrations already discussed show orb images created
@by photographing dust in the air. In order to get an idea of
@what the object (dust particle) size and distance has to do with
@the sizes of the orb images, experiments were conducted using
@tiny glass spheres with a size distribution ranging from about 30

@to about 150 microns (0.003 to .015 cm), with the peak of the
@distribution at about 100 microns. These tiny hollow spheres
@were dense enough to fall downward but slowly. Using a
@recycleable camera (approximately a 3 mm diameter lens aperture,
@31 mm focal length, hence an f/10 system) and a meter stick to
@determine the distance from the lens, a large number of spheres
@was dropped above the camera field of view and then flash
@photographed as they fell. Figure 5 shows the results of three
@such experiments. The top picture was taken with the spheres in
@the distance range 8 - 10 cm from the lens, the middle picture
@with the spheres about 25 cm from the lens and the bottom picture
@with the spheres about 40 cm from the lens. In the middle and
@bottom pictures a few stray sphere images that were closer can be
@seen at the left (indicated by lines). The diameters of the
@circular images in the top picture are roughly 1-1.3 mm, in the
@middle picture roughly 0.25 mm and in the bottom picture roughly
@0.15 mm. These sizes are roughly independent of the sizes of the
@spheres themselves (this is not geometric imaging; see below).

@
@Generally one can say that the closer the spheres, the larger and
@brighter are the images. This is to be expected although I have
@not been able to determine a quantitative relationship.
@Qualitatively one knows that the reflected light that reaches the
@film plane and makes an image is proportional to the illumination
@reaching the object (which depends upon the optical power output
@of the flash multiplied by the "radiation pattern" factor), to
@the reflectivity of the object, to area of the lens aperture and
@to the inverse fourth power of the distance (just as with radar -
@inverse square out to the target and inverse square back to the
@receiver). The inverse fourth power with distance means that the
@image brightness (actually the image exposure, which is the
@product of the optical power per unit area within the image
@multiplied by the exposure time) changes rapidly with distance of
@the reflective object. On the other hand, the image size also
@decreases with increasing distance, almost in the inverse
@proportional to distance (even though the object is too close for
@to be focused) so the image area is approximately proportional to
@the inverse square of the distance. Therefore the combination of
@the inverse fourth power decrease of illumination on the image
@with the inverse square shrinkage of the image area means that
@the exposure (proportional to the power per unit area) decreases
@only as the inverse square of the distance. Both the overall
@decrease in image size and brightness with increasing distance is
@evident in Figure 5. However, distance alone does not explain
@the brightness variation. The image brightness is also affected
@by the object size and this means that a collection of different
@sized objects all at the same distance will make images
@approximately the same size but differing considerably in
@brightness. The size dependence of the brightness occurs because
@the amount of light reflected by one of these tiny objects is

@proportional to its "cross-sectional area," that is, to its
@diameter squared. In the case of these glass spheres there was a
@wide range in diameters and hence a wide range in image
@brightnesses even for spheres at nominally the same distance.

@

@

@@(B) FLASH DURATION

@

@The shape of an image of a moving object is determined by the
@object shape itself as modified by motion during the exposure
@time. Hence, if a perfectly circular light or steady intensity
@moved in a straight line a distance 3 times its own diameter
@during the exposure time the resulting image would be elongated,
@4 times as long as it is wide, with rounded ends. (Why not 3
@times its own width? Draw a circle on a piece of paper. It has
@some diameter, d . Now imagine sliding the circle to the right by
@the distance d , and then another distance d and then once more.
@Now measure the distance from the far left to the far right
@boundary. It is $d + md$, where m is the number of displacements.)
@In the case of a constantly moving object with a constant
@velocity v perpendicular to the line of sight the length of the
@image is $d + vt$. (In the previous example vt was 3 times the
@diameter, $3d$, so we had $d + 3d = 4d$.) (In the more general case
@the length of the image is the integral of the component of
@velocity perpendicular to the sighting line over the time of the
@exposure.) Clearly the shorter the exposure time the smaller the
@motion "smear." In order to determine how much of the image
@shape might be due to motion it is necessary to know the exposure
@duration. This duration is determined by the shutter during
@ordinary non-flash photography and by the flash duration when a
@flash is used.

@

@I set up an experiment to measure the shutter time (time during
@which the shutter is open), the flash duration and the
@synchronization between the shutter and flash of a recycleable
@camera. This experiment used a steady light illuminating the
@lens and a photodiode to measure the light transmitted. (Note:
@this experiment required partial destruction of the camera since
@I wanted to place the light source just behind the
@lens/aperture/shutter combination.) I operated the shutter
@several times without the flash and I also operated the shutter
@with flash. Figure 6 shows the results. The near-trapezoidal
@shape of the two "shutter graphs" at the left side is expected
@from the mechanics of the shutter: it opened quickly but not
@instantaneously, remained fully open for a period of time and
@then quickly closed. (The downward slope of the "top" of the
@shutter curve is not a result of the shutter starting to close
@slowly but rather an artifact - a capacitive effect - of the
@electronic circuitry.) According to the measurements the shutter
@was fully open for about 8 ms ($1/125$ of a second, which is a

@standard camera shutter time for general use). The illustration
@at the right side of the figure shows the shutter-time curve with
@the much shorter flash "spike" superimposed. (This was obtained
@by letting light from the flash reach the photodiode.) Notice
@that the flash began about 3.5 milliseconds after the shutter
@started to open and hence about 1.7 ms after the shutter was
@completely open.

@
@Figure 7 illustrates the time dependence of the flash intensity
@for the recycleable camera and also for the Polaroid Model 600.
@The amplitudes of the two flash intensities were about the same,
@but obviously the Polaroid flash was shorter. For the
@recycleable camera the flash intensity reached its peak very,
@very quickly (about 30 microseconds) and then the flash
@brightness decayed (approximately exponentially) over the next
@millisecond. The effective duration of the flash was about 300-
@500 microseconds (depending upon how one wants to quantitatively
@define "effective duration"). When photos are taken in the dark
@the only source of light is the flash and hence the flash
@duration determines the exposure time. (In normal non-flash
@daylight shots the shutter determines the exposure time.) This
@is an "effective shutter time" of 1/2000 to 1/3000 of a second.
@An object moving several meters per second or millimeters per
@millisecond will be quite effectively "stopped" in its motion by
@such a short shutter. By "stopping the motion" is meant having
@such a short exposure that the image hardly moves during the
@exposure. For example, if a tiny object were to move
@perpendicular to the line of sight at 1 meter per second at a
@distance of 10 cm from the camera lens its angular rate would be
@ $(100 \text{ cm/sec})/(10 \text{ cm}) = 10 \text{ rad/sec}$. For a 3 cm focal length this
@transfers to an image velocity of 30 cm/sec. In 1/3000 of a
@second the image would move $30 \times (1/3000) = 0.01 \text{ cm} = 0.1 \text{ mm}$. At
@the same time, these experiments suggest that the image diameter
@for a tiny object 10 cm from the lens (of the recycleable type of
@camera) would be a bit over 1 mm (see above). Hence the motion
@smear would be a small fraction of the image size and the image
@would be nearly circular. Objects moving more slowly than 1 m
@sec or objects at greater distance would create even less smear.
@ (However, objects at greater distance also make smaller images so
@for constant sized objects at the same velocity but at varying
@distances the percentage of the image which is smear could be
@constant.) In the case of the glass spheres used in these
@experiments the velocities were in the range of several to ten
@centimeters per second rather than a meter per second so the
@motion smear is not detectable.

@
@
@CONCLUSION: ORBS OR DUST

@
@A considerable "mythology" has developed over the last few years

@about the nature of these strange orb images, with some people
@attributing them to "creatures" or intelligent entities from some
@other reality that are penetrating our reality. This mythology
@has resulted from the failure of the initial "orbists" to find
@reasonable explanations for the images. Of course, I cannot
@state positively that every anomalous image of the basic orb type
@ (nothing was seen when the flash photo was taken and the image is
@a small, "transparent" circle or disc) was caused by a reflection
@of light from a tiny object close to the camera. However, it
@seems to be a "good guess" that many or most of them are.

The TRUE report on Flying Saucers, True Magazine, 1967

This is a night shot of a house, taken with a flash. An out-of-focus bright object is in the upper left corner of the photo, and was not seen by the photographer.

@>07/09/73 Nagai Japan

UFO-II CD-ROM. (That's all I have on it - it was included in a CD-ROM bargain pack -- 25 CDs for \$15. Copyright info pertains to the media playing software, not the UFOs.)

This is supposedly a police shot taken at a night traffic accident. The UFO is a fuzzy bright object in the upper right quadrant of the photo. Some people next to the car were the subject of the photo. The caption says that "it appears that some of the people are watching the object" but it is obvious that they are not all facing the same way. The only way they could have been looking at the object is if they were farther away from the camera than the UFO. It appears that the people were actually discussing the accident with an officer in the picture.

@Not familiar with these. References where they are published?

@Comments welcome.

@James.

I know Brad will protest, but I see all of the effects and illusions caused by fire balloons in this case, at least as far as Witnesses 1-6 described it:

I would like to know the wind direction for that night.

Witness 1 gives an almost classic description. A policeman in Linton Indiana said "A flying two-story house with golden transparent rooms" in his description of a (later known) fire balloon on 10/14/73. Almost an exact match, except for the color, and that is known to vary.

Witness 2 gave the following points which I have seen over and over again in known fire balloon cases:

- * Slightly pulsating lights.
- * A few large lights, with a lot of little tiny lights or windows around them (parts of the envelope reflecting the candles).
- * Object suddenly moved directly away at high speed (actually, a candle went out, rapidly dimming and shrinking the image of the object).

Witnesses gave widely varying sizes and distances.

Obviously, witnesses 7 and 8 didn't see the same object.

Witness 8's description sounds more like an ultralight, but it could have been another fire balloon.

Bruce wrote:

>If you simply use 47 miles you get 1658 mph.

Bruce,

Much appreciated, that's reasonably close to my own calculations of a _perceived_ airspeed circa 1500 mph and I'm happy to go with your figure as a more accurate 'best guess'.

We can hopefully come back to this significant point shortly and see how it fits with the overall possibilities. Meantime, another question which is equally important to establish the parameters of this case.

In his account given to the 'UFO symposium', Arnold detailed how the sighting initially occurred:

"As I came out below on this first sweep I passed over a little community of Mineral Washington, the pine trees there, and knew pretty much where I was. I made a turn at probably 2000ft over Mineral, Washington and started climbing back slowly but steadily, climbing to gain sufficient altitude to go back on the high plateau again for another pass at this mountain. As I was making this turn and of course flying directly toward Mt. Rainier, at about 9200 ft elevation - it was a beautiful day, in fact the plane was very stable, I didn't have to fight controls or weather or anything - a tremendous flash appeared in the sky and it lit up my whole aircraft, even it seemed the cockpit of the airplane and I was rather startled. I thought I hadn't seen a plane that was very close to me, or possibly it had been a military plane that had dove over my nose and the reflection of the afternoon sun against his wing surfaces had caused the flash. Now this just, in less than one tenth of a second, I think, went through my mind".

A key point is his confirmation, "and of course flying directly toward Mt. Rainier", which he reiterates later:

"As the first one, putting its nose out of the southern edge of the snowfield of Mt. Rainier, my sweep second hand was just approaching, if I remember it correctly, about one minute to three. I think it was just going over the three and they kept of course flying and in between Mt Rainier and Mt Adams there is quite a lot of rough, high terrain, it's been named for many

years Goat Ridge. I don't know why. Supposedly because it is very rough and very steep. But this Goat Ridge, as I later flew it, is approximately 5 miles long, is in a line similar to this. I was approaching Mt. Rainier. I realized that my attempt to clock their speed absolutely accurately would have been hopeless because I was rapidly approaching Mt. Rainier at 9200 ft at about a hundred miles an hour, steadily climbing myself and of course they were passing from north to south and, uh, anyhow, what took place was that as the first one was passing this Goat Ridge... as the first one actually passed the end of Goat Ridge the last one seemed to enter above the Goat Ridge".

And again:

"Now, when they gave off this flash they would appear to be round. When they turned lengthwise or flatwise to me they were very, very thin. And actually they disappeared behind a sharp projection on Mt. Rainier in the snow field to my eyesight and since I knew approximately where I was, flying of course toward the mountain..."

Does this confirm what I had ascertained to be the true perspective, that Arnold was flying from above Mineral, directly towards the western slope of Mt. Rainier - making another pass in his search for the missing C-46.

It agrees with Arnold's accounts from the early radio interview and in his book.

What it doesn't quite equate with of course are the circumstances outlined in his letter - sometimes taken as the definitive context - when Arnold states the sighting occurred whilst he was heading in the direction of Yakima.

Can we conclude he wasn't, especially as in that letter Arnold claims Yakima was "almost directly east of my position". Yakima is a good bit further south than directly east of Mineral and any flight-path towards Yakima simply must have taken him away from Mt. Rainier, not towards it.

I can understand why Arnold would portray in his letter that he was heading in the general direction of Yakima, although making his way back towards Mt. Rainier. It's 'roughly' correct, however, the accuracy of that heading does make a huge difference to the probabilities.

Does anyone have objections therefore if we accept the overall evidence clearly indicates Arnold was on the approximate course shown in red, as opposed to the one in blue, on the map uploaded at:

<http://web.ukonline.co.uk/voyager/heading.gif>

The heading toward Yakima was about 95 deg azimuth.

Bruce,

When I first highlighted the existence of this interview, I noted it was unfortunately a disappointment so far as the sighting.

If there's one conclusion we can perhaps all agree with, it's a regret that the many questions which have come to light were never asked when Kenneth Arnold could easily have provided answers.

I do recall that Greg Long interviewed Arnold not long before he died and I had bookmarked both:

Northwest Mysteries - July 1, 1997 -- Kenneth Arnold: 50 Years of Flying Saucers

<http://www.nwmyst.com/nwmyst-ufo-0023.html>

and

Northwest Mysteries - June 24, 1997 -- the 50th Anniversary of "Flying Saucers"

<http://www.nwmyst.com/nwmyst-ufo-0022.html>

As this site seems to be no longer online, I wonder if Greg still has copies of the material?

Aside from what has been discussed, Arnold's only other published comments I'm aware of are also now online at:

<http://www.project1947.com/fig/kamurrow.htm>

Its significance is Arnold's acknowledgement of how the 'flying saucer' mythology was borne of our long recognised misunderstanding.

For those who still conceive that the archetypal 'flying saucer' ever

existed, the glaring question which asks itself is how big a clue do we need.

Although that's another issue, if a slightly fundamental one for 'ufology' to address, it does have a critical bearing on the Arnold case. His account of those nine puzzling aerial objects is somewhat unique and must be considered in that context.

On the question of other available material, you might be interested in my impending reply to Larry.

James.

>Hey! Where's the film?

Larry,

Well, there's an interesting question.

I have located a contact which could be relevant, indicating that some of
Arnold's previously unavailable footage still exists and can be made
available.

It also indicates the existence and availability of a previously unpublished
account from Arnold.

I'll let yourself and others know if any substance to this - looks like
there might be.

Otherwise, indeed, where is the Arnold footage from his various
'encounters'?

James.

Subject: Re: Kenneth Arnold InterviewStatus:

James,

I've been ill the past few days and unable to respond to the intricate questions you posed earlier.

Let me respond to this posting first and I'll try to get back to the others.

First, some of the important questions we've been posing here WERE asked directly of Arnold by Jim McDonald in a series of telephone interviews and letters in Nov 1966, as I've previously documented. And Arnold was unable to satisfactorily resolve them for McDonald.

Second, Arnold's claim to have been misquoted by the press about saucer SHAPES when he supposedly meant saucer-like FLIGHT PATTERN skipping over water is simply and flatly incorrect.

Arnold HIMSELF in his own hand with no dastardly reporters around to "misquote" him wrote to the AAF in July 1947 that the objects were "saucer like objects" and "SAUCER-LIKE DISKS."

In view of this early letter to the military, the lack of complaint about "misquotation" in it, and the pervasiveness of his "saucer" quotes to different news agencies in different words saying the SAME THING about the objects' ROUND DISK "saucer" shape, indicates accurate quotation but an inaccurate or inconsistent witness.

"silvery and shiny and seemed to be shaped like a pie plate" -- Chicago Tribune, June 26, 1947. PARAPHRASE

"They were shaped like saucers...." -- UP, Pendleton, June 26, 1947. DIRECT QUOTE

"saucer-shaped" -- United Press, Pendleton, Ore., June 26, 1947. DIRECT QUOTE

"nine shiny round objects" -- UP, Pendleton, June 27, 1947. PARAPHRASE

"saucer-like" -- Portland Oregonian, June 28, 1947. PARAPHRASE

Brad
