Subject: Re: Kenneth Arnold InterviewStatus: O

James,

I've been ill the past few days and unable to respond to the intricate questions you posed earlier.

Let me respond to this posting first and I'll try to get back to the others.

First, some of the important questions we've been posing here WERE asked directly of Arnold by Jim McDonald in a series of telephone interviews and letters in Nov 1966, as I've previously documented. And Arnold was unable to satisfactorily resolve them for McDonald.

Second, Arnold's claim to have been misquoted by the press about saucer SHAPES when he supposedly meant saucer-like FLIGHT PATTERN skipping over water is simply and flatly incorrect.

Arnold HIMSELF in his own hand with no dastardly reporters around to "misquote" him wrote to the AAF in July 1947 that the objects were "saucer like objects" and "SAUCER-LIKE DISKS."

In view of this early letter to the military, the lack of complaint about "misquotation" in it, and the pervasiveness of his "saucer" quotes to different news agencies in different words saying the SAME THING about the objects' ROUND DISK "saucer" shape, indicates accurate quotation but an inaccurate or inconsistent witness.

"silvery and shiny and seemed to be shaped like a pie plate" -- Chicago Tribune, June 26, 1947. PARAPHRASE

"They were shaped like saucers...." -- UP, Pendleton, June 26, 1947. DIRECT QUOTE

"saucer-shaped" -- United Press, Pendleton, Ore., June 26, 1947. DIRECT QUOTE

"nine shiny round objects" -- UP, Pendleton, June 27, 1947. PARAPHRASE

"saucer-like" -- Portland Oregonian, June 28, 1947. PARAPHRASE

Sky lights to be flares, not UFOs, Guard says

By Dave Walker
The Arizona Republic
March 7, 2000

Look to the sky, conspiracy buffs: See the spheres of light floating eerily in the night sky.

It's . . . the return of the fabled "Phoenix lights!"

Actually, it's a flare-lit night-training exercise, which the Arizona Air National Guard says will be conducted this week and next on the Barry M. Goldwater Range near Gila Bend.

A similar scenario - almost exactly three years ago - sparked an ongoing run of UFO buzz over the mysterious lights in the sky.

This time, a tactical media blitz has preceded the invasion of the parachute-borne flares. Dubbed Operation Snowbird, the exercises involve jets and helicopters from Air Guard squadrons in Michigan, California and New York.

They are scheduled from 8:30 to 10 p.m. tonight through Thursday and for March 13-16. Weather permitting, that is - Monday night's eerie night-sky activities were scrubbed due to rain.

This could be a good test. Get your video cameras out and shoot,
Arizonans!

If the flares look just like the UFO videos, that would clinch
the ID, since we know there were flares in the area in 1997.

It would also be a good idea to collect data on what witnesses
(who didn't hear the announcement) report as UFOs BEFORE we tell
them the objects were flares.

Regarding the phoenix lights, I attach a shortened version of a long research paper that was published on the web a year and a half ago.
A shortened version of the attached paper was published in the MUFON journal a year ago.

I predict that if the National Guard drops all their flares at low altitude (below 10,000 ft) there will be no sightings from Phoenix and the witnesses there will say , "see, that proves it wasn't flares."

However, if the AF drops flares between roughly 10,000 and 15,000 ft people in the high elevations of the Phoenix area will see lights.

I have attached the text and some figures to this message.
will attach the other figures to another message.

Figure 9 attached.

I have heard that local media (TV) videotaped the National Guard flare exercises last night and have shown video. However, they use 50,000 dollar-type cameras, not home video cameras. Also, they were probably too close.

The initial response has been that "even the media no longer believes the March 13 lights were flares" because the new video is so different. BUT if the dodo's don't duplicate the conditions of March 13, 1997 (using home video cameras from locations at or near the locations of the March 13 videos, they they won't have proved anything..... except that excellent cameras can get good pictures of flares!

Hello List,

I'm currently seeking some information on a sighting report received by ATIC that occurred in Port Austin, Michigan on February 17, 1953 which was mentioned in a ATIC Project Blue Book Report (10073). Does anyone know where I can obtain or view this particular report and gain further information on this particular sighting? Or is there another reference I can obtain some info from on this report?

Also mentioned within UFO ROUNDUP Vol. 4, #36 within the article titled, "A Century of UFOs" it mentions a sighting that occurred in 1914 over Benton Harbor Michigan. Is anyone here familiar with this sighting and/or more information concerning this report?

Thanks in advance,
Todd Lemire

Clearly Arnold was caught up in the hysteria which followed. That he
apparently never, at the time, made a declaration which put an end to
this misconception is quite understandable, Arnold probably having
enough problems defending his reported observation without complicating
matters further.

It's equally understandable why he never explained until much later
that one of the objects seemed to be different from the others. In his
book, he claims to have "forgotten to mention the fact". I suspect it
was the least of his concerns.

Well evidenced is how much ridicule Arnold had to endure and no matter
if mistaken in his perceptions, such scorn was never justified. Then
again, it ain't a just world [the planet's blameless, it's the folks on
it who are the problem!].

Arnold was dutiful and courageous in reporting what he considered might
be evidence of a Russian threat and more than entitled to be applauded
for that, even if he was wrong, on which all opinions seem to concur.

Our central question remains though; as we now understand the
mythological genesis of the archetypal 'flying saucer' perception which
immediately took hold of the US public's psyche and consequently the
world's, how can any 'report' of that misconceived, archetypal 'flying
saucer' be 'real'?

James.

Subject: Re: Kenneth Arnold InterviewStatus: O

James,

I hope to get to your flight path questions this weekend -- it's all calculated on my Excel programmed spreadsheet but I haven't had the time to write it all out.

In answer to your last question, it is fairly straightforward I should think to be able spot possible "copycat" sightings that imitate Arnold's or follow the media "flying saucer" stereotype. Many sightings followed neither. It is highly unlikely that multiple military witnesses would fabricate a sighting, for instance.

Astronomer Dr. Lincoln LaPaz reportedly had a sighting of a classic Daylight Disc while driving with three family members on July 10, 1947, as reported in the famous LIFE article of April 7, 1952, but withholding his identity. These 4 witnesses saw a wobbling white ellipsoid against the clouds 20-30 miles away that disappeared and reappeared from behind the clouds, thus establishing the distance (he evidently obtained the weather records, which must have showed the cloud bank at 2,000 to 3,000 feet his margin of error seen in his calculations).

The object's "sudden ascent" through 2 degrees of azimuth and 1 degree of elevation in 5 seconds "convinced" LaPaz the UFO was an "absolutely novel airborne device." Any physicist or astronomer can easily calculate in his head that this represents an angular velocity of about 8 milliradians/second (about a full moon's diameter or 1/2 degree per second) and that at 20-30 miles' distance this comes out to about 600 to 900 mph, as LaPaz himself computed (see below), very possibly supersonic. What was not reported was that this rapid acceleration then apparent deceleration back to its 120-180 mph velocity in 5 seconds represents 9 to 13 g's, at the very limit of fighter pilot endurance today and catastrophic for most aircraft. The vertical climb rate of about 400 to 600 feet PER SECOND is beyond any meteorological balloon ascent rate (typically 17 feet PER SECOND) and certainly could not be stopped and started and stopped again as evidently happened here.

The shape was unlike Arnold's and NOT a "saucer" either, the major/minor axis ratio of the ellipsoid was about 2.45 to 1, it was not metallic in appearance, but thought to be "self-luminous." The details of the 2-1/2-minute sighting are scientifically precise, with angular elevations, azimuths, angular sizes, durations, distances, etc., and backed up by multiple witnesses that LaPaz asked to render independently of him before comparing notes. And there are many more cases besides this.

Let's review the LaPaz sighting from LIFE quoted as follows (see <http://www.primenet.com/~bdzeiler/> and the bracketed comments are from this website not me):

"INCIDENT 2 On July 10, 1947 at 4:47 p.m., one of the U.S.'s top astronomers was driving from Clovis to Clines Corners, N. Mex. [Note: Later revealed to be Dr. Lincoln La Paz -- see Incident 10, green fireballs, which La Paz investigated.] His wife and his teen-aged daughters were also in the car. (For professional reasons he has

asked LIFE to withhold identity.) It was a bright sunny day, but the whole western half of the sky was a "confused cloud sea." All at once, as the car headed toward these clouds, "all four of us almost simultaneously became aware of a curious bright object almost motionless" among the clouds. Instantly, from long habit in dealing with celestial phenomena, he began to make calculations. with what crude materials he had at hand. He held a pencil at arm's length, measured the size of the object against the windshield of the car, measured the distance between his eyes and the windshield, etc. His wife and two daughters did the same, each making independent!

! t calculations. The object, says the scientist, "showed a sharp and firm regular outline, namely one of a smooth elliptical character much harder and sharper than the edges of the cloudlets... The hue of the luminous object was somewhat less white than the light of Jupiter in a dark sky, not aluminum or silver-colored.... The object clearly exhibited a sort of wobbling motion ... This wobbling motion served to set off the object as a rigid, if not solid body." After 30 seconds in plain view, the ellipsoid moved slowly behind a cloud (273 degrees azimuth, elevation 1 degree) "and we thought we had lost it." But approximately five seconds later it reappeared (275 degrees azimuth, elevation 2 degrees). "This remarkably sudden ascent thoroughly convinced me that we were dealing with an absolutely novel airborne device." After reappearing, the object moved slowly from south to north across the clouds. "As seen projected against these dark clouds, the object gave the strongest impre!

! ssion of self-luminosity." About two and a half minutes after it first came into view, the thing disappeared finally behind a cloudbank.

"EVALUATION

"The astronomer vouches for the approximate accuracy of his observations and computations. He determined that the object was not less than 20 nor more than 30 miles from his viewing point; that it was ellipsoidal and rigid; that it was 160 feet long and 65 feet thick, if seen at minimum distance; or 245 feet long and 100 feet thick if at maximum; and that its horizontal speed ranged between 120 and 180 mph and its vertical rise between 600 and 900 mph. He also observed that the object moved with a wobble, no sounds, and left no exhaust or vapor trail. His wife and daughters support his observations, and their computations were in accordance with his own, though slightly less conservative. The object's appearance and behavior answer no known optical or celestial phenomenon. No known or projected aircraft, rocket or guided missile can make such a rapid vertical ascent without leaving an exhaust or vapor trail.

This is a very impressive UFO sighting by one of the world's leading meteoriticists and an expert in visual observations -- let me repeat this once again for emphasis, AN EXPERT IN VISUAL OBSERVATIONS. LaPaz had had YEARS of experience in interviewing witnesses of meteor sightings in order to determine meteor orbits and to SUCCESSFULLY find and recover fallen meteorites based on his interviews with witnesses, proving the accuracy of the details he obtained from them. He would spend hours and days with witnesses to pin down sighting azimuths, elevations and especially durations (without this crucial factor you cannot determine the velocity and therefore the solar orbit). He did the same meticulous scientific observational work and record-keeping on his own suite of HUNDREDS of meteor and fireball sightings over a period of decades.

Here was in essence as of 1947 the world's leading expert in UFO-type witness interrogation HAVING HIS OWN MULTIPLE-WITNESS DAYLIGHT UFO SIGHTING. And it cannot be explained away as a mythological or folklore-generating effect of silly-season publicity about "flying saucers." The sighting details are clearly uninfluenced by the Arnold publicity or the metallic-disk-saucer genre in general and they evidence the careful workmanship of a world-class scientist, not a kook, nut, hysteric, publicity-seeker or suggestible personality.

Subject: Re: Kenneth Arnold Interview / LaPazStatus:

James,

I hope to get to your flight path questions this weekend -- it's all calculated on my Excel programmed spreadsheet but I haven't had the time to write it all out.

In answer to your last question, it is fairly straightforward I should think to be able spot possible "copycat" sightings that imitate Arnold's or follow the media "flying saucer" stereotype. Many sightings followed neither. It is highly unlikely that multiple military witnesses would fabricate a sighting, for instance.

Astronomer Dr. Lincoln LaPaz reportedly had a sighting of a classic Daylight Disc while driving with three family members on July 10, 1947, as reported in the famous LIFE article of April 7, 1952, but withholding his identity. These 4 witnesses saw a wobbling white ellipsoid against the clouds 20-30 miles away that disappeared and reappeared from behind the clouds, thus establishing the distance (he evidently obtained the weather records, which must have showed the cloud bank at 2,000 to 3,000 feet his margin of error seen in his calculations).

The object's "sudden ascent" through 2 degrees of azimuth and 1 degree of elevation in 5 seconds "convinced" LaPaz the UFO was an "absolutely novel airborne device." Any physicist or astronomer can easily calculate in his head that this represents an angular velocity of about 8 milliradians/second (about a full moon's diameter or 1/2 degree per second) and that at 20-30 miles' distance this comes out to about 600 to 900 mph, as LaPaz himself computed (see below), very possibly supersonic. What was not reported was that this rapid acceleration then apparent deceleration back to its 120-180 mph velocity in 5 seconds represents 9 to 13 g's, at the very limit of fighter pilot endurance today and catastrophic for most aircraft. The vertical climb rate of about 400 to 600 feet PER SECOND is beyond any meteorological balloon ascent rate (typically 17 feet PER SECOND) and certainly could not be stopped and started and stopped again as evidently happened here.

The shape was unlike Arnold's and NOT a "saucer" either, the major/minor axis ratio of the ellipsoid was about 2.45 to 1, it was not metallic in appearance, but thought to be "self-luminous." The details of the 2-1/2-minute sighting are scientifically precise, with angular elevations, azimuths, angular sizes, durations, distances, etc., and backed up by multiple witnesses that LaPaz asked to render independently of him before comparing notes. And there are many more cases besides this.

Let's review the LaPaz sighting from LIFE quoted as follows (see <http://www.primenet.com/~bdzeiler/> and the bracketed comments are from this website not me):

"INCIDENT 2 On July 10, 1947 at 4:47 p.m., one of the U.S.'s top astronomers was driving from Clovis to Clines Corners, N. Mex. [Note: Later revealed to be Dr. Lincoln La Paz -- see Incident 10, green fireballs, which La Paz investigated.] His wife and his teen-aged daughters were also in the car. (For professional reasons he has

asked LIFE to withhold identity.) It was a bright sunny day, but the whole western half of the sky was a "confused cloud sea." All at once, as the car headed toward these clouds, "all four of us almost simultaneously became aware of a curious bright object almost motionless" among the clouds. Instantly, from long habit in dealing with celestial phenomena, he began to make calculations. with what crude materials he had at hand. He held a pencil at arm's length, measured the size of the object against the windshield of the car, measured the distance between his eyes and the windshield, etc. His wife and two daughters did the same, each making independent!

! t calculations. The object, says the scientist, "showed a sharp and firm regular outline, namely one of a smooth elliptical character much harder and sharper than the edges of the cloudlets... The hue of the luminous object was somewhat less white than the light of Jupiter in a dark sky, not aluminum or silver-colored.... The object clearly exhibited a sort of wobbling motion ... This wobbling motion served to set off the object as a rigid, if not solid body." After 30 seconds in plain view, the ellipsoid moved slowly behind a cloud (273 degrees azimuth, elevation 1 degree) "and we thought we had lost it." But approximately five seconds later it reappeared (275 degrees azimuth, elevation 2 degrees). "This remarkably sudden ascent thoroughly convinced me that we were dealing with an absolutely novel airborne device." After reappearing, the object moved slowly from south to north across the clouds. "As seen projected against these dark clouds, the object gave the strongest impression of self-luminosity."

! ssion of self-luminosity." About two and a half minutes after it first came into view, the thing disappeared finally behind a cloudbank.

"EVALUATION

"The astronomer vouches for the approximate accuracy of his observations and computations. He determined that the object was not less than 20 nor more than 30 miles from his viewing point; that it was ellipsoidal and rigid; that it was 160 feet long and 65 feet thick, if seen at minimum distance; or 245 feet long and 100 feet thick if at maximum; and that its horizontal speed ranged between 120 and 180 mph and its vertical rise between 600 and 900 mph. He also observed that the object moved with a wobble, no sounds, and left no exhaust or vapor trail. His wife and daughters support his observations, and their computations were in accordance with his own, though slightly less conservative. The object's appearance and behavior answer no known optical or celestial phenomenon. No known or projected aircraft, rocket or guided missile can make such a rapid vertical ascent without leaving an exhaust or vapor trail.

<

Surely you're Joking,,,, Mr. Eastman.

You ask: "How can any "report" be "real?"

Are you suggesting we reject all testimony/reports as fabrications or delusions?

Are you suggesting that because there were lots of reports there was a hysteria that was creating the reports and not actual sightings?

And what about the sightings that occurred before Arnold and the June '47 flap?

I am quite confident that General George Shulgen of the Air Force Intelligence requirements Branch wouldn't have been involved in the interrogation of a AF pilot who reported a sighting had it been just a "delusional reaction:" to the large number of reports in the papers.

And I'm sure the good General wouldn't have contacted the FBI and asked for help interviewing witnesses (and finding out whether or not communist subversion was involved) had he thought the sightings were all baloney. (Info on George Shulgen is in the FBI file.... as described in my soon-to-be published book THE UFO=-FBI Connection.

<

A year and a half after this La Paz was one of the early witnesses to a "green fireball" and was active in compiling and analyzing fireball sightings from December 1948 through 1950. It was La Paz who told the FBI that if the fireballs were not our own military experiments then they must be Russian fractional orbital missiles that were "targeting:" our top secret atomic installations (Los Alamos, Sandia in Albuquerque, and then Killeen Base at Fort Hood in Texas). At the very least La Paz concluded in no uncertain terms that these green fireballs were not normal meteors or fireballs. So far as I know, no one yet knows the true origin of the fireballs. (Note: most of them, by far, were seen in the southwestern USA and very few were reported outside that general area. The occurrence of reports was very geographically selective.)

Can I just point out that LaPaz consistently expressed the opinion that the Green Fireballs he was so interested in were really man-made missiles...and that he was intensely interested in recovering the Norton County meteorite even before his 1947 sighting -- because he thought it was a Soviet missile. He was firmly in the "secret weapon" camp.

Brad wrote:

>Now we even have Mr. Pelican himself conceding that Arnold must
>have meant the objects passed behind Little Tahoma. That makes
>the distance 20+ miles and an impossibility for birds.

Brad,

The point established is how the peak Arnold perceived the objects passed behind, may have been Little Tahoma.

Nothing is conceded as such, especially that the objects did in fact travel behind this, or any other, peak.

This is probably the crux of Arnold's sighting and I'm concerned the identification of Little Tahoma may be incorrect. We have such a brief description to go on and the area has numerous 'peaks'. The fact that Arnold couldn't later identify the peak, could imply it was one of the minor ones and not the hugely prominent Little Tahoma.

There's also no question that Arnold describes how the objects were to the west of Mt. Rainier. However, I do agree that Little Tahoma is evidentially the most likely candidate.

If so, then there is now a factually strong case for the objects being much closer than Arnold recognised.

I'm not convinced either about your argument that the only reference to the objects going behind Mt. Rainier, the 'Chicago Daily Tribune' article, is so reliable. In fact, I believe it can be demonstrated it isn't, as the article also quotes Arnold as stating, "I took out my watch and checked off one minute and 42 seconds.". Unless we need to re-write the story, Arnold didn't 'take out his watch'.

Although it was reported elsewhere that he 'looked at his watch', it's clarified this was the 'stopwatch' on his instrument panel.

Either the article isn't so verbatim as you suspect, or Arnold is evidently a hopelessly unreliable witness. If the former, then it may well be that the reported quote 'behind the peak of Mt. Rainier', could as I suggested have been a misquote of 'behind a

peak on Mt. Rainier'.

In order to accept key evidence for the eastern trajectory, you therefore have to accept the entire article is to be trusted as proposed and consequently Arnold claimed he timed the objects by 'taking out his watch'.

You had raised some questions about the hypothesis a formation of American White Pelicans (AWP) could have been what Arnold observed and didn't recognise - Arnold would almost certainly never have encountered them before - specifically, can it be proven that they migrate at high altitude.

At the outset, it's a question I had asked of various ornithological sources, over two years ago. One response, which I don't believe has been highlighted before:

"When they come migrating through, there are frequently flocks that literally disappear from view as they bank and the sun is no longer reflecting directly on them. Put the binocs on them and there they are. But being a lousy judge of distance, I have no idea how high they are. Much higher than the airplanes on approach and they are still 10 miles out. You can put the numbers on that".

Some further relevant material:

"In flight, white pelicans are a spectacular sight. Almost always in groups, they fly gracefully in precisely spaced lines or 'V' formations, flapping slowly in unison half a dozen times, then gliding, then flapping and gliding again. They fly with the neck held back against the shoulders, and the bill resting against the breast. Whooping Cranes, Snow Geese, and swans all fly with outstretched necks. Despite their ungainly appearance, white pelicans are excellent gliders and agile fliers. When leaving a migration rest-stop, or heading to a foraging lake from the nesting island, they often catch thermal air currents and soar to great heights, even disappearing from view".

"As we watched them on Saturday after about 5 minutes they decided to fly away in 4 or 5 groups. As they flew, during the first couple of miles they joined together in one flock. They seemed to catch an updraft of the wind currents and it was a sight to see them soar higher and higher. They went higher than the scattered clouds as the black underneath their wing would show a contrast to their white bodies in the bright afternoon sun rays. During the next 15 minutes they went so high they were only tiny specks in the sky and they ascended out of our eyesight. Seeing them soar into the heavens was a most beautiful sight".

"Have been monitoring several hundred white pelicans on wetlands at the confluence of Mississippi and Illinois rivers. Am curious as to their flying habits, and have witnessed flocks rising on air currents and prevailing winds to great heights in a spiralling fashion sometimes resulting in a retrace of several miles before gaining sufficient height to continue their flying course. What height do these magnificent birds reach when spiralling, it appears to be several thousand feet!"

"Many people confuse the pelican when in flight with snow geese".

Bottom line - I was able to locate a definitive answer to the question about altitude capabilities of AWP's, observed in the cascades. It comes from a documented 1989 sighting:

"A flock of fourteen overflowed TRS 4 Aug 89 (D.Thrall, R.Belloir), headed slowly northward several thousand feet above the station. This may represent the only record for the Western Cascades away from reservoirs in e. Jackson Co. in recent years".

Plus, let's not forget:

'New Westminster British Columbian'
Saturday, July 12, 1947

'SAYS FLYING SAUCERS ARE PELICANS'

Spokane, Wash., July 12 (BUP).

A veteran Northwest Airlines pilot who has flown over the Pacific northwest's "flying saucer" country for 15 years today took all the glamor out of the mystery of the flying discs.

All that people have been seeing, he said, are pelicans. Or maybe geese or swans.

Capt. Gordon Moore disclosed that he and his co-pilot, Vern Kesler were saucer-hunting last Wednesday on a regular flight between here and Portland, Ore. Kesler was sure he had seen some flying saucers on July 2, and the pilots were armed with movie cameras and binoculars for another encounter.

"Suddenly we spotted nine big round disks weaving northward two thousand feet below us," Moore related.

"We investigated and found they were real all right --- real pelicans."
[End]

If these nine pelicans were only some two thousand feet beneath the aircraft, what would their altitude be - Arnold stated that a nearby DC-10 was flying at approximately 14,000 feet.

Overall, does this satisfy the altitude doubt you had raised?

Ironically, I've come across the following query and answer, posted to a specialised AWP on-line forum and which seems to be the result of the possible explanation I had brought to light:

"Posted by Asgeir Skavhaug on July 30, 1999:

Hello

I'm wondering whether any of you on this List know if American White Pelicans are observed in Washington State in May, June, July? Maybe in the Cascade Mountains, Mt. Baker, etc. How about 30 to 40 years ago? I'm also wondering whether they're flying in some sort of formation; a chain or step-wise formation, for instance, with the leader at the front, and higher up than the others.

Is it possible to show any in flight photos of these pelicans, included in a mail on this List, or maybe give some reference to a URL?

Regards,
A. Skavhaug
[End]

yes, AWP's are found in Washington State - your state Fish and Wildlife people contacted us a few years ago. As about the movies of them in flight... good idea! we'll work at it, perhaps not immediately, but soon I hope. Yes, they do fly in formation normally... undulating "Vs" or "Ls" with the leader flapping first, and the others following in a sort of wave. These birds are terrific at rising on thermals, soaring incredibly high before striking out in their direction of choice.

Cheers,
Peter
[End]

The respondent was Peter Kingsmill, Director General of a significant AWP conservation project.

Peter describes an undulating motion and the distinctive flight characteristics of these particular birds have previously been emphasised, particularly the undulating, flapping and gliding, clearly comparative to Arnold's nine undulating objects - "like a

saucer would if you skipped it across water" or "like speed boats on rough water" - which also "fluttered and sailed"

Especially poignant was the article I recently mentioned in which a detailed observation of AWP's could be noted as comparable with Arnold's [quoted] descriptions:

"They were flying diagonally in echelon formation with a larger gap in their echelon between the first four and last five".

Then I realize about thirty birds trail in a line, and second and third squadrons move up, to the left and right. Bombers, they are too large for fighters, yet more graceful, flying in perfect formation. The second and third groups fan out, from the center line, forming flawlessly into Vs, mirroring the very image of flight.

"They flew in a definite formation but erratically".

The staccato movement is like the first film of a bird in flight, one frame at a time.

"Or maybe it would be best to describe their flight characteristics as very similar to a formation of geese, in a rather diagonal chain-like line, as if they were linked together".

They are a kind of third reality, all moving impeccably together without a sound... all following the lead of the first.

"As I put it to newsmen in Pendleton, Oregon, they flew like a saucer would if you skipped it across the water".

They all executed the ripple, at the precise point the first started to climb.

"They fluttered and sailed...".

...each waiting for the bird in front to flap his wings, for two powerful strokes, before returning to a glide.

"As I described them at the time their flight was like speed boats on rough water or similar to the tail of a Chinese kite that I once saw blowing in the wind".

They appear as crepe paper strips, tied to an invisible wind.
[End]

Further revealed was a cited reference:

"The surface structure of the feathers may affect a bird's appearance in other ways. In certain birds, including pelicans, terns and petrels, some black pigmented feathers in the wings may in fact have a silvery appearance. ...The silver gleam is caused by light reflected from very long, fine, non-pigmented fibres in the feathers".

What hasn't been addressed before is that if these were AWP's, how could one of them be different from the others and darker in colour, as Arnold later explained was a feature of his nine objects.

If a formation of AWP's, even the inclusion of a darker and smaller/larger bird has a probable and well known explanation. I'm in the process of confirming this definitively.

One relevant documented observation of AWP's which was noted:

"On June 5, 99 there was a small flock of white pelicans land on Navajo Reservoir, in land. The reservoir is approximately 50 miles south/east of Durango, Colorado. The flock seemed to be lead by a beige/brown bird..."

Although I've usually kept contributions about the facts of Arnold's observations separate from a possible explanation, there's sometimes a crossover.

You can I trust concede there's no debate that whatever Arnold observed, those nine objects exhibited several proven characteristics consistent with a formation of AWP's.

James.

James wrote (at the end of a long feathery description of pelicans, etc/.)

>

Although I've usually kept contributions about the facts of Arnold's observations separate from a possible explanation, there's sometimes a crossover.

You can I trust concede there's no debate that whatever Arnold observed, those nine objects exhibited several proven characteristics consistent with a formation of AWP's.

James.

<

"several proven characteristics consistent with a formation of AWP's.

Yes:

....there were more than one (nine; can have 9 pelicans)
....were in the air (above ground) (pelicans can be above ground)
....were at high altitude (apparently pelicans can be at high altitude)
....traveling at a considerable ANGULAR rate (pelicans can travel at a high angular rate.... if CLOSE ENOUGH t the observer)
.....easily seen against the background (snow, for example or distant sky haze) (pelicans can be seen)

BUT:

Jim, you still don't get it.

Guys/Gals/....whomever..... James still doesn't get it!

No pelican will reflect sun like a mirror, even with the "sheen" of its feathers
and DRAW A MAP!!!

No pelican hypothesis can be seriously entertained until it is possible to demonstrate that Arnold could never have gotten close enough to see shape, wings flapping, etc. (I assume that had Arnold seen such things he would have identified the pelicans and we never would have heard about his "sighting"... although it might have been reported to

ornithologists).

James, its not just enough to argue that under some circumstances the pelicans might APPEAR to be shiny objects not resembling manmade aircraft (but without mirror reflections). It is also necessary that the DYNAMICS are consistent. Arnold was flying at 100 mph or more relative to any objects flying southward and carried by the wind (20 mph to the east we have been told) such as birds (unless they crab into the wind!). The assumed birds were doing no more than and probably less than 50 mph. So DRAW A MAP. I have already sent one for perusal. Make your own. Make my day! :)

Hello Group

Anybody like to comment on this slide of daylight orbs taken in the Yukon in the early 1970s, unfortunately it is a dup:
<http://www.ufobc.org/yukon/tagishnew2.htm>

More scans of same slide at various magnifications:
<http://www.ufobc.org/yukon/tagishscans.htm>

Background story and analysis:
<http://www.ufobc.org/yukon/tagish.htm>

About the man who took the photo:
<http://www.ufobc.org/yukon/tagishjimconacher.htm>

Martin

Very interesting "orbs", not unlike others I have seen in photos.
Clearly not the "dust orbs" picked up by a camera flash.
Images appear overexposed indicating considerable light brightness.
In principle one could make an estimate of the radiation level.
Probably the equivalent of several light bulbs, but depends upon the
distance and settings (f stop and shutter speed) of the camera.
Too bad it is so old!

The "orb" picture is "unquestionably" genuine.
The other one looks like a nice drawing superimposed on the picture or
combined digitally or
whatever.

Wow. What a lot of orbs! The large number of diffuse, generally circular
images suggests there must have been a lot of tiny stuff in the air.

These images are entirely consistent with the orb
images I created by using a flash at night to photograph dust near the
lens.

Surprising to get these in the daytime, although it certain is not
impossible that tiny objects very close to the lens could reflect skylight
into the lens. However, I wonder if the photographer used a flash to
"eliminate shadows." There doesn't seem to be any evidence of flash usage
in the picture (other then, perhaps, the presence of the orb images
themselves). However, I would not expect the effect of the flash to be
very great because of the daytime usage if they were more than 15 feet from
the object of their intention (the pig-stump).

Assuming a flash-less photo, this raises the question of whether or not a
group of tiny flies might have passed in front of the camera at the time of
the photo. Not given the date or location I can only
hazard a guess that it was early spring because the grass is green but
there seem to be no or few leaves on the trees and none on a nearby bush.
Was it a warm early spring day?

The leftmost orb is particularly interesting because of its nearly
hexagonal shape. I wonder if the lens aperture is also hexagonal.

OK James,
I took my "test."
Now,

DRAW A MAP!

It would be good to determine the radiation level. The orbs look even brighter and more spectacular when one views the slide directly. Since we don't have the shutter speed and f-stop could we establish a range based on some data. i.e. time of day, the fact that it was overcast, the maximum distance is about 300 metres to the largest orb. What sort of specialized equipment would you use to determine the radiation level. I will be in St. Paul Alberta for the UFO conference this summer also and perhaps I can bring the slide with me.

Martin,

Bruce is talking about LIGHT radiation, radiant energy in the visible range maybe a little into UV and IR depending on the sensitivity of the film and transparency of the lens in those wavelengths. Ionizing radiation ("radioactivity") would not be focused through a lens into "orb" images but would fog the entire scene on the film.

SAMPLE CALCULATION:

ASSUME: ASA 25 color reversal (slide) film.

By definition, Speed = $10/H$

where H = exposure in lux-seconds (lumen-sec/m²). Hence ASA 25 requires for "GOOD" exposure, $H = 10/(ASA) = 10/25 = 0.4$ lumen-sec/m². (lumen is a measure of light energy taking into account the response of the eye over the visible band; it can be related to absolute energy collected by the film image, in joules).

[In the following I have done a parallel calculation presented in square brackets. This calculation is based on the assumption that the absolute sensitivity of the film in J/cm² can be determined. Based on a previous film analysis using ASA 10 slide film, it might be that the sensitivity for good exposure with ASA25 film is about $4E-8$ J/cm². This is less certain than the use of 0.4 lumen-sec/m² as the sensitivity.]

ASSUME: overexposure = 10 to 100 times GOOD exposure (this is just a guess based on my experience analyzing the New Zealand movie film of 22 years ago). Accurate densitometric measurements on the original slide might narrow this estimated range of overexposure. Hence let H be in the range $10(.4)$ to $100(.4)$ or 4 to 40 lm/m²

[It might also be $4E-6$ J/cm² for overexposure, based on previous analysis of a similar type of film.]]

ASSUME: f stop in daylight is f/11; shutter time = 1/125 sec

(typical numbers for daylight. since the photo seems underexposed for the trees, etc., it might be that the assumed ASA is too large or that the f stop was larger or the shutter time was smaller)

EQUATIONS:

METHOD 1: use the standard camera equation BACKWARDS

This method essentially assumes that the source is resolved by the camera, i.e., the size of the image is geometrically related to the size of the light source

Camera equation : $E = \pi B T / 4 (f\#)^2$

Exposure equation: $H = E t$ luminous flux per unit area collected in time t

This is how the image is created (calculate the exposure based on image brightness)

1) $E =$ The luminous flux per unit area per unit time = $(\pi) B T / (4 f^2)$ for an orb near

the center of the picture (way off axis requires $\cos^4$ correction factor).

$\pi = 3.14$

$B =$ brightness of source (assumed here to be resolved, so use the LARGEST orb image only; $T =$ lens transmission; $t =$ shutter time; $f =$ fstop.

2) $H = E t$ so

$$E = H/t$$

In this case $E = (4 \text{ to } 40)/(1/125) = 500 \text{ to } 5000 \text{ lm/m}^2/\text{sec}$

which can be written in power of ten notation as $1.25E2$ to $1.25E3$

[It might also be $5E-4 \text{ J/cm}^2/\text{sec}$]

Rearrange the equation to find B as a function of the (measured or assumed) H

$$B \text{ in lumens/m}^2/\text{steradian} = 4Ef^2/\pi T = 4(500 \text{ to } 5000)(11^2)/(3.14 \times 0.9) =$$

85,600 to 856,000 or $8.56E4$ to $8.56E5$, $\text{lm/m}^2/\text{steradian}$.

ROUNDED OFF

[It might also be $0.0856 \text{ J/cm}^2/\text{sec}$]

IF it radiated uniformly over its whole surface (B is constant over the surface), then, IF we knew the size we could estimate the lumen output (and convert to power output)

How big is the image? Based on the html version of the picture the width of

the largest orb appears to be about 0.007 of the total picture width.

Assuming

the picture width is 35 mm, that makes the image width about 0.25 mm.

Since images tend to increase in size with exposure level (the greater the exposure the larger the diameter.... but the diameter only grows logarithmically (i.e. slowly) with exposure), I will use 0.2 mm as the "true" size of the orb image (if there were perfect imaging with no overexposure)
 If it were a 50 mm focal length camera, then the angular size would have been about $0.2/50 = 0.004$ radians.
 I will assume it was closer than the trees and
 ASSUME: $d = 200$ m.
 Then the object would have been $0.004 \times 200 = 0.8$ m in diameter (smaller than the calculation presented on the web page)

ASSUME it was spherical. Then the surface area was $4\pi (0.8/2)^2 \text{ m}^2 = 2.0 \text{ m}^2 = 2\text{E}4 \text{ cm}^2$

ASSUME it was a Lambertian emitter at each point of the surface, which means that, instead of each small area radiating uniformly into 2π steradians (a hemisphere), each small area radiates AS IF it were radiating uniformly into only π (not 2π) steradians (because of the Lambertian cosine radiation factor)
 Then the lumen output is

$B \text{ times surface area times } \pi = (8.56\text{E}4 \text{ to } 8.56\text{E}5) \text{ times } (2) \text{ times } 3.14 = (5.4\text{E}5 \text{ to } 5.4\text{E}6) \text{ lumens}$

[It might also be $0.0856 \text{ J/cm}^2/\text{sec} \text{ times } 2\text{E}4 \text{ cm}^2 \text{ times } 3.14 = 5400 \text{ J/sec or watt}$]

.....

A SECOND WAY OF ESTIMATING (perhaps more basic physics) (Maccabee Method)

This method makes no assumption about object size or shape, only about its "radiation pattern." This method does not use the camera equation, but rather simply keeps track of the energy!
 (Note: this can be shown to be equivalent to the camera equation when the image is resolved)

For complete accuracy this method requires an accurate measurement of estimate of the total energy collected by the image.

Since I don't have measurements I have to
 ASSUME the image was 0.2 mm in diameter and ASSUME the exposure was approximately uniform over the area at 500 to 5000 lm/m^2 . (Of course, it wasn't uniform over the area but the integral of exposure times area could lie between the numbers used

here.)

The area is $(\pi/4)(0.2)^2 = 0.0314 \text{ mm}^2 = 3.1\text{E-}8\text{m}^2$, so the total lumens collected by the image is ESTIMATED to lie in the range (500 to 5000) times $3.1\text{E-}8 = 1.6\text{E-}5$ to $1.6\text{E-}4 \text{ lm}$.

Now, all of these lumens came through the lens. If the focal length was 50 mm, then the lens diameter was 4.5 mm (in order to have f/11: focal length / lens diameter = 11).
(Note: I am ignoring the transmission of the lens in this calculation.)

The solid angle of acceptance of the lens at a distance d from the light source is essentially (area of lens aperture)/distance². If I assume 200 m,

$$(\pi/4 \text{ times } 4.5^2 \text{ mm}^2)/(200 \text{ m} \times 1000 \text{ mm/m})^2 = 15.9 \text{ mm}^2/(4\text{E}10 \text{ mm}^2) =$$

$4\text{E-}10$ steradians. This is a small number of steradians (want to see small?
try figuring out the solid angular size of a distant star!)

ASSUME the light radiated uniformly in all directions into 4π steradians, and the lens received only $(4\text{E-}10)/4\pi = 3.2\text{E-}11$ of that.

That means the total lumens radiated was about $(1.6\text{E}5\text{ to } 1.6\text{E-}4 \text{ lm})/3.2\text{E-}11$

$$= 5.0\text{E}5 \text{ to } 5.0\text{E}6 \text{ lm}.$$

[The energy calculation would give the same result as in the square brackets above.]

.....

The two calculations produce results that are "remarkably close".....
not surprising if
the light was a Lambertian emitter of light (which is typical).

So, how much power?

The official conversion factor is 680 lumens per watt at 550 nm (green). Yellow light has less luminous "efficiency", about 80% of green (harder for the eye to see, and the eye sensitivity is what determines the definition of "lumen"). Perhaps one could say that over the color band represented by these yellow orbs the conversion would be about 500 lm/watt. Then $(5\text{E}5 \text{ to } 5\text{E}6 \text{ lm})/(500 \text{ lm/watt}) = 1000 \text{ to } 10000 \text{ watts}$ of yellow light power.

[The direct optical energy calculation above yielded about 5,400 watts, which is clearly in agreement with the above result. However, we would need a good calibration of the film sensitivity to do better.]

A 100 watt bulb puts out around 1,500 - 2,000 lumens (20 lm/ electrical watt)

according to a book I have.

(Or look on a light bulb box). So the above calculation implies on the order of

$2E6/2E3 = 1000$, 100 watt light bulb equivalents. A 10,000 watt bulb puts out 330,000 lm

(runs at higher temperature than a 100 watt bulb so better efficiency), so six of these would do it!. Note that this refers to electrical watts input to an incandescant light bulb. This is NOT the same as the number of watts of optical power calculated in the previous paragra

BUT before someone starts yelling PUBLISH, consider that this calculation is based on a bunch of assumptions.

IF the image size is smaller there was less luminous flux

IF the shutter time was slower or the f# was smaller there was less luminous flux

IF the distance was less there was less luminous flux

IF the exposure was lower (or ASA larger) there was less luminous flux...

However, even with all these modifications I would guess that these little orbs are powerful radiators!

(For comparison, see OPTICAL POWER OUTPUT OF AN UNIDENTIFIED HIGH ALTITUDE LIGHT SOURCE, Journal of Scientific Exploration Vol 13, pg 199, (1999). A much shortened version has been cited by Vallee , paper available at www.jse.com/ufo_reports/Sturrock/9.html. Although Vallee did not cite the actual number, my paper shows the radiation of this large "object" in the clouds to be on the order of $10E9$ to $10E10$ watts if a Lambertian emitter.)

I did mean "visible light" radiation. Thanks for the info on how "radioactivity" would effect the film. Interesting.

I see now why you brought the "radiation issue up". In my question to Bruce I asked about "specialized equipment". I meant equipment to measure the exposure level of the slide/orbs and not for measuring radioactivity.

Martin

Martin,

And yes when you said "radiation level" that's a stock term for radioactivity. Glad we're clear now.

Bruce wrote:

>The "orb" picture is "unquestionably" genuine.

Yes and no attempt was made to capture our enigmatic 'orbs' - it's actually a photograph I took at the weekend and I was somewhat astounded when all those orbs appeared!

>Wow. What a lot of orbs! The large number of diffuse,
>generally circular images suggests there must have been a lot of
>tiny stuff in the air.

That's all I could think of, however, nothing was visibly evident and I'm not so sure about this.

>These images are entirely consistent with the orb images I
>created by using a flash at night to photograph dust near the
>lens.

I'm wondering if this is maybe an artefact exacerbated by the combination of digital technology and a flash. I had the use of an Olympus C-830L and the photograph was simply a snapshot. With no zoom lens, the odd-looking tree was always likely to be too small in the image (I couldn't get any closer as there's a hedge in the way and the shot was taken over it). The photograph was 'high resolution' and I was interested to see how much the tree could subsequently be enlarged via software, before losing detail.

>Surprising to get these in the daytime, although it certain is
>not impossible that tiny objects very close to the lens could
>reflect skylight into the lens. However, I wonder if the
.photographer used a flash to "eliminate shadows."

Not intentionally, however, this camera will automatically use the in-built flash and I noticed it did so on several other occasions when I didn't think it would be necessary. Although, I can't recall if the flash was triggered on this photograph, the lighting contrast was sufficiently low that I would expect it.

>There doesn't seem to be any evidence of flash usage in the
>picture (other then, perhaps, the presence of the orb images
>themselves). However, I would not expect the effect of the flash
>to be very great because of the daytime usage if they were more
>than 15 feet from the object of their intention (the pig-stump).

Yes and it's a small, 'compact' camera with a low-powered flash.

>Was it a warm early spring day?

Almost - it's late winter/'first signs of spring' and still a bit too early for flies to hatch or minuscule airborne seeds. I'm puzzled by what caused the apparent reflections.

>The leftmost orb is particularly interesting because of its
>nearly hexagonal shape. I wonder if the lens aperture is also
>hexagonal.

I've taken many photographs with an SLR and never had anything comparative - even when fill-in flash was used. We may have an attribute particular to digital cameras and following from your recently published research, something which is common in Olympus models.

Does there have to be 'Something in the Air' before these artefacts occur? Looking closely at other photographs taken with this camera, especially some from a path through dense woodlands when I do recall the flash was always triggered, there are no 'orbs' at all - zero.

I've highlighted the photograph and raised some questions on a digital camera forum, it may be something that has a known explanation.

Since writing the above, I've been thinking about how this photograph was taken near where Thomas the Rhymer was spirited away by the Queen of Elfland. Allegedly, some say.

[Hmmm... opportunities like this don't come along twice]

In fact, I'm sure there's a real mystery here and I've suddenly remembered I did see something _and_ I recall a period of time being unaccounted for... err... if you know what I mean.

A local glassblowing company is very keen to produce replica orb paperweights and the Scottish Tourist Board say they will give their full support to a 'Sightings/Orb/Nessie' museum. We'll be negotiating for an adjoining McDonalds franchise.

Look out for the Internet site 'OrbWorld.com', where you can order a vast range of merchandise by credit card.

A film of my encounter is in the pipeline, to be entitled either 'Spheres of Destiny', or 'Great Balls of Fire in the Sky'.

For the sceptical subscribers - you know who you are - I would simply point out the following web site:

<http://geocities.com/Heartland/Bluffs/2441/rhymer.html>

Say... what's that orb-like image.

James.

>puzzled by what caused the apparent reflections.

You said the photo was taken over hedgerow. Perhaps the camera was quite close to a source of dust particles on the hedgerow . Particulate matter not distributed uniformly in the atmosphere. It is possible to have a "bunch" of tiny things carried by the wind that just happen to pass when you take a photograph... and then the next photo at the same location might show nothing. If, as you say, the flash might have gone off, then I could imagine tiny particles close to the camera creating these images even in daylight.

I wrote:

>The leftmost orb is particularly interesting because of its

One way to determine the shape of the aperture is place a tiny, shiny sphere close to the lens, illuminate it brightly (or use the flash) and look at the image shape. Even a drop of water on the end of a needle might do it. Is the aperture round or hexagonal or some other shape?

The reports of "obs" began with the general use of digital cameras. If you read the "orbsite" you can see how the orbists then "graduated" to other types of cameras. As I wrote in my paper, it was a correspondent who wondered if there was something wrong with his camera who discovered the key to unlocking these "flash orbs."

[James]

>Does there have to be 'Something in the Air' before these
>artefacts occur? Looking closely at other photographs taken with
>this camera, especially some from a path through dense woodlands

<

I would say that there has to be something in the air. The
"something(s)"

can be so small you can't see them. And, as I pointed out above, these
somethings are not uniformly distributed through the atmosphere.
So there might be a group of them in front of the camera one time
and then nothing many other times when you take photos.

Bruce wrote:

>...draw a map...

Bruce,

As I've explained before, we can no more 'draw a map' of how Arnold might not have recognised a formation of nine large, reflective birds any more than we can do so for the nearby 25-30, 2-3 ft in diameter, brass-coloured objects which "flew like ducks", yet according to Arnold were too fast for ducks.

Incidentally, as Arnold recalled how he was "a little bit shocked and excited" when he realised that these 25-30 objects "had the same flight characteristics of the large objects" seen on 24 June, we should of course note that ducks are one of the bird species which also have an undulating flight action - 'like a saucer would if your skipped it'... etc.

It's a simple question; is it possible - keeping in mind we don't actually know where Arnold was, his heading, the objects heading and critically when and how Arnold turned his plane around, etc. - that Arnold might have been mistaken in his perceptions (forgetting for the moment how the identification of Little Tahoma seems to prove this)?

Yes or no?

As the answer is yes, no 'maps' are required to explain that and how can they ever really do so, taking into account a witness's perceptions at any given time.

If it's a choice between 'draw a map illustrating why Arnold couldn't recognise either what was apparently a formation of AW Pelicans or a close-by flock of ducks', or... explain why mass 'UFO' encounters were so prevalent in his flying experience, some critical thinking might provide a default answer and one which would, objectively, be easily recognised as such.

James.

And therein lies the problem.

Either we accept Arnold's description of where his location and the objects
for what it is, or we assume that his commentary is incomplete (or
inaccurate) and he witnessed something much more explainable.

One problematical explanation is being substituted for another, based upon
what our personal belief dictates as more likely. Unfortunately, the
"bird" explanation can never be absolutely proven as the cause of his
sighting, so it is unlikely that this explanation will quiet the debate.

One question I would pose is how we might view the Kenneth Arnold sighting
if there was a flyover of an alien craft in formation as part of a "first
contact" scenario. Would the bird explanation remain the "apparent" answer
if it were a proven fact that alien craft flying in formation were real?
Or, would we then be speculating as to when aliens had first visited Earth
with the Arnold sighting among the historical references?

IMO, critical thinking is certainly necessary, but we must also understand
the limitations that come with it. IMO it is very useful in developing
theories, but of extremely limited value as proof. Of course, the other
side of that coin is the "open mind" that allows one's brains to flow out
onto the floor. So it often becomes a balancing act based on our personal
reality and beliefs.

>

The answer is yes. It is not necessary to know the "absolute position" of Arnold relative to ground features. All that is necessary is to make some reasonable assumption (he was in the vicinity of Mineral or some miles roughly east of Mineral).

What is necessary is to assume some RELATIVE locations of the assumed birds and Arnold's plane at the time he first saw a bright flash on this plane (good thing Arnold's birds were the only mirror like ones ever reported. Otherwise we might expect that some other pilots could have been temporarily blinded by solar reflections off birds.)

Once you make an assumption about the initial locations and you take into account the flight speed of birds and or Arnold you then imagine the birds flying along and Arnold flying along

and try to see how, from Arnold's perspective, it could APPEAR that the birds were initially to the left of Rainier, then passing Rainier (whether in front of or behind.. but I accept in front of) and then eventually appearing to pass Mt. Adams. The birds must be close enough to be "startlingly bright" (Arnold thought another plane had passed his aircraft) and at the same time far enough away so that Arnold could not recognize that they were birds despite concentrated observation (trying to figure what kind of planes they were).

My claim is simple: there are NO initial starting points of birds an Arnold such that the conditions of Arnold's sighting can be met.

I would challenge anyone on this list to "draw a map."

>If it's a choice between 'draw a map illustrating why Arnold couldn't recognise either what was apparently a formation of AW Pelicans or a close-by flock of ducks', or... explain why mass 'UFO' encounters were so prevalent in his flying experience, some critical thinking might provide a default answer and one which would, objectively, be easily recognised as such.

<

We are talking about his first sighting here. The fact that he couldn't recognize pelicans that were shiny enough to cause bright flashes on his plane and to outfly him may have had an impact on his later interpretations of sighting, but not on this one.

I know it takes GUTS to apply logic and follow-through to a "reasonable" hypothesis. But that's what happens all the time in Science.

James

I agree with Bruce, Yes you can 'draw a map'. Anybody who has done some flying in a plane (Not an airliner but a small plane where you have close to a 360 view) will appreciate how impossible it would be to mistaken birds from a faster flying aircraft. If one attempts to draw a map with aircraft and bird vectors one will establish that it is impossible for the birds to be perceived as traveling faster than the observing aircraft.

Martin

Bruce wrote:

>...draw a map...

Bruce,

As I've explained before, we can no more 'draw a map' of how Arnold might not have recognised a formation of nine large, reflective birds any more than we can do so for the nearby 25-30, 2-3 ft in diameter, brass-coloured objects which "flew like ducks", yet according to Arnold were too fast for ducks.

COMMENTS: Arnold gave no detailed sighting azimuths etc. for the July 29, 1947, sighting of 25-30 duck-like objects. However, Arnold did give detailed information on sighting directions for the objects on June 24, varying from north of Rainier down to south of Adams or across some 90 degrees of sky. There is no comparison.

Your inability to draw a map of the sighting circumstances for Arnold's June 24 sighting to demonstrate your bird theory is evidence that it is impossible to fit birds to the sighting's flight dynamics, otherwise you would have drawn the map long ago.

As I've pointed out many times on this list without ever getting a response from you, your bird theory requires Arnold to ORBIT the slower-speed birds in his 120 mph aircraft at a radius of about 1 mile, with the birds ALWAYS out his RIGHT WINDOW and never in front, in order for the sighting directions

from Arnold to the birds to point towards Rainier-Goat Ridge-Adams. And he has to start by flying to the NW or NNW instead of E.

Why don't you simply admit that you have to throw out all of Arnold's sighting directions to Rainier-Goat Ridge-Adams in order to fit a bird scenario?

[Easton]

Incidentally, as Arnold recalled how he was "a little bit shocked and excited" when he realised that these 25-30 objects "had the same flight characteristics of the large objects" seen on 24 June, we should of course note that ducks are one of the bird species which also have an undulating flight action - 'like a saucer would if your skipped it'... etc.

It's a simple question; is it possible - keeping in mind we don't actually know where Arnold was, his heading, the objects heading and critically when and how Arnold turned his plane around, etc. - that Arnold might have been mistaken in his perceptions (forgetting for the moment how the identification of Little Tahoma seems to prove this)?

Yes or no?

COMMENTS: If we "don't know where Arnold was" etc. then we don't have any basis for saying his perceptions were mistaken so on that basis the answer has to be NO!!!! It's NOT a "simple question" when you load it that way.

The "identification of Little Tahoma proves" Arnold was mistaken about objects flying in front of the mountain only if we KNOW APPROXIMATELY where he was located -- and we do know. The identification of Little Tahoma proves the distance to the objects, at 23+ miles, was much too great for birds even to have been visible. And Arnold might not have been entirely mistaken if he saw as he said "images" of the objects' flashes off the front sides of the mountains which might have misled him into thinking they flew in front.

[Easton]

As the answer is yes, no 'maps' are required to explain that and how can

they ever really do so, taking into account a witness's perceptions at any given time.

COMMENTS: The answer is "NO" as stated above. Regardless of errors in Arnold's perceptions, there is one thing we KNOW for ABSOLUTE CERTAINTY and that is that your bird theory MUST OBEY THE LAWS OF PHYSICS. If birds must obey the laws of physics then they must be susceptible to being MAPPED like any other objects such as aircraft and mountains that can be drawn on a map.

[Easton]

If it's a choice between 'draw a map illustrating why Arnold couldn't recognise either what was apparently a formation of AW Pelicans or a close-by flock of ducks', or... explain why mass 'UFO' encounters were so prevalent in his flying experience, some critical thinking might provide a default answer and one which would, objectively, be easily recognised as such.

James.

COMMENTS: While you've come up with lots of bird stories you still haven't come up with any of birds so bright it was "ALMOST BLINDING" or like "ARC LIGHT."

Bruce,

It seems to be perfectly round.

I could easily create some 'orbs' taking close-up shots, using
flash of:

a) a small crystal - see:

<http://web.ukonline.co.uk/voyager/orbtest1.jpg>

b) a clear bottle filled with water -see:

<http://web.ukonline.co.uk/voyager/orbtest2.jpg>

This weekend's been the first chance I've had since to try and duplicate these apparent artefacts outdoors. Despite always using the built-in flash and selecting a number of likely sources, I couldn't 'make' any orbs appear.

Last weekend's photograph, which was inadvertently 'successful', features more orb artefacts than the image on my web site. That was cropped to remove extraneous overhead wires and the full-size photograph [179k] has been uploaded to:

<http://web.ukonline.co.uk/voyager/orbsfull.jpg>

As can be seen, there are also 'orbs in the sky'. Although this photograph was taken over a hedgerow, so were others, with nothing comparable being produced. It's probable, as you say, that whatever might have caused the reflections was localised and transient.

Even if I go back to that exact location, it seems extremely unlikely the photograph could be reproduced. As with any photograph, it captures a moment in time...

Given that the flash wasn't relatively powerful, it seems to have captured numerous, consistent 'orbs' over a large area of the exposure. I remain puzzled as to what was conceivably responsible and you might spot some further clues in the full sized photograph.

James.

To which Steve K responded:

>And therein lies the problem.

>Either we accept Arnold's description of where his location and the
objects
>for what it is, or we assume that his commentary is incomplete (or
>inaccurate) and he witnessed something much more explainable.

>One problematical explanation is being substituted for another, based upon
>what our personal belief dictates as more likely. Unfortunately, the
>"bird" explanation can never be absolutely proven as the cause of his
>sighting, so it is unlikely that this explanation will quiet the debate.>

The bird explanation cannot be absolutely proven but. what could be proven, in principle, is that the bird explanation is CONSISTENT with what is known. But, to prove this one has to compare reported CHARACTERISTICS or DETAILS of the sighting with DERIVED CHARACTERISTIC or details, that is characteristics derived from the assumed bird explanation. Of course, proving that the bird explanation is completely consistent with the sighting does not prove the explanation but removes all "complaints" about it being a "birdbrain" explanation. In order to make the bird explanation consistent with the sighting one has to modify our understanding of what Arnold reported. For example. We have to modify our understanding of Arnold's claim that the objects reflected light like a metal surface or a mirror. We have to modify this to merely a "bright" explanation, as from a white surface at some distance (mile, two miles) in the bright sunlight.\

>One question I would pose is how we might view the Kenneth Arnold sighting
>if there was a flyover of an alien craft in formation as part of a "first
>contact" scenario. Would the bird explanation remain the "apparent"

answer

>if it were a proven fact that alien craft flying in formation were real?

>Or, would we then be speculating as to when aliens had first visited Earth

with the Arnold sighting among the historical references?.

<

This is amusing to contemplate. If we already knew characteristics of alien craft then we could go for a positive identification: the characteristics

of the observed object do or don't match the known characteristics of alien craft. If they do match, then alien craft are a contender for the explanation. IF the characteristics do no match any other possible explanation then the identification as alien craft is accepted.

First, I have sent the most recent and "final" version of my paper (final for now!). This new version tackles the enigmatic "orb tubes." Also, three new illustrations.

JAMES WROTE:

>I could easily create some 'orbs' taking close-up shots, using
>flash of:

>a) a small crystal - see:

><http://web.ukonline.co.uk/voyager/orbtest1.jpg>

Amusing. small inclusions in the crystal or tiny bits of dust on the surface could create "orbs"

>b) a clear bottle filled with water -see:

><http://web.ukonline.co.uk/voyager/orbtest2.jpg>

Also amusing. Again, bits of dust on the surface or tiny floating particles will reflect unfocused "orb light"

>>>.Does there have to be 'Something in the Air' before these
>>>artefacts occur?SNIP

>>I would say that there has to be something in the air. The

The density of particles in the air is highly variable.

>Last weekend's photograph, which was inadvertently 'successful',
>features more orb artefacts than the image on my web site. That
>was cropped to remove extraneous overhead wires and the full-size
>photograph [179k] has been uploaded to:

><http://web.ukonline.co.uk/voyager/orbsfull.jpg>

A cropped photo, eh? Trying to TRICK us, eh? It is amusing to see that you must have been in a shadow to get such low exposure of nearby items. I would guess that the camera tried to compensate for the disparity in brightness between the sky above and the nearby scene.

>As can be seen, there are also 'orbs in the sky'. Although this
>photograph was taken over a hedgerow, so were others, with
>nothing comparable being produced. It's probable, as you say,
>that whatever might have caused the reflections was localised and

Orbs in the sky would still be tiny particles close to the camera (not actually "in the sky").

>Even if I go back to that exact location, it seems extremely
>unlikely the photograph could be reproduced. As with any
>photograph, it captures a moment in time...

Take along a full, "ripe" dustmop and shake it over the camera just before you take the picture. Perhaps your orb desires will be fulfilled. :)

>Given that the flash wasn't relatively powerful, it seems to have
>captured numerous, consistent 'orbs' over a large area of the
>exposure. I remain puzzled as to what was conceivably responsible
>and you might spot some further clues in the full sized
>photograph.

Please realize that although the flash isn't "powerful" it is the brightest thing that is close to the lens. As I point out in my research paper on orbs, the illumination intensity decreases as the fourth power of the distance.

At the same time the area of the orb image decreases approximately as the square of the distance. The result is that the luminous power per unit area of the image

decreases as the square of the distance. (I know....leave the math out, but...

Exposure = power/area of the image = power reaching the reflector times some constants divided by the area of the image = (PK/R^4) divided by (A/R^2)

where

K and A are constants such as reflectivity and area of the reflector, the initial

intensity in the direction from the flash to the "orb," transmission of the lens, shutter

time, etc. The net result of the division indicated above is Exposure = constant/ R^2 .

The point is that the exposure from small particles close to the lens can be comparable

to the exposure level of distant bright objects (e.g., sky) simply because the flash is so close.

Digital cameras introduce new elements that haven't been considered before: the effects of static electricity and heat. These can cause random pixels, or groups of pixels to be set. Here are some characteristics of such kinds of interference:

1. Depending on where a static discharge took place, the pixels affected may be grouped or individual.
2. Three kinds of changes could be noticed: Random intensities (in which no two affected pixels are the same brightness or color), all bits set dark, and all bits set white.
3. It is possible that smoothing routines can make point discontinuities into small circles of diminished brightness. Sometimes these routines are used to remove small single-pixel variations that would otherwise appear as speckles in the picture.
4. "Lossy" data compression methods can turn single-pixel errors into larger discontinuities that seem to be out of focus.
5. Leaving the camera in a hot car can cause parts of the image array to respond as if light struck them, or in a non-linear way.
6. If an error occurs in the storage medium, and error correction routines fail to fully correct it, data compression methods could cause the error to appear in many places within the frame.

On other parts of this topic:

The shape of the iris will be revealed by the method of placing a tiny light source very close to the lens only if the lens is stopped down almost closed. If it is wide open, the lens itself will provide the shape.

I have seen many hexagonal lens flares from older cameras, along with other shapes. It usually indicates that the sun (or some other extremely bright light source) has struck the lens and has reflected between various lens surfaces. When this happens, bright areas can appear on the image in various positions,

depending on the geometry of the lens. Some of the bright points may be out of focus. I have also seen this happen when sun struck the trim ring around the lens, but not the lens itself. Simple box cameras without color correction rarely produce lens flares, while the most expensive lenses seem to have a proclivity toward making them.

Jewelry worn by the photographer can reflect or refract light into the lens and cause a lens flare, unless the lens is shielded by a cup to prevent this. If the flash strikes jewelry, it can be redirected into the lens in the same way. This will have an effect similar to that of sunlight striking the lens. In one of her books, Coral Lorenzen published a photo of a lens flare caused by a diamond ring refracting sun into the lens. Always check this, as the small size of the new cameras can allow jewelry formerly hidden by larger camera bodies to shine light onto the lens.

WHY SOME BRIGHT UFOS APPEAR ROUNDED

When strong light enters the eye, a phenomenon called HALATION occurs. This is the scattering of light within the retina of the eye. It also occurs in the emulsion of photographic film (hence the name), and in video cameras.

The strong light is focused when it strikes the retina, but then much of that light is scattered, activating cells near the focus point rather than just the ones at the focus. The light diminishes as the distance increases from the focal point, because the retinal cells absorb it. This produces a circle of brightness around the actual focused image of the bright object.

The result is that each point in the actual image is expanded in all directions by the scattering. This produces an expanded image that is larger, more rounded, and more convex. A rectangle will appear as a larger rectangle with rounded corners.

There are several obvious cases where halation can be noticed by observers looking for it:

1. When the dark portion of the crescent moon is visible because of earthshine, the lighted portion appears larger in radius than the darkened portion, making the moon seem to bulge on the lighted side. Part of this is due to halation, and part is an optical illusion.
2. When a specular airplane reflects bright sunlight off of its fuselage into the eye of the observer, it appears to expand into a sausage shape.
3. Car headlights appear larger at night when they are on than they look when they are off.
4. Streetlights in night photos appear to be larger than they do in day photos.
5. Older TV cameras produced strange looking streaks when they were panned past a light source (such as stadium lights at a night football game). This happened when the photosensitive

surface became overloaded by strong light.

6. Halation was quite apparent in the videos of the 1997 Phoenix Lights.

European Space Agency
Press Release No 19-2000
Paris, France 17 March 2000

Airships to complement satellite and terrestrial systems

Our skies could soon be home to special airships able to provide local to regional telecommunication services, Earth observation services, atmospheric science and astronomical observations. The European Space Agency, together with DaimlerChrysler Aerospace of Germany, Lindstrand Balloons Ltd. of the United Kingdom and the Technical University of Delft in the Netherlands, have completed a first assessment of a concept for High-Altitude Long-Endurance (HALE) aerostatic craft, positioned in the stratosphere at about 20 km altitude -- in a region of space where no aircraft or satellites fly -- and with an operational lifetime ranging from months to years.

HALEs are large helium-filled powered airships with an aerodynamic "cigar" shape about 220 m in length and 55 m in diameter, carrying payloads of up to 1000 kg or so. Unlike Zeppelins, which they closely resemble from the outside, HALEs do not need a rigid overall internal structure. With modern flexible hull materials, helium-tight and UV-resistant, their design can rely on pressurisation to impart the necessary stiffness to the airship body. Only local rigid reinforcements for the engine and payload attachment are necessary.

HALEs are equipped with an engine for mobility and stable positioning against stratospheric winds. The altitude of 20 km is high enough to give local or regional coverage of about 100 km in diameter and also offers the advantage of minimum wind speeds. Solar cells covering the upper, sun-oriented parts of the airship skin gather energy at daytime to power a high-efficiency electric engine, which drives a large propeller, and feed energy into a storage and conversion system, from which it is drawn for nighttime propulsion and operation of the vehicle.

Earth observation is a domain where HALEs can play an important role in permanent or ad-hoc services such as environmental monitoring or disaster management. After detection of a problem identified via a satellite system, a HALE airship could, after arrival on the scene, provide detailed, up-to-date and round-the-clock information. These airships could be used -- for instance -- to guide rescue operations in the event of a flood or earthquake, when local telephone connections, including ground-net based mobiles, fail and rapid local observations of

the disaster area are vital.

In telecommunications, various applications can be envisaged. Located above a densely populated area, HALE airships could support future mobile multimedia services (voice, Internet, radio and TV broadcast) without the need for a network of antennas and ground-based relay stations.

Remote meter reading (gas, water and electricity) is another possibility. Quick local observation and information could also make for more efficient traffic management.

ESA's interest in HALEs is due to their relevance to a broad range of space technologies such as thin-film solar cells, inflatable technology, telecommunication equipment, astronomical instruments and various subsystems such as power management and distribution, steerable antennas, Earth observation sensors and radar imagers. Lightweight design, another typical area of space expertise, is particularly important to the development of HALE airships. Also Industry is interested: Considerable effort is currently being put into assessing HALE's business potential and market access while additional companies and institutions are considering to join the team and discussing their possible roles in the development and commercial exploitation. This initiative must be seen in the context of similar efforts in Japan (Sky-Net) and the US (Sky Station Int'l), in which also European Space and Balloon-manufacturing companies are participating.

This obviously started out its life as a guitar pick. You can almost read the trademark. It takes a man with "sound" judgement to see that (I do live sound recording in my spare time).

web.ukonline.co.uk/voyager/orbs.jpg

Milkweed seeds or the like? The shadow on the ridge up high indicates that the sun was somewhere in front of the camera, but out of frame.

www.ufobc.org/yukon.tagish.htm

There seem to be people on the beach in the foreground of this picture. Maybe they have poles with lanterns or flares.

Has anyone checked for the presence of sodium lamps there?

The objects seem to be expanded by halation in the film.

Did the photographer report seeing the objects, or did they appear on the film?

Larry,

I thought someone with 'relevant expertise' might identify this
craft from planet Fender. ;)

The 'craft' was indeed a plectrum/pick, stuck onto a glass window
and photographed with fill-in flash against the background -
which turned out surprisingly well.

It was interesting to see how much difference the flash made,
enhancing the 'corner lights' (Tippex) and especially the central
'light'. The latter appears to be reddish-white and arguably
looks like it has a light source. It's actually a dot of white
sticky paper, coloured with an orange felt pen. Reflected light
at the right-hand side edge was reasonably consistent with the
setting sun, yet never intentional. Overall, as it only took some
30 minutes to create and photograph, I didn't think the result
was that bad.

This was simply an exercise, resulting from discussions about
likely authenticity of the Petit-Rechain photograph. However, it
still reinforced what I've come to appreciate about hoaxes and
I'm sure is recognised by others - you can achieve surprisingly
plausible fakery with basic creativity and endeavour. With more
time and learning by experience - how useful the fill-in flash
can be, etc. - I would expect to have produced a correspondingly
convincing fake.

Some former/current 'classic' UFO photographs, especially of
'flying saucers' - such as the celebrated 'Warminster' photograph
- were of course the most basic hoaxes, yet 'fooled the world'.

The point was to make a rudimentary study of how the Petit-
Rechain photograph could have been created. The primary
difficulty I found was a believable perspective - this was after
all a 'flat' object. Shooting from a 'side angle' helped.

(Not [yet] exactly up to the standards of Billy Meier and Ed Walters, etc. 'portfolios').

James.

Larry Robinson wrote:

>WHY SOME BRIGHT UFOS APPEAR ROUNDED

When strong light enters the eye, a phenomenon called HALATION occurs. This is the scattering of light within the retina of the eye. It also occurs in the emulsion of photographic film (hence the name), and in video cameras.

The strong light is focused when it strikes the retina, but then much of that light is scattered, activating cells near the focus point rather than just the ones at the focus. The light diminishes as the distance increases from the focal point, because the retinal cells absorb it. This produces a circle of brightness around the actual focused image of the bright object.
<

I agree with the comments about halation. Halation is not a problem here, however, except in the unusual case that an "orb" particle is so close to the lens as to create considerable overexposure.

As for halation, I found years ago, while analyzing the New Zealand sighting movie of Dec. 31, 1978, that the width of an image can be represented as

$$W_i = W_g + K \log E$$

where W_g is the resolved image size based on the object size, focal length and distance: $W_i = W_o F/D$, where W_o is the object width, F is the effective focal length and D is the distance to the object from the camera. In the above equation K is a constant and $\log E$ is the logarithm (base ten) of the exposure level.

The value of K had to be determined by experiment for the particular type of film used. I expect that there would be a comparable formula for a digital camera.

And to think you criticized me for saying it was a likely fake!
Anyway, I did not think of guitar pick.... although I certainly noted the
"extreme resemblance" once Larry had identified it. My problem'
was that the outlines didn't look just right.

Reminds me of the series of four photos taken by Peter Beard
(think I have the name right) who lived in a town in Britain ... a name I
don't recall right now, taken in August 1987, if I recall correctly.

The case became public knowledge when the
local paper published the story and a couple of photos. It was
investigated by Philip Mantle and others. They asked me to evaluate
the photos. The photos were of an "object" seen above the houses
across the street. The several photos showed the object at several
locations as if on a flight track from left to right and then
reversing and going back to the right (in the last photo).

Beard claimed he saw th object out his very early one morning, had
a loaded camera in his second floor room and he took the pictures.
His girlfriend also saw it, she said. Beard showed the pix to some
friends in a bar and they alerted a newspaper guy who interviewed
Beard and published the story.

The investigation was extensive. I asked for many comparison
shots, etc. By the early spring of 1988 (during the time I was
beginning the Walters investigation!) I had been able to demonstrate

that the sighting lines through the window ALL PASSED THROUGH THE SAME POINT or at least were very close to passing through the same point. This was based on the fact that the apparent motion of th object over the houses across the street was "consistent with" the motion of the camera relative to the window frame. Beard' s big mistake was in showing th window frame. He admitted the window was closed. There was nothing I could find to contradict the assumption of a paste-on the window while he moved from shot to shot to make it look as if the object were distant and moving. Thus Beard faded into history just as Walters and dozens of Gulf Breeze residents.. were making history.

* I found the object I was trying to find earlier, but I have no idea when it was first made.

Ryan Aviation made a semicircular drone target plane. The trailing edge was straight, the leading edge semicircular. it had three small vertical stabilizers, one at the center (reminding me of the pole of the McMinnville photo) and one at each wingtip, extending above and below the wing. Two small jet engines powered it.

* Just before World War II, Richard B. Johnson made disk shaped aircraft with single tractor propellers.

A photo of one appears in:

Flying Saucers Pictorial
Real Magazine
(C) 1967 Max B Miller

* I suggest that we consider the possibility that halation might have affected the shape experienced by Kenneth Arnold.

* Someday, I will put my 1967 fake on so you can see it. I have refrained from doing this because (a) I don't have a scanner, and (b) I fear that some nut will latch onto it as the real thing.

Last year, I came across Robert Shaffer's fake in a book, purported to be an actual UFO photo. This photo is a triple exposure, made by shooting a scene, and then twice shining a light through the center hole of a tilted 45 RPM record. It is one of the optically fabricated examples in the Condon Report.

* Speaking of fakes, my favorite fake is the 4/24/1959 Piata Beach, Itapoan Brazil series of 4 photos. The "UFO" can be found inside any Collaro record changer (Barking England) made from 1953 to 1964. It is the original wheel that drives the change cycle, minus the rubber tire. Unfortunately, the replacement wheels sold here look different. They don't have the four little

holes around the hub.

How do I know this? Easy! I repaired my own Collaro, and there it was, right under the turntable.

Halation is all but certain in the Arnold case due to the intense arc-light-like almost blinding flashes. It is extraordinarily peculiar that Arnold said that it was ONLY when the objects tipped and flashed that he could see their shape. But that's when halation would set in, rounding off the shape.

NASA knew Mars Polar Lander doomed
United Press International - March 21, 2000 15:01

By James Oberg, UPI Space Writer
HOUSTON, March 21 (UPI) -- The disappearance of NASA's Mars Polar Lander last December was no surprise to space officials, UPI has learned.

Prior to its arrival at Mars, a review board had already identified a fatal design flaw with the braking thrusters that doomed the mission, but NASA withheld this conclusion from the public.

The probe was lost while attempting to land near the martian south pole on December 3. Two small microprobes which had deployed separately also were never heard from again.

It was the second expensive setback for American interplanetary exploration in less than three months. On September 23, a companion probe had been destroyed when a navigation error sent it skimming too deeply into the atmosphere of Mars.

Following these failures, NASA commissioned several expert panels to review the accidents and recommend improvements in NASA procedures.

A source close to the panel probing the second accident has told UPI that its conclusions are "devastating" to NASA's reputation. Unlike the previous accident, where management errors merely prevented the recognition of other human errors, in this case it was a management misjudgment which caused the fatal flaw in the first place.

"I'm as certain as I can be that the thing blew up," the source concluded.

As explained privately to UPI, the Mars Polar Lander vehicle's braking thrusters had failed acceptance testing during its construction. But rather than begin an expensive and time-consuming redesign, an unnamed space official simply altered the conditions of the testing until the engine passed.

"That happened in middle management," the source told UPI. "It was done

unilaterally with no approval up or down the chain of command."

The Mars Polar Lander employed a bank of rocket engines which use hydrazine fuel. The fuel is passed through metal grates which cause it to decompose violently, creating the thrust used by the engines.

These metal grates are called "catalyst beds," or "cat beds." Their purpose is to initiate the explosive chemical reaction in the hydrazine.

"They tested the cat bed ignition process at a temperature much higher than it would be in flight," UPI's source said.

This was done because when the cat beds were first tested at the low temperatures predicted after the long cruise from Earth to Mars, the ignition failed or was too unstable to be controlled.

So the test conditions were changed in order to certify the engine performance. But the conditions then no longer represented those most likely to occur on the real space flight.

Following the September loss of the first spacecraft due to management errors, NASA had initiated a crash review of the Mars Polar Lander to identify any similar oversights. According to UPI's source, the flaws in the cat bed testing were uncovered only a few days before the landing was to occur on December 3.

By then it was too late to do anything about it.

Garbled rumors of some temperature-related design flaw circulated in the days before the landing attempt. However, as in the September case when space officials possessed terrifying indications of imminent failure even before the arrival at Mars, NASA made no public disclosure of these expectations.

The Mars Polar Lander investigation team has also reportedly identified a second fatal design flaw that would have doomed the probe even if the engines had functioned properly.

The three landing legs of the probe contain small microswitches which are triggered when the legs touch the surface. This signal commands the engines to cease firing.

Post-accident tests have shown that when the legs are initially unfolded during the final descent, springs push them so hard that they "bounce" and trigger the microswitches by accident. As a result, the computer receives what it believes are indications of a successful touchdown, and it shuts off the engines.

Since this false signal actually occurs high in the air, the engine shutdown automatically leads to a free fall and destructive high-speed impact.

Ground testing prior to launch apparently never detected this because each of

the tests was performed in isolation from other tests. One team verified that the legs unfolded properly. Another team verified that the microswitches functioned on landing.

No integrated end-to-end test was performed due to budget and time constraints. But UPI has been privately told that "this has been reproducible on a regular basis" in post-flight tests.

Perhaps by coincidence, in a safety memo to NASA employees distributed on March 20, NASA administrator Dan Goldin stressed "the importance of adequate testing." Reliability, he said, "requires well-thought-out verification and test activities."

Goldin explicitly described the adverse impact of "our difficulties with recent failures in late stages of development -- such as system integration and testing -- and during mission operations." The memo did not specifically attribute these problems to the Mars failures.

The Mars Polar Lander also deployed two small "penetrator" probes, both called Deep Space 2. They were designed to fall freely through the thin atmosphere, hit the ground at about 200 meters per second (400 miles per hour), and come to rest deep in the soil.

All attempts to pick up radio signals from these probes, relayed via another spacecraft already orbiting Mars, also failed. Reportedly, the review board believes that the probe radio equipment could not have survived the impact.

Alternately, the probes may simply have hit ground too rocky for survival. Engineers also suspected that their batteries, which had been charged before launch almost a year earlier and not checked since then, might not have retained sufficient power.

"Nobody in the know really expected either of the penetrators to work," UPI's primary source said.

Dr. Carl Pilcher, head of NASA's planetary program, talked with space scientists at last week's Lunar and Planetary Science Conference in Houston. While expressing disappointment at the setbacks and skepticism of ambitious flight schedules -- "Our ambition exceeded our grasp," he told the scientists -- he would not discuss the results of the accident investigation.

The conclusions, he did admit, "make sober reading." The investigation was led by Tom Young, a former manager at NASA's Jet Propulsion Laboratory which runs most of NASA's deep space probes.

"Goldin recently told his managers that the Young report will be the Rogers Commission of space science," Andrew Lawler wrote in the March 10 issue of Science magazine, "referring to the devastating critique delivered by a panel that examined the 1986 Challenger disaster."

And in a March 9 internal memo from JPL director Ed Stone, which UPI has obtained, space workers are warned that "the days ahead may at times be difficult."

According to Lori Garver, NASA's associate administrator for plans, the report on NSA's failures will be reviewed internally and then will be sent to the White House before being released to the public.

* I suggest that we consider the possibility that halation might have affected the shape experienced by Kenneth Arnold.

<

Arnold wrote that when the objects flashed brightly they looked round. Obviously he was taking into account the effect of "halation."

The shapes he ascribed to the objects were based on seeing them against the side of the mountain when they weren't flashing bright light into his eyes.

He wrote (Air Force Letter) : "Of course when the sun reflected from one or two or three

of these units, they appeared completely round; but I am making a drawing to the best

of my ability , which I am including, as to the shape I observed these objects

to be as they passed the snow covered ridges as well as Mt. Rainier. When the

objects were flying straight and even they were just a thin black line and when they flipped was

the only time I could get a judgement as to their size."

Since it was a bright sunny day and he was looking at the snowfields of Rainier one may assume his eyes were bright-adapted (pupils small) which means (a) he was more "immune" to "halation effects" than would be the typical nighttime witness and (b) he probably had the best visual acuity he could have (smallest aperture generally means most accurate viewing for a lens system, including the eye)

Uhm, incidently, from the above it would SEEM that Arnold is IMPLYING that the objects were between him and Mt. Rainier.: "as they passed the snow covered ridges as well as Mt. Rainier."

Subject: Re: Arnold and other sundry items.Status:

Bruce,

Of course, Arnold also said he could ONLY discern the shape when the objects flipped and that when they flipped was when they FLASHED with intense brightness. A non-flipped "thin black line" is no real indication of shape especially when so far below 0.5 arcminute visual resolution acuity limits (1/11 to 1/20 of the 2.6 arcminute width is only about 0.1 to 0.2 arcminute). (The long-thin object effect doesn't work unless the object is MANY times longer/wider than the acuity limit. An object about 0.2 x 2.6 arcminutes is NOT EVEN VISIBLE.)

If the objects were really "mirror-like" then when seen on-edge they should have reflected the SNOW of Mt. Rainier at a slight grazing angle and APPEARED SNOW-LIKE -- and thus would have been INVISIBLE against the WHITE SNOW.

The objects "passed the snow covered ridges" of Goat Ridge HIGH ABOVE the ridge line as shown in Arnold's one and only known DRAWING (on IUR's cover Mar/Apr 95) which labels the UFO flight path as at 10,000 feet altitude and that ridge is only at about 5,000-7,000 feet. So that phrase does not mean "passing" in FRONT of a mountain.

Hence I conclude that Arnold could not possibly have seen any "shiny mirror-like" objects or intense white flashing objects against a bright white snow background of a mountain.

Brad

I<

True, they supposedly flashed when they flipped. HOWEVER, one does not need to assume that the flashed brightly every time they flipped. Alignment with the sun would occur only for a single "flip" angle or a narrow range of angles of tilt and also yaw and pitch//// angles in all three dimensions must be right. Hence, since Arnold is no longer around to state that each one flashed each time it flipped, I think it would be reasonable to assume that the flash did not occur at every flip.

However, even if it did occur, it would only occur during a rather steep angle of tilt if the top surfaces were basically flat. As the object tilted Arnold could see the shape until the flash occurred... if it occurred. In other words, in spite of flashing I think Arnold could have seen the overall shape.

Subject: Re: Arnold and other sundry items.Status:

Hi Bruce,

Well, when Arnold WAS still around he said he could only see the objects' shape when they flipped or dipped and that whenever they flipped/dipped they FLASHED intense light:

"... I could see them ONLY plainly when they seemed to TIP their wing, or whatever it was, and the SUN FLASHED on them." (KWRC radio interview, June 26, 1947)

"... when they FLIPPED was the ONLY time I could get a judgment as to their size." (Letter to AAF, ca. July 8-10, 1947)

"... as two or three of them every few seconds would DIP or change their course slightly, just enough for the SUN to strike them at an angle that REFLECTED BRIGHTLY on my plane." (Letter to AAF)

Arnold connected the "flipping" and the "flashing" in phrases such as how he "watched them FLIP and FLASH in the SUN" (AAF letter), they "FLIPPED and FLASHED" (COTS 1952).

Right after stating he could "only" see the objects "plainly" when they TIPPED and FLASHED, Arnold claimed he would see the objects "against the SNOW ... as they were FLASHING" (KWRC interview) and my point is that that was all but an optical impossibility, to "plainly" see WHITE FLASHES against BRIGHT WHITE SNOW, that he must have seen the flashes against the dark blue SKY.

Of course, Arnold also said he could ONLY discern the shape when the objects flipped and that when they flipped was when they FLASHED with intense brightness. A non-flipped "thin black line" is no real indication

of shape especially when so far below 0.5 arcminute visual resolution acuity limits (1/11 to 1/20 of the 2.6 arcminute width is only about 0.1 to 0.2 arcminute). (The long-thin object effect doesn't work unless the object is MANY times longer/wider than the acuity limit. An object about 0.2 x 2.6 arcminutes is NOT EVEN VISIBLE.)

I<

True, they supposedly flashed when they flipped. HOWEVER, one does not need to

assume that they flashed brightly every time they flipped. Alignment with the sun

would occur only for a single "flip" angle or a narrow range of angles of tilt and also

yaw and pitch//// angles in all three dimensions must be right.

Hence, since Arnold is no longer around to state that each one flashed each time it flipped,

I think it would be reasonable to assume that the flash did not occur at every flip.

However, even if it did occur, it would only occur during a rather steep angle of tilt if the top surfaces were basically flat. As the object tilted Arnold could see the shape until the flash occurred... if it occurred. In other words, in spite of flashing I think Arnold could have seen the overall shape.

@* I suggest that we consider the possibility that halation might
@have affected the shape experienced by Kenneth Arnold.
@<
@
@Arnold wrote that when the objects flashed brightly they looked round.
@Obviously he was taking into account the effect of "halation."
@The shapes he ascribed to the objects were based on seeing them
@against the side of the mountain when they weren't flashing bright light
@into his eyes.
@He wrote)Air Force Letter) : "Of course when the sun reflected from one
@or two or three
@of these units, they appeared completely round; but I am making a drawing
@to the best
@of my ability , which I am including, as to the shape I observed these
@objects
@to be as they passed the snow covered ridges as well as Mt. Rainier. When
@the
@objects were flying straight and levent they were just a thin black line and
@when they flipped was
@the only time I could get a judgement as to their size."
@Since it was a bright sunny day and he was looking at the snowfields
@of Rainier one may assume his eyes were bright-adapted (pupils
@small) which means (a) he was more "immune" to "halation effects" than
@would be the typical nighttime witness and (b) he probably had the best
@visual acuity he could have (smallest aperture generally means most
@accurate viewing for a lens system, including the eye)

True. But I once saw halation increase the size and change the shape of an airplane. I was on vacation in northern Indiana when I saw a large, extremely bright, silver "blimp" moving rapidly across the eastern sky. It was about 4 o'clock, and the sun was

high in the west. Since it was going way too fast for a blimp, I watched it carefully. Suddenly the apparent fuselage diameter shrunk by two thirds, and the length shortened. The object was then easily identified as the DC-3 that was operating out of the local "airport" there, on final approach.

The radius of the halation effect was as large as the image of the fuselage diameter, so halation completely obscured the wings and the tail. After the sun reflection was directed elsewhere, the distinctive shape of the wings of the DC-3 became visible. After the halation had disappeared, the angular size of the length of the plane was about one moon diameter. The "airport" was about three miles away to the south southeast, and the approach path to it was perpendicular to my line of sight to the east. It consisted of whichever field the farmer who owned it left fallow that year. He planted his fields in long narrow strips, so he would always have a runway as he rotated his crops.

My eyes were already accommodated to bright sunlight. At the time the object appeared, I had been checking the trees across the lake for wind effects, to see if there was enough wind to go sailing. At the time, my vision was 20/15 and needed no correction (I have since acquired presbyopia). My vision interpreted the diminishing effect of halation at the edges as curvature away from me, making the halated image appear sausage-shaped and three dimensional.

Many bright daytime UFOs might be halation effects of sunlight reflecting off of ordinary aircraft. Since there is an air route just east of where I live, I see "silver missiles" all of the time, as distant airliners reflecting the low sun pass by. Sometimes they are red or orange at sunset. The halation obscures the wings and tail, since they are not reflecting the sunlight directly toward me.

The Takeda photo (8/20/57 Fujisawa City Japan) seems to be a case of halation on film by an aircraft, but it might have been a lens flare instead.

My only "unidentified" sighting was a halation effect. I know something was reflecting the sun at me, but I have no idea whether it was a plane, a balloon instrumentation package, a satellite, or something else. The object was about 30 degrees away from the sun, and displayed no apparent motion. When it faded in, the object was so far away that nothing was seen against the blue-white sky beforehand. I had just happened to look in that direction to check for traffic (I was sailing) when it faded in. Unfortunately, I did not see it disappear. Two boats came toward me from another direction, and when I looked back to the object, it was gone. The duration was about 15 seconds.

@Uhm, incidently, from the above it would SEEM that Arnold is
@IMPLYING that the objects were between him and Mt. Rainier.:
@"as they passed the snow covered ridges as well as Mt. Rainier."

The "black line" might be more indicative of what the objects
were. So would the angle of the reflection needed to produce
halation, relative to the flight path of the objects.

all
but an optical impossibility, to "plainly" see WHITE FLASHES against BRIGHT

WHITE SNOW, that he must have seen the flashes against the dark blue SKY.
<

I don't buy that. To be invisible against the snow the flashes would
have to
match the snow reflection in intensity and also in color. The sun itself
tends
to be tinted toward yellow, whereas snow does tend to be white or sometimes
bluish white. We are talking spectral comparisons, here. The reflection
from
the snow does modify the spectrum. Spectral modification is most
noticeable
in the clear blue sky.... where reflection of light is better for short
wavelengths
than for longer wavelengths (for molecular density fluctuations within
dimensions
much smaller than the wavelengths of visible light, the reflection is
proportional
to the fourth power of the frequency so, for example, blue photons would be
scattered or reflected roughly 16 times better than red photons). The
spectral modification for snow is not as great as for clear air, but it
doesn't take
much blue "bias" in the spectrum to shift from a yellow tint to "pure"
white.
(Consider that "bluing" is used to restore "whiteness" to turn "yellowed"
clothing.)

Aside from the lack of spectral match between a metallic reflection of the
sun
from a neutral mirror, we don't know whether the mirror surfaces might,
themselves,
have shifted the color slightly (by not reflecting equally at all
wavelengths;

compare reflection from a copper mirror with reflection from an aluminized mirror, for example).

Hence from spectral considerations alone we cannot say that it was an "optical impossibility" for Arnold to see flashes of sunlight against the snow.

Then there is the intensity factor. Whatever size the object was, IF SEEN AGAINST THE SNOW AS ARNOLD REPORTED which would only have happened if they were seen against Mt. Rainier if the objects were at 10,000 ft high (too high to be seen against the snow of the surrounding peaks).... then it momentarily BLOCKED the view of the snow over an angular area equal to that of the object. Would Arnold notice the difference between having the snow unblocked and having it blocked by a flashing "object?"

I have already pointed out that, since the object angular size was less than that of the sun (less than 1/2 degree) the amount of light reflected (assuming a flat surface..... if the surface wasn't flat the calculation overestimates the amount) is basically the "fraction of the sun" that is seen (like looking at the sun through a small hole that is smaller than the angular size of the sun.)

I previously presented calculations based on this to demonstrate that Arnold could have seen flashes over long distances (much farther than he could see a Pelican,..... for example!). In this particular case we "only" have to compare the effective reflectivity of the mirror surface with that of the snow. Snow is not a specular reflector. For a specular reflector light is merely changed in direction. A "beam" of light that hits a mirror

has its direction changed, but it stays "in a beam" (the light does not diverge any faster after hitting a FLAT mirror than it did before hitting the mirror; in the case of sunlight there is essentially no divergence).

For snow, white paper, paint, etc. and diffuse reflectors the light is "bounced" into a hemisphere of directions. This increases the divergence tremendously.

The solar illumination at the earth's surface is about 10^5 lumens/square meter (10^5 lm/m^2).

Subject: Re: Arnold and other sundry items.Status: O

Bruce,

I appreciate the great calculations but you answered the wrong question: I didn't say Arnold could not see FLASHES against the snow. I said Arnold could not see the "OBJECTS 'PLAINLY' " against the SNOW when FLASHING as they tipped/dipped/flipped. Of course he could see flashes of bright light against less bright snow but he could not possibly have made out any real "OUTLINE" or "SHAPE" or silhouette, due to halation (he might have mistakenly THOUGHT he had, not realizing halation was at work obliterating any real shape). And, of course, sunlight reflecting off mirror-like GLACIER FACES on Mt. Rainier could have made Arnold think they were flashes from the objects when in fact the objects were behind the mountain.

As for color, Arnold described the flashes as "very bright BLUE-WHITE" (COTS 1952) -- just like the color of BLUE-WHITE SNOW, as I've pointed out before (in my Point 11: NO SNOW INVISIBILITY). Arnold also described the objects in his earlier 1947 news interviews as "nickel-plated" or "silvery" indicating again a BLUE-METALLIC TINGE.

My point is that Arnold was claiming these FLASHES as the moments of his BEST OBSERVATION of SHAPES and I'm saying the laws of optics and physics say he was MISTAKEN due to the optical phenomenon of HALATION -- that these had to be the times of the WORST OBSERVATION of any sort of details. In my previously posted Point 11, I argued that Arnold should have reported DIFFICULTY seeing snow-white-like flashing objects in front of snow, but didn't, suggesting he never actually saw such objects travel in front of snow-covered mountains.

Bruce, if you or I had seen a BLUE-WHITE FLASH against BLUE-WHITE SNOW don't you think we would have said something like, "When they flashed bright blue-white it BLINDED ME so I couldn't see them at all against the blue-white snow and could barely even see where the flash came from as it was so BLINDING and fast." ??? ARNOLD INSTEAD SAID THE OPPOSITE -- that he could "only" see the objects "plainly" when they "flipped" and "flashed" and that was when he could determine their shapes against the snow.

IF nine shiny mirror-like metallic spacecraft or aircraft had actually been seen by Arnold flying in FRONT of a snow-capped mountain like Rainier I would have expected him to say something like: "I saw them fly in front of Mt. Rainier crossing from the north edge. But I had great DIFFICULTY seeing the objects against the snow. When their mirror-like surfaces were on-edge they actually DISAPPEARED because they looked just like the snow they were reflecting. When they tipped over and flashed bright blue-white light I was BLINDED and lost them too. ONLY when for a FRACTION OF A SECOND IN BETWEEN on-edge and when they tipped over for the FLASH could I get any look at all at their SHAPE but it was instantly drowned out by the flash." Of course, Arnold never said any such thing, it would have been admitting too much weakness in his story -- even though physics demands it.

And I think the reason Arnold never provided such a realistic account of difficulties in seeing mirror-like objects in front of Rainier is simple: Arnold never saw the objects fly in front of mountains, though he THOUGHT they did because some of their flashes of light, or "images" as he called it, were reflected off Rainier's glacier faces as the objects approached and departed the mountain (in fact one would have to say that because of the intensity of the light from the objects and the numerous angles of ice faces on Rainier's 68 glaciers that there MUST have been a reflection of the light off glacier ice from some or at least one of the 9 objects that flashed at SOME time, as well as confusingly similar direct sunlight reflections off the glaciers, too).

And I think that the one and only time Arnold ever thought he actually saw the shape of an object was when the odd-looking one pointed its tail at him as it passed south of Goat Ridge, projected against the sky, not snow. (See 1977 transcript.) I think Arnold mentally superimposed this "one good look" (my words) on ALL of the objects resulting in a strange confusion over whether his drawings of the shape related to the "odd" one or the other 8. Arnold was so defensive to the skeptical press, the public and the government about how he knew the shapes were unconventional that he smeared over this one momentary observation onto virtually his entire sighting, assuring "all and sundry" that he did get good looks at the shape. THAT is the real reason why, I think, that Arnold "forgot" to mention the "oddball" object to anyone for years after his sighting. Because it was the ONLY "shape" observation he ever succeeded in making and he didn't want to admit that weakness in his sto!

! ry under the harsh glare of publicity and hostile scrutiny of various experts talking about snow blindness, spots before his eyes, window reflections and hallucinations. So he let the truth slip out a little bit years later in his 1952 book.

I appreciate the great calculations but you answered the wrong question: I didn't say Arnold could not see FLASHES against the snow. I said Arnold could not see the "OBJECTS 'PLAINLY' " against the SNOW when FLASHING as they tipped/dipped/flipped. Of course he could see flashes of bright light against less bright snow but he could not possibly have made out any real "OUTLINE" or "SHAPE" or silhouette, due to halation (he might have mistakenly THOUGHT he had, not realizing halation was at work obliterating any real shape). And, of course, sunlight reflecting off mirror-like GLACIER FACES on Mt. Rainier could have made Arnold think they were flashes from the objects when in fact the objects were behind the mountain.

<

We are, of course, making both explicit and tacit assumptions about the reflective nature of these objects.

However, if they were reflective and had to tilt to align with the sun, I presume that any flat parts that would have reflected the sun brightly had to be tilted at about 60 degrees relative to their "normal" horizontal (thin line orientation). (This extreme tilt is consistent with the claim of FRED JOHNSON that last saw them, "standing on edge banking into a cloud")

Unless the rotation from horizontal to 60 degrees was instantaneous, which I doubt,

Arnold could have gotten a view of them before the flash and again after the flash.

During the flash there would have been halation. After the flash there would be no halation but perhaps an afterimage of the halation. Hence I would guess that he could see what they looked like as they tilted toward him. Unfortunately we don't know how rapidly this tilt took place, so we don't know how much time he would have had.

You argue that he couldn't have seen the objects against the white snow background AS THEY

TILTTED. My response is... if they were DARKER than the white snow, their outlines could have been seen against the snow. Why would they appear darker than the snow?

Their upper surfaces could have reflected light from the sky above, which is bluer than the light reflected from the snow which appears white (uniform spectral distribution). The quantity of light integrated over the visible spectrum that was reflected by the tops of the objects could well have been lower than that of the same area (or angular area) of the white snow. A way of testing this is to place a mirror tilted up toward the sky in front of a snow bank and viewing the mirror from such a great distance that it is barely resolved. It will appear darker than the snowbank unless the mirror happens to be reflecting a bright white cloud.

You have argued that the objects would have reflected the light from the snow on the mountain. This might be true when the objects were horizontal or nearly horizontal. But after they had tilted some degrees (actual angle depends upon their altitude and distance from the mountain and the height of snow on the mountain) they would have no longer reflected light from the snow. One can get a "grip" on how many degrees by assuming that the objects were west of the mountain by, say, 1 mile, and that the snow on the mountain went up 4000 ft higher than they were.

Subject: Re: Arnold and other sundry items.Status: O

Hi Bruce,

Of course what you say is POSSIBLE but unfortunately, Arnold NEVER TELLS US this. It's possible that Arnold saw the objects for a split second between horizontal mode -- where they would have been reflecting white snow and thus have been invisible against the white snow background -- and the 60-degree tilt mode reflecting the bright sun, but NOT AFTERWARD when the BLINDING light would have saturated his retinas. He was not about to admit that he only got a look at the objects' shapes at the exact split second before they blinded his eyes.

I wrote out a reasonable sample narrative as an example of how he could easily have said it. Instead, Arnold tells us he saw the objects' shapes or outlines or "images" against the snow -- BUT NEVER TELLS US AT THAT POINT IN HIS NARRATIVE WHAT "OUTLINE" OR "SHAPE" HE SAW (since he actually had a very poor view at this point) -- but he does tell about getting a look at the shape of the "odd-looking" (my words) object, 2nd from last of the 9, after it passed Goat Ridge. This is when he tries to make a comparison of differences in appearance between the objects. He says the odd object was "wraith-like" and the others were like "tadpoles" yet he admits "But I couldn't quite positively determine if they were all the same design as this one I particularly noticed." The odd object was slightly darker and wider, he said. I think that's where all of our illustration material comes from as well as the confusion -- from the point when the objects were already past Goat Ridge and on !
!

their way to Mt. Adams.

As for duration of the "flash" Arnold gives us a comparison or estimate in his 1977 Fate lecture when he says "less than 1/10th of a second."

We both calculated that Arnold's angular size measurement -- made DURING the sighting -- comes out to 2.6 arcminutes (less than 1/12th of a full moon). But when seen edge-on Arnold thought they were 20 times thinner (his drawing shows 11 times thinner) than this, or about 0.1 to 0.2 arcminute, and that is below human visual resolution acuity of about 0.5 arcminute WHICH ASSUMES GOOD CONTRAST AND NON-MOVING OBJECTS which doesn't apply here with the POOR CONTRAST of a mirror-like object seen against snow MOVING at a rapid 2 degs/sec angular rate. Just barely resolving something isn't enough to resolve a SHAPE in any event. Recognition Acuity to recognize a SHAPE requires at least 5 arcminutes. Even if Arnold saw the objects full-on for a fraction of a second he would only have had a picture of about 5 x 5 pixels in dimensions with a poor contrast background and objects moving at high speed, thus not enough to resolve any details.

In short, my conclusion is that Arnold never saw the objects in front of the mountains, that the objects' tiny images were so small and of such poor contrast that they would have been all but invisible had they been in front, and that his "shapes observation" actually comes from a brief observation of the objects when they had traveled past

Goat Ridge and were seen against a sky background and with much less lateral motion (because of looking almost down their flight path).

Of course, Arnold never said any such thing, it would have been admitting too much weakness in his story -- even though physics demands it.

The physics does not demand it. As I pointed out in my previous message, unless the tilt of the object was very fast, Arnold could have gotten a look at a silhouetted of the object against the side of the mountain before the flash. Also, there might not have been a flash every time an object tilted because it might not have been properly aligned in pitch, yaw and rotation to reflect the sun toward Arnold. Also, during a substantial portion of the tilt the top of each object would have been reflecting the blue sky above, which is not as bright as the white snow (and which has a color shift relative to white snow). Hence the objects could have appeared DARK RELATIVE to the snow background.

.....

BRAD WROTE:

>And I think the reason Arnold never provided such a realistic account of difficulties i seeing mirror-like objects in front of Rainier is simple: Arnold never saw the objects fly in front of mountains, though he THOUGHT they did because some of their flashes of light, or "images" as he called it, were reflected off Rainier's glacier faces as the objects approached and departed the mountain (in fact one would have to say that because of the intensity of the light from the objects and the numerous angles of ice faces on Rainier's 68 glaciers that there MUST have been a reflection of the light off glacier ice from some or at least one of the 9 objects that flashed at SOME time, as well as confusingly similar direct sunlight reflections off the glaciers, too).

<

I would be surprised if there were a specular reflector on the mountain,

i.e., a flat ice surface properly aligned, but even if there were, such a surface reflecting light along a Very, VERY SLOWLY moving "beam" path (moving with the solar motion) and if ARNOLD FLEW INTO IT (the only way he could get into the beam in a short time, it would be a moderately rapid increase and decrease in brightness and its source would be fixed to one point on the mountain. I have been in airplanes and seen bright sun reflections from windows, shiny rooftops, etc. The "flash" builds up and then decreases quickly but not very quickly.

I could imagine a brief flash from a particular point on the mountain if there were a mirror-like ice surface and if Arnold flew through the "beam" of light created by the mirror. However, the reflection from ice, like the reflection from glass, would be less bright than from metal. (Most of the light is transmitted through the surface of the ice into the ice where it is subsequently scattered randomly in all directions.) About 90 % is reflected from metal but only about 3% from ice (or water or glass). That is, the specular component of the reflection from the ice would be only about 1/30 of that from metal.

Although I could imagine the possibility of a weak specular reflection from some ice surface, I would have a difficult time believing that there would be so many such surfaces that he would think nine flashing objects were passing in front of the mountain at the time nine objects were going behind the mountain, and yet, have the flashes from the mountain (a) not be occurring BEFORE the nine objects reached the mountain and (b) stop occurring immediately after the last object left the vicinity of the mountain and (c) create an apparent progression across the face of the mountain such that it would APPEAR that nine objects (repeatedly flashing) had crossed the face of the mountain.

In other words, if there were flat reflective ice surfaces causing "flashes" in Arnold's direction (actually he would be passing through the numerous beams of sunlight projected outward from the mountain) I would expect such flashes to have occurred ON THE SURFACE OF THE MOUNTAIN BEFORE

Arnold saw objects and also AFTER the objects departed the mountain and even after the objects were long gone. IN fact, such flashes from the mountain alone should have been rather common occurrences, unless we want to assume that only in the presence of UFOs are there flat surfaces of the glacier which can create bright sunlight reflections. IN this case I suspect he would recognize the "mountain flashes" for what they were and pay no attention.

As for light reflecting from the objects onto the glacier and causing brightenings of small areas of the glacier (not exactly "flashes" of light), I suppose that would be possible, but Arnold would not have seen such brightenings unless the objects were on the west side of the mountain.

And these brightenings would be no where near as bright as the flashes from the objects/.

Rainier may have 68 glaciers, but only the ones visible to Arnold could have played any role in this.

Split second..... unfortunately we don't know if this rotation was "instantaneous" or slower. Since he did include a drawing for the Air Force I assume he was providing his best estimate of the shape based on having seen 9 of them present their shapes to him several times each. And we don't know that there was a flash EACH time one of them tilted. Again, to get a solar reflection to hit Arnold's plane requires more than just a 60 degree tilt.

Brad wrote

>As for duration of the "flash" Arnold gives us a comparison or estimate in his 1977 Fate lecture when >he says "less than 1/10th of a second."

This would mean that the exact alignment was very brief. Does not mean that there was only 1/10 sec between flashes or that it took only 1/10 sec for the object to rotate by 60 degrees. If it took 1 second to tilt then he got about a second to watch the shape change for each one each time it tilted and he could have "built up" a model of what it looked like after seeing this shape several times/
Of course if it took, say 5, seconds to reach maximum tilt he wouldn't have had plenty of time.
Unfortunately we don't know. Since he doesn't really say much about the tilting I deduce that it was "lazy tilting back and forth", not perfectly periodic and not fast.

I agree that he couldn't have resolved any details and would have gotten only a basic idea of the outline. But that's all he drew, the basic shape.

Subject: Re: Arnold and other sundry items.Status: O

Hi Bruce,

The objects were also FAST MOVING, at 2 degs/sec angular velocity, thus BLURRING their images. Add to that the alleged FLIPPING MOTION, providing even less solid contrast to get a good look at the shapes. And finally, at 2.6 arcminutes horizontal length (or much much less when averaged in with the vertical width supposedly varying from about 0.1 to 2 arcmins) they were well below the Recognition Acuity limit of 5 arcminutes and thus TOO SMALL to easily RECOGNIZE SHAPES.

Arnold did not see ALL 9 objects flashing at the same time in synch. He said he saw random selections flashing at random intervals scattered across their line formation. Since there was no orderly progression of flashes of 9 objects in the first place there was none to miss by going behind the mountain. And a random erratic set of flashes could have easily blended in with east and west side glacier reflections of the objects' flashes and with sunlight flashes off the front faces of Rainier's glaciers (let's say about half of the 68 glaciers or about 34 since we don't know the exact distribution). Yes ice is less reflective than metal (assuming the objects were metal) but there is MORE OF IT, in fact entire mountain glacier blocks of it. The C-46 Arnold was looking for had crashed into a 1,000-foot ice cliff face of the Tahoma Glacier on the SW slope of Rainier.

Subject: Re: Arnold and other sundry items.Status: O

Bruce,

Wow, we're starting to converge a little bit as we analyze this in depth. (My posting seems to have gotten out before I was done, so if you see a later duplicate it's probably not actually identical but slightly revised.)

Unfortunately, we're having to make for the failure to do a "reenactment of the crime" -- a reconstruction and a competent investigation on-site back in 1947 -- which Hynek advocated for the Rhodes case in early 1949 (but didn't advocate for Arnold, in either case it wasn't done anyway).

Brad

@Subject: Re: Arnold and other sundry items.
@
@
@Then there is the intensity factor. Whatever size the object
@was, IF SEEN AGAINST THE SNOW AS ARNOLD REPORTED which
@would only have happened if they were seen against Mt. Rainier
@if the objects were at 10,000 ft high (too high to be seen
@against the snow of the surrounding peaks).... then it
@momentarily BLOCKED the view of the snow over an angular area
@equal to that of the object. Would Arnold notice the difference
@between having the snow unblocked and having it blocked by a
@flashing "object?"

@I have already pointed out that, since the object angular size
@was less than that of the sun (less than 1/2 degree) the amount
@of light reflected (assuming a flat surface..... if the surface
@wasn't flat the calculation overestimates the amount) is
@basically the "fraction of th sun" that is seen (like looking at
@the sun through a small hole that is smaller than te angular
@size of the sun.)

@I previously presented calculations based on this to demonstrate
@that Arnold could have seen flashes over long distances (much
@farther than he could see a Pelican,..... for example!). In
@this particular case we "only" have to compare the effective
@reflectivity of the mirror surface with that of the snow. Snow
@is not a specular reflector. For a specular reflector light is
@merely changed in direction. A "beam" of light that hits a
@mirror has its direction changed, but it stays "in a beam" (the
@light does not diverge any faster after hitting a FLAT mirror
@than it did before hitting the mirror; in the case of sunlight
@there is essentially no divergence). For snow, white paper,
@paint, etc. and diffuse reflectors the light is "bounced" into a
@hemisphere of directions. This increases the divergence
@tremendously.

@The solar illumination be at the earth's surface is about
@ 10^5 lumens/square meter ($1E5 \text{ lm/m}^2$).

@Subject: Re: Arnold and other sundry items.

@
@Bruce,

@I appreciate the great calculations but you answered the wrong
@question: I didn't say Arnold could not see FLASHES against the
@snow. I said Arnold could not see the "OBJECTS 'PLAINLY' "
@against the SNOW when FLASHING as they tipped/dipped/flipped.
@Of course he could see flashes of bright light against less
@bright snow but he could not possibly have made out any real
@"OUTLINE" or "SHAPE" or silhouette, due to halation (he might
@have mistakenly THOUGHT he had, not realizing halation was at
@work obliterating any real shape). And, of course, sunlight
@reflecting off mirror-like GLACIER FACES on Mt. Rainier could
@have made Arnold think they were flashes from the objects when
@in fact the objects were behind the mountain.

The spots of light reflected from fixed sheets of ice would not
give sudden flashes, but extended bright times, because the
reflection from a specular planar surface would be expanded to
1/6 mile circles by the time they got to Arnold, because of the
angular size of the sun itself. He would see a flash only if he
grazed the very edge of the cone of light, or if the reflector
was moving to bring the plane into and out of the cone of light.
Otherwise, we would have to temporarily shrink the sun to make
this work.

@As for color, Arnold described the flashes as "very bright
@BLUE-WHITE" (COTS 1952) -- just like the color of BLUE-WHITE
@SNOW, as I've pointed out before (in my Point 11: NO SNOW
@INVISIBILITY). Arnold also described the objects in his earlier
@1947 news interviews as "nickel-plated" or "silvery" indicating
@again a BLUE-METALLIC TINGE.

@My point is that Arnold was claiming these FLASHES as the

@moments of his BEST OBSERVATION of SHAPES and I'm saying the
@laws of optics and physics say he was MISTAKEN due to the
@optical phenomenon of HALATION -- that these had to be the times
@of the WORST OBSERVATION of any sort of details.

RIGHT! And afterimages of the flashes enter into the mess too.

@In my previously posted Point 11, I argued that Arnold should
@have reported DIFFICULTY seeing snow-white-like flashing objects
@in front of snow, but didn't, suggesting he never actually saw
@such objects travel in front of snow-covered mountains.

@Bruce, if you or I had seen a BLUE-WHITE FLASH against
@BLUE-WHITE SNOW don't you think we would have said something
@like, "When they flashed bright blue-white it BLINDED ME so I
@couldn't see them at all against the blue-white snow and could
@barely even see where the flash came from as it was so BLINDING
@and fast." ??? ARNOLD INSTEAD SAID THE OPPOSITE -- that he
@could "only" see the objects "plainly" when they "flipped" and
@"flashed" and that was when he could determine their shapes
@against the snow.

@IF nine shiny mirror-like metallic spacecraft or aircraft had
@actually been seen by Arnold flying in FRONT of a snow-capped
@mountain like Rainier I would have expected him to say something
@like: "I saw them fly in front of Mt. Rainier crossing from the
@north edge. But I had great DIFFICULTY seeing the objects
@against the snow. When their mirror-like surfaces were on-edge
@they actually DISAPPEARED because they looked just like the snow
@they were reflecting. When they tipped over and flashed bright
@blue-white light I was BLINDED and lost them too. ONLY when for
@a FRACTION OF A SECOND IN BETWEEN on-edge and when they tipped
@over for the FLASH could I get any look at all at their SHAPE
@but it was instantly drowned out by the flash." Of course,
@Arnold never said any such thing, it would have been admitting
@too much weakness in his story -- even though physics demands
@it.

The fun part is the direction they would have had to tip to
reflect the sun into Arnold's eyes. Assuming that the upper flat
surface of a disk was the specular one, the object would have had
to be oscillating like a coin on a table, or banking to the right
and simultaneously diving. A more likely reflector is a flat
panel of glass on a windscreen, set at an angle to both the top
surface and the direction of flight. The panels on the P-40 and
B-17 are examples.

@And I think the reason Arnold never provided such a realistic
@account of difficulties i seeing mirror-like objects in front of
@Rainier is simple: Arnold never saw the objects fly in front of

@mountains, though he THOUGHT they did because some of their
@flashes of light, or "images" as he called it, were reflected
@off Rainier's glacier faces as the objects approached and
@departed the mountain (in fact one would have to say that
@because of the intensity of the light from the objects and the
@numerous angles of ice faces on Rainier's 68 glaciers that there
@MUST have been a reflection of the light off glacier ice from
@some or at least one of the 9 objects that flashed at SOME time,
@as well as confusingly similar direct sunlight reflections off
@the glaciers, too).

@And I think that the one and only time Arnold ever thought he
@actually saw the shape of an object was when the odd-looking one
@pointed its tail at him as it passed south of Goat Ridge,
@projected against the sky, not snow. (See 1977 transcript.) I
@think Arnold mentally superimposed this "one good look" (my
@words) on ALL of the objects resulting in a strange confusion
@over whether his drawings of the shape related to the "odd" one
@or the other 8. Arnold was so defensive to the skeptical press,
@the public and the government about how he knew the shapes were
@unconventional that he smeared over this one momentary
@observation onto virtually his entire sighting, assuring "all
@and sundry" that he did get good looks at the shape. THAT is
@the real reason why, I think, that Arnold "forgot" to mention
@the "oddball" object to anyone for years after his sighting.
@Because it was the ONLY "shape" observation he ever succeeded in
@making and he didn't want to admit that weakness in his story
@under the harsh glare of publicity and hostile scrutiny of
@various experts talking about snow blindness, spots before his
@eyes, window reflections and hallucinations. So he let the
@truth slip out a little bit years later in his 1952 book.

@Brad

@Subject: Re: Arnold and other sundry items.

@
@We are, of course, making both explicit and tacit assumptions
@about the reflective nature of these objects. However, if they
@were reflective and had to tilt to align with the sun, I presume
@that any flat parts that would have reflected the sun brightly
@had to be tilted at about 60 degrees relative to their "normal"
@horizontal (thin line orientation). (This extreme tilt is
@consistent with the claim of FRED JOHNSON that last saw them,
@"standing on edge banking into a cloud")

@Unless the rotation from horizontal to 60 degrees was
@instantaneous, which I doubt,. Arnold could have gotten a view
@of them before the flash and again after the flash. During the
@flash there would have been halation. After the flash there
@would be no halation but perhaps an afterimage of the halation.
@Hence I would guess that he could see what they looked like as
@they tilted toward him. Unfortunately we don't know how rapidly
@this tilt took place, so we don't know how much time he wuld
@have had.

@You argue that he couldn't have seen the objects against the
@white snow background AS THEY TILTTED. My response is... if
@they were DARKER than the white snow, their outlines could have
@been seen against th snow. Why would they appear darker than
@the snow? Their upper surfaces could have reflected light from
@the sky above, which is bluer than the light reflected from the
@snow which appears white (uniform spectral distribution). The
@quantity of light integrated over the visible spectrum that was
@reflected by the tops of the objects could well have been lower
@than that of the same area (or angular area) of the white snow.
@A way of testing this is to place a mirror tilted up toward the
@sky in front of a snow bank and viewing the mirror from such a
@great distance that it is barely resolved. It will appear
@darker than the snowbank unless the mirror happens to be

@reflecting a bright white cloud.

Another possibility is that the mirror did not cover the entire surface of the object, but only a portion. If the top flat surface of the object was the specular surface, the object would have had to tilt at an oblique angle to its flight path, like a coin spun on a table, or bank and dive at the same time. Alternately, the specular surface might have been at an angle to the flat top plane of the object. A windscreen panel fills this bill nicely. See pictures of the B-17 and P-40 to see such panels.

@You have argued that the objects would have reflected the light @from the snow on the mountain. This might be true when the @objects were horizontal or nearly horizontal. But after they had @tilted some degrees (actual angle depends upon their altitude @and distance from the mountain and the height of snow on the @mountain) they would have no longer reflected light from the @snow. One can get a "grip" on how many degrees by assuming that @the objects were west of the mountain by, say, 1 mile, and that @the snow on teh mountain went up 4000 ft higher than they were.

Larry,

According to Arnold, he saw random flashes throughout the sighting. Flashes caught his attention and flashes were all he could see as the objects disappeared south of Mt. Adams.

MEA CULPA.

PELICAN EGG ON MY FACE.

I forgot to take into account the "pinhole camera" effect brought into this discussion by Larry Robinson who pointed out that the angular size of the sun introduces a divergence even though from any point on the sun the "waves are plane." When sunlight passes through a hole/aperture and reaches a screen there is an image of the sun on the screen and the size of the image is equal to the angular size of the sun times the distance to the screen as long as the pinhole is many times larger than a wavelength of the light being imaged but much much smaller than the distance to the screen. Increasing the size of the pinhole is similar to putting many pinholes side by side. Their images overlap, thus blurring the image and increasing its overall size, but the brightness is increased. Because the images overlap, at any particular point you get the summation of shifted images. Imagine two pinholes side by side. If they are far enough apart the images from the pinholes will not overlap. This requires a spacing greater than $0.009D$, where 0.009 radians is the angular diameter of the sun. For smaller spacings the images overlap and the intensities simply add (incoherent addition).

A small flat reflector (small compared the distance to the screen) acts like a pinhole of some size. Hence the size of the beam of reflected light grows with distance from the mirror, as Larry pointed out. The intensity is not uniform over the projected beam, but for simplicity in calculation one can assume that the total number of lumens captured by the mirror (or passing through the pinhole) is spread over the projected image (beam) solid angle in steradians. If you know the angle of width of a cone then the solid angle is $2\pi(1-\cos[\text{angle}/2])$. In this case $[\text{angle}] = 0.52$ deg, so $SA = \text{solid angle} = 6.46E-5$ steradians (sr) which is approximately the beam angular diameter in radians squared times $\pi/4$: $0.009^2(\pi/4) = 6.36E-5$ sr. The luminous intensity from the mirror is therefore approximately $I = EA/6.4E-5$ in lum/sr where $E = 1E5$ lm/m² and A is the assumed area of the reflector as projected onto the line of sight from the reflector to the sun. Previously I had used 520 m² (30 m by 20 m, with the 20 m size foreshortened by the 30 degree tilt) which now means the luminous intensity would be , using 0.9 as the reflectivity of the metal,

FOR FLAT METAL REFLECTOR OF AREA 520 m²:

At 20 miles the size of the image of the sun is 20×0.009 rad $\times 20 \times 1609$ = 20×289.6 m or about 310 m (Brad got 316). The area of the image is about 75476 m² and the solid angle is about $75476/(20 \times 1609)^2 = 7.6E-5$ sr, which is a little larger than calculated

just from the divergence of the sun by itself, $6.4\text{E-}5$ sr, because of the assumed size of the reflector that increases the beam size.
Hence the effective illuminous intensity is

$$I_m = 0.9 \times 1\text{E}5 \times 520 / 7.6\text{E-}5 \text{ sr} = 6.2\text{E}11 \text{ lm/sr}$$

Assuming uniform distribution of lumens over the image of the sun we get $0.9 \times 520 \times 1\text{E}9 / 75476 = 620 \text{ lm/m}^2$.

The area of Arnold's eyeball is approximately $\pi (0.002\text{m})^2 / 4 = 3.14\text{E-}6 \text{ m}^2$, so the power collected by his eyeball is estimated at $3.14\text{E-}6 \times 620 = 0.00195$ or 0.002 lm .

(WHICH IS THE ANSWER BRAD GOT)

The alternative way is to calculate the solid angle of his pupil and this is where I (shudder shudder) SCREWED UP BEFORE: I forgot to square the distance. At 20 miles = 32,000 m, the solid angle is $3.14\text{E-}6 \text{ m}^2 / (3.2\text{E}4)^2 = 3.1\text{E-}15 \text{ sr}$ (I had $9\text{E-}11$ before!!!! SHAME ON ME!) This DOES make a difference, as you will see below!

Multiplying the luminous intensity by the solid angle size of the pupil we get

$$\text{lumens into eyeball} = 6.2\text{E}11 \times 3.1\text{E-}15 = 1.9\text{E-}3 = 0.002 \text{ lm as above.}$$

NOW LETS REDO THE DIFFUSE CALCULATION:

By way of comparison, the luminous intensity of a similar area of diffuse reflector that reflects 90% of the light into 4π steradians is

FOR DIFFUSE REFLECTOR OF AREA 520 m^2

$$I_d = 0.9 \times 1\text{E}5 \times 520 / 4\pi = 3.7\text{E}6 \text{ lm/sr.}$$

If you compare this luminous intensity with the previous you will see that the "handwriting is on the wall".... as I said before, the diffuse "flash" cannot compare with the specular "flash:"

$$\text{Multiply by the solid angle of Arnold's eyeball and get} \\ 3.7\text{E}6 \text{ lm/sr} \times 3.1\text{E-}15 \text{ sr} = 1.1\text{E-}8$$

So, you see, previously I made "compensating errors" that provided the correct QUALITATIVE answer that the diffuse reflection is less bright than the specular. Oddly enough, when the errors are corrected the ratio of specular to diffuse is even greater than before!

CONTINUING:

A flat ice mirror of the same size but specularly reflecting only about 3% of the light would have an intensity of

FOR FLAT ICE REFLECTOR OF AREA 520 m^2

$$I_i = 0.03 \times 1\text{E}5 \times 520 / 7.6\text{E-}5 \text{ in lm/sr} = 2.1\text{E}10 \text{ lm/sr.}$$

Compare this with Im above. the "ice flash" would be of lower intensity than the "metal flash" (about 1/30th of the metal flash)

.....
Brad wrote:

>The objects were also FAST MOVING, at 2 degs/sec angular velocity, thus BLURRING their images. Add to that the alleged FLIPPING MOTION, providing even less solid contrast to get a good look at the shapes. And finally, at 2.6 arcminutes horizontal length (or much much less when averaged in with the vertical width supposedly varying from about 0.1 to 2 arcmins) they were well below the Recognition >Acuity limit of 5 arcminutes and thus TOO SMALL to easily RECOGNIZE SHAPES. <

Assume the objects were moving steadily at 1700 mph.
During the sighting Arnold was about 20 miles west and 10 miles south of Rainier (close to Mineral, Washington)
Hence the southward track of the objects (160-170 azimuth) was perpendicular to Arnolds sighting line when they were about 10 - 20 tan (10) = 6.5 miles south of Rainier. At this time the angular velocity was $(1700 \text{ mi/hr}) / (3600 \text{ sec/hr}) / 19 \text{ mi} = 0.025 \text{ rad/sec} = 1.4 \text{ deg/sec}$. (This assumes the objects were roughly 1 mile west of Rainier as they passed the "perpendicular sighting line" point which was about 6.5 milea south of Rainier and hence about 19 mi from Arnold.) If Arnold was a mile or so closer, then the angular rate was larger (e.g., at 15 miles, 1.8 deg/sec). The angular rate of speed from Arnold's perspective would be lower than this when the objects were north and south of the "perpendicular point" because the distance would be foreshortened by the perspective according to the cosine of the angle between the direction to the "perpendicular point" and the instantaneous direction to the objects. However, for locations closest to Arnold the angular rate variation would not be great enough to consider. (When passing Mt. Rainier the objects would have been about 16 degrees north of the "perpendicular point" and so the effective speed transverse to the line of sight would be 1700 mph cosine 16 which is about 4% less.)

Very crudely speaking the eye takes about 25 pictures per second The "twinkling of an eye" is the inverse of this, 0.04 sec (picture time). Hence only substantial motion during that time will cause irreducible blur (and even that isn't always true because the eye process various portions of the visual field at various times and hence it is possible to have occasion short periods when small portions of the visual field can see "faster" than 25 frames/ pictures per second). (See "ACCELERATION" at www.nidsci.org/articles/maccabee/acceleration.html for a deeper discussion of the eyeball reaction to rapid motion. THis is a paper presented at the MUFON Symp. in 1996)

Assume the resolution angle (resolution "element) of Arnold's eyeball was at least as small as 0.5 mr (milliradian) based on his claim to have been

able to see the spacing of engines on a plane about 15 miles away. (it might have been better than this). At $0.025 \text{ rad/sec} = 25 \text{ mr/sec}$ it would require $0.5 \text{ mr}/25 \text{ mr/sec} = 0.02 \text{ sec}$ for the objects to move 1 resolution element. During the "twinkling of his eye" (0.04 sec) the object would move $.04/0.02 = 2$ resolution elements. This would be the "edge smear" for an object larger than 2 resolution elements in size.

The above calculation gives an indication of the smear for focused images in a FIXED eyeball. However, the eye is not fixed. If a person is watching a moving object he tracks the object with a combination of eye and head motion. It is easy to turn the eye/head at several degrees per second. Hence one may imagine that Arnold could have tracked the objects and in this case cause the edge smear to be less than 2 resolution elements.

Thus I do not believe that the images of the objects were noticeably smeared by motion. Since he went to the trouble of describing the shape and making a drawing I would tend to accept his claim that he could see shape, as opposed to him saying "They were so small they were just dots." He did "admit" not being able to see a "shape" when the objects were edge-on. At that time they appeared as thin lines.

Brad wrote:

>Arnold did not see ALL 9 objects flashing at the same time in synch. He said he saw random selections flashing at random intervals scattered across their line formation. Since there was no orderly progression of flashes of 9 objects in the first place there was none to miss by going behind the mountain. And a random erratic set of flashes could have easily blended in with east and west side glacier reflections of the objects' flashes and with sunlight flashes off the front faces of Rainier's glaciers (let's say about half of the 68 glaciers or about 34 since we don't know the exact distribution). Yes ice is less reflective than metal (assuming the objects were metal) but there is MORE OF IT, in fact entire mountain glacier blocks of it. The C-46 Arnold was looking for had crashed into a 1,000-foot ice cliff face of the Tahoma Glacier on the SW slope of Rainier. <

<

You suggest that the presence of "glacier flashes" would "make up for" the lack of "object flashes" as the objects went behind the mountains and Arnold would confuse the "glacier flashes" with object flashes and thus be confused as to what really happened.

First of all, I doubt the existence of numerous glacier flashes. But even if they existed they should have been discernible from object flashes. You pointed out that glacier ice is less reflective than metal (roughly $1/30$ as reflective) but that there was "more of it." True, the brightness of the flash depends upon the area of the mirror, but I would be surprised to find, on a convoluted and weather beaten surface such as a glacier ANY

flat surface comparable in size to the 520 m^2 used here, or even 52 m^2 or even 5^2 that was flat. More likely it would be a curved surface and this would introduce further divergence in the reflected beam.

Let us now consider flash duration. Arnold said the flash was brief, like 0.1 sec. Of course, he couldn't time the flash. But let's consider how brief it would have been if Arnold flew through the "beam" from a stationary large flat reflector at Mt. Rainier. Arnold was traveling at about 120 mph (100 plus 20 wind, assuming that this actually was the wind speed eastward), which is $176 \text{ ft/sec} = 53 \text{ m/sec}$. (Note: this is relative to the ground. For pelicans one needs a differential speed which takes into account the fact that the pelicans were also blowing eastward at 20 mph.) As Larry has pointed out the beam width at 20 miles is much larger than the size of the reflector and is around 310 m as calculated above. Therefore to traverse IN A PERPENDICULAR DIRECTION the light beam width of 310 m would take about 6 seconds. Not exactly a rapid flash. If the beam were coming from the direction of Rainier, then the beam was heading west-southwestward toward Arnold and Arnold was flying nearly due eastward, so he did not cross the beam perpendicular to it, but rather at a slant angle to it. Hence he spent more time in the beam. (Note: the limit of this would be if he flew directly toward the reflector and stayed "in the beam" continually.) I use roughly 25 degrees as an estimate of the angle between Arnold's flight path and the direction of axis of the beam. Hence the distance traveled by Arnold while in the beam would have been more like $310/\sin 25 = 730 \text{ m}$. Had he been flying more directly toward the reflector, say at 20 degrees with respect to the beam, the distance would have been greater, say 906 m. Had Arnold been flying toward the mountain the distance within the beam could have been miles. The point is that, because of the size of the assumed beam and because Arnold was not flying perpendicular to the beam axis, the duration of the reflection could have been ten seconds or more. This is not a flash as brief as 0.1 second.

To assume flat reflectors on the mountain one essentially assumes there are many of them pointing in random directions such that Arnold could have flown through a group of the beams from these reflectors. They would, presumably, be located at random areas on the mountain side and surely would have been noticed before and after Arnold's sighting by Arnold and others, including investigators in later years.
I don't buy that.

COMMENTS: Hey Professor Bruce I was sleeping through your lecture. Did I miss anything important? :)

Seriously, I'm starting to get lost here. Let me try to restate this as simply as possible: We have an assumed a metallic UFO with an area of 520 sq.meters (for those of you out there on the List barely following this, that is the meaning of that awkward looking thingy "m²" which is m or meter to the 2nd power or meter squared, or "square meter" a unit of area; most E-mail can't show exponents or superscript letters so we use "hats" or ^ to indicate superscripts).

These 520 square meters collect 90,000 lumens of sunlight each, or per square meter (taking into account already a 90% reflectivity) for a total of about 46.8 million lumens. This light is projected out 20 miles to where Arnold is located and at his distance the light covers about 75,476 sq.meters (Bruce's figure) or 78,000 sq.meters (my figure) of area. So, using Bruce's figure, we have about 620 lumens per square meter at Arnold's distance. Arnold's pupils are not a square meter in size but a tiny fraction of that. They were probably light adapted to about 2 millimeters' diameter so the area covered is almost a million times less. So only about 0.002 lumen would have been received by Arnold's pupils, each (see below).

- > The area of Arnold's eyeball is approximately $\pi (0.002\text{m})^2 / 4 = 3.14E-6$
- > m², so the power collected by his eyeball is estimated at $3.14E-6 \times 620 =$
- > 0.00195 or 0.002 lm.

- >
- > If you compare this luminous intensity with the previous you will see that
- > the "handwriting is on the wall" as I said before, the diffuse "flash"
- > cannot compare with the specular "flash:"

COMMENTS: Wrong question again. We're talking about the contrast between SNOW BACKGROUND and the objects' FLASH, and NOT about any FLASH from a GLACIER.

The snow gets brightness contributions from the ENTIRE SNOW-CAPPED MOUNTAIN. Mt. Rainier's Lambertian diffuse contributions from snow would probably cover, at an order of magnitude estimate, about 5 miles' width times 10,000 feet height divided by 3 for area of a triangle, or VERY ROUGHLY 8 million sq.meters – NOT 520 sq.meters.

So we should probably bump up Bruce's diffuse reflector figure from 3.7E6 lumens/steradian to about 5.7E10 lm/sterad.

- > Multiply by the solid angle of Arnold's eyeball and get
- > $3.7\text{E}6 \text{ lm/sr} \times 3.1\text{E}-15 \text{ sr} = 1.1\text{E}-8$
- >

- > correct QUALITATIVE answer that the diffuse reflection is less bright than
- > the specular. Oddly enough, when the errors are corrected the ratio of
- > specular to diffuse is even greater than before!
- >

COMMENTS: We had to bump up Bruce's snow brightness figure to 5.7E10 lm/sterad so the correct figure here should be more than what's indicated here, perhaps roughly 2E-4 (1/5,000th) rather than 1.1E-8 (about 1/100 millionth).

- > CONTINUING:
- > A flat ice mirror of the same size but specularly reflecting only about 3%
- > of the light would have an intensity of

COMMENTS: I don't doubt that ice is less reflective than metal, except of course at grazing angles of incidence where almost every substance has nearly 100%

reflectance. But I wonder about 3%, it seems too low. That makes ice BLACKER than the blackest objects in the solar system (Phobos and Deimos which I think are about 6%) or carbonaceous chondrite meteorites. Isn't charcoal around 3% reflectance? Something doesn't seem right here.

> FOR FLAT ICE REFLECTOR OF AREA 520 m²

>

> $I_i = 0.03 \times 1E5 \times 520 / 7.6E-5$ in lm/sr = 2.1E10 lm/sr.

>

> Compare this with I_m above. the "ice flash" would be of lower intensity

> than the "metal flash" (about 1/30th of the metal flash)

COMMENTS: Basically this calculation amounts to nothing more than the claim that ice is 1/30th as reflective as metal and I've already suggested (above) that that would make ice almost as black as charcoal, so something doesn't seem right.

> "perpendicular sighting line" point which was about 6.5 milea south of
> Rainier and hence about 19 mi from Arnold.) If Arnold was a mile or so
> closer, then the angular rate was larger (e.g., at 15 miles, 1.8 deg/sec
>).

COMMENTS: I'm estimating Arnold's location based on his detailed statement to the AAF in July 1947 that he flew for 2-3 minutes east of Mineral, Wash., before

seeing his first “flash” then at least another 20-30 seconds before the objects reached Mt. Rainier, then several seconds to pass Rainier. Say 3 minutes or 6 miles east of Mineral at his ground speed of 2 miles per minute.

Since I’m trying to show the physical incongruity of the objects flying in FRONT of Mt. Rainier, the distance from Arnold to the only “peak” (actually virtually invisible and much too low in altitude), Pyramid Peak, in FRONT of the mountain is then only 13 miles away from Arnold at azimuth 59 degrees. Hence, the perpendicular angular velocity was about 2.2 degs/sec. With the objects traveling on an estimated heading of about 170 degrees according to Arnold’s numerous statements (after working it out on a map), a further cosine 21 degs factor applies in order to compensate for the objects’ flight path not being quite perpendicular to Arnold’s line of sight (21 degs off), but this is almost negligible and brings the angular velocity down to about 2.1 degs/sec or about 0.036 radian/sec or about 126 arcminutes/sec.

The angular rate of speed from Arnold's perspective would be lower

- > than this when the objects were north and south of the "perpendicular
- > point" because the distance would be foreshortened by the perspective
- > according to the cosine of the angle between the direction to the

- >
- > Very crudely speaking the eye takes about 25 pictures per second The
- > "twinkling of an eye" is the inverse of this, 0.04 sec (picture time).

COMMENTS: The “flicker rate” is more like 16 pictures per second or about 0.06 second flicker period. Slower than this and you start seeing flickering in a movie or video image sequence.

- > Hence only substantial motion during that time will cause irreducible blur
- > (and even that isn't always true because the eye process various portions

- > object would move $.04/0.02 = 2$ resolution elements. This would be the
- > "edge smear" for an object larger than 2 resolution elements in size.

COMMENTS: Using my figures (above) we have the Arnold objects moving about 8 arcminutes within one flicker interval of 0.06 second, whereas the OBJECTS THEMSELVES WERE ONLY ABOUT 2.6 arcminutes in length in the direction of motion. Hence, rather than some mere blur of an "edge" we are talking about the ENTIRE OBJECTS BEING BLURRED OUT over some 3 lengths of an object. Even if we use Bruce's figures for angular velocity and flicker rate, we still have 2.6 arcminute-long objects moving about 3.4 arcminutes within one flicker time. That is substantial blurring.

- > The above calculation gives an indication of the smear for focused images

- > head motion. It is easy to turn the eye/head at several degrees per
- > second. Hence one may imagine that Arnold could have tracked the objects
- > and in this case cause the edge smear to be less than 2 resolution
- > elements.

COMMENTS: But Arnold could not see or could only barely see the objects when on edge (see Bruce's remarks, below) so he did not have continuous tracking. Moreover, with 9 different objects to shift his focus from, it is highly unlikely that his eyes tracked on any one object – or another powerful reason he could not have been continuously tracking with his eyeballs.

- > the angle between Arnold's flight path and the direction of axis of the
- > beam. Hence the distance traveled by Arnold while in the beam would have
- > been more like $310/\sin 25 = 730$ m.

COMMENTS: I have programmed a computer spreadsheet and loaded it with coordinates for Arnold's location, various mountain spots and his Yakima Airport heading. It turns out that as I said above Pyramid Peak in FRONT of Mt. Rainier is at about 59 degs azimuth from Arnold's estimated location about 6 miles east of Mineral (per his AAF letter). And Yakima is at 97 degs azimuth (Bruce had calculated 96 degs somewhere, very close). The difference is 38 degs so $310 \text{ meters}/\sin 38 = 503$ meters.

Had he been flying more directly

- > To assume flat reflectors on the mountain one essentially assumes there
- > are many of them pointing in random directions such that Arnold could have
- > flown through a group of the beams from these reflectors. They would,
- > presumably, be located at random areas on the mountain side

COMMENTS: Given the random orientations it is highly unlikely Arnold would have flown right across the maximum diameter of such a glacier reflection of the sun. Far more likely that he BRIEFLY CLIPPED OFF chords across such reflected beams, with durations from a fraction of a second up to some seconds, and he would have MUCH MORE FREQUENTLY AND BRIEFLY CROSSED SUCH REFLECTIONS than he would have crossed a LONG-DURATION FULL BEAM.

and surely

- > would have been noticed before and after Arnold's sighting by Arnold and
- > others, including investigators in later years.
- > I don't buy that.
- >

COMMENTS: Well, the only people flying at Arnold's altitude around Mt. Rainier were the occasional searchers for the missing C-46. And when the plane was finally found on July 21, 1947, it was by a GROUND observer. It may very well be that ice reflections of the sun from Mt. Rainier are a well-known local phenomenon ignored by residents from their long familiarity but noticed by outsiders passing through –

such as Arnold who was a Boise, Idaho, resident passing through that fateful day in 1947.

Regarding the reflection from a flat metal surface vs the diffuse reflection from the snow I wrote:

>>

> If you compare this luminous intensity with the previous you will see that
> the "handwriting is on the wall".... as I said before, the diffuse "flash"
> cannot compare with the specular "flash:"

To which Brad replied:

>COMMENTS: Wrong question again. Were talking about the contrast between SNOW >BACKGROUND and the objects FLASH, and NOT about any FLASH from a GLACIER.

>The snow gets brightness contributions from the ENTIRE SNOW-CAPPED MOUNTAIN. Mt. Rainiers >Lambertian diffuse contributions from snow would probably cover, at an order of magnitude estimate, >about 5 miles width times 10,000 feet height divided by 3 for area of a triangle, or VERY ROUGHLY 8 >million sq.meters NOT 520 sq.meters.

>So we should probably bump up Bruces diffuse reflector figure from 3.7E6 lumens/steradian to about >5.7E10 lm/sterad.

As long as the objects are AT LEAST the size of one "resolution element" (And they were larger than this) then the proper comparison is between the light reflected by the object of some assumed size and the light reflected by a comparable area of the snow. This is because the areas of snow adjacent to the area "covered by" the object are "resolved" that is, in his eye the images of the mountain to the left, right, above, below, etc. are not overlapping or blurred into the image of the object. Hence one does not use the whole snowy area of the mountain for comparison because the flash from an object is a concentration of light from just a small fraction of the total area. Rather one compares the reflected light using comparable sized areas. Hence I stick by my original estimate except for one proviso: I can't unquantify the effect of veiling glare. The light from the nearby snowy areas and even from the whole mountain and surrounding sky contribute to veiling glare light, light scattered within his eyeball, that lies "on top of " the light from any

particular resolution area. This glare could make anything thing "difficult to see" by setting a lower bound to the amount of light hitting any part of the retina. However, Arnold reported that he did see flashes of light from the objects before and after they passed Rainier from what he wrote one can certainly infer that he saw flashes also as they passed the mountain. Therefore I deduce that the flashes were brighter than the snow and all surroundings. Of course, Arnold said this, when he compared them to looking at an arc. I know from experience (experiment) that looking at the sun reflected from aluminized mirror can be compared to "looking at an arc" although not as blue.

I wrote:

lm/sterad so the correct >figure here should be more than whats indicated
here, perhaps roughly 2E-4 (1/5,000th) rather than >1.1E-8 (about 1/100
millionth).
```

I would bump it back to where it was... with the proviso that veiling glare in his eyeball, which IS a result of summing all the brightness of the mountain, sky, etc. (but most importantly the snow near the objects) could decrease the visibility of the flashes. Unfortunately I don't know how to estimate glare in his eyeball/ (I did estimate and in fact measure glare and its effects in the Trent photos!)

Isnt charcoal around 3% >reflectance? Something doesnt seem right here. >
```

The low reflectivity of ice is a result of reflection from a DIELECTRIC material as opposed to a conductor. The transparent (to visible wavelnengths) dielectric allows light penetration through the surface and

therefore has appreciable transmission. The formula for normal (perpendicular) incidence is $R = \frac{(n-1)^2}{(n+1)^2}$ where n is the refractive index. Reflectivity changes with angles (and polarization), especially angles close to grazing incidence, but for the angles considered here this is a valid value for reflectivity.

For typical glass this is 1.55 ± 0.05 . R becomes 0.046. This is the reflectivity at each surface or boundary. For plate glass the total reflection back is 0.046 from the first surface plus $(0.0954 \text{ transmission through the surface} \times 0.046 \text{ reflection at the second surface} \times 0.0954 \text{ transmission of light backwards through the first surface}) = 0.088$. (Here I am ignoring the possibility of multiple-pass wave interference effects such as with a particular type of parallel plate interferometer.)

For water/ice the refractive index is about 1.33 which gives a reflectivity of 0.02, even lower than the 0.03 I mentioned before. Note that this is the specular reflectivity from a surface of ice. There could be further light bounced back by inclusions in the ice, but that would add a diffuse component. Black means an object doesn't reflect light back. A perfectly transparent medium would be "black" even though it wouldn't look black unless it were silhouetted against a black background. Black materials, however, absorb light. They are not transparent and they specularly reflect no more than would be expected from the discontinuity in refractive index (air vs the material) at the surface of material.

Consider black glass. It does reflect light (4% from the front surface), yet looks black. To reduce the reflection further one does not use a flat surface but rather a diffuse surface. Black velvet (which nevertheless as a "gloss" reflection at very flat angles) is of the blackest things. Ultimate black is a hole in a large box that has diffuse black material coating the inside. Like the roach motel, photos check in but they don't check out. BUT... if you put a clear glass window over the hole it is no longer perfectly black.

Anyway, we shouldn't be talking about blackness but rather reflectivity.

Moreover, with 9 different objects to >shift his focus from, it is highly unlikely that his eyes tracked on any one object or another powerful >reason he could not have been continuously tracking with his eyeballs.

He could see the whole group moving and I'm sure he was tracking the group. Not all were on edge at the same time, I presume, but even if they were he could have established a "tracking rate" by continual observation of motion of the group.

This ice is not like a perfect crystal. There are lots of dislocations from microscopic to macroscopic in size. The glacier ice is, after all, a series of layers of freezing or compressed snow. Any "face" of newly broken off ice will most likely be a jumble surfaces in various sizes directions and curvatures. And, snow fallen on the ice and melting from the sun and wind will also effect the surfaces.

I have done an experiment. I have measured the "light curve" of sunlight off a mirror.

As expected the light intensity increases gradually, first slowly, then rapidly then slowly again to reach the peak intensity at the center of the flash. The point is that a chord across a portion of the "beam" from a flat reflector (or a curved reflector) will pass through a much lower intensity than does a line through the center. Thus the brief flash obtained by going along a chord at some distance from the center of the beam is likely to be much dimmer than going through the center. The 1/30 used above (or 1/50 using the refractive index calculation) as the intensity of an ice reflection relative to the metal reflection of the same area reflector, pertains to the center of the beam. Comparing the center of the metal reflection beam with the edge of an ice reflection beam brings in a much smaller factor (1/1000, perhaps).

<

Arnold himself would have observed ice flashes while he was searching for the military transport. He also would have seen ice flashes before the objects reached the mountain and after they passed it, whether in front or behind. He would have seen ice flashes as he continued his trip toward Yakima. Therefore, even if he had never seen such flashes before, he

would have had plenty of time to develop for himself a recognition of "ice flash phenomenology" that he could therefore separate from "flying saucer flash phenomenology."

I still doubt the existence of a multiplicity of ice "beams" that could somehow be mistaken for flashes from some metal reflector and which would, as the plane flew along, occur in such an order as to make it appear that metallic reflectors creating brief very bright flashes north of the mountain continued their paths across the face of the mountain and then continued further south of the mountain.

Regarding the size and brightness of the "beam" of sunlight reflected from a flat mirror:

I have done a couple of experiments. The first was with an 11 inch diameter front silver mirror, a white card and the sun.

Bruce,

Appreciate and have noted with interest the recent discussions.

How you can 'reject' flashes from large, reflective birds as being a conceivable candidate? I have already provided testimony of how their mirror-like reflections fooled one eminent scientist and even cited a documented observation of how specifically an 'invisible' formation of American White Pelicans "flashed" their location.

As this was referenced over six months ago now and in view of current discussions about the topic, I will restate:

[Start]

Some new material has come to light which has a direct relevance on the Arnold case and the specularity of birds per se.

I quote:

"This was on the other side of the world - in Brisbane, state capital of Queensland. I was in an office overlooking the city (arguing, if I remember correctly, with a customs inspector about import licenses) and it was late in the afternoon. The sun was low on the horizon - and moving slowly above it from north to south was a line of brilliant silver disks.

They looked like metallic mirrors, and they were oscillating or flipflopping with a regular seesaw motion. Once again, I could not guess their size or distance.; they were so bright and tiny against the darkening sky that it was almost impossible to decide their shape, but they gave the impression of being

ellipses. I don't mind admitting that in the few minutes before they came closer I felt myself wondering if the Martian invasion had started; this was the only time I have ever seen a fleet of textbook flying saucers.

In this case, the explanation turned out to be something I already knew - and didn't believe. Many UFO sightings (including one that is the subject of a celebrated and authentic film) were due, I'd read, to birds reflecting sunlight under unusual conditions of illumination. This theory seemed so absurd that I dismissed it contemptuously; but it is perfectly correct.

The lights I saw flipping across Brisbane were nothing more than sea gulls, the undersurfaces of their wings acting as mirrors.

Though I have lived beside the sea for a quarter of my life and am doing so now, this is the only time I have ever witnessed this phenomenon, and I would never have credited it without the evidence of my own eyes.

The effect of oscillating metallic disks was absolutely realistic; it would have fooled anyone".

James,

Your examples of shiny reflective birds are from late afternoon sun (or early morning in another quote) when low grazing angle incidence creates mirror-like reflections from virtually any substance. But this does not apply to the Arnold case when the mid-afternoon sun was high (nearly 60 degs above horizon) and almost directly behind Arnold, to the southwest, reflecting almost straight backwards from the scene and any objects in his view to the northwest.

But I did notice your quote of ornithologist and amateur astronomer Michael Price from the Pacific Northwest about the brightness of reflected light from Mt. Rainier's glaciers: "Given the location, 25 mi off Mt Rainier's glacial sides, ice would be a great substitute reflector and would easily blast enough sunlight back up...."

Brad

So we have a situation in which birds at a distance large enough to be barely resolvable fly "over" the sun with only a small angle (degrees?) between the direction to the birds and the direction to the sun.

>They looked like metallic mirrors, and they were oscillating or
>flipflopping with a regular seesaw motion. Once again, I could
>not guess their size or distance.; they were so bright and tiny

NOT SURPRISING. Here we have the optimum reflection scenario: when the angle of reflection is "grazing". Even BLACK VELVET has a noticeable reflection at a flat angle. About the only thing that doesn't is rough carbon black particles. Anyway, the point is that the optical conditions described by this

ornithologist do not apply to the Arnold case as Brad has already pointed out

There is no way the sun could make a grazing angle reflection from birds that were east of Arnold while the sun was west of (and above) Arnold.

>The lights I saw flipping across Brisbane were nothing more than
>sea gulls, the undersurfaces of their wings acting as mirrors.

Again, this was a particular incidence of alignment with the sun. It does not apply to the Arnold case at all.

]

>Consider the reflective capabilities of a glossy, all white (bar
>the wingtips) bird with a ten foot wingspan. Under appropriate
>conditions, could this act like a large mirror?

>Yes,

if the birds are "close to " the sun, whether above or below the "NORMAL GLOSS" AKA "FORWARD GLOSS" effect which we have been discussing could make them appear very shiny. This would still NOT be as reflective as flat mirror surfaces seen under the same conditions.
But again, this is not the "optical setup" which pertains to the Arnold sighting.

This brings up the "alternate hypothesis"

>"So, on to Mr. Arnold's description that started this whole damn
>thing about UFO's (part of my misspent youth was spending a few
>thousand hours as an amateur astronomer and I never got to see
>even one UFO that really baffled me, he grumbled). Given the
>location, 25 mi off Mt Rainier's glacial sides, ice would be a
>great substitute reflector and would easily blast enough
>sunlight back up onto birds' underwings to make them reflect
>very brightly.

Since the birds had to be close to Arnold..within a couple of miles, they were far from Rainier. They were also about at Arnold's altitude and he was seeing them from the side. Hence their 10 ft wingspan (assuming all nine were the same full size) plays little role here... Arnold wouldn't have seen their wingspan unless they stretched out their wings and flew with a 90 degree roll (right or left).

Anyway, the light reflected from Rainier is NOT as bright as direct sunlight on a glossy surface.

Note, by the way, that the top of Rainier was several degrees above Arnold's horizon and therefore above the birds. If most of the Glacier ice

is above 9,000 ft then most of the light would have been glancing off the backs of the birds, not off their bellies.

IF the sighting had taken place in the early morning instead of late afternoon then one MIGHT have justification for saying he saw bright forward gloss reflections of the sun from bird feathers.

But the Rainier hypothesis as a source for the flashes just won't hack it.

First of all he saw them

flashing when they were far north and far south... in direction.... of Rainier. Assume they were birds. Then the birds were at first a few miles north of Arnold and at the end a few miles south. But he saw flashes in both cases. Whereas one might try to argue forward gloss of Rainier light when the birds were between Arnold and Rainier, one could not make that argument when the birds were left or right of the direction to Rainier.

>Just look at the excruciating whiteness of the underwings of an
>adult white-headed gull such as a Herring or Glaucous-winged
>flying over snow on a sunny winter day.

If you want to see "excruciatingly bright" look at the reflection of the sun off a mirror the same size as the bird.

>Of course Arnold's sighting wasn't as a ground observer and if
>birds were the source, any reflectivity wouldn't necessarily be
>confined to the underwings.

More likely the upper surface since the birds were at about Arnold's height and the glaciers were at an even greater altitude.

>I previously wrote:

>"I would only add a mention of the National Geographical

>of the [Salton] sea, observed a hundred white birds manoeuvring
>majestically in the sky. They played follow the leader.

>Then they soared into the blue until only the sun, glinting on
>white feathers, flashed their location'.

YES, the sun "glinting on their feathers." Sounds as if the writer was using a term that implies a greater than usual reflection because the birds were flying "close to the sun."

>As I've said, this is proof these birds were reflective from a
>considerable distance, even 'out of sight'."

Sure, why not? A glint is like a specular reflection from a dielectric material: impressive but still not as bright as from a metal surface of the same size.

FRom the Arnold paper I wrote:

>'It is important to notice how Arnold's attention was first
>drawn to the presence of strange flying objects because his
>initial observation rules out any explanation that is based on
t>hings in the sky which are not shiny (reflective, like a
>mirror) such as, for example, birds'."

James wrote in response:

>I trust it is now proven that birds can be reflective, like a
>mirror, and this equally applies when considering other 'UFO'
>cases where that explanation may have been ruled out.

Birds can give a mirror-like reflection... but not as good as a metal mirror... if the angle between the bird the the source of light is very small (a few degrees or less). I knew this when I wrote the abov section from my book. I also knew then, and know now, that the forward gloss, "mirror-like" reflection of "glint" did not apply in the Arnold case because the direction to the birds was far from the direction to the sun fro Arnold's viewpoint. Specifically, if the birds were due east of him then the angle between his sighting line to the birds as compared to his sighting line to the sun was about $90+30 = 120$ degrees, whereas forward glass occurs when the angle is several degrees or less (the less the degrees the better the gloss).

>We can read too much into semantics of course and it wouldn't
>only be birds that could 'flip and flash in the sun, just like a
>mirror'.

>Conversely, the significant point now established is that this
>description could apply to birds.
<

The description can apply to birds, but so what? The optical conditions do not apply to birds.
And DRAW A MAP!!.

Now, something new.

In my experiments reported before I pointed out that I could not synthesize a 20 miles path throuh the atmosphere. The primary effect of that path would be to decrease the light intensity.

The optical extinction coefficient for visible light decreases with altitude. The extinction coefficient, b , enters into the equation $I(R) = (I_0/R^2)e^{(-bR)}$ where I_0 is the initial intensity (flash brightness or mountain snow brightness), R is the range in km and b varies with altitude as follows, assuming a standard clear atmosphere probably similar to what Arnold was experiencing (not much haze):

$b = 0.0153 e^{(-z/7.26 \text{ km})} + 0.155 e^{(-z/1.14 \text{ km})}$ in inverse km.

9000 ft = 2.74 km, so plugging into the equation $z=2.74$ we get about 0.025/km. Take 20 miles = 32 km as the longest path expected and get the attenuation exponent, $bR = 0.025 \times 32 = 0.78$.

Hence the transmission factor due to the atmosphere is expected to be $e^{(-0.78)} = 0.46$. In other words, a little more than half the light is lost to the atmosphere. This is not a big thing when compared to a solar reflection.

Suppose, now, we have birds at 3 km. Lit by the sun and with diffuse white surfaces WITHOUT a glint or normal/forward gloss. As with the snow before one can assume $1E5 \text{ lm/m}^2$ on the birds surface. It is kind of difficult to determine just what would be the cross-sectional area projected onto the line of sight to the Arnold would be since they were at his altitude, but let's be generous and assume that the bird is a 1 m^2 diffuse reflector. Therefore it reflects $1E5$ lumens, but not into the $1/2$ degree beam that a mirror would do, but into 2π steradians of solid angle. Hence the intensity of a bird, assuming unit diffuse reflectivity (better than the best white paper), would be $1E5/2 \pi \text{ lm/sr} = 15923 \text{ lm/sr}$. The transmission to Arnold's eyeball is given by $(15923 e^{(-0.025 \times 3)})$ (area of eyeball/ R^2).

The area of his eyeball was $3E-6 \text{ m}^2$. Therefore we have entering his eyeball $15923 \times e^{(-0.075)}(3E-6/3000^2) = 5E-9 \text{ lm}$.

This can be compared with the previous calculation (as corrected by Brad) at 0.002 lm for a metal mirror of tens of meter size at Mt. Rainier, except we now know this has to be approximately cut in half because of atmospheric extinction. That is, one expects Arnold to get about 0.001 lm from the flashing metal surface. If you shrink the metal mirror area by 100, making the equivalent flat mirror surface dimension simply meters rather than tens of meters, the number of lumens from the metal mirror is $1E-5$, still much greater than expected for birds at about 2 miles (3 km) distance.

Oddly enough, the number of lumens of light reflected into Arnold's eye from the direct sunlight by the 1 m^2 birds at 3 km is comparable to the number expected from the tens of meter size area (520 m^2) of snow on the mountain, $1E-8/2 = 5E-9$ (where I have cut the mountain brightness by 2 because of the atmospheric extinction). That means that the bird brightness would be comparable to the snow brightness from Arnold's perspective. If by some amazing coincidence the birds also reflected some light from the mountain toward Arnold (a forward gloss effect!), then at best the brightness of the birds would be the sum of the reflection from direct sunlight plus the reflection of light that had been reflected by the mountain snow. Since these numbers were calculated and found to be about

equal, it would seem that the most brightness one could imagine for birds would be twice that of the mountain, i.e. about $1\text{E-}8$ lm into Arnold's eye, which is many factors of 10 less than the light reflected by even a meter size mirror at the distance of the shiny objects.

Sometimes I think I must be a birdbrain to continue with this!

The bottom line is that there is no reason to believe that a forward gloss reflection would have occurred in the Arnold situation, and hence there is every reason to believe that the birds would have been diffuse reflectors, with the net result that they would have appeared approximately as bright as the mountain itself (if they were 1 m size at 3 km, corresponding to about 10 m size at 30 km; if their effective cross-sectional area was less than 1 m^2 then they were dimmer than the mountain).

Hence there is no reason to believe that Arnold could have misidentified "flashes" of light (pulsations in brightness might be a better term) from birds and, instead, thought they were arc-bright flashes from metal surfaces.

And

DRAW A MAP!

ROUGHLY 8 >million sq.meters NOT 520 sq.meters.

>So we should probably bump up Bruces diffuse reflector figure from $3.7E6$
lumens/steradian to about $>5.7E10$ lm/sterad.

As long as the objects are AT LEAST the size of one "resolution element"
(And they were
larger than this) then the proper comparison is between the light reflected
by the object of some
assumed size and the light reflected by a comparable area of the snow.
This is because the areas of snow adjacent to the area "covered by" the
object are "resolved" that is, in his eye the images of the mountain to the
left, right, above, below, etc. are not overlapping or blurred into the
image of the object. Hence one does not use the whole snowy area of the
mountain for comparison because the flash from an object is a concentration
of light from just a small fraction of the total area. Rather one
compares the reflected light using comparable sized areas. Hence I stick by
my original estimate except for one proviso: I can't unquantify the effect
of veiling glare. The light from the nearby snowy areas and even from the
whole mountain and surrounding sky contribute to veiling glare light, light
scattered within his eyeball, that lies "on top of " the light from any
particular resolution area. This glare could make anything thing
"difficult to see" by setting a lower bound to the amount of light hitting
any part of the retina.

MORE COMMENTS: We're assuming each Arnold UFO to have been a FLAT MIRROR

reflector of 520 sq.meters area. But this is TOO MUCH. Arnold's side view profile of the objects drawn for the AAF in early July 1947 shows a BICONVEX not FLAT profile with focal points about 1-2 object diameters behind the presumably reflecting surfaces. So the luminosity of the objects will have to be dropped.

[Bruce]

However, Arnold reported that he did see flashes

of light from the objects before and after they passed Rainier from what he

wrote one can certainly infer that he saw flashes also as they passed the mountain.

MORE COMMENTS: But it is ONLY "inference" that he saw flashes in front of the mountain, since he never says clearly that he did, and that is troubling.

I've discovered an interesting "coincidence." I've previously pointed out that the estimated 5-mile long chain of objects is WIDER than Mt. Rainier at that altitude, about 4 miles, so that if the objects passed BEHIND Rainier (as I contend they did, putting their distance far greater than birds could possibly be seen from) there would ALWAYS be at least ONE OBJECT VISIBLE at all times. In other words, there would be no time, no moment, in which ALL objects would have been hidden behind the mountain.

But there is another extremely interesting pattern based on some data from Arnold on the duty cycle of the flashes. In his July 1947 letter to the AAF, Arnold states he saw flashes "as two or three of them every few seconds would dip." This means that 2-3 objects flashed every 2-3 seconds, or that on average one object of the nine would flash every second, or that EACH OBJECT would flash EVERY 9 SECONDS or so. But it would take only about 8 seconds to cross Mt. Rainier (4 miles crossed at 1/2 mile/sec speed). No one in the more than fifty years of controversy over this case has ever noticed this before.

In other words, if Arnold tried to track one particular object by its flashes it could very easily miss flashing behind or in front of Rainier because the flashes were not that frequent (a 9-second interval between flashes might just miss the 8-second passage of Rainier). Arnold indicates the flashes were not orderly but erratic in timing and seemingly clumped together in 2-3 roughly at the same time. Hence there must have been 2-3-second gaps of time with no flashes anyway and if the objects passed behind Mt. Rainier only perhaps 3-4 objects' flashes would be missed, but at least one object of a clump of 2-3 would STILL FLASH IN SIGHT before or after passing BEHIND Rainier. So the NUMBER of objects flashing would diminish by a few but there

would be no increase in the length of the 2-3-second intervals between clumps of flashes. HENCE ARNOLD WOULD HAVE HAD TO BE EXTREMELY OBSERVANT TO HAVE NOTICED A FEW LESS FLASHES if the objects passed BEHIND Rainier and there would have been no time delays or gaps at all to notice. And these few (perhaps 3-4) easily missed flashes could have been "filled in" by side reflections of the flashes from Rainier's glaciers as the objects approached the mountain and as they departed and/or POSSIBLY a sun reflection from a glacier.

And I submit that when the objects were in the vicinity of Rainier they could ONLY be seen by their FLASHES because otherwise their angular size was so tiny (especially vertically -- too thin to see), contrast so low, and their angular velocity was then so high that the objects moved in a "flicker" time interval from about 1.3 object length (your figure) to 3 objects lengths (my figure), blurring the images to invisibility. Because of the increase in distance and the more parallel perspective angle, by the time the objects appeared south of Goat Ridge on the way to Mt. Adams, their angular speed would have dropped by roughly a factor of four. And that is precisely when Arnold is able to give a description of the objects' (or the lone odd-object's) appearance as part of his chronological sequence (all other descriptions he gives out of order as digressions).

[Bruce]

Therefore I deduce that the flashes were brighter than the snow

and all surroundings. Of course, Arnold said this, when he compared them to looking at an arc. I know from experience (experiment) that looking at the sun reflected from aluminized mirror can be compared to "looking at an arc" although not as blue.

I wrote:

lm/sterad so the correct >figure here should be more than whats indicated

here, perhaps roughly $2E-4$ (1/5,000th) rather than $>1.1E-8$ (about 1/100 millionth).

I would bump it back to where it was... with the proviso that veiling glare in his eyeball, which IS a result of summing all the brightness of the mountain, sky, etc. (but most importantly the snow near the objects) could decrease the visibility of the flashes. Unfortunately I don't know how to estimate glare in his eyeball/ (I did estimate and in fact measure glare and its effects in the Trent photos!)

I wrote

>> CONTINUING:

> >A flat ice mirror of the same size but specularly reflecting only about 3%

course at grazing angles of incidence where almost every substance has

nearly 100% reflectance. But I wonder about 3%, it >seems too low. That

makes ice BLACKER than the blackest objects in the solar system (Phobos and

>Deimos which I think are about 6%) or carbonaceous chondrite meteorites.

Isn't charcoal around 3% reflectance? Something doesn't seem right here. >

The low reflectivity of ice is a result of reflection from a DIELECTRIC material as opposed to a conductor. The transparent (to visible wavelengths) dielectric allows light penetration through the surface and therefore has appreciable transmission. The formula for normal (perpendicular) incidence is $R = \frac{(n-1)^2}{(n+1)^2}$ where n is the refractive index. Reflectivity changes with angles (and polarization), especially angles close to grazing incidence, but for the angles considered here this is a valid value for reflectivity.

For typical glass this is 1.55 ± 0.05 . R becomes 0.046. This is the reflectivity at each surface or boundary. For plate glass the total reflection back is 0.046 from the first surface plus (0.0954 transmission through the surface times 0.046 reflection at the second surface times 0.0954 transmission of light backwards through the first surface) = 0.088. (Here I am ignoring the possibility of multiple-pass wave interference effects such as with a particular type of parallel plate interferometer.)

For water/ice the refractive index is about 1.33 which gives a reflectivity of 0.02, even lower than the 0.03 I mentioned before. Note that this is the specular reflectivity from a surface of ice. There could be further light bounced back by inclusions in the ice, but that would add a diffuse component. Black means an object doesn't reflect light back. A perfectly transparent medium would be "black" even though it wouldn't look black unless it were silhouetted against a black background. Black materials, however, absorb light. They are not transparent and they

specularly reflect no more than would be expected from the discontinuity in refractive index (air vs the material) at the surface of material.

Consider black glass. It does reflect light (4% from the front surface), yet looks black. To reduce the reflection further one does not use a flat surface but rather a diffuse surface. Black velvet (which nevertheless as a "gloss" reflection at very flat angles) is of the blackest things.

Ultimate black is a hole in a large box that has diffuse black material coating the inside. Like the roach motel, photos check in but they don't check out. BUT... if you put a clear glass window over the hole it is no longer perfectly black.

Anyway, we shouldn't be talking about blackness but rather reflectivity.

>> FOR FLAT ICE REFLECTOR OF AREA 520 m²

>>

>> $I_i = 0.03 \times 1E5 \times 520 / 7.6E-5$ in lm/sr = 2.1E10 lm/sr.

>COMMENTS: But Arnold could not see or could only barely see the objects when on edge (see >Bruces remarks, below) so he did not have continuous tracking. Moreover, with 9 different objects to >shift his focus from, it is highly unlikely that his eyes tracked on any one object or another powerful >reason he could not have been continuously tracking with his eyeballs.

He could see the whole group moving and I'm sure he was tracking the group.

Not all were on

edge at the same time, I presume, but even if they were he could have

established a "tracking rate" by continual observation of motion of the group.

MORE COMMENTS: But Arnold could not pick up fine details with his scotopic vision when the objects were spread over 12-22 degrees (5-mile long "chain" of objects from 13 to 23 miles away) and his foveal vision blinded by after-images from the flashes.

I have previously posted arguments that Arnold mentally projected the group's motion forward past Rainier (Arnold SAYS he did this) and now at least you're semi-independently arriving at the same type of "tracking rate" ability.

[Bruce]

be

>> confused as to what really happened.

>>

>> First of all, I doubt the existence of numerous glacier flashes.

MORE COMMENTS: But there also might have been reflections or "images" (as Arnold called them) of the objects' flashes off Rainier's glaciers as they approached the mountain, as Arnold seems to indicate. As I pointed out (above) there were only about 3-4 isolated missing flashes to "fill in" and even if not filled in Arnold almost certainly would have overlooked them anyway.

[Bruce]

But

Brad wrote:

>COMMENTS: Glaciers constantly move and flake off HUGE FLAT CHUNKS of their crystalline >faces. They would hardly be CURVED!

This ice is not like a perfect crystal. There are lots of dislocations from microscopic to macroscopic in size. The glacier ice is, after all, a series of layers of freezing or compressed snow. Any "face" of newly broken off ice will most likely be a jumble surfaces in various sizes directions and curvatures. And, snow fallen on the ice and melting from the sun and wind will also effect the surfaces.

>

MORE COMMENTS: We need actual empirical data on glaciers' optical properties. Glaciers flake off in huge flat frontal planes as they slowly move downslope, which would provide reflective interfaces. And as I've pointed out, Arnold's objects cannot be treated as FLAT MIRRORS of 520 sq.meter area when they were described as BICONVEX, so glacier "reflectors" could be more "competitive" in relative effective area of reflection of sunlight.

[Bruce]

BRIEFLY
CROSSED SUCH >REFLECTIONS than he would have crossed a LONG-
DURATION FULL
BEAM.

I have done an experiment. I have measured the "light curve" of sunlight off a mirror.

As expected the light intensity increases gradually, first slowly, then rapidly then slowly again to reach the peak intensity at the center of the flash. The point is that a chord across a portion of the "beam" from a flat reflector (or a curved reflector) will pass through a much lower intensity than does a line through the center. Thus the brief flash obtained by going along a chord at some distance from the center of the beam is likely to be much dimmer than going through the center. The 1/30 used above (or 1/50 using the refractive index calculation) as the intensity of an ice reflection relative to the metal reflection of the same area reflector, pertains to the center of the beam. Comparing the center of the metal reflection beam with the edge of an ice reflection beam brings in a much smaller factor (1/1000, perhaps).

>well-known local phenomenon ignored by residents from their long familiarity but noticed by outsiders >passing through such as Arnold who was a Boise, Idaho, resident passing through that fateful day in >1947.

<

Arbnold himself would have observed ice flashes while he was searching for the military transport. He also would have seen ice flashes before the objects reached the mountain and after they passed it, whether in front or behind. He would have seen ice flashes as he continued his trip toward Yakima. Therefore, even if he had never seen such flashes before, he would have had plenty of time to develop for himself a recognition of "ice flash phenomenology" that he could therefore separated from "flying saucer flash phenomenology."

I still doubt the existence of a multiplicity of ice "beams" that could somehow be mistaken for flashes from some metal reflector and which would, as the plane flew along, occur in such an order as to make it appear that metallic reflectors creating brief very bright flashes north of the mountain continued their paths across the face of the mountain and then continued further south of the mountain.

@Yakima. Therefore, even if he had never seen such flashes before, he
@would have had plenty of time to develop for himself a recognition of "ice
@flash phenomenology" that he could therefore separated from "flying saucer
@flash phenomenology."
@I still doubt the existence of a multiplicity of ice "beams" that could
@somehow be mistaken for flashes from some metal reflector and which would,
@as the plane flew along, occur in such an order as to make it appear that
@metallic reflectors creating brief very bright flashes north of the
@mountain continued their paths across the face of the mountain and then
@continued further south of the mountain.

The question I have about the ice flash theory is how ice flashes
can travel in a straight line.

The following are NOT intended to be explanations for the Arnold
sightings, but are means by which I have seen flashes travel in a
straight line:

I have seen a glow at a certain angle from the sun seem to follow
along with me as I travelled in a vehicle after a frost. It was
on the ground, and always maintained the same angle with respect
to my location and the sun's position. My theory is that it was
an effect of combination reflection and refraction through
randomly oriented hexagonal crystals of ice attached to blades of
grass.

Many times I have seen a specular reflection that rose and fell

ahead of the auto I drove down a straight road at night. It was caused by reflections of a distant light from telephone or power lines. When the poles were not right next to the road, the cause of the effect was not immediately obvious, until I stopped and examined the surroundings.

Here is one I have only a partial explanation for: In 1985, I was in a commuter airliner flying to Chicago over northern Indiana. I looked down and I saw a series of bright flashes from three sources apparently flying in echelon just above the ground. They flashed in sequence: 1, 2, 3, pause, 1, 2, 3, pause. Closer inspection revealed that just after each time the three finished flashing, they passed a high tension tower. Apparently they were some form of sun reflection from the high tension lines, one from each of the cables for the three phases. The only thing I can think of is that there was a flat specular surface on each of the cables. The wires themselves were not visible from the plane, but the towers were.

>not FLAT profile with focal points about 1-2 object diameters behind the
>presumably reflecting surfaces. So the luminosity of the objects will have
>to be dropped.

You will note that in a more recent message I discussed the brightness of the reflected light which gave about 0.002 lumen into his eyeball for 520 m² and then pointed out that even if the area were reduced by a factor of 100 the brightness of the mirror reflection would be much greater than that of the snow or "ice flashes"

I WROTE

[Bruce]

>the mountain, since he never says clearly that he did, and that is troubling.

Yes, but I believe this is a logical inference barring any claim by Arnold that he saw them disappear behind the mountain or that he thought he somehow mixed up UFO flashes with ice flashes (if there were such a thing).

BRAD WROTE:

>I've discovered an interesting "coincidence." I've previously pointed out

(my
>figure), blurring the images to invisibility. Because of the increase in
>distance and the more parallel perspective angle, by the time the objects
>appeared south of Goat Ridge on the way to Mt. Adams, their angular speed
>would have dropped by roughly a factor of four. And that is precisely
when
>Arnold is able to give a description of the objects' (or the lone
>odd-object's) appearance as part of his chronological sequence (all other
>descriptions he gives out of order as digressions). >

I think you are making too much of a semi-quantitative statement. You are tacitly assuming that each object dipped/flushed only once in 9 seconds. What if only 2 or 3 of the objects did all the dipping and flashing? More likely is that they were all dipping perhaps at a nearly regular rate but only occasionally did the dip angle line up just right to shine light on Arnold's plane. When they dipped they may have been visible against the mountain as a silhouette when NOT aligned with the sun. Same when they were south of the mountain.. they might have been silhouetted against the white horizon sky (which is not blue unless there is NO water vapor in the atmosphere at the altitude of viewing) sky or, if low enough against a mountain/snow background.

I wrote:

>after-images from the flashes. >

>I have previously posted arguments that Arnold mentally projected the
group's

>motion forward past Rainier (Arnold SAYS he did this) and now at least
you're

>semi-independently arriving at the same type of "tracking rate" ability.

I don't believe his foveal vision was blinded by after-images because the
flashes were so brief. What Arnold saw from 20 miles was NOT as bright as
what I saw from 270 ft and my own experiment involved viewing steady bright
reflections, not flashes. Moreover, each flash would focus to some point on
his retina. However, quite likely that they did not all focus at exactly
the same point ..

Anyway, it is my opinion that there are just too many imponderables to
allow us to reasonably second guess Arnold as to what he could or couldn't
see. He made a report in which he mentioned the difficulties in viewing
yet went ahead and drew a shape anyway..... a shape that was not round,
even though he said that the objects looked round when they flashed (not
surprising that the flash would appear round regardless of the shape of the
reflector, because it was viewed from a large distance; my experiment proved
the rounding off of the reflection beam shape as distance increased.)
Hence I believe that he could see the basic shape of the objects when they
did not flash.

I WROTE>

>> You suggest that the presence of "glacier flashes" would "make up for"

>>be confused as to what really happened.

>>

>> First of all, I doubt the existence of numerous glacier flashes.

BRAD WROTE:

>MORE COMMENTS: But there also might have been reflections or "images" (as

>Arnold called them) of the objects' flashes off Rainier's glaciers as they

>approached the mountain, as Arnold seems to indicate. As I pointed out
>(above) there were only about 3-4 isolated missing flashes to "fill in"
and

>even if not filled in Arnold almost certainly would have overlooked them
>anyway.

I believe less in reflections from the objects hitting the mountain and
creating noticeable "double reflections." The best the objects could do

would be to reflect the equivalent of direct sunlight onto the mountain over small areas comparable to the size of the objects plus beam divergence over the distance from the object to the mountain. This could not be brighter than the direct sunlight. Hence "object-to-ice flashes" would be less bright than "direct sun on ice flashes."

>sunlight. >

I have no problem with getting "glacier flash data" if that is possible.
On the other hand, I pointed out that it was not necessary to imagine 520
m² effective flat surface area in order to calculate a luminous intensity
much greater than that of the glacier flashes or snow.

.....

Perhaps the only valuable information to come out of this argument is the
calculation of relative brightness for comparison with pelicans....
which shows that only pelicans which happened to be welding pieces of steel
together could have been mistaken for metallic reflectors at 20 miles
distance.

For those who are really curious to see what Rainier looks like from 9200 ft from various positions, Microsoft Flight Simulator 2000 Professional Edition has a pretty accurate terrain simulation of Washington State. The sim allows you to input any date and time, giving correct sun/moon position, a simulated snowline on the mountain that changes by season, etc. It even has an airport at Chehalis, so you can take off at the correct time in a Cessna of similar performance to Arnold's plane, then fly his route. Little Tahoma is quite visible. Flight Sim 2000 Pro sells for about \$69 USD.

Subject: Re: Arnold and other sundry items.Status:

Larry,

If you read my subsequent posting you'll see that I point out that according to Arnold there were not that many flashes, only about one flash every 9 seconds for any given object. Because crossing Mt. Rainier would take only about 8 seconds most objects' flashes would happen to skirt around Rainier without interruption, making it impossible to tell if they went behind or in front of the mountain just from the flashes. There would only have been about 3-4 flashes missing by going behind Mt. Rainier and none would cause a time gap or increase the delay to the next because Arnold indicated the flashes came in clumps of 2-3 so only the numbers of flashes in each clump would be diminished, not their timing increased (there might not even have been as many as 3-4 missing if a few showed up in the gap between Rainier and Little Tahoma). Arnold indicated they flashed erratically with no orderly sequence of 1-2-3 so there was no need for glacier ice reflections to be seen in a sequence as if "traveling" in the same direction as the UFO's. Since there was NO TIME when flashes ever completely stopped and only a few would have been missing from the clumps of flashes (reduced from 2-3 to 1 or 2), and Arnold did not see a simple 1-2-3 sequence to the flashes, it would have been almost impossible for Arnold to keep track of exact numbers of flashes to see that ANY at all were missing. And it would take only ONE sun reflection off a glacier in front of Mt. Rainier to make Arnold think that maybe the objects were responsible and were traveling in front of the mountain -- or just one side glacier's reflection of an approaching or departing object's flash. Seeing a few flashes from between Rainier's summit and Little Tahoma Peak might have indicated to Arnold that the objects were flying behind the mountain thus creating confusion in his mind as to whether they flew behind or in front. (Little Tahoma is about 5/8 mile wide at the 10,000-foot level, the exact spacing of Arnold's nine objects in a chain 5 miles long, eight segments in between each about 5/8 mile long.)

The only other way Arnold could tell whether the objects were in front or behind Rainier is if he could see them in between flashes and I contend that it was virtually impossible -- the objects were at their highest angular velocity near Rainier and would have been blurred by about 1.3 to 3 object lengths in the space of a "flicker" interval (1/16 to 1/25 second depending on whose figures). They were already extremely tiny, at 2.6 arcminutes in length horizontally, which is less than 1/12 the full moon. And they were very "thin" vertically according to Arnold, but his estimate makes them so thin (about 0.1 to 0.2 arcmin) they would DISAPPEAR, going well below visual resolution acuity (0.5 arcmin), and he actually seems to suggest that is what they did, DISAPPEARED. Arnold said they were "so thin I could barely see them" (UP, Pendleton, Ore., June 26, 1947) and then there is Arnold's peculiarly ambiguous statement "When they turned lengthwise or flat-wise to me, they were very thin and they actually disappeared from sight behind a sharp projection on Mount Rainier in the snowfield." (1977 Fate Proceedings

published in 1980, p. 21). One could try to argue that maybe in between horizontally flat/thin and the bright flash they were not so thin as to be invisible but that does not dispose of the high-speed blur problem or overall tiny size in the first place. And it runs into the problem of poor contrast.

As supposedly mirrored surfaces they would have made almost zero contrast reflecting the images of the snow against the snow or the sky against the sky, and reflecting the image of bright sky near the sun against the bright snow would not have made very good contrast either.

Subject: Re: Arnold Sun Mirror ExperimentsStatus:

Bruce,

Arnold himself said he was "BLINDED" by the flashes. In his original newspaper interview of June 25, 1947, "He said the reflection was so brilliant that it BLINDED him 'as if someone had started an ARC light in front of my eyes.' " (Pendleton East Oregonian, June 26.)

So when you noticed after-images from a sunlit mirror experiment made comparable in angular size to Arnold's objects, I immediately thought of his "BLINDING" observations (on the road to Damascus or Discus????).

Arnold said they were "so thin I could barely see @them" (UP, Pendleton, Ore., June 26, 1947) and then there is Arnold's @peculiarly ambiguous statement "When they turned lengthwise or flat-wise to @me, they were very thin and they actually disappeared from sight behind a @sharp projection on Mount Rainier in the snowfield." (1977 Fate Proceedings @published in 1980, p. 21). One could try to argue that maybe in between @horizontally flat/thin and the bright flash they were not so thin as to be @invisible but that does not dispose of the high-speed blur problem or overall @tiny size in the first place. And it runs into the problem of poor contrast. @ As supposedly mirrored surfaces they would have made almost zero contrast @reflecting the images of the snow against the snow or the sky against the @sky, and reflecting the image of bright sky near the sun against the bright @snow would not have made very good contrast either.

@

@

@The question I have about the ice flash theory is how ice flashes
@can travel in a straight line.

@

@The following are NOT intended to be explanations for the Arnold
@sightings, but are means by which I have seen flashes travel in a
@straight line:

@

@I have seen a glow at a certain angle from the sun seem to follow
@along with me as I travelled in a vehicle after a frost. It was
@on the ground, and always maintained the same angle with respect
@to my location and the sun's position. My theory is that it was
@an effect of combination reflection and refraction through
@randomly oriented hexagonal crystals of ice attached to blades of
@grass.

@

@Many times I have seen a specular reflection that rose and fell
@ahead of the auto I drove down a straight road at night. It
@was caused by reflections of a distant light from telephone or
@power lines. When the poles were not right next to the road, the
@cause of the effect was not immediately obvious, until I stopped
@and examined the surroundings.

@

@Here is one I have only a partial explanation for: In 1985, I was
@in a commuter airliner flying to Chicago over northern Indiana. I
@looked down and I saw a series of bright flashes from three
@sources apparently flying in echelon just above the ground. They
@flashed in sequence: 1, 2, 3, pause, 1, 2, 3, pause. Closer
@inspection revealed that just after each time the three finished
@flashing, they passed a high tension tower. Apparently they were
@some form of sun reflection from the high tension lines, one from
@each of the cables for the three phases. The only thing I can
@think of is that there was a flat specular surface on each of the
@cables. The wires themselves were not visible from the plane,
@but the towers were.

Subject: Re: Arnold and other sundry items.Status:

If there was only ONE flash of sun from a glacier then there is no sequence to set up. Arnold never said the objects' flashes were in an orderly simple sequence but were erratic.

I WRITE:

I maintain that Arnold could not have confused glacier flashes with object flashes because of (a) time duration and (b) brightness.

I have already pointed this out. (a)... the glacier flash durations would depend upon what part of a glacier "reflection beam" Arnold's plane passed through. If he passed through the edge or "chord" at a distance from the center the flash might be brief by very DIM. The brightest flash from the glacier would occur if he went through the center of the glacier beam but this would take much longer than 0.1 sec or thereabouts (it would take

some seconds;)

(b) even passing through the center of the beam would not necessarily be as bright a flash as from the objects.

Brad's analysis assumes that there were no dips or tilts of the UFOs without causing flashes. That fact is that there could have been many dips without

flashes and Arnold could have seen the shape during a dip without a flash/. Arnold did not provide precise information on the relationship between the number of times an object dipped/tilted and the number of times that object flashed. All he gave was a crude statistical statement about the number of flashes (2-3) every several seconds. These numbers could be qualitatively correct but wrong quantitatively. Brad interprets this as meaning that since there were nine objects each one only flashed once in nine seconds

(BRAD WROTE:

If you read my subsequent posting you'll see that I point out that according

to Arnold there were not that many flashes, only about one flash every 9 seconds for any given object. Because crossing Mt. Rainier would take only

about 8 seconds most objects' flashes would happen to skirt around Rainier without interruption, making it impossible to tell if they went behind or in

front of the mountain just from the flashes.)

If A and C flashed during the first second, B and D during the third second,

F and H during the 5th second, E and I during the 7th second and A and J during

the 9th second and C and B during the 12th second,

we would have 2 flashes every several (3) seconds and it would be 8 seconds between flashes of one of the objects (A) and at least 9 seconds between flashes of another object (B).

But if there were three flashes during every pair of seconds or if one of the

objects happened to flash several times in 9 seconds this would screw up the scenario. Arnold didn't say that any one object never flashed twice or three times on a row.

The Bottom Line is that we can't read too much into Arnold's crude statistical

statement. Any "mountain" of logic based on that statement is on shaky ground.

>The only other way Arnold could tell whether the objects were in front or

>behind Rainier is if he could see them in between flashes and I contend that
 >it was virtually impossible -- the objects were at their highest angular

 > As supposedly mirrored surfaces they would have made almost zero contrast
 >reflecting the images of the snow against the snow or the sky against the
 >sky, and reflecting the image of bright sky near the sun against the bright
 >snow would not have made very good contrast either. >

If we don't assume that any one object flashed each time it dipped, but rather
 that there were dips when it didn't flash, then Arnold could have gotten a
 view of it (a) against the mountain and (b) against the horizon haze (likely to
 be white). Brad assumes low contrast because of reflecting the mountain snow,
 However,.when the object dipped it's
 mirrored surface presumably was tilted toward Arnold CLOSE TO BUT
 NOT EXACTLY aligned with the and for solar reflection. That would mean it
 would not be tilted in such a way as to reflect mountain snow to the EAST

of the object
but rather the blue sky (instead of the sun) to the WEST of the object.
This would make it appear
DARKER than the white mountainside. The same would be true is silhouetted
against the white horizon sky (horizon is not blue as long as there is
water vapor
in the air).

As for the "high speed blur problem" I tried looking at objects at varying
distances
from my automobile. It was, of course, easy to find things for which the
angular
rate of motion was large (objects close to the car). I could perfectly
well see the
shapes of tree branches, twigs on tree branches (no leaves right now)
telephone poles, etc, that were moving past
at several degrees per second. In Arnold's case we had a max angular
speed like 1.4 degrees/sec. So I don't think motion blur plays a role
here.

I point out again that Arnold did draw a picture showing an outline.
Therefore I believe that he got a good enough look at them to have an
idea of the outline. After all, he concentrated on trying to see and
identify
the shape and was not able to compare it with any known (to him) aircraft.

An alternative to ponder.:"
If he HADN'T been able to see the shape well enough to reject the
"conventional aircraft" identification, and if they hadn't flown in a
"weird"
manner, he might well have passed it off as ultra fast aircraft and
not bothered to report it.

Regarding my solar cell experiment Larry wrote:

>

Are you sure you didn't saturate the photocell? Try rotating it in sunlight, from edge-on to full-face to the sun, and continuing on to edge-on in the other direction. You should get a perfect sine curve (with a deviation at the bottom if other light is also striking it), unless the photocell is non-linear. If it saturates, the top will flatten out. This is the control for your experiment.

<

I cut the area of the mirror from 0.098 m^2 to 0.055 m^2 . The amplitude of the peak intensity at the solar cell should drop by the same ratio, $0.055/0.098 = 0.56$.

The amplitude of the solar cell output dropped from "1" to "0.57". In other words in this simple test the nonlinearity was only a couple of percent.

What kind of photocell were you using?

Different kinds of light sensitive materials and different kinds of dopants affect the output curve. Many kinds of cells designed for solar power are doped to give more power at low light levels, but they flatten out earlier at high light levels. Wavelength affects the output curve too.

<

True. But as I have pointed out before , it seems to me unlikely that Arnold would confuse a "glacier flash" with an "object flash.". First of all, this glacier flash beam would be much less intense than the beam from a metal reflection because of the lower reflectivity of ice. Second, an more important, the temporal variation of the flash would depend upon the distance over which Arnold's plane would "penetrate" the flash beam. For a "brief flash" he would be at the edge of the supposed glacier beam and would hardly see any flash at all. To see the brightest possible glacier flash, still something like 1/30 to 1/50 of the flash brightness of the objects, he would have to fly through the beam, which could require many seconds.... hardly a "brief flash" like 0.1 second.

BRAD WROTE:

>Arnold himself said he was "BLINDED" by the flashes. In his original newspaper interview of June 25, >1947, "He said the reflection was so brilliant that it BLINDED him 'as if someone had started an ARC >light in front of my eyes.' " (Pendleton East Oregonian, June 26.)

>So when you noticed after-images from a sunlit mirror experiment made comparable in angular size >to Arnold's objects, I immediately thought of his "BLINDING" observations (on the road to Damascus >or Discus????).

Well, perhaps Arnold had a "Damascus" type revelation as a result of this, but as far as "blinding" is concerned I can say this: if the flashes had been so intense and repetitive as to cause a "spot" to appear at the center of his field of view, then he would, in fact, been able to see nothing but the flashes. Even the mountain itself would have been reduced in apparent brightness because once created a "spot" before the eyes stays for a while. I don't know how many lumens of light in a short burst are needed to create a "spot" of noticeable "depth." By short I mean so brief that it is completed before the cells have a chance to begin regenerating the vision (recharging the rhodopsin, or whatever). And by "depth" I mean the contrast in sensitivity between the "flash blinded" eye and the unblinded eye.

Flash blinded can mean virtually blind (look into a flash bulb from a few feet)..... but this condition does not last long. What does last is the color shift as the various color sensors are saturated. Thus you can see something, but it appears "pale" compared to normal.

We simply don't know what sort of blinding condition Arnold suffered from these flashes/ He said several every several seconds, but the flashes were not coming from the same points in his field of view because the several were not from the same object I presume. Hence the "duty cycle" for any one point in his field of view was low: 0.1 sec flash every several seconds.. This is quite different from the situation with my experiment where the "duty cycle" was 100% when I was looking at the mirror trying to determine the effective edges of the beam.

I plan to do an experiment with a flash bulb in daylight.

Different kinds of light sensitive materials and different kinds
of dopants affect the output curve. Many kinds of cells designed
for solar power are doped to give more power at low light levels,
but they flatten out earlier at high light levels. Wavelength
affects the output curve too.

<

If it really became important to know the exact shape of the
light curve to within the proverbial gnat's eyebrow I would
do a complete calibration using a more sensitive recorder
and a lower resistance. The solar cell itself was a standard
silicon type I got years ago, about 2 cm long by 1 cm wide.
Such a device is "ideally linear" only when loaded with
zero ohms.... which can be effectively done with an operational
amplifier circuit. I did not try to create such a circuit for this
experiment.

Subject: Re: Arnold and other sundry items.Status: RO

Arnold said he saw the objects traveling south in a line well BEFORE they even reached Rainier. In his letter to the AAF, Arnold said that at the first flash "I looked to the left and the north of Mt. Rainier where I observed a chain of nine peculiar looking aircraft flying from north to south at approximately 9,500 foot elevation and going, seemingly, in a definite direction of about 170 degrees."

Arnold also clearly states that he was able to mentally project the objects' flight path forward to anticipate where they were going to be BEFORE they reached Rainier: "I could see the formation was going to pass directly in front of me, as it was flying at approximately 170 degrees. I watched as these objects rapidly neared the snow border of Mount Rainier...." (COTS) (Too bad he couldn't continue the account right here and describe how they didn't just "rapidly near" the snow border but passed over the border and in front.)

By the way, Arnold later came to doubt that these "flashes" were sun reflections at all but instead were emitted by the objects themselves, being self-luminous evidently: In 1952 Arnold wrote, "AT THE TIME [in 1947] I did not get the impression that these FLASHES were EMITTED by them, but rather that it was the sun's reflection" but apparently Arnold changed his mind in the intervening time and did believe the flashes were luminous emissions. "This brilliant flash that came from their surfaces, which I ASSUMED was from the sun reflection AT FIRST, would pulsate," he said in 1977. I think Arnold came to believe in space animals or some such theory.

I didn't suggest the "objects" themselves were after-images, though it is true that after-images are dark against lighter background.

In a message dated 3/28/00 5:35:45 AM, lrobins@indiana.edu writes:

<<

Then how did he get the impression they were traveling in a line towards the south?

Subject: Re: Arnold and other sundry items.Status: RO

Bruce,

Thanks for nicely summarizing the previous highly technical discussions. I would like to point out that sun reflections off metal is an assumption, a theory that is being modeled, and not necessarily the actual cause of the intense "flashes" which Arnold himself came to believe were luminous emissions and not sun reflections (see my previous post).

Brad

In a message dated 3/28/00 8:24:09 AM, brumac@compuserve.com writes:

<<

Brad wrote in response to Larry:

>

If there was only ONE flash of sun from a glacier then there is no sequence to set up. Arnold never said the objects' flashes were in an orderly simple sequence but were erratic.

<

True. But as I have pointed out before , it seems to me unlikely that Arnold would confuse a "glacier flash" with an "object flash.". First of all, this glacier flash beam would be much less intense than the beam from a metal reflection because of the lower reflectivity of ice. Second, and more important, the temporal variation of the flash would depend upon the distance over which Arnold's plane would "penetrate" the flash beam. For a "brief flash" he would be at the edge of the supposed glacier beam and would hardly see any flash at all. To see the brightest possible glacier flash, still something like 1/30 to 1/50 of the flash brightness of the

objects, he would have to fly through the beam, which could require many seconds.... hardly a "brief flash" like 0.1 second.

BRAD WROTE:

>Arnold himself said he was "BLINDED" by the flashes. In his original newspaper interview of June 25, >1947, "He said the reflection was so brilliant that it BLINDED him 'as if someone had started an ARC >light in front of my eyes.' " (Pendleton East Oregonian, June 26.)

>So when you noticed after-images from a sunlit mirror experiment made comparable in angular size >to Arnold's objects, I immediately thought of his "BLINDING" observations (on the road to Damascus >or Discus????).

Well, perhaps Arnold had a "Damascus" type revelation as a result of this, but as far as "blinding" is concerned I can say this: if the flashes had been so intense and repetitive as to cause a "spot" to appear at the center of his field of view, then he would, in fact, been able to see nothing but the flashes. Even the mountain itself would have been reduced in apparent brightness because once created a "spot" before the eyes stays for a while. I don't know how many lumens of light in a short burst are needed to create a "spot" of noticeable "depth." By short I mean so brief that it is completed before the cells have a chance to begin regenerating the vision (recharging the rhodopsin, or whatever). And by "depth" I mean the contrast in sensitivity between the "flash blinded" eye and the unblinded eye.

Flash blinded can mean virtually blind (look into a flash bulb from a few feet)..... but this condition does not last long. What does last is the color shift as the various color sensors are saturated . Thus you can see something, but it appears "pale" compared to normal.

We simply don't know what sort of blinding condition Arnold suffered from these flashes/ He said several every several seconds, but the flashes were not coming from the same points in his field of view because the several were not from the same object I presume. Hence the "duty cycle" for any one point in his field of view was low: 0.1 sec flash every several seconds.. This is quite different from the situation with my experiment where the "duty cycle" was 100% when I was looking at the mirror trying to determine the effective edges of the beam.

I plan to do an experiment with a flash bulb in daylight.

IGNORE PREVIOUS MESSAGE THAT AOL LAUNCHED BEFORE I EVEN
WROTE A WORD

Bruce,

Thanks for the analysis. Keep me posted on your experiments.

It just seems to me that it would be hard for Arnold not to have caught at least one flash out of the total 100-200 or so right smack in the center of his field of view, thus impeding his fine-resolution foveal vision. And if he had these dark after-images from the flashes arranged in a horizontal line on either side of his center of focus wouldn't these dark after-images be suspiciously similar to the "thin dark lines" he reported for the objects when not flashing?

Brad

<

OK, I did them in a lighted room!

I first used a clear glass plate as a reflector. Figure 4% reflection from each surface so 8% of the flash light from a small camera (recycleable type). To carry this out.... flashing in my own eye from a distance,... I stood about 10 ft from the glass, so I was effectively 20 ft from the flash.

I found (a) the flash produced a small spot in my field of vision which was only "wiped out" for a second or so and (b) even when the spot was wiped out, it was so small that I still had photopic vision around it. I know this because I immediately looked at a grid drawn on white paper and so I have something to compare with before and after flash. After a second the "burn spot" had gone away.

Then I used a metal surface mirror at the same distance. Naturally this produced a somewhat larger and "deeper" burn spot, but still I could see "around" it to easily see the grid I looked at right after the flash. The spot lasted longer this time.

I found it was difficult to get the flash to occur always on the same spot on my fovea. The point here is that since Arnould couldn't be sure where each flash was coming from the probability is that most of the flashes occurred NOT at the exact center of the fovea where one would least like to have a flash "burn."

I suggest you guys try this yourself. Need "eyeball statistics" if we are really going to push the flash blindness aspect to the "wall."

emissions and not sun reflections (see my previous post).

<

Naturally I am aware that the flash reflection hypothesis is just that.
If the flashes were not reflections of sunlight then there is no way to
estimate their brightness other than by Arnold's testimony. Of course
all arguments about flat mirrors and optical alignment, etc. become moot.
The brightness calculations for snow and "glacier flashes" still hold.

Subject: Re: Arnold and Other Sundry ItemsX-User-Info: 137.195.5.210
Status:

Re recent discussions, which appear to assume without question that Arnold's objects were far distant and travelling at the speed he surmised, perhaps we could go over some related points. My comments are indicated:

Source: Pendleton, Oregon East Oregonian, June 26, 1947 -

"The Boise man, who owns the Great Western fire control supply which handled automatic fire fighting systems, described the objects as 'flat like a pie pan and somewhat bat-shaped' and so shiny they reflected the sun like a mirror.

He said the reflection was so brilliant that it blinded him, 'as if someone had started an arc light in front of my eyes'.

Mr. Arnold reported he was flying east at 2:50 p.m. Tuesday toward Mt. Rainier when the objects appeared directly in front of him 25-30 miles away at about 10,000 feet altitude.

[...]

When first sighted, he thought the objects were snow geese.

'But geese don't fly that high -- and, anyway, what would geese be doing going south for this time of year?'"

COMMENTS: Odd that Arnold is quoted as dismissing a flock of geese because of his perception about the objects' altitude and that geese wouldn't be flying south. It's an aspect I've brought up before; if Arnold truly did first notice the objects because of bright/brilliant reflections and they were initially so far distant as he claimed/thought, then why would he ever consider they might be birds?

Doesn't it imply these reflections weren't so startling, maybe only bright flashes of light, and the objects were in relatively close proximity?
[End]

"He said the 'planes' remained visible by the flashes of

reflected sunlight for some seconds after they passed Mt. Adams, perhaps for as far away as 50 miles.

COMMENTS: How feasible is this and if factual, which I greatly doubt, what might it tell us about the objects' size and reflectability?

[End]

[...]

He said that at first he thought the window of his plane might be causing the reflections, but that he still saw the objects after rolling it down.

He also described the objects as 'saucer-like' and their motion 'like a fish flipping in the sun'.

Mostly, he said, he was surprised at the way they twisted just above the higher peaks, almost appearing to be threading their way along the mountain ridge line.

'No orthodox plane would be flying like that,' he commented."

COMMENTS: And least likely of all things conceivable is a fleet of alien spacecraft. It would be consistent with birds though.

[End]

Source: Norman, Oklahoma Transcript, June 26, 1947 -

""There were nine of them and they were flying in a screwy formation about 25 miles away from me. It wasn't any military formation I ever saw before'.

[...]

Arnold said the strange aircraft were skittering across the southwest slope of Mount Rainier when he first sighted them".

COMMENTS: So far as I can see, this is essentially the story Arnold first told - the objects, or 'flashes' from them, were noticed as they passed Mt. Rainier.

It later became the tale of nine objects which _even after they first came to Arnold's notice_ were supposedly still over a hundred miles away! As he claimed in his book:

"It was during this search and while making a turn of 180 degrees over Mineral, Washington, at approximately 9200 feet altitude, that a tremendously bright flash lit up the surfaces of my aircraft. I was startled. I thought I was very close to collision with some other aircraft whose approach I had not noted. I spent the next twenty to thirty seconds urgently searching the sky all around--to the sides, above and below me--in an attempt to determine where the flash of light had come from.

[...]

Before I had time to collect my thoughts or to find any close aircraft, the flash happened again. This time I caught the direction from which it had come. I observed, far to my left and to the north, a formation of very bright objects coming from the vicinity of Mount Baker, flying very close to the mountain tops and traveling at tremendous speed.

At first I couldn't make out their shapes as they were still at a distance of over a hundred miles..."

[End of quote]

And must have been even further away when, some 30 seconds before and travelling at the declared speed, they first 'flashed' and practically turned night into day.

Is this universally accepted as a ridiculous exaggeration and if so, where do we draw the line?

[End]

Source: Oregon Journal, June 27, 1947 -

"Arnold, general manager and owner of the Great Western Fire Control Company, said he first saw the objects when they flashed in the sun low over the slopes of Mt. Rainier.

"Then I saw them, weaving and ducking in and out as they came south not more than 500 feet over the plateau. They looked like they were rocking. I looked for the tails but suddenly realized they didn't have any. They were half-moon shaped, oval in front and convex in the rear. I was in a beautiful position to watch them. I thought they might be jet planes, and I clocked them. Then when I saw they had no tails and I realized how fast they were going, I knew they were like nothing I had ever heard of before. There were no bulges or cowlings; they looked like a big flat disk. They

were larger than the ordinary jet plane but slightly smaller than a DC4, if you don't count the rear fuselage'.

COMMENTS: A further reported testimony of how these objects were first seen over the slopes of Mt. Rainier, not a couple of hundred miles northwards.

The fact they were 'flashing' is, as I demonstrated, comparative to how a formation of large, predominately white birds have been documented as exceptionally reflective, using the exact same terminology.
[End]

Arnold said that the objects waved 'like the tail of a Chinese kite'."

COMMENTS: And as previously demonstrated, identical to how a formation of certain large, undulating, predominately white birds are known to fly.
[End]

Source: Radio Interview -

"...I was approximately 25 to 28 miles from Mt. Rainier, I climbed back up to 9200 feet and I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier. I, at first, thought they were geese because it flew like geese..."

COMMENTS: Even at this stage, when they crossed in front of Mt. Rainier, apparently these nine objects were similar to a flight of birds. Although Arnold does go on to say he thought they were flying too fast (then again, he thought the 25-30 duck-like objects were quicker than ducks could fly), where is Arnold's rationale about the supposed brilliant reflections during or before he first observed a 'chain' of objects? Strangely, he doesn't mention here at all how the flashes 'lit up his plane'.

The point is, if he simply noticed a chain/ribbon/kite-tail like formation of nine objects crossing Mt. Rainier, then it's a whole different story. That's what he says here and it's also the circumstances described in those early newspaper reports.

In short, no mention of any inaugural 'flashes' . The story

is one where the objects were simply noticed crossing Mt. Rainier.

What we seem to have in these formative accounts is Arnold's explanation of how, as he was _making a turn_ over the town of Mineral, his attention was caught by one or more bright flashes of light and he then noticed a number of objects either approaching or crossing Mt. Rainier.

As their chain-like formation was similar to a flock of Geese, Arnold statedly at first thought that's what they were.

It seems absolutely certain these objects flew on the western side of Mt. Rainier and we have seen how Arnold clarified this on a number of occasions.

That recognised, it also has to be accepted why if Arnold's referenced peak was, as looks most likely, Little Tahoma, then his distance perceptions are _proven_ to be literally miles off.

Everything else falls down from there - his speed calculations based on apparent size and distance, etc.

Do we actually now have any factual reasons - excluding opinions about what Arnold should have recognised (it's become clear there were a number of things Arnold _should_ have recognised and not only about this incident) - why the `flashes' were not simply bright/brilliant reflections from exceptionally large, white birds, crossing Mt. Rainier and heading in the direction of Mt. Adams, eventually disappearing from sight?

James.

BRAD WROTE:

>It just seems to me that it would be hard for Arnold not to have caught at least one flash out of the total 100-200 or so right smack in the center of his field of view, thus impeding his fine-resolution foveal vision. And if he had these dark after-images from the flashes arranged in a horizontal line on either side of his center of focus wouldn't these dark after-images be suspiciously similar to the "thin dark lines" he reported for the objects when not flashing?
<

We don't know exactly how many seconds from the time of the first flash to the time when the objects were flying past Mt. Rainier, or when they were closest to Arnold (about 10 miles south of Rainier, silhouetted against either the white horizon haze or against the mountains below, depending upon one's "preference" for altitude; I choose lower altitude). However, if it were, say, 30 seconds, and if there were 3 flashes every "several seconds", say every 3 seconds, then there were $30/3 = 10$ bursts of 3 flashes = 30 flashes (obviously I can't say there were exactly 30 flashes). This is considerably less than the 1-- or more you mention, most of which occurred when the objects were south of Arnold on their flight toward Adams.

So, maybe by the time Arnold was seeing their shape there had been almost three dozen flashes.

These occurred at random positions within the line/chain of nine objects, we are told.

MAIN POINT: the probability of having one exactly in the middle of his fovea is lower than you imply (but not zero).

By the time of the 30th flash the "spot" from the first few flashes would be diminished considerably or would have been gone complete, depending upon exactly how bright these flashes were.

And, by the way, there is no need to assume they were all the same brilliance. Perhaps one or two when the objects were south of Rainier, were so bright as to appear like arc lights, but perhaps most of them were not that bright. We just don't know. Arnold has "massaged" (processed/analyzed) the data for us and given us the "massaged" result,

and here we are trying to reverse-engineer is "message process". We just cannot do it. He did not say "Every flash was like a welding arc, totally blinding me." He did say that he could see flashes far to the south (passing Mt. Adams)... which indicates they were bright,. And, by the way, which indicates that either the objects had flat surface that faced rearward during part of the tilt creating solar reflections backward or that the solar reflection (if it was a reflection) was from a nominally curved surface. (Curved surface could explain why there were solar reflections visible over such a wide angle of observation relative to the flight track.... over an angular range of about 100 degrees). Of course, if the flashes were pulses as if from a strobe light, radiating in all directions, then there would be no need for geometric alignment.

Speaking of flashes: another calculation coming up!

What would have been the initial luminous intensity of a SOURCE of light, radiating into "all space" (uniform radiation in all directions, even if mountain on a surface that blocks part of the radiation) bright enough to cause "spots before his eye" at a distance of 20 miles = 32 km?

.....THE FOLLOWING SHOULD BE COPIED AND APPENDED TO MY PREVIOUS PAPER SUMMARIZING THE CALCULATIONS

Arnold was looking into a bright field of light. I have already estimated the luminous intensity of the snow on Mt. Rainier. But Arnold was looking mostly at the white horizon sky if these objects were at his altitude or several thousand feet above or below. (The horizon is almost always white because of aerosol particles which are larger than the wavelength of visible light. Looking down from the horizon one sees ground. Looking up, the color of the sky changes from white to pale blue to deep blue directly overhead.... WHEN CLEAR, of course!).

I have a research article that indicates when the sun is at 42 degrees elevation in the west and the person is looking east from an altitude of 9000 ft the luminance, B , of the sky at the horizon is in the neighborhood of $B = 7500 \text{ lm/sr/m}^2$. The luminance decreases if you look up or down from the horizon. The general definition of luminance or "brightness" is the flux per unit area of the source projected onto the line of sight per unit solid angle of the receiver from the distance of the source to receiver. That is, the flux collected by the receiver is $B \times$ (solid angle of receiver aperture) $\times$ (projected area of source). But when one is looking at the sky this raises the questions (1) how far is the sky (the distance from the source is needed to calculate the solid angle of the receiver aperture) and "which square meter of the sky should I use for the area of the sky?" To solve this problem one writes Flux received into aperture = $B \times$ (area of aperture/ R^2) $\times$ (area of source). This doesn't mean much until you shift the position of R : Flux = B (area of aperture) $\times$ (area of source/ R^2). Now, (area of source)/ R^2 is by definition the solid angle of the source. The solid angle of the source is a "cone of acceptance" of light projecting from the aperture of the receiver out into the sky. The light coming into the aperture over this cone angle is the

integral over light sources "out there" in the sky. It is assumed that throughout the cone angle the brightness is constant.

Therefore the way to use this information is to assume a certain angular size resolution element in Arnold's eyeball and use this to calculate the "cone of acceptance" or solid angle of sky that would contribute light to that resolution element. Then multiply this by the area of his pupil to get the number of lumens hitting that resolution element. If we assume a resolution ("pixel") size of $0.6 \text{ mr} = 0.034$ degrees (corresponding to about 20 meter resolution at 20 miles) the solid angle is $2 \pi (1 - \cos(0.034/2)) = 2.2\text{E-}7$ steradians (where 0.034 is the "cone angle"). The area of Arnold's pupil was assumed to be about $3\text{E-}6 \text{ m}^2$ so the lumens entering his eyeball and hitting a resolution element would be only $7500 \times 2.2\text{E-}7 \times 3\text{E-}6 = 5\text{E-}9 \text{ lm}$.

It is amusing...and somewhat gratifying....to note that this number of lumens is comparable to what was calculated before for snow on the mountain using a large surface area (520 m^2), $5\text{E-}9 \text{ lm}$. One expects these to be comparable because the distance to the mountain is considerable and in each case the source is sunlight scattered from a diffuse surface (the sky has lots of tiny diffuse surfaces...aerosol articles). (NOTE: the mountain would be a lot brighter than the sky close to the mountain. As one gets closer to the mountain the lumens from the sky stays the same (!) since the solid angle of acceptance doesn't change, but the number of lumens from the mountain increases as the range shrinks - solid angle of acceptance increases - and the atmospheric attenuation decreases.)

The amount of lumens from the flash was larger than this. I don't have data on the illuminance, lm/m^2 necessary to "flash blind" a resolution element of the eye. Assume for working purposes that it is B lumens. Then with the eye pupil $3\text{E-}6 \text{ m}^2$ and the distance to the source being $R = 20 \text{ miles} = 32\,000 \text{ m}$, the luminous intensity of the source, I_s , is found by inverting the equation, $B = (I_s/R^2)(\text{Area})T = (I_s/32000^2)(3\text{E-}6)(1/2)$, where T is the atmospheric transmission over range R . Solving for I_s :

$$I_s = B(32000^2)/(3\text{E-}6 \times 1/2) = (6.8\text{E}14)B.$$

If B were as low as $1\text{E-}8$, that is, comparable to the sky brightness calculated above (and we know that sky brightness can produce "spots before the eyes" that you can observe by closing your eyes or going into a dark room, but not while looking at the bright sky) then I_s would be around $7\text{E}6 \text{ lm/sr}$. However, to produce "spots before your eyes" that can be "dense" enough to wipe out vision in full daylight (over a resolution area), B would likely have to be 10 or 100 times as intense as the skylight. That would put I_s into the range of $7\text{E}7$ to $7\text{E}8 \text{ lm/sr}$. Assuming 4π radiation from the source this puts the number of lumens radiated at about $9\text{E}8$ to $9\text{E}9$. High pressure arc lamps are about the most efficient visible light sources and operate at luminous efficiencies on the order of 50 $\text{lm/electrical watt input}$. A source with this efficiency would have to be driven by about $1.8\text{E}7$ to $1.8\text{E}8$ watts to create the number of lumens. I don't know what a welding arc puts out (not listed as a typical light source!), but probably not a lot more than a xenon high pressure short arc

lamp.

Incidentally, the Applied Optics paper which provided the sky luminance also lists the reflectance of water as 0.02 to 0.03 and of snow as ranging from 0.6 to 0.8 under the conditions of observation that would apply to the Arnold sighting (for which water reflectance is related to the reflection of clear ice).

Unfortunately, yes we do have a factual reason.

There is one BIG fact that causes a problem here. One about the size of an airplane. I seem to recall that Arnold was flying

one at the time of the sighting.

In order for any theory to work, it has to be consistent with the fact that Arnold was flying in an airplane going at least twice as fast as the fastest sustained level flight by a bird on record. This makes the geometry of the sighting difficult to explain with birds, unless Arnold was flying in a compass direction more than 100 degrees away from the heading of the objects.

Even then, it's hard to reconcile with the account, because as they neared Mt Adams, they should have seemed to get larger in angular size and faster in angular velocity before they faded into the distance BEHIND Arnold's plane. Birds could have receded from Arnold's plane only in a rearward direction. The very fact that they first appeared to his far left and then crossed in front of his plane is sufficient to indicate that their airspeed exceeded his own. The possible angle at which the objects were first sighted (with respect to Arnold's flight path) decreases as the object speed is reduced.

Unless Arnold was in a constant left turn throughout the sighting. But then, they might have appeared to follow a curved path, and the closest approach would have been on his right.

The only other way I can get around that is if the birds tied themselves together with ropes and pelican hooks, and that the lead bird had the PK-421 jet engine conversion kit installed. And of course, they all had to have the PK-U2 aluminum high speed stabilizer accessory to keep from spinning like mad. This, of course, reflected the sun. :)

I think he was straining to find a reasonable explanation and in the heat of the moment was thinking more about the way they flew than the way they flashed. Also, one does not necessarily think logically in the heat of the moment.

Also consider this: he was first attracted by a flash of light, he didn't know from where, and started looking for a nearby airplane. This implies the flash was bright. As he was still looking around when another flash came and attracted his attention to the north of Rainier. Then he saw the objects... tiny dots in a chain, flying like geese and immediately thought "those look like geese..". Perhaps there were no flashes for a few seconds and Arnold said to himself, "But they can't be geese. They're too high and flying in the wrong direction."

Then another flash came and another and he realized they had to be some new high speed aircraft and all thought of geese FLEW out the window. :)

. Hence he started looking for a familiar aircraft shape and decided to time them.

>Doesn't it imply these reflections weren't so startling,

No.

And, by the way, my brightness calculations have turned the pelicans into albatrosses. Even the Ancient Mariner

wouldn't continue proposing the "aviary hypothesis."

Following my previously mentioned enquiries of local, knowledgeable sources, in an attempt to confirm the identity of Arnold's "jagged peak that just out from the base of Mt. Rainier proper", I have received a belated, although no less welcome reply.

This is from the staff at Mount Rainier National Park:

Hello James,

The consensus from my coworkers is that the "jagged peak" is Little Tahoma. This peak can be seen from many areas around the mountain.

Mt. Rainier is said to rise 11,000 feet from its base. Hope this helps you out.

Chris Trotter
Park Guide

Douglas Kraus
Park Naturalist
[End]

It's consequently even more convincing that Little Tahoma is the source.

As discussed, we have to acknowledge Arnold's considerable testimony which confirms the object's flight path was west of Mt. Rainier and unless Arnold's objects did in fact travel eastwards behind Mt. Rainier, what was the pivotal 'UFO' case increasingly has a demonstrable, fundamental predicament.

James.

>Adams, perhaps for as far away as 50 miles.>"

>COMMENTS: How feasible is this and if factual, which I
>greatly doubt, what might it tell us about the objects'
>size and reflectability?

This is an interesting point which I have alluded to in a previous

post, namely that the light from the objects, whether solar reflections or generated by light sources at the objects, must have been quite great. However, the idea that he could see them as far as Mt Adams about 40 mile south is consistent with his claim of "blinding brightness," or whatever. If they were "extremely bright" as seen near Mt Rainier about 20 miles away, then they certainly were bright enough TO BE SEEN (although not bright enough to cause temporary "spots before his eyes) at 40 miles. The decrease in brightness is proportional to the (atmospheric attenuation)/distance². Previously I gave the atmospheric transmission factor as 0.46 for 32000 k (20 miles). Now at double the distance I get 0.2 or about 1/2 of the previous transmission. The distance was doubled so the 1/R² factor is 1/4 of the previous. Thus the flash brightnesses of the previous calculations should be multiplied by about (1/2) 1(4) = 1/8. The flashes were so bright at 20 miles that they would still be visible even if reduced in intensity by a factor of 8. Hence I conclude that they would still be visible at Mt. Adams..... unlike pelicans, of course.

.....

Continuing with what James sent:

>He said that at first he thought the window of his plane
>might be causing the reflections, but that he still saw the
>objects after rolling it down.

>He also described the objects as 'saucer-like' and their
>motion 'like a fish flipping in the sun'.

>Mostly, he said, he was surprised at the way they twisted
j>ust above the higher peaks, almost appearing to be
t>heading their way along the mountain ridge line.

>'No orthodox plane would be flying like that,' he
>commented."

>COMMENTS: And least likely of all things conceivable is a
f>leet of alien spacecraft. It would be consistent with
>birds though.

That's the problem, James. Not consistent with birds. Thanks to all this discussion of the brightness and my calculation of just how bright a large bird might appear if at Arnold's altitude (or close to it) and within a mile or so of his plane, we now have another physics based reason to reject birds. (The first reason was..... well, you know what it was... DRAW A MAP!)

>Source: Norman, Oklahoma Transcript, June 26, 1947 -

>"There were nine of them and they were flying in a screwy formation about 25 miles away from me. It wasn't any military formation I ever saw before'.

[...]

>Arnold said the strange aircraft were skittering across the southwest slope of Mount Rainier when he first sighted them".

>COMMENTS: So far as I can see, this is essentially the story Arnold first told - the objects, or 'flashes' from them, were noticed as they passed Mt. Rainier.

Seems to me like typical newspaper misreporting. The newspaper guy couldn't care less whether Arnold said he saw the objects before they reached Rainier or when they reached Rainier.

>It later became the tale of nine objects which _even after they first came to Arnold's notice_ were supposedly still over a hundred miles away! As he claimed in his book:

Yes.... but he didn't have any distance reference to go by in this case. They seemed to be near Mt. Baker, but more likely they were in the direction of Baker and much closer.

>"It was during this search and while making a turn of 180 degrees over Mineral, Washington, at approximately 9200 feet altitude, that a tremendously bright flash lit up the surfaces of my aircraft. I was startled. I thought I was very close to collision with some other aircraft whose approach I had not noted. I spent the next twenty to thirty seconds urgently searching the sky all around--to the sides, above and below me--in an attempt to determine where the flash of light had come from.

[...]

>Before I had time to collect my thoughts or to find any close aircraft, the flash happened again. This time I caught the direction from which it had come. I observed, far to my left and to the north, a formation of very bright objects coming from the vicinity of Mount Baker, flying very close to the mountain tops and traveling at tremendous speed.

>At first I couldn't make out their shapes as they were
>still at a distance of over a hundred miles...".
[End of quote]

>And must have been even further away when, some 30 seconds
>before and travelling at the declared speed, they first
>'flashed' and practically turned night into day.

>Is this universally accepted as a ridiculous exaggeration
>and if so, where do we draw the line?
[End]

If you project a line passing the west side of Rainier at
160 degrees azimuth and draw a line from Mineral to
Mt. Baker you can get a better idea of how far they were
away. Also, by the way, they may not have been following
a straight path as they approached Rainier.

On the other hand, to give "the explanation" its due,
pelicans east of him wouldn't cast a "bright light" on his
aircraft unless they were within a few feet...and about
to get chopped into birdmeat by the propellor.

>Source: Oregon Journal, June 27, 1947 -

>"Arnold, general manager and owner of the Great Western
>Fire Control Company, said he first saw the objects when
t>hey flashed in the sun low over the slopes of Mt. Rainier.

>"Then I saw them, weaving and ducking in and out as they
>came south not more than 500 feet over the plateau. They
>looked like they were rocking. I looked for the tails but
>suddenly realized they didn't have any. They were half-moon
>shaped, oval in front and convex in the rear. I was in a
>beautiful position to watch them. I thought they might be
>jet planes, and I clocked them. Then when I saw they had no
t>ails and I realized how fast they were going, I knew they
>were like nothing I had ever heard of before. There were no
>bulges or cowlings; they looked like a big flat disk. They
>were larger than the ordinary jet plane but slightly
>smaller than a DC4, if you don't count the rear fuselage'.

>COMMENTS: A further reported testimony of how these objects
>were first seen over the slopes of Mt. Rainier, not a
>couple of hundred miles northwards.

>The fact they were 'flashing' is, as I demonstrated,
>comparative to how a formation of large, predominately
>white birds have been documented as exceptionally
>reflective, using the exact same terminology.

>[End]

A further likelihood of the newspaper reporter not getting it quite right. But, on the other hand, he did give a shape (half moon shaped, oval in front, convex in the rear.. no bulges or cowlings, they looked like a big flat disc. larger than the jet plane but smaller than a DC-4.... which he CONVENIENTLY had for comparison (at an estimated 15 miles; might have been closer than that). Not one mention of wings, flapping, etc..

As for white birds being described as bright using Exact same terminology"... so what? That's a qualitative statement where we are trying to make quantitative comparisons. White paper is bright compared to grass. But my eyes do not get flashblinded by looking at white paper.

>Arnold said that the objects waved 'like the tail of a Chinese kite'."

>COMMENTS: And as previously demonstrated, _identical_ to
>how a formation of certain large, undulating, predominately
>white birds are known to fly.
>[End]

Yes, yes, yes..... and Arnold quickly rejected the bird hypothesis, although perhaps for the wrong reasons, but he evidently found no reason to return to the birds hypothesis after he had once rejected it because the objects WEREN'T BIRDS!

>Source: Radio Interview -

>"...I was approximately 25 to 28 miles from Mt. Rainier, I
>climbed back up to 9200 feet and I noticed to the left of
>me a chain which looked to me like the tail of a Chinese
>kite, kind of weaving and going at a terrific speed across
t>he face of Mt. Rainier. I, at first, thought they were
>geese because it flew like geese..."

>COMENTS: Even at this stage, when they crossed in front of
>Mt. Rainier, apparently these nine objects were similar to
>a flight of birds. Although Arnold does go on to say he
t>hought they were flying too fast (then again, he thought
t>he 25-30 duck-like objects were quicker than ducks could
>fly), where is Arnold's rationale about the supposed
>brilliant reflections during or before he first observed a
'>chain' of objects? Strangely, he doesn't mention here at

>all how the flashes 'lit up his plane'.

>The point is, if he simply noticed a chain/ribbon/kite-tail
>like formation of nine objects crossing Mt. Rainier, then
>it's a whole different story. That's what he says here and
>it's also the circumstances described in those early
>newspaper reports.

>In short, no mention of any inaugural 'flashes' . The story
>is one where the objects were simply noticed crossing Mt.
>Rainier.

>What we seem to have in these formative accounts is
>Arnold's explanation of how, as he was _making a turn_ over
>the town of Mineral, his attention was caught by one or
>more bright flashes of light and he then noticed a number
>of objects either approaching or crossing Mt. Rainier.

>As their chain-like formation was similar to a flock of
>Geese, Arnold statedly at first thought that's what they
>were.

>It seems absolutely certain these objects flew on the
>western side of Mt. Rainier and we have seen how Arnold
>clarified this on a number of occasions.

>That recognised, it also has to be accepted why if Arnold's
>referenced peak was, as looks most likely, Little Tahoma,
>then his distance perceptions are _proven_ to be literally
>miles off.

>Everything else falls down from there - his speed
>calculations based on apparent size and distance, etc.

>Do we actually now have any factual reasons - excluding
>opinions about what Arnold should have recognised (it's
>become clear there were a number of things Arnold _should_
>have recognised and not only about this incident) - why the
>'flashes' were not simply bright/brilliant reflections from
>exceptionally large, white birds, crossing Mt. Rainier and
>heading in the direction of Mt. Adams, eventually
>disappearing from sight?

Any factual reasons.....

1) despite your desire, no one ever got "flashblinded" by
light from a bird that WAS NOT nearly aligned with the sun
(and probably not even by birds that were nearly aligned
with the sun); and in Arnold's case the hypothetical birds were
definitely not aligned with the sun. Moreover, they could

not have been close (within a mile) or he would have recognized them.

2) Arnold did give a shape that did not match birds.

3) since the hypothetical birds would have had to pass no more than a couple of miles from the plane he would have overtaken them and would have realized he was going more rapidly than they. More specifically, if they were far enough north when he first saw them he would pass the crossing point of their paths (he eastward and they southward) before they got there, in which case he would last see them behind and to the left./ OR if they were far enough south when he first saw them they might pass the crossing point first and he would last see them out the passenger side window (unless he turned his airplane to follow...in which case he could approach them since they were going more slowly than he) OR they might reach the crossing point at the same time and feathers might fly!

It if walks like a duck, talks like a duck and looks like a duck, and if it does nothing that a duck couldn't do, its a duck. Unfortunately, Jim. all you've got is "it walks like a duck."

>objects.

><

Larry,

I can see that you have done, at least in your mind, what
I have been urging James to do for about a year or more
(how far back does this go anyway?)

namely..

DRAW A MAP.....

(showing the plane flying and the birds flying along
reasonable trajectories and find out whether or

not the bird hypothesis makes any sense in the context of what Arnold wrote/said about the speed and trajectory of the objects, seen first north of Rainier, then passing Rainier then traveling southward at a steady rate and passing Mt. Adams about 102 seconds after they passed Mt. Rainier)

Subject: Re: Kenneth Arnold and Little Tahoma PeakStatus:

James,

This statement from the Mt. Rainier National Park naturalist and guide confirming that Arnold's description of the peak the objects passed BEHIND must be Little Tahoma also confirms they passed BEHIND Rainier as a whole since Little Tahoma was more distant than Rainier's summit from Arnold's position.

That is indeed a "predicament" in view of some of Arnold's testimony putting the objects in FRONT of Rainier and the great bulk of his testimony, his DRAWING, his MAPPING data, which put the objects BEHIND Rainier.

And if the objects were BEHIND Mt. Rainier then they were at least 20+ miles away and IMPOSSIBLE TO SEE if they were BIRDS.

In the past week I have been going over the optics of Arnold's sighting with Dr. Bruce Maccabee on this List (we disagree on some points but more data is coming in). The objects' flashes were easy to see because of their brightness. The objects were more difficult to see when NOT flashing -- Arnold indicated they almost or actually did disappear when flying flat.

Please note that the non-flashing objects would have been the MOST DIFFICULT to see both when MOST DISTANT and also when the CLOSEST, and easiest to see in between those phases. This sounds paradoxical. Difficulty in seeing something due to distance is understandable. But at the CLOSEST distance to Arnold and most nearly at right-angles to his line of sight -- i.e., when near Rainier -- the objects were traveling at their highest angular velocity and would have been the most difficult to see. In the "flicker rate" interval of less than the blink of an eye these extremely tiny objects would have traveled about 1.3 to 3 times their length (depending on whose figures you use) and I contend would have been completely INVISIBLE (Bruce disagrees but this was originally his calculation and there are no other empirical data to prove it wrong). But when farther away and looking more "down their tailpipes" (if they had any) their sideways motion would have been much less.

Thus, it appears that Arnold's conflicting testimony about east-side/west-side or behind/front passage of the objects can therefore be explained if in fact his principal means of observing the objects when they were near Rainier was by their infrequent FLASHES, that there were not enough flashes to blaze an easy-to-see path across Rainier (the gap between flashes was large enough to "miss" Rainier or occur before and after), and so he was guessing about their flight path.

Subject: Re: Kenneth Arnold and Little Tahoma PeakStatus:

James,

Thank you for pursuing this research into the geography of Mt. Rainier.

This statement from the Mt. Rainier National Park naturalist and guide confirming that Arnold's description of the peak the objects passed BEHIND must be Little Tahoma also confirms they passed BEHIND Rainier as a whole (since Little Tahoma was more distant than Rainier's summit from Arnold's position).

That is indeed a "predicament" in view of some of Arnold's testimony putting the objects in FRONT of Rainier and the great bulk of his testimony, his DRAWING, his MAPPING data, which put the objects BEHIND Rainier.

And if the objects were BEHIND Mt. Rainier then they were at least 20+ miles away and IMPOSSIBLE TO SEE if they were BIRDS.

In the past week I have been going over the optics of Arnold's sighting with Dr. Bruce Maccabee on this List (we disagree on some points but more data is coming in). The objects' flashes were easy to see because of their brightness. The objects were more difficult to see when NOT flashing -- Arnold indicated they almost or actually did disappear when flying flat and not flashing of course.

Please note that the non-flashing objects would have been the MOST DIFFICULT to see both when MOST DISTANT and also when the CLOSEST, and easiest to see in between those phases. This sounds paradoxical. Difficulty in seeing something due to distance is understandable. But at the CLOSEST distance to Arnold and most nearly at right-angles to his line of sight -- i.e., when near Rainier -- the objects were traveling at their highest angular velocity and would have been the most difficult to see. In the "flicker rate" interval of less than the blink of an eye these extremely tiny objects would have traveled about 1.3 to 3 times their length (depending on whose figures you use) and I contend would have been completely INVISIBLE (Bruce disagrees but this was originally his calculation and there are no other empirical data to prove it wrong). But when farther away and looking more "down their tailpipes" (if they had any) their sideways motion would have been much less.

Thus, it appears that Arnold's conflicting testimony about east-side/west-side or behind/front passage of the objects can therefore be explained if in fact his principal means of observing the objects when they were near Rainier was by their infrequent FLASHES, that there were not enough flashes to blaze an easy-to-see path across Rainier (the gap between flashes was large enough to "miss" Rainier or occur before and after), and so he was guessing about their flight path. Some of his guesses passed in front of Mt. Rainier and some passed behind. I think he probably settled on "behind" Rainier after he thoroughly reviewed the flight path on his map after the first few days.

Larry,

One of the important aspects which may have been clarified is that, contrary to what Arnold stated in his letter to the Air Force, he wasn't cruising towards Yakima when the observation occurred.

Even in the symposium talk he gave years later and corroborating the scenario depicted in his book, Arnold explained that the sighting began when he was in the process of making a turn over Mineral. For example, from the symposium:

"As I came out below on this first sweep I passed over the little community of Mineral Washington, the pine trees there, and knew pretty much where I was. I made a turn at probably 2000ft over Mineral, Washington and started climbing back slowly but steadily, climbing to gain sufficient altitude to go back on the high plateau again for another pass at this mountain. As I was making this turn and of course flying directly toward Mt. Rainier, at about 9200 ft elevation - it was a beautiful day, in fact the plane was very stable, I didn't have to fight controls or weather or anything - a tremendous flash appeared in the sky and it lit up my whole aircraft...".

This was a turn to the right, according to his letter.

However, as we know Arnold made another, potentially significant, turn:

Source: Radio Interview

"Well, uh, I uh, it was about one minute to three when I started clocking them on my sweep second hand clock, and as I kept looking at them, I kept looking for their tails, and they didn't have any tail. I thought, well, maybe something's wrong with my eyes and I turned the plane around and opened the window, and

looked out the window, and sure enough, I couldn't find any tails on 'em".

Source: Letter

"A number of news men and experts suggested that I might have been seeing reflections or even a mirage. This I know to be absolutely false, as I observed these objects not only through the glass of my airplane but turned my airplane sideways where I could open my window and observe them with a completely unobstructed view".

This seems to be a point which was regrettably never clarified in later years, as were obviously now many others, and we can only deduce what exactly happened.

Judging by his comments from the interview, it sounds like Arnold made that turn just after he began his timing exercise.

Which window - right or left-hand side - would Arnold probably have 'lined up' sideways with the objects? Does that tell us how he most likely turned his airplane and in which direction?

What then - did he return to his original heading?

Unless we quantify this, it's debatable - not factual - what Arnold's perceptions were throughout the incident.

And which version of events do we accept. In his letter, sometimes taken as the definitive account, Arnold stated:

"I observed the chain of these objects passing another high snow-covered ridge in between Mt. Rainier and Mt. Adams and as, the first one was passing the south crest of this ridge the last object was entering the northern crest of the ridge.

As I was flying in the direction of this particular ridge, I measured it and found it to be approximately five miles so I could safely assume that the chain of these saucer like objects were at least five miles long".

Was Arnold at this time, really travelling in the direction of 'Goat Ridge'? If so, he must have radically altered course from the original heading towards Mt. Rainier.

I've highlighted how Arnold alternatively claimed in his book:

"As the first unit of these craft cleared the southernmost edge of this background, the last of the formation was just entering

the northern edge. I later flew over this plateau in my plane and came to a close approximation that this whole formation of craft, whatever they were, formed a chain in the neighborhood of five miles long".

This seems to be a different story - the estimation was made afterwards.

Although I had assumed Arnold didn't measure the plateau until later, I'm not so sure anymore, realising in hindsight that Arnold consistently portrays he wasn't immediately anxious about events and continued with his search. As he recalled in his letter:

"I continued my search for the marine plane for another fifteen or twenty minutes and while searching for this marine plane, what I had just observed kept going through my mind. I became more disturbed, so after taking a last look at Tieton Reservoir I headed for Yakima".

[An aside - I can't find Tieton Reservoir on any map - where was/is this located?]

So, assuming these nine, undulating, objects with ribbon/chain/kite-tail-like flight characteristics were conceivably large, reflective birds... does the fact Arnold turned his airplane around to get a better look, plus possibly changed direction and maybe followed them, whatever, equate with a basis why Arnold would definitely - not 'in all probability' - have recognised what the circumstances truly were?

James.

Perhaps..... but certainly no worse than the
predicament than the pelican hypothesis.

This indicates that we really need to know the exact path of Arnold's plane. If he made a left turn to watch them out the right hand window, then the bird hypothesis is not dead, as I said before.

But if he made a left, and then a right, then it isn't dead.

One of the drawings somebody posted (I can't see them while they are in the emails, so I don't know who anymore) shows the plane turning south during the sighting.

It's very possible that halation produced the observed shape.

@later years, as were obviously now many others, and we can only
@deduce what exactly happened.

@

@Judging by his comments from the interview, it sounds like Arnold
@made that turn just after he began his timing exercise.

@

@Which window - right or left-hand side - would Arnold probably
@have 'lined up' sideways with the objects? Does that tell us how
@he most likely turned his airplane and in which direction?

@

@What then - did he return to his original heading?

@

@Unless we quantify this, it's debatable - not factual - what

@Arnold's perceptions were throughout the incident.

@

@And which version of events do we accept. In his letter,

@sometimes taken as the definitive account, Arnold stated:

@

@ "I observed the chain of these objects passing another high snow-

@covered ridge in between Mt. Rainier and Mt. Adams and as, the

@first one was passing the south crest of this ridge the last

@object was entering the northern crest of the ridge.

@

@As I was flying in the direction of this particular ridge, I

@measured it and found it to be approximately five miles so I

@could safely assume that the chain of these saucer like objects

@were at least five miles long".

@

@Was Arnold at this time, really travelling in the direction of

@ 'Goat Ridge'? If so, he must have radically altered course from

@the original heading towards Mt. Rainier.

@

@I've highlighted how Arnold alternatively claimed in his book:

@

@ "As the first unit of these craft cleared the southernmost edge

@of this background, the last of the formation was just entering

@the northern edge. I later flew over this plateau in my plane and

@came to a close approximation that this whole formation of craft,

@whatever they were, formed a chain in the neighborhood of five

@miles long".

@

@This seems to be a different story - the estimation was made

@afterwards.

@

@Although I had assumed Arnold didn't measure the plateau until

@later, I'm not so sure anymore, realising in hindsight that

@Arnold consistently portrays he wasn't immediately anxious about

@events and continued with his search. As he recalled in his

@letter:

@

@ "I continued my search for the marine plane for another fifteen

@or twenty minutes and while searching for this marine plane, what

@I had just observed kept going through my mind. I became more

@disturbed, so after taking a last look at Tieton Reservoir I

@headed for Yakima".

@

@ [An aside - I can't find Tieton Reservoir on any map - where

@was/is this located?]

@

@So, assuming these nine, undulating, objects with

@ribbon/chain/kite-tail-like flight characteristics were
@conceivably large, reflective birds... does the fact Arnold
@turned his airplane around to get a better look, plus possibly
@changed direction and maybe followed them, whatever, equate with
@a basis why Arnold would definitely - not 'in all probability' -
@have recognised what the circumstances truly were?

@

@

@James.

<

It is too bad that Arnold wasn't second-by-second precise, but he wasn't. We have to cobble together a story from "partial records," truncated statements, etc., where he mentions something in one statement and not in another. It recently came to my attention that he mentioned the DC-4 sighting in his AF letter and in his book but NOT IN THE RADIO TESTIMONY THE DAY AFTER !!!!!

HORRORS! Does tha mean that we have to throw out his statement made in the AF letter and his book?

NO! It merely means that his radio testimony is incomplete. How many of the newspaper accounts mention the DC-4?

(BY THE WAY: since there have now been many newspaper references and other souces mentioned in this discussion I think it would be a good idea for someone to make a collection similar to my recently posted - and more recently updated... collection of calculations. It would be nice to have ONE text file as a reference for ALL available Arnold statements. I could probably do this by searching past mail, but perhaps one of you guys already has such a text file.)

As for choosing the souces of data I stick to my CUFOS/MUFON version which uses the AF letter and the book exclusively with his radio address appended. The AF letter, in particular, is likely to be the most thoughtful, recent account of the event. He spent considerable time in the letter describing himself and how he happened to be searching for the Marine transport, etc. Point is that he was careful and tried to be complete. The newspaper stories, etc., leave stuff out, shift events in time,

truncate, etc.

REgarding James' question above: it is true that we don't have an exact track of Arnold's plane. In the AF letter he clearly says he had trimmed out his plane toward Yakima. This was written only weeks after the event, as opposed to a verbal statement made 30 years after the event at the 1977 symposium. I would put more weight on the statement in his letter.

But then comes the question of turning his aircraft and rolling down the window. He was heading east (even if just coming out of a turn) as these objects were flying southward past Rainier. I believe he started his timing and then, turned his plane tO THE RIGHT and rolled down the window at his left... which was the closest window to him. That way he would have been flying parallel to the objects. No reason to turn to the left and reach across the cockpit to open the window while head AWAY (northward) from the objects (flying southward). Now, even if he wasn't flying almost due east toward Yakima, but rather toward Rainier for another search (not a big angle difference here), it would have made more sense for him to turn to the right and open the left window.

He may not have turned 90 degrees to the right, but only enough to see through the open window. This amount of turn could have headed him toward Goat Ridge. But, in any case, Goat Ridge was not far south of his originally intended track toward Yakima, so when he says he was flying generally in the direction of Goat Ridge, this could be true even if he wasn't headed exactly directly toward it.

Now, once he had turned enough to see the "birds" through the open window, because of the way the cockpit is built, he wuld have been heading in a direction AHEAD of the birds (at that "instant " of viewing out the window) UNLESS he turned about 90 degrees and flew parallel with them,. In EITHER CASE... he could hardly fail to notice within a few seconds that he was GAINING on them.... catching up to them..... unless, as Larry pointed out, they happened to be attached to an invisible "Stealth" aircraft dragging them along.....

Make some reasonable assumptions and DRAW A MAP!!!
I did. Perhaps others have. It's not so hard.
Then you'll see.
All you've got here is "it walks like a duck."

UK subscribers might be interested in a couple of satellite TV programs being shown later tonight:

History Channel, 7.00-8.00pm:
Project Cancelled - A report on the Rotodyne, a failed vertical take-off aircraft.

UK Horizons, 11.00-12.00pm:
Secrets of World War II - A look at the Japanese plan to bomb America and Canada using explosive balloons.

The Japanese Fugo (Fu-go) balloons are an interesting topic (they feature in the Roswell case - although apparently not the explanation!) and have been the subject of past discussions.

I hope to watch this program and if there's anything of note, I'll post details.

James.

"FIRST AUTHENTIC PHOTO OF FLYING SAUCERS"

I have a UFO magazine with an article that has that headline. We had been in World War II less than 3 months. An object was seen flying over the city of Los Angeles California on February 25, 1942. Searchlights converged on the object, and antiaircraft guns opened fire. The photo was of the object caught in the searchlight beams, surrounded by bursts of flak. The object looked like a blimp, and moved slowly. No bombs were dropped and no airplanes were shot down. Debris from the flak rained down on the city below. The object suddenly left the beam, and they

couldn't find it again.

I think this was a Fugo.

@I hope to watch this program and if there's anything of note,

Subject: Re: Arnold Database & His Open WindowStatus:

Hi Guys,

I am compiling a comprehensive database of all interviews and statements of Arnold. It is about 75% complete but some major sections are riddled with scanning errors which will take time to correct (mostly his Coming of the Saucers text and 1980 Fate book chapter).

As for the turn to open his window, Joel Carpenter who is a pilot, estimates that a 90-degree turn would have been executed in about 10 seconds and a return 90-degree turn back on course another 10 seconds (it could have been done faster but would've required more steep banking). As Bruce points out Arnold may not have needed to turn a full 90 degs or so. Let's say 45 degs. Then the two 45-deg turns would have occupied about 10 seconds total.

Brad

Date: Thu, 30 Mar 2000 18:14:14 EST
Subject: Re: Arnold -- Wrong TurnStatus:

Larry,

How can a brief left turn -- lasting probably 5-10 seconds (see my last posting) and followed by a compensating right turn of 5-10 seconds to get back on course -- explain the sighting directions of the full 2+ minute event if the objects were BIRDS? You need to DRAW A MAP. Arnold reported a continuous north-to-south flight path appearing to cross 100+ degrees of sky in 1.7+ minutes while Arnold was traveling eastward at 2 miles per minute.

Birds would have to be seen projected against a direction to the north of Mt. Rainier towards Mt. Baker and then progressively appear to move southward till disappearing south of Mt. Adams.

The left or northwest edge of Mt. Rainier from Arnold's position at approximately six miles east of Mineral, Wash., is at about azimuth 46 degrees. Arnold's heading towards Yakima is at 97 degs. The right hand edge of Mt. Adams is at about 144 degs azimuth. Hence the total azimuth spread of the objects' flight path covered at least 98 degrees of sky as seen by Arnold of which about half, or 51 degs (or more), was to the LEFT of Arnold's heading and about half, or 47 degs (or more), was to the RIGHT.

Another way to look at this is from a clock position centered on Arnold with straight ahead as 12 o'clock. Very roughly the objects were first seen to the north of Rainier at about Arnold's 10 o'clock position passing to the right through 12 o'clock straight ahead in roughly 1 minute of time and continuing till they disappeared south of Mt. Adams at roughly the 2 o'clock position after roughly another 1 minute of time. (I'm rounding off to the nearest clock hour and incorporating the additional flight path north of Rainier and south of Adams which can only be crudely estimated.)

The only way a LONG LEFT turn can make birds appear in the first half of the sighting moving from Arnold's 10 o'clock to his 12 o'clock is if they were so far away he could not overtake them (overtaking them would, of course, absurdly put the birds behind Arnold instead of in front). That means a minimum initial distance of 2 miles (because Arnold was traveling 2 mi/min and this first half of the sighting lasted about 1 minute). The birds obviously had to be about north-northeast of Arnold initially.

But at the end of this one minute Arnold must now be heading straight northeast towards the birds in order for them to be at his 12 o'clock position. But the birds must appear to the east not northeast of Arnold at this point about 1 minute into the sighting. How is this possible?

Either DRAW A MAP or provide a table of positions and directions at half minute or smaller intervals showing the positions of Arnold, the birds and background features of Rainier, Goat Ridge and Adams.

Brad

In a message dated Thu, 30 Mar 2000 9:45:22 AM Eastern Standard Time, Larry Robinson S/AP/EIS Kinesiology <lrobins@indiana.edu> writes:

<<

This indicates that we really need to know the exact path of Arnold's plane. If he made a left turn to watch them out the right hand window, then the bird hypothesis is not dead, as I said before.

But if he made a left, and then a right, then it isn't dead.

One of the drawings somebody posted (I can't see them while they are in the emails, so I don't know who anymore) shows the plane turning south during the sighting.

It's very possible that halation produced the observed shape.

@

@@

@Larry wrote:

@

@>There is one BIG fact that causes a problem here. One about the size
@>of an airplane. I seem to recall that Arnold was flying one at the
@>time of the sighting.

@

@[...]

@

@

@Larry,

@

@One of the important aspects which may have been clarified is
@that, contrary to what Arnold stated in his letter to the Air
@Force, he wasn't cruising towards Yakima when the observation
@occurred.

@

@Even in the symposium talk he gave years later and corroborating
@the scenario depicted in his book, Arnold explained that the
@sighting began when he was in the process of making a turn over
@Mineral. For example, from the symposium:

@

@ "As I came out below on this first sweep I passed over the little
@community of Mineral Washington, the pine trees there, and knew
@pretty much where I was. I made a turn at probably 2000ft over
@Mineral, Washington and started climbing back slowly but
@steadily, climbing to gain sufficient altitude to go back on the
@high plateau again for another pass at this mountain. As I was
@making this turn and of course flying directly toward Mt.
@Rainier, at about 9200 ft elevation - it was a beautiful day, in
@fact the plane was very stable, I didn't have to fight controls
@or weather or anything - a tremendous flash appeared in the sky
@and it lit up my whole aircraft..."

@

@This was a turn to the right, according to his letter.

@

@However, as we know Arnold made another, potentially significant,
@turn:

@

@Source: Radio Interview

@

@ "Well, uh, I uh, it was about one minute to three when I started
@clocking them on my sweep second hand clock, and as I kept
@looking at them, I kept looking for their tails, and they didn't
@have any tail. I thought, well, maybe something's wrong with my
@eyes and I turned the plane around and opened the window, and
@looked out the window, and sure enough, I couldn't find any tails
@on 'em'".

@

@Source: Letter

@

@ "A number of news men and experts suggested that I might have
@been seeing reflections or even a mirage. This I know to be
@absolutely false, as I observed these objects not only through
@the glass of my airplane but turned my airplane sideways where I
@could open my window and observe them with a completely
@unobstructed view".

@

@

@This seems to be a point which was regrettably never clarified in
@later years, as were obviously now many others, and we can only
@deduce what exactly happened.

@

@Judging by his comments from the interview, it sounds like Arnold
@made that turn just after he began his timing exercise.

@

@Which window - right or left-hand side - would Arnold probably
@have 'lined up' sideways with the objects? Does that tell us how
@he most likely turned his airplane and in which direction?

@

@What then - did he return to his original heading?

@

@Unless we quantify this, it's debatable - not factual - what
@Arnold's perceptions were throughout the incident.

@

@And which version of events do we accept. In his letter,
@sometimes taken as the definitive account, Arnold stated:

@

@"I observed the chain of these objects passing another high snow-

Brad,

I've accumulated a collection of related text files from various sources and might be able to help with this.

To retain the formatting, rather than post anything to the list I've uploaded a compilation to:

<http://web.ukonline.co.uk/voyager/arnold.txt>

Trusting that it's permissible to include some content from the 'Project 1947' web site (duly attributed) and Bruce's symposium transcript (reformatted), the copyright concern would be material from Arnold's book. However, this was found on a web site and I can't realistically see any problems now.

James.

Subject: Re: Arnold's Flight PathStatus:

James,

If Arnold was not constrained by his 97-degree heading to Yakima but actually "changed direction" to "follow" the objects which you postulate were BIRDS, then he would have rapidly overtaken them and perhaps chopped them up in his propellers (as I think Bruce has suggested). He would never have lost sight of them in the distance if he was chasing around birds in a 100-120 mph airplane.

As for alleged discrepancies in heading, you need to be quantitative. You need numbers. The numbers make the discrepancies much less significant (see below). My problem is with inconsistency in Arnold's recollection of his intentions and actions -- did he head to Rainier to continue the search for the missing C-46 or did he head for home (via Yakima) or did he head for Goat Ridge immediately after his sighting?

The heading to Yakima was 97 degrees. The heading to the northwest end of Goat Ridge was about 112 degrees, a difference of only 15 degrees or half o'clock. The heading to Rainier's south side was about 66 degrees, a difference of about 31 degrees or one o'clock. So if Arnold was heading exactly towards Yakima he was still heading in approximately the general direction of Mt. Rainier.

This general-versus-specific direction must be the case because Arnold's July 1947 letter to the AAF has BOTH in sequence. First he says he flew westward AWAY from Mt. Rainier and towards Mineral. He made his turn over Mineral "starting again toward Mt. Rainier," indicating the GENERAL direction of east to distinguish it from heading west and away from Rainier to get to Mineral in the first place. THEN he says more SPECIFICALLY "trimmed out my airplane in the direction of YAKIMA, Washington, which was almost directly east of my position." That is when he saw the first flash.

Later, in 1977, Arnold apparently did not recall that he had headed to Yakima and thought he was continuing back to Rainier for another pass at searching for the downed C-46.

Tieton Reservoir/Dam are located at roughly 46-39 N, 121-07 W.

[...]

Larry,

One of the important aspects which may have been clarified is that, contrary to what Arnold stated in his letter to the Air Force, he wasn't cruising towards Yakima when the observation occurred.

Even in the symposium talk he gave years later and corroborating the scenario depicted in his book, Arnold explained that the sighting began when he was in the process of making a turn over Mineral. For example, from the symposium:

"As I came out below on this first sweep I passed over the little community of Mineral Washington, the pine trees there, and knew pretty much where I was. I made a turn at probably 2000ft over Mineral, Washington and started climbing back slowly but steadily, climbing to gain sufficient altitude to go back on the high plateau again for another pass at this mountain. As I was making this turn and of course flying directly toward Mt. Rainier, at about 9200 ft elevation - it was a beautiful day, in fact the plane was very stable, I didn't have to fight controls or weather or anything - a tremendous flash appeared in the sky and it lit up my whole aircraft...".

This was a turn to the right, according to his letter.

However, as we know Arnold made another, potentially significant, turn:

Source: Radio Interview

"Well, uh, I uh, it was about one minute to three when I started clocking them on my sweep second hand clock, and as I kept looking at them, I kept looking for their tails, and they didn't have any tail. I thought, well, maybe something's wrong with my eyes and I turned the plane around and opened the window, and looked out the window, and sure enough, I couldn't find any tails on 'em".

Source: Letter

"A number of news men and experts suggested that I might have been seeing reflections or even a mirage. This I know to be

absolutely false, as I observed these objects not only through the glass of my airplane but turned my airplane sideways where I could open my window and observe them with a completely unobstructed view".

This seems to be a point which was regrettably never clarified in later years, as were obviously now many others, and we can only deduce what exactly happened.

Judging by his comments from the interview, it sounds like Arnold made that turn just after he began his timing exercise.

Which window - right or left-hand side - would Arnold probably have 'lined up' sideways with the objects? Does that tell us how he most likely turned his airplane and in which direction?

What then - did he return to his original heading?

Unless we quantify this, it's debatable - not factual - what Arnold's perceptions were throughout the incident.

And which version of events do we accept. In his letter, sometimes taken as the definitive account, Arnold stated:

"I observed the chain of these objects passing another high snow-covered ridge in between Mt. Rainier and Mt. Adams and as, the first one was passing the south crest of this ridge the last object was entering the northern crest of the ridge.

As I was flying in the direction of this particular ridge, I measured it and found it to be approximately five miles so I could safely assume that the chain of these saucer like objects were at least five miles long".

Was Arnold at this time, really travelling in the direction of 'Goat Ridge'? If so, he must have radically altered course from the original heading towards Mt. Rainier.

I've highlighted how Arnold alternatively claimed in his book:

"As the first unit of these craft cleared the southernmost edge of this background, the last of the formation was just entering the northern edge. I later flew over this plateau in my plane and came to a close approximation that this whole formation of craft, whatever they were, formed a chain in the neighborhood of five miles long".

This seems to be a different story - the estimation was made afterwards.

Although I had assumed Arnold didn't measure the plateau until later, I'm not so sure anymore, realising in hindsight that Arnold consistently portrays he wasn't immediately anxious about events and continued with his search. As he recalled in his letter:

"I continued my search for the marine plane for another fifteen or twenty minutes and while searching for this marine plane, what I had just observed kept going through my mind. I became more disturbed, so after taking a last look at Tieton Reservoir I headed for Yakima".

[An aside - I can't find Tieton Reservoir on any map - where was/is this located?]

So, assuming these nine, undulating, objects with ribbon/chain/kite-tail-like flight characteristics were conceivably large, reflective birds... does the fact Arnold turned his airplane around to get a better look, plus possibly changed direction and maybe followed them, whatever, equate with a basis why Arnold would definitely - not 'in all probability' - have recognised what the circumstances truly were?

James.

Subject: Re: Arnold DatabaseStatus:

James,

Thanks! This helps a little bit though it trades off one set of problems (scanner errors) for another (loss of all formatting from your text).

Please note the scanner error in the time given in the 1947 site's text of the Pendleton East Oregonian article of June 26, 1947: The sighting was at 2:59 NOT 2:50, as shown in my direct photocopy of the article courtesy Jan Aldrich.

Bruce's very valuable direct transcription of the 1977 Arnold tape has numerous typos requiring correction.

I would think that it is okay to quote from Arnold's book for scientific criticism so long as you do not use it to promote your site or to sell it.

>Saucers text and 1980 Fate book chapter).

Brad,

I've accumulated a collection of related text files from various sources and might be able to help with this.

To retain the formatting, rather than post anything to the list I've uploaded a compilation to:

<http://web.ukonline.co.uk/voyager/arnold.txt>

Trusting that it's permissible to include some content from the 'Project 1947' web site (duly attributed) and Bruce's symposium transcript (reformatted), the copyright concern would be material from Arnold's book. However, this was found on a web site and I can't realistically see any problems now.

James.

Subject: Re: Arnold Sun Mirror ExperimentsStatus:

Bruce,

Thanks for these helpful calculations. I have some questions on some technical specifics. But first some points in comment on your points.

Arnold did estimate 20-30 seconds to search the sky to find the source of the flash (COTS 1952 p. 10) but only finding the DC-4. Then another flash and he spotted far to his left and to the north the formation of very bright objects. Arnold's duty cycle estimate comes from when the objects were approaching Rainier so perhaps I need to smooth in a gradual increase from 1 flash per 20 seconds to 1 per second for the group. My estimate of 100-200 flashes was for the entire sighting duration of 100-200 seconds. This should perhaps be reduced to about 50-100 flashes. The number of flashes total on the approach might be 10-20 or even less than the 30 you were estimating.

You make a point I was going to make and that is the statistical improbability of a flat mirror surface being oriented by chance so many times in exactly Arnold's direction from such a great distance as 50 miles (if that figure is assumed for modeling a flat-mirror UFO scenario). It would suggest that the UFO's were deliberately targeting Arnold with sun reflections from flat mirror surfaces of their vehicles, unless there is another explanation: You suggest reflections from high points of a curved surface, which would therefore be able to cover a wider area with solar reflections. But can you model this numerically?

Also, can you re-do your luminosity calculations for different distances such as bird distances of 1-2 miles? And can you re-do for sun elevation at 58 degrees? (The sun was at 58 degs at 2:59 PM MST.) Can the atmospheric attenuation factor be reduced for clearer air? Arnold's description is suggestive of CAVU conditions and not a "white horizon."

What is the lumens to watts conversion for sunlight?

Brad

In a message dated Wed, 29 Mar 2000 11:59:29 AM Eastern Standard Time, bruce maccabee <brumac@compuserve.com> writes:

<<

BRAD WROTE:

>It just seems to me that it would be hard for Arnold not to have caught at least one flash out of the total 100-200 or so right smack in the center of his field of view, thus impeding his fine-resolution foveal vision. And if

he had these dark after-images from the flashes arranged in a horizontal line

on either side of his center of focus wouldn't these dark after-images be suspiciously similar to the "thin dark lines" he reported for the objects when not flashing?

<

We don't know exactly how many seconds from the time of the first flash to the time when the objects were flying past Mt. Rainier, or when they were closest to Arnold (about 10 miles south of Rainier, silhouetted against either the white horizon haze or against the mountains below, depending upon one's "preference" for altitude; I choose lower altitude). However, if it were, say, 30 seconds, and if there were 3 flashes every "several seconds", say every 3 seconds, then there were $30/3 = 10$ bursts of 3 flashes = 30 flashes (obviously I can't say there were exactly 30 flashes). This is considerably less than the 1-- or more you mention, most of which occurred when the objects were south of Arnold on their flight toward Adams.

So, maybe by the time Arnold was seeing their shape there had been almost three dozen flashes.

These occurred at random positions within the line/chain of nine objects, we are told.

MAIN POINT: the probability of having one exactly in the middle of his fovea is lower than you imply (but not zero).

By the time of the 30th flash the "spot" from the first few flashes would be diminished considerably or would have been gone complete, depending upon exactly how bright these flashes were.

And, by the way, there is no need to assume they were all the same brilliance. Perhaps one or two when the objects were south of Rainier, were so bright as to appear like arc lights, but perhaps most of them were not that bright. We just don't know. Arnold has "massaged" (processed/analyzed) the data for us and given us the "massaged" result, and here we are trying to reverse-engineer the "massage process". We just cannot do it. He did not say "Every flash was like a welding arc, totally blinding me." He did say that he could see flashes far to the south (passing Mt. Adams)... which indicates they were bright,.

And, by the way, which indicates that either the objects had flat surface that faced rearward during part of the tilt creating solar reflections backward or that the solar reflection (if it was a reflection) was from a nominally curved surface. (Curved surface could explain why there were solar reflections visible over such a wide angle of observation relative to the flight track.... over an angular range of about 100 degrees). Of course, if the flashes were pulses as if from a strobe light, radiating in all directions, then there would be no need for geometric alignment.

Speaking of flashes: another calculation coming up!

What would have been the initial luminous intensity of a SOURCE of

light, radiating into "all space" (uniform radiation in all directions, even if mountain on a surface that blocks part of the radiation) bright enough to cause "spots before his eye" at a distance of 20 miles = 32 km?

.....THE FOLLOWING SHOULD BE COPIED AND APPENDED TO MY PREVIOUS PAPER SUMMARIZING THE CALCULATIONS

Arnold was looking into a bright field of light. I have already estimated the luminous intensity of the the snow on Mt. Rainier. But Arnold was looking mostly at the white horizon sky if these objects were at his altitude or several thousand feet above or below. (The horizon is almost always white because of aerosol particles which are larger than the wavelength of visible light. Looking down from the horizon one sees ground. Looking up, the color of th sky changes from white to pale blue to deep blue directly overhead.... WHEN CLEAR, of course!).

I have a research article that indicates when the sun is at 42 degrees elevation in the west and the person is looking east from an altitude of 9000 ft the luminance, B , of the sky at the horizon is in the neighborhood of $B = 7500 \text{ lm/sr/m}^2$. The luminance decreases if you look up or down from the horizon. The general definition of luminance or "brightness" is the flux per unit area of the source projected onto the line of sight per unit solid angle of th receiver from the distance of the source to receiver. That is, the flux collected by the receiver is $B \times (\text{solid angle of receiver aperture}) \times (\text{projected area of source})$. But when one is looking at the sky this raises the questions (1) how far is the sky (the distance from the source is needed to calculate the solid angle of the receiver aperture) and "which square meter of the sky should I use for the area of the sky?" To solve this problem one writes Flux received into aperture = $B \times (\text{area of aperture}/R^2) \times (\text{area of source})$. This doesn't mean much until you shift the position of R : Flux = $B (\text{area of aperture}) \times (\text{area of source}/R^2)$. Now, $(\text{area of source})/R^2$ is by definition the solid angle of the source. The solid angle of the source is a "cone of acceptance" of light projecting from the aperture of the receiver out into the sky. The light coming into the aperture over this cone angle is the integral over light sources "out there" in the sky. It is assumed that throughout the cone angle the brightness is constant.

Therefore the way to use this information is to assume a certain angular size resolution element in Arnold's eyeball and use this to calculate the "cone of acceptance" or solid angle of sky that would contribute light to that resolution element. Then multiply this by the area of his pupil to get the number of lumens hitting that resolution element. If we assume a resolution ("pixel") size of $0.6 \text{ mr} = 0.034$ degrees (corresponding to about 20 meter resolution at 20 miles) the solid angle is $2 \pi (1 - \cos(0.034/2)) = 2.2\text{E-}7$ steradians (where 0.034 is the "cone angle"). The area of Arnold's pupil was assumed to be about $3\text{E-}6 \text{ m}^2$ so the lumens entering his eyeball and hitting a resolution element would be only $7500 \times 2.2\text{E-}7 \times 3\text{E-}6 = 5\text{E-}9 \text{ lm}$.

It is amusing...and somewhat gratifying....to note that this number of lumens is comparable to what was calculated before for snow on the

mountain using a large surface area (520 m^2), $5\text{E}-9 \text{ lm}$. One expects these to be comparable because the distance to the mountain is considerable and in each case the source is sunlight scattered from a diffuse surface (the sky has lots of tiny diffuse surfaces...aerosol articles). (NOTE: the mountain would be a lot brighter than the sky close to the mountain. As one gets closer to the mountain the lumens from the sky stays the same (!) since the solid angle of acceptance doesn't change, but the number of lumens from the mountain increases as the range shrinks - solid angle of acceptance increases - and the atmospheric attenuation decreases.)

The amount of lumens from the flash was larger than this. I don't have data on the illuminance, lm/m^2 necessary to "flash blind" a resolution element of the eye. Assume for working purposes that it is B lumens. Then with the eye pupil $3\text{E}-6 \text{ m}^2$ and the distance to the source being $R = 20 \text{ miles} = 32\,000 \text{ m}$, the luminous intensity of the source, I_s , is found by inverting the equation, $B = (I_s/R^2)(\text{Area})T = (I_s/32000^2)(3\text{E}-6)(1/2)$, where T is the atmospheric transmission over range R. Solving for I_s :

$$I_s = B(32000^2)/(3\text{E}-6 \times 1/2) = (6.8\text{E}14)B.$$

If B were as low as $1\text{E}-8$, that is, comparable to the sky brightness calculated above (and we know that sky brightness can produce "spots before the eyes" that you can observe by closing your eyes or going into a dark room, but not while looking at the bright sky) then I_s would be around $7\text{E}6 \text{ lm}/\text{sr}$. However, to produce "spots before your eyes" that can be "dense" enough to wipe out vision in full daylight (over a resolution area), B would likely have to be 10 or 100 times as intense as the skylight. That would put I_s into the range of $7\text{E}7$ to $7\text{E}8 \text{ lm}/\text{sr}$. Assuming 4π radiation from the source this puts the number of lumens radiated at about $9\text{E}8$ to $9\text{E}9$. High pressure arc lamps are about the most efficient visible light sources and operate at luminous efficiencies on the order of 50 $\text{lm}/\text{electrical watt input}$. A source with this efficiency would have to be driven by about $1.8\text{E}7$ to $1.8\text{E}8$ watts to create the number of lumens. I don't know what a welding arc puts out (not listed as a typical light source!), but probably not a lot more than a xenon high pressure short arc lamp.

Incidentally, the Applied Optics paper which provided the sky luminance also lists the reflectance of water as 0.02 to 0.03 and of snow as ranging from 0.6 to 0.8 under the conditions of observation that would apply to the Arnold sighting (for which water reflectance is related to the reflection of clear ice).

Subject: Re: Arnold and Other Sundry ItemsStatus:

James,

You're dangerously close to exactly simulating my "COMMENTS" format for inserting responses. I'm going to have to distinguish mine as "SPARKS REMARKS."

Brad

In a message dated Wed, 29 Mar 2000 9:51:45 AM Eastern Standard Time, J.Easton@btinternet.com writes:

<<

Re recent discussions, which appear to assume without question that Arnold's objects were far distant

SPARKS REMARKS: We're not "assuming" great distances but trying to DETERMINE the distances by settling such as issues as the objects' passage in front or behind a massive object of known location, Mt. Rainier.

[Easton]

and
travelling at the speed he surmised, perhaps we could go over some related points. My comments are indicated:

Source: Pendleton, Oregon East Oregonian, June 26, 1947 -

"The Boise man, who owns the Great Western fire control supply which handled automatic fire fighting systems, described the objects as 'flat like a pie pan and somewhat bat-shaped' and so shiny they reflected the sun like a mirror.

He said the reflection was so brilliant that it blinded him, 'as if someone had started an arc light in front of my eyes'.

Mr. Arnold reported he was flying east at 2:50 p.m.

SPARKS REMARKS: Typo in the scan copy, the article says 2:59.

[Easton quoting article]

Tuesday
toward Mt. Rainier when the objects appeared directly in front of him 25-30 miles away at about 10,000 feet

altitude.

[...]

When first sighted, he thought the objects were snow geese.

SPARKS REMARKS: Please note these comments above from the newspaper article are NOT QUOTES and the second one is really NOT even a PARAPHRASE but a REPORTER'S UNDERSTANDING. A paraphrase would say "Arnold SAID that XYZ happened" without using quote marks. The second comment about geese is however implied to be paraphrase by the context of the overall reporting (preceding sentence is a clear paraphrase).

[Easton quoting article]

'But geese don't fly that high -- and, anyway, what would geese be doing going south for this time of year?'"

COMMENTS: Odd that Arnold is quoted as dismissing a flock of geese because of his perception about the objects' altitude and that geese wouldn't be flying south. It's an aspect I've brought up before; if Arnold truly did first notice the objects because of bright/brilliant reflections and they were initially so far distant as he claimed/thought, then why would he ever consider they might be birds?

Doesn't it imply these reflections weren't so startling, maybe only bright flashes of light, and the objects were in relatively close proximity?

[End]

SPARKS REMARKS: Arnold states in his 1952 book that it was 20-30 seconds before he saw another flash and could then connect up the flashes with the series of nine bright objects. There was a certain amount of time necessary to IDENTIFY THE SOURCE OF FLASHES as the BRIGHT OBJECTS he could now see. Evidently there was a brief time from Arnold spotting the 9 bright objects before he SAW A FLASH COMING DIRECTLY FROM THE OBJECTS so that he could positively connect the FLASHES with the OBJECTS. In between that time is when he momentarily considered the objects might be geese -- but that thought was obliterated by the next intense flash. So here is the sequence as I reconstruct it from Arnold's testimony. Let's say that the first flash occurred at T+0 seconds.

1. Flash. (T+0 secs)
2. Looks for source of flash 20-30 secs, cannot find (sees only DC-4).
3. Second flash narrows down area of sky.
4. Looks for source of 2nd flash.
5. Now spots 9 bright objects.

[NOTE-- the connection between "flash" and "object" is still not direct. THIS IS WHEN ARNOLD MOMENTARILY WONDERED IF BRIGHT OBJECTS WERE GEESE. Let's call this time T+20 secs.]

6. 3rd and succeeding flashes are now seen to come DIRECTLY FROM THE 9 BRIGHT OBJECTS.

[Now there is no doubt in Arnold's mind that ALL the flashes came from these 9 objects and he instantly rejects the "geese" thought and returns to his original "near-collision with fighter plane" theory when he saw the first flash. Let's call this T+30 secs.]

Evidently in the first days of Arnold telling the story he had to mentally correct his sequence of thoughts to reflect (no pun intended) the fact he had eventually at T+30 seconds identified FLASH=OBJECT and had to go back to the very beginning of the story with the FIRST FLASH at T+0 seconds to make that the time when he first saw "the objects."

Until Arnold did that mental editing of his story to incorporate his belated FLASH=OBJECT identity, in the first few days he would apparently say that when he first saw the "OBJECTS" (at T+20 seconds) he thought they were geese for a moment. This led to obvious confusion. And when reporters failed to directly quote Arnold verbatim they may have lost subtle nuances in Arnold's story that would have tipped off the fact that Arnold was trying to distinguish in his mind between what he thought he saw at T+0, T+20, and T+30 seconds, and then relate back the T+30 identification to T+0.

[Easton quoting article]

"He said the 'planes' remained visible by the flashes of reflected sunlight for some seconds after they passed Mt. Adams, perhaps for as far away as 50 miles.

COMMENTS: How feasible is this and if factual, which I greatly doubt, what might it tell us about the objects' size and reflectability?

[End]

SPARKS REMARKS: I think Bruce calculated an 8x factor reduction in brightness of sun reflections at 50 miles, which would certainly not make arc-light-like brightnesses invisible. In fact, it raises the whole question why they shouldn't still have been seen. It suggests self-luminosity that was simply turned off or burned out.

[...]

He said that at first he thought the window of his plane might be causing the reflections, but that he still saw the objects after rolling it down.

He also described the objects as 'saucer-like' and their motion 'like a fish flipping in the sun'.

Mostly, he said, he was surprised at the way they twisted just above the higher peaks, almost appearing to be threading their way along the mountain ridge line.

'No orthodox plane would be flying like that,' he commented."

COMMENTS: And least likely of all things conceivable is a fleet of alien spacecraft. It would be consistent with birds though.
[End]

Source: Norman, Oklahoma Transcript, June 26, 1947 -

"'There were nine of them and they were flying in a screwy formation about 25 miles away from me. It wasn't any military formation I ever saw before'.

[...]

Arnold said the strange aircraft were skittering across the southwest slope of Mount Rainier when he first sighted them".

SPARKS REMARKS: Note this is a PARAPHRASE of Arnold and not a DIRECT QUOTE, and it actually comes from a UP dispatch out of Pendleton, reprinted in the Norman, Okla., paper and elsewhere.

[Easton] COMMENTS: So far as I can see, this is essentially the story Arnold first told - the objects, or 'flashes' from them, were noticed as they passed Mt. Rainier.

It later became the tale of nine objects which _even after they first came to Arnold's notice_ were supposedly still over a hundred miles away! As he claimed in his book:

SPARKS REMARKS: The UP story on June 26, of objects first seen passing Rainier, is NOT the "first" story Arnold told. I note that in Arnold's second known interview, for the Chicago Tribune on June 25, 1947, the DAY BEFORE the UP interview, there is an indication of seeing the objects or flashes first to the NORTH of Rainier, but it is garbled by the reporter in his rendition (not even a paraphrase). The reporter said Arnold "encountered the mystery objects while he was NORTH of Mount Ranier [Rainier]," but everyone agrees that Arnold himself was NEVER to the north of Rainier, it was the "objects" that must have been meant.

The Chicago Tribune article does go on to directly quote Arnold verbatim saying: "The first thing I noticed was series of FLASHES in my eyes as if a MIRROR was REFLECTING SUNLIGHT on me,' he said."

Sunlight-like reflections are inconsistent with the optical properties of birds, whether geese or pelicans, when not at grazing angles to the sun.

[Easton quoting 1952 book]

"It was during this search and while making a turn of 180 degrees over Mineral, Washington, at approximately 9200 feet altitude, that a tremendously bright flash lit up the surfaces of my aircraft. I was startled. I thought I was very close to collision with some other aircraft whose approach I had not noted. I spent the next twenty to thirty seconds urgently searching the sky all around--to the sides, above and below me--in an attempt to determine where the flash of light had come from.

[...]

Before I had time to collect my thoughts or to find any close aircraft, the flash happened again. This time I caught the direction from which it had come. I observed, far to my left and to the north, a formation of very bright objects coming from the vicinity of Mount Baker, flying very close to the mountain tops and traveling at tremendous speed.

At first I couldn't make out their shapes as they were still at a distance of over a hundred miles..."

[End of quote]

And must have been even further away when, some 30 seconds before and travelling at the declared speed, they first 'flashed' and practically turned night into day.

Is this universally accepted as a ridiculous exaggeration and if so, where do we draw the line?

[End]

SPARKS REMARKS: Come now, James, you know perfectly well how difficult it is for witnesses to estimate distances without a reference point. Arnold thought the objects were coming from the direction of Mt. Baker, some 143 miles away, so a 100+ mile distance figure must have seemed about right to him, without any real way of knowing.

HOWEVER, please note that if at one point on the objects' long linear trajectory Arnold could get a reasonable distance estimate or some kind of upper or lower bound (i.e., when near Rainier), he could quite reasonably proportion it to when the objects disappeared past Mt. Adams by comparing relative sizes as the objects got smaller and the flashes dimmer. Projecting it backwards in time mentally would have been harder.

Source: Oregon Journal, June 27, 1947 -

"Arnold, general manager and owner of the Great Western Fire Control Company, said he first saw the objects when they flashed in the sun low over the slopes of Mt. Rainier.

SPARKS REMARKS: The "first saw" is a reporter's PARAPHRASE of Arnold. The direct quotes are below.

'Then I saw them, weaving and ducking in and out as they came south not more than 500 feet over the plateau. They looked like they were rocking. I looked for the tails but suddenly realized they didn't have any. They were half-moon shaped, oval in front and convex in the rear. I was in a beautiful position to watch them. I thought they might be jet planes, and I clocked them. Then when I saw they had no tails and I realized how fast they were going, I knew they were like nothing I had ever heard of before. There were no bulges or cowlings; they looked like a big flat disk. They were larger than the ordinary jet plane but slightly smaller than a DC4, if you don't count the rear fuselage'.

COMMENTS: A further reported testimony of how these objects were first seen over the slopes of Mt. Rainier, not a couple of hundred miles northwards.

SPARKS REMARKS: Again, it was a reporter's PARAPHRASE not verbatim quotation of Arnold and thus subject to more error. Arnold never said anything about "a COUPLE of HUNDRED miles" distance.

[Easton]

The fact they were 'flashing' is, as I demonstrated, comparative to how a formation of large, predominately white birds have been documented as exceptionally reflective, using the exact same terminology.

[End]

Arnold said that the objects waved 'like the tail of a

Chinese kite'."

COMMENTS: And as previously demonstrated, identical to how a formation of certain large, undulating, predominately white birds are known to fly.
[End]

Source: Radio Interview -

"...I was approximately 25 to 28 miles from Mt. Rainier, I climbed back up to 9200 feet and I noticed to the left of me

SPARKS REMARKS: If Arnold was flying directly towards Rainier then "to the left of me" would be to the NORTH of Rainier. If Arnold was flying directly towards Yakima, the "left of me" direction would be ambiguous on this point.

[Easton quoting radio transcript]
a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier. I, at first, thought they were geese because it flew like geese..."

COMMENTS: Even at this stage, when they crossed in front of Mt. Rainier, apparently these nine objects were similar to a flight of birds. Although Arnold does go on to say he thought they were flying too fast (then again, he thought the 25-30 duck-like objects were quicker than ducks could fly), where is Arnold's rationale about the supposed brilliant reflections during or before he first observed a 'chain' of objects? Strangely, he doesn't mention here at all how the flashes 'lit up his plane'.

SPARKS REMARKS: Again, I would make the T+20 seconds distinction, the time when he first saw the "OBJECTS" and before he recognized these as the source for the flashes. Arnold didn't realize that FLASHES=OBJECTS till T+30 seconds so when he was asked by reporters when did he first see "the OBJECTS" he was still stuck on T+20 seconds -- which was also when he thought of geese. He didn't realize for certain that all of the flashes from T+0 onward were FROM THE OBJECTS till he saw a FLASH COME FROM ONE OF THE OBJECTS at T+30 seconds. And then he immediately rejected geese as impossible to account for the flashes, now recognized as coming from the objects.

[Easton]
The point is, if he simply noticed a chain/ribbon/kite-tail like formation of nine objects crossing Mt. Rainier, then it's a whole different story. That's what he says here and

it's also the circumstances described in those early newspaper reports.

In short, no mention of any inaugural 'flashes' . The story is one where the objects were simply noticed crossing Mt. Rainier.

SPARKS REMARKS: Bruce caught you on this once before, James. The KWRC radio interview DOES quote Arnold talking about the FLASHES, it is NOT simply a story of NON-flashing objects passing Mt. Rainier:

Arnold: And, they seemed to flip and FLASH in the SUN, just like a mirror, and, in fact, I happened to be in an angle from the SUN that seemed to hit the tops of these peculiar looking things in such a way that it almost BLINDED you when you looked at them through your plexiglass windshield....

"... and I could see them only plainly when they seemed to tip their wing, or whatever it was, and the SUN FLASHED on them."

[Easton]

What we seem to have in these formative accounts is Arnold's explanation of how, as he was _making a turn_ over the town of Mineral, his attention was caught by one or more bright flashes of light and he then noticed a number of objects either approaching or crossing Mt. Rainier.

As their chain-like formation was similar to a flock of Geese, Arnold statedly at first thought that's what they were.

It seems absolutely certain these objects flew on the western side of Mt. Rainier and we have seen how Arnold clarified this on a number of occasions.

SPARKS REMARKS: It is NOT at all "absolutely certain" the objects flew in FRONT of Rainier (west side) as you yourself recently admitted new testimony from the US Park Service that again identifies Rainier's Little Tahoma Peak as the feature that Arnold said the objects flew BEHIND (see your own next remarks). I don't know how you can say this. Do you just forget things from day to day? I'm really puzzled.

[Easton]

That recognised, it also has to be accepted why if Arnold's referenced peak was, as looks most likely, Little Tahoma, then his distance perceptions are _proven_ to be literally miles off.

Everything else falls down from there - his speed

calculations based on apparent size and distance, etc.

Do we actually now have any factual reasons - excluding opinions about what Arnold should have recognised (it's become clear there were a number of things Arnold _should_ have recognised and not only about this incident) - why the `flashes' were not simply bright/brilliant reflections from exceptionally large, white birds, crossing Mt. Rainier and heading in the direction of Mt. Adams, eventually disappearing from sight?

James.

SPARKS REMARKS: Bruce has already addressed the optical physics of the situation, and the impossibility of birds reflecting "BLINDING" quantities of sunlight at non-grazing angles.

regarding reflections from mirror surfaces:

>suggest reflections from high points of a curved surface, which would therefore be able to cover a >wider area with solar reflections. But can you model this numerically?

This can be done but raises the problem that one must assume not only the size of a reflecting surface but also its radius of curvature (which is automatically infinite for a flat surface). The assumed radius of curvature of the reflecting area could range from a few meters to hundreds of meters or kilometers. There just is no way of knowing what radius of curvature to assign. However, one can assume something and work out a result.... whether or not it means anything.

REFLECTION FROM A CURVED SURFACE

Imagine a FLAT surface of length L and width W. Sunlight hits the surface and because the sun is not a point source the reflected light diverges. To understand how much it diverges, consider the light from a point at "one side" of the sun. It hits both sides of the reflector and is diverted by an angle that obeys the reflection rule: "angle of reflection = angle of incidence." Since the sun is so far away, a ray of light from any one POINT (a small area) on the sun hitting one side of the mirror is effectively PARALLEL to a ray of light from the same POINT on the sun that hits the other side of the mirror. (You don't believe it? Imagine a mirror one mile wide. The sun is 93,000,000 miles away. Light from A POINT of the sun hitting one side of the mirror is at an angle of $1/93,000,000$ radians away from light from that SAME POINT that hits the other side of the mirror. Now imagine the mirror is only 0.01 miles wide comparable to the size of a "flying saucer mirror": the divergence angle is now only about $1E-10$ radians..... the beams are effectively parallel!). So you can draw light rays that come from ONE SIDE of the sun and hit the

two opposite sides of the mirror and reflect as basically parallel rays (with a divergence of $1\text{E}-10$ radians). Now imagine light starting from the "other side" of the sun. These rays hit each side of the mirror and they are effectively parallel to one another as they reflect off the surface. However, because the sun is wide, these rays are NOT parallel to the rays from the "first side" of the sun. In fact, the angle between the pairs of reflected rays is the same as the angle between the two sides of the sun, 0.52 degrees. Hence the aside from some "near field" effects, close to the mirror, the reflected light diverges like a beam, with angular width equal to that of the sun.

Now imagine that the left side of the mirror is at a different angle from that of the right side, as would be the case if the mirror is curved. Light from one side of the sun (remember, rays traveling parallel from A POINT on the sun) is now reflected into two different directions, with a divergence equal to the TWICE the angle between the two surfaces. Why twice the angle? Because if a flat mirror surface turns by angle A , then in order to obey the reflection rule at the rotated surface the angle of the reflected ray turns by $2A$. (To see this, imagine a flat surface reflecting light right directly back to a point or distant source. At this time the angle between the oncoming ray and the PERPENDICULAR to the mirror surface --- the "surface normal" -- is zero. Now imagine turning the mirror by angle A . Now the angle between the surface normal and the incident ray is A . But the reflection rule says the angle between the surface normal and the reflected ray equals that of the incident ray, A . Hence the angle between the incident and reflected ray is $2A$. As the mirror is turned more the angle A increases and the angle between the incident and reflected rays increases twice as fast as the mirror turns.)

Suppose, then, we have a curved surface for which there is a radius of curvature, R_c , which would be the center of the sphere that fits the curved surface, i.e., a section of a spherical surface. The central angle (apex at the center of the sphere) made by this surface from one side to the other is A . One can show that a TANGENT to this curved surface at one side of the surface is at an angle A to the tangent at the other side of the surface. Hence light reflected from a distant point source that is reflected from the two sides will, after reflection, diverge by angle $2A$. When the source is not a point but rather has an angular size itself, as the sun has, the "natural divergence" due to the size of the source is augmented by the curved surface divergence. It is my impression that these divergences will simply add, i.e., $A_{\text{total}} = A_{\text{sun}} + 2A_{\text{mirror}}$. Thus with $A_s = 0.52$ deg, if $A_m = 1$ deg, the total divergence angle is $A_t = 2.52$ deg. The solid angle of divergence (assuming a circular curved mirror surface) could be found from $2\pi (1 - \cos [(0.52+2A)/2]) = 2\pi (1 - \cos[0.26+A])$ steradians.

Now, the curvature of the mirror surface is related to the width of the mirror and the radius of curvature. Imagine a flat mirror surface of width W . Flat means the radius of curvature is infinite so the angle $A = 0$. Now let the radius shrink to R_c which is still much greater than W . The full angle of the mirror surface is W/R_c in radians for practical purposes even though the surface is now curved and W is not a measurement lying in the surface but rather is a "chord" - a straight line across a

circular or spherical surface. As R_c continues to shrink the surface curves more and one needs a trigonometric relation to get the angle from $A = 2 \arcsin(W/2R_c)$. Since $\arcsin B = B$ in radians for angles up to 20 degrees or more (depending upon the degree of accuracy desired) $A = W/R_c$ (radians) as long as $W < R_c/2.5$. For practical purposes the area of oncoming rays of sunlight is based on W , not on the actual surface area of the curved surface, so it is convenient to consider W is the primary measure of the size of the surface. If the surface were round then W would be the diameter of the circular surface area, $\pi \times W^2/4 \text{ m}^2$, intercepting power from sun rays and the rays would be reflected into a beam of angular size $0.52 + 2A$ with the solid angle given above.

A curved surface does not have to be spherical. A cylinder surface has finite curvature in one direction and an infinite radius of curvature in the other. Hence divergence of reflected light parallel to the cylinder axis depends upon the divergence of the incident light whereas the divergence of reflected light perpendicular to the axis is the sum of the incident divergence angle plus the cylinder angle, W/R_c , where W is the width of the cylinder and R_c is the radius of the cylinder. Since the divergence is different in perpendicular directions (along and perpendicular to the cylinder axis) one can calculate an overall solid angle of divergence by multiplying the two angles and multiplying the result by $\pi/4$ as if calculating the area of a circle: $(\pi/4) \times 0.009 \times 2 \arcsin(W/2R_c)$ which is approximately $(\pi/4) \times 0.009 \times W/R_c$ for $W < R_c/2.5$, where 0.009 is the solar divergence angle, 0.52 deg., in radians. (Note that the solid angle formula given above, for small angles can be approximated as $(\pi/4)(0.52 + 2A)^2$ because for small angles $\cos(C) = 1 - C^2/2$ where, in this case, $C = (0.52 + 2A/2)$.)

In the case of the Arnold's "curved surfaces" one has to make a guess at the curvature as well as the area. For simplicity I assume classic "saucers," circular objects 27.6 m in diameter with the surface having a radius of curvature, $R_c = 100 \text{ m}$. The area of sunlight intercepted could be $(\pi/4) \times (27.6^2) \times \cos(\text{angle between the approximating flat surface and the line to the sun, } 30 \text{ degrees}) = 518 \text{ m}^2$ (W chosen to make an area comparable to what I used before). The width $W = 27.6 \text{ m}$ so $A = 27.6/100 = 0.276$ radians (to a good level of accuracy...if you use the arcsin you get 0.279) = 15.8 degrees. Therefore the solid angle of divergence is $2 \pi (1 - \cos(0.26 + 15.8)) = 0.245 \text{ sr}$. (Previously the angle was $6.5\text{E-}5 \text{ sr}$ due to solar divergence alone.) Hence the luminous intensity from this curved surface is approximately (using 0.9 reflectivity)

$$I_m, \text{ curved metal} = (1\text{E}5 \text{ lm/m}^2)(0.9)(518 \text{ m}^2)/(0.245 \text{ sr}) = 1.9\text{E}8 \text{ lm/sr}$$

Clearly this is much lower than the previous value, $7\text{E}11$, for a flat surface of the same area.

As before, the atmospheric transmission would be about 1/2 so at Arnold's eyeball one might expect about $1\text{E}8 \text{ lm/sr}$. With the angular size of his eye being about $3\text{E-}15 \text{ sr}$ at 20 mi = 32 km, the flux entering his eyeball would be around $3\text{E-}7 \text{ lm}$. This is to be compared with the previous value (after taking into account the atmosphere) of $(1/2)7\text{E}11(3\text{E-}15) = 1\text{E-}3 \text{ lm}$.

Previously I had for snow $I_s = 5.8E6 \text{ lm/sr}$ so the luminous intensity of the curved metal surface is still greater than that of snow of the same area. The situation with curved ice would be similar to that for the comparison of flat ice with flat metal: the ice reflects 3% or less of what the metal does. The above luminous intensity is still much greater than that of a bird at a mile or so (around $15,000 \text{ lm/sr}$).

Naturally one can reduce the effective luminous intensity of a curved surface by shrinking its width or by increasing the curvature, although there is a limit to the shrinkage of R_c : it can't be smaller than $W/2$. If we take this situation as a limiting case of brightness for an object 27.6 m in diameter - a sphere or hemisphere surface so $R_c=W/2$, then the divergence angle is $2 \arcsin[(W/2)/(W/2)] = 2 \times 90 = 180$ degrees. Thus the incident radiation gets scattered everywhere, just as with a diffuse reflector, but the diffuse factor. There is even scattering in the forward direction so that the solid angle is essentially 4π . The luminous intensity is then $(1E5 \text{ lm/m}^2)(0.9)(518 \text{ m}^2)/4 \pi = 3.7E6 \text{ lm/sr}$. This is about half as intense as a patch of snow of the same area scattering into 2π steradians. Hence if the objects had been spheres they probably would have been hard to see against the snow background and against the whitish sky.

>Also, can you re-do your luminosity calculations for different distances such as bird distances of 1-2 >miles?

You mean different distances of birds or of everything? It is quite easy to use the intensity in lm/sr for any one of the light sources and change the distance. Even the atmospheric transmission (which hardly effects the birds cause they would be so close) is easy to figure.

>And can you re-do for sun elevation at 58 degrees? (The sun was at 58 degs at 2:59 PM MST.)

Don't need to. All calculations are based on the sun being within 20 degrees of 60 degrees (i.e., solar flux changes slowly with angle). I used $1E5 \text{ lm/m}^2$ for the solar flux. At zenith the solar flux is about $1.23E5 \text{ lm/m}^2$. Of course it drops rapidly as the sun goes below 45 degrees.

>Can the atmospheric attenuation factor be reduced for clearer air? Arnold's description is suggestive >of CAVU conditions and not a "white horizon."

Even CAVU has a horizon that is "whiter" than the blue sky. At its bluest it is "pale blue" at the horizon. Perhaps over desert areas with negligible water vapor one can get a "blue horizon"... but then dust particles could whiten it. The calculation I did is for a standard "clear air". If the air were clearer then perhaps instead of having $T=0.46$ you might have $T=0.5$ or 0.6 over the 32 km distance. Not a big deal.

>What is the lumens to watts conversion for sunlight?

At zenith get $1.24 \times 10^5 \text{ lm/m}^2$

Above the atmosphere you get about 1300 W/m^2 and about $1/2$ that at the earth's surface, if I recall correctly. Thus it would appear that one has about 200 lm/watt for sunlight.

In my large "compendium": on brightness I calculated the luminous intensity of snow.

However, I have modified it somewhat because I used the wrong solid angle. I have replaced 4π with 2π in what follows and made a couple of other small changes./ I suggest you cut out the previous version of the following section and past this in its place.

.....

BRIGHTNESS OF THE SNOW (Revised)

Date: Fri, 31 Mar 2000 19:35:54 EST
Subject: Re: Arnold Sun Mirror ExperimentsStatus:

Bruce,

Thanks for the new calculations. What is the corrected brightness (correcting for solid angle error) for a GLACIER ICE FLASH, as compared to the curved mirror model for sun reflection to Arnold? It should be closer now. Also, I mentioned in an earlier posting that I measured Rc radius of curvature for Arnold's objects from his drawing to the AAF at about 1-2 object diameters. This is a tighter curvature than your Rc of nearly 4 object diameters which would reduce brightness further.

What is the total flux for a radiator uniformly emitting in all directions if it had the luminous intensity you estimate for the cylindrical curved mirror reflector?

The solar constant outside the atmosphere is about 1370 W/sq.meter but I can't find the figure for the earth's surface.

Brad

REFLECTION FROM A CURVED SURFACE

Imagine a FLAT surface of length L and width W . Sunlight hits the surface and because the sun is not a point source the reflected light diverges. To understand how much it diverges, consider the light from a point at "one side" of the sun. It hits both sides of the reflector and is diverted by an angle that obeys the reflection rule: "angle of reflection = angle of incidence." Since the sun is so far away, a ray of light from any one POINT (a small area) on the sun hitting one side of the mirror is effectively PARALLEL to a ray of light from the same POINT on the sun that hits the other side of the mirror. (You don't believe it? Imagine a mirror one mile wide. The sun is 93,000,000 miles away. Light from A POINT of the sun hitting one side of the mirror is at an angle of $1/93,000,000$ radians away from light from that SAME POINT that hits the other side of the mirror. Now imagine the mirror is only 0.01 miles wide comparable to the size of a "flying saucer mirror": the divergence angle is now only about $1\text{E-}10$ radians..... the beams are effectively parallel!). So you can draw light rays that come from ONE SIDE of the sun and hit the two opposite sides of the mirror and reflect as basically parallel rays (with a divergence of $1\text{E-}10$ radians). Now imagine light starting from the "other side" of the sun. These rays hit each side of the mirror and they are effectively parallel to one another as they reflect off the surface. However, because the sun is wide, these rays are NOT parallel to the rays from the "first side" of the sun. In fact, the angle between the pairs of reflected rays is the same as the angle between the two sides of the sun, 0.52 degrees. Hence the aside from some "near field" effects, close to the mirror, the reflected light diverges like a beam, with angular width equal to that of the sun.

Now imagine that the left side of the mirror is at a different angle from that of the right side, as would be the case if the mirror is curved. Light from one side of the sun (remember, rays traveling parallel from A POINT on the sun) is now reflected into two different directions, with a divergence equal to the TWICE the angle between the two surfaces. Why twice the angle? Because if a flat mirror surface turns by angle A , then in order to obey the reflection rule at the rotated surface the angle of the reflected ray turns by $2A$. (To see this, imagine a flat surface reflecting light right directly back to a point or distant source. At this time the angle between the oncoming ray and the PERPENDICULAR to the mirror surface --- the "surface normal" -- is zero. Now imagine turning the mirror by angle A . Now the angle between the surface normal and the incident ray is A . But the reflection rule says the angle between the surface normal and the reflected ray equals that of the incident ray, A . Hence the angle between the incident and reflected ray is $2A$. As the mirror is turned more the angle A increases and the angle between the incident and reflected rays increases twice as fast as the mirror turns.)

Suppose, then, we have a curved surface for which there is a radius of curvature, R_c , which would be the center of the sphere that fits the curved surface, i.e., a section of a spherical surface. The central angle (apex at the center of the sphere) made by this surface from one side to the other is A . One can show that a TANGENT to this curved surface at one side of the surface is at an angle A to the tangent at the other side of

the surface. Hence light reflected from a distant point source that is reflected from the two sides will, after reflection, diverge by angle $2A$. When the source is not a point but rather has an angular size itself, as the sun has, the "natural divergence" due to the size of the source is augmented by the curved surface divergence. It is my impression that these divergences will simply add, i.e., $A_{\text{total}} = A_{\text{sun}} + 2A_{\text{mirror}}$. Thus with $A_s = 0.52$ deg, if $A_m = 1$ deg, the total divergence angle is $A_t = 2.52$ deg. The solid angle of divergence (assuming a circular curved mirror surface) could be found from $2\pi (1 - \cos [(0.52+2A)/2]) = 2\pi (1 - \cos[0.26+A])$ steradians.

Now, the curvature of the mirror surface is related to the width of the mirror and the radius of curvature. Imagine a flat mirror surface of width W . Flat means the radius of curvature is infinite so the angle $A = 0$. Now let the radius shrink to R_c which is still much greater than W . The full angle of the mirror surface is W/R_c in radians for practical purposes even though the surface is now curved and W is not a measurement lying in the surface but rather is a "chord" - a straight line across a circular or spherical surface. As R_c continues to shrink the surface curves more and one needs a trigonometric relation to get the angle from $A = 2 \arcsin(W/2R_c)$. Since $\arcsin B = B$ in radians for angles up to 20 degrees or more (depending upon the degree of accuracy desired) $A = W/R_c$ (radians) as long as $W < R_c/2.5$. For practical purposes the area of oncoming rays of sunlight is based on W , not on the actual surface area of the curved surface, so it is convenient to consider W is the primary measure of the size of the surface. If the surface were round then W would be the diameter of the circular surface area, $\pi \times W^2/4$ m², intercepting power from sun rays and the rays would be reflected into a beam of angular size $0.52 + 2A$ with the solid angle given above.

A curved surface does not have to be spherical. A cylinder surface has finite curvature in one direction and an infinite radius of curvature in the other. Hence divergence of reflected light parallel to the cylinder axis depends upon the divergence of the incident light whereas the divergence of reflected light perpendicular to the axis is the sum of the incident divergence angle plus the cylinder angle, W/R_c , where W is the width of the cylinder and R_c is the radius of the cylinder. Since the divergence is different in perpendicular directions (along and perpendicular to the cylinder axis) one can calculate an overall solid angle of divergence by multiplying the two angles and multiplying the result by $\pi/4$ as if calculating the area of a circle: $(\pi/4) \times 0.009 \times 2 \arcsin(W/2R_c)$ which is approximately $(\pi/4) \times 0.009 \times W/R_c$ for $W < R_c/2.5$, where 0.009 is the solar divergence angle, 0.52 deg., in radians. (Note that the solid angle formula given above, for small angles can be approximated as $(\pi/4)(0.52 + 2A)^2$ because for small angles $\cos(C) = 1 - C^2/2$ where, in this case, $C = (0.52+2A/2)$.)

In the case of the Arnold's "curved surfaces" one has to make a guess at the curvature as well as the area. For simplicity I assume classic "saucers," circular objects 27.6 m in diameter with the surface having a radius of curvature, $R_c = 100$ m. The area of sunlight intercepted could be $(\pi/4) \times (27.6^2) \times \cos(\text{angle between the approximating flat surface and the line to the sun, } 30 \text{ degrees}) = 518 \text{ m}^2$ (W chosen to

make an area comparable to what I used before). The width $W = 27.6$ m so $A = 27.6/100 = 0.276$ radians (to a good level of accuracy...if you use the arcsin you get 0.279) = 15.8 degrees. Therefore the solid angle of divergence is $2\pi(1 - \cos(0.26+15.8)) = 0.245$ sr. (Previously the angle was $6.5E-5$ sr due to solar divergence alone.) Hence the luminous intensity from this curved surface is approximately (using 0.9 reflectivity)

$$I_{m, \text{ curved metal}} = (1E5 \text{ lm/m}^2)(0.9)(518 \text{ m}^2)/(0.245 \text{ sr}) = 1.9E8 \text{ lm/sr}$$

Clearly this is much lower than the previous value, $7E11$, for a flat surface of the same area.

As before, the atmospheric transmission would be about 1/2 so at Arnold's eyeball one might expect about $1E8$ lm/sr. With the angular size of his eye being about $3E-15$ sr at 20 mi = 32 km, the flux entering his eyeball would be around $3E-7$ lm. This is to be compared with the previous value (after taking into account the atmosphere) of $(1/2)7E11(3E-15) = 1E-3$ lm.

Previously I had for snow $I_s = 5.8E6$ lm/sr so the luminous intensity of the curved metal surface is still greater than that of snow of the same area. The situation with curved ice would be similar to that for the comparison of flat ice with flat metal: the ice reflects 3% or less of what the metal does. The above luminous intensity is still much greater than that of a bird at a mile or so (around 15,000 lm/sr).

Naturally one can reduce the effective luminous intensity of a curved surface by shrinking its width or by increasing the curvature, although there is a limit to the shrinkage of R_c : it can't be smaller than $W/2$. If we take this situation as a limiting case of brightness for an object 27.6 m in diameter - a sphere or hemisphere surface so $R_c = W/2$, then the divergence angle is $2 \arcsin[(W/2)/(W/2)] = 2 \times 90 = 180$ degrees. Thus the incident radiation gets scattered everywhere, just as with a diffuse reflector, but the diffuse factor. There is even scattering in the forward direction so that the solid angle is essentially 4π . The luminous intensity is then $(1E5 \text{ lm/m}^2)(0.9)(518 \text{ m}^2)/4\pi = 3.7E6$ lm/sr.

This is about half as intense as a patch of snow of the same area scattering into 2π steradians. Hence if the objects had been spheres they probably would have been hard to see against the snow background and against the whitish sky.

>Also, can you re-do your luminosity calculations for different distances such as bird distances of 1-2 >miles?

You mean different distances of birds or of everything? It is quite easy to use the intensity in lm/sr for any one of the light sources and change the distance. Even the atmospheric transmission (which hardly effects the birds cause they would be so close) is easy to figure.

>And can you re-do for sun elevation at 58 degrees? (The sun was at 58 degs at 2:59 PM MST.)

Don't need to. All calculations are based on the sun being within 20 degrees of 60 degrees (i.e., solar flux changes slowly with angle). I used $1\text{E}5 \text{ lm/m}^2$ for the solar flux. At zenith the solar flux is about $1.23\text{E}5 \text{ lm/m}^2$. Of course it drops rapidly as the sun goes below 45 degrees.

>Can the atmospheric attenuation factor be reduced for clearer air?
Arnold's description is suggestive >of CAVU conditions and not a "white horizon."

Even CAVU has a horizon that is "whiter" than the blue sky. At its bluest it is "pale blue" at the horizon. Perhaps over desert areas with negligible water vapor one can get a "blue horizon"... but then dust particles could whiten it. The calculation I did is for a standard "clear air". If the air were clearer then perhaps instead of having $T=0.46$ you might have $T = 0.5$ or 0.6 over the 32 km distance. Not a big deal.

>What is the lumens to watts conversion for sunlight?

At zenith get $1.24\text{E}5 \text{ lm/m}^2$

Above the atmosphere you get about 1300 W/m^2 and about 1/2 that at the earth's surface, if I recall correctly. Thus it would appear that one has about 200 lm/watt for sunlight.

In my large "compendium": on brightness I calculated the luminous intensity of snow.

However, I have modified it somewhat because I used the wrong solid angle. I have replaced 4π with 2π in what follows and made a couple of other small changes./ I suggest you cut out the previous version of the following section and past this in its place.

.....

BRIGHTNESS OF THE SNOW (Revised)

>Thanks for the new calculations. What is the corrected brightness (correcting for solid angle error) for >a GLACIER ICE FLASH, as compared to the curved mirror model for sun reflection to Arnold? It >should be closer now. Also, I mentioned in an earlier posting that I measured Rc radius of curvature f>or Arnold's objects from his drawing to the AAF at about 1-2 object diameters. This is a tighter >curvature than your Rc of nearly 4 object diameters which would reduce brightness further.

As I pointed out a calculation for curved (spherical or cylindrical or a "combination") would be the same as for a curved metal mirror of the same size but with only 2-3% of the reflectivity.

I should also point out that the 2-3% is for reflection at the curved surface, This would be the ONLY reflection if the ice were "pure"--- no "defects" in the volume (interior) of the ice. HOwever, there are random deflects which scatter radiation within the volume of ice and some of this comes back out again. I suppose for simplicity one could treat natural ice, with bubbles, etc, imbedded, as aspecular reflector of 2-3% PLUS a diffuse reflector, in other words a sum of "snow-like" reflection plus "mirror-like" reflection. The diffuse "snow like" component could be a large fraction of the total reflection if the radius of curvature were small.

As for the Rc in Arnold's case.... this requires an estimate of thic kness of the object, which he was not able to make, plus an assumption that the whole surface is uniformly curved, as opposed to a "control room bubble" on a nominally flat surface. We JUST DON'T KNOW... which is why I was relctant to try a curved surface calculation. There are just so many unknown "parameters" when we try to characterize the shape and reflectivity of TOTALLY UNKNOWN objects/craft. The main thing is that the calculation establishes that Arnold COULD HAVE BEEN TELLING THE TRUTH when he said the light coming from the objects was very bright. The calculations show that despite the distance, reflected sunlight COULD BE very bright (this was NOT KNOWN BEFORE!!). (The calculations also confirm that BIRDS ARE NOT THAT BRIGHT... this WAS known before... at least t some of us!) OF course, if the objects were generating flashes of light unrelated to sunlight, then "all bets are off" as to the nature of that light and one can only set maximum and minimum limits such as the lumen radation level if they emitted light uniformly into all directions (4 pi steradians) or if they emitted

light into a narrow beam pointed toward Arnold (a very tiny number of steradians, such as the solid angle of his eye at 20 miles).

>What is the total flux for a radiator uniformly emitting in all directions if it had the luminous intensity you >estimate for the cylindrical curved mirror reflector?

.....

I don't know exactly what you mean here.... I don't recall calculating the luminous intensity for a cylinder....

.

PREVIOUSLY I WROTE:

A curved surface does not have to be spherical. A cylinder surface has finite curvature in one direction and an infinite radius of curvature in the other. Hence divergence of reflected light parallel to the cylinder axis depends upon the divergence of the incident light whereas the divergence of reflected light perpendicular to the axis is the sum of the incident divergence angle plus the cylinder angle, W/R_c , where W is the width of the cylinder and R_c is the radius of the cylinder. Since the divergence is different in perpendicular directions (along and perpendicular to the cylinder axis) one can calculate an overall solid angle of divergence by multiplying the two angles and multiplying the result by $\pi/4$ as if calculating the area of a circle: $(\pi/4) \times 0.009 \times 2 \arcsin(W/2R_c)$ which is approximately $(\pi/4) \times 0.009 \times W/R_c$ for $W < R_c/2.5$, where 0.009 is the solar divergence angle, 0.52 deg., in radians. (Note that the solid angle formula given above, for small angles can be approximated as $(\pi/4)(0.52 + 2A)^2$ because for small angles $\cos(C) = 1 - C^2/2$ where, in this case, $C = (0.52 + 2A/2)$.)

.....

If the length of the mirror axis were W and the width (a chord across the curved surface) were W then the solid angle would have divergence 0.009 radians along the axis and W/R_c perpendicular to the axis, as above. The effective area of reflection would be W^2 . The total luminous reflected flux would be that of the capture area (the "cross-section"), W^2 times $1E5$ (lm/m^2 from the sun) times reflectivity.

In your question you ask for the total luminous flux from a radiator emitting in ALL DIRECTIONS.

If it emits in all directions then it emits uniformly into 4π steradians and the luminous intensity would have been calculated as the total flux divided by 4π . Hence multiplication by 4π returns the original flux. If it is a surface emitting into 2π steradians then the luminous intensity multiplied by 2π will give back the total flux. (Here there are no radiation patterns assumed. But a beam is a radiation pattern.)

>The solar constant outside the atmosphere is about 1370 W/sq.meter but I can't find the figure for the >earth's surface.

As I recall 600-800 w/m^2 reach the surface.... but note that this is the

TOTAL power including infrared and ultraviolet.

I will directly respond to some recent list postings soon as possible.

In the meantime and posting material which necessarily will be referred to, I can add some new insight that might help clarify probabilities re the premise why Kenneth Arnold's unidentified objects could have been a formation of birds.

One thing I would be confident about is that there is only one candidate - our White Pelicans. I couldn't support Kottmeyer's initial suggestion of swans, even though large and potentially reflective, as they wouldn't match the flight characteristics Arnold described. Otherwise, there seems no other birds which can realistically be advocated.

It's been over a year since I last saw film of White Pelicans and I've now been able to study new video footage which has proved an immensely important understanding.

To observe in context, particularly striking and distinctive is the gliding ability of these 10ft wingspan birds. A typical motion seems to be five wing beats and a long glide. Conducting a timing exercise, the flapping commonly lasts for three seconds and the gliding for twelve, giving an approximate 15 second sequence. Scaling this up to a minute, we would have twelve seconds of flapping and 48 seconds of motionless gliding, or, covering two minutes, 24 seconds and one minute 36 seconds respectively.

That roughly confirms what I had seen must be the reason - assuming these birds were Arnold's nine aerial artefacts [I still think the biggest clue by far is the number of objects] - why Arnold was baffled by the observation. Most of the time, these birds would be large, reflective, straight-winged, gliding objects.

Considering this footage further, I wanted to go back and look at some of Arnold's descriptions with an opportunity to make more informed comparisons.

Source: Interview -

"I could see them only plainly when they seemed to tip their wing, or whatever it was, and the sun flashed on them".

Yes, I confirmed how they do tip their wings and fly with a noticeable 'rocking motion'. They're quite exceptional and bizarre aviators and don't keep to a 'straight' heading, as with most other birds. I asked someone else who was watching the film (they had no inclination of any 'UFO' connection) how they would describe the flight characteristics. 'Like a roller coaster', was their opinion and that's spot on.

I didn't see that individual birds themselves had an undulating flight, however, as formation flyers, that's exactly how they travel.

"They looked something like a pie plate that was cut in half with a sort of a convex triangle in the rear".

Yes, they do. Having no tails or trailing legs, all that's evident is a small triangle in the 'rear'.

[Start]

Date: Sat, 01 Apr 2000 18:35:52 -0500

From: Todd Lemire <tlemire@home.com>

Subject: Northumberland, UK 'UFO'

This was taken from the uk.rec.ufo news.group, thought I'd pass it along.

From: croft_house@hotmail.com

A couple of weeks ago I was talking in the pub with some of the locals Alnmouth, when a guy from one of the village restaurants said he'd seen weird lights whilst walking down the coast from Boulmer to Alnmouth. A couple of others said they'd seen the same thing.

There was some discussion about whether it could have been from RAF Boulmer, [Northumberland --ebk] but this was discounted as they're a none-flying base - something to do with the UK early warning defences.

[See: <http://www.cmrt.swinternet.co.uk/heli3.htm>

also:

<http://www.raf.mod.uk/stations/ukadge.html>

"RAF Boulmer

Boulmer was originally an Operational Training Unit when it opened in 1943. Today it is home to the School of Fighter Control and is one of the Control and Reporting Centres in the UK ASACS. The station is also home to Headquarters and 'A' Flight of 202 Squadron with 2 Sea King HAR3s providing Search and Rescue and Mountain Rescue cover to the Borders." --ebk]

About 5 people said that they've seen the same thing - a strange glow over the golf course and red and blue lights zipping about, far too fast to be a helicopter or aircraft - they changed direction too quickly.

Anyway, I took all of this with a pinch of salt as I doubt that any aliens would bother to travel light years just to piss about over a tiny village golf course - unless they're trying to learn golf! - until last night when I was fishing off Foxton beach.

It was about 2:00 am and fairly clear when I heard a low buzzing noise behind me and I turned and looked over the beach to Foxton golf club and to the left, towards Alnmouth, I could see a kind of milky glow. It was fairly localised and looked like fog would look if it was lit from inside.

I watched for a few minutes and then from the middle of the glow came three very bright balls of light. There was one blue and two red. They shot out to sea at a hell of a speed and then seemed to hang in the air for a few seconds before slowly swinging around towards Boulmer and they seemed to drift slowly off the sea and then they shot straight towards me at an amazing speed.

Just as they reached the edge of the bay they winked out (but I could still hear the buzzing) and then they reappeared over the golf course and slowly sank down behind the a place called Bracken Hill.

Very strange experience. I've no idea at all what these thing were (Ball lightening?) but I've never seen anything like it before in my life.

Joe

Todd Lemire
[End]

One 'weird' aspect from the 'Rendlesham forest' case were reported 'balls of light', not dissimilar to this.

Any ideas what the explanation might be?

I see there was also a 'strange fog' present in the above story, although, like Rendlesham, coastal fog would be quite common. I dare say we should take into account that 'Joe' apparently didn't leave the pub until 2.00 a.m.!

James.

One thing I would be confident about is that there is only one candidate - our White Pelicans. I couldn't support Kottmeyer's initial suggestion of swans, even though large and potentially reflective, as they wouldn't match the flight characteristics

Arnold described. Otherwise, there seems no other birds which can realistically be advocated.

It's been over a year since I last saw film of White Pelicans and I've now been able to study new video footage which has proved an immensely important understanding.

To observe in context, particularly striking and distinctive is the gliding ability of these 10ft wingspan birds. A typical motion seems to be five wing beats and a long glide. Conducting a timing exercise, the flapping commonly lasts for three seconds and the gliding for twelve, giving an approximate 15 second sequence.

COMMENTS: As I've repeatedly posted last week, the duty cycle described by Arnold is just ONE tip/flash by an object every 9 seconds or so. Where are the 5 FLAPS in a row? Please point to any account by Arnold of seeing a series of several flaps or light flashes closely spaced in time from a SINGLE OBJECT that could be interpreted as 5 wing flaps in a row?

Scaling this up to a minute, we would have twelve seconds of flapping and 48 seconds of motionless gliding, or, covering two minutes, 24 seconds and one minute 36 seconds respectively.

That roughly confirms what I had seen must be the reason - assuming these birds were Arnold's nine aerial artefacts [I still think the biggest clue by far is the number of objects] - why Arnold was baffled by the observation. My quick response to your Pelican Brief..... is

DRAW A MAP!

You don't get any points from me until you do so...
and prove that Arnold could have seen the birds move over the reported
angular range
(more than 90 degrees) from apparently north of Rainier, even in line with
Mt Baker, perhaps,
to so far southward that they appeared to pass Mt. Adams.
If the DYNAMICS don't work... the bird hypothesis doesn't fly.
(I note that Larry picked up on this fact immediately... without having
been part of the discussion
from the beginning.)

JAMES WROTE
in summarizing his latest Pelican Brief :

>In essence, what Kenneth Arnold portrayed and couldn't identify
>were nine tail-less objects with curved wings, which flew like
>geese in a chain-like formation, "fluttered and sailed" and,
>resembling a kite tail or ribbon, undulated in formation,
>habitually descending and climbing whilst maintaining a
>relatively consistent altitude.

>I've now repeatedly watched a video where the stars gave an Oscar
>deserving impersonation of these professed alien spaceships - you
>could double-track some of Arnold's descriptions as a narrative
f>or this film.

>That highlighted and although I would conclude the most important
>and blatant clues are self-evidently being explained, I'm
>personally no less interested and appreciative of discussions
>concerning the plausible 'reflection' physics and remain open to
>evidence why these could have been extremely thin ET vehicles -
>with presumably 'jockey' sized pilots, or remotely controlled.>

>I do wonder though what's required before it becomes untenable to
>support the extraordinary belief these were nine alien
>spacecraft.

And I, in turn, (and I'm sure Brad and possibly others on this list)
wonder what's required before it becomes clear that, whatever the
objects were, they weren't pelicans or swans or geese or birds.

1).....

I have already given my quick response to your discussion:
DRAW A MAP/.

You refuse to do so. I have been and so have Brad and others, very
patient in listening to you continual Pelican Defense, in spite of our
conclusion that one of the MOST BASIC of Arnold's claims cannot be
satisfied by pelicans or ANY OBJECTS for that matter which would
travel at no more than 50 mph, while Arnold was going
at least 100 mph.

I reject pelicans because of the speed differential and,
I CLAIM THE IMPOSSIBILITY that pelicans could be spotted north

of Arnold and travel across his initial eastward track at a distance in front of him that would be so far that he wouldn't recognize them and eventually appear so far south that they seemed to pass Mt. Adams (the essentially aligned with Mt. Adams).\

I also claim the IMPOSSIBILITY that Arnold could have thought they were traveling faster than he if he turned his plane in the direction of their flight. One thing Arnold was clear on was that the objects were FAST. His direct observation was of a large ANGULAR rate of speed. True, he didn't know until later what the actual speed was and this would depend upon the distance assumed. BUT, had he turned in their direction and flown parallel or even at 45 degrees to their track he would have noticed that their angular speed decreased (with respect to his plane) and further more that he was approaching them. Yet NOT ONCE did he indicate that he thought he was gaining on these objects. IF they were pelicans, WHY DID HE NOT SAY THAT HE WAS GETTING A LOT CLOSER TO THEM as time went on (before they then moved away)?

2).....

Apparently all the previous brightness calculations and analysis of Arnold's statements about the reflectivity or brightness of the objects has gone over like a lead pelican.

The bottom line here is that sun reflection from pelicans are NOT BRIGHT LIKE AN ARC or CAN'T BE COMPARED WITH REFLECTION FROM A METAL SURFACE.'

The fact that a "forward gloss" or "normal gloss" could give an enhanced reflection when the angle between the sun and the birds is SMALL is irrelevant here!

IN his book Arnold talks about an initial impression of a flash of light from a nearby aircraft.... metal.... reflective...

He does not say he immediately suspected a bright flash from a nearby bird.

Date: Mon, 3 Apr 2000 03:52:19 EDT
Subject: Re: Arnold and Pelican BriefStatus:

Hi List,

As Bruce correctly points out James is not dealing with (1) the DYNAMIC CONSTRAINTS of Arnold flying at 120 mph against birds with top speeds of 50 mph and somehow never overtaking them. Nor is he dealing with (2) the QUANTITATIVE MEASUREMENTS Arnold made of the angular speed and directions of the objects in traveling from Mt. Rainier to Mt. Adams in 102 seconds nor with (3) his brightness comparisons which Bruce and I have turned semiquantitative. Points 1 and 2 require that James DRAW A MAP to show how it could possibly be birds.

The only response James ever makes -- and we've been over this again and again for nearly two years on this List -- is to try to argue from precedent that Arnold's sighting of duck-like objects on July 29, 1947, somehow proves that Points 1, 2 and 3 (above) regarding his famous June 24 sighting can be dismissed as baseless or erroneous.

There is one major problem: Arnold OVERTOOK the bird-like objects in the July 29 incident -- he did not and could not on June 24. They may well have been birds in the second event, despite Arnold's protests that he thought they were too fast for ducks, because Arnold MADE NO MEASUREMENTS. His impressions of speed are completely unsupported by any QUANTITATIVE estimates or figures of any kind. After he OVERTOOK the objects the first time from their rapid head on approach he claimed he tried to turn and chase them but it all happened "suddenly" and they disappeared rapidly almost directly behind him to the east (he had heading west or more precisely WNW for landing) apparently before he could make the turn or complete it. Arnold estimated their size at about 2-2.5 feet, much smaller than 10-foot pelicans, so they would have disappeared from sight 4-5 times faster.

Given a 1 arcminute approximate angular size for disappearance this translates to a distance of roughly a mile -- versus roughly 6 miles for the much larger pelicans. At a closing speed of roughly 100 ft/sec, this means about one minute to disappear. At the standard rate of a two-minute turn shown on aircraft instrument panels a 180-degree turn would take this same one minute but too late as the objects would already have been gone -- hence Arnold's surprise. Had they crossed Arnold's flight path at RIGHT ANGLES (as the objects did on June 24) instead of head on he could easily have turned 90 degrees in just half a minute to pursue them at max speed BEFORE they disappeared, overtaking them in just another half minute. Arnold may have been surprised at how fast these objects disappeared but it's simply a matter of the optics of angular size and distance for such small objects.

These are simple flight DYNAMICS and elementary geometry and I wish James would address them instead of ignoring them.

Brad

I DREW A MAP!

Here it is (sort of -- Listbot didn't like it all in the one email that I sent Friday, It didn't work again today in two parts, so here goes again, in one email, plus a web page link).

I ran the numbers in a spreadsheet, and then plotted a chart of them as a MAP of the flight paths.

The numbers reflect what a pilot is supposed to do if a collision is possible:

In this scenario, Arnold was heading to Rainier to do another sweep for the missing plane, not Yakima (but this makes no real difference, other than the time I start my calculations at).

He noticed "objects rapidly approaching his plane at high speed" and turned to pass astern of them (as a low speed plane should do when confronted with high speed traffic). Then he KEPT them in view out his right side window throughout the rest of the sighting, not noticing that his heading was gradually changing. He then reported the heading he found himself on after the sighting ended.

Notice that I am not saying that this DID happen, but it is a way to make the bird theory work geometrically.

I was unable to send the 101K spreadsheet. You can see it at:

<http://php.indiana.edu/~lrobins/arnbird1.htm>

There are no links to this page from the rest of my site, because it is just a preliminary theory I want to bounce around. UFORL list readers are the only ones with this URL.

The spreadsheet contains data plotted at 6-second (.1 minute) intervals.

The origin is placed at Mineral Washington

All data are either relative to Mineral or to Arnold's plane.

Time data are relative to the starting of the timed interval.

Data are in miles, minutes, and degrees.

Positive values are north, east, faster, left, and counterclockwise.

I assumed that Arnold was three miles due east of Mineral at the start of the sighting. This value is not critical if the birds are also moved an equal distance.

Attachment 1 of this part is a .gif file which shows a 7-mile square plotted with the path of Arnold's plane (in this scenario), and the path of the birds .

Attachment 2 of this part is a .gif file that shows the big picture, with the three mountains, the birds, and Arnold's plane.

The plots are taken straight from the spreadsheet values.

The observed heading is different than the actual heading of the birds, because Arnold's plane supplied the rest of the motion effect that caused him to assume a 170 degree heading (that also just happens to be the line from Rainier to Adams). And the echelon form becomes a straight line of objects with an assumed heading along the line of echelon.

Location data of landmarks came from a Rand McNally Road Atlas.

I did this to show that a map can be drawn. We still have the brilliantly flashing birds to contend with.

That, and the fact that Arnold was looking at the tail ends of the birds during most of the sighting. Of course, birds don't come with vertical stabilizers.

Confirming that 'orbs' are an artefact produced by flash - certainly on the Olympus digital camera I used - is the image [285k] I've uploaded to:

<http://web.ukonline.co.uk/voyager/snoworbs.jpg>

It was one of several taken earlier tonight and is a photograph of snow/hail falling [early spring has returned to winter]. I thought this would be an ideal opportunity to document the effect and even though a standard compact flash, it was powerful enough to 'light up the sky' [I wonder how far away this was visible] as it reflected from the hailstones. Good fun!

James.

Subject: Re: I Drew a MAP (fwd)Status:

Larry,

Nice work! You've plotted the ORBIT I've been talking about on this List for more than a year, except for an initial S-shape curve for Arnold's flight path. And I've pointing out all this time that such a scenario clashes with Arnold's testimony.

This shallow orbit of the hypothetical flock of birds poses numerous problems of conflict with Arnold's testimony -- I realize you're modeling James' theory so I'm not putting the onus on you to explain them:

1. Still doesn't explain why the supposed pelicans would disappear at what you've modeled as a terminal distance of about 3.34 miles viewed towards a direction south of Mt. Adams. Angular size would be 2 arcminutes compared to 4 arcminutes at closest approach (Arnold's figures come out to 2.6 arcmins) and they should still have been visible. At your reasonable bird speed of 30 mph or 1/2 mile/min, they would have receded another 3 miles in 6 minutes (or at 50 mph in about 4 minutes) reducing their angular size down to about 1 arcminute which might well have been visible, too, it's borderline.

If they were smaller birds than pelicans, with effective diameters of one foot, they would have been too small to be seen even at your closest approach distance of 1.77 miles (0.4 arcmin).

2. Arnold should still have been able to see pelicans for another 4-6 minutes so why didn't he chase them? He could have caught up with them in about 1-1/2 minutes.

3. This flight path means Arnold never saw the objects first from "far to the left" then crossing to "directly in front" as he had reported he had seen.

4. This flight path has Arnold traveling NORTH more or less instead of EAST, more or less, completely contradicting his testimony.

5. The flight path has Arnold unconsciously making a sharp collision-avoidance turn to the left (60 degs in 12 seconds) then gradually straightening out in a long arc, all without any awareness he had done so, and contrary to all his reports from day one and over the years.

6. This flight path also has Arnold ending up headed for Mt. Rainier instead of Yakima afterward, contrary to Arnold's usual testimony.

7. On this flight path, Arnold could not have turned his plane around during the clocking phase to briefly open his window and view the objects unobstructed by windshield, which he reported he had done. With this reconstruction, two HIGH-SPEED TIGHT 135 to 180-degree turns would have been required to bring the objects in view out his opened window and then back to the weird orbital arc flight path, which would have required a minimum of 1/2 minute. This would have brought

Arnold almost 1 MILE CLOSER TO THE BIRDS and on a course he could obviously have stopped midway in order to just pursue the (alleged) birds and catch up with them in just seconds, but didn't. (Had Arnold used a slower standard two-minute turn he would in fact have OVERTAKEN the birds.)

8. Had Arnold made the sharp turn to view pelicans out his open window the close distance of 1 mile or less would have made them so large in angular size (nearly 8 arcmins or almost FULL MOON) that he would easily have SEEN THE PELICAN'S WINGS and seen that they were birds.

9. Of course, the birds in this scenario could not have flown BEHIND Mt. Rainier/Little Tahoma at roughly 20 miles' distance during the sighting, contrary to Arnold's testimony and mapping.

10. The birds in this scenario do not fly almost due SOUTH as Arnold reported for the objects (170 heading) but almost due EAST (100 heading).

11. And as you point out this dynamic flight scenario doesn't even touch optical brightness considerations, birds not being bright enough to "BLIND" like "ARC LIGHT."

Brad

Subject: Re: Arnold Sun Mirror ExperimentsStatus:

Bruce,

I thought all your curved metal reflector calcs were based on a cylinder to get the all-angle effect while reducing some of the dissipation you'd have with a spherical reflector.

Can you give me total brightness estimates for a power source or light on an object at 20 miles assuming isotropic radiation into a hemisphere for each of the differing intensity levels per steradian you've calculated for flat mirror sun intensity and curved mirror sun intensity, etc.? The reason I ask is that I can't easily hunt up and pick out which of so many E-mail messages has your calculations.

Thanks!

Brad

In a message dated Sat, 1 Apr 2000 11:00:04 AM Eastern Standard Time, bruce maccabee <brumac@compuserve.com> writes:

<<

BRAD WROTE:

>Thanks for the new calculations. What is the corrected brightness (correcting for solid angle error) for >a GLACIER ICE FLASH, as compared to the curved mirror model for sun reflection to Arnold? It >should be closer now. Also, I mentioned in an earlier posting that I measured Rc radius of curvature f>or Arnold's objects from his drawing to the AAF at about 1-2 object diameters. This is a tighter >curvature than your Rc of nearly 4 object diameters which would reduce brightness further.

As I pointed out a calculation for curved (spherical or cylindrical or a "combination") would be the same as for a curved metal mirror of the same size but with only 2-3% of the reflectivity.

I should also point out that the 2-3% is for reflection at the curved surface, This would be the ONLY reflection if the ice were "pure"--- no "defects" in the volume (interior) of the ice. HOwever, there are random deflects which scatter radiation within the volume of ice and some of this comes back out again. I suppose for simplicity one could treat natural ice, with bubbles, etc, imbedded, as aspecular reflector of 2-3% PLUS a diffuse reflector, in other words a sum of "snow-like" reflection plus "mirror-like" reflection. The diffuse "snow like" component could be a large fraction of the total reflection if the radius of curvature were small.

As for the Rc in Arnold's case.... this requires an estimate of thickness of the object, which he was not able to make, plus an assumption that the whole surface is uniformly curved, as opposed to a "control room bubble" on a nominally flat surface. We JUST DON'T KNOW... which is why I was reluctant to try a curved surface calculation. There are just so many unknown "parameters" when we try to characterize the shape and reflectivity of TOTALLY UNKNOWN objects/craft. The main thing is that the calculation establishes that Arnold COULD HAVE BEEN TELLING THE TRUTH when he said the light coming from the objects was very bright. The calculations show that despite the distance, reflected sunlight COULD BE very bright (this was NOT KNOWN BEFORE!!). (The calculations also confirm that BIRDS ARE NOT THAT BRIGHT... this WAS known before... at least to some of us!) Of course, if the objects were generating flashes of light unrelated to sunlight, then "all bets are off" as to the nature of that light and one can only set maximum and minimum limits such as the lumen radiation level if they emitted light uniformly into all directions (4π steradians) or if they emitted light into a narrow beam pointed toward Arnold (a very tiny number of steradians, such as the solid angle of his eye at 20 miles).

>What is the total flux for a radiator uniformly emitting in all directions if it had the luminous intensity you estimate for the cylindrical curved mirror reflector?

.....

I don't know exactly what you mean here.... I don't recall calculating the luminous intensity for a cylinder....

.

PREVIOUSLY I WROTE:

A curved surface does not have to be spherical. A cylinder surface has finite curvature in one direction and an infinite radius of curvature in the other. Hence divergence of reflected light parallel to the cylinder axis depends upon the divergence of the incident light whereas the divergence of reflected light perpendicular to the axis is the sum of the incident divergence angle plus the cylinder angle, W/R_c , where W is the width of the cylinder and R_c is the radius of the cylinder. Since the divergence is different in perpendicular directions (along and perpendicular to the cylinder axis) one can calculate an overall solid angle of divergence by multiplying the two angles and multiplying the result by $\pi/4$ as if calculating the area of a circle: $(\pi/4) \times 0.009 \times 2 \arcsin(W/2R_c)$ which is approximately $(\pi/4) \times 0.009 \times W/R_c$ for $W < R_c/2.5$, where 0.009 is the solar divergence angle, 0.52 deg., in radians. (Note that the solid angle formula given above, for small angles can be approximated as $(\pi/4)(0.52 + 2A)^2$ because for small angles $\cos(C) = 1 - C^2/2$ where, in this case, $C = (0.52 + 2A/2)$.)

.....

If the length of the mirror axis were W and the width (a chord across the curved surface) were W then the solid angle would have divergence 0.009 radians along the axis and W/R_c perpendicular to the axis, as above. The

effective area of reflection would be W^2 . The total luminous reflected flux would be that of the capture area (the "cross-section"), W^2 times $1E5$ (lm/m^2 from the sun) times reflectivity.

In your question you ask for the total luminous flux from a radiator emitting in ALL DIRECTIONS.

If it emits in all directions then it emits uniformly into 4π steradians and the luminous intensity would have been calculated as the total flux divided by 4π . Hence multiplication by 4π returns the original flux. If it is a surface emitting into 2π steradians then the luminous intensity multiplied by 2π will give back the total flux. (Here there are no radiation patterns assumed. But a beam is a radiation pattern.)

>The solar constant outside the atmosphere is about 1370 W/sq.meter but I can't find the figure for the >earth's surface.

As I recall 600-800 w/m^2 reach the surface.... but note that this is the TOTAL power including infrared and ultraviolet.

Excellent - clever idea to use a spreadsheet.

>the bird theory work geometrically.

As I've said from the outset, there are too many unknown factors to ever prove what Arnold witnessed, or how exactly he flew in relation to the objects. I've long suspected that if we could theoretically see a map of his actual flightpath it might be a case of, 'well, we never knew he did that...".

It's compounded by the fact that so much also depended on Arnold's individual perceptions.

>I was unable to send the 101K spreadsheet.

ListBot [or at least the free service we use] has a limit of 100k for postings.

Strictly, as with any mailing list, to avoid inconveniencing subscribers who aren't interested in the material yet still have to download it, there should be no attachments to list postings. I have no problems with this though and unless anyone does object [please do let me know if it causes problems], it offers a facility which most computer users perhaps now accept and welcome.

Unless objections are received, I'm happy to leave well alone and occasional postings with attachments up to 100k inclusive will remain permissible.

We have the technology, allegedly.

James.

James,

I already posted an 11-point critique of this scenario in detail this afternoon (see copy BELOW). Larry's reconstruction is merely a modified version of the bird ORBIT I've been describing to you as the only geometry allowing for viewing a flock of birds against a wide range of angles across the sky from north of Rainier to south of Adams -- but which keeps the objects always to Arnold's RIGHT and NEVER to his LEFT contrary to what Arnold reported.

I use a spreadsheet for positional calculations, too, as I've mentioned before and I use spherical trigonometry.

From: RB47Expert@aol.com

Larry,

Nice work! You've plotted the ORBIT I've been talking about on this List for more than a year, except for an initial S-shape curve for Arnold's flight path. And I've pointing out all this time that such a scenario clashes with Arnold's testimony.

This shallow orbit of the hypothetical flock of birds poses numerous problems of conflict with Arnold's testimony -- I realize you're modeling James' theory so I'm not putting the onus on you to explain them:

1. Still doesn't explain why the supposed pelicans would disappear at what you've modeled as a terminal distance of about 3.34 miles viewed towards a direction south of Mt. Adams. Angular size would be 2 arcminutes compared to 4 arcminutes at closest approach (Arnold's figures come out to 2.6 arcmins) and they should still have been visible. At your reasonable bird speed of 30 mph or 1/2 mile/min, they would have receded another 3 miles in 6 minutes (or at 50 mph in about 4 minutes) reducing their angular size down to about 1 arcminute which might well have been visible, too, it's borderline.

If they were smaller birds than pelicans, with effective diameters of one foot, they would have been too small to be seen even at your closest approach distance of 1.77 miles (0.4 arcmin).

2. Arnold should still have been able to see pelicans for another 4-6 minutes so why didn't he chase them? He could have caught up with them in about 1-1/2 minutes.

3. This flight path means Arnold never saw the objects first from "far to the left" then crossing to "directly in front" as he had reported he had seen.
4. This flight path has Arnold traveling NORTH more or less instead of EAST, more or less, completely contradicting his testimony.
5. The flight path has Arnold unconsciously making a sharp collision-avoidance turn to the left (60 degs in 12 seconds) then gradually straightening out in a long arc, all without any awareness he had done so, and contrary to all his reports from day one and over the years.
6. This flight path also has Arnold ending up headed for Mt. Rainier instead of Yakima afterward, contrary to Arnold's usual testimony.
7. On this flight path, Arnold could not have turned his plane around during the clocking phase to briefly open his window and view the objects unobstructed by windshield, which he reported he had done. With this reconstruction, two HIGH-SPEED TIGHT 135 to 180-degree turns would have been required to bring the objects in view out his opened window and then back to the weird orbital arc flight path, which would have required a minimum of 1/2 minute. This would have brought Arnold almost 1 MILE CLOSER TO THE BIRDS and on a course he could obviously have stopped midway in order to just pursue the (alleged) birds and catch up with them in just seconds, but didn't. (Had Arnold used a slower standard two-minute turn he would in fact have OVERTAKEN the birds.)
8. Had Arnold made the sharp turn to view pelicans out his open window the close distance of 1 mile or less would have made them so large in angular size (nearly 8 arcmins or almost FULL MOON) that he would easily have SEEN THE PELICAN'S WINGS and seen that they were birds.
9. Of course, the birds in this scenario could not have flown BEHIND Mt. Rainier/Little Tahoma at roughly 20 miles' distance during the sighting, contrary to Arnold's testimony and mapping.
10. The birds in this scenario do not fly almost due SOUTH as Arnold reported for the objects (170 heading) but almost due EAST (100 heading).
11. And as you point out this dynamic flight scenario doesn't even touch optical brightness considerations, birds not being bright enough to "BLIND" like "ARC LIGHT."

@
@
@Larry,

@Nice work! You've plotted the ORBIT I've been talking about on
@this List for more than a year, except for an initial S-shape
@curve for Arnold's flight path. And I've pointing out all this
@time that such a scenario clashes with Arnold's testimony.

I really just wanted to see if anything at all was possible, and
that's what I came up with. Some variations are possible. I
concentrated on keeping the birds near his straight right after
the initial turn.

@This shallow orbit of the hypothetical flock of birds poses
@numerous problems of conflict with Arnold's testimony -- I
@realize you're modeling James' theory so I'm not putting the
@onus on you to explain them:

@1. Still doesn't explain why the supposed pelicans would
@disappear at what you've modeled as a terminal distance of about
@3.34 miles viewed towards a direction south of Mt. Adams.
@Angular size would be 2 arcminutes comared to 4 arcminutes at
@closest approach (Arnold's figures come out to 2.6 arcmins) and
@they should still have been visible. At your reasonable bird
@speed of 30 mph or 1/2 mile/min, they would have receded another
@3 miles in 6 minutes (or at 50 mph in about 4 minutes) reducing
@their angular size down to about 1 arcminute which might well
@have been visible, too, it's borderline.

Question: Could any of these account for that?

Loss of lighting (due to clouds)?

Matching the background sky?

The birds being edge-on?

@If they were smaller birds than pelicans, with effective
@diameters of one foot, they would have been too small to be seen
@even at your closest approach distance of 1.77 miles (0.4
@arcmin).

Unless they were bright enough to stimulate the eye. Stars have an angular size of much less than that, and we can see them. Objects darker than their surroundings are limited by the eye's resolution to be seen, but objects brighter than their surroundings have no such limitation because they are emitting more light energy than their surroundings.

@2. Arnold should still have been able to see pelicans for
@another 4-6 minutes so why didn't he chase them? He could have
@caught up with them in about 1-1/2 minutes.

Was he thinking in terms of military craft? If so, you just don't go and do that. We had just been a war, and the cold war was already escalating.

@3. This flight path means Arnold never saw the objects first
@from "far to the left" then crossing to "directly in front" as
@he had reported he had seen.

Read my accompanying text. I had originally done the sim as though Arnold was heading back to the mountain to search some more (as he said in some accounts). All you have to do is backtrack a few seconds earlier, with Arnold turning left during those seconds, and you have a course to Yakima.

@4. This flight path has Arnold traveling NORTH more or less
@instead of EAST, more or less, completely contradicting his
@testimony.

But the question is, at what portion of the sighting did he ascertain his heading? At the end, he IS flying east.

@5. The flight path has Arnold unconsciously making a sharp
@collision-avoidance turn to the left (60 degs in 12 seconds)
@then gradually straightening out in a long arc, all without any
@awareness he had done so, and contrary to all his reports from
@day one and over the years.

Could this be a lapse of memory, an automatic response, or the turn to put the objects in his right window?

As everyone has repeatedly pointed out to me, memory tends to be

inaccurate, especially when one's perception of an event suddenly changes. As an example, in the auto accident I was in last year, it took me two days to realize that there had been a van in between me and the car that hit me from behind. I finally pieced together what really happened, but after all of the reports had been filed. For you in the UK, the fact that we drive on the right is significant here:

A. I was about to turn my big blue and white van into the first right hand driveway beyond a tee intersection with its side road on the left. The driveway entrance was an acute angle, so a very sharp turn was required. I had my right turn signal on, and it was working properly. The speed limit was 40 mi/hr, but the through highway makes a curve to the right through the section involved, and the curve was posted at 30 mi/hr advisory speed.

B. Just before I turned, I checked traffic behind me to see if it was slowing down. I was relieved when I saw that the white van behind me was turning left onto the side road. I concluded that it was safe to brake sharply to make the turn. This segment was the part I had totally forgotten until two days later.

C. I braked to less than 10 mi/hr, and just as I started to make the turn, there was a terrific bang. A red blur whizzed by on the right, and an object looking like a long thin snake loomed in my windshield, writhing.

D. I realized that something had hit me. I stopped as soon as the tail of my van was entirely in the driveway. The red sedan that had hit my van stopped just beyond the next driveway, and then backed into it. The entire fender behind the left rear wheel and part of the back bumper were missing from the sedan.

E. I got out and found that the missing pieces of the red sedan (all made of plastic) had caught behind the hooked end of my bumper, and had been shoved between the bumper and the body of my van. I called the cops from my friend's house, which was my destination.

F. The driver of the other car said she had been passing a left turning car on what she call a passing loop. I responded that I had been signaling a right turn, not a left turn. I then turned the power back on to check the bulbs, and the signal came on immediately because the lever was still up (it hadn't automatically returned to center because I never completed the turn). But she still insisted that she thought I was turning left.

G. The officer determined that it was her fault, because that was not a passing loop, but just the road shoulder. It ends at the

driveway I turned into by passing under the driveway in a culvert.

H. The snake-like thing was the rubber and chrome trim strip from the left side of her car. We found it wrapped twice around the 3 mailbox posts next to the driveway. Later, I found part of her tail-light assembly at the other end of the 100 ft long driveway.

Once I realized that there had been another vehicle between us, it explained how neither of us could have seen the other until just before the impact. She had passed on the right a vehicle that was making a left turn, but had not expected another vehicle to be almost stopped in front of it. And the large white van had hidden her car from my view until she was on the shoulder alongside the van. She effectively "ran out of road" because the shoulder ended at the culvert, and my van was obstructing the real driving lane. But, BECAUSE THE STEERING WHEELS ARE ON THE LEFT, neither of us could see the other, because the white van was interposed, and because the road curves to the right.

But if I hadn't later remembered the presence of the white van, I would have never figured why on earth someone would pass a right-turning vehicle on the right, or why she continued to insist that she thought I was turning left.

@6. This flight path also has Arnold ending up headed for Mt. Rainier instead of Yakima afterward, contrary to Arnold's usual testimony.

That's just a matter of where I ended the sim (I was trying to make a spreadsheet that webbed under the 100K limit of Listbot, but failed). As long as they were in sight, he would have continued his gradual turn to the right.

@7. On this flight path, Arnold could not have turned his plane around during the clocking phase to briefly open his window and view the objects unobstructed by windshield, which he reported he had done. With this reconstruction, two HIGH-SPEED TIGHT 135 to 180-degree turns would have been required to bring the objects in view out his opened window and then back to the weird orbital arc flight path, which would have required a minimum of 1/2 minute. This would have brought Arnold almost 1 MILE CLOSER TO THE BIRDS and on a course he could obviously have stopped midway in order to just pursue the (alleged) birds and catch up with them in just seconds, but didn't. (Had Arnold used a slower standard two-minute turn he would in fact have OVERTAKEN the birds.)

His RIGHT window was in position through most of the orbit. Who

says he was in the left seat (did the plane have dual controls)? Many planes have the right seat as the primary pilot's location. In others, it depends on which hand the pilot prefers to operate the throttle with. Some makers place the throttle control between the seats, some on the dashboard, and others have one on each side, right on the fuselage. Pilots who learned in WW-2 military trainers tend to like the throttle on the left, and sit in the seat that places it there. Most airline pilots prefer the throttle on the right.

@8. Had Arnold made the sharp turn to view pelicans out his open @window the close distance of 1 mile or less would have made them @so large in angular size (nearly 8 arcmins or almost FULL MOON) @that he would easily have SEEN THE PELICAN'S WINGS and seen that @they were birds.

You are assuming that he sat in the left seat of the plane. The sharp turn to see them out the window is also the collision avoidance one, if he used the right window. If he had turned right, he could have been putting himself on a collision course with the objects as he observed them out his left window.

@9. Of course, the birds in this scenario could not have flown @BEHIND Mt. Rainier/Little Tahoma at roughly 20 miles' distance @during the sighting, contrary to Arnold's testimony and mapping.

Could they have matched it enough to be rendered invisible?

@10. The birds in this scenario do not fly almost due SOUTH as @Arnold reported for the objects (170 heading) but almost due @EAST (100 heading).

The difference could be caused by the motion of Arnold's plane itself, and the fact that he used the locations of the mountains to figure out the heading of the objects. In this scenario, because he thought the aircraft were faster than he was, he attributed motion his plane provided to motion provided by the birds.

If you can, find my post about the police helicopter having the dogfight with the fire balloon (Jefferson co KY, 02/26/93), and how they thought it was trying to ram them. This case and the Gorman case (Fargo ND, 10/01/48) are examples how, if a pilot overestimates the size of an unknown object, he also overestimates the distance, and then his own motions are reflected in his perception of the flight path of the unknown.

@11. And as you point out this dynamic flight scenario doesn't @even touch optical brightness considerations, birds not being @bright enough to "BLIND" like "ARC LIGHT."

Right! That's the big problem. (Was Arnold photophobic???)

@Brad

LARRY WROTE:

>I DREW A MAP!

WOW! HAHAAAAHA HHOHOHOHOHO HEE HEE HEE HEEE
(whap! hand over laughing mouth!)
Not to be disrespectful..... but this has to be the most amusing
version of Arnold's sighting ever proposed.
Don't get me wrong here, I appreciate your effort and understand
that it took quite a bit of time to compile that spreadsheet, point
by point and thereby form a quantitative check of a
previous conjecture by Brad.

HOWEVER, this reminds me of
MACCABEE'S FIRST RULE OF DEBUNKING:
Any explanation is better than none.
(Second Rule: if the first explanation doesn't work, try another.
Maccabee's Corollary to the Second Rule...you guessed it!...
of the 2nd doesn't work try a 3rd.... ad infinitum)

Of course, I realize this doesn't apply to you, Larry because you
wouldn't be a debunker,..... now would you?..... but you merely rose
to the challenge to DRAW A MAP!
And now we see Brad's "solution" presented in full glory..... and
what a glorious solution it is. It makes full use of the classical
method
established by PROJECT GRUDGE, J. ALLEN HYNEK and
epitomized by DONALD MENZEL, namely,

MACCABEE'S RULE FOR CREATING AN EXPLANATION:
modify the sighting data as needed to make the
preferred explanation fit.

.....
OK. enough jollity. Let's look at this more closely.

Larry wrote:

Tremendous work!

>The numbers reflect what a pilot is supposed to do if a collision
>is possible:

>In this scenario, Arnold was heading to Rainier to do another
>sweep for the missing plane, not Yakima (but this makes no real
>difference, other than the time I start my calculations at).

>He noticed "objects rapidly approaching his plane at high speed"
>and turned to pass astern of them (as a low speed plane should do
>when confronted with high speed traffic).

This is the first problem. I don't know what the source of your quote is (your brain?), but it isn't either the Air Force Letter or his book. His report is that he first observed a flash and this started him looking everywhere to see where it came from. He would NOT have turned his plane northward or any direction at this time since he didn't know where the flash had come from and, in fact, didn't figure that out until about 20 seconds more, when the next flash came and attracted his attention to the north.... to his left. Then, when he first saw the objects themselves it was obvious that they were FAR away.... no chance of a collision.

SO, the rationale for arguing that he would have turned LEFT to pass behind objects that he (mistakenly) thought were close just does not exist. This also applies if, in fact, he saw birds at a distance so great that he couldn't make out their wings and flapping. There would have been no reason to deviate from his path unless he thought he was going to run into the birds. Your map shows that he had no reason to think this.

If, in your map, you draw Arnold's track eastward instead of northward you can see that his track would pass south of the birds' most southward position, EVEN IF YOU TURN THE BIRD TRACK SO THEY FLEW AT 160-170 DEGREES AS ARNOLD CLAIMED.

Incidentally, in his Air Force letter, he wrote "I observed the chain of these objects passing another snow-covered ridge between Mt. Rainier and Mt. Adams, and as the first one was passing the south crest the last object was entering the northern crest of the ridge. AS I WAS FLYING IN THE DIRECTION OF THIS PARTICULAR RIDGE.....".(my emphasis)

We have discussed whether or not he was actually heading toward this ridge (Goat Ridge) at the time or whether he was heading toward Yakima or Mt. Rainier, but the point is that this statement implies that at the time he saw them pass Goat Ridge he was headed generally eastward, not northward.> Then he KEPT them in

>view out his right side window throughout the rest of the
>sighting, not noticing that his heading was gradually changing.
>He then reported the heading he found himself on after the
>sighting ended.

Yes, yes,..... turning his plane, flying willy nilly, while watching birds, etc. And then he conveniently forgot that he had been travelig northward while the strange objects were traveling southward.

>Notice that I am not saying that this DID happen, but it is a way
>to make the bird theory work geometrically.
<,

Yes. Brad already figured this out and rejected it because there is no testimonial evidence for anything like this.

James wrote:

>

<http://web.ukonline.co.uk/voyager/snoworbs.jpg>

It was one of several taken earlier tonight and is a photograph of snow/hail falling [early spring has returned to winter]. I thought this would be an ideal opportunity to document the effect and even though a standard compact flash, it was powerful enough to 'light up the sky' [I wonder how far away this was visible] as it reflected from the hailstones. Good fun!
<

THEY'RE BACK! ORB CREATURES!!

Looking at your picture I would say that MOST of the particles were reasonably well focused..... not surprising since the "reach" of the flash is tens of feet for white reflectors, at least, and the near focal distance was probably 4 -5 ft. I counted 18 roundish images of which about 1/2 are clearly "Standard Orbs" - reflectors so close that the image has the shape of the aperture rather than the shape of the reflector.

For experimental sorts, I am presently carrying out a long-term orb search in which I go outside at night and take a few pictures. I plan to search for orbs near the woods, in fields, etc. IT will be several weeks before I have a collection of "spring orbs"/////..... assuming some do turn up on my pictures.

Subject: Re: Arnold Sun Mirror Experiments boundary="a6e01033-0a81-11d4-942e-00805fea3c3d"
Status:

BRAD WROTE:

>I thought all your curved metal reflector calcs were based on a cylinder to get the all-angle effect while >reducing some of the dissipation you'd have with a spherical reflector.

I have now done calculations for both spherical and cylindrical surfaces (as well as flat).

..... WHAT FOLLOWS IS A MODIFICATION AND ADDITION TO THE BRIGHTNESS PAPER (a revised version of which is attached. I suggest you dump the old version. There are numerous corrections in this one.)

REFLECTION FROM A CURVED SURFACE 03/31/00

Imagine a FLAT surface of length L and width W. Sunlight hits the surface and because the sun is not a point source the reflected light diverges. To understand how much it diverges, consider the light from a point at "one side" of the sun. It hits both sides of the reflector and is diverted by an angle that obeys the reflection rule: "angle of reflection = angle of incidence." Since the sun is so far away, a ray of light from any one POINT (a small area) on the sun hitting one side of the mirror is effectively PARALLEL to a ray of light from the same POINT on the sun that hits the other side of the mirror. (You don't believe it? Imagine a mirror one mile wide. The sun is 93,000,000 miles away. Light from A POINT of the sun hitting one side of the mirror is at an angle of $1/93,000,000$ radians away from light from that SAME POINT that hits the other side of the mirror. Now imagine the mirror is only 0.01 miles wide comparable to the size of a "flying saucer mirror": the divergence angle is now only about $1E-10$ radians..... the beams are effectively parallel!).

So you can draw light rays that come from ONE SIDE of the sun and hit the two opposite sides of the mirror and reflect as basically parallel rays (with a divergence of $1E-10$ radians). Now imagine light starting from the "other side" of the sun. These rays hit each side of the mirror and they are effectively parallel to one another as they reflect off the surface. However, because the sun is wide, these rays are NOT parallel to the rays from the "first side" of the sun. In fact, the angle between the pairs of reflected rays is the same as the angle between the two sides of the sun, 0.52 degrees. Hence the aside from some "near field" effects, close to the mirror, the reflected light diverges like a beam, with angular width equal to that of the sun.

Now imagine that the left side of the mirror is at a different angle from that of the right side, as would be the case if the mirror is curved. Light from one side of the sun (remember, rays traveling parallel from A POINT on the sun) is now reflected into two different directions, with a divergence equal to the TWICE the angle between the two surfaces. Why twice the angle? Because if a flat mirror surface turns by angle A, then in order to obey the reflection rule at the rotated surface the angle of the reflected ray turns by 2A. (To see this, imagine a flat surface reflecting light right directly back to a point or distant source. At this time the angle between the oncoming ray and the PERPENDICULAR to the mirror surface --- the "surface normal" -- is zero. Now imagine turning the mirror by angle A. Now the angle between the surface normal and the incident ray is A. But the reflection rule says the angle between the surface normal and the reflected ray equals that of the incident ray, A. Hence the angle between the incident and reflected ray is 2A. As the mirror is turned more the angle A increases and the angle between the incident and reflected rays increases twice as fast as the mirror turns.)

Suppose, then, we have a curved surface for which there is a radius of curvature, R_c , which would be the center of the sphere that fits the curved surface, i.e., a section of a spherical surface. The central angle (apex at the center of the sphere) made by this surface from one side to the other is A. One can show that a TANGENT to this curved surface at one side of the surface is at an angle A to the tangent at the other side of the surface. Hence light reflected from a distant point source that is reflected from the two sides will, after reflection, diverge by angle 2A. When the source is not a point but rather has an angular size itself, as the sun has, the "natural divergence" due to the size of the source is augmented by the curved surface divergence. It is my impression that these divergences will simply add, i.e., $A_{total} = A_{sun} + 2A_{mirror}$. Thus with $A_{sun} = 0.52$ deg, if $A_m = 1$ deg, the total divergence angle is $A_t = 2.52$ deg. The "solid angle" of divergence (assuming a circular curved mirror surface) could be found from $2 \pi (1 - \cos [(0.52+2A)/2]) = 2 \pi (1 - \cos[0.26+A])$ or, if angles are in radians, $2 \pi (1 - \cos[0.0045+A])$ steradians.

Now, the curvature of the mirror surface is related to the width of the mirror and the radius of curvature. Imagine a flat mirror surface of width W. Flat means the radius of curvature is infinite so the angle A = 0. Now let the radius shrink to R_c which is still much greater than W. The full angle of the mirror surface is W/R_c in radians for practical purposes even though the surface is now curved and W is not a measurement lying in the surface but rather is a "chord" - a straight line across a circular or spherical surface. As R_c continues to shrink the surface curves more and one needs a trigonometric relation to get the angle from $A_{sphere} = 2 \arcsin(W/2R_c)$. Since $\arcsin B = B$ in radians for angles up to 20 degrees or more (depending upon the degree of accuracy desired) $A_s = W/R_c$ (radians) as long as $W < R_c/2.5$. For practical purposes the area of oncoming rays of sunlight is based on W, not on the actual surface area of the curved surface, so it is convenient to consider W is the primary measure of the size of the surface. If the surface were round then W would be the diameter of the circular area, $\pi \times W^2/4 \text{ m}^2$, that

intercepts power from sun rays and the rays would be reflected into a beam of angular size $0.52 + 2A_s$ with the solid angle given by the cosine formula above.

A curved surface does not have to be spherical. A cylinder surface has finite curvature in one direction and an infinite radius of curvature in the other. Hence divergence of reflected light parallel to the cylinder axis depends upon the divergence of the incident light whereas the divergence of reflected light perpendicular to the axis is the sum of the incident divergence angle plus the cylinder angle, $A_c = W/R_c$, where W is the width of the cylinder and R_c is the radius of the cylinder ($A_c = 2 \arcsin(W/2R_c)$ if the angle is greater than 25 degrees). Since the divergence is different in perpendicular directions (along and perpendicular to the cylinder axis) one can calculate an overall solid angle of divergence by multiplying the two "perpendicular" divergence angles and multiplying the result by $\pi/4$ as if calculating the area of a circle: $(\pi/4) \times 0.009 \times (0.009 + 2 A_c)$ which for $W < R_c/2.5$, where 0.009 is the solar divergence angle in radians. (Note that the cosine solid angle formula given above applies only for a circular area of a sphere with the same divergence angle "all around" - a circular cone. For small angles the cosine formula can be written in a form which can be compared with the cylinder solid angle. That is, for a spherical/circular surface it can be approximated as $(\pi/4)(0.009 + 2A_s)(0.009+2A_s) = (\pi/4)(0.009+2A_s)^2$ because for small angles $\cos(C) = 1 - C^2/2$ where, in this case, $C = [(0.009+2A_s)/2]$ so that $2 \pi (1-\cos(0.009+2A_s)/2) = \{2 \pi [(0.009+2A_s)/2]^2\}/2$.)

CIRCULAR SAUCERS WITH SPHERICAL SURFACE

In the case of the Arnold's "curved surfaces" one has to make a guess at the curvature as well as the area. For simplicity let's assume classic "saucers," circular objects 27.6 m in diameter with the surface having a radius of curvature, $R_c = 100$ m. The area of sunlight intercepted could be $(\pi/4) \times (27.6^2) \times \cos(\text{angle between the approximating flat surface and the line to the sun, } 30 \text{ degrees}) = 518 \text{ m}^2$ (W chosen to make an area comparable to what I used before). The width $W = 27.6$ m so $A = 27.6/100 = 0.276$ radians (to a good level of accuracy...if you use the arcsin you get 0.279) = 15.8 degrees. Since these are assumed to be circular we can use the cosine formula or the product of two angles: $2 \pi (1-\cos[(0.009+2(A))/2]) = 2 \pi (1-\cos[0.0045+.276]) = 0.245 \text{ sr}$. [Note that the product of angles formula gives $(\pi/4) (0.009 + 2 \times 0.276)^2 = 0.247$.] The luminous intensity, then, with reflectivity = 0.9 is

$I_{m,\text{circular/spherical}} = (1E5 \text{ lm/m}^2)(0.9)(518 \text{ m}^2)/0.245 \text{ sr} = \text{about } 2E8 \text{ lm/sr}$.

Clearly this is several orders of magnitude less than the flat surface value of $7E11 \text{ lm/sr}$. (At Arnold's distance the atmospheric transmission would reduce this to about $1E8 \text{ lm/sr}$.) This is still larger than the snow brightness (around $1E7 \text{ lm/sr}$; see above). Obviously with less curvature the brightness would be greater and with more curvature it

would be less.

There is a limit to the shrinkage of R_c : it can't be smaller than $W/2$. If we take this situation as a limiting case of brightness for an object 27.6 m in diameter - a sphere or hemisphere surface so $R_c=W/2$, then the divergence angle is $2 \arcsin[(W/2)/(W/2)] = 2 \times 90 = 180$ degrees. Thus the incident radiation gets scattered everywhere, just as with a diffuse reflector (but with the diffuse reflection factor). There is even scattering in the forward direction so that the solid angle is essentially 4π . The luminous intensity is then

$$I_{\text{sphere}, R_c=W} = (1E5 \text{ lm/m}^2)(0.9)(518 \text{ m}^2)/4 \pi = \text{about } 4E6 \text{ lm/sr.}$$

This is about half as intense as a patch of snow of the same area scattering into 2π steradians. Hence if the objects had been spheres they probably would have been hard to see against the snow background and against the whitish sky.

.....

CIRCULAR SAUCERS WITH CYLINDRICAL SURFACE

Imagine a circular piece of metal bent over a pipe. In this case the circular piece has a cylindrical surface. Assume the R_c for the cylinder curvature is 100 m and the diameter of the chord connecting the "ends" of the circle is 27.6 m so $W/R_c = 0.276$. The solid angle of divergence is now $(\pi/4) \times (0.009) \times (0.009 + 2 \times 0.276) = 0.0039$ sr. Assume the cylinder is illuminated obliquely so projected onto the line to the sun the area is $(\pi/4)(27.6^2)(\cos(30)) = 518 \text{ m}^2$ as before. For a reflectivity of 0.9

$$I_{\text{metal, cylinder}} = (1E5 \text{ lm/m}^2)(0.9)(518 \text{ m}^2)/(0.0039 \text{ sr}) = \text{about } 1E10 \text{ lm/sr}$$

This is less than the flat surface of the same area ($7E11$) and more than the spherical surface of the same area and radius of curvature, $2E8$. This is not surprising since the cylinder is a case of "intermediate divergence" between pure spherical and perfectly flat. Any complex combination of surface curvatures can be approximately modelled as spherical or cylindrical or flat over the appropriate portions of the reflector surface. Thus, for example, one might have 1/2 of the area being a cylinder surface with some value of R_c and one quarter of the area being flat and the other quarter being spherical with some other value of R_c . Since each type of reflection would have its own divergence one would have to calculate the lumens per unit area at the distance of Arnold's eye for each type of surface and then add these together (since the light is incoherent there is no problem of interference).

.....

BRAD WROTE

>Can you give me total brightness estimates for a power source or light on an object at 20 miles >assuming isotropic radiation into a hemisphere for each of the differing intensity levels per steradian >you've calculated for flat mirror sun intensity and curved mirror sun intensity, etc.? The reason I ask is t>hat I can't easily hunt up and pick out which of so many E-mail messages has your calculations.

<

As you can see from the attached paper, $I = I_0 e^{-(bR)}$ takes care of the atmospheric transmission.

The number of lumens/m² at a distance R is $I(R) = [I_0 e^{-(bR)}]/R^2$. This can be inverted to get I_0 , the initial intensity in lm/sr.

Multiply by 4 pi to get the number of lumens.

If you take the flat mirror intensity of 7E11 lm/sr close to the mirror so the atmosphere doesn't count then the flux is $7E11 \times 4 \pi = 8.8E12$ lm. All the other values were lower than that.

I think you'll be better able to pick out the appropriate numbers from the attached new version of the paper.

Larry suggests a major loss in memory plus photophobia to explain why Arnold could have taken a sinuous path northward while brightly flashing birds were flying southward and afterward Arnold would remember only that brightly flashing objects SEEMED to fly southward while he SEEMED to be flying eastward.

HAHAHAHAHA

Why even accept Arnold's claim that he started near Mineral and was heading generally east. Why accept the implied claim that at the end of the sighting he was heading eastward. Why accept his claim that he rolled his window down? Why accept his claim about timing the objects?

Even if they were birds they were far enough away and perhaps above or below him, so as to be no threat. He could have resumed his flight eastward while watching them. IN fact, it should have been apparent to him that he could get closer if he wanted to.

There is no evidence that Arnold initially "panicked" and turned his plane to avoid a collision. The available evidence is that Arnold believed the objects were far away.... whether birds or not, that is what he thought at the time...that the objects were far away... so why panic?

Oh, yes. He forgot that he panicked turned his plane. The most traumatic part of the event.... he forgot.

And photophobia..... well, if he was hypersensitive to light... he shouldn't have been out flying on a bright sunny day.

But photophobia is an excessive reaction to brightness. In Arnold's case he was bombarded by photons from "all over the place". The flashes took up only a tiny portion of his field of view. Photophobia might make Arnold more "sensitive" to the flashes, but it wouldn't change the apparent brilliance.

Perhaps the pelicans were packing mirrors to signal to fellow pelicans from miles away.

Yes

I like that better,

@Not to be disrespectful..... but this has to be the most
@amusing version of Arnold's sighting ever proposed. Don't get
@me wrong here, I appreciate your effort and understand that it
@took quite a bit of time to compile that spreadsheet, point by
@point and thereby form a quantitative check of a previous
@conjecture by Brad.

Don't bust a vein. :)

@HOWEVER, this reminds me of
@MACCABEE'S FIRST RULE OF DEBUNKING:
@Any explanation is better than none.
@(Second Rule: if the first explanation doesn't work, try another.
@Maccabee's Corollary to the Second Rule...you guessed it!...
@of the 2nd doesn't work try a 3rd.... ad infinitum)

But the second rule is exactly what has to be done in the process
of eliminating all known causes.

Larry's corollary to Maccabee's corollary: Proposing a solution
doesn't make it one. It must be tested into the ground first. Get
busy!

@Of course, I realize this doesn't apply to you, Larry because
@you wouldn't be a debunker,..... now would you?..... but you
@merely rose to the challenge to DRAW A MAP! And now we see
@Brad's "solution" presented in full glory..... and what a

@glorious solution it is. It makes full use of the classical
@method established by PROJECT GRUDGE, J. ALLEN HYNEK and
@epitomized by DONALD MENZEL, namely,

@MACCABEE'S RULE FOR CREATING AN EXPLANATION:

@modify the sighting data as needed to make the
@preferred explanation fit.

I do not consider this to be THE explanation for the sighting,
but only a possibility. I just wanted to see if it could be done.
We still have the brilliant flashing pelicans to contend with. I
would have to be shown that pelicans can reflect light bright
enough to cause the observed effects.

Unless, of course, it can be shown that some embellishing
occurred in the numerous retellings (some of which do not match).

Do we actually have ANY data of Arnold's flight path (where's
that flight recorder when you neeeded it?), or is his path only
conjecture, or do we have his path at certain points only. He did
say that he altered course to put the objects in his side window,
and then opened it. But it never says which side. Other parts of
the data conflict. WHAT DO WE ACTUALLY KNOW?

@.....

@OK. enough jollity. Let's look at this more closely.

@Larry wrote:

@>I ran the numbers in a spreadsheet, and then plotted a chart of
@>them as a MAP of the flight paths.

@Tremendous work!

@>The numbers reflect what a pilot is supposed to do if a collision
@>is possible:

@>In this scenario, Arnold was heading to Rainier to do another
@>sweep for the missing plane, not Yakima (but this makes no real
@>difference, other than the time I start my calculations at).

@>He noticed "objects rapidly approaching his plane at high speed"
@>and turned to pass astern of them (as a low speed plane should do
@>when confronted with high speed traffic).

@This is the first problem. I don't know what the source of your
@quote is (your brain?), but it isn't either the Air Force Letter
@or his book. His report is that he first observed a flash and
@this started him looking everywhere to see where it came from.

@He would NOT have turned his plane northward or any direction at
@this time since he didn't know where the flash had come from
@and, in fact, didn't figure that out until about 20 seconds
@more, when the next flash came and attracted his attention to
@the north.... to his left. Then, when he first saw the objects
@themselves it was obvious that they were FAR away.... no chance
@of a collision.

Sorry, it's a quote from memory from a rule in a book on flying,
not from Arnold. I don't have it with me, so data will come
later.

@SO, the rationale for arguing that he would have turned LEFT to pass
@behind objects that he (mistakenly) thought were close just does
@not exist. This also applies if, in fact, he saw birds at a distance
@so great that he couldn't make out their wings and flapping.
@There would have been no reason to deviate from his path unless he
@thought he was going to run into the birds. Your map shows that
@he had no reason to think this.

High speed planes don't have to be close to present a hazard. A
military jet can become a hazard within seconds of first
visibility.

@If, in your map, you draw Arnold's track eastward instead of
@northward you can see that his track would pass south of the
@birds' most southward position, EVEN IF YOU TURN THE BIRD
@TRACK SO THEY FLEW AT 160-170 DEGREES AS ARNOLD
@CLAIMED.

I need to try another experiment, and report back on this. I need
to plot the bird track relative to Arnold's plane.

@Incidentally, in his Air Force letter, he wrote "I observed the chain
@of these objects passing another snow-covered
@ridge between Mt. Rainier and Mt. Adams, and as the first one was
@passing the south crest the last object was entering the northern
@crest of the ridge. AS I WAS FLYING IN THE DIRECTION OF THIS
@PARTICULAR RIDGE.....".(my emphasis)

Data! If this is true, then the map I drew doesn't work.

@We have discussed whether or not he was actually heading toward
@this ridge (Goat Ridge) at the time or whether he was heading
@toward Yakima or Mt. Rainier, but the point is that this statement
@implies that at the time he saw them pass Goat Ridge he
@was headed generally eastward, not northward.>

@>Then he KEPT them in
@>view out his right side window throughout the rest of the

@>sighting, not noticing that his heading was gradually changing.
@>He then reported the heading he found himself on after the
@>sighting ended.

@Yes, yes,..... turning his plane, flying willy nilly, while watching
@birds, etc. And then he conveniently forgot that he had been
@traveling northward while the strange objects were traveling
@southward.

Relative to his plane, that is true. He had no actual data on
their true heading, but only their motion relative to his plane.
The question is: when did he ascertain his heading? Before the
sighting? Continuously during the sighting? After the sighting?

@>Notice that I am not saying that this DID happen, but it is a way
@>to make the bird theory work geometrically.
@<,

@Yes. Brad already figured this out and rejected it because there
@is no testimonial evidence for anything like this.

The only testimonial evidence against it is the statement that he
was heading toward Goat ridge as they passed it. But that's
enough!

Subject: Re: MAP? WOW! HAHAAHAHStatus:

LARRY WROTE:
>I DREW A MAP!>

Sorry I am just catching up on my favorite subject Kenneth Arnold.
I have not seen the map.

About pelicans.....brings out the Irish in me.
It has never been determined that pelicans actually do come thru
Washington. I live HERE! I have never seen a pelican. I spend every
weekend at Mt. Rainier and the Cascades from June to mid October.
I have never seen a pelican. I live on the beach. I have never seen
a pelican. It is too cold here for pelicans.

Nice try on the maps but I am not sure maps can actually describe what
the area looks like. You cannot understand the scope -- you have to see it
personally. Its very deceiving when you have a 14,410 foot volcano within a
short distance of sea level. Because of Mt. Rainier's mass, most objects are
lost.

There is no other place in the U.S. that is like this. I have lived in
many places. That mountain can appear big or small when you are standing
from one angle or another. A flash of a white pelican is perhaps the most
far out theory yet.

I was on a ridge less than 15 miles, over 6,000 feet and I could not see
a Cessna flying over her unless I took out my binoculars. I spent last
summer taking video of every angle of that volanco, at the highest locations
I could get to by Jeep or hiking. No I wasn't in a plane. Someone has
to convince me first of all that pelicans come thru Washington State.
And NO, I don't mean that report from some pelican specialist who lives
in the middle of Canada.

I'm not an ornithologist -- right word (?) but I can't imagine a pelican would
fly over a volcano when it could follow the coast line down where food
"might" be available. What is the air temperature over Mt. Rainier in
June. I know little about thermals. How would a bird survive freezing when
the temperature just 15 miles away would be mild?

Just an opinion.

Subject: Re: MAP? WOW! HAHAAHAHStatus:

Larry,

You claim that "The only testimonial evidence against it is the statement that he was heading toward Goat ridge as they passed it. But that's enough!"

Yet I presented an 11-point critique in which ALL of the points were TESTIMONIAL evidence against the bird-plane (superman???) reconstruction you presented.

Here they are again:

1. Still doesn't explain why the supposed pelicans would disappear at what you've modeled as a terminal distance of about 3.34 miles viewed towards a direction south of Mt. Adams. Angular size would be 2 arcminutes compared to 4 arcminutes at closest approach (Arnold's figures come out to 2.6 arcmins) and they should still have been visible. At your reasonable bird speed of 30 mph or 1/2 mile/min, they would have receded another 3 miles in 6 minutes (or at 50 mph in about 4 minutes) reducing their angular size down to about 1 arcminute which might well have been visible, too, it's borderline.

If they were smaller birds than pelicans, with effective diameters of one foot, they would have been too small to be seen even at your closest approach distance of 1.77 miles (0.4 arcmin).

2. Arnold should still have been able to see pelicans for another 4-6 minutes so why didn't he chase them? He could have caught up with them in about 1-1/2 minutes.

3. This flight path means Arnold never saw the objects first from "far to the left" then crossing to "directly in front" as he had reported he had seen.

4. This flight path has Arnold traveling NORTH more or less instead of EAST, more or less, completely contradicting his testimony.

5. The flight path has Arnold unconsciously making a sharp collision-avoidance turn to the left (60 degs in 12 seconds) then gradually straightening out in a long arc, all without any awareness he had done so, and contrary to all his reports from day one and over the years.

6. This flight path also has Arnold ending up headed for Mt. Rainier instead of Yakima afterward, contrary to Arnold's usual testimony.

7. On this flight path, Arnold could not have turned his plane around during

the clocking phase to briefly open his window and view the objects unobstructed by windshield, which he reported he had done. With this reconstruction, two HIGH-SPEED TIGHT 135 to 180-degree turns would have been required to bring the objects in view out his opened window and then back to the weird orbital arc flight path, which would have required a minimum of 1/2 minute. This would have brought Arnold almost 1 MILE CLOSER TO THE BIRDS and on a course he could obviously have stopped midway in order to just pursue the (alleged) birds and catch up with them in just seconds, but didn't. (Had Arnold used a slower standard two-minute turn he would in fact have OVERTAKEN the birds.)

8. Had Arnold made the sharp turn to view pelicans out his open window the close distance of 1 mile or less would have made them so large in angular size (nearly 8 arcmins or almost FULL MOON) that he would easily have SEEN THE PELICAN'S WINGS and seen that they were birds.

9. Of course, the birds in this scenario could not have flown BEHIND Mt. Rainier/Little Tahoma at roughly 20 miles' distance during the sighting, contrary to Arnold's testimony and mapping.

10. The birds in this scenario do not fly almost due SOUTH as Arnold reported for the objects (170 heading) but almost due EAST (100 heading).

11. And as you point out this dynamic flight scenario doesn't even touch optical brightness considerations, birds not being bright enough to "BLIND" like "ARC LIGHT."

@preferred explanation fit.

I do not consider this to be THE explanation for the sighting, but only a possibility. I just wanted to see if it could be done. We still have the brilliant flashing pelicans to contend with. I would have to be shown that pelicans can reflect light bright enough to cause the observed effects.

Unless, of course, it can be shown that some embellishing occurred in the numerous retellings (some of which do not match).

Do we actually have ANY data of Arnold's flight path (where's that flight recorder when you needed it?), or is his path only conjecture, or do we have his path at certain points only. He did say that he altered course to put the objects in his side window, and then opened it. But it never says which side. Other parts of the data conflict. WHAT DO WE ACTUALLY KNOW?

@.....

@OK. enough jollity. Let's look at this more closely.

@Larry wrote:

@>I ran the numbers in a spreadsheet, and then plotted a chart of
@>them as a MAP of the flight paths.

@Tremendous work!

@>The numbers reflect what a pilot is supposed to do if a collision
@>is possible:

@>In this scenario, Arnold was heading to Rainier to do another
@>sweep for the missing plane, not Yakima (but this makes no real
@>difference, other than the time I start my calculations at).

@>He noticed "objects rapidly approaching his plane at high speed"
@>and turned to pass astern of them (as a low speed plane should do
@>when confronted with high speed traffic).

@This is the first problem. I don't know what the source of your
@quote is (your brain?), but it isn't either the Air Force Letter
@or his book. His report is that he first observed a flash and
@this started him looking everywhere to see where it came from.
@He would NOT have turned his plane northward or any direction at
@this time since he didn't know where the flash had come from
@and, in fact, didn't figure that out until about 20 seconds
@more, when the next flash came and attracted his attention to
@the north.... to his left. Then, when he first saw the objects
@themselves it was obvious that they were FAR away.... no chance
@of a collision.

Sorry, it's a quote from memory from a rule in a book on flying,
not from Arnold. I don't have it with me, so data will come
later.

@SO, the rationale for arguing that he would have turned LEFT to pass
@behind objects that he (mistakenly) thought were close just does
@not exist. This also applies if, in fact, he saw birds at a distance
@so great that he couldn't make out their wings and flapping.
@There would have been no reason to deviate from his path unless he
@thought he was going to run into the birds. Your map shows that
@he had no reason to think this.

High speed planes don't have to be close to present a hazard. A
military jet can become a hazard within seconds of first
visibility.

@If, in your map, you draw Arnold's track eastward instead of
@northward you can see that his track would pass south of the
@birds' most southward position, EVEN IF YOU TURN THE BIRD
@TRACK SO THEY FLEW AT 160-170 DEGREES AS ARNOLD\
@CLAIMED.

I need to try another experiment, and report back on this. I need
to plot the bird track relative to Arnold's plane.

@Incidentally, in his Air Force letter, he wrote "I observed the chain
@of these objects passing another snow-covered
@ridge between Mt. Rainier and Mt. Adams, and as the first one was
@passing the south crest the last object was entering the northern
@crest of the ridge. AS I WAS FLYING IN THE DIRECTION OF THIS
@PARTICULAR RIDGE.....".(my emphasis)

Data! If this is true, then the map I drew doesn't work.

@We have discussed whether or not he was actually heading toward
@this ridge (Goat Ridge) at the time or whether he was heading
@toward Yakima or Mt. Rainier, but the point is that this statement
@implies that at the time he saw them pass Goat Ridge he
@was headed generally eastward, not northward.>

@>Then he KEPT them in
@>view out his right side window throughout the rest of the
@>sighting, not noticing that his heading was gradually changing.
@>He then reported the heading he found himself on after the
@>sighting ended.

@Yes, yes,..... turning his plane, flying willy nilly, while watching
@birds, etc. And then he conveniently forgot that he had been
@traveling northward while the strange objects were traveling
@southward.

Relative to his plane, that is true. He had no actual data on
their true heading, but only their motion relative to his plane.
The question is: when did he ascertain his heading? Before the
sighting? Continuously during the sighting? After the sighting?

@>Notice that I am not saying that this DID happen, but it is a way
@>to make the bird theory work geometrically.
@<,

@Yes. Brad already figured this out and rejected it because there
@is no testimonial evidence for anything like this.

The only testimonial evidence against it is the statement that he
was heading toward Goat ridge as they passed it. But that's
enough!

Yes, I am well aware that trying explanations is the "scientific method"
Try to explain new phenomena with information/theory based on
previously understood phenomena. Whether or not one can
make an explanation "stick" is the criterion for the discovery of
truly new phenomena.

>Larry's corollary to Maccabee's corollary: Proposing a solution
>doesn't make it one. It must be tested into the ground first. Get
>busy!

ABSOLUTELY... and this is where the debunkers fall on their
faces and caused me to write the paper "PROSAIC EXPLANATIONS,
the FAILURE of UFO Skepticism " (which I have mentioned on
this list previously).

>@Of course, I realize this doesn't apply to you, Larry because

>@modify the sighting data as needed to make the

>@preferred explanation fit.

I should have pointed out that this RULE FOR CREATING AN EXPLANATION is intended to be in the context of the debunker's FIRST RULE that ANY explanation is better than none. If you have to modify data to arrive at an explanation.. go to it!

>I do not consider this to be THE explanation for the sighting,
>but only a possibility. I just wanted to see if it could be done.
>We still have the brilliant flashing pelicans to contend with. I

Actually, we still have the flight dynamics to contend with since your flight path of the aircraft has no, zero, zip support from the Arnold testimony.

>Unless, of course, it can be shown that some embellishing
>occurred in the numerous retellings (some of which do not match).

True, there are differences, but not as much as one would expect if Arnold had flown along a path such as you (or Brad) suggested.

>Do we actually have ANY data of Arnold's flight path (where's
t>hat flight recorder when you neeeded it?), or is his path only

You have the same testimonial information that we all have.
I suppose we "know" that Arnold wasn't intentionally lying.
I suppose we "know" that Arnold told the truth as he remembered it.

Arnold himself was somewhat circumspect about his ability to accurately determine the speed of the objects by measuring the time it took to go from mountain to mountain; he was circumspect about the accuracy because he knew he was looking at the flight path obliquely. He arbitrarily reduced the calculated speed from 1700 to 1200 to account for possible observational errors. Sounds to me like a guy who knew ALMOST EXACTLY what had happened during the sighting and was trying to adjust or compensate for imperfections in his measurements.

Are you saying you have data which show that ARNOLD SAID
the "objects (were) rapidly approaching his plane at high speed"?
I don't think there was such a statement by ARnold. I have no
doubt that there is such a statement in a book of "rules of the
road" about how to react to rapidly approaching
aircraft.

There is no evidence that Arnold thought these objects were
approaching his craft. The evidence is that he saw them on
a crossing track... and quickly realized they would cross the
track long before he got there!

I WROTE

>@SO, the rational for arguing that he would have turned LEFT to pass

>military jet can become a hazard within seconds of first
>visibility.

Yeah, but this requires further definition. High speed aircraft so
far away that you can't see wings, vertical stabilizers, etc. AND
WHICH ARE ON A CROSSING TRACK are not a hazard
if you are in a relative clunker, if they are at a different altitude,
etc.

(they might be if you are TOP GUN and doing Mach 2 directly

toward them in your own jet at the same altitude)

I WROTE

>@If, in your map, you draw Arnold's track eastward instead of

>their true heading, but only their motion relative to his plane.
>The question is: when did he ascertain his heading? Before the
>sighting? Continuously during the sighting? After the sighting?

He had no actual data on their true heading BUT.....
he evidently got the clear impression that they were flying
roughly parallel to the chain of mountains. At the very least
they were on a crossing track. This he discerned within the
first minute of the sighting. Recall that he said in his AF letter
that he had trimmed out his plane and was heading east
(he said toward Yakima in the AF letter, but in another
source said toward Mt. Rainier... in either case he would have
been flying generally eastward or east-northeastward)

LARRY WROTE

>@>Notice that I am not saying that this DID happen, but it is a way

>enough!

Actually he testimony does NOT indicate a "panic" turn to avoid
the objects which he thought was "over 100 miles away"
when he first saw them. (They were probably closer than that,
but that's another matter; what counts is his interpretation at the
time and his LACK OF PANIC REACTION - NOT turning his plane -
to avoid them, indicating that he believed them to be far away
and not a threat to his safety.)
Since there was no panic turn, his plane remained heading
generally east.

Hello List,

I'm trying to obtain a copy of a report that is referenced as follows:

Chatham, George N., East Coast Aerial Explosion, December 30, 1977 Report, Library of Congress Report, 3 January 1978.

Would I obtain this directly from the Library of Congress? I search for this document on their website, but it returned no matches. I'm not sure if I'm looking in the right place. Any help would be greatly appreciated.

Thanks in advance,
Todd Lemire

Subject: Re: MAP? WOW! HAHAAHAHStatus: O

Hi Larry, Bruce & List,

I think what is needed and is helpful is that if someone proposes an explanation for a sighting that requires some witness or sighting data to be modified or rejected that:

- (1) These modifications or rejections of sighting data be set out for everyone to consider so that it does not have to be dug out of the source materials, so that this fact is not "hidden" or "covered up" in layer after layer of tedious argument; and
- (2) That the reasoning or justification for modifying or rejecting the witness data be presented.

This is only fair and it is basic to intellectual and scientific scholarship.

As for Arnold's heading, I previously posted the fact that in his AAF letter he said he turned toward Mt. Rainier THEN "trimmed out" toward his destination Yakima at the time of the sighting. This therefore explains how both headings might get confused in the accounts even by Arnold as he laconically dropped out a detail. As for heading toward Goat Ridge he WAS HEADING in that direction GENERALLY by heading to Yakima -- it was only 15 degrees apart (97 to Yakima 112 to Goat Ridge).

Let me make it clear in case other readers on the List haven't followed or been able to follow the voluminous postings on the Arnold case: I proposed the "BIRD ORBIT" solely for the purpose of putting on the table a quantitative working hypothesis in order to show that James' bird theory is UNTENABLE and CONTRADICTS the mass of witness data and because James would not DRAW A MAP or even try to or explain why.

Larry has now fleshed this out even further and drawn a map for James. Bruce and I have now pointed out the numerous discrepancies this numerical model creates with Arnold's testimony in trying to explain his sighting as pelicans. And I think Kathleen Anderson has reiterated that she has never even seen pelicans in all the years she has lived in the State of Washington or visited the Mt. Rainier area.

Brad

Brad,

A response to some of the issues [others if time allows and as
necessary] you have raised:

>4. This flight path has Arnold traveling NORTH more or less
>instead of EAST, more or less, completely contradicting his
>testimony.

No-one contradicts the scenario more than Arnold himself. His
letter to the Air Force, the main source of that 'eastwards'
trajectory, is an entirely different account of proceedings than
given elsewhere.

Where was Kenneth Arnold when the first 'flash' occurred? Was he:

A. Cruising east/south-east towards Yakima and had been for "more
than two or three minutes".

B. Somewhere near the western slopes of Mt. Rainier, having just
come out of a canyon.

C. Making a turn of 180 degrees over Mineral, Washington.

D. Climbing directly towards Mt. Rainier, still making the turn
over Mineral.

As you know, they're all correct - each a variance, some
significantly, on the story as told directly by Arnold.

>6. This flight path also has Arnold ending up headed for Mt.
>Rainier instead of Yakima afterward, contrary to Arnold's usual
>testimony.

Arnold didn't make his way towards Yakima until later, confirming

that after the sighting he continued his search of Mt. Rainier for "another fifteen or twenty minutes".

>8. Had Arnold made the sharp turn to view pelicans out his open
>window the close distance of 1 mile or less would have made
>them so large in angular size (nearly 8 arcmins or almost FULL
>MOON) that he would easily have SEEN THE PELICAN'S WINGS and
>seen that they were birds.

When it comes to 'UFO' sightings, can we ever say that any witness 'would' have recognised the object(s) to be [insert usual, mundane explanation here]?

Arnold also encountered those 25-30, 2-3ft, brass-coloured objects which flew like ducks. Are you sure he would also have recognised they had wings etc. and as such, they couldn't be ducks?

It's important to remember exactly what Arnold claimed about this second of many sightings:

"I recall looking at my instrument clock which read about five minutes to seven. As I looked up from my instrument panel and straight ahead over the La Grande valley, I saw a cluster of about twenty to twenty-five brass coloured objects that looked like ducks.

They were coming at me head on and at what seemed a terrific rate of speed.

The sun was at my back and to my right. These objects were coming into the sun. I wasn't sighting through the viewfinder on my camera but was sighting along the side of it. As the group of objects came within 400 yards of me they veered sharply away from me and to their right, gaining altitude as they did so and fluttering and flashing a dull amber color.

They appeared to be round, rather rough on top, and to have a dark or a light spot on top of each one. I couldn't be absolutely positive of this because it all happened so suddenly. I attempted to make a turn and follow them but they disappeared to the east at a speed far in excess of my airplane. I knew they were not ducks because ducks don't fly that fast".

[End]

Arnold further noted, "I was a little bit shocked and exited when I realized they had the same flight characteristics of the large objects I had observed on June 24".

By any rationale, these fluttering objects which looked like ducks were ducks. Yet they came within a stated 400 yards and Arnold never realised this?

And he thought they could fly "at a speed far in excess" of his aircraft?

I did contemplate that, although unlikely, these might have been meteors. However, I've never come across a meteor which resembles a duck.

Sorry, but this is the same witness under hugely similar circumstances and that these second batch of 'UFOs' exhibited the "same flight characteristics of the large objects I had observed on June 24", has to be a blatant clue, even if we can't understand why it wasn't similarly obvious to Kenneth Arnold.

Surely he 'would' also have been able to identify Little Tahoma, albeit years later. It's such an evident candidate for the peak. Maybe he did and also realised there were consequential issues about his perceptions.

>9. Of course, the birds in this scenario could not have flown
>BEHIND Mt. Rainier/Little Tahoma at roughly 20 miles' distance
>during the sighting, contrary to Arnold's testimony and mapping.

I would wholeheartedly agree. Unless the trajectory was to the east of Mt. Rainier, there's unquestionably no longer any sustainable substance to Arnold's claims. It is however, without question, comprehensively documented that the objects flew west of Mt. Rainier.

That's a somewhat fundamental fact I would have thought and one which has to be addressed before anyone is overconfident these were, amazingly, nine alien spacecraft.

>10. The birds in this scenario do not fly almost due SOUTH as
>Arnold reported for the objects (170 heading) but almost due
>EAST (100 heading).

One thing which does seem consistent is that before the incident, Arnold was searching for the missing C-46 on the western slopes of Mt. Rainier, passed over Ashford and ended up at Mineral, where he made that turn.

If, as seems likely, he then turned his aircraft around and headed back towards the western slopes, it was, alternatively, during this time that the first 'flash' occurred, or later, when

he was for some reason on a heading towards Yakima.

There's such a variance in both scenarios that I can only conclude one of them is incorrect.

In Arnold's own words, scenario one:

"I flew directly toward Mt. Rainier after reaching an altitude of about 9,500 feet, which is the approximate elevation of the high plateau from which Mt. Rainier rises. I had made one sweep of this high plateau to the westward, searching all of the various ridges for this marine ship and flew to the west down and near the ridge side of the canyon where Ashford, Washington, is located.

Unable to see anything that looked like the lost ship, I made a 360 degree turn to the right and above the little city of Mineral, starting again toward Mt. Rainier. I climbed back up to an altitude of approximately 9,200 feet.

The air was so smooth that day that it was a real pleasure flying and, as most pilots do when the air is smooth and they are flying at a higher altitude, I trimmed out my airplane in the direction of Yakima, Washington, which was almost directly east of my position and simply sat in my plane observing the sky and the terrain".

[...]

"The sky and air was clear as crystal. I hadn't flown more than two or three minutes on my course when a bright flash reflected on my airplane"

Scenario two:

"It was during this search and while making a turn of 180 degrees over Mineral, Washington, at approximately 9200 feet altitude, that a tremendously bright flash lit up the surfaces of my aircraft. I was startled. I thought I was very close to collision with some other aircraft whose approach I had not noted. I spent the next twenty to thirty seconds urgently searching the sky all around--to the sides, above and below me--in an attempt to determine where the flash of light had come from. The only actual plane I saw was a DC-4 far to my left and rear, apparently on its San Francisco to Seattle run. My momentary explanation to myself was that some lieutenant in a P-51 had given me a buzz job across my nose and that hit was the sun reflecting from the surface of his wings as he passed that had caused the flash".

[End]

"As I came out below on this first sweep I passed over the little community of Mineral Washington, the pine trees there, and knew pretty much where I was. I made a turn at probably 2000ft over Mineral, Washington and started climbing back slowly but steadily, climbing to gain sufficient altitude to go back on the high plateau again for another pass at this mountain. As I was making this turn and of course flying directly toward Mt. Rainier, at about 9200 ft elevation - it was a beautiful day, in fact the plane was very stable, I didn't have to fight controls or weather or anything - a tremendous flash appeared in the sky and it lit up my whole aircraft, even it seemed the cockpit of the airplane and I was rather startled. I thought I hadn't seen a plane that was very close to me, or possibly it had been a military plane that had dove over my nose and the reflection of the afternoon sun against his wing surfaces had caused the flash. Now this just, in less than one tenth of a second, I think, went through my mind.

I looked all around below me and looked ahead of me. And then the flash came again and, uh, this very, very bright flash, it was almost like an arc light, was coming from a group of objects far up to the north of Mt. Rainier, in the area of Mt. Baker, which is almost in a line with Mt. Rainier and Mt. Adams. I observed a chain of very, very peculiar aircraft approaching Mt. Rainier very rapidly...

[...]

I was approaching Mt. Rainier. I realized that my attempt to clock their speed absolutely accurately would have been hopeless because I was rapidly approaching Mt. Rainier at 9200 ft at about a hundred miles an hour, steadily climbing myself and of course they were passing from north to south".
[End]

The problem is, how could Arnold have been on a Yakima heading for two or three minutes and also be, as stated, "of course flying directly toward Mt. Rainier".

How also could he have "trimmed out my airplane" two or three minutes before and also still be "steadily climbing"?

Sorry, but NOT hugely similar circumstances.

Similarity: objects seen in sky

Unsimilarity: these objects were approaching rapidly and
disappeared rapidly. Est mated 400 yards is estimate.

No way to be certain. Could have been much farther (or
closer). Whole event occurred quickly. Your "were ducks"
explanation is a guess.

At any rate, not really comparable to the first sighting with
brilliant flashes (oh yes, pelicans signalling each other with
mirrors!), large distance, geographical features (went
behind SOMETHING) and timing while carefully observing.

Subject: EUROPEAN JOURNAL OF UFO STUDIES
Mime-Version: 1.0
Status:

Hello list-members everywhere!

You may be interested in learning that the first issue of the "European Journal of UFO And Abduction Studies" (EJUFOAS) is now available.

EJUFOAS is born as an attempt to bring the European UFO community together, an idea put forward by Craig Roberts.

After graduating with a thesis in psychology about UFOs, Craig has been teaching "ufology" in the only existing UFO course in a UK college, in Totton. He and his students formed a group called TRUTH [The Totton Researchers of Ufology Theory and History] and in 1999 launched the idea of an academic-style UFO journal, much like the now-defunct UPIAR (UFO Phenomena International Annual Review) of the '70s or CUFOS Journal of UFO Studies, but more Europe-oriented.

The journal has been initially set up to bring the European UFO community closer and is primarily, but not exclusively, aimed at these organisations.

The journal is objective in nature, allowing an outlet for the broad spectrum of issues related to UFO and Abduction phenomena. This includes all academic based subjects (e.g. astronomy, biology, psychology etc.) as well as spiritual aspects, scepticism and new theoretical issues.

Therefore, the European Journal of UFO and Abduction Studies wants to publish ufological papers and ideas from a wide range of individuals, organisations and stand points.

The Journal put an editorial board together, formed by some well-known ufologists from several European countries (UK, France, Spain, Portugal, Romania, Russia and Italy) and each submitted article is refereed before being accepted for publication.

A launch issue (No. 0) was published in September, 1999, with articles like:

- Project for a database of ball lightning observations in Italy.
Paolo Toselli & Renato Fedele [Italy]

- Preliminary Identifications of alien contact / abduction experiences as hallucinatory states induced by prolonged exposures to electromagnetic pollution in the environment.
Albert Budden [UK]

- UFO declassification - The Spanish model.

Vicente-Juan Ballester Olmos [Spain]

Volume 1 No. 1 issue was just released in March, 2000, with articles like:

- Physics from UFO Data.

Massimo Teodorani [Italy]

- UK UFO Organizations:

What do they have knowledge of, and what do they investigate?

Craig Roberts [UK]

- Unusual Aerial Phenomena Tracked on radar in Romania.

Ion Lazeanu [Romania]

- A Debate on alleged evidence of covert human/military involvement
in North American alien abduction cases.

Helmut Lammer [Austria] vs. Luis R. Gonzalez Manso [Spain]

The Italian Center for UFO Studies (Centro Italiano Studi Ufologici, CISU)

- as well as some other European UFO organizations - is helping to promote

EJUFOAS and thus accepted to host some pages about it on our website at

"<http://www.cisu.org/ejufoas.htm>" (also mirrored at

"<http://www.arpnet.it/ufo/ejufoas.htm>").

Therein you may find more details about the EJUFOAS concept, a presentation
of its editorial board members, detailed contents of both the launch issue
and the latest Vol. 1 No. 1, instructions to (would-be) authors and a
subscription form for (would-be) readers.

More details may be asked directly from the editor in chief, Craig Robers,
B.Sc.: ejufos@totton.ac.uk

I beg your pardon for some duplicates of this message you may get from
different mailing lists.

Best regards

Edoardo Russo

GOBBLE

@>I do not consider this to be THE explanation for the sighting,
@>but only a possibility. I just wanted to see if it could be
@done. >We still have the brilliant flashing pelicans to contend
@with. I >would have to be shown that pelicans can reflect light
@bright >enough to cause the observed effects. >

@Actually, we still have the flight dynamics to contend with since
@your flight path of the aircraft has no, zero, zip support from the
@Arnold testimony.

True. It was merely an exercise. But Arnold did say he turned his
plane to get the objects to a side window he could open.

SNIP

@MY RESPONSE

@>@This is the first problem. I don't know what the source of your
@>@quote is (your brain?), but it isn't either the Air Force Letter
@>@or his book. His report is that he first observed a flash and
@>@this started him looking everywhere to see where it came from.
@>@He would NOT have turned his plane northward or any direction at
@>@this time since he didn't know where the flash had come from
@>@and, in fact, didn't figure that out until about 20 seconds
@>@more, when the next flash came and attracted his attention to
@>@the north.... to his left. Then, when he first saw the objects
@>@themselves it was obvious that they were FAR away.... no chance
@>@of a collision.

LOOK AGAIN:

@>Sorry, it's a quote from memory from a rule in a book on flying,
@>not from Arnold. I don't have it with me, so data will come

@>later.

@Are you saying you have data which show that ARNOLD SAID
@the "objects (were) rapidly approaching his plane at high speed"?
@I don't think there was such a statement by ARnold. I have no
@doubt that there is such a statement in a book of "rules of the
@road" about how to react to rapidly approaching
@aircraft.

NO (Try carefully reading what I wrote again). I was quoting from
a rule in an old booklet I have on private aviation:

"Yes, you CAN learn to fly" 1960, Be-A-Pilot.

"16. If a jet aircraft is rapidly approaching your plane at high
speed, turn to pass behind it. The pilot of the other plane won't
be able to see your small aircraft in time to avoid it."

I substituted the word "object" for "aircraft." I have since
found out that this booklet was the product of a local flight
instructor, not a national set of rules from the CAB (which I
thought it was). I had picked it up from a brochure table at our
local airport. Amazingly, it has survived three moves intact.

Neither Arnold nor UFOs are mentioned in this little book. I kept
it because I thought it contained the CAB rules for visual flight
rules (VFR).

@Yeah, but this requires further definition. High speed
@aircraft so far away that you can't see wings, vertical
@stabilizers, etc. AND WHICH ARE ON A CROSSING TRACK are not a
@hazard if you are in a relative clunker, if they are at a
@different altitude, etc.

How long did Arnold take to determine that they actually WERE on
a crossing track?

@LARRY:

@>Relative to his plane, that is true. He had no actual data on
@>their true heading, but only their motion relative to his plane.
@>The question is: when did he ascertain his heading? Before the
@>sighting? Continuously during the sighting? After the sighting?
@
@He had no actual data on their true heading BUT..... he
@evidently got the clear impression that they were flying roughly
@parallel to the chain of mountains. At the very least they were
@on a crossing track. This he discerned within the first minute
@of the sighting. Recall that he said in his AF letter that he
@had trimmed out his plane and was heading east (he said toward
@Yakima in the AF letter, but in another source said toward Mt.

@Rainier... in either case he would have been flying generally
@eastward or east-northeastward)

But it's JUST an impression. Arnold was in a moving frame of reference relative to the ground, and was not equipped to locate objects with reference to the ground (except for being able to line them up with landmarks and his moving airplane).

(SNIP)

@Actually he testimony does NOT indicate a "panic" turn to avoid
@the objects which he thought was "over 100 miles away" when he
@first saw them. (They were probably closer than that, but
@that's another matter; what counts is his interpretation at the
@time and his LACK OF PANIC REACTION - NOT turning his plane - to
@avoid them, indicating that he believed them to be far away and
@not a threat to his safety.) Since there was no panic turn,
@his plane remained heading generally east. Q.E.D.

But it does indicate that he turned to get them into a side window to open it and see them without the glass.

Did Arnold FIRST think they were over 100 miles away? Or did he come to that conclusion later, after figuring out their supposed path on a chart?

For some reason, people keep forgetting that NOBODY can determine the distance to an unknown object farther away than 30 feet away, without some other clue that reveals the distance. In the case of a pilot, the clue is that he knows the object IS an airplane (and he can probably identify it by type and better his estimate). But if the object is NOT an airplane, his distance measurement will be off by the ratio of his size estimate of the object and its true size:

$$\text{error\_factor} = \text{estimated\_size} / \text{actual\_size}$$

Using the law of similar triangles for a common subtended angle:

$$\text{true\_distance} = \text{perceived\_distance} / \text{error\_factor}$$

In the 2/26/93 Jefferson Co KY case, a police helicopter was attempting to identify a UFO. They reported that the UFO was larger and faster than their helicopter, and that it made ramming attacks on them. But people on the ground reported that the helicopter kept passing the UFO, as if it couldn't find it. The UFO was later positively identified as a fire balloon. The illusions were caused by a very large error_factor.

Now:

1. At least one report by Arnold has the objects moving across the face of Rainier. This puts the upper bound on the distance.
2. At least one report has the objects moving behind Little Tahoma. That puts a lower bound on the distance.
3. At least one report gives the objects a heading of 160 to 170 degrees.

Putting all three statements together and determining the set of possible distances produces: EMPTY SET.

Conclusion: At least one of the above statements is false.

Questions:

- A. Which was brighter: sunlit Little Tahoma, or the sky beyond it?
- B. Was Little Tahoma bright enough to halate the "dark phase" of the objects into invisibility?
- C. Was Rainier bright enough to halate the dark phase into invisibility?
- D. Little Tahoma has an elevation of 11138 ft. If Arnold was at his stated 10000 ft, were the UFOs seen against the sky or the distant horizon as they passed that peak?

If objects at the distance of Little Tahoma were seen against the sky, their altitude must be within a range of 9300 ft to 11138 ft. Below 9300 ft, they would have been seen against distant mountains beyond Rainier and little Tahoma, not just the sky. Of course, if the objects were closer to Arnold, they also would be constrained to a tighter altitude range.

But if the object is NOT an airplane, his distance measurement will be off by the ratio of his size estimate of the object and its true size:

<

WHoa, there!// No one said Arnold could determine the distance from looking at the objects BUT... this means "quantitative distance." After finally seeing the objects, according to him BEFORE they reached Mt Rainier (from his perspective; he was about 10 miles south and about 20 miles west), he thought they were 100 miles away. Very probably he was wrong in the quantitative distance. But, he could tell they were FAR AWAY... how? Because he assumed they were planes and he couldn't see any of the expected features of airplanes (jets). Therefore they had to be far enough away for those features to be unresolved. The REPORTED FACT that he NEVER was able to see the details does not apply to his initial reaction to seeing the objects. Evidently when he first saw the objects...not just the flashes,.... he assumed they were jets and therefore had to be FAR away... NO threat to him.... so he didn't try to turn his plane to avoid them.

As for turning his plane, he did that. Seems more likely he would turn right and fly along with the objects, opening the nearby left window to look out, rather than turn left and fly AWAY from the direction they were going.

Since at one point in his testimony (AF letter) he says he was flying toward Goat Ridge after he saw them fly past (at least that's one interpretation) it is possible that WHEN HE SAW THEM he was flying toward Mt Rainier or toward Yakima and then when he turned his plane TO THE RIGHT while looking out the open window he ended up heading toward Goat Ridge.

Subject: Re: Distance to unknownStatus:

Hi Bruce & Larry,

I have already pointed out on this List that once Arnold had some kind of distance estimate (upper or lower limit, to us, our way of thinking) when the objects passed behind Mt. Rainier/Little Tahoma he could roughly estimate the distances further out towards Mt. Adams because of a decrease in angular size of the objects (assuming he could see the darker-phase of the objects when near Goat Ridge, I doubt he could when near Rainier because of motion blur). That is because he has an absolute value near Rainier or Goat Ridge and a relative change in angular size from there to Adams. He could also mentally project this back to the beginning though with less accuracy. I think his 50+ mile initial distance estimates were based on symmetry with the 50-mile distance past Mt. Adams but he later dropped this reasonable stance when he got the idea in mind of judging the objects as having come from Mt. Baker, so then he spoke of 100+ mile distance.

Arnold said he could see the objects' flight path was almost at right angles to him by the time they approached Mt. Rainier. This is reasonable as he would by then have seen the objects' linear flight path over more than 30 degrees of azimuth (to about the left edge of Rainier estimated azimuth 46 degs) and he could mentally project it forward to the perpendicular crossing point almost directly ahead of his flight path. His normal (perpendicular) point to their 170 estimated heading would have been at about 80 degs azimuth. The objects disappeared about 5 miles past Mt Adams, or roughly at a distance of 48-51 miles at azimuth 146-147 degs according to Arnold's mapping (depending on whether behind or in front of Mt. Adams, as you can see it makes little difference). The azimuth spread from perpendicular crossing point to disappearance was about 66-67 degrees. Double that to arrive at symmetrical appearance and disappearance points about 134 degrees in azimuth apart.

Based on this quite well observable symmetry in the appearance and disappearance distances and angles of the objects I would therefore estimate the objects' appearance at around say 13 degs azimuth and as much as 80 seconds before the clocking (see below). Interestingly, this is close to the directional information Arnold told the Boise Statesman (June 28, 1947), that he first saw the objects towards Fairfax, Wash. (47-00-38 N, 122-00-54 W), which was at an azimuth of about 5 degs from Arnold's position which I estimate at about six miles east of Mineral. Mt. Baker is at 4 degs from Arnold's position. Since Arnold stated they could only be seen by their flashes when they got towards Mt. Adams, by symmetry I would estimate the same for the symmetrical first-appearance point, that that is when the first flash occurred, before non-flashing "dark phase" objects could be seen.

In units of radius to the perpendicular crossing point, the famous 102-second timing covered azimuths 66-80 degrees (to the perpendicular crossing) then 80-147 degs (from perpendicular crossing to disappearance past Mt. Adams) or $\tan 14 + \tan 67 = 2.605$ radius units in 102 seconds. (If the objects were at 23-mile range behind Little Tahoma at azimuth 66 then the radial distance unit at perpendicular crossing is $(23 \times \cos 14) = 22.3$ miles.) This also means the objects' angular sizes would have been

about 2.6 times smaller past Mt. Adams than at the closest point, at the perpendicular crossing.

Proportionally, the pre-clocking phase, assuming uniform velocity and symmetrical appearance/disappearance angles, would have covered azimuths 13-66 degrees or $\tan 67 - \tan 14 = 2.106$ radius units or about $(2.106/2.605)(102 \text{ seconds}) = 82 \text{ seconds}$. Total duration therefore about 184 seconds or roughly 3 minutes by proportional extrapolation of the clocking and assuming sighting symmetry (this estimate has an error margin of $\pm 1/2$ minute, see below). Round off to the nearest 10 seconds and say the pre-clocking was 80 seconds the clocking 100 seconds and post-clocking visibility negligible. The first 20-30 seconds were occupied in spotting the first two flashes before finally spotting the chain of 9 objects, then perhaps as much as 50 seconds of watching the objects approach Mt. Rainier.

This symmetry estimate is dependent on the accuracy of Arnold's right-angle crossing estimate, based on the 170 heading he estimated. At one time, apparently before he fully worked over his map, in the KWRC radio interview at noon June 26, 1947, he mentions a 160 figure. It could go in the other direction to 180 due south perhaps, so call it ± 10 degrees in observational error. (However, when I'm talking about Arnold's MAPPING abilities, it is ridiculous to think Arnold could not visually distinguish a 180+ angle on his grid-marked piece of paper from a 170 angle. When he charted a 170 he meant 170 and not 180 or 190 or 160. Whether it accurately represented his SIGHTING skills is a separate issue.)

A 180 heading for the objects means a crossing point to Arnold at azimuth 90 (his heading to Yakima was 97). This reduces the symmetry to an azimuth range from appearance at 33 degs azimuth to disappearance at 147 degs. This reduces the clocking to 1.985 distance units in 102 seconds and the total sighting to roughly 158 seconds, or roughly 2-1/2 minutes.

Again, how many times must I point out that the heading towards Goat Ridge was almost the same as towards Yakima, differing by only about 15 degrees?

Arnold said in his letter to the AAF that he turned to head towards Mt. Rainier THEN "trimmed out" toward Yakima. Accounts that mention the Rainier heading have simply dropped out the detail about "trimming out" to Yakima.

Subject: Re: Distance to unknownStatus:

Hi Bruce & Larry,

I have already pointed out on this List that once Arnold had some kind of distance estimate (upper or lower limit, to us, our way of thinking) when the objects passed behind Mt. Rainier/Little Tahoma he could roughly estimate the distances further out towards Mt. Adams because of a decrease in angular size of the objects (assuming he could see the darker-phase of the objects when near Goat Ridge, I doubt he could when near Rainier because of motion blur). That is because he has an absolute value near Rainier or Goat Ridge and a relative change in angular size from there to Adams. He could also mentally project this back to the beginning though with less accuracy. I think his 50+ mile initial distance estimates were based on symmetry with the 50-mile distance past Mt. Adams but he later dropped this reasonable stance when he got the idea in mind of judging the objects as having come from Mt. Baker, so then he spoke of 100+ mile distance.

Arnold said he could see the objects' flight path was almost at right angles to him by the time they approached Mt. Rainier. This is reasonable as he would by then have seen the objects' linear flight path over more than 30 degrees of azimuth (to about the left edge of Rainier estimated azimuth 46 degs) and he could mentally project it forward to the perpendicular crossing point almost directly ahead of his flight path. His normal (perpendicular) point to their 170 estimated heading would have been at about 80 degs azimuth. The objects disappeared about 5 miles past Mt Adams, or roughly at a distance of 48-51 miles at azimuth 146-147 degs according to Arnold's mapping (depending on whether behind or in front of Mt. Adams, as you can see it makes little difference). The azimuth spread from perpendicular crossing point to disappearance was about 66-67 degrees. Double that to arrive at symmetrical appearance and disappearance points about 134 degrees in azimuth apart.

Based on this quite well observable symmetry in the appearance and disappearance distances and angles of the objects I would therefore estimate the objects' appearance at around say 13 degs azimuth and as much as 80 seconds before the clocking (see below). Interestingly, this is close to the directional information Arnold told the Boise Statesman (June 28, 1947), that he first saw the objects towards Fairfax, Wash. (47-00-38 N, 122-00-54 W), which was at an azimuth of about 5 degs from Arnold's position which I estimate at about six miles east of Mineral. Mt. Baker is at 4 degs from Arnold's position. Since Arnold stated they could only be seen by their flashes when they got towards Mt. Adams, by symmetry I would estimate the same for the symmetrical first-appearance point, that that is when the first flash occurred, before non-flashing "dark phase" objects could be seen.

In units of radius to the perpendicular crossing point, the famous 102-second timing covered azimuths 66-80 degrees (to the perpendicular crossing) then 80-147 degs (from perpendicular crossing to disappearance past Mt. Adams) or $\tan 14 + \tan 67 = 2.605$ radius units in 102 seconds. (If the objects were at 23-mile range behind Little Tahoma at azimuth 66 then the radial distance unit at perpendicular crossing is $(23 \times \cos 14) = 22.3$ miles.) This also means the objects' angular sizes would have been

about 2.6 times smaller past Mt. Adams than at the closest point, at the perpendicular crossing.

Proportionally, the pre-clocking phase, assuming uniform velocity and symmetrical appearance/disappearance angles, would have covered azimuths 13-66 degrees or $\tan 67 - \tan 14 = 2.106$ radius units or about $(2.106/2.605)(102 \text{ seconds}) = 82 \text{ seconds}$. Total duration therefore about 184 seconds or roughly 3 minutes by proportional extrapolation of the clocking and assuming sighting symmetry (this estimate has an error margin of $\pm 1/2$ minute, see below). Round off to the nearest 10 seconds and say the pre-clocking was 80 seconds the clocking 100 seconds and post-clocking visibility negligible. The first 20-30 seconds were occupied in spotting the first two flashes before finally spotting the chain of 9 objects, then perhaps as much as 50 seconds of watching the objects approach Mt. Rainier.

This symmetry estimate is dependent on the accuracy of Arnold's right-angle crossing estimate, based on the 170 heading he estimated. At one time, apparently before he fully worked over his map, in the KWRC radio interview at noon June 26, 1947, he mentions a 160 figure. It could go in the other direction to 180 due south perhaps, so call it ± 10 degrees in observational error. (However, when I'm talking about Arnold's MAPPING abilities, it is ridiculous to think Arnold could not visually distinguish a 180+ angle on his grid-marked piece of paper from a 170 angle. When he charted a 170 he meant 170 and not 180 or 190 or 160. Whether it accurately represented his SIGHTING skills is a separate issue.)

A 180 heading for the objects means a crossing point to Arnold at azimuth 90 (his heading to Yakima was 97). This reduces the symmetry to an azimuth range from appearance at 33 degs azimuth to disappearance at 147 degs. This reduces the clocking to 1.985 distance units in 102 seconds and the total sighting to roughly 158 seconds, or roughly 2-1/2 minutes.

Again, how many times must I point out that the heading towards Goat Ridge was almost the same as towards Yakima, differing by only about 15 degrees?

Arnold said in his letter to the AAF that he turned to head towards Mt. Rainier THEN "trimmed out" toward Yakima. Accounts that mention the Rainier heading have simply dropped out the detail about "trimming out" to Yakima.

Subject: Arnold's Objects & Bird MotionsStatus:

James,

We've all been taking too much for granted your claims that Arnold's objects matched the motions and formations of pelicans. I still have not seen the evidence for it except for formations moving in unison (my No. 4 below).

Here is a rough list of Arnold's observations about the objects' formation and motions with respect to terrain features. Please match this with detailed descriptions of pelicans exhibiting the same motions with respect to the same terrain features (mountain peaks, canyons, etc.) in the same type of formation. Just using a lot of "-ing" words is NOT sufficient:

MOTIONS & FORMATION FLIGHT REPORTED FOR ARNOLD'S OBJECTS

- (1) SKIPPING: "Saucers skipping across water" or like "speed boats on rough water."
- (2) WEAIVING THE MOUNTAINTOPS: "Weaving in and out right above the mountaintops."
- (3) IRREGULAR LIGHT FLASHES AT SAME TIME: Dipping down motion seemingly tipping or flipping wings, and simultaneously flashing intense blue-white light, "not in a regular rhythm" among the 9 objects, but averaging 2-3 objects flashing every few seconds (=1 flash/sec from the 9 or 1 flash every 9 seconds for any one object).
- (4) UNISON FORMATION MOTION: Formation generally moves in unison as if connected.
- (5) VERY ERRATIC INDIVIDUAL MOTIONS: But individual objects move "very erratically," "fluttering and jerking very rapidly."
- (6) STRAIGHT LINE REVERSE ECHELON FORMATION: Flying in "definite direction," a "straight line" in reverse echelon with the first object highest and the last lowest.
- (7) FORMATION IN TWO GROUPS OF 4 AND 5 IN A SINGLE-FILE LINE: Formation split with a gap between the first 4 and last 5.
- (8) FORMATION OF 9.
- (9) SECOND TO LAST DARKER/DIFFERENT: Second to last object darker, slightly larger or slightly different in shape.
- (10) INTENSE ARC-LIKE BLINDING BRIGHTNESS. In the opposite part of the sky from the sun, no grazing-angle reflections of sunlight.

(11) HIGH VELOCITY. (Arnold's clocking indicates about 2 degs/sec angular velocity which for birds at 1 mile distance is about 125 mph, much too fast for birds with top speeds of 30 possibly 50 mph.)

Correct me if I'm wrong, James, but I see nothing here (below) in your descriptions of pelican behavior, nor do I recall from your other postings, ANYTHING about PELICANS moving like (1) speedboats skipping across water, (2) weaving in and out of mountain peaks, (3) irregularly flashing intense light when dipping down and flipping/tipping, (5) very erratic individual motions, (6) straight line reverse echelon formation, (7) formation split into two groups of even APPROXIMATELY 4 and 5 in a single-file line with a gap in between, (8) a total number of only ABOUT 9, (9) and the second-to-LAST object darker/different.

Remember, the Arnold sighting is FAMOUS for the "saucers skipping across water" and you have showed me NOTHING of BIRD behavior that is like that, nothing from pelicans, ducks, snow geese, or whatever.

Instead, let's review what you presented below. If you have further evidence that bears on these specific points then PLEASE PRESENT IT and PLEASE USE MY NUMBERING (above and below) WITHOUT SKIPPING ANY. Give us your best shot.

So far as I can see your Pelican Evidence has the following:

PELICAN FORMATIONS & MOTIONS

(1) UNISON FORMATION MOTION. (The only point in common with Arnold.)

(2) BANKING MOTION. (When did Arnold's objects "bank"? Dipping down in altitude is not banking. Flipping or tipping wings is not banking. Pilots can explain the difference.)

(3) FLAPPING WINGS SLOWLY IN UNISON. (Arnold never reported this. He said INDIVIDUAL objects "VERY RAPIDLY" fluttered and jerked but "ERRATICALLY" and NOT IN UNISON.)

(4) HALF DOZEN SLOW FLAPPINGS OF ALL BIRDS IN UNISON -- THEN GLIDING -- THEN SLOW FLAPPINGS IN UNISON -- ETC. (Arnold never reported all 9 objects "flapping" in unison like this. See Arnold List Nos. 3 and 5, above. He said 2-3 objects light-flashed/dipped altitude every 2-3 seconds IRREGULARLY, but NOT the whole chain of 9 objects in UNISON.)

(5) PRECISELY SPACED LINES OR V- OR L-FORMATIONS. (Arnold never said the objects were uniformly spaced, in fact mentioned a gap in the middle, and never reported a V-shape or L-shape formation.)

(6) SOARING HIGH ON THERMALS. (Arnold reported the objects more or less maintained the same height except rising gradually towards the end -- McDonald taking this as 9,000 feet near Rainier rising to 13,000 feet some 50 miles farther along

near Adams, from his Arnold interviews in Nov 1966 -- which is less than a 1-degree rise and obviously not the classic birds "soaring on a thermal.")

(7) SPIRALLING UP TO SEVERAL THOUSAND FEET. (Arnold obviously reported no such thing.)

(8) RETRACED PATHS. (Arnold again obviously reported no such thing.)

(9) UNDULATING SHAPES OF THE V- OR L-FORMATIONS: (Arnold's description of a "Chinese kite tail" motion, however, is of "erratic" almost violent motion not the GRACEFUL UNDULATIONS of a formation of birds.)

(10) LEADER FLAPPING FIRST FOLLOWED BY THE REST. (This is not a contradiction to UNISON FORMATION MOTION, No. 1, but an alternative motion. But not reported by Arnold, though, unlike No. 1. THIS is a "staccato" motion, one suddenly followed by others like dominos, which is NOT "erratic.")

(11) THREE GROUPS OF ABOUT 30 EACH IN LINES THEN FORMING "V's". (Still not Arnold's 9 in a line with a gap in the middle. James, you keep saying in other postings that the number of 9 objects is so bird-like. Well lets hear some reports of SINGLE-LINE FORMATIONS OF ABOUT 9 (or 8, 10, 11, 7, somewhere around there) PELICANS with a GAP IN THE MIDDLE. Must be billions of birds on earth surely if this is normal someone would have seen it, especially given how fanatical birdwatchers can be.)

(12) LEAD BIRD DARK -- REMAINDER WHITE. (Arnold said the 2nd-to-LAST object was SLIGHTLY DARKER, and a bit larger, but as a matter of degree. This was NOT the LEAD object.)

Contrary to your claim of demonstrating that Arnold's objects exhibited "several proven" characteristics of a formation of Pelicans, you've in fact shown only 1 out of 12 pelican flight/formation characteristics that match Arnold's objects. I've further shown 10 additional flight/formation characteristics that Arnold reported for which you have yet to show ANY matches from evidence of pelicans.

Brad

P.S.: As for the Chicago Tribune supposedly being discredited as misquoting Arnold about "taking out his watch" (so therefore we're not supposed to believe the Tribune quotes of Arnold on other points such as objects flying behind Rainier) it was NOT later "clarified" that he had a "stopwatch" on his instrument panel as HE DIDN'T. It is indisputable that the KWRC radio interview quotes Arnold saying "I looked at my watch" so it was Arnold who misspoke both times, not the Chicago Tribune reporter who misquoted.

Subject: Arnold & Bird MotionsStatus:

James,

We've all been taking too much for granted your claims that Arnold's objects matched the motions and formations of pelicans. I still have not seen the evidence for it except for formations moving in unison (my No. 4 below).

Here is a rough list of Arnold's observations about the objects' formation and motions with respect to terrain features. Please match this with detailed descriptions of pelicans exhibiting the same motions with respect to the same terrain features (mountain peaks, canyons, etc.) in the same type of formation. Just using a lot of "-ing" words is NOT sufficient:

MOTIONS & FORMATION FLIGHT REPORTED FOR ARNOLD'S OBJECTS

- (1) SKIPPING: "Saucers skipping across water" or like "speed boats on rough water."
- (2) WEAIVING THE MOUNTAINTOPS: "Weaving in and out right above the mountaintops."
- (3) IRREGULAR LIGHT FLASHES AT SAME TIME: Dipping down motion seemingly tipping or flipping wings, and simultaneously flashing intense blue-white light, "not in a regular rhythm" among the 9 objects, but averaging 2-3 objects flashing every few seconds (=1 flash/sec from the 9 or 1 flash every 9 seconds for any one object).
- (4) UNISON FORMATION MOTION: Formation generally moves in unison as if connected.
- (5) VERY ERRATIC INDIVIDUAL MOTIONS: But individual objects move "very erratically," "fluttering and jerking very rapidly."
- (6) STRAIGHT LINE REVERSE ECHELON FORMATION: Flying in "definite direction," a "straight line" in reverse echelon with the first object highest and the last lowest.
- (7) FORMATION IN TWO GROUPS OF 4 AND 5 IN A SINGLE-FILE LINE: Formation split with a gap between the first 4 and last 5.
- (8) FORMATION OF 9.
- (9) SECOND TO LAST DARKER/DIFFERENT: Second to last object darker, slightly larger or slightly different in shape.
- (10) INTENSE ARC-LIKE BLINDING BRIGHTNESS. In the opposite part of the sky from the sun, no grazing-angle reflections of sunlight.

(11) HIGH VELOCITY. (Arnold's clocking indicates about 2 degs/sec angular velocity which for birds at 1 mile distance is about 125 mph, much too fast for birds with top speeds of 30 possibly 50 mph.)

Correct me if I'm wrong, James, but I see nothing here (below) in your descriptions of pelican behavior, nor do I recall from your other postings, ANYTHING about PELICANS moving like (1) speedboats skipping across water, (2) weaving in and out of mountain peaks, (3) irregularly flashing intense light when dipping down and flipping/tipping, (5) very erratic individual motions, (6) straight line reverse echelon formation, (7) formation split into two groups of even APPROXIMATELY 4 and 5 in a single-file line with a gap in between, (8) a total number of only ABOUT 9, (9) and the second-to-LAST object darker/different.

Remember, the Arnold sighting is FAMOUS for the "saucers skipping across water" and you have showed me NOTHING of BIRD behavior that is like that, nothing from pelicans, ducks, snow geese, or whatever.

Instead, let's review what you presented below. If you have further evidence that bears on these specific points then PLEASE PRESENT IT and PLEASE USE MY NUMBERING (above and below) WITHOUT SKIPPING ANY. Give us your best shot.

So far as I can see your Pelican Evidence has the following:

PELICAN FORMATIONS & MOTIONS

(1) UNISON FORMATION MOTION. (The only point in common with Arnold.)

(2) BANKING MOTION. (When did Arnold's objects "bank"? Dipping down in altitude is not banking. Flipping or tipping wings is not banking. Pilots can explain the difference.)

(3) FLAPPING WINGS SLOWLY IN UNISON. (Arnold never reported this. He said INDIVIDUAL objects "VERY RAPIDLY" fluttered and jerked but "ERRATICALLY" and NOT IN UNISON.)

(4) HALF DOZEN SLOW FLAPPINGS OF ALL BIRDS IN UNISON -- THEN GLIDING -- THEN SLOW FLAPPINGS IN UNISON -- ETC. (Arnold never reported all 9 objects "flapping" in unison like this. See Arnold List Nos. 3 and 5, above. He said 2-3 objects light-flashed/dipped altitude every 2-3 seconds IRREGULARLY, but NOT the whole chain of 9 objects in UNISON.)

(5) PRECISELY SPACED LINES OR V- OR L-FORMATIONS. (Arnold never said the objects were uniformly spaced, in fact mentioned a gap in the middle, and never reported a V-shape or L-shape formation.)

(6) SOARING HIGH ON THERMALS. (Arnold reported the objects more or less maintained the same height except rising gradually towards the end -- McDonald taking this as 9,000 feet near Rainier rising to 13,000 feet some 50 miles farther along

near Adams, from his Arnold interviews in Nov 1966 -- which is less than a 1-degree rise and obviously not the classic birds "soaring on a thermal.")

(7) SPIRALLING UP TO SEVERAL THOUSAND FEET. (Arnold obviously reported no such thing.)

(8) RETRACED PATHS. (Arnold again obviously reported no such thing.)

(9) UNDULATING SHAPES OF THE V- OR L-FORMATIONS: (Arnold's description of a "Chinese kite tail" motion, however, is of "erratic" almost violent motion not the GRACEFUL UNDULATIONS of a formation of birds.)

(10) LEADER FLAPPING FIRST FOLLOWED BY THE REST. (This is not a contradiction to UNISON FORMATION MOTION, No. 1, but an alternative motion. But not reported by Arnold, though, unlike No. 1. THIS is a "staccato" motion, one suddenly followed by others like dominos, which is NOT "erratic.")

(11) THREE GROUPS OF ABOUT 30 EACH IN LINES THEN FORMING "V's". (Still not Arnold's 9 in a line with a gap in the middle. James, you keep saying in other postings that the number of 9 objects is so bird-like. Well lets hear some reports of SINGLE-LINE FORMATIONS OF ABOUT 9 (or 8, 10, 11, 7, somewhere around there) PELICANS with a GAP IN THE MIDDLE. Must be billions of birds on earth surely if this is normal someone would have seen it, especially given how fanatical birdwatchers can be.)

(12) LEAD BIRD DARK -- REMAINDER WHITE. (Arnold said the 2nd-to-LAST object was SLIGHTLY DARKER, and a bit larger, but as a matter of degree. This was NOT the LEAD object.)

Contrary to your claim of demonstrating that Arnold's objects exhibited "several proven" characteristics of a formation of Pelicans, you've in fact shown only 1 out of 12 pelican flight/formation characteristics that match Arnold's objects. I've further shown 10 additional flight/formation characteristics that Arnold reported for which you have yet to show any matches from evidence of pelicans.

As for the Chicago Tribune supposedly being discredited as misquoting Arnold about "taking out his watch" (so therefore we're not supposed to believe the Tribune quotes of Arnold on other points such as objects flying behind Rainier) it was NOT later "clarified" that he had a "stopwatch" on his instrument panel as HE DIDN'T. It is indisputable that the KWRC radio interview quotes Arnold saying "I looked at my watch" so it was Arnold who misspoke both times, not the Chicago Tribune reporter who misquoted.

>Did Arnold FIRST think they were over 100 miles away? Or did he
>come to that conclusion later, after figuring out their supposed
>path on a chart?

It is my interpretation that when he saw the flash he was startled and
egan looking to see what caused it. Some seconds (20?) later he saw
another flash and noted it was coming from his left-front
and then he saw the objects but no flashes at that instant,
But at the same time they were tiny dots which meant that if they
were birds flying in a chain (his first impression) they were far away
and certainly no threat. Then he saw another flash, this time from
one of the objects (or maybe several flashes as time went on)
and realized they weren't birds because (a) birds don't
flash like metal mirrors and (b) assuming they must be jets
he deduced they were far away because he couldn't see
any of the typical plane features (had they been close enough
for him to see details he might have felt in danger) and
(c) because they were jets (he assumed) and far enough away
(exact distance NOT KNOWN) so he couldn't see details,
the ANGULAR RATE of motion (apparent speed) across
his field of view indicated they were traveling very fast....
and couldn't be birds. One may gather that his subjective
impression at the time was that birds that were far enough away
to appear as dots or "fat dots" would have an angular rate of
speed much lower than what he witnessed. One can actually
make a quantitative comparison, here.

BIRD AT 6 miles (we are told barely visible) - TRAVELING
50 MPH (Indianapolis 500 speed for a bird) HAS A CROSS
ANGULAR RATE OF $50 \text{ mph} / 6 \text{ mi} = 0.0023 \text{ radian/sec}$

UNKNOWN AT 30 MILES (before reached Rainier,
appeared as a "fat" dot)
TRAVELING AT 1700 mph (based on Arnold's subsequent
measurement of distance/time) HAS A CROSSING ANGULAR RATE
OF $1700 / 30 = 0.0157 \text{ rad/sec}$. This is nearly 8 times faster than
the expected bird rate.

Hence there is some quantitative justification for Arnold to say to himself "they can't be birds... they're traveling too fast" or words to that effect, at the the time of his initial sighting.

SNIP

Now:

>1. At least one report by Arnold has the objects moving across
>the face of Rainier. This puts the upper bound on the distance.

>2. At least one report has the objects moving behind Little
>Tahoma. That puts a lower bound on the distance.

>3. At least one report gives the objects a heading of 160 to 170
>degrees.

>Putting all three statements together and determining the set of
>possible distances produces: EMPTY SET.

>Conclusion: At least one of the above statements is false.

Yeah I agree. My "solution" to the puzzle is in the paper I wrote. I reject the suggestion that they were always at an altitude of 10,000 ft (above Arnold at estimated 9200 ft). I suggest they were more like 6-7000 ft in altitude (2 degree depression angle from Arnold) and low enough to disappear behind peaks in the "hogback range" south of Rainier. NOTE: they might have passed Rainier at a higher altitude and then dropped down to fly at the altitude of the peaks south of Rainier.

>Questions:

>A. Which was brighter: sunlit Little Tahoma, or the sky beyond
>it?

Tahoma, Little or otherwise, was so far away to be of comparable brightness, or perhaps less bright, depending upon the amount of haze in the air at Arnold's altitude.

>B. Was Little Tahoma bright enough to halate the "dark phase" of
t>he objects into invisibility?

I doubt it. I suspect the "dark phase" was simply a result of their thinness and the fact that they did not present a high contrast with 'the background . (Totally black objects would present the

highest contrast without being themselves sources of light.)

>C. Was Rainier bright enough to halate the dark phase into
>invisibility?

I doubt it. Again, if the objects "disappeared" when not tilted then it was because they offered little contrast.

HOWEVER: Arnold DID make a drawing of the objects on edge and gave a crude estimate of the length to thickness ratio.

The natural implication is that he did see some thickness.

I suspect is ratio of length to thickness is about twice as large as it ought to be.

>D. Little Tahoma has an elevation of 11138 ft. If Arnold was at
>his stated 10000 ft, were the UFOs seen against the sky or the
>distant horizon as they passed that peak?

He said he sas about at 9200. HOwever, the 2000 ft distance over a distance of 20+ miles would correspond to only about a degree of elevation from his plane. You say "were they seen against the sky"... and I presume you mean the blue sky as opposed to the whitih horizon. Even at a 1 degree elevation it is likely they would have appeared against the white horizon rather than the "clear blue" . I haven't measured it, but I would guess from having flown many times that one would have to look upward several degrees above the horizon to see something silhouetted against "the wild blue yonder"..... and to get "true blue" you'd have to look upward at 30 degrees or more (depending upon where you are relative to the height of the haze layer).

>If objects at the distance of Little Tahoma were seen against the
>sky, their altitude must be within a range of 9300 ft to 11138
f>t. Below 9300 ft, they would have been seen against distant
>mountains beyond Rainier and little Tahoma, not just the sky. Of
>course, if the objects were closer to Arnold, they also would be
>constrained to a tighter altitude range.

I don't think so. I don't think there were any mountains in vicinity of Rainier that are 9300 ft high... after you least the Rainier "plateau" itself. Maybe someone can correct me on this.

BRAD WROTE:"
>BIG SNIP

>A 180 heading for the objects means a crossing point to Arnold at azimuth 90 (his heading to Yakima >was 97). This reduces the symmetry to an azimuth range from appearance at 33 degs azimuth to >disappearance at 147 degs. This reduces the clocking to 1.985 distance units in 102 seconds and >the total sighting to roughly 158 seconds, or roughly 2-1/2 minutes.
<

I generally agree with Brad's analysis of sighting angles except for two points:

- a) I don't accept the "behind Rainier" scenario...Instead I think the objects were LOWER than Brad has suggested (based on Arnold's drawing)
Note that Arnold's testimony indicates that they were flying very close to the mountain tops BEFORE they reached Mt. Rainier. But the mountain tops north of Rainier are just as low (relative to Rainier) as the mountain tops south of Rainier. Hence if they were close to the mountain tops both north and south of Rainier, then they were lower than 9500 ft, perhaps as low as 6000 ft.
- b) There is NO GUARANTEE that the objects flew along a straight path from the "far north:" to the "far south." In particular, I think we have to consider the possibility that they were flying more eastward (e.g., azimuth 120, maybe) until they got to the vicinity of Rainier and they made a gradual turn to their right and headed roughly southward (160 to 180 degrees).
This assumption doesn't change much except it does mean that when the first flash occurred or when Arnold saw the second flash (and his attention was drawn to the objects themselves as tiny dots way off in the distance in that direction - roughly - of Mt. Baker) the actual position of the objects was closer to Arnold's plane than he estimated. (He thought 100 miles away.
A straight path would allow them to be only 50 miles away - if the straight path passes the WEST side of Rainier. A curved path would allow them to be even closer, maybe 40 - 30 miles away when he first saw them.

>Or small enough! You can't assume they were airplane sized.
<

MY POINT: there is no reason to suspect that Arnold panicked at
seeing these objects traveling along at a high angular rate of
speed because the images were so small that the objects,
if airplanes, were, therefore tens of miles
away (out of danger distance) or they were small, like
birds a few miles away, and clearly no immediate danger.
few miles away but no threat

>MOTIONS & FORMATION FLIGHT REPORTED FOR ARNOLD'S OBJECTS

>(1) SKIPPING: "Saucers skipping across water" or like "speed
>boats on rough water."

Brad,

I think we need to examine the exact quote and also a perspective, which - and this may be a surprise - it seems Arnold only ever really clarified in his book:

"As I described them at the time, their flight was like speed boats on rough water or similar to the tail of a Chinese kite that I once saw blowing in the wind. Or maybe it would be best to describe their flight characteristics as very similar to a formation of geese, in a rather diagonal chain-like line, as if they were linked together. As I put it to newsmen in Pendleton, Oregon, they flew like a saucer would if you skipped it across the water".

What's important is how Arnold explains this 'skipping' characteristic related to the formation, not individuals, and was also like a kite-tail. Now, a kite-tail is essentially a long ribbon and I've previously cited an observation of AWP's which uses the 'ribbon' terminology, plus another which describes how "they appear as crepe paper strips, tied to an invisible wind".

By any standards, that's a pretty emphatic correlation on this point.

As highlighted within the past couple of weeks, Arnold's comment about how "they flew like a saucer would if you skipped it across the water", may have been a misunderstanding for over 50 years.

Consider that even more so than the comprehensively misconstrued 'flying saucer' remark, Arnold states, "maybe it would be best to describe their flight characteristics as very similar to a formation of geese, in a rather diagonal chain-like line, as if

they were linked together".

"Saucers skipping across water" - "speed boats on rough water"... when we truly grasp the context, it looks like this is no more than Arnold using metaphors to similarly describe that weaving, undulating, kite-tail characteristic of all nine objects in formation.

In, respectively, the radio interview and his letter to the Air Force, Arnold reiterated:

"I climbed back up to 9200 feet and I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier. I, at first, thought they were geese because it flew like geese."

"They flew like many times I have observed geese to fly in a rather diagonal chain-like line as if they were linked together..."

There was apparently never any 'skipping' attribute, other than Arnold's recollection of how he described this to reporters and subsequently confirms it was related to the formation's weaving motion.

That's all this is.

Being such a fundamental aspect, perhaps we can first of all agree it's now understood.

James.

Subject: Re: Arnold's Objects & Bird MotionsStatus:

James,

You failed to print out my list of 11 points about the motions and formation of Arnold's objects -- only one of which matches your pelican evidence (No. 4 Unison Formation Motion) -- and my analysis of 12 points about pelican motion (again only one matches up with Arnold, No. 1, Unison Formation Motion).

You attempt to dismiss the Skipping Motion (no. 1) as simply the same thing as Unison Formation Motion (no. 9). But you ignore my comment under Pelican Point No. 9: "Arnold's description of a "Chinese kite tail" motion, however, is of "erratic" almost violent motion not the GRACEFUL UNDULATIONS of a formation of birds."

Your latest comments ignoring mine go on about the linked or unison motion of a Chinese kite (or ribbons or crepe paper) but ignore the aspect of VIOLENTLY ERRATIC MOTION that everyone is familiar with from seeing or flying KITES. So when Arnold was struggling to explain how the objects seemed to be linked in their motions but also very erratic -- two different aspects of the motions -- it is perfectly understandable how he would run down a list of comparisons to try to convey a difficult concept -- saucers skipping over water, speedboats on ROUGH WATER, Chinese kite tail, fish flipping and flashing in the sun, etc. The only evidence you've presented for pelicans is of GRACEFUL UNDULATING formations (Pelican Point No. 9, see below). Nothing about pelican formations with ERRATIC irregular motion, like speedboats going over ROUGH WATER.

Here are my lists once again:

Here is a rough list of Arnold's observations about the objects' formation and motions with respect to terrain features. Please match this with detailed descriptions of pelicans exhibiting the same motions with respect to the same terrain features (mountain peaks, canyons, etc.) in the same type of formation. Just using a lot of "-ing" words is NOT sufficient:

MOTIONS & FORMATION FLIGHT REPORTED FOR ARNOLD'S OBJECTS

(1) SKIPPING: "Saucers skipping across water" or like "speed boats on rough water."

(2) WEAVING THE MOUNTAINTOPS: "Weaving in and out right above the mountaintops."

(3) IRREGULAR LIGHT FLASHES AT SAME TIME: Dipping down motion seemingly tipping or flipping wings, and simultaneously flashing intense blue-white

light, "not in a regular rhythm" among the 9 objects, but averaging 2-3 objects flashing every few seconds (=1 flash/sec from the 9 or 1 flash every 9 seconds for any one object).

(4) UNISON FORMATION MOTION: Formation generally moves in unison as if connected.

(5) VERY ERRATIC INDIVIDUAL MOTIONS: But individual objects move "very erratically," "fluttering and jerking very rapidly."

(6) STRAIGHT LINE REVERSE ECHELON FORMATION: Flying in "definite direction," a "straight line" in reverse echelon with the first object highest and the last lowest.

(7) FORMATION IN TWO GROUPS OF 4 AND 5 IN A SINGLE-FILE LINE: Formation split with a gap between the first 4 and last 5.

(8) FORMATION OF 9.

(9) SECOND TO LAST DARKER/DIFFERENT: Second to last object darker, slightly larger or slightly different in shape.

(10) INTENSE ARC-LIKE BLINDING BRIGHTNESS. In the opposite part of the sky from the sun, no grazing-angle reflections of sunlight.

(11) HIGH VELOCITY. (Arnold's clocking indicates about 2 degs/sec angular velocity which for birds at 1 mile distance is about 125 mph, much too fast for birds with top speeds of 30 possibly 50 mph.)

Correct me if I'm wrong, James, but I see nothing here (below) in your descriptions of pelican behavior, nor do I recall from your other postings, ANYTHING about PELICANS moving like (1) speedboats skipping across water, (2) weaving in and out of mountain peaks, (3 & 10) irregularly flashing intense arc-like light when dipping down and flipping/tipping, (5) very erratic individual motions, (6) straight line reverse echelon formation, (7) formation split into two groups of even APPROXIMATELY 4 and 5 in a single-file line with a gap in between, (8) a total number of only ABOUT 9, (9) and the second-to-LAST object darker/different.

Instead, let's review what you presented below. If you have further evidence that bears on these specific points then PLEASE PRESENT IT and PLEASE USE MY NUMBERING (above and below) WITHOUT SKIPPING ANY. Give us your best shot.

So far as I can see your Pelican Evidence has the following:

PELICAN FORMATIONS & MOTIONS

- (1) UNISON FORMATION MOTION. (The only point in common with Arnold.)
- (2) BANKING MOTION. (When did Arnold's objects "bank"? Dipping down in altitude is not banking. Flipping or tipping wings is not banking. Pilots can explain the difference.)
- (3) FLAPPING WINGS SLOWLY IN UNISON. (Arnold never reported this. He said
INDIVIDUAL objects "VERY RAPIDLY" fluttered and jerked but
"ERRATICALLY" and
NOT IN UNISON.)
- (4) HALF DOZEN SLOW FLAPPINGS OF ALL BIRDS IN UNISON -- THEN
GLIDING -- THEN
SLOW FLAPPINGS IN UNISON -- ETC. (Arnold never reported all 9 objects
"flapping" in unison like this. See Arnold List Nos. 3 and 5, above. He
said 2-3 objects light-flashed/dipped altitude every 2-3 seconds IRREGULARLY,
but NOT the whole chain of 9 objects in UNISON.)
- (5) PRECISELY SPACED LINES OR V- OR L-FORMATIONS. (Arnold never
said the
objects were uniformly spaced, in fact mentioned a gap in the middle, and
never reported a V-shape or L-shape formation.)
- (6) SOARING HIGH ON THERMALS. (Arnold reported the objects more or less
maintained the same height except rising gradually towards the end --
McDonald taking this as 9,000 feet near Rainier rising to 13,000 feet some 50
miles farther along near Adams, from his Arnold interviews in Nov 1966 --
which is less than a 1-degree rise and obviously not the classic birds
"soaring on a thermal.")
- (7) SPIRALLING UP TO SEVERAL THOUSAND FEET. (Arnold obviously
reported no
such thing.)
- (8) RETRACED PATHS. (Arnold again obviously reported no such thing.)
- (9) UNDULATING LINE, V- OR L-FORMATIONS: (Arnold's description of a
"Chinese kite tail" motion, however, is of "erratic" almost violent motion
not the GRACEFUL UNDULATIONS of a formation of birds.)
- (10) LEADER FLAPPING FIRST FOLLOWED BY THE REST. (This is not a
contradiction to UNISON FORMATION MOTION, No. 1, but an alternative motion.
But not reported by Arnold, though, unlike No. 1. THIS is a "staccato"
motion, one suddenly followed by others like dominos, which is NOT "erratic.")
- (11) THREE GROUPS OF ABOUT 30 EACH IN LINES THEN FORMING "V's".
(Still not

Arnold's 9 in a line with a gap in the middle. James, you keep saying in other postings that the number of 9 objects is so bird-like. Well lets hear some reports of SINGLE-LINE FORMATIONS OF ABOUT 9 (or 8, 10, 11, 7, somewhere around there) PELICANS with a GAP IN THE MIDDLE. Must be billions of birds on earth surely if this is normal someone would have seen it, especially given how fanatical birdwatchers can be.)

(12) LEAD BIRD DARK -- REMAINDER WHITE. (Arnold said the 2nd-to-LAST object was SLIGHTLY DARKER, and a bit larger, but as a matter of degree. This was NOT the LEAD object.)

Contrary to your claim of demonstrating that Arnold's objects exhibited "several proven" characteristics of a formation of Pelicans, you've in fact shown only 1 out of 12 pelican flight/formation characteristics that match Arnold's objects. I've further shown 10 additional flight/formation characteristics that Arnold reported for which you have yet to show ANY matches from evidence of pelicans.

Brad

>MOTIONS & FORMATION FLIGHT REPORTED FOR ARNOLD'S OBJECTS

>(1) SKIPPING: "Saucers skipping across water" or like "speed
>boats on rough water."

Brad,

I think we need to examine the exact quote and also a perspective, which - and this may be a surprise - it seems Arnold only ever really clarified in his book:

"As I described them at the time, their flight was like speed boats on rough water or similar to the tail of a Chinese kite that I once saw blowing in the wind. Or maybe it would be best to describe their flight characteristics as very similar to a formation of geese, in a rather diagonal chain-like line, as if they were linked together. As I put it to newsmen in Pendleton, Oregon, they flew like a saucer would if you skipped it across the water".

What's important is how Arnold explains this 'skipping' characteristic related to the formation, not individuals, and was also like a kite-tail. Now, a kite-tail is essentially a long ribbon and I've previously cited an observation of AWP's which uses the 'ribbon' terminology, plus another which describes how "they appear as crepe paper strips, tied to an invisible wind".

By any standards, that's a pretty emphatic correlation on this point.

As highlighted within the past couple of weeks, Arnold's comment about how "they flew like a saucer would if you skipped it across the water", may have been a misunderstanding for over 50 years.

Consider that even more so than the comprehensively misconstrued

'flying saucer' remark, Arnold states, "maybe it would be _best_ to describe their _flight characteristics_ as _very similar to a formation of geese_, in a rather diagonal chain-like line, as if they were linked together".

"Saucers skipping across water" - "speed boats on rough water"... when we truly grasp the context, it looks like this is no more than Arnold using metaphors to similarly describe that weaving, undulating, kite-tail characteristic of all nine objects in formation.

In, respectively, the radio interview and his letter to the Air Force, Arnold reiterated:

"I climbed back up to 9200 feet and I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier. I, at first, thought they were geese because it flew like geese."

"They flew like many times I have observed geese to fly in a rather diagonal chain-like line as if they were linked together..."

There was apparently never any 'skipping' attribute, other than Arnold's recollection of how he described this to reporters and subsequently confirms it was related to the formation's weaving

motion.

That's all this is.

Being such a fundamental aspect, perhaps we can first of all
agree it's now understood.

James.

@Subject: Arnold's Objects & Bird Motions

Are we ducking the questions, or questioning the ducks? These lists have raised some questions in my mind. They are indicated by *** in the text below:

@
@James,

@We've all been taking too much for granted your claims that
@Arnold's objects matched the motions and formations of pelicans.
@I still have not seen the evidence for it except for formations
@moving in unison (my No. 4 below).

@Here is a rough list of Arnold's observations about the objects'
@formation and motions with respect to terrain features. Please
@match this with detailed descriptions of pelicans exhibiting the
@same motions with respect to the same terrain features (mountain
@peaks, canyons, etc.) in the same type of formation. Just using
@a lot of "-ing" words is NOT sufficient:

@MOTIONS & FORMATION FLIGHT REPORTED FOR ARNOLD'S OBJECTS

@(1) SKIPPING: "Saucers skipping across water" or like "speed
@boats on rough water."

*** Could this effect be caused by alternate zones of rising and calm air? I'm not suggesting powerful thermals, but little ones.

@(2) WEAVING THE MOUNTAINTOPS: "Weaving in and out right above
@the mountaintops."

*** This is based on the assumption that the objects were actually at the distance of the mountaintops. Did Arnold ever say

they went behind anything other than Little Tahoma?

@(3) IRREGULAR LIGHT FLASHES AT SAME TIME: Dipping down motion @seemingly tipping or flipping wings, and simultaneously flashing @intense blue-white light, "not in a regular rhythm" among the 9 @objects, but averaging 2-3 objects flashing every few seconds @ (=1 flash/sec from the 9 or 1 flash every 9 seconds for any one @object).

*** This is the fact that confuses me most:

1. It is very hard for me to imagine pelicans giving off sufficient reflections from the sun (Unless they had been sprayed with a RADAR reflective coating of aluminum paint to avoid collisions :)).
2. I also have trouble with the aerodynamic surfaces of an aircraft producing the reflection, since the aircraft would have to bank and yaw simultaneously in an attitude that would not produce the observed direction of flight.
3. The ONLY thing I can think of that would make the reflection in the observed direction while maintaining flight in the observed direction is a flat-paned canopy of the type made before and during World War II. But if the reflections were observed during the entire observation, then that doesn't make any sense.

@(4) UNISON FORMATION MOTION: Formation generally moves in @unison as if connected.

@(5) VERY ERRATIC INDIVIDUAL MOTIONS: But individual objects @move "very erratically," "fluttering and jerking very rapidly."

*** Sounds like birds to me.

@(6) STRAIGHT LINE REVERSE ECHELON FORMATION: Flying in @ "definite direction," a "straight line" in reverse echelon with @the first object highest and the last lowest.

*** Is this ever used by the military?

@(7) FORMATION IN TWO GROUPS OF 4 AND 5 IN A SINGLE-FILE LINE: @Formation split with a gap between the first 4 and last 5.

*** Why doesn't this match pelicans? In flights of ducks I have seen, sometimes a single duck will drop back, and a gap will remain until the rear grouping can catch up with the front again.

@(8) FORMATION OF 9.

*** Why doesn't this match pelicans? Do they wait until they have enough reservations for a convoy?

@(9) SECOND TO LAST DARKER/DIFFERENT: Second to last object @darker, slightly larger or slightly different in shape.

*** IN other accounts I have read, the LAST object was the different one.

*** I don't know about pelicans, but ducks trade off leaders as they fly. Every so often, the leader will peel off and attach to one of the ends of the vee formation. Then one of the two ducks next in line backs off, relinquishing the lead to the other. Since the lead position uses up more energy to fly (the other positions have added lift from the wake of the duck in front), they all take turns leading. If pelicans do the same thing, then the position of the dark one is a matter of chance.

@(10) INTENSE ARC-LIKE BLINDING BRIGHTNESS. In the opposite @part of the sky from the sun, no grazing-angle reflections of @sunlight.

@(11) HIGH VELOCITY. (Arnold's clocking indicates about 2 @deg/s angular velocity which for birds at 1 mile distance is @about 125 mph, much too fast for birds with top speeds of 30 @possibly 50 mph.)

*** This is assuming that the motions of Arnold's own plane did not affect the timing.

@Correct me if I'm wrong, James, but I see nothing here (below) @in your descriptions of pelican behavior, nor do I recall from @your other postings, ANYTHING about PELICANS moving like (1) @speedboats skipping across water, (2) weaving in and out of @mountain peaks, (3) irregularly flashing intense light when @dipping down and flipping/tipping, (5) very erratic individual @motions, (6) straight line reverse echelon formation, (7) @formation split into two groups of even APPROXIMATELY 4 and 5 in @a single-file line with a gap in between, (8) a total number of @only ABOUT 9, (9) and the second-to-LAST object @darker/different.

@Remember, the Arnold sighting is FAMOUS for the "saucers @skipping across water" and you have showed me NOTHING of BIRD @behavior that is like that, nothing from pelicans, ducks, snow @geese, or whatever.

@Instead, let's review what you presented below. If you have @further evidence that bears on these specific points then PLEASE

@PRESENT IT and PLEASE USE MY NUMBERING (above and below)
WITHOUT
@SKIPPING ANY. Give us your best shot.

@So far as I can see your Pelican Evidence has the following:

@PELICAN FORMATIONS & MOTIONS

@(1) UNISON FORMATION MOTION. (The only point in common with Arnold.)

@(2) BANKING MOTION. (When did Arnold's objects "bank"?
@Dipping down in altitude is not banking. Flipping or tipping
@wings is not banking. Pilots can explain the difference.)

@(3) FLAPPING WINGS SLOWLY IN UNISON. (Arnold never reported
@this. He said INDIVIDUAL objects "VERY RAPIDLY" fluttered and
@jerked but "ERRATICALLY" and NOT IN UNISON.)

*** And if one pelican needs more energy farther back in the
line, does he have to wait for the leader to start flapping?

@(4) HALF DOZEN SLOW FLAPPINGS OF ALL BIRDS IN UNISON -- THEN
@GLIDING -- THEN SLOW FLAPPINGS IN UNISON -- ETC. (Arnold never
@reported all 9 objects "flapping" in unison like this. See
@Arnold List Nos. 3 and 5, above. He said 2-3 objects
@light-flashed/dipped altitude every 2-3 seconds IRREGULARLY, but
@NOT the whole chain of 9 objects in UNISON.)

*** Do pelicans ALWAYS do this, or is this the USUAL behavior?

@(5) PRECISELY SPACED LINES OR V- OR L-FORMATIONS. (Arnold
@never said the objects were uniformly spaced, in fact mentioned
@a gap in the middle, and never reported a V-shape or L-shape
@formation.)

*** With ducks, I have observed both Vee and straight line
(offset to one side) formations. Do pelicans also vary their
flight methods?

@(6) SOARING HIGH ON THERMALS. (Arnold reported the objects
@more or less maintained the same height except rising gradually
@towards the end -- McDonald taking this as 9,000 feet near
@Rainier rising to 13,000 feet some 50 miles farther along near
@Adams, from his Arnold interviews in Nov 1966 -- which is less
@than a 1-degree rise and obviously not the classic birds
@"soaring on a thermal.")

Are we talking about straight line soaring, or circular motion to
gain much altitude. Both are valid maneuvers (ask any sailplane
pilot). Straight line soaring is following the edge of a ridge

and gaining lift from the chain of updrafts there.

@(7) SPIRALLING UP TO SEVERAL THOUSAND FEET. (Arnold obviously @reported no such thing.)

*** But do they constantly spiral, or is that just how they get up there in the first place? (And don't forget ridge thermals.)

@(8) RETRACED PATHS. (Arnold again obviously reported no such thing.)

*** Not necessary with ridge soaring!

@(9) UNDULATING SHAPES OF THE V- OR L-FORMATIONS: (Arnold's @description of a "Chinese kite tail" motion, however, is of @"erratic" almost violent motion not the GRACEFUL UNDULATIONS of @a formation of birds.)

*** No, but it is a characteristic of striking a series of updrafts interspersed by calm air. They hold sailplane races in the Appalachians, and the same kind of motion is apparent as each plane flies into areas of rise and sink air.

@(10) LEADER FLAPPING FIRST FOLLOWED BY THE REST. (This is not @a contradiction to UNISON FORMATION MOTION, No. 1, but an @alternative motion. But not reported by Arnold, though, unlike @No. 1. THIS is a "staccato" motion, one suddenly followed by @others like dominos, which is NOT "erratic.")

*** Is this always true?

@(11) THREE GROUPS OF ABOUT 30 EACH IN LINES THEN FORMING "V's".
@ (Still not Arnold's 9 in a line with a gap in the middle.
@ James, you keep saying in other postings that the number of 9
@ objects is so bird-like. Well let's hear some reports of
@ SINGLE-LINE FORMATIONS OF ABOUT 9 (or 8, 10, 11, 7, somewhere
@ around there) PELICANS with a GAP IN THE MIDDLE. Must be
@ billions of birds on earth surely if this is normal someone
@ would have seen it, especially given how fanatical birdwatchers
@ can be.)

*** I have seen single lines of 9 ducks, sometimes with gaps.

@(12) LEAD BIRD DARK -- REMAINDER WHITE. (Arnold said the 2nd-to-LAST object was SLIGHTLY DARKER, and a bit larger, but as a matter of degree. This was NOT the LEAD object.)

*** Again, is this always true? If pelicans do anything like ducks do, the lead keeps changing. The exception is a mother leading her young brood (flight school). In that case, the mother always takes the lead.

@Contrary to your claim of demonstrating that Arnold's objects exhibited "several proven" characteristics of a formation of Pelicans, you've in fact shown only 1 out of 12 pelican flight/formation characteristics that match Arnold's objects. I've further shown 10 additional flight/formation characteristics that Arnold reported for which you have yet to show ANY matches from evidence of pelicans.

@Brad

@P.S.: As for the Chicago Tribune supposedly being discredited @as misquoting Arnold about "taking out his watch" (so therefore @we're not supposed to believe the Tribune quotes of Arnold on @other points such as objects flying behind Rainier) it was NOT @later "clarified" that he had a "stopwatch" on his instrument @panel as HE DIDN'T. It is indisputable that the KWRC radio @interview quotes Arnold saying "I looked at my watch" so it was @Arnold who misspoke both times, not the Chicago Tribune reporter @who misquoted.

*** There may be a difference in regional linguistics here. Where I live, everyone calls the thing on the wall a "clock" and the thing on your wrist a "watch." But I have been places (primarily Spanish neighborhoods) where everyone called both objects a "clock." I think the reason for this is that the Spanish language does not have the same distinction of timepieces. Their first word "reloj" (clock) means either a clock or a watch, but their second word "despertador" (waker) refers to any timepiece that can wake you up). People who use "clock" for both time pieces tend to say "watch" to refer to a stopwatch.

I have also been places (primarily seaports and naval bases) where they call both objects a "watch" from naval practice. The Navy seems to rename everything (see my piece on "secure the building" on the English Language section of my website). I have two friends in Virginia who always say "watch. In the Arnold case, somebody may have made an unwarranted assumption due to their different word usages.

So the whole misunderstanding here may stem from different use of words in different regions. For instance, everyone here says to find a "bucket" for them but where my grandmother lives, everyone wants a "pail" instead. Here, we "plug in" and "turn on" electrical appliances, but just 100 miles to the south, they "plug up" and "put on" everything. But we recently got a little British English in our vocabularies. They just put in a roundabout.

SOME OTHER THOUGHTS:

There are many activities which can cause UFO sightings, but are not thought of when possible causes are considered:

1. Unlisted flights: When a sighting is reported, the first thing somebody does is call the local airport. When they say they had no planes up, the investigators **WRONGLY** assume that a plane could not have caused the sighting. But there are two reasons why that is not true:

A: Military, commercial, and private airports each have information on primarily the kind of flight that uses that kind of airport. They each know very little about the other two types of planes that happen to be in the air.

B: Some aircraft (mostly private pilots flying Visual Flight Rules) are not on any list.

2. Illegal activity: Many UFO sightings have been traced to people engaged in illegal activity. Several sightings have been shown to be caused by poachers taking game out of season. One group was using a helicopter. During the years 1974 to 1979, a series of UFO sightings along the US-Mexico border baffled investigators: meteors that always went straight up. They finally caught some criminals using model rockets to smuggle drugs into the US. Of course, we can't forget the "mutes." Members of a satanic cult were jailed in the mid 1980s for killing cattle belonging to farmers and taking animal parts for their rituals. They were traced to activities in Iowa, Minnesota, North Dakota, Colorado, Utah, Arizona, New Mexico, Wyoming, and California.

3. Unusual objects in or superimposed on the air: Escaped advertising balloons (we had a life-sized car flying upside down here a few years ago), ultralight aircraft, and kites come to mind. I have an oval kite that rotates on its transverse axis and is made of reflective diffraction grating mylar. It even **LOOKS** like a "classic" flying saucer shape in flight (I haven't gotten any reports that coincide with when I was flying it yet).

Also reported in my area: exploding pole transformers, a barium cloud (saw it myself), a building collapsed and tore down power lines, power lines arcing to trees, fireworks (in January?), a helicopter lifting large beams to the roof of a new church, the swinging ball of a large crane (seen at night in a high wind), a power line insulator reflecting a streetlight, headlights reflected from building windows, burning debris from a fire in a trash dump, and (of course) fire balloons launched by students.

4. Police activity: We had a report last week of two lighted objects hovering over a wooded area, coincident with a power

failure. Police with helicopters and nightscopes were hunting for a man who had just killed his girlfriend and set fire to both of their houses (it seems the IRS was after him for back taxes, and he went nuts). Power was cut to prevent one of the fires from spreading. In this case, the report was made to police, who immediately identified their helicopters. But if the report had gone to a regional UFO group instead of the police, then the trail would have been cold by the time the investigators arrived. Other cases here included police helicopters being used to look for traffic violators, other manhunts, and a police car with its lights flashing up on a hill (the observer couldn't see the hill at night).

5. Combined independent effects: I wouldn't have believed this explanation if I hadn't seen it myself. A lady friend reported to me several years ago that she had seen a large white bird-shaped object chasing a car. It was reported to be bigger than the car roaring very loud, and it didn't flap like a bird. I went with her to the scene (a new shopping center), and after a few minutes, observed almost a repeat of the event. The differences were that the roaring started halfway through the sighting, there was no car being chased, and the object landed. It landed on the parking lot, much closer than it at first seemed to be. It was a seagull ... in southern Indiana! The roar turned out to be from a quarry crane hidden behind a nearby hill, which happened to line up with the road. The car and the seagull happened to have lined up perfectly the first time, but only from the viewpoint of the witness. It was the roar that had attracted her attention to the bird, and she assumed it to be larger than a bird because of the roar.

Another weird case here was a sighting at night of an orange glowing object, followed by the appearance of a series of concentric rings of dead grass in a yard the next day. Two independent pranks by teenagers were responsible. One launched a fire balloon. The other played a trick on his girlfriend by making a "target for planes" with a stick, string, and Spectracide on the lawn of her house. Independent events strike again.

AND AN INTERESTING FACT:

I found out recently that most Air Traffic Control systems in the US and Canada no longer have primary reflected RADAR capability. Most of them use transponders exclusively now. The RADAR sends out a much lower power coded request, and the aircraft transponder transmits the appropriate response back to the RADAR set. That means that these systems can't detect a UFO unless it has a transponder. It also means that planes with special equipment could falsify their position. Second-trip responses

also behave strangely, because the transponder response received is for the wrong request each time, giving a strange identification and altitude reading.

@>constrained to a tighter altitude range.

@
@I don't think so. I don't think there were any mountains in vicinity
@of Rainier that are 9300 ft high... after you least the Rainier
@"plateau" itself. Maybe someone can correct me on this.

If he was at 9200 ft, then I revise that figure downward to 8300
ft. I calculated the heights of distant mountains in Arnold's
perspective and included curvature of the earth. At 7750 ft, they
would have been below Arnold's horizon at Little Tahoma distance
WITHOUT any distant mountains being present.

The mountains I refer to are:

Colockum Pass, Mission Pk, Redtop Mt, Swauk Pass, Whiskey Dick
Mt, Deer Butte, Signal Pk, and Satus Pk. These are all high
enough that if the objects had passed Little Tahoma at it's
distance, they would have visibly passed below these peaks (from
Arnold's viewpoint) if they were lower than 8300 ft.

@From: RB47Expert@aol.com
@@To: UFORL@listbot.com
@Subject: Re: Arnold's Objects & Bird Motions
@
@@
@James,
@
@You failed to print out my list of 11 points about the motions and formation
@of Arnold's objects -- only one of which matches your pelican evidence (No. 4
@Unison Formation Motion) -- and my analysis of 12 points about pelican motion
@(again only one matches up with Arnold, No. 1, Unison Formation Motion).
@
@You attempt to dismiss the Skipping Motion (no. 1) as simply the same thing
@as Unison Formation Motion (no. 9). But you ignore my comment under Pelican
@Point No. 9: "Arnold's description of a "Chinese kite tail" motion, however,
@is of "erratic" almost violent motion not the GRACEFUL UNDULATIONS of a
@formation of birds."
@
@Your latest comments ignoring mine go on about the linked or unison motion of
@a Chinese kite (or ribbons or crepe paper) but ignore the aspect of VIOLENTLY
@ERRATIC MOTION that everyone is familiar with from seeing or flying KITES.
@So when Arnold was struggling to explain how the objects seemed to be linked
@in their motions but also very erratic -- two different aspects of the motions
@ -- it is perfectly understandable how he would run down a list of
@comparisons to try to convey a difficult concept -- saucers skipping over
@water, speedboats on ROUGH WATER, Chinese kite tail, fish flipping and
@flashing in the sun, etc. The only evidence you've presented for pelicans is
@of GRACEFUL UNDULATING formations (Pelican Point No. 9, see below).
Nothing
@about pelican formations with ERRATIC irregular motion, like speedboats going
@over ROUGH WATER.

That depends on what kind of wind the kite is flying in. I have
seen Chinese kites in very stiff winds with their tails
thrashing violently, and I have seen them in smooth winds with
the tails gently undulating.

@Here are my lists once again:

AAAAACKKK! Please stop repeating everything from the previous posts in each post, unless it is absolutely necessary. I want to keep all of it, and I am running out of disk space. It takes a good 15 minutes to reload the deleted ones from the backups, because the file format is such that all posts saved in the grouping are in the same file (and I have to delete another grouping to reload them).

Kenneth Arnold is now taking up 10 percent of my disk space all by himself.

Subject: Re: Arnold's Objects & Bird MotionsStatus:

Larry,

These are good questions. My point was not to say that in all instances of flight behavior listed that pelicans were an impossibility only that I was trying to ascertain what is the natural habit of the birds, what has been observed. I raised this point in this manner because James kept insisting that Arnold's sighting details fit so many facets of well-known pelican behavior. So when I actually tabulated the Pelican Flight Behavior AS PRESENTED BY JAMES HIMSELF I was quite surprised to find how little correlation there was with the Flight Behavior in Arnold's case.

Very few of these points are dispositive or conclusive. Obviously it is possible for pelicans to have formations of exactly 9 birds but how COMMON is it? Is it something that is exceedingly rare? I don't know. I'm just presenting JAMES' OWN EVIDENCE and he had nothing from ornithologists on formations of 9 pelicans only an account of about 90 pelicans organized in groups of about 30. This isn't very close to 9. James otherwise can only point to the unconfirmed newspaper clip about the Northwest pilots who allegedly saw 9 "round disks" which were supposedly actually pelicans -- which is suspicious for being a deliberate copycat designed to discredit Arnold, not investigated by anyone and was unconfirmed by other observers or by any movie camera footage.

The numbers of birds in a formation is not entirely arbitrary since as I understand it there are aerodynamic considerations in formation flying which may prefer larger numbers of birds taking advantage of the easier slipstream created by the formation. This is something ornithologists would know presumably. (I posted this point subsequent to the posting you responded to here.)

Some more COMMENTS below.

Brad

> @MOTIONS & FORMATION FLIGHT REPORTED FOR ARNOLD'S OBJECTS
>
> @(1) SKIPPING: "Saucers skipping across water" or like "speed
> @boats on rough water."
>
> *** Could this effect be caused by alternate zones of rising and
> calm air? I'm not suggesting powerful thermals, but little ones.

COMMENTS: Possibly. There are a whole host of physical wave phenomena that could cause this and Arnold seized on imagery of water waves to describe it.

> @(2) WEAVING THE MOUNTAINTOPS: "Weaving in and out right above
> @the mountaintops."
>
> *** This is based on the assumption that the objects were
> actually at the distance of the mountaintops. Did Arnold ever say
> they went behind anything other than Little Tahoma?

COMMENTS: Read what Arnold said very carefully (it's from his KWRC radio interview, June 26, 1947), he says "ABOVE the mountaintops," so there is actually no occultation to establish a distance (later in the interview he suggests they dipped down by 100 feet but that is too small even to be seen). But even if Arnold mistakenly THOUGHT these mountaintops were Goat Ridge's peaks roughly 28 miles away it DOES NOT MATTER because if they were birds within a few miles of Arnold that STILL PUTS THEM OVER MOUNTAINS. And James has claimed pelican behavior is a close match -- so do pelicans fly this way over mountainous regions? Yes to your question, he suggested on occasion the objects dipped down very slightly in behind peaks of Goat Ridge but in other accounts this is so slight as to be questionable, or in the case of his drawing he has the objects high above Goat Ridge

(which is at about 5,000-7,000 ft) on a line he has labeled as "10,000 ft." He told McDonald in Nov 1966 the o!

!

bjects increased in altitude from about 9,000 feet near Rainier to 13,000 feet passing Mt Adams, which by interpolation indicates an altitude around 11,000 feet over Goat Ridge. In general Arnold suggested an error margin of about +/- 1,000 feet for the altitude of the objects not just over Goat Ridge (unless he meant an actual physical undulation of that magnitude, but in the KWRC interview he gave the altitude drop as only 100 feet).

- > @ (3) IRREGULAR LIGHT FLASHES AT SAME TIME: Dipping down motion
- > @seemingly tipping or flipping wings, and simultaneously flashing
- > @intense blue-white light, "not in a regular rhythm" among the 9
- > @objects, but averaging 2-3 objects flashing every few seconds
- > @ (=1 flash/sec from the 9 or 1 flash every 9 seconds for any one
- > @object).
- >
- > *** This is the fact that confuses me most:
- >
- > 1. It is very hard for me to imagine pelicans giving off
- > sufficient reflections from the sun (Unless they had been
- > sprayed with a RADAR reflective coating of aluminum paint
- > to avoid collisions :)).
- >
- > 2. I also have trouble with the aerodynamic surfaces of an
- > aircraft producing the reflection, since the aircraft would
- > have to bank and yaw simultaneously in an attitude that would
- > not produce the observed direction of flight.
- >
- > 3. The ONLY thing I can think of that would make the reflection
- > in the observed direction while maintaining flight in the
- > observed direction is a flat-paned canopy of the type made
- > before and during World War II. But if the reflections were
- > observed during the entire observation, then that doesn't
- > make any sense.

COMMENTS: Bruce Maccabee did calculations on this List for curved mirror-like reflectors which could illuminate wider areas without having to precisely angle a flat mirror reflector in exactly the right direction. It still results in brilliant or blinding intensity.

- > @ (4) UNISON FORMATION MOTION: Formation generally moves in
- > @unison as if connected.
- >
- > @ (5) VERY ERRATIC INDIVIDUAL MOTIONS: But individual objects
- > @move "very erratically," "fluttering and jerking very rapidly."
- >
- > *** Sounds like birds to me.

COMMENTS: The VERY RAPID "fluttering" might be hummingbirds <g> but hardly large sailing birds such as pelicans, and it hardly fits ERRATIC JERKING motions.

- > @(6) STRAIGHT LINE REVERSE ECHELON FORMATION: Flying in
- > @"definite direction," a "straight line" in reverse echelon with
- > @the first object highest and the last lowest.
- >
- > *** Is this ever used by the military?

COMMENTS: I thought Joel Carpenter found something to this effect but I'm not sure it actually matched.

- > @(7) FORMATION IN TWO GROUPS OF 4 AND 5 IN A SINGLE-FILE LINE:
- > @Formation split with a gap between the first 4 and last 5.
- >
- > *** Why doesn't this match pelicans? In flights of ducks I have
- > seen, sometimes a single duck will drop back, and a gap will
- > remain until the rear grouping can catch up with the front again.

COMMENTS: Maybe it does match pelicans. But James didn't present any evidence and I'm just summarizing what he presented. See my comments at the beginning.

- > @(8) FORMATION OF 9.
- >
- > *** Why doesn't this match pelicans? Do they wait until they have
- > enough reservations for a convoy?

COMMENTS: Again, maybe it does match pelicans. But James didn't present any evidence and I'm just summarizing his material. See my comments at the beginning.

- > @(9) SECOND TO LAST DARKER/DIFFERENT: Second to last object
- > @darker, slightly larger or slightly different in shape.
- >
- > *** IN other accounts I have read, the LAST object was the
- > different one.

COMMENTS: Again, I'm just summarizing James' data -- maybe there is info on this somewhere. I haven't seen it.

- > *** I don't know about pelicans, but ducks trade off leaders as
- > they fly. Every so often, the leader will peel off and attach to
- > one of the ends of the vee formation. Then one of the two ducks
- > next in line backs off, relinquishing the lead to the other.

- > Since the lead position uses up more energy to fly (the other
- > positions have added lift from the wake of the duck in front),
- > they all take turns leading. If pelicans do the same thing, then
- > the position of the dark one is a matter of chance.

COMMENTS: Of course this makes great flight dynamic and aerodynamic sense but we need to find out if pelicans do this. As I say my listing just capsulizes James' data on pelicans.

- > @ (10) INTENSE ARC-LIKE BLINDING BRIGHTNESS. In the opposite
- > @part of the sky from the sun, no grazing-angle reflections of
- > @sunlight.
- >
- > @ (11) HIGH VELOCITY. (Arnold's clocking indicates about 2
- > @deg/s angular velocity which for birds at 1 mile distance is
- > @about 125 mph, much too fast for birds with top speeds of 30
- > @possibly 50 mph.)
- >
- > *** This is assuming that the motions of Arnold's own plane did
- > not affect the timing.

COMMENTS: Right, this goes back to the issue of whether Arnold ORBITED birds so that his airplane created the panoramic sweep of the horizon painting the birds against widely separated landmarks. This would require dismissing Arnold's testimony that he saw the objects initially to his "far left" and that they crossed in front of him on a path nearly at right angles to his, etc. (there are several other observations reported that would also have to be thrown out). But if we accept Arnold's data and measurements we get a peak angular velocity of about 2 deg/s at the perpendicular crossing point to his line of sight.

- > @Correct me if I'm wrong, James, but I see nothing here (below)
- > @in your descriptions of pelican behavior, nor do I recall from
- > @your other postings, ANYTHING about PELICANS moving like (1)
- > @speedboats skipping across water, (2) weaving in and out of
- > @mountain peaks, (3) irregularly flashing intense light when
- > @dipping down and flipping/tipping, (5) very erratic individual
- > @motions, (6) straight line reverse echelon formation, (7)
- > @formation split into two groups of even APPROXIMATELY 4 and 5 in
- > @a single-file line with a gap in between, (8) a total number of
- > @only ABOUT 9, (9) and the second-to-LAST object
- > @darker/different.
- >
- > @Remember, the Arnold sighting is FAMOUS for the "saucers
- > @skipping across water" and you have showed me NOTHING of BIRD
- > @behavior that is like that, nothing from pelicans, ducks, snow
- > @geese, or whatever.
- >
- > @Instead, let's review what you presented below. If you have

- > @further evidence that bears on these specific points then PLEASE
- > @PRESENT IT and PLEASE USE MY NUMBERING (above and below) WITHOUT
- > @SKIPPING ANY. Give us your best shot.

- > @jerked but "ERRATICALLY" and NOT IN UNISON.)
- >
- > *** And if one pelican needs more energy farther back in the
- > line, does he have to wait for the leader to start flapping?

COMMENTS: This is JAMES' data.

- > @ (4) HALF DOZEN SLOW FLAPPINGS OF ALL BIRDS IN UNISON -- THEN
- > @GLIDING -- THEN SLOW FLAPPINGS IN UNISON -- ETC. (Arnold never
- > @reported all 9 objects "flapping" in unison like this. See
- > @Arnold List Nos. 3 and 5, above. He said 2-3 objects
- > @light-flashed/dipped altitude every 2-3 seconds IRREGULARLY, but
- > @NOT the whole chain of 9 objects in UNISON.)
- >
- > *** Do pelicans ALWAYS do this, or is this the USUAL behavior?

COMMENTS: This pattern is all that James presented.

- > @ (5) PRECISELY SPACED LINES OR V- OR L-FORMATIONS. (Arnold
- > @never said the objects were uniformly spaced, in fact mentioned
- > @a gap in the middle, and never reported a V-shape or L-shape
- > @formation.)
- >
- > *** With ducks, I have observed both Vee and straight line
- > (offset to one side) formations. Do pelicans also vary their
- > flight methods?

COMMENTS: Apparently they do (see my No. 10 below).

- > @ (6) SOARING HIGH ON THERMALS. (Arnold reported the objects
- > @more or less maintained the same height except rising gradually
- > @towards the end -- McDonald taking this as 9,000 feet near
- > @Rainier rising to 13,000 feet some 50 miles farther along near
- > @Adams, from his Arnold interviews in Nov 1966 -- which is less
- > @than a 1-degree rise and obviously not the classic birds
- > @ "soaring on a thermal.")
- >
- > Are we talking about straight line soaring, or circular motion to
- > gain much altitude. Both are valid maneuvers (ask any sailplane
- > pilot). Straight line soaring is following the edge of a ridge
- > and gaining lift from the chain of updrafts there.

COMMENTS: Both straight-line and circular soaring are covered in this item and the next (No. 7) below.

- > @ (7) SPIRALLING UP TO SEVERAL THOUSAND FEET. (Arnold obviously
- > @reported no such thing.)
- >
- > *** But do they constantly spiral, or is that just how they get
- > up there in the first place? (And don't forget ridge thermals.)

COMMENTS: Again, this is JAMES' data I'm just the messenger, let him explain it. Or better yet, get some expert ornithologists.

- > @ (8) RETRACED PATHS. (Arnold again obviously reported no such thing.)
- >
- > *** Not necessary with ridge soaring!

COMMENTS: Again, James reported this.

- > @ (9) UNDULATING SHAPES OF THE V- OR L-FORMATIONS: (Arnold's
- > @description of a "Chinese kite tail" motion, however, is of
- > @ "erratic" almost violent motion not the GRACEFUL UNDULATIONS of
- > @a formation of birds.)
- >
- > *** No, but it is a characteristic of striking a series of
- > updrafts interspersed by calm air. They hold sailplane races in
- > the Appalachians, and the same kind of motion is apparent as each
- > plane flies into areas of rise and sink air.

COMMENTS: Maybe, maybe not if it does not create the violently erratic jerking motion Arnold tried to convey in his descriptions. But this item No. 9 recounts James' data which do not describe this, and only describe graceful maneuvers.

- > @ (10) LEADER FLAPPING FIRST FOLLOWED BY THE REST. (This is not
- > @a contradiction to UNISON FORMATION MOTION, No. 1, but an

- > @alternative motion. But not reported by Arnold, though, unlike
- > @No. 1. THIS is a "staccato" motion, one suddenly followed by
- > @others like dominos, which is NOT "erratic.")
- >
- > *** Is this always true?

COMMENTS: Don't know. Only reporting what I read in James' posting.

- > @(11) THREE GROUPS OF ABOUT 30 EACH IN LINES THEN FORMING "V's".
- > @Still not Arnold's 9 in a line with a gap in the middle.
- > @James, you keep saying in other postings that the number of 9
- > @objects is so bird-like. Well lets hear some reports of
- > @SINGLE-LINE FORMATIONS OF ABOUT 9 (or 8, 10, 11, 7, somewhere
- > @around there) PELICANS with a GAP IN THE MIDDLE. Must be
- > @billions of birds on earth surely if this is normal someone
- > @would have seen it, especially given how fanatical birdwatchers
- > @can be.)
- >
- > *** I have seen single lines of 9 ducks, sometimes with gaps.

COMMENTS: See my first remarks (above).

- > @(12) LEAD BIRD DARK -- REMAINDER WHITE. (Arnold said the 2nd-to-LAST object was SLIGHTLY DARKER, and a bit larger, but as a matter of degree. This was NOT the LEAD object.)
- >
- > *** Again, is this always true? If pelicans do anything like
- > ducks do, the lead keeps changing. The exception is a mother
- > leading her young brood (flight school). In that case, the mother
- > always takes the lead.

COMMENTS: See above.

- > @Contrary to your claim of demonstrating that Arnold's objects exhibited "several proven" characteristics of a formation of Pelicans, you've in fact shown only 1 out of 12 pelican flight/formation characteristics that match Arnold's objects. I've further shown 10 additional flight/formation characteristics that Arnold reported for which you have yet to show ANY matches from evidence of pelicans.
- >
- > @Brad
- >
- >
- > @P.S.: As for the Chicago Tribune supposedly being discredited
- > @as misquoting Arnold about "taking out his watch" (so therefore
- > @we're not supposed to believe the Tribune quotes of Arnold on
- > @other points such as objects flying behind Rainier) it was NOT
- > @later "clarified" that he had a "stopwatch" on his instrument
- > @panel as HE DIDN'T. It is indisputable that the KWRC radio

- > @interview quotes Arnold saying "I looked at my watch" so it was
- > @Arnold who misspoke both times, not the Chicago Tribune reporter
- > @who misquoted.
- >
- > *** There may be a difference in regional linguistics here. Where
- > I live, everyone calls the thing on the wall a "clock" and the
- > thing on your wrist a "watch." But I have been places (primarily
- > Spanish neighborhoods) where everyone called both objects a
- > "clock." I think the reason for this is that the Spanish language
- > does not have the same distinction of timepieces. Their first
- > word "reloj" (clock) means either a clock or a watch, but their
- > second word "despertador" (waker) refers to any timepiece that
- > can wake you up). People who use "clock" for both time pieces
- > tend to say "watch" to refer to a stopwatch.
- >
- > I have also been places (primarily seaports and naval bases)
- > where they call both objects a "watch" from naval practice. The
- > Navy seems to rename everything (see my piece on "secure the
- > building" on the English Language section of my website). I have
- > two friends in Virginia who always say "watch. In the Arnold
- > case, somebody may have made an unwarranted assumption due to
- > their different word usages.

COMMENTS: Arnold was not Spanish and was never in the Navy or maritime service. Dialect differences do not explain Arnold claiming he used a "stopwatch." But a sports background does and Arnold played college football.

- > So the whole misunderstanding here may stem from different use of
- > words in different regions. For instance, everyone here says to
- > find a "bucket" for them but where my grandmother lives, everyone
- > wants a "pail" instead. Here, we "plug in" and "turn on"
- > electrical appliances, but just 100 miles to the south, they
- > "plug up" and "put on" everything. But we recently got a little
- > British English in our vocabularies. They just put in a
- > roundabout.

>

>

> SOME OTHER THOUGHTS:

>

- > There are many activities which can cause UFO sightings, but are
- > not thought of when possible causes are considered:

>

- > 1. Unlisted flights:

COMMENTS: Not relevant to the Arnold case. A flight of 9 aircraft would have been found out whether listed or not due to the glare of nationwide publicity.

When a sighting is reported, the first thing

- > somebody does is call the local airport. When they say they had

- > no planes up, the investigators WRONGLY assume that a plane could
- > not have caused the sighting. But there are two reasons why that
- > is not true:
- >
- > A: Military, commercial, and private airports each have
- > information onm primarily the kind of flight that uses that
- > kind of airport. They each know very little about the other
- > two types of planes that happen to in the air.
- >
- > B: Some aircraft (mostly private pilots flying Visual Flight
- > Rules) are not on any list.
- >
- > 2. Illegal activity: Many UFO sightings have been traced to
- > people engaged in illegal activity. Several sightings have been
- > shown to be caused by poachers taking game out of season. One
- > group was using a helicopter. During the years 1974 to 1979, a
- > series of UFO sightings along the US-Mexico border baffled
- > investigators: meteors that always went straight up. They finally
- > caught some criminals using model rockets to smuggle drugs into
- > the US. Of course, we can't forget the "mutes." Members of a
- > satanic cult were jailed in the mid 1980s for killing cattle
- > belonging to farmers and taking animal parts for their rituals.

COMMENTS: I never heard there were any arrests of Satanists accused of cattle mutilations.

I'm still waiting for proof of that ballooning ad in the magazine that sounds like a distorted echo of the Zamora case (unless it's your memory playing tricks).

Have you tried reconstructing what magazines you were reading in the mid-60's then going to a library to browse in the archives?

I know you're just digressing and sidetracking here but it's getting quite far afield from the Arnold case in 1947.

- > They were traced to activities in Iowa, Minnesota, North Dakota,
- > Colorado, Utah, Arizona, New Mexico, Wyoming, and California.

COMMENTS: Oh come on now! There were no arrests of Satanists "traced" to mutilations in 9 states!!!! I was willing to entertain the possibility of some arrests of Satanists linked to a few localized cases but not this!!! You blew your credibility here. Prove it.

- > 3. Unusual objects in or superimposed on the air: Escaped
- > advertizing balloons (we had a life-sized car flying upside down
- > here a few years ago), ultralight aircraft, and kites come to
- > mind. I have an oval kite that rotates on its transverse axis and

- > is made of reflective diffraction grating mylar. It even LOOKS
- > like a "classic" flying saucer shape in flight (I haven't gotten
- > any reports that coincide with when I was flying it yet).

COMMENTS: I doubt that Mylar kites existed in 1947.

- > Also reported in my area: exploding pole transformers, a barium
- > cloud (saw it myself), a building collapsed and tore down power
- > lines, power lines arcing to trees, fireworks (in January?), a
- > helicopter lifting large beams to the roof of a new church, the
- > swinging ball of a large crane (seen at night in a high wind), a
- > power line insulator reflecting a streetlight, headlights
- > reflected from building windows, burning debris from a fire in a
- > trash dump, and (of course) fire balloons launched by students.
- >
- > 4. Police activity: We had a report last week of two lighted
- > objects hovering over a wooded area, coincident with a power
- > failure. Police with helicopters and nightscopes were hunting for
- > a man who had just killed his girlfriend and set fire to both of
- > their houses (it seems the IRS was after him for back taxes, and
- > he went nuts). Power was cut to prevent one of the fires from
- > spreading. In this case, the report was made to police, who

- > gone to a regional UFO group instead of the police, then the
- > trail would have been cold by the time the investigators arrived.
- > Other cases here included police helicopters being used to look
- > for traffic violators, other manhunts, and a police car with its
- > lights flashing up on a hill (the observer couldn't see the hill
- > at night).

COMMENTS: Still farther afield from Arnold 1947.

- > 5. Combined independent effects: I wouldn't have believed this
- > explanation if I hadn't seen it myself. A lady friend reported to
- > me several years ago that she had seen a large white bird-shaped
- > object chasing a car. It was reported to be bigger than the car
- > roaring very loud, and it didn't flap like a bird. I went with
- > her to the scene (a new shopping center), and after a few
- > minutes, observed almost a repeat of the event. The differences
- > were that the roaring started halfway through the sighting, there
- > was no car being chased, and the object landed. It landed on the
- > parking lot, much closer than it at first seemed to be. It was a
- > seagull ... in southern Indiana! The roar turned out to be from a
- > quarry crane hidden behind a nearby hill, which happened to line
- > up with the road. The car and the seagull happened to have lined
- > up perfectly the first time, but only from the viewpoint of the
- > witness. It was the roar that had attracted her attention to the
- > bird, and she assumed it to be larger than a bird because of the

> roar.

COMMENTS: I hope this isn't leading to a new explanation of the Zamora case!

> Another weird case here was a sighting at night of an orange
> glowing object, followed by the appearance of a series of
> concentric rings of dead grass in a yard the next day. Two
> independent pranks by teenagers were responsible. One launched a
> fire balloon. The other played a trick on his girlfriend by
> making a "target for planes" with a stick, string, and
> Spectracide on the lawn of her house. Independent events strike
> again.

COMMENTS: Are you SURE that Arnold didn't merely see 9 FIRE BALLOONS
tied together????? <g>

Seriously, Larry, do you think you could ever post for one month straight on UFO's
without a single mention of fire balloons?

> AND AN INTERESTING FACT:

Subject: Re: Arnold's Objects & Bird MotionsStatus:

Larry,

These are good questions. My listings were an effort to summarize JAMES' pelican data -- NOT mine as I have none except whatever James turned up -- and compare it to Arnold's sighting. Whatever deficiencies there are in the pelican data are just what I read from James' postings (and I have invited James to PLEASE correct, augment, or add to this database).

My point was not to say that in all instances of flight behavior listed that pelicans were an impossibility only that I was trying to ascertain what is the natural habit of the birds -- what has been observed. I raised this point in this manner because James kept insisting that Arnold's sighting details fit so many facets of well-known pelican behavior. So when I actually tabulated the Pelican Flight Behavior AS PRESENTED BY JAMES HIMSELF I was quite surprised to find how little correlation there was with the Flight Behavior in Arnold's case.

Very few of these points are dispositive or conclusive. Obviously it is possible for pelicans to have formations of exactly 9 birds but how COMMON is it? Is it something that is exceedingly rare? I don't know. I'm just presenting JAMES' OWN EVIDENCE and he happened to have nothing from ornithologists on formations of 9 pelicans only an account of about 90 pelicans organized in groups of about 30. This isn't very close to 9. James otherwise can only point to the unconfirmed newspaper clip about the Northwest pilots who allegedly saw 9 "round disks" which were supposedly actually pelicans -- which is suspicious for being a deliberate copycat case designed to discredit Arnold, it was not investigated by anyone and was unconfirmed by other observers or by any movie camera footage though the pilots were on a "saucer hunt" equipped with the camera.

The numbers of birds in a formation is not entirely arbitrary since as I understand it there are aerodynamic considerations in formation flying which may prefer larger numbers of birds taking advantage of the easier slipstream created by the formation. This is something ornithologists would know presumably. (I posted this point subsequent to the posting you responded to here.)

Some more COMMENTS below.

Brad

In a message dated Mon, 10 Apr 2000 1:23:59 PM Eastern Daylight Time, Larry Robinson S/AP/EIS Kinesiology <lrobins@indiana.edu> writes:

COMMENTS: Possibly. There are a whole host of physical wave phenomena that could cause this and Arnold seized on imagery of water waves to describe it.

> @(2) WEAVING THE MOUNTAINTOPS: "Weaving in and out right above
 > @the mountaintops."
 >
 > *** This is based on the assumption that the objects were
 > actually at the distance of the mountaintops. Did Arnold ever say
 > they went behind anything other than Little Tahoma?

COMMENTS: Read what Arnold said very carefully (it's from his KWRC radio interview, June 26, 1947), he says "ABOVE the mountaintops," so there is actually no occultation to establish a distance (later in the interview he suggests they dipped down by 100 feet but that is too small even to be seen). But even if Arnold mistakenly

THOUGHT these mountaintops were Goat Ridge's peaks roughly 28 miles away it DOES NOT MATTER because if they were birds within a few miles of Arnold that STILL PUTS THEM OVER MOUNTAINS. And James has claimed pelican behavior is a close match -- so do pelicans fly this way over mountainous regions? Yes to your question, he suggested on occasion the objects dipped down very slightly in behind peaks of Goat Ridge but in other accounts this is so slight as to be questionable, or in the case of his drawing he has the objects high above Goat Ridge (which is at about 5,000-7,000 ft) on a line he has labeled as "10,000 ft." He told McDonald in Nov 1966 the o!

!

bjects increased in altitude from about 9,000 feet near Rainier to 13,000 feet passing Mt Adams, which by interpolation indicates an altitude around 11,000 feet over Goat Ridge. In general Arnold suggested an error margin of about +/- 1,000 feet for the altitude of the objects not just over Goat Ridge (unless he meant an actual physical undulation of that magnitude, but in the KWRC interview he gave the altitude drop as only 100 feet).

- > @ (3) IRREGULAR LIGHT FLASHES AT SAME TIME: Dipping down motion
- > @seemingly tipping or flipping wings, and simultaneously flashing
- > @intense blue-white light, "not in a regular rhythm" among the 9
- > @objects, but averaging 2-3 objects flashing every few seconds
- > @ (=1 flash/sec from the 9 or 1 flash every 9 seconds for any one
- > @object).
- >
- > *** This is the fact that confuses me most:
- >
- > 1. It is very hard for me to imagine pelicans giving off

- > in the observed direction while maintaining flight in the
- > observed direction is a flat-paned canopy of the type made
- > before and during World War II. But if the reflections were
- > observed during the entire observation, then that doesn't
- > make any sense.

COMMENTS: Bruce Maccabee did calculations on this List for curved mirror-like reflectors which could illuminate wider areas without having to precisely angle a flat mirror reflector in exactly the right direction. It still results in brilliant or blinding intensity.

- > @ (4) UNISON FORMATION MOTION: Formation generally moves in
- > @unison as if connected.
- >
- > @ (5) VERY ERRATIC INDIVIDUAL MOTIONS: But individual objects
- > @move "very erratically," "fluttering and jerking very rapidly."
- >
- > *** Sounds like birds to me.

COMMENTS: The VERY RAPID "fluttering" might be hummingbirds <g> but hardly large sailing birds such as pelicans, and it hardly fits ERRATIC JERKING motions.

- > @ (6) STRAIGHT LINE REVERSE ECHELON FORMATION: Flying in
- > @ "definite direction," a "straight line" in reverse echelon with
- > @the first object highest and the last lowest.
- >
- > *** Is this ever used by the military?

COMMENTS: I thought Joel Carpenter found something to this effect but I'm not sure it actually matched.

- > @ (7) FORMATION IN TWO GROUPS OF 4 AND 5 IN A SINGLE-FILE LINE:
- > @Formation split with a gap between the first 4 and last 5.
- >
- > *** Why doesn't this match pelicans? In flights of ducks I have
- > seen, sometimes a single duck will drop back, and a gap will
- > remain until the rear grouping can catch up with the front again.

COMMENTS: Maybe it does match pelicans. But James didn't present any evidence and I'm just summarizing what he presented. See my comments at the beginning.

- > @ (8) FORMATION OF 9.
- >
- > *** Why doesn't this match pelicans? Do they wait until they have
- > enough reservations for a convoy?

COMMENTS: Again, maybe it does match pelicans. But James didn't present any evidence and I'm just summarizing his material. See my comments at the beginning.

- > @ (9) SECOND TO LAST DARKER/DIFFERENT: Second to last object
- > @darker, slightly larger or slightly different in shape.
- >
- > *** IN other accounts I have read, the LAST object was the
- > different one.

COMMENTS: Again, I'm just summarizing James' data -- maybe there is info on this somewhere. I haven't seen it.

- > *** I don't know about pelicans, but ducks trade off leaders as
- > they fly. Every so often, the leader will peel off and attach to
- > one of the ends of the vee formation. Then one of the two ducks
- > next in line backs off, relinquishing the lead to the other.
- > Since the lead position uses up more energy to fly (the other
- > positions have added lift from the wake of the duck in front),
- > they all take turns leading. If pelicans do the same thing, then
- > the position of the dark one is a matter of chance.

COMMENTS: Of course this makes great flight dynamic and aerodynamic sense but we need to find out if pelicans do this. As I say my listing just capsulizes James' data on pelicans.

- > @(10) INTENSE ARC-LIKE BLINDING BRIGHTNESS. In the opposite
- > @part of the sky from the sun, no grazing-angle reflections of
- > @sunlight.
- >
- > @(11) HIGH VELOCITY. (Arnold's clocking indicates about 2

- > @about 125 mph, much too fast for birds with top speeds of 30
- > @possibly 50 mph.)
- >
- > *** This is assuming that the motions of Arnold's own plane did
- > not affect the timing.

COMMENTS: Right, this goes back to the issue of whether Arnold ORBITED birds so that his airplane created the panoramic sweep of the horizon painting the birds against widely separated landmarks. This would require dismissing Arnold's testimony that he saw the objects initially to his "far left" and that they crossed in front of him on a path nearly at right angles to his, etc. (there are several other observations reported that would also have to be thrown out). But if we accept Arnold's data and measurements we get a peak angular velocity of about 2 deg/s at the perpendicular crossing point to his line of sight.

- > @Correct me if I'm wrong, James, but I see nothing here (below)
- > @in your descriptions of pelican behavior, nor do I recall from

> the US. Of course, we can't forget the "mutes." Members of a
> satanic cult were jailed in the mid 1980s for killing cattle
> belonging to farmers and taking animal parts for their rituals.

COMMENTS: I never heard there were any arrests of Satanists accused of cattle mutilations.

I'm still waiting for proof of that ballooning ad in the magazine that sounds like a distorted echo of the Zamora case (unless it's your memory playing tricks).

Have you tried reconstructing what magazines you were reading in the mid-60's then going to a library to browse in the archives?

I know you're just digressing and sidetracking here but it's getting quite far afield from the Arnold case in 1947.

> They were traced to activities in Iowa, Minnesota, North Dakota,
> Colorado, Utah, Arizona, New Mexico, Wyoming, and California.

COMMENTS: Oh come on now! There were no arrests of Satanists "traced" to mutilations in 9 states!!!! I was willing to entertain the possibility of some arrests of

Satanists linked to a few localized cases but not this!!! You blew your credibility here. Prove it.

- > 3. Unusual objects in or superimposed on the air: Escaped
- > advertizing balloons (we had a life-sized car flying upside down
- > here a few years ago), ultralight aircraft, and kites come to
- > mind. I have an oval kite that rotates on its transverse axis and
- > is made of reflective diffraction grating mylar. It even LOOKS
- > like a "classic" flying saucer shape in flight (I haven't gotten
- > any reports that coincide with when I was flying it yet).

COMMENTS: I doubt that Mylar kites existed in 1947.

- > Also reported in my area: exploding pole transformers, a barium
- > cloud (saw it myself), a building collapsed and tore down power
- > lines, power lines arcing to trees, fireworks (in January?), a
- > helicopter lifting large beams to the roof of a new church, the
- > swinging ball of a large crane (seen at night in a high wind), a
- > power line insulator reflecting a streetlight, headlights
- > reflected from building windows, burning debris from a fire in a
- > trash dump, and (of course) fire balloons launched by students.
- >

- > failure. Police with helicopters and nightscopes were hunting for
- > a man who had just killed his girlfriend and set fire to both of
- > their houses (it seems the IRS was after him for back taxes, and
- > he went nuts). Power was cut to prevent one of the fires from
- > spreading. In this case, the report was made to police, who
- > immediately identified their helicopters. But if the report had
- > gone to a regional UFO group instead of the police, then the
- > trail would have been cold by the time the investigators arrived.
- > Other cases here included police helicopters being used to look
- > for traffic violators, other manhunts, and a police car with its
- > lights flashing up on a hill (the observer couldn't see the hill
- > at night).

COMMENTS: Still farther afield from Arnold 1947.

- > 5. Combined independent effects: I wouldn't have believed this
- > explanation if I hadn't seen it myself. A lady friend reported to
- > me several years ago that she had seen a large white bird-shaped
- > object chasing a car. It was reported to be bigger than the car
- > roaring very loud, and it didn't flap like a bird. I went with
- > her to the scene (a new shopping center), and after a few
- > minutes, observed almost a repeat of the event. The differences

> were that the roaring started halfway through the sighting, there
 > was no car being chased, and the object landed. It landed on the
 > parking lot, much closer than it at first seemed to be. It was a
 > seagull ... in southern Indiana! The roar turned out to be from a
 > quarry crane hidden behind a nearby hill, which happened to line
 > up with the road. The car and the seagull happened to have lined
 > up perfectly the first time, but only from the viewpoint of the
 > witness. It was the roar that had attracted her attention to the
 > bird, and she assumed it to be larger than ia bird because of the
 > roar.

COMMENTS: I hope this isn't leading to a new explanation of the Zamora case!

> Another weird case here was a sighting at night of an orange
 > glowing object, followed by the appearance of a series of
 > concentric rings of dead grass in a yard the next day. Two
 > independent pranks by teenagers were responsible. One launched a
 > fire balloon. The other played a trick on his girlfriend by
 > making a "target for planes" with a stick, string, and
 > Spectracide on the lawn of her house. Independent events strike
 > again.

COMMENTS: Are you SURE that Arnold didn't merely see 9 FIRE BALLOONS
 tied together????? <g>

Seriously, Larry, do you think you could ever post for one month straight on UFO's
 without a single mention of fire balloons?

> AND AN INTERESTING FACT:

JAMES RESPONDED:

>It's all so subjective. Not only was Arnold's observation brief,
>he was in the meantime rolling his window down, turning his
>airplane around, trying to measure the comparative size of a
>distant DC-4... and then immeasurably compounded by the fact we
>primarily have to rely on Arnold's story subsequent to the
>'flying saucer' hysterics he initiated.

If its all "so subjective" why bother to discuss this case at all?
Could be mirage, snow, clouds, meteors, birds, motes in the eye,
reflections off windows, drops of water on windows,
all of which have been proposed by sober, considerate citizens
of the world.

On the other hand, in terms of detecting flashes every several seconds
or whatever, the observation was not "brief" (Arnold himself pointed out
that one can see a lot in a couple of minutes). You seem to imply
he couldn't chew gum and tie his shoes at the same time.

Vis: he was turning his airplane, rolliwing down his
window, trying to measure the angular size of a comparable
distant aircraft... etc.

Well, guess what, he didn't try to do all these things at the same time.

And as for the "hysterics" that followed, of course, the question becomes
how much "feedback" there was that could have modified his
report. But it certainly seemed that Arnold felt it his duty to provide
the

best report he could to the Air Force, hysteria notwithstanding.
Remember, at that time one of the suggested explanations was
Soviet aircraft and you can bet that thought led a number of
patriotic individuals to report sightings, including Arnold.
Under these conditions the objective would be to provide the
most accrate report possible to aid in determining the nature
of the objects and, if possible , their Soviet origin,.

BIG SNIP

BRAD WROTE

>>(10) INTENSE ARC-LIKE BLINDING BRIGHTNESS. In the opposite
>>part of the sky from the sun, no grazing-angle reflections of
>>sunlight.

JAMES RESPONDED:

>How do _you_ explain this in relation to, hypothetically, nine
>spaceships from another planet/dimension?

>Isn't that - as applies to all other demands for non-terrestrial
>'evidence' - somewhat out of context?

>Even though it's extremely difficult to locate any comparative
>_documented_ sightings - and almost impossible from pilots who
>observed a high altitude formation of AWP's in perfect visibility
>- we can perhaps note a previously mentioned comment published by
>G. Alexander Virden:

>"The sun burns the whites of their perfectly rigid backs upon the
>negative of my mind, blinding my eye to all else".

>Sounds like a 'blinding' reference to me and this wasn't of AWP's
i>n 'perfect' conditions, as a pilot might experience.

Sounds more like a poetic reference than a semi-quantitative
report. He talks about "perfectly rigid backs." HAHAHAHA
perfectly rigid? Do they never move their wings?

Anyway, you don't seem to get it. If there is a choice between
ET spacecraft and Pelicans you chose pelicans even if there
are valid arguments against the pelican explanation
(DRAW A MAP and FLASH). Not exactly "any explanation
is better than none...." but close!

The fact is, ET spacecraft is the last SUGGESTION after
all other explanations have been rejected. You claim tha the
Pelican BRIef cannot be rejected and therefore they MUST HAVE
BEEN PELICANS.

AND yet the DRAW A MAP and FLASH objections are like
water on a pelican's back (water rolling off) as far as you are
concerned...

don't even address them quantitatively. Be more like an
ostrich and stick your head in the sand.... maybe DRAW A
MAP and FLASH will go away.

Well, not so quickly will we embrace the Pelican Brief....
those of us who have put it to the critical test

DRAW A MAP know that Arnold would have had to be temporarily bereft of his senses to have gotten it ALL WRONG with respect to the apparent flight path and flight time of the objects. OF course, HALLUCINATION and MENTAL PROBLEMS are the ultimate resort of the skeptic who can't accept the obvious and therefore blames the witness (ultimately you can't trust witnesses unless their sightings are explainable).

To address another part of James' comment:

>How do _you_ explain this in relation to, hypothetically, nine
>spaceships from another planet/dimension?

UFOS/Spaceships/etc. can do ANYTHING... because we don't know what they are, how they exist, what they can do, etc. We wouldn't expect them to violate the laws of physics as we now know them BUT (a) we don't know everything and (b) a non-violation might APPEAR as a violation to us because we don't understand completely what we do know!

Anyway, the bottom line is, there is nothing written in the Star Trek Handbook that says a "spaceship" can't have a shiny flat surface or can't send off brief intense pulses of light or whatever.

So, there is no point in arguing about what a spaceship can or cannot do.

The argument is about what the CANDIDATE EXPLANATORY PHENOMENON (in this case, pelicans) can do.

Brad wrote:

>>(11) HIGH VELOCITY. (Arnold's clocking indicates about 2
>>deg/sec angular velocity which for birds at 1 mile distance is
>>about 125 mph, much too fast for birds with top speeds of 30
>>possibly 50 mph.).

>Perhaps re Arnold's 'clocking' et al, it's now evidently
judicious to take a step back, or several, and conversely ask,
>_with over 50 years hindsight_, what factual evidence exists that
these nine unidentified airborne objects were realistically
>extremely thin and historically unique vessels on an undulating
>flight, weaving through the Cascade's peaks.>

Irrelevant. We have Arnold's report,. You are trying to force a square peg (sighting) into a round hole (pelicans)

I claim, and so do, that your square peg will never make it.

>I mean... think about it.. the only evidence for conceivably
>NINE, wafer-thin, ET spaceships now requires you to move the
>mountain to even sustain a case.

No need to move a mountain to DRAW A MAP or

FLASH.

>And you're questioning the comprehensive, infinitely more likely
>FACTS I've established?

We don't question your Pelican Brief Facts. We do question
your "mapping " of those facts onto the Arnold sighting.

>I assuredly have no problem - as will ensue - highlighting the
>facts to any objective scientific scrutiny.

<

Neither do I. LET THE SCRUTINY BEGIN!

(if it hasn't already begun!

(To 99.9999999999% of the world this is a tempest in a teapot
anyway!)

@Subject: Re: Arnold's Objects & Bird Motions

@
@Larry,

(SNIP)

@COMMENTS: Arnold was not Spanish and was never in the Navy or
@maritime service. Dialect differences do not explain Arnold
@claiming he used a "stopwatch." But a sports background does
@and Arnold played college football.

I was thinking of the REPORTER misunderstanding Arnold because of
a possible difference in usage. Those variations were examples,
there are other regional variations on the usage of those two
words. For instance, in Norfolk Virginia, not only the people IN
the Navy but also the general population tends to use naval
usage, just because there are so many people living there who are
in the Navy.

I was in a department store there a few years ago, and there was
a sign on a water fountain that said "SECURED." Only someone who
lived there or knew the naval term would know that it means that
it was turned off because it didn't work.

@> So the whole misunderstanding here may stem from different use of
@> words in different regions. For instance, everyone here says to
@> find a "bucket" for them but where my grandmother lives, everyone
@> wants a "pail" instead. Here, we "plug in" and "turn on"
@> electrical appliances, but just 100 miles to the south, they
@> "plug up" and "put on" everything. But we recently got a little
@> British English in our vocabularies. They just put in a
@> roundabout.
@>

Note: I did not intend this part to refer to just the Arnold case:

@> SOME OTHER THOUGHTS:

@> There are many activities which can cause UFO sightings, but are
@> not thought of when possible causes are considered:

@> 1. Unlisted flights:

@COMMENTS: Not relevant to the Arnold case. A flight of 9
@aircraft would have been found out whether listed or not due to
@the glare of nationwide publicity.

Really? By the time they heard about it, they might not have connected it to their own activities, especially if their work was routine. According to Jenny Randles' book "UFOs, Danger in the Air," the crews of the Venoms in the Lakenheath/Bentwaters case were unaware that their activity that night was reported as a UFO until recently. They said they were routinely scrambled to investigate strange RADAR echoes, because they were still learning about RADAR.

@> When a sighting is reported, the first thing
@> somebody does is call the local airport. When they say they had
@> no planes up, the investigators WRONGLY assume that a plane could
@> not have caused the sighting. But there are two reasons why that
@> is not true:

@> A: Military, commercial, and private airports each have
@> information onm primarily the kind of flight that uses that
@> kind of airport. They each know very little about the other
@> two types of planes that happen to in the air.

@> B: Some aircraft (mostly private pilots flying Visual Flight
@> Rules) are not on any list.

@> 2. Illegal activity: Many UFO sightings have been traced to
@> people engaged in illegal activity. Several sightings have been
@> shown to be caused by poachers taking game out of season. One
@> group was using a helicopter. During the years 1974 to 1979, a
@> series of UFO sightings along the US-Mexico border baffled
@> investigators: meteors that always went straight up. They finally
@> caught some criminals using model rockets to smuggle drugs into
@> the US. Of course, we can't forget the "mutes." Members of a
@> satanic cult were jailed in the mid 1980s for killing cattle
@> belonging to farmers and taking animal parts for their rituals.

@COMMENTS: I never heard there were any arrests of Satanists
@accused of cattle mutilations.

I DO have that handy. I will find it and post it later this week.

@I'm still waiting for proof of that ballooning ad in the
@magazine that sounds like a distorted echo of the Zamora case
@(unless it's your memory playing tricks).

@Have you tried reconstructing what magazines you were reading in
@the mid-60's then going to a library to browse in the archives?

@I know you're just digressing and sidetracking here but it's
@getting quite far afield from the Arnold case in 1947.

@> They were traced to activities in Iowa, Minnesota, North Dakota,
@> Colorado, Utah, Arizona, New Mexico, Wyoming, and California.

@COMMENTS: Oh come on now! There were no arrests of Satanists
@"traced" to mutilations in 9 states!!!! I was willing to
@entertain the possibility of some arrests of Satanists linked to
@a few localized cases but not this!!! You blew your credibility
@here. Prove it.

I will post the reference. I have to leave this location to get
it.

@> 3. Unusual objects in or superimposed on the air: Escaped
@> advertizing balloons (we had a life-sized car flying upside down
@> here a few years ago), ultralight aircraft, and kites come to
@> mind. I have an oval kite that rotates on its transverse axis and
@> is made of reflective diffraction grating mylar. It even LOOKS
@> like a "classic" flying saucer shape in flight (I haven't gotten
@> any reports that coincide with when I was flying it yet).

@COMMENTS: I doubt that Mylar kites existed in 1947.

I didn't intend it to refer to Arnold, but to spark some thoughts
about alternatives in the Arnold case.

@> Also reported in my area: exploding pole transformers, a barium
@> cloud (saw it myself), a building collapsed and tore down power
@> lines, power lines arcing to trees, fireworks (in January?), a
@> helicopter lifting large beams to the roof of a new church, the
@> swinging ball of a large crane (seen at night in a high wind), a
@> power line insulator reflecting a streetlight, headlights
@> reflected from building windows, burning debris from a fire in a
@> trash dump, and (of course) fire balloons launched by students.

@> 4. Police activity: We had a report last week of two lighted
@> objects hovering over a wooded area, coincident with a power
@> failure. Police with helicopters and nightscopes were hunting for

@> a man who had just killed his girlfriend and set fire to both of
@> their houses (it seems the IRS was after him for back taxes, and
@> he went nuts). Power was cut to prevent one of the fires from
@> spreading. In this case, the report was made to police, who
@> immediately identified their helicopters. But if the report had
@> gone to a regional UFO group instead of the police, then the
@> trail would have been cold by the time the investigators arrived.
@> Other cases here included police helicopters being used to look
@> for traffic violators, other manhunts, and a police car with its
@> lights flashing up on a hill (the observer couldn't see the hill
@> at night).

@COMMENTS: Still farther afield from Arnold 1947.

No, but start thinking about other stuff that might have been
going on in 1947. Brainstorm!

@> 5. Combined independent effects: I wouldn't have believed this
@> explanation if I hadn't seen it myself. A lady friend reported to
@> me several years ago that she had seen a large white bird-shaped
@> object chasing a car. It was reported to be bigger than the car
@> roaring very loud, and it didn't flap like a bird. I went with
@> her to the scene (a new shopping center), and after a few
@> minutes, observed almost a repeat of the event. The differences
@> were that the roaring started halfway through the sighting, there
@> was no car being chased, and the object landed. It landed on the
@> parking lot, much closer than it at first seemed to be. It was a
@> seagull ... in southern Indiana! The roar turned out to be from a
@> quarry crane hidden behind a nearby hill, which happened to line
@> up with the road. The car and the seagull happened to have lined
@> up perfectly the first time, but only from the viewpoint of the
@> witness. It was the roar that had attracted her attention to the
@> bird, and she assumed it to be larger than a bird because of the
@> roar.

@COMMENTS: I hope this isn't leading to a new explanation of the
@Zamora case!

Nope! Just the Bloomington Big Bird.

@> Another weird case here was a sighting at night of an orange
@> glowing object, followed by the appearance of a series of
@> concentric rings of dead grass in a yard the next day. Two
@> independent pranks by teenagers were responsible. One launched a
@> fire balloon. The other played a trick on his girlfriend by
@> making a "target for planes" with a stick, string, and
@> Spectracide on the lawn of her house. Independent events strike
@> again.

@COMMENTS: Are you SURE that Arnold didn't merely see 9 FIRE

@BALLOONS tied together????? <g>

Yes. They dont reflect that brightly, and they don't fly at high speeds relative to the wind.

@Seriously, Larry, do you think you could ever post for one month @straight on UFO's without a single mention of fire balloons?

Only if no cases arise that could be explained by fire balloons.

@> AND AN INTERESTING FACT:

@> I found out recently that most Air Traffic Control systems in the
@> US and Canada no longer have primary reflected RADAR capability.
@> Most of them use transponders exclusively now. The RADAR sends
@> out a much lower power coded request, and the aircraft
@> transponder transmits the appropriate response back to the RADAR
@> set. That means that these systems can't detect a UFO unless it
@> has a transponder. It also means that planes with special
@> equipment could falsify their position. Second-trip responses
@> also behave strangely, because the transponder response received
@> is for the wrong request each time, giving a strange
@> identification and altitude reading.

I need to locate a copy of Morris K. Jessup's "The Case for UFOs" (Citadel 1955). Somebody can lend it to me? I will cover all expenses.

I am specifically interested in reading how Mr. Jessup presented the famous teleportation of an Spanish soldier between Philippines and Mexico in the XVI century, so I just need those pages.

Thanks in advance for your help.

Our email system here is going through some transformations. Service has been spotty, but I hope to have some REAL capabilities once the change is made (like real attachment functions).

Now on to the mutilations I mentioned earlier.

I found 3 of the books (and part of a 4th) containing information on the arrest of satanic cult leaders responsible for mutilations in many states:

Ronald Story's "The Encyclopedia of UFOs" p22 contains the following information:

The "unnatural" mutilations occurred in the following states: Minnesota, Wisconsin, Kansas, Nebraska, Iowa, South Dakota, Colorado, Texas, Arizona, and California in 1974 and 1975.

Investigators closed in on and arrested leaders of a satanic cult.

Peter Brookesmith's "UFOs: The Complete Sightings" says the wave occurred in 1975-1976, but cases continued into the 1990s.

In 1981, tissue samples were taken to a lab in Briggsdale CO. The lab was broken into and the tissues were stolen.

A wave occurred in Alabama in 1992.

Brookesmith also mentions in the case of Snippy the Horse (Alamosa CO, 9/8/67) that there were 8 other similar mutilations in the following weeks, plus some in Pennsylvania that year.

Peter Brookesmith's "UFOs: The Government Files" says a wave occurred in New Mexico and Arkansas in 1978-1979.

I have a file of notes from various sources (including TV shows) on the

subject. Unfortunately, until I proposed the Socorro solution, I didn't realize how important the references to the data were, since it was originally intended only for my own use. I wrote down the facts, but not where they came from. I was more interested in saving file space at the time.

The file contains these additional items:

- The list of states I gave last week.
- The satanic cult had a helicopter with a chase-light unit on it. It was connected to lights on a large hoop attached around the helicopter. This was used to make the appearance of lights whirling around the edge of a large disk.
- When they were discovered in the act, they turned on the chase lights while they were taking off. This misled authorities to look for a UFO instead of a cult.
- The cult moved to another state whenever the law started to get too close.
- As soon as members got out of jail, they moved to another state and started their rituals again, using "stolen" animals (but minus the helicopter).
- There are suspicions that some of them were in Puerto Rico, Mexico, and Honduras in the middle 1990s. They were suspected by one expert in the chupacabras cases.

Satanic cults? Perhaps it was pelicans? I suspect there are a number of stealth-like abilities possessed by brown pelicans. Especially at night.

Subject: Re: Email and MutesStatus:

Larry,

I do hope your E-mail system improves.

None of your references substantiates your original assertion that there had been arrests of Satanic cult members responsible for mutilations in 11 states.

The Ron Story reference mentions mutilations occurring in 10 states but does not document that Satanic cultists had been arrested for causing the mutilations in those 10 states. There's a big difference there and I hope you can see that.

Brad

Many thanks to everybody for your help (Kathleen Andersen got a copy to xerox me).

As a retribution, I will offer some explanations. I began searching the question of teleportations after my good Argentinian friend, Alejandro Agostinelli definitely uncover that the famous Vidal teleportation was a film publicity hoax. We decided to prepare an article about it for The Anomalist, so I decided to tackle with other teleportations.

We located references to several cases in Argentina and Brazil (Creighton in FSR -unfortunately I have been still unable to obtain a copy-) and afterwards I discovered that a similar "flap" of teleportation allegedly from Spain to Chile were circulated in 1979, here in Spain. In a recent book just published here in Spain, such "travels" are considered "urban legends".

None of the cases we located have been substantiated, but we are open to hearing of additional cases.

Centering in the Spanish "Aparecido" in the XVI century (1593), according to an article written by Mr.X (his legal name) in FORTEAN TIMES 52: 55-59, Morris K. Jessup was the one who first recounted the story relating it with UFOs. He gave as his sources:

Luis González Obregon, "Las calles de Mexico"
Antonio de Morga, "Sucesos de las Islas Filipinas"

and referred vaguely to "the records of the chroniclers of the Order of San Augustin and the Order of Santo Domingo".

Mr. X tried to verify this, and that he what he discovered:

Obregón cited as his source Antonio de Morga, but Antonio de Morga did not mention anything about the teleportation.

But, Mr. X added: "Both Gonzalez Obregon and Father Gaspar de San Agustín -whose Conquista de las Islas Filipinas published in 1698 is quoted by Obregon - say the mysterious soldier appeared in Mexico City on the same day that the Governor died, October 25th, 1593".

Mr. X located some instances of foreknowledge of the Governor's death in other book written in 1640, but no reference to the Aparecido. The only other reference is in a book written in 1906.

In the end, Mr. X concluded that there are not known contemporary chronicles

about the "Aparecido" and that probably it was just a "ghost story" added by Father Gaspar de Agustin, more than a century after the alleged event.

I hope this helps,
Luis R. González Manso

Very soon, I hope to be able to actually look at your old posts without having to enter the editor to see the ends of the paragraphs. However, there is one drawback: All of the old Email I save will lose its date information. The date of the message will become today's date (the date of the transfer). Since this message is still on the old system, it will be affected too.

> I hope you can see that.

> Brad

I realize that all too well. I gave you what I had handy. I think the documentation of the arrests is on a video, but I don't know which one. It might even be on a video about cults (not UFOs). I have over 240 hours of documentaries about UFOs on video tape. Finding it is going to be a major chore. My media system is busy doing something else right now, so it might be several months before I could get to that. Then, at an average of 6 hours a week, it will take an average of half a year just to find it. Is this important enough to pursue?

The curse of too much data! I am glad that I kept the files on paper, or I wouldn't have even that. My ex took the computer stuff in the divorce several years ago. (Horrors! Another thought just struck! She may have ended up with the video tape with the data, if it was intermixed with movies on the same cassette. Most of my UFO stuff was on separate dedicated tapes, but if movies and UFO programs were timer-recorded on the

same day, then they ended up on the same tape.)

It DOES mention that they caught the leaders (look farther down the page), but gives no date.

But you are mistaken in your assumption. They were convicted only in the one state where they were caught:

- They were caught in the act of the crime they were convicted for.
- The apprehension happened sometime in the '80s. The statute of limitations had already run out for the big wave in 1974-1975.
- There wasn't enough evidence to extradict and convict them in the other states.
- There wasn't much of a charge to convict them on, so they were out after a short sentence.
- I think the list of states I quoted earlier came from testimony of a cult member who was given immunity.

Larry,

Try hand-dating the first message of each date if your system will at least keep them in the same chronological order.

I think you're missing the point. UFOlogists have never heard of any such alleged comprehensive explanation of mutes in 11 states caused by a Satanic group with actual arrests and confessions. Why don't you check with researchers involved in mutes?

Subject: Re: STS-75 "UFO Videos" Status: O

Subject: Does ANYBODY Believe UFOMAG's STS-75 "Smoking Gun"?

I'm considering writing a long debunking of the UFO magazine (www.ufomag.co.uk) video on a "Smoking Gun" UFO scenes from STS-75, revealed in Nevada and on their home page a few months ago.

But I asked myself, why bother? Nobody but a handful of eager-believers seems to have fallen for it.

Has anybody seen ANY "real ufologist" (aside from "Filer's Files") endorse these claims, thus making a detailed refutation necessary?

Please pass around and re-post this genuine request.

Jim,

The 'Secret NASA Transmissions' video is now being marketed by 'UFO Magazine' (see their web site) in conjunction with a forthcoming conference. I'm sure the assembled mass would by any definition strictly qualify as 'eager believers'.

The conference content perhaps confirms why 'ufology' is open to comments that it has become something of a 'freak show' circus.

Larry Warren tells of underground alien bases at RAF Bentwaters and Woodbridge... Robert and Ryan Wood endorse the MJ-12 documents and this diabolical cover up we all endure... alien abductions... aliens mutilating cattle... it's pretty much the standard fare nowadays and recently available in staggering quantities at Laughlin.

Has 'ufology' ever been more scientifically reviled and irrelevant?

I'm seriously surprised not to see Laughlin stars Reed and Raith [aliens made us poor - send money] are guest speakers at the UK conference, although they may well be.

That's not to disparage every speaker at any 'abductology' conference and there may be exceptions, although seemingly a rare breed and scarcer each season.

I would personally doubt it's worthwhile dedicating considerable time to the footage issue. As we know, people will believe in what they want to be true and especially when there are elements of a religious conviction. The UK news media will generally feature any ridiculous 'NASA cover-up' claims, etc. on a 'breakfast TV show' and if I recall, that's already happened in this case.

It's somewhat analogous to the promoters inviting Larry Warren. Most 'real ufologists', especially in the UK, now have a good understanding of the 'Rendlesham Forest' evidence and how it was recognised from earliest investigations that Warren's claims were an ever increasing fantasy. That fact was even explained in 'Skycrash', Jenny Randle's inaugural book about the case, published long before Warren came to prominence as a 'witness'. Yet, it makes no more difference than would your proposed 'debunking' paper. All that matters is what sells tickets to the tent, side-shows and merchandise.

Ray Santilli must wonder what the hell he did to be so shunned by some within 'ufology' and especially UFO Magazine!

James.

***** LIST ONLY *****

Brad [and others],

I'm close to finalising a reply to all the points recently raised and will respond shortly.

Amongst other things, I wanted to first of all take some related enquiries back to those who have years of relevant experience - ornithologists in the Pacific North-west.

I've also been trying to clarify some separate issues and it all takes time.

By default, the most likely explanations for Arnold's reported sighting was of aircraft. If they were truly so fast as he believed, then they were, as he surmised, possibly 'top secret'.

Although this is an area of research which has been looked at by myself and many others and it seemed all evidence ruled out 'flying wings' - whether 'Northrop' or captured German 'Horten' designs, there's no question that Arnold's later sketch closely resembles the Horten designs, particularly the Horten 'Ho IX', also known as the 'Go 229'. For examples, see the following:

<http://web.ukonline.co.uk/voyager/arnold/ho95.jpg>
<http://web.ukonline.co.uk/voyager/arnold/ho229.jpg>

I can't recall mentioning the following claims previously and they must be considered 'unreliable', even if the intention is sincere:

"I was not there in person, one of the men I have worked with a while back was. He was stationed at Edwards AFB and also at White Sands. They were performing radar testing on some of the German captured aircraft about the right time. There were several vehicles, one was of the Horten IX/GO 229 type. They spent a couple of months doing the tests and the aircraft were flown to another base for some other testing he did not know about. He just performed the radar signature and heat signature testing. All of which is still classified. He stated there were several unusual aircraft there, and very little detail was offered to the radar tracking and testing crew. Some of the aircraft caused serious problems with their equipment. Where they were

transferred to is unknown. He was only involved with a couple. But there were several teams doing the tests at the time. I did some extensive reading up on the Horten IX/GO and was surprised it was so much like the Arnold drawing. I would suspect his speed estimates were not correct during his sighting...".

Presumably any such testing would be over the Edwards/White Sands area and far distant from Arnold's sighting.

However, is there any known evidence that testing of captured Horten aircraft might conceivably have occurred at Edwards/White Sands or anywhere in the US?

Alternatively, is it long accepted/proven this was unlikely/impossible?

Can anyone please identify the exact aircraft shown in the following photograph? :

<http://web.ukonline.co.uk/voyager/arnold/unknown.jpg>

No UFO sightings, but Area 51 now in full view

By Martha Waggoner, Associated Press, 4/18/2000

RALEIGH, N.C. - The truth is out there - on the Web. Photos of Area 51, the super-secret Air Force test site in Nevada that has long tantalized UFO and conspiracy buffs and fans of "The X-Files," are being posted on the Internet.

"This is the first glimpse into the most secret training and testing facility for the Air Force," said John Hoffman, president of Aerial Images Inc. of Raleigh.

The company planned to post five images of the site, divided into four frames each, in collaboration with Microsoft, Kodak, Digital Equipment Corp., Autometric Inc., and the Russian agency Sovinformspутnik. The partners launched a Russian satellite from Kazakhstan in 1998 to map Earth's surface and Area 51. An open-skies agreement signed in 1992 by 24 nations, including the United States and Russia, made the effort possible.

The Air Force only recently acknowledged that Groom Dry Lake Air Force Base even exists. The 8,000-square-mile base is 75 miles northwest of Las Vegas, in the arid, rugged Nellis Range.

Beginning with a U-2 spy plane in the 1950s, the base has been the testing ground for a host of top-secret aircraft, including the SR-71 Blackbird and, more recently, the F-117A stealth fighter and B-2 stealth bomber.

The base's airspace is restricted; aircraft are not allowed to fly over it. But satellite overflights are allowed as part of an agreement to verify arms-control compliance. Among UFO aficionados, it has been known as Area 51, the base's designation on old Nevada test site maps. Some believe that unidentified flying objects from other worlds are hidden at the base, where their parts are copied for US prototypes. The images, with resolution good enough to distinguish a car from a truck, are better than earlier telephoto shots from the nearby mountains. The only other known image purportedly was shot by a satellite in the 1960s. It is much fuzzier.

"There are runways, there are buildings, there are buses, there are test sites, but there aren't any little green men or supersecret aircraft to be seen," Hoffman said of the new photos.

Several government agencies are aware of the images and haven't responded, said Hoffman, 52, a Vietnam veteran who recently retired from the National Guard after 23 years. "I've had no feedback from anybody that indicates anybody gives a hoot," he said.

An Air Force spokeswoman would not comment yesterday on any security concerns about the images.

"We acknowledge having an operating site there, and the work is classified," spokeswoman Gloria Cales said. The work involves "operations critical to the US military and the country's security."

Aerial Images, at www.terraserver.com, planned to offer a link to the Area 51 pages. Viewing the images is free; downloading them costs \$8.95 and up. Kodak will print photographs for \$20 to \$30.

The images show craters, some seemingly formed by something dropped from the sky, others possibly by something coming out of the ground. There are hundreds of buildings, living quarters, tennis courts, a baseball field, a track and a swimming pool.

There are no paved roads and no parking lots; buses are the only visible vehicles, raising the question of how employees get to and from work. Unpaved roads disappear into cliffsides, suggesting a possible underground network. A shrouded aircraft is visible on a ramp, unusual considering the Air Force knows when Russian satellites are overhead, Hoffman said.

Walter Andrus Jr., international director of the Mutual UFO Network, based in Seguin, Texas, seemed to have a hard time believing the object of so much secrecy and discussion would soon be available on the Web.

Even Chris Carter, creator of "The X-Files," apparently was skeptical when Hoffman contacted him. Some of the show's favorite themes are UFOs and secret government activities, and one of its mantras is "The truth is out there."

James -- it's the Northrop YRB-49A -- one built (six-engine modification of B-35 airframe as opposed to eight engines in the other two B-49s).

looks like a Northrop YB-49 (sometimes called YRB-49). I dug up a couple
of pictures on the net that show the resemblance. One is here at

<http://www.discovery.com/area/technology/b2/history.html>

and better info here ...

<http://209.162.216.75/Nurflugel/Northrop/yb-49/yb-49.html>

The only thing that looks different is the length of the wings. They look
shorter in your unknown pic, but if I had to guess, I'd say it's due to
the angle it was taken.

I do hope that as part of your most recent analysis of the bird hypothesis you will provide us with a diagram that shows how Arnold and the birds could have approached or flown past each other in a way that agrees with the basic aspects of the sighting (first north of Rainier, apparently, then flying across Arnold's path and southward and last appearing to be in the direction of Mt. Adams; bright arc-like flashes; high angular rate of speed)

Hello Larry,

Yes, he did mention the fact that mushrooms appear within the circle each year.

Todd

Dear friends,

I have just read the review and update of the Socorro incident written by Patrick Huyghe, commenting also the balloon hypothesis by Larry Robinson. Very interesting.

But what start me wondering was the amazing ¿coincidence? of two very similar humanoid cases the same day. I am referring, of course, to the Tioga City encounter of Gary Wilcox and his "martians". Does anybody knows of any reinvestigation of this case (or even a good investigation of the case related in the ufological literature)? I have read several versions of the case, mentioning several kind of people interviewing him, but did anybody write a report? I would love to learn what did they speak during those two hours.

Yours,
LuisR

It's the YRB-49, a six engine experimental version of the YB-49, designed to increase the range. Enclosed is another shot of it (Wow, I can attach!!!). But Northrop never completed enough of any of their flying wings to account for the Arnold sighting. Maybe if the whole fleet (one of N-1M, four of N-9M, two of XB-35, and two of YB-49) was in the air....

I found out the dope on the Arup S1, S2, S3, or S4 models of advertising aircraft made in 1935. They were designed to have an ad painted on the underside of the disk. There were only three actual airplanes built. The s-1 was converted into the s-2, and the s-3 was converted into the s-4. Then another s-4 was built. They were about the size of a Piper cub. Pictures:

http://www.nurflugel.com/Nurflugel/Others/arup_s-1.jpg

http://www.nurflugel.com/Nurflugel/Others/arup_s-2.jpg

http://www.nurflugel.com/Nurflugel/Others/arus_s-4_and_s-2.jpg

Then there is the Akerman Arroble:

<http://www.nurflugel.com/Nurflugel/Others/akerman.jpg>

and

<http://www.nurflugel.com/Nurflugel/Img0019.jpg>

I don't know how many of these were made, but this is the flying wing with the rounded vertical stabilizers at the ends of the wings I was looking for.

Sent: Tuesday, April 18, 2000 10:42Subject: Arnold's Reported Sighting

***** LIST ONLY *****

Brad [and others],

I'm close to finalizing a reply to all the points recently raised and will respond shortly.

Amongst other things, I wanted to first of all take some related enquiries back to those who have years of relevant experience - ornithologists in the Pacific North-west.

I've also been trying to clarify some separate issues and it all takes time.

By default, the most likely explanations for Arnold's reported sighting was of aircraft. If they were truly so fast as he believed, then they were, as he surmised, possibly 'top secret'.

Although this is an area of research which has been looked at by myself and many others and it seemed all evidence ruled out 'flying wings' - whether 'Northrop' or captured German 'Horten' designs, there's no question that Arnold's later sketch closely resembles the Horten designs, particularly the Horten 'Ho IX', also known as the 'Go 229'. For examples, see the following:

<http://web.ukonline.co.uk/voyager/arnold/ho95.jpg>

<http://web.ukonline.co.uk/voyager/arnold/ho229.jpg>

I can't recall mentioning the following claims previously and they must be considered 'unreliable', even if the intention is sincere:

"I was not there in person, one of the men I have worked with a while back was. He was stationed at Edwards AFB and also at White Sands. They were performing radar testing on some of the German captured aircraft about the right time. There were several vehicles, one was of the Horten IX/GO 229 type. They spent a couple of months doing the tests and the aircraft were flown to another base for some other testing he did not know about. He just performed the radar signature and heat signature testing. All of which is still is classified. He stated there were several unusual aircraft there, and very little detail were offered to the radar tracking and testing crew. Some of the aircraft caused serious problems with their equipment. Where they were transferred to is unknown. He was only involved with a couple. But there were several teams doing the tests at the time. I did some extensive reading up on the Horten IX/GO and was surprised

it was so much like the Arnold drawing. I would suspect his speed estimates were not correct during his sighting...".

Presumably any such testing would be over the Edwards/White Sands area and far distant from Arnold's sighting.

However, is there any known evidence that testing of captured Horten aircraft might conceivably have occurred at Edwards/White Sands or anywhere in the US?

Alternatively, is it long accepted/proven this was unlikely/impossible?

Can anyone please identify the exact aircraft shown in the following photograph? :

<http://web.ukonline.co.uk/voyager/arnold/unknown.jpg>

James.

looks like a Northrop YB-49 (sometimes called YRB-49). I dug up a couple of pictures on the net that show the resemblance. One is here at

<http://www.discovery.com/area/technology/b2/history.html>

and better info here ...

<http://209.162.216.75/Nurflugel/Northrop/yb-49/yb-49.html>

The only thing that looks different is the length of the wings. They look shorter in your unknown pic, but if I had to guess, I'd say it's due to the angle it was taken.

Joel,

Thanks. Although I had it noted as a Northrop aircraft, I  
couldn't find an exact matching photograph.

>They look shorter in your unknown pic, but if I had to guess,

>I'd say it's due to the angle it was taken.

Much appreciated, it was that 'shortening angle' which suggested  
this was a much smaller aircraft than it actually is!

I was hoping to confirm the reasoning why those nine objects  
couldn't have been aircraft.

If we look the previously mentioned Horten wings and comparative  
Northrop designs, it initially seems almost certain that therein  
lies an explanation for Arnold's reported sighting.

We can see a striking resemblance in the aircrafts' shape, especially compared to Arnold's later sketch, and understand why he was puzzled they didn't have any tails. It's also conceivable their metallic, unpainted surface could produce a brilliant reflection, just like a mirror.

Yet there are apparently several significant reasons why that can't be an explanation:

- as there weren't any such similar aircraft in operation during June, 1947, we couldn't have nine of them, or even eight, if one was 'different' as Arnold perceived
- the Cascade mountains wouldn't be a likely flight area, especially for secret tests
- aircraft do not fly in the weaving, undulating, formation Arnold described
- and certainly don't at the speed Arnold reported
- surely someone involved with this flight [nine pilots, ground crews, etc.] realised, even if much later, it was the explanation for a sighting which resulted in 'flying saucer' hysteria and they would have 'had a word' with the air force.

There are perhaps further points which could be stated.

Is this summary factually correct, or are there possibilities which haven't been accounted for?

In short - can we be satisfied that a formation of nine, tail-less aircraft - on 24 June, 1947 and over the Cascades - is definitely not a sustainable explanation, despite the coincidences highlighted?

James.

Thanks for the link to this info. I'll pass it on to my friend,  
as he states that this is the first year that these circles  
appear to be killing his grass.

I have come across some data about Gary Wilcox's case as a note in pages 280-281 of Keel's "UFOS: Operation Trojan Horse". He wrote:

(...) "In a sworn statement to Miss Priscilla J. Baldwin and the sheriff's office, Tioga County, New York, dated April 28, 1964, Mr. Wilcox said, "They also mentioned that Astronauts Glenn and Grissom and two of the astronauts from Russia would die within a year..."

Curiouser and curiouser (or it is more curious, more curious) :-).

Further to the query recently posted, i.e.:

Re Arnold's sketch published in the March/April 1995 IUR - see the copy temporarily on my web site, at:

[http://web.ukonline.co.uk/voyager/arn\\_draw.jpg](http://web.ukonline.co.uk/voyager/arn_draw.jpg)

at the bottom, underneath that crescent-shaped object, Arnold has written 'Black...'.  

Can anyone with a better copy please confirm the exact wording and what Arnold is apparently indicating here?

[End]

In this sketch, it appears that Arnold is emphasising a 'leading edge' on the objects depicted. This is particularly evident on the third of four 'views' [from left to right], where he has drawn the 'clam-shell' like object and then added a line inside the leading, right-hand side edge.

As all three 'top' views seem to have the stated 'front edge', is Arnold noting this was a darker colour - maybe related to the aforementioned 'Black...' comment?

If not, what is he indicating?

James.

Black

Under that is written what looks like "if 400 ft"

Above it is a sketch of the double-crescent-rear UFO "disk" along with several other shapes as if he was trying to provide the best sort of description. (the double crescent shape clearly differs from the other two shapes which have only a convex rear - assuming the curved edge is the leading edge - similar to what appears in HIGHLY ATTENUATED IN TRENT PHOTO #1 at the left of the image. (The left side of the Trent #1 image is NOT a perfect ellipse as expected for a circular object. It has a somewhat pointed shape.... only detectable on large blowups.)

Anyway, he seems to have added emphasis (extra pen or pencil density) to the leading edge of the double crescent UFO. PERHAPS he was indicating that the leading edge of the thing seemed "black".....

and then again.....

maybe not. At any rate.....

DRAW A MAP!

UFORL@listbot.com  
Subject: 'Housekeeping' Rules  
Status: O

It's been a while since these were posted.

Especially for recent, new members, these are the simple 'housekeeping' rules:

1. The 'UFO Research List' (UFORL) is a moderated, discussion forum for related topics which can be evidenced to have a scientific foundation, encompassing 'black projects'.

It is not therefore suitable for those who wish to discuss 'alien abductions', 'MJ-12', etc.

2. The list is also primarily intended to enable secure discussions and as subscribers may request feedback on new data or privately debate controversial, sensitive issues, etc., ALL contributions are therefore 'LIST ONLY - IN CONFIDENCE' unless otherwise denoted.

If it appears on this list, it shouldn't be seen anywhere else without the originator's permission.

3. Archives of messages posted to the list can be viewed on the ListBot server, at URL:

<http://www.listbot.com/>

Log in as a list member under:

contents - log in - list member

You will require the password provided by the list server when you subscribed.

If that's been mislaid, use the 'Lost yours?' link above the password field.

4. You can also use the member log-in to:  
- unsubscribe

- change your password
- change the e-mail address where you wish mail to be sent (very useful and this can be done regularly)
- add e-mail aliases, i.e., provide additional addresses you might send mail from
- update your member profile, i.e., any information you may have provided when you joined the list.

5. The list address for mail is:

UFORL@listbot.com

6. With some e-mail software, using 'reply' may not send a response to the list, it will be sent ONLY to the address shown in the 'From' heading, which is the person who sent the mail.

It's recommended that the destination of your reply is therefore checked before sending and should always be:

UFORL@listbot.com

7. The standard mailing list code applies and messages should be no more than 65 characters in length.

If replying to mail, only the relevant section(s) should be quoted, not the entire original message.

8. The list software also requires that each posting is no larger than 100k in size.

9. Postings should not be anonymous and the sender's name is expected to be contained either in the heading or signature.

10. Strict 'Netiquette' rules apply and all postings are expected to be cordial, ensuring the list is always a pleasant environment.

For further information see:

<http://www.pbs.org/uti/guide/netiquette.html>

Any related problems or queries should be addressed to:

UFORL-owner@listbot.com

James Easton,  
List moderator.

Bruce,

I thought this might be "Black if 800 ft".

As neither seem to make any sense in the known context, what else could it be - maybe "Black if too far"?

>Anyway, he seems to have added emphasis (extra pen or pencil  
>density) to the leading edge of the double crescent UFO. PERHAPS  
>he was indicating that the leading edge of the thing seemed  
>"black".....

Because of the recent problems with ListBot message delivery (looks like this may now thankfully be over), your reply had somewhat crossed with my follow-up, pointing out that Arnold appeared to be emphasising a 'leading edge' in three of the sketches.

Is this a new revelation in our understanding (or lack of it)?

Perhaps another look at the original drawing, wherever that is, might clarify exactly what the text reads.

>Above it is a sketch of the double-crescent-rear UFO "disk"  
>along with several other shapes as if he was trying to provide  
>the best sort of description (the double crescent shape clearly  
>differs from the other two shapes which have only a convex rear  
>- assuming the curved edge is the leading edge - similar to what  
>appears in HIGHLY ATTENUATED IN TRENT PHOTO #1 at the left of  
>the image. (The left side of the Trent #1 image is NOT a perfect  
>ellipse as expected for a circular object. It has a somewhat  
>pointed shape.... only detectable on large blowups.)

I'm assuming you're now referring to the non-pencil drawings, i.e. the more detailed artwork. Isn't this a depiction which was added to the IUR cover and unrelated to Arnold's outline sketch?

James.

I'm looking at it right now! (on the cover of IUR). The symbol which I  
interpret as a 4 is clearly a 4... wide gap at the top between the  
vertical  
lines

somewhat like the above.

>As neither seem to make any sense in the known context, what else  
>could it be - maybe "Black if too far"?

Certainly the 4 doesn't look like a distorted "t" in front of "too"

I stick with

Black

if 400 ft

>Is this a new revelation in our understanding (or lack of it)?

>Perhaps another look at the original drawing, wherever that is,

Don't know, but the cover of IUR looks quite clear

>>Above it is a sketch of the double-crescent-rear UFO "disk"  
>>along with several other shapes as if he was trying to provide  
>>the best sort of description (the double crescent shape clearly

>added to the IUR cover and unrelated to Arnold's outline sketch?>

No, I'm referring to the little sketch at the left of the "double crescent  
rear end"  
sketch and also to the sketch at the right.

Subject: Diamond Shaped UFO Spotted in Macomb County Michigan  
Status:

Place: Macomb County Michigan

Date: 04/26/2000  
Time: 2130  
Duration: 10 Mins  
# of Witnesses: 6  
Shape: Diamond  
Number of Craft: 1  
Lights on Object: Yes

On April 28th, 2000 I received an e-mail report form from a witness reporting a "bright light in the sky with 3 airplanes near it, which disappeared and reappeared in a different spot in the sky."

She goes on to state that "me and 5 others were outside at a friends house and we were looking up at the sky because it was a pretty clear night. We saw a very bright light in the sky, not moving much, with about 3 airplanes or helicopters around it. Then it disappeared. When me and my brother were walking back to our house we saw it again with the airplanes around it again. We don't know what it is, so I guess its a UFO.

If you have any further information concerning this sighting please contact me at tlemire@home.com

Are we are supposed to analyze this sighting. If so, is it possible to get MORE information? Perhaps the direction of the sighting (preferably in azimuth) on both occassions? Angular size and angle of elevation would additionally help. It almost sounds like a simple star that the witness misperceived but that can not be determined until we have the data requested.

A star would move over a period of 10-15 minutes due to the earth's rotation. This movement is not noticable unless you really have a frame of reference to work with. Were the witnesses using the house or some other object as the reference? Of course, the witnesses came and went and one must wonder if they were looking from the same location. Finally, was the sky absolutely clear ("pretty clear" does not mean that it was absolutely clear)?

A cloud passing over a star could make it "disappear" (see Hendry p.26) and then reappear as well. There are many stars present now that could fit the description. Arcturus and Spica are in the east. The stars Sirius, Aldeberan, Rigel, Betelgeuse, Capella, Castor, Pollux, and Procyon are also visible in the west (all are very bright first magnitude stars). Regulus is pretty close to being overhead as well. Again, looking at Hendry, the star could be scintillating giving additional effects such as the appearance of changing colors, distorted shapes, etc. As for the planes, are planes moving about anything out of the ordinary? Were the planes moving in the vicinity of the object or were they just moving in the same part of the sky (as if it were normal air traffic pattern)? These are all possibilities that need to be explored.

I would be more than happy to have you analyze it, as I myself would be ecstatic if I had more information, but unfortunately I've recieved no replies from the witness that filed this report. I sent the report out in order to possibly draw out further reports that may have occurred in the same area, or other witnesses to this particular event. In my opinion it appeared to possibly be a refueling mission, which would be rather senseless since it's so close to Selfridge itself, but I checked anyway, and they only had 1 KC-135 in the air at that time. I've already collected all preliminary information and will not continue to investigate until, or if, I hear from the witness that reported this event.

Thank You,  
Todd Lemire

\* LIST ONLY \*

I have recently been contacted by someone who claims that he served at RAF Bentwaters until a month or so before the well known, late December 1980 events.

Our witness relates 'minor UFO' incidents, which took place about 2-3 months previous, one of which he was involved with. This isn't the first time I've come across a reference to earlier occurrences, which may have been a significant background to those subsequent events.

Although I still need to verify the witness's authenticity, he has provided sufficient information, especially unpublicised names of base personnel which I'm familiar with, to be confident this is a genuine contact. Also, he doesn't have any sensational stories to tell and is hopeful I can help put him in touch with former colleagues.

The incident he mentions being concerned with was apparently reported to "base intelligence" and investigated, the witness recalling he gave his account to "interviewers".

That alone is interesting and so far as I'm aware, something which sets the overall story in a new perspective.

I've put sufficient related questions to him for the moment, including:

What exactly happened prior to the more celebrated 'sightings' and who was the security alert reported to?

What were the ranks of the personnel that interviewed him - were they base personnel - which branch of the services did they belong to - where did the interview take place - what questions was he asked?

Were there any notable repercussions - did anyone offer an explanation re what occurred - was anyone encouraged not to speak about it...

It could be invaluable to understand the context of how this seemingly earlier 'UFO' report was dealt with by "base intelligence" at that time.

In due course, I would like to add any relevant questions from list members.

If I first of all post his presumed response to my initial enquiries [including certain requests for verification of this witness], we can perhaps take it from there.

As it's not often we are offered a new insight into any historical UFO case, especially a 'classic' one, this could be a rare opportunity, even if it transpires there's nothing of consequence.

James.

I sent the report out in order to possibly draw out further reports that may have occurred in the same area, or other witnesses to this particular event. In my opinion it appeared to possibly be a refueling mission, which would be rather senseless since it's so close to Selfridge itself, but I checked anyway, and they only had 1 KC-135 in the air at that time. I've already collected all preliminary information and will not continue to investigate until, or if, I hear from the witness that reported this event.

\*\*\* What is senseless about a refueling training mission right close to the base? That makes perfect sense to me, to give pilots practice in docking and undocking with the tanker. Do it, do it again, and again, and.... If anything goes wrong (one little mistake, and you have two damaged airplanes), the emergency crews are right there. And the whole group of planes would stay close to the base, going back and forth.

\*\*\* The fact that the witnesses will not reply indicates either that they are sick of the whole thing (did they tell the press?), they are gone (on vacation maybe), or that the report was a prank that got out of hand.

\*\*\* If possible, the angular size, angular velocity, and an azimuth-elevation track would be helpful. Also a description of whether the object itself appeared diamond-shaped, or whether lights on the object formed a diamond would help clear the air.

Larry

I believe that what your saying makes good sense, but why perform a refueling mission, training or standard, above the general population and risk the aircraft coming down on civilians, when there are less populated areas that these missions could be performed over?

Larry I'll be more than happy to share any information I recieve on this sighting if and when more comes in. Thanks for your insight.

Todd Lemire

I'm sorry I've lost the original message that had all the info of the sighting in it but I have to wonder a couple things. Is it clear that it was over a populated area and if so, what was the estimated altitude? Seems to me that as long as it wasn't low, any mishap short of an ejection could be handled safely over the heads of the civvies. But what are the chances of a refueling going bad or should I say bad enough to cause an ejection? I live near an ANG base and know several people who work on or around refuelers and have never heard of any serious trouble while "passing gas" but I'm sure it does happen on occasion. I wonder what the regulations are for refueling? Also, how long does it take to refuel a jet? 5 minutes or so after they plug, not counting forming up? If they start out over a non-populated area, chances are that they will end up passing over one at some point.

But then again it was said (sorry can't tell who, I assume James)

"I checked anyway, and they only had 1 KC-135 in the air at that time."

Did you ask if they were just flying around the flagpole or if they were actually refueling? I imagine they were probably fueling someone who was just passing through from another base but it would clear that up quickly if we knew.

I realize of course that this story has very limited info and may not be worth any time to analyze so just ignore me if so. But if ya'll feel froggy, they fly KC-135's here and I could probably dig something up.

Hello List,

I don't know if anyone has been following the story about the satellite debris that fell in Africa just recently but a question has been posed to me concerning the recent "field fires", such as the one that occurred in Australia, or others that involve meteors, entering/re-entering space debris/objects etc. as to whether or not these objects could possibly ignite these "field fires"? Can these fires be ignited by "debris" from space? Are re-entering objects actually hot or cold?

Thanks in advance,  
Todd Lemire

Subject: Gordon Cooper UFO LoreStatus:

Apparently, astronaut Gordon Cooper has a book coming out soon. I wonder if he'll treat any of these subjects in depth?

Here's a collection of factual material on astronaut Cooper and the UFO stories associated with his name:

JimO FAQ on Gordon Cooper: Although there is a UFO sighting story associated with Cooper's Mercury-9 flight in 1963, he himself denounces that story as a fraud (his actual real time radio comments were demonstrably re-shaped by unscrupulous authors, and other baseless tall-tales from Frank Edwards were improved with each retelling over the years). More interesting are Cooper's own accounts of his own UFO encounter over Germany in 1951 (but in 1980-1, when I checked with a dozen other members of his squadron, they had no idea what he was talking about) and of a sighting at Edwards AFB where the film of a 'landing' disappeared (but when I checked with one of the actual cameramen involved, he said it was only a slow fly-by that got blown out of proportion by bar-room gossip -- and the film had been turned over to Blue Book where the whole report still rests in the microfilmed archives). Cooper's recent (1995-6) television appearances to relate embellished versions of these and other stories provide excellent examples of the problems with decades-old memories of people even of high intelligence and integrity: for example, his account of the McDivitt case contains numerous examples of inaccuracies and misinterpretations that one can then reasonably presume also have crept into his narratives of own experiences (none of which have been independently corroborated). Over the years I've written to Cooper about my research results (I briefly discussed my negative results re the German ca UPDATE - OMNI, ISSUE #2 (NOV 1978) by James Oberg

Ex-astronaut L. Gordon Cooper has become something of a celebrity recently with his tv talk show accounts of personal UFO sightings in Europe and California in the 1950s and his present cooperation with international UFO investigators.

Books and magazines are full of detailed accounts of Cooper's encounters with UFOs in space during the Mercury and Gemini programs.

An exciting and provocative UFO revelation attributed to the astronaut appears

on the package of a "Close Encounters Alien Doll," distributed by Columbia Pictures Industries as part of the commercialization of the famous UFO movie. Says the quotation, "Intelligent beings from other planets regularly visit our world in an effort to enter into contact with us.... NASA and the American government know this and possess a great deal of evidence. Nevertheless, they remain silent in order not to alarm people.... I am dedicated to forcing the authorities to end their silence."

The problem is, claims Cooper, he never said that and never even attended the New York City UFO conference at which he is alleged to have made those comments. And to express his profound displeasure at having his name exploited by Columbia, he is suing them for two million dollars. Columbia, meanwhile, refuses to comment on which UFO buff gave them the alleged quotation and why they never tried to verify it.

Nor did Cooper see any UFOs on his space flights, it turns out. "Complete fabrications," he calls the stories that for more than 15 years have enlivened UFO literature.

Cooper does remain intrigued by the real UFO problem, he maintains, and his own UFO experiences remain uninvestigated and unexplained. But the UFO movement evidently was unsatisfied with the honest realities of an astronaut's UFO stories and piled fantasies and fabrications upon them. Cooper's legal action against Columbia may help determine just how far the media can go in carelessly perpetuating profitable UFO frauds.

SIGHTINGS

## Gordon Cooper Says No UFO On His Mercury Flight

By Robert Scott Martin, Staff Writer

<http://www.space.com/area51/cooper.html>

9-11-99

=A0

Pioneering astronaut Gordon Cooper denies being the first astronaut to see a UFO while in orbit, but stands by his reports of a strange encounter over Germany in the 1950s.

=A0

Cooper flatly denied the long-standing claim, repeated over the years by various authors including UFOlogical saints Allen Hynek and Jacques Valley, that he saw a greenish object with a red tail move past his Mercury 9 spacecraft in 1963.

=A0

"No, somebody made a lot of money selling lies on that one," Cooper, the sixth American in space, told Art Bell on the syndicated "Coast to Coast" talk radio show Thursday night. "It was totally untrue, sorry to say."

=A0

However, the retired air force colonel, who once lectured the United Nations on the reality of UFOs, still holds an "unshakable" belief in extraterrestrial intelligence, thanks largely to personal experience.

=A0

"On one occasion, I saw some strange vehicles that we assumed were UFOs," he told Bell.

=A0

In the encounter, which took place over Germany in the early 1950s, Cooper saw "flights of fighters flying by in the same sort of formation we flew, moving east to west." The U.S. Air Force base scrambled its own pilots, including Cooper, who remembers the objects as looking "just like saucers -- they were metallic looking, but we couldn't really get close enough to see more than that. You couldn't see any wings on them."

=A0

At the time, Cooper entertained the possibility that the craft might be a new Soviet design, but "looking back now," he suspects "it was some kind of extraterrestrial vehicle."

=A0

He also stood by his belief that he saw a UFO land at Edwards Air Force Base in California in 1957. Although Cooper had been filming the base with a camera crew at the time, the film, which he handed over to a high-ranking officer from Washington, has never emerged.

=A0

Area 51 and the lost Gemini photographs

=A0

After another round of filming --- this time in orbit aboard Gemini 5 -- Cooper ran into trouble with the authorities when they confiscated film he took from space. However, in contrast to UFO legend, this film did not contain photographic proof of an alien encounter.

=A0

Instead, he had ran afoul of the authorities for taking pictures of the "topsecret" Nevada military base known familiarly as "Area 51".

=A0

"I found out fairly recently that one of the reasons it got confiscated was I had inadvertently overflowed Area 51," while taking test photos, he said.

=A0

====

JimO adds (May 2000): "This is another wonderful story that just doesn't check out. If you check the orbit of Gemini-5, it never flew over "Area-51". The camera was a DoD experiment in airfield monitoring, and indeed it was delivered to the DoD for development rather than to NASA's own labs. A few months later, the DoD turned over a complete set of prints, to NASA, because they were disappointing, not nearly as crisp as they'd hoped, and were therefore declassified. They're still in NASA's archives for inspection to this day."

-----

JimO FAQ (1997):

The question we are faced with is this: how accurate are the stories told by Gordon Cooper if they can't be verified by any other sources?

Cooper has given one case in which his account CAN be compared against other records, and a calibration of his narrative accuracy can be made from this.

On the FOX TV "Paranormal Borderlands" (hosted by Jonathan Frakes), interview with astronaut Gordon Cooper conducted by Yolanda Gaskins, Cooper talked about the "McDivitt UFO" of 1965.

Cooper: "To my knowledge, the only thing that was ever seen on any of our space flights -- and believe me, all of us would like to have seen something -- was on Jim McDivitt's Gemini-7 mission where they saw this glint of something metallic off in the distance. And he reported, and nobody had it listed on the ground, so he tried to get a picture of it. But the sun unfortunately was glinting off of it so bright, all you got was a glint, there was no detail of what it was. But never any further sighting of it."

The following factual problems can be extracted from this story:

1. "....Jim McDivitt's Gemini-7 mission...." Actually, it was Gemini-4, in June 1965. Frank Borman commanded Gemini-7 in December 1965.
2. "... where they saw...." Actually, only he (McDivitt) saw anything, his co-pilot Ed White was asleep.
3. "...this glint..." McDivitt has given extensive descriptions of his sighting and has never used the word "glint" or any other term which

would imply a reflection off the object. He has talked about sun glare on the dirty Gemini window, however.

4. "...of something metallic..." McDivitt has never used this or any synonymous term to describe the nature of the object's composition, he has refused to speculate on this feature.

5. "... off in the distance...." McDivitt explicitly stated that he could not tell the object's distance. It was either a small object close up or a large object far off, but he properly has testified that its range was impossible to determine.

6. "And he reported, and nobody had it listed on the ground, so he tried to get a picture of it." McDivitt saw and attempted to photograph the object while he was out of range of tracking sites, and by the time he was back in contact, the object was no longer visible. This sequence of events is completely garbled.

7. "...nobody had it listed on the ground..." Hours after the report, ground specialists tried to see what they had records ("lists") of that might correlate with the sighting. A "Pegasus" satellite was suggested. Later, the Gemini-4's own booster rocket in a nearby criss-crossing orbit was also suggested. So it's not true that there was nothing on "lists", but that was a long post facto analysis.

8. "But the sun unfortunately was glinting off of it so bright..." McDivitt has never described sunlight glinting off the object.

9. "..., all you got was a glint..." You didn't even get that: there was no photograph of the object that turned out. McDivitt was satisfied that the shots he had quickly fired off did not work.

10. "...there was no detail of what it was...." McDivitt described it visually in quite a bit of detail: beer-can shaped, with an arm sticking out.

In conclusion, I have identified ten major factual errors in this brief oral passage from Cooper's memory. If this is as good as his other testimony is, then the need for independent verification becomes even more critical.

I humbly solicit a rational discussion of this interpretation and this conclusion.

You couldn't see any wings on them."

=A0

At the time, Cooper entertained the possibility that the craft might be a new Soviet design, but "looking back now," he suspects "it was some kind of extraterrestrial vehicle."

=A0

He also stood by his belief that he saw a UFO land at Edwards Air Force Base in California in 1957. Although Cooper had been filming the base with a camera crew at the time, the film, which he handed over to a high-ranking officer from Washington, has never emerged.

=A0

Area 51 and the lost Gemini photographs

=A0

After another round of filming --- this time in orbit aboard Gemini 5 -- Cooper ran into trouble with the authorities when they confiscated film he took from space. However, in contrast to UFO legend, this film did not contain photographic proof of an alien encounter.

=A0

Instead, he had ran afoul of the authorities for taking pictures of the "topsecret" Nevada military base known familiarly as "Area 51".

=A0

"I found out fairly recently that one of the reasons it got confiscated was I had inadvertently overflowed Area 51," while taking test photos, he said.

=A0

====

JimO adds (May 2000): "This is another wonderful story that just doesn't check out. If you check the orbit of Gemini-5, it never flew over "Area-51". The camera was a DoD experiment in airfield monitoring, and indeed it was delivered to the DoD for development rather than to NASA's own labs. A few months later, the DoD turned over a complete set of prints, to NASA, because they were disappointing, not nearly as crisp as they'd hoped, and were therefore declassified. They're still in NASA's archives for inspection to this day."

-----

JimO FAQ (1997):

The question we are faced with is this: how accurate are the stories told by Gordon Cooper if they can't be verified by any other sources?

Cooper has given one case in which his account CAN be compared against other records, and a calibration of his narrative accuracy can be made from this.

On the FOX TV "Paranormal Borderlands" (hosted by Jonathan Frakes), interview with astronaut Gordon Cooper conducted by Yolanda Gaskins, Cooper talked about the "McDivitt UFO" of 1965.

Cooper: "To my knowledge, the only thing that was ever seen on any of our space flights -- and believe me, all of us would like to have seen something -- was on Jim McDivitt's Gemini-7 mission where they saw this glint of something metallic off in the distance. And he reported, and nobody had it listed on the ground, so he tried to get a picture of it. But the sun unfortunately was glinting off of it so bright, all you got was a glint, there was no detail of what it was. But never any further sighting of it."

The following factual problems can be extracted from this story:

1. "....Jim McDivitt's Gemini-7 mission...." Actually, it was Gemini-4, in June 1965. Frank Borman commanded Gemini-7 in December 1965.
2. "... where they saw...." Actually, only he (McDivitt) saw anything, his co-pilot Ed White was asleep.
3. "...this glint..." McDivitt has given extensive descriptions of his sighting and has never used the word "glint" or any other term which

would imply a reflection off the object. He has talked about sun glare on the dirty Gemini window, however.

4. "...of something metallic..." McDivitt has never used this or any synonymous term to describe the nature of the object's composition, he has refused to speculate on this feature.

5. "... off in the distance...." McDivitt explicitly stated that he could not tell the object's distance. It was either a small object close up or a large object far off, but he properly has testified that its range was impossible to determine.

6. "And he reported, and nobody had it listed on the ground, so he tried to get a picture of it." McDivitt saw and attempted to photograph the object while he was out of range of tracking sites, and by the time he was back in contact, the object was no longer visible. This sequence of events is completely garbled.

7. "...nobody had it listed on the ground..." Hours after the report, ground specialists tried to see what they had records ("lists") of that might correlate with the sighting. A "Pegasus" satellite was suggested. Later, the Gemini-4's own booster rocket in a nearby criss-crossing orbit was also suggested. So it's not true that there was nothing on "lists", but that was a long post facto analysis.

8. "But the sun unfortunately was glinting off of it so bright..." McDivitt has never described sunlight glinting off the object.

9. "..., all you got was a glint..." You didn't even get that: there was no photograph of the object that turned out. McDivitt was satisfied that the shots he had quickly fired off did not work.

10. "...there was no detail of what it was...." McDivitt described it visually in quite a bit of detail: beer-can shaped, with an arm sticking out.

In conclusion, I have identified ten major factual errors in this brief oral passage from Cooper's memory. If this is as good as his other testimony is, then the need for independent verification becomes even more critical.

I humbly solicit a rational discussion of this interpretation and this conclusion.

> Gordon Cooper Says No UFO On His Mercury Flight

> By Robert Scott Martin, Staff Writer

[edit]

> In the encounter, which took place over Germany in the early 1950s,

> Cooper saw "flights of fighters flying by in the same sort of formation  
we

> flew, moving east to west." The U.S. Air Force base scrambled its own  
pilots,

> including Cooper, who remembers the objects as looking "just like  
saucers --

> they were metallic looking, but we couldn't really get close enough to  
see

> more than that. You couldn't see any wings on them."

[edit]

Very interesting stuff James - thanks for setting the record  
straight.

Gordon Cooper's description reminds me of when I interviewed  
Jack Pickett wrt his sighting of four discs on the  
ground at MacDill AFB FA back in '67. He claimed to have been  
shown 8x10s of circular a/c flying in formation with US jets.

He was able to take a close look at the discs and described them  
as being in bad shape, but without question jet powered planes of  
unknown origin.

He was perfectly aware that his story sounds crazy, but the  
frustration he felt was still apparent after all these years. I found  
myself believing what he told me, but had problems with some  
of the info. given to him by the USAF officer who briefed him.

And therein lies the difficulty we have with anecdotal evidence. Very often sincerity does not equal with veracity. This is a major problem for the abduction end of this genre, and can also be an issue for the historical research side as well.

Several years ago a program on Nazi Germany that aired on the Discovery Channel network apparently included scenes that were recreations made for a 1960s documentary by David Wolper. The producer of the more recent program did not realize they were recreations and thought they were from the "official" historical record, which merely serves to cloud our understanding of history as we view it through the eyes of others. Wolper had taken a lot of heat for his inclusion of recreated scenes with real ones in his documentary (without identifying which was which), and as it turns out the fears expressed by his critics were more accurate than they realized.

I raise the issue because the power of the Internet has resulted in simple comments taking on a life of their own and becoming "well known facts" in both this arena and others.

Of course, this is just my opinion. . . .<g>

I think there have also been a number of reports where there has been damage from falling meteorites, but no indication of any fire. I'm certainly no expert, but I believe that meteorites are usually slowed by the dense atmosphere as it approaches sea level, which allows them to cool down somewhat. I think this is one reason why "shooting stars" disappear after travelling through the atmosphere for a short ways, as they slow down and fall to the surface below.

The question is whether or not the meteorite retains enough heat to ignite material on the ground, which I think is dependant on a variety of factors.

On June 18, 2000 a large meteorite fell over the Yukon and northern British Columbia. It was visible for 5 seconds as a bright fireball and then exploded at an elevation of 20 kilometers (As determined by DND satellites). The meteorite left a contrail until the terminal explosion point after which it was no longer visible (ie. possibly no longer generating heat). Pieces fell to earth and were found about two weeks later. I don't have any data if the pieces were hot or cold but I suspect dropping from 20km some of the smaller pieces would have time to cool down.

Full story at: <http://www.ufobc.org/yukon/ykfireballjan2000.html>  
complete with many photos of contrail that lingered for 15 minutes.

[edit]

Points taken Steve. Anecdotal evidence acts pretty much like a Rorshach test. My own prejudices would make abduction research very hard for me to undertake, but unconventional a/c - even of unknown manufacture or design is something I feel more drawn towards.

Dear List,

A couple of months ago this topic (regarding the temperature of meteorites) was discussed on another list, I think it was Current Encounters. I think it was triggered by the large meteor that was spotted last autumn over USA. In short: a meteorite is travelling through the atmosphere in mere seconds and since its temperature is somewhere below minus 200 C when it enters the first particles on its way down it is very difficult to heat the meteor. During its decent the meteor is of course heated by the friction but loses its outer layers (they are peeled off) and heat all the time. Since the path through the atmosphere is so short the meteor never gets hot enough to start any fires when it hits the ground. Astronomer and meteor expert Bertil Lindblad at University of Lund in Sweden says to me that some meteorites have been found with small ice particles on its surface after impact. "They are so cold when entering the atmosphere that the short time in the atmosphere doesn't make any difference".

During the last discussion I wrote a summary about this. If it is needed I can try and locate it (right now I don't know exactly where it is).

Subject: Re: Diamond Shaped UFO Spotted in Macomb County MichiganStatus:

In a message dated 5/3/00 3:00:53 AM Hawaiian Standard Time, tlemire@home.com writes:

<< I would be more than happy to have you analyze it, as I myself would be ecstatic if I had more information, but unfortunately I've recieved no replies from the witness that filed this report. I sent the report out in order to possibly draw out further reports that may have occurred in the same area, or other witnesses to this particular event. In my opinion it appeared to possibly be a refueling mission, which would be rather senseless since it's so close to Selfridge itself, but I checked anyway, and they only had 1 KC-135 in the air at that time. I've already collected all preliminary information and will not continue to investigate until, or if, I hear from the witness that reported this event.

Thank You,

Todd Lemire

Michigan UFO CENTRAL

<http://members.home.net/tlemire/UFOCENTRAL.html> >>

Thanks for the reply Todd and sorry I am late responding. I have been away for a week. Of course, everything is guesswork without any concrete information. Again, the azimuth, angle of elevation, etc. could help eliminate or confirm stars. The KC-135 might be the cause but refueling operations do not usually happen over populated areas. Formation flying maybe but to put up a KC-135 for training probably involves an actual refueling evolution to take place. If I recall, there is a possibility of a fuel spill and this would be bad press. I would think stars may be the first suspect but the KC-135 could have been involved somehow as well.

Secret satellites: Three decades of DSP in orbit

By Dwayne A. Day

For FLORIDA TODAY

In the mid-1960s the Soviet Union began developing a powerful new weapon known as the Fractional Orbital Bombardment System, or "FOBS" for short. FOBS consisted of a nuclear warhead on a large rocket, capable of being launched in any direction. The ultimate nightmare for American generals was that a Soviet FOBS could be launched over the South Pole and strike the U.S. totally undetected, destroying NORAD, the Pentagon and the White House before a response could be made.

Satellite systems presented the best way of detecting FOBS and offering early warning that an attack was under way. In addition, satellites using infrared telescopes offered the ability to detect ICBM launches far earlier than ground-based radars. Hence, the Defense Support Program - DSP - was born. These secretive satellites have been orbiting the earth for nearly three decades, and doing many things that their originators never envisioned.

In the early 1960s, the Air Force had tried to develop an infrared satellite system known as MIDAS. MIDAS was to detect the hot exhaust of Soviet ICBMs and provide warning that the United States was under attack. The system was to consist of a constellation of satellites in low earth orbit. One or more satellites would always be in view of Soviet ICBM launch sites.

Jeffrey Richelson, in his recent book on MIDAS and DSP, *America's Space Sentinels*, described the history of these early efforts. According to Richelson, MIDAS ran into technical problems that were gradually hard to maintain. After a series of troubled launches, MIDAS was reduced to a test program and eventually canceled.

In November 1965, the Air Force began developing technology for a new early warning system to operate in geosynchronous orbit. Such a system would only require two or three satellites instead of a dozen or more. It would use a powerful telescope to scan the Earth. This program was given the classified designation "Program 266."

In response to an Air Force request, three proposals were submitted by two contractor teams, Martin/Raytheon and Aerojet-General/TRW, and one solo contractor, Lockheed Missiles and Space Company. In November 1966, the project was renamed Program 949 and shortly thereafter the Air Force eliminated the Martin/Raytheon team. The Aerojet/TRW team was soon declared the winner and awarded a contract for \$104.5 million for two operational satellites and one spare. The satellites would be launched aboard Titan 3 rockets at Cape Canaveral.

While development and construction of the satellites started, the Air Force and Department of Defense determined that an eastern hemisphere ground station would be needed to receive data from the satellite that would operate over the Indian Ocean, observing Soviet and Chinese missile fields. The ground station was where the data would be processed and transmitted to the United States via undersea cable or communications satellite. Australia was identified as the logical site of such a station, since it had served as the base for a ground station for U.S. signals intelligence satellites beginning in 1968.

Another site in the United States, Buckley Air National Guard Base near Denver, Colorado, was selected for the western satellite that would operate over the Pacific Ocean. Eventually a third station, in Germany, would be built. The identity of these ground stations was kept secret for many years. The Australian station was finally closed in the late 1990s. In June 1969, due to a security breach, the project underwent yet another name change, this time from Program 949 to Program 647. It also was finally given an unclassified cover name that was equally obscure: the Defense Support Program, or DSP.

The satellite itself weighed about 2,000 pounds and was 23 feet long and 10 feet wide. It had a 12-foot long Schmidt infrared telescope with a linear array of 2,048 lead sulfide detectors that detected infrared energy. The satellite had an 18-month design life. It was designed to rotate six times per minute. The telescope was set slightly off-angle to the rest of the satellite. Thus, as the satellite rotated, the sensor "scanned" the entire

face of the Earth, sweeping it like the second hand on the face of a clock, returning to any given point six times each minute. The sensor provided below-the-horizon coverage by spotting the missile's exhaust plume against the background of the Earth. By analyzing the temperature, location and trajectory of a hot infrared source, the satellite could build up both a description of the type of missile as well as its target.

The satellites also carried sensors for detecting nuclear explosions in the atmosphere. The first DSP satellite was launched from Cape Canaveral on Nov. 6, 1970 atop a powerful Titan 3C rocket. Despite the fact it was a secret satellite, a bank in Cocoa Beach posted a message on its sign before the launch: "Spy Satellite Goes 5 47 AM Friday Titan 3 Rocket." The rocket initially performed as planned, but suffered a problem late in the flight when its Transtage upper stage misperformed. This resulted in the satellite, known as Flight 1 or F-1, being placed into an elliptical orbit short of its goal. The satellite could not be used to observe Soviet missile launches from this orbit.

This was a devastating setback for the engineers and the Air Force officers who had worked so hard to build DSP. But quick thinking program managers were able to turn failure into a partial success. They heard about an upcoming Minuteman launch scheduled at the Cape and hurriedly requested that the Air Force delay the launch until their satellite was overhead. The Air Force did and the first DSP satellite was able to observe the Minuteman launch from the Cape. DSP worked.

A second satellite was launched from the Cape on May 6, 1971. This time the booster performed normally and after the Transtage burned out and separated, the spacecraft slowly came to life, deploying its solar panels and spinning up to the proper speed. It was named Flight-2 or F-2. By May 23, 1971 it was turned over to the newly built ground station at Nurrungar, Australia. The satellite's initial location was 65° East, over the Indian Ocean, where it could monitor Soviet and Chinese ballistic missile fields. A third satellite was launched on March 1, 1972. It became the first western hemisphere satellite and was initially stationed over the Equator, over Ecuador. Shortly after going into operation it suffered several minor problems, but nothing that could not be fixed or worked around.

Satellite F-4, the last of what were called the Phase I satellites, was launched successfully on June 12, 1973. F-4 was actually the first satellite to be completed and had served as the qualification satellite, undergoing an extensive series of tests of its systems before being overhauled and prepared as a flight-qualified spacecraft. It was the first satellite to take up position over the Pacific Ocean, apparently at 105° West. This marked a change in the positions for the initial constellation.

Satellites F-2 and F-3 had occupied stations at 65° East and 80° West respectively. This had given them contiguous coverage over the entire Atlantic Ocean, the Soviet and Chinese missile fields, and most of the eastern Pacific Ocean. But until a third operational satellite could be placed in orbit, the western Pacific was uncovered. Soviet submarine-launched ballistic missiles had increasing ranges, which would

allow them to be launched from the western Pacific undetected by DSP. But once F-4 achieved orbit, this gap in coverage could be closed.

By late June 1971, initial hardware production was started on the first of four Phase II satellites. The satellites were not to be significantly different from their predecessors. Primary improvements included an increase in reliability and minor improvements in various systems, particularly the main sensor, which would have the capability of scanning the entire field of view instead of leaving a hole in the center of each scan, like a donut. These changes resulted in an increase in weight. Power was also increased. More importantly, satellite lifetime was doubled to three years. Although the Air Force did not realize it at this time, the existing satellites would exceed their design lifetimes by a considerable margin.

By late June 1973, the four DSP satellites in orbit had detected a total of 1,014 missile launches. They had proven quite successful in their mission and had relieved some of the tension that was always present during the Cold War by dramatically reducing the chances of a surprise ICBM attack.

DSP also presented some surprises to its operators. Early on, the satellites began detecting infrared returns within and above the atmosphere. Some of these returns were caused by sunlight reflecting off of satellites and these events were soon designated "Fast Walkers" which UFO buffs later learned about and assumed had something to do with detecting flying saucers. DSP also detected the flash of meteoroids exploding in the atmosphere. Both capabilities were practically useless for security purposes. By 1974 and 1975, however, several studies had shown that the satellite was also useful

at detecting tactical ballistic missiles. In addition, DSP also provided useful intelligence data on new Soviet missiles. By measuring rocket burn times and trajectories, this data could be used in conjunction with other data to assess new ICBM developments.

Satellites five through nine were essentially identical. But satellites 10 through 12 were to be multi-orbit satellites and also incorporated a number of significant modifications known as Performance Improvement Modifications. Collectively, they were to be referred to as the MOS/PIM satellites. The multi-orbit capability was intended to allow the satellites to operate in a Molniya-type highly elliptical orbit (HEO) to close gaps in coverage over northern regions. In this orbit, the satellite would swing high over the northern hemisphere and appear to "hang" there for a long time. DSP could not really see beyond 81° North from its geosynchronous spot and this orbit would allow it to view any missiles launched by submarines in the Arctic. No DSP satellites were ever flown in this higher orbit, however. Power and weight was increased on the new satellites, and they were hardened against nuclear radiation.

Over the next several years, more DSP satellites were launched into orbit to replace the early ones. For complicated reasons, the fifth and sixth satellites were placed in storage while later satellites flew. Virtually all of the satellites in orbit exceeded their design lifetimes by significant margins and 5 and 6 sat on the ground longer than anyone expected. They were designated 5R and 6R for "refit" and given upgraded systems, including much better infrared detectors.

One of the original reasons DSP had been developed was to warn of a Soviet FOBS attack. But FOBS had never emerged as a major threat. By the late 1970s, the Soviets had deployed only 18 of the SS-9 FOBS. Some observers even went so far as to attribute the halt in the deployment of FOBS to the early warning system, although other reasons, including FOBS' destabilizing nature and limited usefulness, also deserve credit. But whereas FOBS was less of a threat, there were other threats that the United States faced and DSP was soon adapted to deal with them.

In the early 1980s the Soviets navy launched the first vessels of the Kirov battlecruiser and Oscar submarine classes. Both the Kirov and the Oscars carried a new, massive anti-ship missile, the aptly named SS-N-19 Shipwreck. The Shipwreck could carry either a nuclear or conventional warhead, was powered by a turbojet and had a top speed of two and a half times the speed of sound.

The Soviet vessels could receive the locations of U.S. aircraft carriers from satellites and feed this information into the guidance systems of the missiles, which then burst out of the launch tubes on the deck of the ship, or from under the ocean, with the aid of two booster rockets. These booster rockets produced infrared signatures visible from space, but only for a short period of time. Such targets were labeled "Slow Walker," for their slow speed compared to ballistic missiles and satellites, and the newly improved sensors on satellites 5R and 6R could detect them. By designating a special Area Of Interest on the Earth and increasing the sensor's

sensitivity for this area, DSP could provide advance warning of an attack against U.S. or NATO ships. The Oscar was particularly worrisome because it was very difficult to track and the launch of a dozen missiles might be the first indication an admiral had that his fleet had been targeted.

For a defender, failing to shoot down the missile on the first try would be fatal. Detection, classification and notification of the potential target were vital in the short period of time available. A Navy collection team first visited Nurrungar in 1983 to look at DSP data and set up a warning system for Navy ships. The initial warning was apparently delivered by voice through a communications link from NORAD. Later the Navy began a program to develop a direct receiving capability onboard command ships. But in 1984 an even more pressing threat emerged and that was the one posed by SS-20 Saber mobile land-based missiles deployed in the Western USSR. The SS-20 carried three warheads and could reach all of Europe. Because it was launched from a wheeled vehicle, detecting it was particularly difficult since it could simply fade into the forest. In 1984, more SS-20 bases were built than in any other year. This prompted the Pentagon to take action. After a meeting of the Joint Chiefs of Staff in March 1984, the decision was made to move the Atlantic DSP satellite closer to Europe, where it could see potential SS-20 launch areas.

On Dec. 22, 1984, the 12th DSP satellite was launched into orbit and designated Flight 12 or F-12 for short. The satellite was actually 6R, the sixth DSP satellite built. It had sat in storage for nearly a decade and been highly modified in the meantime. It was called Flight 12 in orbit.

Flight 12 had an additional capability referred to as "second color." This was a set of mercury cadmium telluride detectors capable of detecting emissions in a different infrared band. They gave the sensor increased capability to detect Above-The-Horizon targets-mainly the second stages of ICBMs firing above the North Pole. This allowed them to more accurately determine the targets. To fully exploit this capability, F-12 would have to be located at the Indian Ocean spot so it could view the hot exhaust of the ICBMs tail on as they headed toward the United States, but this is not where it was initially placed.

F-12's new capabilities led to a more extensive period of testing. Whereas its simpler predecessor had been declared operational in less than two weeks, F-12 didn't become operational until five months later in May 1985. While it was being tested, two older DSP satellites were declared dead. During its testing, F-12 apparently took a new spot over the Pacific Ocean. By the time F-12 was operational, the overall satellite constellation was in decent shape. But the sensors for F-10 and the older satellites were already exceeding design life, so a decision was made to launch Flight 12's sibling, satellite 5R, on September 25, 1985. The satellite was shipped to the Cape in August and mated to its booster in preparation for launch. These plans were to crash headlong into a series of calamities that befell the U.S. military and civilian space programs in the mid 1980s.

In August 1985, a Titan 34D rocket carrying a KH-11 reconnaissance satellite, was launched from its pad at Vandenberg Air Force Base in California. It exploded while over the Pacific Ocean. In January 1986, the

space shuttle Challenger exploded. In April 1986, another Titan 34D exploded spectacularly above its launch pad at Vandenberg. It was carrying the last KH-9 reconnaissance satellite. The Titan and shuttle were the only vehicles capable of launching the DSP. Until the problems with both launch vehicles could be solved, satellite 5R was grounded.

In November 1987, satellite 5R was finally launched from the Cape, reaching orbit fourteen years after it had been delivered to the Air Force. Like its sister, Flight 13 took longer than expected to reach operational status, not achieving this until March 1988, when it relieved the Atlantic Ocean satellite.

Two of the older orbiting satellites were predicted to fail sometime during 1989, so Air Force Space Command made the decision to launch the first of a newer series of satellites, number 14. This satellite would fly atop the first of the new Titan 4 rockets. On June 14 it roared aloft and began its lengthy checkout period as the first of a new, and final class of DSP satellites known as "DSP-1" or "Block 14."

The DSP-1 was much bigger than its predecessors and still operates today. Each DSP-1 satellite weighs over 5,200 pounds, is 33 feet long, and has solar arrays providing at least 1,290 watts of power. They were designed to have a three-year design life with a five-year goal. The satellites also have improved hardening against the electromagnetic pulse produced by nuclear weapons.

F-14 took up position over the Pacific Ocean. But the new satellite took a

long time to declare operational due both to problems and poor planning. In November 1990, another satellite was launched into orbit. It was undergoing testing when DSP was called on for its first time in combat.

In August 1990, Iraq invaded Kuwait. President George Bush soon declared his intention to force Saddam Hussein's army out of Kuwait. The United States attacked Iraq in January 1991. Hussein's military was largely impotent in the wake of the allied arsenal deployed against him. He did have one weapon that could hit his opponents, however, the Scud missile. The Scud was a relatively short range missile and not the type of target that DSP had been designed for. It burned cooler and shorter than an ICBM. But the DSP was very capable and the Air Force was innovative. The sensitivity of the sensors was increased to detect the cooler Scuds that Iraq fired against Saudi Arabia and Israel. This posed the risk of increasing the number of false alarms-a problem that occurred early in the war but was corrected by its end. DSPs were heralded as a great asset during the war, since they provided the first warnings of attacks and accurate predictions of the targets. At one point, late in the war, Israeli planes were apparently sitting ready on the runway, prepared to launch an attack against Iraq when the next Scud missile was launched against them. But DSP detected the attack early and determined that it was headed toward Saudi Arabia. The Israelis did not launch their planes.

In November 1991, another satellite was launched, this time aboard the space shuttle Atlantis during STS-44. Nicknamed by the crew "DSP Liberty," the satellite was formally named Flight 16 upon release from the shuttle bay.

Other DSP satellites were launched in following years, culminating in the launch of DSP-19 in April 1999. Unfortunately, a problem with the IUS upper stage on that flight stranded the satellite in a useless orbit. DSP-20, scheduled for launch Monday, is undoubtedly going to replace a degraded satellite already in orbit. With the Cold War long over, however, the threat is greatly diminished.

Only three more DSP launches are planned after DSP-20. According to Richelson, the satellite's advocates wanted the Air Force to buy two more, but others were successful in arguing that the satellite design was too limited. These veterans of the Cold War will all be retired within the next decade, replaced by a far more capable satellite called the Space Based Infrared System, or SBIRS ("sibirs") for short.

Actually, most shooting stars disappear because they have been completely  
consumed. They are usually small to start with (a bright one can be as small  
as a grain of sand).

On the other hand, consider what the Tunguska meteorite did. It behaved more  
like a huge steam explosion than anything else.

Subject: Re: DSPs and "Fast/Slow Walkers"  
Status:

It's a nice article. The definition of "Fast Walker" is not too convincing. Momentary stationary flashes of sunlight from satellites would not seem very "fast" at all, especially given the lack of Doppler capability to instantaneously determine a velocity. That "meteoroids" are included confirms the fact that they must be "fast." (Cruise missiles are apparently included within "Slow Walker" definition, according to the article.) Day's article doesn't say anything about duration, triangulation by multiple DSP's, etc. Nothing about the strange Fast Walker event of May 5, 1984, which puzzles even Phil Klass, at least a little.

Secret satellites: Three decades of DSP in orbit

By Dwayne A. Day

For FLORIDA TODAY

In the mid-1960s the Soviet Union began developing a powerful new weapon known as the Fractional Orbital Bombardment System, or "FOBS" for short. FOBS consisted of a nuclear warhead on a large rocket, capable of being launched in any direction. The ultimate nightmare for American generals was that a Soviet FOBS could be launched over the South Pole and strike the U.S. totally undetected, destroying NORAD, the Pentagon and the White House before a response could be made.

Satellite systems presented the best way of detecting FOBS and offering early warning that an attack was under way. In addition, satellites using infrared telescopes offered the ability to detect ICBM launches far earlier than ground-based radars. Hence, the Defense Support Program - DSP - was born. These secretive satellites have been orbiting the earth for nearly three decades, and doing many things that their originators never envisioned.

In the early 1960s, the Air Force had tried to develop an infrared satellite system known as MIDAS. MIDAS was to detect the hot exhaust of Soviet ICBMs and provide warning that the United States was under attack. The system was to consist of a constellation of satellites in low earth orbit. One or more satellites would always be in view of Soviet ICBM launch sites.

Jeffrey Richelson, in his recent book on MIDAS and DSP, *America's Space Sentinels*, described the history of these early efforts. According to Richelson, MIDAS ran into technical problems that were gradually hard to maintain. After a series of troubled launches, MIDAS was reduced to a test program and eventually canceled.

In November 1965, the Air Force began developing technology for a new early warning system to operate in geosynchronous orbit. Such a system would only require two or three satellites instead of a dozen or more. It would use a powerful telescope to scan the Earth. This program was given the classified designation "Program 266."

In response to an Air Force request, three proposals were submitted by two contractor teams, Martin/Raytheon and Aerojet-General/TRW, and one solo contractor, Lockheed Missiles and Space Company. In November 1966, the project was renamed Program 949 and shortly thereafter the Air Force eliminated the Martin/Raytheon team. The Aerojet/TRW team was soon declared the winner and awarded a contract for \$104.5 million for two operational satellites and one spare. The satellites would be launched aboard Titan 3 rockets at Cape Canaveral.

While development and construction of the satellites started, the Air Force and Department of Defense determined that an eastern hemisphere ground station would be needed to receive data from the satellite that would operate over the Indian Ocean, observing Soviet and Chinese missile fields. The ground station was where the data would be processed and transmitted to the United States via undersea cable or communications satellite. Australia was identified as the logical site of such a station, since it had served as the base for a ground station for U.S. signals intelligence satellites beginning in 1968.

Another site in the United States, Buckley Air National Guard Base near Denver, Colorado, was selected for the western satellite that would operate over the Pacific Ocean. Eventually a third station, in Germany, would be built. The identity of these ground stations was kept secret for many years. The Australian station was finally closed in the late 1990s. In June 1969, due to a security breach, the project underwent yet another name change, this time from Program 949 to Program 647. It also was finally given an

unclassified cover name that was equally obscure: the Defense Support Program, or DSP.

The satellite itself weighed about 2,000 pounds and was 23 feet long and 10 feet wide. It had a 12-foot long Schmidt infrared telescope with a linear array of 2,048 lead sulfide detectors that detected infrared energy. The satellite had an 18-month design life. It was designed to rotate six times per minute. The telescope was set slightly off-angle to the rest of the satellite. Thus, as the satellite rotated, the sensor "scanned" the entire face of the Earth, sweeping it like the second hand on the face of a clock, returning to any given point six times each minute. The sensor provided below-the-horizon coverage by spotting the missile's exhaust plume against the background of the Earth. By analyzing the temperature, location and trajectory of a hot infrared source, the satellite could build up both a description of the type of missile as well as its target.

The satellites also carried sensors for detecting nuclear explosions in the atmosphere. The first DSP satellite was launched from Cape Canaveral on Nov. 6, 1970 atop a powerful Titan 3C rocket. Despite the fact it was a secret satellite, a bank in Cocoa Beach posted a message on its sign before the launch: "Spy Satellite Goes 5 47 AM Friday Titan 3 Rocket." The rocket initially performed as planned, but suffered a problem late in the flight when its Transtage upper stage misperformed. This resulted in the satellite, known as Flight 1 or F-1, being placed into an elliptical orbit short of its goal. The satellite could not be used to observe Soviet missile launches from this orbit.

This was a devastating setback for the engineers and the Air Force officers who had worked so hard to build DSP. But quick thinking program managers were able to turn failure into a partial success. They heard about an upcoming Minuteman launch scheduled at the Cape and hurriedly requested that the Air Force delay the launch until their satellite was overhead. The Air Force did and the first DSP satellite was able to observe the Minuteman launch from the Cape. DSP worked.

A second satellite was launched from the Cape on May 6, 1971. This time the booster performed normally and after the Transtage burned out and separated, the spacecraft slowly came to life, deploying its solar panels and spinning up to the proper speed. It was named Flight-2 or F-2. By May 23, 1971 it was turned over to the newly built ground station at Nurrungar, Australia. The satellite's initial location was 65° East, over the Indian Ocean, where it could monitor Soviet and Chinese ballistic missile fields. A third satellite was launched on March 1, 1972. It became the first western hemisphere satellite and was initially stationed over the Equator, over Ecuador. Shortly after going into operation it suffered several minor problems, but nothing that could not be fixed or worked around.

Satellite F-4, the last of what were called the Phase I satellites, was launched successfully on June 12, 1973. F-4 was actually the first satellite to be completed and had served as the qualification satellite, undergoing an extensive series of tests of its systems before being overhauled and prepared as a flight-qualified spacecraft. It was the first satellite to take up position over the Pacific Ocean, apparently at 105° West. This

marked a change in the positions for the initial constellation.

Satellites F-2 and F-3 had occupied stations at 65° East and 80° West respectively. This had given them contiguous coverage over the entire Atlantic Ocean, the Soviet and Chinese missile fields, and most of the eastern Pacific Ocean. But until a third operational satellite could be placed in orbit, the western Pacific was uncovered. Soviet submarine-launched ballistic missiles had increasing ranges, which would allow them to be launched from the western Pacific undetected by DSP. But once F-4 achieved orbit, this gap in coverage could be closed.

By late June 1971, initial hardware production was started on the first of four Phase II satellites. The satellites were not to be significantly different from their predecessors. Primary improvements included an increase in reliability and minor improvements in various systems, particularly the main sensor, which would have the capability of scanning the entire field of view instead of leaving a hole in the center of each scan, like a donut. These changes resulted in an increase in weight. Power was also increased. More importantly, satellite lifetime was doubled to three years. Although the Air Force did not realize it at this time, the existing satellites would exceed their design lifetimes by a considerable margin.

By late June 1973, the four DSP satellites in orbit had detected a total of 1,014 missile launches. They had proven quite successful in their mission and had relieved some of the tension that was always present during the Cold War by dramatically reducing the chances of a surprise ICBM attack.

DSP also presented some surprises to its operators. Early on, the satellites began detecting infrared returns within and above the atmosphere. Some of these returns were caused by sunlight reflecting off of satellites and these events were soon designated "Fast Walkers" which UFO buffs later learned about and assumed had something to do with detecting flying saucers. DSP also detected the flash of meteoroids exploding in the atmosphere. Both capabilities were practically useless for security purposes. By 1974 and 1975, however, several studies had shown that the satellite was also useful at detecting tactical ballistic missiles. In addition, DSP also provided useful intelligence data on new Soviet missiles. By measuring rocket burn times and trajectories, this data could be used in conjunction with other data to assess new ICBM developments.

Satellites five through nine were essentially identical. But satellites 10 through 12 were to be multi-orbit satellites and also incorporated a number of significant modifications known as Performance Improvement Modifications. Collectively, they were to be referred to as the MOS/PIM satellites. The multi-orbit capability was intended to allow the satellites to operate in a Molniya-type highly elliptical orbit (HEO) to close gaps in coverage over northern regions. In this orbit, the satellite would swing high over the northern hemisphere and appear to "hang" there for a long time. DSP could not really see beyond 81° North from its geosynchronous spot and this orbit would allow it to view any missiles launched by submarines in the Arctic. No DSP satellites were ever flown in this higher orbit, however. Power and weight was increased on the new satellites, and they were hardened against

nuclear radiation.

Over the next several years, more DSP satellites were launched into orbit to replace the early ones. For complicated reasons, the fifth and sixth satellites were placed in storage while later satellites flew. Virtually all of the satellites in orbit exceeded their design lifetimes by significant margins and 5 and 6 sat on the ground longer than anyone expected. They were designated 5R and 6R for "refit" and given upgraded systems, including much better infrared detectors.

One of the original reasons DSP had been developed was to warn of a Soviet FOBS attack. But FOBS had never emerged as a major threat. By the late 1970s, the Soviets had deployed only 18 of the SS-9 FOBS. Some observers even went so far as to attribute the halt in the deployment of FOBS to the early warning system, although other reasons, including FOBS' destabilizing nature and limited usefulness, also deserve credit. But whereas FOBS was less of a threat, there were other threats that the United States faced and DSP was soon adapted to deal with them.

In the early 1980s the Soviets navy launched the first vessels of the Kirov battlecruiser and Oscar submarine classes. Both the Kirov and the Oscars carried a new, massive anti-ship missile, the aptly named SS-N-19 Shipwreck. The Shipwreck could carry either a nuclear or conventional warhead, was powered by a turbojet and had a top speed of two and a half times the speed of sound.

The Soviet vessels could receive the locations of U.S. aircraft carriers

from satellites and feed this information into the guidance systems of the missiles, which then burst out of the launch tubes on the deck of the ship, or from under the ocean, with the aid of two booster rockets. These booster rockets produced infrared signatures visible from space, but only for a short period of time. Such targets were labeled "Slow Walker," for their slow speed compared to ballistic missiles and satellites, and the newly improved sensors on satellites 5R and 6R could detect them. By designating a special Area Of Interest on the Earth and increasing the sensor's sensitivity for this area, DSP could provide advance warning of an attack against U.S. or NATO ships. The Oscar was particularly worrisome because it was very difficult to track and the launch of a dozen missiles might be the first indication an admiral had that his fleet had been targeted.

For a defender, failing to shoot down the missile on the first try would be fatal. Detection, classification and notification of the potential target were vital in the short period of time available. A Navy collection team first visited Nurrungar in 1983 to look at DSP data and set up a warning system for Navy ships. The initial warning was apparently delivered by voice through a communications link from NORAD. Later the Navy began a program to develop a direct receiving capability onboard command ships. But in 1984 an even more pressing threat emerged and that was the one posed by SS-20 Saber mobile land-based missiles deployed in the Western USSR. The SS-20 carried three warheads and could reach all of Europe. Because it was launched from a wheeled vehicle, detecting it was particularly difficult since it could simply fade into the forest. In 1984, more SS-20 bases were built than in any other year. This prompted the Pentagon to take action. After a meeting

of the Joint Chiefs of Staff in March 1984, the decision was made to move the Atlantic DSP satellite closer to Europe, where it could see potential SS-20 launch areas.

On Dec. 22, 1984, the 12th DSP satellite was launched into orbit and designated Flight 12 or F-12 for short. The satellite was actually 6R, the sixth DSP satellite built. It had sat in storage for nearly a decade and been highly modified in the meantime. It was called Flight 12 in orbit. Flight 12 had an additional capability referred to as "second color." This was a set of mercury cadmium telluride detectors capable of detecting emissions in a different infrared band. They gave the sensor increased capability to detect Above-The-Horizon targets-mainly the second stages of ICBMs firing above the North Pole. This allowed them to more accurately determine the targets. To fully exploit this capability, F-12 would have to be located at the Indian Ocean spot so it could view the hot exhaust of the ICBMs tail on as they headed toward the United States, but this is not where it was initially placed.

F-12's new capabilities led to a more extensive period of testing. Whereas its simpler predecessor had been declared operational in less than two weeks, F-12 didn't become operational until five months later in May 1985. While it was being tested, two older DSP satellites were declared dead. During its testing, F-12 apparently took a new spot over the Pacific Ocean. By the time F-12 was operational, the overall satellite constellation was in decent shape. But the sensors for F-10 and the older satellites were already exceeding design life, so a decision was made to launch Flight 12's sibling,

satellite 5R, on September 25, 1985. The satellite was shipped to the Cape in August and mated to its booster in preparation for launch. These plans were to crash headlong into a series of calamities that befell the U.S. military and civilian space programs in the mid 1980s.

In August 1985, a Titan 34D rocket carrying a KH-11 reconnaissance satellite, was launched from its pad at Vandenberg Air Force Base in California. It exploded while over the Pacific Ocean. In January 1986, the space shuttle Challenger exploded. In April 1986, another Titan 34D exploded spectacularly above its launch pad at Vandenberg. It was carrying the last KH-9 reconnaissance satellite. The Titan and shuttle were the only vehicles capable of launching the DSP. Until the problems with both launch vehicles could be solved, satellite 5R was grounded.

In November 1987, satellite 5R was finally launched from the Cape, reaching orbit fourteen years after it had been delivered to the Air Force. Like its sister, Flight 13 took longer than expected to reach operational status, not achieving this until March 1988, when it relieved the Atlantic Ocean satellite.

Two of the older orbiting satellites were predicted to fail sometime during 1989, so Air Force Space Command made the decision to launch the first of a newer series of satellites, number 14. This satellite would fly atop the first of the new Titan 4 rockets. On June 14 it roared aloft and began its lengthy checkout period as the first of a new, and final class of DSP satellites known as "DSP-1" or "Block 14."

The DSP-1 was much bigger than its predecessors and still operates today. Each DSP-1 satellite weighs over 5,200 pounds, is 33 feet long, and has solar arrays providing at least 1,290 watts of power. They were designed to have a three-year design life with a five-year goal. The satellites also have improved hardening against the electromagnetic pulse produced by nuclear weapons.

F-14 took up position over the Pacific Ocean. But the new satellite took a long time to declare operational due both to problems and poor planning. In November 1990, another satellite was launched into orbit. It was undergoing testing when DSP was called on for its first time in combat.

In August 1990, Iraq invaded Kuwait. President George Bush soon declared his intention to force Saddam Hussein's army out of Kuwait. The United States attacked Iraq in January 1991. Hussein's military was largely impotent in the wake of the allied arsenal deployed against him. He did have one weapon that could hit his opponents, however, the Scud missile. The Scud was a relatively short range missile and not the type of target that DSP had been designed for. It burned cooler and shorter than an ICBM. But the DSP was very capable and the Air Force was innovative. The sensitivity of the sensors was increased to detect the cooler Scuds that Iraq fired against Saudi Arabia and Israel. This posed the risk of increasing the number of false alarms-a problem that occurred early in the war but was corrected by its end. DSPs were heralded as a great asset during the war, since they provided the first warnings of attacks and accurate predictions of the targets. At one point, late in the war, Israeli planes were apparently

sitting ready on the runway, prepared to launch an attack against Iraq when the next Scud missile was launched against them. But DSP detected the attack early and determined that it was headed toward Saudi Arabia. The Israelis did not launch their planes.

In November 1991, another satellite was launched, this time aboard the space shuttle Atlantis during STS-44. Nicknamed by the crew "DSP Liberty," the satellite was formally named Flight 16 upon release from the shuttle bay.

Other DSP satellites were launched in following years, culminating in the launch of DSP-19 in April 1999. Unfortunately, a problem with the IUS upper stage on that flight stranded the satellite in a useless orbit. DSP-20, scheduled for launch Monday, is undoubtedly going to replace a degraded satellite already in orbit. With the Cold War long over, however, the threat is greatly diminished.

Only three more DSP launches are planned after DSP-20. According to Richelson, the satellite's advocates wanted the Air Force to buy two more, but others were successful in arguing that the satellite design was too limited. These veterans of the Cold War will all be retired within the next decade, replaced by a far more capable satellite called the Space Based Infrared System, or SBIRS ("sibirs") for short.

Thankfully most are very small, as you point out. There are many others that merely pass through the atmosphere at a tangent angle and travel off into space again, which would also cause them to disappear as far as the ground observer is concerned.

I believe that most meteorites that actually hit the ground are iron, which doesn't easily burn up. In all the photos of houses and cars that have been hit by a falling meteorite (and that number is admittedly rather small), I have never seen one that indicated that a fire had been started after it struck the ground. I would suspect that the fragment(s) would remain too hot to touch for a while, and if made of iron they might retain the heat longer, but they're temperature wouldn't remain at the flash point of the material around them.

>On the other hand, consider what the Tunguska meteorite did. It behaved more  
>like a huge steam explosion than anything else.

I believe the current theory is that the Tunguska event was piece of water filled comet, which would explain the steam explosion and lack of meteor crater.

As someone else has mentioned, there was a post on the Current Encounters list a while back that dealt with this subject, and I am trying to locate it for reference. It would be good to hear from an expert in the field about meteorites and their temperature when they hit the ground, rather than waste a lot of bandwidth on an issue that should be easily resolved.

<<The definition of "Fast Walker" is not too convincing. Momentary stationary flashes of sunlight from satellites would not seem very "fast" at all, especially given the lack of Doppler capability to instantaneously determine a velocity. >>

The Iridium flashes I've seen from my home are long enough in duration to show significant angular motion, so objects seen from orbit with finer angular resolution would also show high speed even if only from angular displacement. Since the sun is half a degree wide, the arc over which the flash stays visible would be comparable -- it's not instantaneous, as it would be for a point illumination source.

There's an interesting on-line article from 'Airman' magazine,  
at:

<http://www.af.mil/news/airman/1299/ballon.htm>

It's a feature on balloon pioneer, Captain Joe W. Kittinger.

I must confess not having read all of the USAF's `Roswell Report:  
Case Closed', in which I believe Kittinger is suggested as the  
`red-haired Captain' sometimes mentioned in the Roswell folklore.

If I recall, the local mortician, Glenn Dennis, was one person  
who referred to this `Captain' - Dennis has since of course been  
hugely discredited.

I note in this article Kittinger reportedly confirms, "the so-  
called 'alien' that locals saw whisked away in an ambulance was  
actually one of his very human teammates injured during a balloon  
crash".

Was this known prior to the Airman article?

"...at Kittinger's home in Orlando, a mat lies at the front door  
adorned with little green men and flying saucers, greeting  
`visitors' with the words - `Welcome UFO Crews'.

Says Kittinger, `Well, just in case I'm wrong'."

A very sensible precaution.

James Easton.

Subject: Re: Re: DSPs and "Fast/Slow Walkers"Status:

Hi Jim,

Thanks for your comments. A half degree solar reflection would mean a half degree change in satellite orbit approximately, or 1/720th of a typical LEO of say about 90 minutes (rounded for simplicity), or 1/8 of a minute of time (7.5 seconds). However, the early DSP satellites had a scan rate of only once every 10 seconds, so it seems a second solar reflection would have been missed for LEO satellites and thus no indication of 18,000 mph high speed. Reversing the calculation would require that orbits must be slower than 120-minute periods in order for two solar reflections to possibly occur within the field of view of the DSP's. That would drastically cut down the numbers since only a small fraction of earth satellites have longer periods than 120 minutes, and of course they would have to be angled just right for a reflection to hit a DSP out at 20,000+ miles. It seems that DSP analysts would be able to immediately identify which of the few satellites in such high orbits were causing such solar reflections and deduct them from the critical database -- with positive ID's so easy it is difficult to understand why these satellite solar reflections would be included as seemingly mysterious "Fast Walkers."

It's going to take longer to cite that case. The book I thought it was in actually had another similar case where a "meteor" went through a car windshield and struck a child. But close inspection of the photo shows the object to be a chunk of pavement from a pothole, probably thrown up by the vehicle in front. That means that I am going to have to search all of my books to find the correct case.

I did find another case, where a meteorite set fire to a coffee crop in Honduras on 11/22/96. It appears in the March-April 1997 issue of UFO Magazine on page 16.

@ Julia speaks of "stealth fighter", that's the F-117 "Nighthawk"  
@ which is not that big. But then she speaks of "Edwards Air Force  
@ Base" and of "stealth planes" from this base. I may be wrong, but  
@ I think that there are no F-117 (at least usually) at Edwards AFB.  
@ Initially they were at Tonopah (Nevada), and then were dispatched  
@ in some other bases South-West of USA, but not in California  
@ (according to my memories; maybe John Burtenshaw or David can  
@ confirm or correct me). On the other hand, I think that for some  
@ time some stealth bombers B-2 "Spirit" have been based at  
@ Edwards AFB. So maybe Julia thinks in fact of the B-2, which is  
@ real big (wingspan a little more than 52 meters). If the craft  
@ she saw (or said she saw) had this size, it would have been probably  
@ higher than 25 feet above her.

RELEASE: 00-150

NASA charts course to sail to the stars  
on largest spacecraft ever built

NASA is setting sail for the stars - literally. NASA's Marshall Space Flight Center in Huntsville, Ala., is developing space sails technology to power a mission beyond our solar system.

"This will be humankind's first planned venture outside our solar system," said Les Johnson, manager of Interstellar Propulsion Research at the Marshall Center. "This is a stretch goal that is among the most audacious things we've ever undertaken."

The interstellar probe will travel over 23 billion miles - 250 astronomical units - beyond the edge of the solar system. The distance from Earth to the Sun, 93 million miles, is one astronomical unit. For perspective, if the distance from Earth to the Sun equaled one foot, Earth would be a mere 6 inches from Mars, 38 feet from Pluto, 250 feet from the boundaries of the solar system, and a colossal 51 miles from the nearest star system, Alpha Centauri.

This first step beyond our solar system en route to the stars has an estimated trip time of 15 years.

Proposed for launch in a 2010 time frame, an interstellar probe - or precursor mission, as it's often called - will be powered by the fastest spacecraft ever flown. Zooming toward the stars at 58 miles per second, it will cover the distance from New York to Los Angeles in less than a minute. It's more than 10 times faster than the Space Shuttle's on-orbit speed of 5 miles per second.

Traveling five times faster than Voyager - a spacecraft launched in 1977 to explore our solar system's outer limits - an interstellar probe launched in 2010 would pass Voyager in 2018, going as far in eight years as Voyager will have journeyed in 41 years.

Johnson says transportation is quite possibly the toughest challenge with interstellar missions because they have to go so far, so fast. "The difficulty is that rockets need so much fuel that they can't push their own weight into interstellar space. The best

option appears to be space sails, which require no fuel," he said.

Thin, reflective sails could be propelled through space by sunlight, microwave beams or laser beams - just as the wind pushes sailboats on Earth. Rays of light from the Sun would provide tremendous momentum to the gigantic structure. The sail will be the largest spacecraft ever built, spanning 440 yards - twice the diameter of the Louisiana Superdome.

"Nothing this big has ever been deployed in space. We think we know how to do it, but we're in the beginning phases of turning a concept into a real design," Johnson said.

Researchers are optimistic about recent breakthroughs with strong, lightweight composite materials. A leading candidate for sails is a carbon fiber material whose density is less than one-tenth ounce per square yard - the equivalent of flattening one raisin to the point that it covers a square yard. In space the material would unfurl like a fan when it's deployed from an expendable rocket.

The Marshall Center is leading NASA's transportation research for interstellar probes. Engineers at Marshall are conducting laboratory experiments to evaluate and characterize materials for space sails. Materials will be exposed to harsh conditions in a simulated space environment to test their performance and durability in extremely hot and cold temperatures.

The emphasis of the current research effort is on the interstellar precursor missions designed to set the stage for missions to other star systems later this century.

Marshall is partnering with NASA's Jet Propulsion Laboratory in Pasadena, Calif. The Jet Propulsion Laboratory has overall responsibility for NASA's interstellar missions and the Marshall Center is responsible for developing transportation systems for the missions. Marshall's effort is part of its Advanced Space Transportation Program, NASA's core technology program for all space transportation. The Advanced Space Transportation Program is pushing technologies that will dramatically increase the safety and reliability and reduce the cost of space transportation.

Yes. All of it is in the Roswell Report:Case Closed. This was also discussed in a History channel show on Roswell.

Hi All

>@ in some other bases South-West of USA, but not in California  
>@ (according to my memories; maybe John Burtenshaw or David can  
>@ confirm or correct me).

I can find no record of the F-117 being at Edwards during its testing phase, the first experimental a/c ( XST-1) was shipped from Palmdale to Groom Lake during 1977. During June 1981 the F-117 went to Tonopah and finally to Holloman AFB (1983) finally being revealed to the public in November 1988. However Edwards have had F-117s there since 1998 undergoing advanced avionics tests.

Interestingly, in 1995 Lockheed Martin briefed the British Ministry of Defense on a proposed derivative of the Air Force's F-117B dubbed the F-117B (B for British, or F-117C by some) for the RAF. It was suggested to meet the Staff Target (Air) 425 deep-strike requirement that is currently fulfilled by the Panavia Tornado GR.Mk4, which is scheduled for retirement by the end of this century. The F-117C would feature the F-22 style clear canopy, advanced ungridded B-2 type inlets, and an improved powerplant. The proposed RAF F-117C could potentially have GEC-Marconi supplied avionics, Eurojet EJ200 engines, and some structural contents subcontracted to British Aerospace. This might explain the BAE "Skunk Works" at Warton.

When did the infamous Boscombe Down crash occur?

I do not know if this proposal was accepted or was rejected on cost grounds. It may well be hidden in the depths of MoD records under a codename.

Chris Gibson: When did the word Havian first appear?

Cheers

John

Hello Tim,

I may have a few questions for you concerning this case. I'm

going to do an interview with the witnesses tomorrow (Saturday)  
so I should have more information.

Todd

"The reason why the flying-saucer mystery has been-to put it mildly-so exasperating, lies in the fact that we are all blind men, nor can we hope to meet a sighted traveler who can help us. But perhaps it is the beginning of knowledge to recognize our blindness."

Aime' Michel - "Flying Saucers and the Straight Line Mystery"

## Voyager Newsletter - Issue No. 11

### CONTENTS

1. UFO World.
2. The 'Rendlesham Forest' UFO Encounters - Copy of Original, Key Testimony and Sketches Now Published.
3. Trent Photographs - New High-Res Scans Available.
4. UFO Research List.

O0O~O0O~O0O~O0O

1. UFO World.

I'm please to announce that UFO World is now on-line at:

[www.ufoworld.co.uk](http://www.ufoworld.co.uk)

This contains all of my research material previously available on the Internet and the site will be continuously updated and considerably expanded, encompassing the most significant raw data and objective investigations from researchers.

All links to other sources have been verified and it's recommended that anyone interested in the topic should spend some time browsing those sites listed.

Especially advocated this month are:

The Anomalist -  
<http://www.anomalist.com/>

Fortean Times -  
<http://www.forteantimes.com/>

UFOCOM - UFO research in Belgium (Interesting material re the Belgian 'Triangular UFO' sightings)  
<http://195.74.196.113/UfocomHq/usmenu.htm>

CIPFANI - The view from a Brazilian organisation  
<http://users.task.com.br/cipfani/>

Video footage from around the world  
<http://wkweb5.cableinet.co.uk/dledger/video.htm>

Please update any links to my previous web site, or feel free to link to the material at UFO World and let me know of any sites you would like added.

UFO World will contain truly significant evidence relating to the subject of UFOs - we're looking for answers, not mysteries.

000~000~000~000

## 2. The 'Rendlesham Forest' UFO Encounters - Copy of Original, Key Testimony and Sketches Now Published.

When I acquired copies of the original witness testimonies, I provided them to various researches with an long-term interest in this classic British mystery. The pivotal statement of Airman Ed Cabansag was also made available on my web site.

Now, the equally important affidavit and accompanying sketches from Staff-Sergeant Jim Penniston are being published and for the first time ever, the UFO which Penniston originally portrayed can be seen.

Although I have previously confirmed details of this depiction, it may still be something of a surprise for those more familiar with the more celebrated triangular UFO of Rendlesham lore.

The material now available at UFO World is as follows:

<http://www.ufoworld.co.uk/penn1.gif>

The cover page of Penniston's report. This is marked 'Eyes Only' for Lt. Col. Halt. It's crucial to note that the testimonies of Cabansag, Penniston, Airman 1st Class John Burroughs and others were not requested and obtained by Halt until the beginning of January, 1981, a full week after the initial incident they had been involved with.

Halt has explained this was due to the holiday/leave period.

<http://www.ufoworld.co.uk/penn2.gif>

Penniston's full statement.

There are some key points therein.

Penniston does describe observing at the time a "mechanical" object within Rendlesham forest. There's no debate about this as it is verified in the statement of Master-Sergeant J. D. Chandler, who was monitoring radio communications.

Penniston also confirms he was never closer to the unidentified object than 50 meters. This is a huge anomaly given his accounts in later years of spending some twenty minutes examining and touching the object, plus documenting the strange symbols on its surface.

Completely absent from this statement is any mention of having next pursued an unidentified light for some two miles, before realising it originated from a nearby lighthouse, almost certainly at Orfordness [Orford Ness].

That fact is documented in all other statements.

<http://www.ufoworld.co.uk/penn3.gif>

Penniston's first diagram.

As noted in his statement, this shows the scene as viewed from 'east gate' sentry point, looking down east gate road towards the forest.

For comparison, see the photograph I took of this viewpoint:

[http://www.ufoworld.co.uk/eg\\_road.jpg](http://www.ufoworld.co.uk/eg_road.jpg)

It's part of the article on UFO World at:

<http://www.ufoworld.co.uk/rend3.htm>

<http://www.ufoworld.co.uk/penn4.gif>

A map of the route which the patrol, consisting of Burroughs, Cabansag and Penniston, took through the forest. The point at which they left their vehicle and continued on foot is shown and

this agrees with the evidence which had been gathered from other sources.

<http://www.ufoworld.co.uk/penn5.gif>

The scene when the object was viewed at closer range within Rendlesham forest.

I can't make out that writing in the middle, with an arrow pointing towards the lights/object within the trees - any suggestions are welcome.

<http://www.ufoworld.co.uk/penn6.gif>

The UFO...

Note that within the insert, Penniston apparently questions the light sequence. This would be consistent with the object never being viewed at close range and that's the scenario reported by all other participant accounts.

Subsequently, Penniston's recollections differed considerably, as emphasised in the illustrations which he seemingly first produced in public circa 1997. These were published on the Microsoft Network's UFO forum and later in an article I wrote for UFO Magazine (UK).

Apparently claimed to be copies of the sketches from his original notebook and drawn at the time he closely examined a triangular craft at leisure, these can be seen at:

<http://www.ufoworld.co.uk/jpdraw1.jpg>

The triangular craft.

<http://www.ufoworld.co.uk/jpdraw1.jpg>

The triangular craft as viewed side-on and related ground indentations.

<http://www.ufoworld.co.uk/jpdraw3.jpg>

A copy of the insignia allegedly 'etched' into the craft's surface.

To help understand all of this in context, there's detailed, factual background material on UFO World.

It can be directly accessed via:

<http://www.ufoworld.co.uk/rendlsham.htm>

or by the redirected URL:

[www.rendlesham.com](http://www.rendlesham.com)

The background articles highlight numerous evidential anomalies and questions which remain unanswered.

Most obviously, how can Penniston have examined and sketched the craft/insignia with such detail when it's acknowledged in his testimony that he was never closer than 50 meters - how could he have drawn the insignia [or indeed anything] with perfect lines and circles, in the dark of night and the middle of a dense forest!

How can his later accounts be equated with that of Burroughs, his partner in the forest, when Burroughs is on records as confirming, "I never saw anything metallic or anything hard".

And why were we led to believe for so many years by Burroughs, Penniston and Halt, that Orfordness lighthouse would never have fooled any of the participants, when it was known all along that it was at least partly responsible for the UFO scare.

Although Col. Halt has on more than one occasion been contacted and asked to comment on these matters, he has not responded.

Nonetheless, this is UFO history and an exclusive insight into the UK's most famous UFO case.

O0O~O0O~O0O~O0O

### 3. Trent Photographs - New High-Res Scans Available.

One of the most highly regarded UFO cases in the US remains the 'Trent' photographs.

Some background material can be seen at:

<http://www.ncas.org/condon/case46.htm>

A sceptical appraisal is offered by Robert Sheaffer at 'The Debunkers Domain':

<http://www.debunker.com/trent.html>

Central to the evidence is of course the photographs and I'm grateful to Bruce Maccabee for providing copies of the highest quality images yet available. I believe these are scans of the original negatives and they can be viewed on UFO World at:

<http://www.ufoworld.co.uk/trent1.jpg>

<http://www.ufoworld.co.uk/trent2.jpg>

O0O~O0O~O0O~O0O

The 'UFO Research List' (UFORL) is a moderated, discussion forum for related topics which can be evidenced to have a \_scientific\_ foundation, encompassing 'black projects'. There are currently around 100 subscribers.

To join UFORL, you can sign up from UFO World's home page or by sending a blank e-mail, with a blank subject line, to:

[UFORL-subscribe@listbot.com](mailto:UFORL-subscribe@listbot.com)

You will then be sent a verification message and a copy of the list 'housekeeping rules'.

O0O~O0O~O0O~O0O

Although this newsletter is shorter than usual, the content is of particular importance and further revelations will be held over until the next issue!

Back issues can be obtained free of charge from UFO World's home page.

James Easton,  
Editor.

I have updated the list of world-wide UFO organisations at:

<http://www.ufoworld.co.uk/org.htm>

Please let me know of any suggested amendments or additions.

I recall a web site for a UFO related organisation in Turkey - does anyone have details?

I'm delighted to include NUFORA and wonder what the situation is now with BUFORA.

Do they remain in any way a credible source within British Ufology?

Have they ceased publishing UFO Times?

Just curious - what's the size of BUFORA's current membership?

Any related comments are welcome.

Whatever happened to the following, notable on-line sources:

ParaNet Archive

<ftp://grind.isca.uiowa.edu/info/paranet/infopara/>

Microsoft Network's UFO Forum

<http://forums.msn.com/UFO>

United Kingdom UFO Network

<http://www.holodeck.demon.co.uk>

Continuum Magazine

<http://www.paranetinfo.com/html/continuum.html>

Are issues of 'The Crop Watcher' still available?

I might be able to provide an on-line home for any relevant material and would particularly like to acquire the considerable 'Alien Autopsy' material which Mark Center used to host.

If I could be of help, please contact me.

James Easton.

Subject: Re: Hot metal balls fall from sky in South AfricaStatus:

In a message dated 5/12/00 8:57:15 AM Hawaiian Standard Time, steve@konsulting.com writes:

<< It would be good to hear from an expert in the field about meteorites and their temperature when they hit the ground, rather than waste a lot of bandwidth on an issue that should be easily resolved. >>

Interesting discussion about meteorites and fires. One of my experiences as an amateur astronomer was observing meteors and talking to those who were involved in meteorite recoveries. I also was on several tektite hunts in Georgia. Over the years, I have read a lot on the subject and I do know Harold Povenmire, who wrote a book on the subject (Unfortunately my copy is in a storage area far from my present location). I don't recall Hal ever discussing fires being caused by meteorites. I did a bit of searching on the web for those that want to look into the subject.

The Meteoritical Society

<http://www.uark.edu/campus-resources/metsoc/index1.htm>

Meteorite Central

<http://www.meteoritecentral.com/>

SEDS site

<http://sed.s.lpl.arizona.edu/nineplanets/nineplanets/meteorites.html>

American Meteor Society has this in the FAQ section on fireballs

<http://www.amsmeteors.org/faqf.html>

"9. Are meteorites "glowing" hot when they reach the ground?

Probably not. The ablation process, which occurs over the majority of the meteorite's path, is a very efficient heat removal method, and was effectively copied for use during the early manned space flights for re-entry into the atmosphere. During the final free-fall portion of their flight, meteorites undergo very little frictional heating, and probably reach the ground at only slightly above ambient temperature.

For the obvious reason, however, exact data on meteorite impact temperatures is rather scarce and prone to hearsay. Therefore, we are only able to give you an educated guess based upon our current knowledge of these events."

I don't consider myself an expert in the field but familiar with the topic.

I just do not know of any meteorites known to have cause a fire due to their heat. It is also interesting to note is that most meteorites are not iron but of the stony type.

<P>Does anybody have information that the F-22 has hover capability? When the contract was announced that the F-22 was going into production (this was about 2 -3 years ago?) CNN Headline News showed a simulated clip showing the F-22 hovering 2 to 3 aircraft length above the ground, clearly bobbing up and down. The simulation showed it hovering over a clearing that had trees around the it that were higher in elevation than the F-22. Then it showed a transition to normal flight. But if I recall correctly, the transition was in a strange manner. It tipped its nose UP and started climbing and accelerating forward and skyward. The clip was shown only a few times. I tried to tape it but it never came on again. Ever since then I have been keeping my eye open to anything that states that the F-22 can hover but have not found anything. Was the stock footage given to CNN by error? Meaning that the hover capability of the F-22 is secret?

<p>John Burtenshaw wrote:

<blockquote TYPE=CITE>UFO Research List - <a href="http://www.ufoworld.co.uk/">http://www.ufoworld.co.uk/</a>

<p>Hi All

<p>>@ in some other bases South-West of USA, but not in California  
<br>>@ (according to my memories; maybe John Burtenshaw or David can  
<br>>@ confirm or correct me).

<p>I can find no record of the F-117 being at Edwards during its testing  
<br>phase, the first experimental a/c ( XST-1) was shipped from Palmdale to

<br>Groom Lake during 1977. During June 1981 the F-117 went to Tonopah and

<br>finally to Holloman AFB (1983) finally being revealed to the public in

<br>November 1988. However Edwards have had F-117s there since 1998 undergoing

<br>advanced avionics tests.

<p>Interestingly, in 1995 Lockheed Martin briefed the British Ministry of

<br>Defense on a proposed derivative of the Air Force's F-117B dubbed the  
<br>F-117B (B for British, or F-117C by some) for the RAF. It was suggested to

<br>meet the Staff Target (Air) 425 deep-strike requirement that is currently

<br>fulfilled by the Panavia Tornado GR.Mk4, which is scheduled for retirement

<br>by the end of this century. The F-117C would feature the F-22 style

clear  
<br>canopy, advanced ungridded B-2 type inlets, and an improved powerplant.  
The  
<br>proposed RAF F-117C could potentially have GEC-Marconi supplied avionics,  
<br>Eurojet EJ200  
<br>engines, and some structural contents subcontracted to British Aerospace.  
<br>This might explain the BAE "Skunk Works" at Warton.  
<p>When did the infamous Boscombe Down crash occur?  
<p>I do not know if this proposal was accepted or was rejected on cost  
<br>grounds. It may well be hidden in the depths of MoD records under a  
codename.  
<p>Chris Gibson: When did the word Havian first appear?  
<p>Cheers

Research List - <A

href="http://www.ufoworld.co.uk/">http://www.ufoworld.co.uk/</A>

<P>Does anybody have information that the F-22 has hover capability? When the contract was announced that the F-22 was going into production (this was about 2 -3 years ago?) CNN Headline News showed a simulated clip showing the F-22 hovering 2 to 3 aircraft length above the ground, clearly bobbing up and down. The simulation showed it hovering over a clearing that had trees around the it that were higher in elevation than the F-22. Then it showed a transition to normal flight. But if I recall correctly, the transition was in a strange manner. It tipped its nose UP and started climbing and accelerating forward and skyward. The clip was shown only a few times. I tried to tape it but it never came on again. Ever since then I have been keeping my eye open to anything that states that the F-22 can hover but have not found anything. Was the stock footage given to CNN by error? Meaning that the hover capability of the F-22 is secret?

<P>Martin

<P>&nbsp;</P>

<P><FONT size=2>Martin, you may have seen footage of the Lockheed Martin Joint

Strike Fighter/X-35, which resembles the F-22. Versions of it can hover.

<p>John Burtenshaw wrote:

<blockquote TYPE=CITE>UFO Research List - <a href="http://www.ufoworld.co.uk/">http://www.ufoworld.co.uk/</a>

<p>Hi All

<p>>@ in some other bases South-West of USA, but not in California  
<br>>@ (according to my memories; maybe John Burtenshaw or David can  
<br>>@ confirm or correct me).

<p>I can find no record of the F-117 being at Edwards during its testing  
<br>phase, the first experimental a/c ( XST-1) was shipped from Palmdale to

<br>Groom Lake during 1977. During June 1981 the F-117 went to Tonopah and

<br>finally to Holloman AFB (1983) finally being revealed to the public in

<br>November 1988. However Edwards have had F-117s there since 1998 undergoing

<br>advanced avionics tests.

<p>Interestingly, in 1995 Lockheed Martin briefed the British Ministry of

<br>Defense on a proposed derivative of the Air Force's F-117B dubbed the  
<br>F-117B (B for British, or F-117C by some) for the RAF. It was suggested to

<br>meet the Staff Target (Air) 425 deep-strike requirement that is currently

<br>fulfilled by the Panavia Tornado GR.Mk4, which is scheduled for retirement

<br>by the end of this century. The F-117C would feature the F-22 style

clear  
<br>canopy, advanced ungridded B-2 type inlets, and an improved powerplant.  
The  
<br>proposed RAF F-117C could potentially have GEC-Marconi supplied avionics,  
<br>Eurojet EJ200  
<br>engines, and some structural contents subcontracted to British Aerospace.  
<br>This might explain the BAE "Skunk Works" at Warton.  
<p>When did the infamous Boscombe Down crash occur?  
<p>I do not know if this proposal was accepted or was rejected on cost  
<br>grounds. It may well be hidden in the depths of MoD records under a  
codename.  
<p>Chris Gibson: When did the word Havian first appear?  
<p>Cheers

I thought this might be of interest - from:

[http://www.f-111.net/t\\_no\\_E.htm](http://www.f-111.net/t_no_E.htm)

"F-111E 68-024 - Crashed and destroyed 11 January 1973 near Crawley UK (Ben Marselis) Upper Heyford (Doc Servo).

Callsign Sewn 11. Crewed by pilot Maj Bob Kroos and WSO Capt Roger A Beck. The main body of the aircraft fell near in North Crawley, in Buckinghamshire. An engine caught fire just after takeoff at 08:56, melted the rudder linkage so that it froze hard over, and the crew ended up flying around in circles trying to get back to Upper Heyford. The fuel dumping procedure gave rise to several UFO sightings that morning! The crew abandoned the aircraft at 09:47 after Kroos lost control of the aircraft. The capsule came down in a farm, and the startled owner came out and plied the crew with brandy, which rather messed up the USAF's mandatory blood-alcohol test! They were exonerated from blame. (Tony Thornborough)"

There's also a remarkable photograph of the crashed F-111 at:

[http://www.f-111.net/images/E-68-024\\_down11Jan73\\_Bucks\\_UK.jpg](http://www.f-111.net/images/E-68-024_down11Jan73_Bucks_UK.jpg)

[If the F-111 was abandoned, how did it end up 'relatively' intact and horizontal?]

Aside from all this - if any UK subscribers are aware of 'UFO' reports in the area on that date, perhaps they can let us know.

James Easton.

Luis,

Thank you, I've added these links to:

<http://www.ufoworld.co.uk/org.htm>

>In South America, you have the personal pages of two ufologists:

>Chile - Diego Zuñiga:  
><http://www.geocities.com/Area51/Dunes/9515/ovnis/ovnis.html>  
>Argentina - Rubén Morales:  
><http://www.advance.com.ar/usuarios/moralesr/>

Although there are some well known hoaxes featured on Diego's site, it's always welcome to see material from little known sources.

I'm not surprised to find a couple of photographs therein that are interesting and which I've certainly never seen before:

<http://www.geocities.com/Area51/Dunes/9515/ovnis/fotos2.html>

1. Imagen tomada sobre el lago Hanson, Ensanada, México, el 18 ó 19 de noviembre de 1996. Personalmente pienso que es un avión F-117 A -el avión invisible-, ya que su silueta se asemeja mucho a la de uno de estos aviones, o una mancha en el negativo. Aún así son sólo especulaciones. La foto es de Raúl Espinoza.

The 'UFO' perhaps looks unconvincing, however, can anyone possibly please translate this?

2. Ovni triangular fotografiado en Inglaterra por Gordon

Thompson, el 21 de octubre de 1996. Quiero dejar en claro que este tipo de fotografías es fácilmente trucable. No hay puntos de referencia, por ejemplo.

Was Gordon Thompson the person who also produced video footage of a 'triangular UFO', featured on a UK TV documentary last year (?) and found to be a probable hoax?

Also, re:

<http://www.geocities.com/Area51/Dunes/9515/ovnis/fotos5.html>

and 'OVNIS EN BARRA DE TIJUCA, BRASIL'

- there's some further related material at:

<http://www.ncas.org/condon/pl-23-40.htm>

- note also the full Condon report on-line at:

<http://www.ncas.org/condon/contents.htm>

...if the Trent photographs are perceived to be significant because they 'captured' different profiles, how is that equated with these ostensibly more convincing photographs?

Have these 1952 photos of a 'flying saucer' been confirmed as a hoax and if so, how were they faked?

If not definite, what are the reasons for believing them to be hoaxed?

Rubén has some apparently detailed research material on his site and although I can hardly understand a word, it's noted there seem to be several cases perhaps worthy of further exposure at:

<http://www.advance.com.ar/usuarios/moralesr/mytoCAAB.htm>

Presumably there's no English translation of this material?

James Easton.

reference, for example.

@

@ Was Gordon Thompson the person who also produced video footage of  
@ a 'triangular UFO', featured on a UK TV documentary last year (?)  
@ and found to be a probable hoax?

A&E's "Investigative Reports" looked at this photo and deduced that it was merely an airliner with its landing lights on, coming in for a landing.

I looked at the rest of the pictures on the page. Reading across, I see:

1. That's water with a boat in it, not the sky. The photo was taken from a higher aircraft. See the waves?

2. Photos just like these were taken at Gulf Breeze, Florida, on May 12, 1994.

The objects are close to the camera, including the plane. The photographer requested anonymity, according to the source I have (UFO Magazine).

3. A flying Portuguese man of war? Get real! That's a jellyfish.

4. Nice photo of a disk brake rotor.

5. See above.

6. This is a lens flare. The sun is definitely shining on the camera lens, as evidenced from the lighting on the LEM.

7. This looks like 4 bacteria attacking a protozoan, taken through a microscope.

8. I have one of those silver-plated Olympic Frisbees.

9. We covered this one months ago.

10. The text says it's a heat lamp or space heater.

11. This can't be very far away. It looks like a hubcap from a '65 American. Either that, or it's a cap snaffler somebody painted silver.

12. Unless that's a windblown leaf, the lighting is wrong.

13. See above.

14. It's just a flag. There is a red star on a white background in the upper left quadrant, with the upper right quadrant being yellow, and the lower

half black.

@

@ Also, re:

@

@ <http://www.geocities.com/Area51/Dunes/9515/ovnis/fotos5.html>

@

@ and 'OVNIS EN BARRA DE TIJUCA, BRASIL'

@

@ - there's some further related material at:

@

@ <http://www.ncas.org/condon/pl-23-40.htm>

@

>James Easton.

Hi,

Surprised you were not aware that this F-111 crash is a classic solved case in UK literature.

I have an entire chapter (A Perfect Case?) in the new book 'The UFOs that Never Were' (by Andy Roberts, Dave Clarke and myself) (London House, February 2000) on this very subject - although its by no means the first time it has been discussed in the literature.

In fact the case concerned is the multi witness, cine filmed encounter involving building surveyor Peter Day often featured on TV (eg BBCs 'Out of this world' and 'Horizon' - neither of which bothered to consult investigators and learn the truth - a fault they would have slated UFOlogists for in reverse, of course!).

We (BUFORA - as this was a case I had a long association with during my 13 years as Director of Investigations) identified the connection with the F-111 crash many years ago but could not get the accident report to confirm it 100% until the FOI release about four years ago.

However, I did write up a column in OMNI about 10 years ago on the fact that

we now believed this was the solution to this famous and complex case. The witness never accepted my opinion. Then, in 1989, I wrote 'Fire in the Sky' - a case history on this incident that was published as a special booklet by BUFORA to set out the data . (The UFO movie of that title came three years afterwards BTW so pinched my title!!!)

Anyhow, for the new book I set the full case in context with a 10,000 word report on the matter - so it describes the complete story of the sightings, the investigation which took us many years and led through lots of twists and turns but ultimately unraveled the truth and the data provided by the recent F-111 accident report.

I think its a classic example of how to track a UFO case to source, despite the events seeming to be fantastic and inexplicable and against the odds (ie little help was ever given by the authorities - largely because the F-111 nearly fried a schoolyard full of primary school children by dumping blazing fuel right on top of them - a misfortune but a faux pas that clearly led to it being considered preferable that this case be perceived as a UFO for 25 years).

Its also a classic example to investigators of how never to give up and how if you try hard enough and strive for long enough (in this instance 24 years!) you will eventually get your reward.

For the few who will ever see this book (10 - 20 people maybe!) I think its a very instructive case. But of course UFOlogists in general will still prefer to read twaddle about aliens - as will the public and the media.

C'est la vie.

Best wishes,

Jenny Randles

There's a newspaper clipping on UFO World at:

<http://www.ufoworld.co.uk/news6.jpg>

Dated 24 July, I'm not sure of the year - maybe 1947?

This is amongst approx. one hundred historical clippings which I'll be providing details about shortly.

Although the first 24 July report seems almost certainly a recurrent sighting of stars, how do we explain the observers believing that stars 'took off'.

It's analogous to the situation Sgt. Randy Smith described in the observation tower at RAF Bentwaters, when the assembled security personnel watched three star-like objects, one (or more) of which apparently then 'rapidly departed'.

For background details, see:

<http://www.ufoworld.co.uk/newslet4.htm>

Can it also be compared to Lt. Col. Halt's experiences that same night, when he documented star-like objects which seemed to be sharply moving across the sky?

In 'UFO Crash Landing', Jenny Randles has actually explained why Halt's account could be consistent with merely an observation of stars.

The problem with Halt's scenario are those 'pencil-thin' beams of light being directed towards the ground, which he claims were witnessed by some 30 personnel and reported over the radio as coming down near the Weapons Storage Area [WSA].

Curiously, I have yet to hear one corroborative account concerning these 'beams' and Sgt Smith, stationed in the WSA at that exact time, has no recollection of seeing or ever hearing about this.

Wasn't there something mentioned a year or so back about typical characteristics of stars mistaken for UFOs - from Allen Hendry's 'The UFO Handbook'. What were these?

This is important to understand as it might resolve a number of UFO sightings.

Despite my best efforts, I can't duplicate this 'moving star' phenomenon at all - does it require liberal consumption of ale?

I presume the other report on this clipping - when six jets were apparently scrambled in response to a 'weather balloon' sighting - is a relatively well known incident.

James Easton.

Subject: Re: StarsStatus: O

James,

The comment about "weather research balloon" explanation in the second July 24 item would seem to suggest a later year than 1947 since I didn't think the AF had recognized Skyhook balloons as an IFO source that early. Also the AF didn't exist by that name in July 1947.

What does it mean to say that the star-like lights "shot off"? How many degrees of azimuth and elevation did they change IF AT ALL? Did they "shoot off" backwards away from the observer? (An increase in fog-like atmospheric haze can cause stars to dim to disappearance making an observer think they had shot off backwards at high speed and disappeared due to increased distance.) Without investigative details such as these this newspaper report is worthless insofar as using to explain away other cases.

Brad

@ Subject: Stars

@

@

@ @

@ There's a newspaper clipping on UFO World at:

@

@ <http://www.ufoworld.co.uk/news6.jpg>

@

@ Dated 24 July, I'm not sure of the year - maybe 1947?

@

@ This is amongst approx. one hundred historical clippings which

@ I'll be providing details about shortly.

@

@ Although the first 24 July report seems almost certainly a

@ recurrent sighting of stars, how do we explain the observers

@ believing that stars 'took off'.

This is one of the classic symptoms of fire balloons. When the last candle or wick goes out, the fire balloon seems to "shoot away," moving directly away from the witness. Actually, it just dims out.

@ It's analogous to the situation Sgt. Randy Smith described in the  
@ observation tower at RAF Bentwaters, when the assembled security  
@ personnel watched three star-like objects, one (or more) of which  
@ apparently then 'rapidly departed'.

@

@ For background details, see:

@

@ <http://www.ufoworld.co.uk/newslet4.htm>

This is consistent with a spy satellite film drop, and efforts to cover that up. Remember that this was just days before the hostages in Iran were released.

@

@ Can it also be compared to Lt. Col. Halt's experiences that same @ night, when he documented star-like objects which seemed to be @ sharply moving across the sky?

Another fire balloon symptom. Since they are perceived to be a lot farther away than they really are, they are also perceived as moving a lot faster than they really are. They can also undulate.

@ In 'UFO Crash Landing', Jenny Randles has actually explained why @ Halt's account \_could\_ be consistent with merely an observation @ of stars.

@

@ The problem with Halt's scenario are those 'pencil-thin' beams of @ light being directed towards the ground, which he claims were @ witnessed by some 30 personnel and reported over the radio as @ coming down near the Weapons Storage Area [WSA].

ANOTHER symptom of fire balloons, if seen at a distance! This effect is produced when a candle melts itself free of its support and falls, still burning. This makes a streak of light that falls. It is one of the reported effects that makes me strongly suspect fire balloons (undulatory flight, recede suddenly into distance, irregular rotation, rotation independent of flight path, and warm color are the others).

At the early date of 1947, the fire balloons are the type I tissue paper and multiple wick tallow cup kind. With those, burning wax, or one of the wicks, can also fall and produce a streak effect. Thin plastic suit bags hadn't yet made their debut.

But if the beam supposedly struck close to the witnesses and illuminated an area longer than just momentarily, then a fire balloon is ruled out.

One thing that amazes me is that people see the beam itself, not just the spot. This implies a very strong light source, or a dusty atmosphere, or for a very short beam duration, a fire balloon.

@ Curiously, I have yet to hear one corroborative account @ concerning these 'beams' and Sgt Smith, stationed in the WSA at @ that exact time, has no recollection of seeing or ever hearing @ about this.

@

@

@ Wasn't there something mentioned a year or so back about typical @ characteristics of stars mistaken for UFOs - from Allen Hendry's @ 'The UFO Handbook'. What were these?

Since I have it, I can look them up. Autokinesis is one of them.

@

@ This is important to understand as it might resolve a number of  
@ UFO sightings.

@

@ Despite my best efforts, I can't duplicate this 'moving star'  
@ phenomenon at all - does it require liberal consumption of ale?

The star has to be well away (at least 20 degrees) from ground objects,  
otherwise you have a frame of reference to hold the star's position still.  
Also, the better the observer has trained his eyes to stars, the less  
prominent autokinesis is, because the observer is used to it.

But if you look at a star through the rising hot air from a car park, the  
image is really moving, because the air distorts the light path.

@

@ I presume the other report on this clipping - when six jets were  
@ apparently scrambled in response to a 'weather balloon' sighting  
@ - is a relatively well known incident.

Well James, you did note Hendry's analysis of such sightings. Clouds not visible by the observer could obscure the star, giving the impression of the star suddenly disappearing. The changing characteristics of scintillation could also give the impression the star moved into the distance rapidly.

<<The problem with Halt's scenario are those `pencil-thin' beams of light being directed towards the ground, which he claims were witnessed by some 30 personnel and reported over the radio as coming down near the Weapons Storage Area [WSA].>>

The concept of beams shooting off from a star is easily understood. A case of Sirius shooting beams was documented in the Condon study <A HREF="http://www.ncas.org/condon/text/case38.htm">http://www.ncas.org/condon/text/case38.htm</A>. I have seen the scintillation effects of many stars and the idea that beams could be perceived to be shooting off (especially of Sirius) is not far fetched. Halt's beam shooter matches the location of Sirius in the sky. Didn't Halt once state that the beam illuminated the ground at his feet? That night the bright last quarter moon was in the sky. In a dark location, the light of the moon is very bright (I don't even bother to go to a dark sky site if the moon is up and is greater than a crescent). It would easily have illuminated the ground already making one wonder how he could see the ground illuminate in front of him if it was already illuminated by the moonlight. One could probably put forth a case that the moon was behind the trees and the motion from the wind produced an illuminated portion of the ground that Halt would later recall as being produced by the beams. The tape does not mention the ground being illuminated. It just states that the beam appeared to be going towards the ground. A big difference in my book.

Brad,

Well noted. The extract was scanned and cropped from a photocopy of the original paper, however, as only the bottom half page was originally copied, there's consequently no source or date shown. Following your comments, I have pursued a reference within an unrelated article and indeed, it must date the newspaper to 1952 or later.

It could be from the 'New York Times', as are many other 'flying saucer' related clippings I was given by an acquaintance in the US some time ago. He had collected these from various newspaper archives.

Yes, that might work.

What does the observer conclude when the 'UFO' returns? Perhaps it might not be seen again due to haze or cloud cover and they would presume it had permanently departed. It would still eventually come back though. ;)

>Without investigative details such as these this newspaper  
>report is worthless insofar as using to explain away other

Appreciated - it's merely a possible example re the question raised, i.e., how can stars appear to suddenly 'take off'?

A primary reason for bringing this up is there may be significant indications to suspect that the three 'UFOs' which Randy Smith and several others scrutinised for a lengthy period at RAF Bentwaters were in fact stars. To recall, Randy stated, "I asked what everyone was looking at and they pointed out 3 objects that appeared like stars to the naked eye".

That seems such an obvious clue, yet apparently countermanded by the information these objects were being regularly viewed through binoculars - as we know it's extremely difficult to focus on stars for any time with hand-held binoculars.

In the related material I published, it wasn't possible to include every detail from considerable correspondence and there's one aspect which has never previously been mentioned.

It was Randy's wife, Kathy, who remembered him describing how those UFOs had, "lights on the bottom that sparkled and twinkled and it seemed like you could see colors twinkling".

Isn't this a documented characteristic of stars under certain conditions - possibly even explicitly noted in 'The UFO Handbook'?

If that's the case and we can also rationalise any 'sudden take off' - Randy recalling that two of the three objects were reported as leaving (by the person using the binoculars at that time), then we may have a probable explanation. It should also be kept in mind that by this time - the night after our original 'UFO' scare - we had an inherent and documented excitement about UFOs.

Can it be equated with other evidence from events on the night/early morning of 28/29 December, 1980?

Halt's microcassette recording confirmed:

HALT: 3:05. At about ten degrees, horizon, directly north, we've got two strange objects, er, half moon shape, dancing about, with colored lights on 'em. At, er, guess to be about five to ten miles out, maybe less. The half moons have now turned into full circles as though there was an eclipse or something there for a minute or two.

HALT: 03:15. Now we've got an object about 10 degrees directly

south, 10 degrees off the horizon. And the ones to the north are moving. One's moving away from us.

VOICE: Moving out fast.

VOICE: This one on the right's heading away, too.

HALT: They're both heading north. Hey, here he comes from the south, he's coming toward us now.

HALT: Now we're observing what appears to be a beam coming down to the ground.

SHOUT IN BACKGROUND: Colors! [?]

HALT: This is unreal.

HALT: 03:30 and the objects are still in the sky, although the one to the south looks like it's losing a little bit of altitude. We're going around and heading back toward the base.

HALT: The object to the south is still beaming down lights to the ground.

HALT: 04:00 hours. One object still hovering over Woodbridge base at about five to ten degrees off the horizon, still moving erratic and similar lights and beaming down as earlier.  
[End]

It's clear all three objects were visible for several hours and we can in fact tie this up with Halt's memo to the Ministry of Defence (MoD), where he informed:

"...three star-like objects were noticed in the sky, two objects to the north and one to the south, all of which were about 10 degrees off the horizon. The objects moved rapidly in sharp angular movements and displayed red, green and blue lights. The objects to the north appeared to be elliptical through an 8-12 power lens. They then turned to full circles. The objects to the north remained in the sky for an hour or more. The object to the south was visible for two or three hours and beamed down a stream of light from time to time. Numerous individuals, including the undersigned, witnessed the activities in paragraphs 2 and 3".

The crux of this case is whether there were multiple witnesses. Halt is claiming between 30 and 40 - so where are they all?

Halt stated (taken from an article written by Salley Rayl):

"We've crossed the farmer's field past his house and across the road, stumbled through a small stream and went out into a large ploughed field. Somebody noticed several objects in the sky to the north - three objects clearly visible with multiple-colored lights on them. The objects appeared elliptical and then they turned full round, which I thought was quite interesting. All three doing that. They were stationary for awhile and then they started to move at high speed in sharp angular patterns as though they were doing a grid search. About that same time, somebody noticed the south, a similar object, it was round - did not change shape - and at one point it appeared to come toward us at a very high speed. It stopped overhead and sent down a small pencil-like beam, sort of like a laser beam. It was an interesting beam in that it stayed - it was the same size all the way down the beam. It illuminated the ground about ten feet from us and we just stood there in awe wondering whether it was a signal, a warning, or what it was. We really didn't know."

The beam, says Halt, just went away. "It clicked off as though someone threw a switch, and the object receded, back up into the sky," he says. "Then it moved back toward Bentwaters and continued to send down beams of light, at one point near the weapons storage facility. We knew that, because we could hear the chatter on the radio."

Halt was baffled. Whatever this object was, wherever it was from, it must have been under intelligent control. Within a couple of minutes, it was gone. Perhaps it retreated high into the skies with the other erratically moving lights up there. It was hard to say.

At around 4:30 a.m., Halt called the investigation off. "It was a cold winter night," he says. "The wind was blowing, we were wet, and I just ordered everybody back to the base. I saw no reason to stay out there any longer. We left those objects up there."

All told, Halt estimates that somewhere between 30 and 40 people stationed at various places around the dual Bentwaters-Woodbridge base, saw the object emitting beams that night. And that meant, says Halt, that this situation had to be dealt with and contained. "The thoughts running through my mind were: 'How am I going to explain this. Nobody's going to believe this. It's just too ridiculous.' But it couldn't be ignored, because now too many people were involved."  
[END]

To understand this in context, there's a map showing both bases and Halt's approximate position relative to them, at:

<http://www.ufoworld.co.uk/bases2.jpg>

This also indicates where the weapons storage area at RAF Bentwaters was located and Randy's recollection of general directions re the lights he watched.

Halt subsequently expanded on these claims during a Microsoft Network discussion, hosted by Salley:

So, we went on past the farmer's house, fell into a small stream, out into a ploughed field and about that time somebody noticed one of the people that was with me noticed some objects in the sky. There were several objects, I believe three, to the north about 35 or 40 degrees off the horizon. It looked they were elliptical, sort of like a Cherokee Moon. But they had lights on. And as we watched them, they turned into a full circle and then they started moving about in a strange pattern. One of the members suggested they were doing a grid search. I'm not really sure.

Somebody else noticed another object very similar to the south. This object hovered back and forth and at one time approached us at very high speed. It stopped overhead, probably, 2, 3, maybe 4,000 feet, and sent down a beam, sort of like a laser beam that fell very close to our feet and illuminated the ground for probably maybe 3, 4, 5, 6, 7 seconds.

[...]

RAYL: What about the object that shot the pencil-like beam? Any way to gauge how large that was?

HALT: Not really because it was dark and it was hard to tell. I would say they had to be at least 3, 4, 5,000 feet in altitude, maybe a little higher.

RAYL: Okay. So this object moves directly toward you. It shoots down this pencil-like beam toward your feet. What happens then? What happens to the beam, and what happens ...

HALT: Well, we stood there in awe and watched and suddenly it was like it was switched off. It just clicked. It was gone. The object was still in the sky. We also noticed it receded. It moved about. It sent down beams other places, included some various places on the base. And we could hear chatter on the radios. We were on three different radio nets two security police nets and the command net and we could hear chatter. Other people on the base were seeing these things, especially security police.

I had called the Command Post when we first saw the objects in the sky and asked them to call Eastern Radar Eastern Radar had, that was their air defense sector and gave them directions and locations and asked them to try and see what they could come up with. And I didn't get any good feedback although I heard later from second-hand sources that they did see some objects on the radar. But, of course ...

RAYL: But at that point in time you didn't know that?

HALT: I didn't know that at that time.

RAYL: Okay. Had you ever encountered, you had a, you were in the Air Force at this point, about 16 years. Had you ever encountered UFOs before at any point during your career?

HALT: No, I hadn't.

RAYL: And what did you think ... what happened next?

HALT: Well, we spent quite a bit of time. We were out there for several hours watching them and it was just amazing. And finally it was 2, 3, 4 o'clock in the morning. It just, we were wet and cold and people were getting miserable, and I was quite concerned about the five people that were out there with me. We decided to head back in. Then we went back to the base and went home and, in disbelief, I guess.

RAYL: But they never came as close as they did at the point where the object shot down the pencil-like beam?

HALT: No. That was the closest anything came.

RAYL: Okay. What happened in the days following this event? I understand you took reports from Penniston and Burroughs and ...

HALT: And one other individual that was involved in the first night. The three individuals that were out, and I also took them from the Flight Commander and one individual that went out with me, a Master Sergeant.

[End]

That "other individual" would be Ed Cabansag, the Flight Commander was Fred Buran and the Master Sergeant must be J. D. Chandler. These are the statements I obtained copies of.

It seems Halt didn't request affidavits from those involved in the second night's events, presumably because he was there and

appreciated what had occurred.

Interesting to note that Chandler was also with Halt on that second night, which probably makes him the only person to have been \_directly\_ involved in both incidents.

Strikingly missing from Halts' clarifications is any hint that he knows those "three individuals" at least partly pursued the light from a nearby lighthouse beacon for some two miles, believing it to be connected with the original `UFO' sighting.

There seems to be a difference in Halt's later account here, compared to what was documented on tape.

In the interview, he claims this southwards `object' was believed to have "receded, back up into the sky" and then "moved back toward Bentwaters and continued to send down beams of light, at one point near the weapons storage facility", confirming, "we knew that, because we could hear the chatter on the radio".

Conversely, Halt noted on his microcassette, how what seems to be the same artefact was "still hovering over Woodbridge base at about five to ten degrees off the horizon, still moving erratic and similar lights and beaming down as earlier".

Was it in the sky above the Woodbridge base, or the Bentwaters base?

Furthermore, Halt's memo to the MoD seems to confirm it was only the southern artefact which `beamed', directly above Bentwaters and/or Woodbridge, yet how do we explain this, when anything south of Halt's position would be nowhere near either base?

James Easton.

@ Wasn't there something mentioned a year or so back about typical  
@ characteristics of stars mistaken for UFOs - from Allen Hendry's  
@ 'The UFO Handbook'. What were these?

A synopsis of Allen Hendry's information on stars and planets as impostors  
for UFOs:

35% of all Nocturnal Light cases -- #1 cause (#2 was ad planes).

Usually point source, but sometimes reported as "2 distant plane, and rarely  
"3 full moon."

All colors have been reported, but usual colors are red, white, or blue.

Strobing, flashing multiple colors.

Durations up to 12 hours.

Unexpected motions:

1. Sudden disappearance - clouds not visible to the witness can occult the star.
2. Autokinesis - motion caused by eye movements or perspective mistakes.
3. Atmospheric refraction - usually less than full moon diameter (.5 degree), but there are reliable reports of up to 2 degree deviations.

Reported motions (atmospheric or autokinetic) include up/down, side to side, zigzag, loops, eights, pendulum, "leaf falling up", stepped motion, square turns, "A" shape.

4. Apparent rotation due to scintillation.

5. Unexpected real motions beyond the polar axis ("Stars don't go east.")
6. Moving clouds make star appear to move in opposite direction.
7. The "astronomical body appearing to follow a vehicle" effect.

Atmospheric distortion creates momentary shapes.

Sparks appear to shoot out from star and sometimes detach.

Distorted into various shapes by magnifying optics.

Interesting report characteristics:

1. "Too bright for a star." The culprit was usually Sirius, Capella, Arcturus, Vega, Antares, Venus, Mars, or Jupiter.
2. "It wasn't there a week ago." Venus, on it's trip around the sun, suddenly appears in the sky after it crosses in front of or behind the sun.
3. "But I also saw Venus." The UFO was Venus, and "Venus" was really Jupiter.
4. In cases where the witness left and returned hours later, another astronomical body took the original object's place in the sky.
5. Reported "distances" varied from 200 ft to 125 miles.
6. The Pleiades are sometimes reported as a UFO the size of the full moon (accurate).
7. Shining a flashlight at a star can drown it out, and make it "disappear."
8. 12 percent of star sightings are repeat sightings, where the object is seen several nights in succession.
9. One report called a star a "stationary satellite."
10. Hendry's favorite quote, from an FAA controller at the Detroit Metropolitan Airport (for small planes): "Do you know how many times we've cleared Venus to land?"

<< It was Randy's wife, Kathy, who remembered him describing how those UFOs had, "lights on the bottom that sparkled and twinkled and it seemed like you could see colors twinkling".

Isn't this a documented characteristic of stars under certain conditions - possibly even explicitly noted in 'The UFO Handbook'? >>

Sorry to jump in again James but this is a process called scintillation. Just for a quote from Minnaert's Nature of Light and Color in the open air.

"The colour changes are to be ascribed to slight dispersion of the normal terrestrial ray curvature, so that the rays from the star travel along slightly different paths in the atmosphere, according to their colour. For a star at a height of  $10^\circ$  above the horizon we compute distance between the violet and red rays to be as much as 11 inches at a height of 1.25 miles, and 23 inches at 3 miles. The air striae are, on an average, fairly small, so that it may often happen that the violet ray passes through a striation and is deflected, whereas the red ray passes on without deviation. The moments when the light of a star becomes brighter or feebler as a result of scintillation are, therefore, different for the different colours. Colour changes never occur, apparently, at altitudes of more than  $50^\circ$ , but frequently below  $35^\circ$ . The most beautiful scintillation of all is that of the bright star Sirius, which is visible in the winter months rather low in the sky."

Having personally seen this phenomena many times, I can see how people think there are flashing lights attached to the star. I have seen many people think that Sirius was a landing airplane because of this effect. They swore they could see the navigation lights flickering. After a few minutes it became obvious to them that I was correct since the star never finished it's landing. The effect is known and discussed several times in the Condon report. I have also seen scintillating stars still spark UFO reports. One individual swore that he had never seen a star behave that way before. Most people just don't look up and are not familiar with the effect.

But how did they measure the 2 degree deviation? Most of these are gross  
estimates made by individuals, who have no expertise in doing this. I have  
known many amateur astronomers that are not that good at estimating such  
distances even when they are estimating at the time of the event. In many of  
these UFO reports, the two degrees was an estimate made a day or more after  
the incident. Memory can make an event seem a lot bigger than it really was.  
The 2 degree deviation has to be taken with a grain of salt since it really  
is not an exact value but a gross estimate usually made some time after the  
event.

Tim,

I agree with you. But the claim was made that there were "reliable" reports of this 2-degree deviation of a star's position and now this undated newspaper clip is being used to try to explain away the Bentwaters sightings in 1980 despite my cautioning against such a use. I don't believe any of it in the absence of reliable data.

>>

Hmmmm....I may be missing something about how 2 degree deviations are directly connected to Bentwaters. Large deviations of stars in the sky could easily be explained as the Autokinesis effect. "Reliable" reports usually means the witnesses are supposed to be experts or tend to not make mistakes (usually reserved for Pilots, police officers, astronomers, weathermen, etc).

As I pointed out, in my experience, measuring a 2 degree deviation is difficult even for experienced astronomers. "Expert/Reliable" witnesses are not always so reliable. The data is usually subject to error. The longer one waits to get the details, the more unreliable it becomes. The interesting thing about Bentwaters is that the rough measurements were made on tape at the time of the event. That is about as reliable as it can get (assuming the person making the measurement knows how to do this).

As for the Bentwaters case, I am inclined to believe that stars were the cause. There are just too many coincidences. On the tape, Halt reports the motion of the brightest object as being moving towards the west with time. His approximation of elevation and azimuth are very close to the bright star Sirius. As for the two northern objects, his locations are close to Deneb and Vega. However, the statements he made to Jenny Randles pretty much seal the solution. In her book UFO crash landing, we read "the objects were still in the sky - however, it was getting light and they were getting faint." A perfect example of stars fading in the twilight.

Of course, the standard argument is how could trained airmen and officers mistake stars for UFOs. Well, one has to realize that it was very early morning and many of the party were very tired. According to Halt (UFO Crash Landing), they were cold and had fallen into some water during their journey through the woods and field. I have done numerous all nighters as an amateur astronomer and most of that was sitting in a chair guiding on a star during photographs. You tend to get a bit punchy at 4AM even if you take breaks. If you are really tired and exhausted, stars scintillating wildly can really look odd. Additionally, autokinesis is based on the observer bobbing about. For a rested person, it is hard enough to stand still. For a tired person, it becomes very difficult. The apparent motion could seem to the observer as moving away or moving erratically.

Most of this is speculation (as most UFO discussions revolve around). We have no videos or pictures of the objects and no "reliable data" that can be quantified. However, considering the data that is available, I think stars fit pretty good in this case.

Hendry's language is rather imprecise. I wasn't sure whether the deviations had a diameter or a radius of 2 degrees.

I may have seen something like that myself, but I have no "quantitative documentation." The problem is that you don't know when it's going to happen, so you don't always have instrumentation available. And even if you do, you may not realize the significance of the event, if you know the object is a star or a planet.

The time I saw it (10/16/73), I knew the object was Mars, because I had been keeping track of Mars and the UFO sightings it had been generating.

It had been a sunny day, but it was now cool enough that I needed a jacket. Mars had risen about half an hour before, and my line of sight passed above the parking lots of three shopping centers. Mars was scintillating quite heavily, flashing colors and projecting "rays" in different directions. Occasionally, the planet seemed to wobble, but I couldn't determine if it was distortion or autokinesis.

Suddenly the planet seemed to split in two, with one part heading horizontally to the north. It seemed to move out about 3 moon diameters. The whole thing was over in half a second. I wish I had had known that measuring this would have been important. At the time, I could have easily measured the angular displacement. But at the time, I didn't know such an event was that unusual, and chalked it up to "atmospherics" from the heat rising from the parking lots, without any further thought. I was looking for the possible causes of the wobbly UFOs that were reported to cross the sky the previous night.

Now the view at the place I was standing is blocked by buildings. I will see if I can find a location where I can measure the size at that distance, but I am afraid my recollection may be distorted by the intervening 27 years. This will be a good experiment in observation. I can determine with instruments just how much my recollected deviation really is, and compare it with my subjective recall of the event. The horizon moon effect may contribute to these reports of 2 degree displacements.

That same night, a photographer took a telephoto time exposure of Mars as it scintillated. I have a newspaper copy of the photo (appeared in the 10/17/73 issue of the now defunct Bloomington Courier-Tribune.) The photo looks like an egg thrown on a sidewalk, but in the general shape of a very wiggly number 9.

Here's the interesting part. While I was scanning the skies for the wobbly UFOs without seeing anything, people 3 miles west of me were reporting them

again. All I saw that night were stars, Mars (complete with the sudden split), and airplanes.

Larry,

Taking exposures of Mars with a telephoto lens is not easy. Odds are that it  
wiggled due to the motion of the cameraman taking the photograph without a  
tripod. Of course, we don't have that information on the exposure.

Date: Fri, 26 May 2000 19:44:24 EDT  
Subject: Ancient NICAP mysteryStatus:

DEAR COLLEAGUES -- In the course of doing some research I recently had reason to go back into my file of UFO Investigators and came upon an article on p. 8 of the July-August 1961 issue, "The Attacks on NICAP."

This dealt with two years' worth of assaults upon NICAP by an unnamed "publisher of a certain UFO magazine." The piece featured extracts from letters to Major Keyhoe from this person. Here's a key quotation from the article: "Some time ago, this publisher asked to take over printing the UFO Investigator and put it on sale on newsstands.... When we refused, the publisher began violent attacks on all NICAP officials with any military background."

At first I thought the miscreant was either Jim Moseley or Gray Barker I dismissed Jim almost immediately, and on further reflection, decided Barker doesn't fit. He really hated Keyhoe and NICAP and surely wouldn't have tried to land the "Investigator" printing business under any circumstances. Jim Moseley has confirmed both these conclusions to me and is as puzzled as I about the matter.

I would very much appreciate knowing who this character was, what 'zine he published, etc. Can anyone out there help? Thx and have a great weekend! -- Cheers, KARL

An extremely interesting reference.

>Halt's beam shooter matches the location of Sirius in the sky.  
>Didn't Halt once state that the beam illuminated the ground at  
>his feet?

In the tape recording, he does actually say "what appears to be a beam" is "coming down to the ground". More recently, he's elaborated that "it illuminated the ground about ten feet from us".

>That night the bright last quarter moon was in the sky. In a dark  
>location, the light of the moon is very bright (I don't even  
>bother to go to a dark sky site if the moon is up and is greater  
>than a crescent). It would easily have illuminated the ground  
>already making one wonder how he could see the ground illuminate  
>in front of him if it was already illuminated by the moonlight.

Point noted. It's so difficult for us to understand the exact circumstances. Incidentally, I can't see that Halt ever mentions the moon being visible that night, although it may well have been.

>The tape does not mention the ground being illuminated. It just  
>states that the beam appeared to be going towards the ground. A  
>big difference in my book.

It's immensely helpful to actually hear the tape and reactions to certain events. When Halt reports the beam, someone in the background shouts out. I thought they might be exclaiming "colours!", however, having listened to it again, I'm now doubtful and wondering...could it be "take cover!", or "take shelter!"?

If we knew this, it could be an important clue.

Thanks also for your other helpful comments.

>the solution. In her book UFO crash landing, we read "the  
>objects were still in the sky - however, it was getting light and  
>they were getting faint." A perfect example of stars fading in  
>the twilight.

Given that Halt was at this time completely unaware how Orfordness lighthouse had been a factor in the preceding UFO incident, it's almost certain - key reasons previously being highlighted by Ian Ridpath, Jenny, myself and others - why this 'strange flashing red (or yellow) light' was also the lighthouse.

Halt was apparently quite significantly mistaken when he later recalled this light 'exploded', as it can be proven from the tape that seemingly the same light was seen again later:

HALT: 2:44. We're at the far side of the second farmer's field and made sighting again about 110 degrees. This looks like it's clear off to the coast. It's right on the horizon. Moves about a bit and flashes from time to time. Still steady or red in color. Also after negative readings in the center of the field we're picking up slight readings, four or five clicks now, on the meter.

HALT: 3:05. We see strange strobe-like flashes to the... rather sporadic, but there's definitely something there. Some kind of phenomenon.

[End]

The explanation for this 'phenomenon', which was 'clear off to the coast', seems self evident.

We therefore have to ask, how likely is it that during the excitement caused by an existing perception of UFOs - those inconsequential radiation readings were also being taken as indications that something significant had been occurring - the base would be visited by extraordinary craft, terrestrial or otherwise.

We can pretty much write that off.

>Of course, the standard argument is how could trained airmen and

>"reliable data" that can be quantified. However, considering the  
>data that is available, I think stars fit pretty good in this  
>case.

Definitely. The problem then becomes how to rationalise Halt's later claims.

Even if we make allowances for misperceptions that night and although these would have to be considerable, can we explain Halt's assertions how, "it moved back toward Bentwaters and continued to send down beams of light, at one point near the weapons storage facility. We knew that, because we could hear the chatter on the radio"?

There's no evidence of this from his tape recording and no indications I've ever come across of any concerns - at the time or afterwards - about what must have been a potentially serious

threat to base security.

As Larry Warren and Peter Robbins also claimed in 'Left at East Gate', that Halt told them 'off the record', how these beams had penetrated the weapons storage bunkers - and Warren confirmed to myself that Halt told them this "face to face" - it raises questions about the reliability of certain recollections.

Anyway, I'm pleased to announce that the entire Halt tape recording is now available for the first time ever online and can be downloaded from UFO World at:

<http://www.ufoworld.co.uk/halttape.rm>

I think the term "Colours" might fit. A scintillating star often creates  
various color changes. It may actually have been "Colours" if the source was  
Sirius.

Working through related material and particularly a detailed response to points which Brad Sparks raised, I thought it may be of interest to see some photographs of Little Tahoma peak, confirming how well it matches Arnold's description.

I've spent considerable time looking at an alternative for the peak which Arnold mentioned and it seems there isn't any other candidate, especially given the altitude Arnold states.

I'm now satisfied this can be evidenced as a significant breakthrough in understanding the Arnold case and that it does have a fundament impact on the probabilities.

There seems no question that Arnold repeatedly stated how those nine objects flew on the western side of Mt. Rainier and his numerous statements actually confirming same have been cited. As we know, it's simply impossible for those nine unidentified artefacts to have done so, travelling towards Mt. Adams, and yet also have momentarily disappeared behind Little Tahoma, on the mountain's far eastern side.

Either, as Brad believes, we have to discard previously accepted understandings - including apparently Kenneth Arnold's - and now assume the objects did in fact pass behind Mt. Rainier and consequently Little Tahoma, or, accept Arnold was deceived that those objects went behind Little Tahoma and the evidence clearly indicates they absolutely must have been closer than he perceived.

The latter is by far most likely of the two scenarios, indeed it seems impossible to sustain the first argument without portraying much of Arnold's previously accepted testimony as wholly unreliable.

Whichever is the preferred scenario, it's difficult to escape the fact that Arnold's perception was significantly mistaken.

Anyway, more on the consequences later, in the meantime, some photographs which help set the issue in context:

.....

Regarding the following excerpt from the tape:

HALT: You say there is a positive after-effect?

VOICE: Yes, there is, definitely. That's on the center  
spot. There is an after-effect.

VOICE: What does that mean?

VOICE: It means that when the lights are turned off, once we are  
focused in and allow time for the eyes to adjust we are getting an  
indication of a heat source coming out of that center spot, which will  
show up on...

HALT: Heat or some form of energy. It's hardly heat at this stage of  
the game.

Could it be that the lights they used were focussed on the center spot  
and this heated it up slightly, and which they observed as it cooled off?

Regards,  
Ronald Hill.

Subject: Re: Kenneth Arnold and Little TahomaStatus: O

James,

Thanks for the Little Tahoma Peak photo links.

If your case is so strong one might wonder why is there a problem. Aren't you forgetting to mention something? Aren't you forgetting to mention that the whole problem arises because Arnold many times stated that the objects passed BEHIND (east) of Rainier or Rainier's "peak" which you agree can only be Little Tahoma Peak (which was further behind Rainier's summit)? This puts the distance to Arnold at 20+ miles, much farther than is possible for birds to have been visible.

Most of the "west side" stories come from reporters' summaries of the case in newspaper articles and are not even paraphrasing Arnold. Arnold's direct statements that the objects flew BEHIND Rainier or its peak are more numerous than the few ambiguous statements of his suggesting they flew to the west and he never states directly they went "in front" of Rainier. In a few cases he speaks of seeing the "image" or "outline" of the objects "against" the snow but can't bring himself ever to squarely say he saw the objects in front of Mt. Rainier.

Whereas in his second known interview, with the Chicago Tribune on June 25, 1947, he stated squarely and is quoted directly, not paraphrased, saying:

"I counted nine of them as they disappeared BEHIND the peak of Mt. Rainier [Rainier]."

Isn't it strange that there is NO statement on record by Arnold stating the OPPOSITE, that "I counted nine of them as they passed in FRONT of Mt. Rainier"? All you have is vague and ambiguous comments, hints and reporters' understandings at second-hand.

Brad

Subject: Re: Eureka! Scientists break speed of lightStatus: O

Sign Historical Group - <http://www.project1947.com/shg/>

Please note the last line concerning possibilities for interstellar travel.

June 4 2000 UNITED STATES

Eureka! Scientists break speed of light

Jonathan Leake, Science Editor

SCIENTISTS claim they have broken the ultimate speed barrier: the speed of light.

In research carried out in the United States, particle physicists have shown that light pulses can be accelerated to up to 300 times their normal velocity of 186,000 miles per second.

The implications, like the speed, are mind-boggling. On one interpretation it means that light will arrive at its destination almost before it has started its journey. In effect, it is leaping forward in time.

Exact details of the findings remain confidential because they have been submitted to Nature, the international scientific journal, for review prior to possible publication.

The work was carried out by Dr Lijun Wang, of the NEC research institute in Princeton, who transmitted a pulse of light towards a chamber filled with specially treated caesium gas.

Before the pulse had fully entered the chamber it had gone right through it and travelled a further 60ft across the laboratory. In effect it existed in two places at once, a phenomenon that Wang explains by saying it travelled 300 times faster than light.

The research is already causing controversy among physicists. What bothers them is that if light could travel forward in time it could carry information. This would breach one of the basic principles in physics - causality, which says that a cause must come before an effect. It would also shatter Einstein's theory of relativity since it depends in part on the speed of light being unbreachable.

This weekend Wang said he could not give details but confirmed: "Our light pulses did indeed travel faster than the accepted speed of light. I hope it will give us a much better understanding of the nature of light and how it behaves."

Dr Raymond Chiao, professor of physics at the University of California at

Berkeley, who is familiar with Wang's work, said he was impressed by the findings. "This is a fascinating experiment," he said.

In Italy, another group of physicists has also succeeded in breaking the light speed barrier. In a newly published paper, physicists at the Italian National Research Council described how they propagated microwaves at 25% above normal light speed. The group speculates that it could be possible to transmit information faster than light.

Dr Guenter Nimtz, of Cologne University, an expert in the field, agrees. He believes that information can be sent faster than light and last week gave a paper describing how it could be done to a conference in Edinburgh. He believes, however, that this will not breach the principle of causality because the time taken to interpret the signal would fritter away all the savings.

"The most likely application for this is not in time travel but in speeding up the way signals move through computer circuits," he said.

Wang's experiment is the latest and possibly the most important evidence that the physical world may not operate according to any of the accepted conventions.

In the new world that modern science is beginning to perceive, sub-atomic particles can apparently exist in two places at the same time - making no distinction between space and time.

Separate experiments carried out by Chiao illustrate this. He showed that in certain circumstances photons - the particles of which light is made - could apparently jump between two points separated by a barrier in what appears to be zero time. The process, known as tunnelling, has been used to make some of the most sensitive electron microscopes.

The implications of Wang's experiments will arouse fierce debate. Many will question whether his work can be interpreted as proving that light can exceed its normal speed - suggesting that another mechanism may be at work.

Neil Turok, professor of mathematical physics at Cambridge University, said he awaited the details with interest, but added: "I doubt this will change our view of the fundamental laws of physics."

Wang emphasises that his experiments are relevant only to light and may not apply to other physical entities. But scientists are beginning to accept that man may eventually exploit some of these characteristics for inter-stellar space travel.

The implications, like the speed, are mind-boggling. On one interpretation it means that light will arrive at its destination almost before it has started its journey. In effect, it is leaping forward in time.

Exact details of the findings remain confidential because they have been submitted to Nature, the international scientific journal, for review prior to possible publication.

The work was carried out by Dr Lijun Wang, of the NEC research institute in Princeton, who transmitted a pulse of light towards a chamber filled with specially treated caesium gas.

Before the pulse had fully entered the chamber it had gone right through it and travelled a further 60ft across the laboratory. In effect it existed in two places at once, a phenomenon that Wang explains by saying it travelled 300 times faster than light.

The research is already causing controversy among physicists. What bothers them is that if light could travel forward in time it could carry information. This would breach one of the basic principles in physics - causality, which says that a cause must come before an effect. It would also shatter Einstein's theory of relativity since it depends in part on the speed of light being unbreachable.

This weekend Wang said he could not give details but confirmed: "Our light pulses did indeed travel faster than the accepted speed of light. I hope it will give us a much better understanding of the nature of light and how it behaves."

Dr Raymond Chiao, professor of physics at the University of California at Berkeley, who is familiar with Wang's work, said he was impressed by the

findings. "This is a fascinating experiment," he said.

In Italy, another group of physicists has also succeeded in breaking the light speed barrier. In a newly published paper, physicists at the Italian National Research Council described how they propagated microwaves at 25% above normal light speed. The group speculates that it could be possible to transmit information faster than light.

Dr Guenter Nimtz, of Cologne University, an expert in the field, agrees. He believes that information can be sent faster than light and last week gave a paper describing how it could be done to a conference in Edinburgh. He believes, however, that this will not breach the principle of causality because the time taken to interpret the signal would fritter away all the savings.

"The most likely application for this is not in time travel but in speeding up the way signals move through computer circuits," he said.

Wang's experiment is the latest and possibly the most important evidence that the physical world may not operate according to any of the accepted conventions.

In the new world that modern science is beginning to perceive, sub-atomic particles can apparently exist in two places at the same time - making no distinction between space and time.

Separate experiments carried out by Chiao illustrate this. He showed that in certain circumstances photons - the particles of which light is made - could apparently jump between two points separated by a barrier in what appears to be zero time. The process, known as tunnelling, has been used to make some of the most sensitive electron microscopes.

The implications of Wang's experiments will arouse fierce debate. Many will question whether his work can be interpreted as proving that light can exceed its normal speed - suggesting that another mechanism may be at work.

Neil Turok, professor of mathematical physics at Cambridge University, said he awaited the details with interest, but added: "I doubt this will change our view of the fundamental laws of physics."

Wang emphasises that his experiments are relevant only to light and may not apply to other physical entities. But scientists are beginning to accept that man may eventually exploit some of these characteristics for inter-stellar space travel.

I can't see any problems with the evidence, I merely highlighted some photographs supportive of the Little Tahoma determination, commenting that further research seemed to establish this and the repercussions.

>Aren't you forgetting to mention something? Aren't you  
>forgetting to mention that the whole problem arises because  
>Arnold many times stated that the objects passed BEHIND (east)  
>of Rainier or Rainier's "peak" which you agree can only be  
>Little Tahoma Peak (which was further behind Rainier's summit)?

To recap, isn't there only one instance where Arnold reportedly stated the objects went behind Mt. Rainier?

It can also be interpreted this was a misquote, as the brief article claims he said, "I took out my watch and checked off one minutes and 42 seconds", which, as Arnold apparently used the dashboard clock, is surely the reporter's mistake.

Conversely, we have looked at numerous examples where Arnold clearly indicated the objects flew west of Mt. Rainier, between his position and the mountain.

I've now located something which could further help our understanding - an aerial photograph of Mt. Rainier taken from Arnold's \_approximate\_ position:

<http://mt.rainier.tribnet.com/photogallery/detail.asp?id=29>

As we can see, Little Tahoma would apparently have been visible.

I wonder how far distant this image is from Mt. Rainier?

It illustrates a fundamental issue which has always troubled me - how could Arnold have so clearly observed such detail in the objects at the distances he claims?

Related, although for reference and realising it doesn't of course match either Arnold's location or perspective, here are a couple of photographs which show the landscape to Mt. Adams, as viewed from Mt. Rainier:

<http://www.physics.georgetown.edu/~porezag/rainier98/rainier98-77.jpg>

<http://mt.rainier.tribnet.com/photogallery/detail.asp?id=99>

>This puts the distance to Arnold at 20+ miles, much farther than  
>is possible for birds to have been visible.

If there was, overall, consequential evidence why the objects passed behind Mt. Rainier, there would naturally be no premise that birds could explain his sighting.

>Most of the "west side" stories come from reporters' summaries  
>of the case in newspaper articles and are not even paraphrasing  
>Arnold.

Simply not so and I'm surprised you would suggest this. Even at the outset, in his radio interview, Arnold explained:

"I was approximately 25 to 28 miles from Mt. Rainier, I climbed back up to 9200 feet and I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier".

"Across the face", not behind it.

Especially in his UFO Symposium talk, Arnold clarified:

"When they approached Mt. Rainier's north edge, I could see they were to the west of Mt. Rainier, to me, which was a very good observation from my standpoint, because I was at right angles to them".

This 'west side story' is Arnold's own testimony.

Aside from which, if the newspapers report statements such as, "The Boise flyer said they flew on the west sides of Rainier and Adams, adding that he believed this would make it more difficult for them to be seen from the ground", that had to come from somewhere. It couldn't realistically have been a complete misquotation, resulting in a meaningful clarification which Arnold never made.

In his book, Arnold said, "I determined my distance from their pathway to be in the vicinity of twenty-three miles because I knew where I was and they revealed their true position by disappearing from my sight momentarily behind a jagged peak that juts out from the base of Mount Rainier proper".

It would only be of significance when the objects 'disappeared from sight momentarily', if they were visible the rest of the time. Otherwise, as I've highlighted before, it must surely already have been obvious how far distant these were - they would be lost from view for quite some time beforehand, when they disappeared behind the mountain. It's a tall and wide landmark.

And if they had gone behind the mountain, then how could he have observed them against it as he also stated, for example in the radio interview, "I could see them against the snow, of course, on Mt. Rainier..."

>All you have is vague and ambiguous comments, hints and  
>reporters' understandings at second-hand.

I can't understand why you believe this.

>Arnold's direct statements that the objects flew BEHIND Rainier  
>or its peak are more numerous than the few ambiguous statements  
>of his suggesting they flew to the west and he never states  
>directly they went "in front" of Rainier.

Where are these numerous statements, how are his clear explanations of a western flightpath ambiguous and why is "across the face" different from "in front" of?

>Whereas in his second known interview, with the Chicago Tribune  
>on June 25, 1947, he stated squarely and is quoted directly, not  
>paraphrased, saying:  
>  
>"I counted nine of them as they disappeared BEHIND the peak of  
>Mt. Ranier [Rainier]."

Yet, Arnold's also directly quoted as saying he took out his stopwatch. It can't work both ways - either there is evidence of misquotation in this brief article (presumably a reporter quickly taking notes), or Arnold's later, detailed story of how he timed the objects via his dashboard clock is a fabrication.

>Isn't it strange that there is NO statement on record by Arnold  
>stating the OPPOSITE, that "I counted nine of them as they  
>passed in FRONT of Mt. Rainier"?

Not compared to Arnold's four main accounts - the radio interview, Air Force report, book and symposium, where he seemingly gives no indication that the objects were \_ever\_ lost from sight, for some time, behind Mt. Rainier and appears to confirm the opposite.

Overall, I believe it may reveal how in retrospect, especially when Arnold amazingly couldn't confirm which 'distant peak' it was, he recognised there were certain irreconcilable anomalies.

The evidence overwhelmingly points towards Arnold having been deceived by a momentary disappearance of the objects behind Little Tahoma. Even if we were to accept the only rationale by which those objects could in fact have travelled beyond Little Tahoma, it means we must acknowledge that many of Arnold's other claims are proven to be untrustworthy.

It's Catch 22...

I remain unburdened by any preconceptions of the story and its perceived foundation to ufology. Irrespective and indeed quite separate from looking at any possible solution for what Arnold reportedly observed, by any objective assessment surely the context is now a case where the witness's perspective of the object's distance, size and consequently airspeed - whatever scenario you choose - has been demonstrated as factually unreliable.

How do you equate this with any sustained argument that the observation was possibly of nine alien spaceships?

James Easton.

Arnold referred to disappearance behind a peak at the BASE of  
Mt. Rainier. Little Tahoma is not exactly at the base.

My own solution to this conundrum is to place the objects lower  
than Arnold's estimated height and have them or at least one  
disappear momentarily behind a peak south of Rainier.

How does anyone equate this with pelicans and geese?  
Arnold could have been wrong in thinking that one of the objects  
disappeared behind a peak. Perhaps the Kottmeyer solution  
applies: the object(s) flipped edgewise and "disappeared"  
just as they happened to be passing a peak (Tahoma or otherwise).  
That possibility is not sufficient to raise to the pelican explanation  
to the status of "proven" or even "likely", in the face of all the  
contradictory dynamical

evidence reported by Arnold.  
Once again.

Interesting if true. Does this have anything to do with the system reported in Scientific American last month? It used particle parity.

Now the big question: Was everything well verified before this announcement was made, or is this like the cold-fusion mess -- a premature claim? It will be interesting to see how this claim settles out under scrutiny. Many errors in observation or measurement are traced to effects the experimenter didn't anticipate. For example, the reported "discovery" of a magnetic monopole several years ago was actually caused by a workman dropping a hammer in the lab above. Mechanical vibration had not been anticipated in the design of the experiment, because it was not expected to happen.

I "discovered" a similar effect several years ago, while trying to measure the speed of something that moves much slower than light -- nerve impulses. They were recorded as propagating at speeds much faster than we expected.

Then I found the trouble, in the UNIX operating system. It was recording the times of the events wrong. It seemed simple enough to the experimenter to write an interrupt-based subprocess that responded to a signal and recorded the exact time. Any latency in the process of recording the time should affect both inputs equally. It worked, but---

When the second event occurred, it interrupted the first event's process long enough to open a new frame for the second event. Then the first event's time was recorded late, followed immediately by the second event's time. The result was a longer latency time for both processes, since they interleaved, but shorter times to read the accurate clock.

I made a hardware device to read the clock and latch it to a buffer when the pulse came in, and the program then read the latched times. That fixed the problem.

The 'Los Angeles Evening Herald and Express' also carried the 'Roswell' press release story and a copy of that front page can be seen at:

<http://www.ufoworld.co.uk/013.jpg>

The continuation is:

<http://www.ufoworld.co.uk/015.jpg>

Although these are primarily for those interested in seeing the actual historical accounts, there's a question related to this newspaper. In the 'late news insert', it's reported that Senator Johnson of Colorado, who was in Washington, told the Denver Post that the Roswell wreckage may have been either a "radar target or meteorollogical (sic) device".

I'm curious about the timescale - both insets at top are from 'International News Service' and dated 8 July. It's reported that Johnson told the Denver post "earlier today" about this determination, yet Gen. Ramey didn't reveal it until "tonight".

Presumably Johnson heard about this explanation from Gen Ramey or sources close to Ramey?

Was Johnson anyone of particular note at the time?

Obviously if Johnson did in fact know about the 'weather balloon' story before Ramey, that might be interesting. If the newspapers' apparent sequence of articles is as shown (latest on top), the 'Johnson' news release would seem to have preceded Ramey's.

The full 'Flying Disc Proves Weather Balloon' story was published on 9 July and can be seen here:

<http://www.ufoworld.co.uk/019.jpg>

continuing at:

<http://www.ufoworld.co.uk/020.jpg>

The \_complete\_ 'New York Times' report is also now online:

<http://www.ufoworld.co.uk/024.jpg>

and

<http://www.ufoworld.co.uk/025.jpg>

The 'Los Angeles Evening Herald and Express' also carried the 'Roswell' press release story and a copy of that front page can be seen at:

ListBot have assured me that recent server upgrades are complete and with rare exceptions there should be no further delays with distributing mail (I was beginning to think they'd upgraded the mail server to a Commodore 64).

Although mail delivery seems much improved this past couple of days, there's still a few quirks and some mail I sent earlier didn't arrive as it should have.

The new subject header 'The Day Before Roswell' was sent long before my follow up 'Re: The Day Before Roswell'. As the original hadn't arrived and wasn't showing in the UFORL archives, I sent a duplicate of 'The Day Before Roswell'. Both have now duly appeared in the archives (typical...).

It's all a bit erratic, however, things will hopefully settle down before too long.

The duplication of text in the mail headed 'Roswell Press Releases' would appear to be my responsibility (doubtless everyone's figured out where the duplication begins and ends).

A reminder that the all mail is archived and can be viewed - by subscribers only - as follows:

Go to:

<http://www.listbot.com/>

Log in as a list member under:

contents - log in - list member

You will require the password provided by the list server when you subscribed.

If that's been mislaid, use the 'Lost yours?' link above the password field.

This also enables you to check if mail sent to the list has been

received by the list server (even though it might not yet have been distributed).

If it hasn't shown up in the archives, be patient (as I should have), it's probably only been delayed and will appear shortly.

James Easton.

Bruce,

As previously confirmed, when I sought the opinion of local expertise, I quoted Arnold's exact statement from his book. This is from 'Voyager Newsletter No. 11':

Following discussions with other interested researchers and the perusal of several, different topographical maps, it seemed there was only one likely candidate for 'Arnold's peak'. Confident this could yet be determined, I wrote to some indigenous sources who had expertise of the mountain range:

"I wonder if you could offer an informed opinion concerning a historical observation near Mt. Rainier.

I'm trying to locate what was described by an observer in the 1940s as, 'a jagged peak that juts out from the base of Mount Rainier proper'.

Having researched the locality from topographical maps, I'm still uncertain about the identity of this peak and what constitutes 'the base of Mount Rainier proper'.

An important clue could be that the writer was a pilot and made this observation from approximately over the town of Mineral and heading in the mountain's direction.

Therefore, the 'jagged peak' must be visible from that location, to the west/southwest of Mt. Rainier.

Any opinions or comments would be greatly appreciated and could be of invaluable help in my research.

It would be fully understood that any opinions would be a 'best guess' and I'm happy to have more than one possibility suggested for this 'jagged peak'."

David Basset is a mountaineer with vast experience of Mt. Rainier and surrounding peaks. He responded:

"The jagged peak you are referring to is clearly Little Tahoma. It is jagged because it is unglaciated and very steep. It rises from the base of Mt. Rainier on the East or Southeast side. You said the observation was taken from the west or southwest. This might be troubling because it is on the other side of the mountain, but rest assured, Little Tahoma is the peak. It stands out, being much higher than any other mountain close to Rainier".

Located at Mt. Rainier National Park, Chris Trotter, the Park Guide and Douglas Kraus, the Park Naturalist, confirmed:

"The consensus from my co-workers is that the 'jagged peak' is Little Tahoma. This peak can be seen from many areas around the mountain. Mt. Rainier is said to rise 11,000 feet from its base".  
[End]

Although there's an apparent difference of opinion on whether the mountain rises from the base of Little Tahoma or vice versa, there seem to be no qualms that the un-named pilot's observation identified Little Tahoma.

Aside from which, is there another candidate suggested here or elsewhere?

>My own solution to this conundrum is to place the objects lower  
>than Arnold's estimated height and have them or at least one  
>disappear momentarily behind a peak south of Rainier.

Arnold does refer to the objects disappearing behind a landmark south of Rainier, however, he says this was a "very high plateau" - to quote from the account in his book:

"Between Mount Rainier and Mount Adams there is a very high plateau with quite definite north and south edges. Part of this chain-like formation actually dipped below the near edge".

It seems to confirm the "jagged peak" was somewhere else.

As your suggested solution is 'based' on a premise that would appear to be untenable, would you like to now offer an alternative?

>Once again.

>DRAW A MAP!

Based on which scenario - Brad's or your own?

With Little Tahoma being established as the almost certain 'peak' Arnold used as a distance marker - I did have the same doubts as yourself, that's why I specifically checked them out - if you could possibly now clarify what your scenario actually is, then we can maybe make some further progress.

Incidentally, re Brad's insistence, contrary to your assessment, my own and the general understanding, that Arnold never said the objects went in front of Mt. Rainier, there's one more reference in addition to those already cited:

CUFOS Associate Newsletter, February-March 1984, Page 3:

Transcript of Ed Murrow-Kenneth Arnold Telephone Conversation -

"I assumed at the time they were a new formation or a new type of jet, though I was baffled by the fact that they did not have any tails. They passed almost directly in front of me..."

Best wishes,

James Easton.

This [unedited] account was kindly sent to myself within the past week from someone I don't personally know:

Hi James,

please don't feel obligated to reply, but I have, unfortunately seen what is commonly called a flying saucer. I ain't talking about lights in the sky or lost time blah blah I mean I have been within 20 ft (est) of a large disk, silver in colour, with a brushed metal surface and no obvious openings except for where the rusty iron grappling apparatus came out (you think I'm a crackpot now and I don't blame you mate.) I am not the only one to have seen this, the traffic was going crazy to avoid going under it. I drove under it, Ask the South Shields Gazette to do a confidential questionnaire on who knows someone who saw something and you might have a nice suprise. That's the King George Road, South Shields, Tyne & Wear, November 1998.

I always wanted to see a flying saucer after seeing C.E. of the third kind, but I wish I hadn't now, when you see something that makes you question absolutely everything, you realise you would have been quite happy just keeping an open mind. I tried, nearly lost my job, I heard one guy who work's for Nissan in Sunderland lost his through being honest (he was in one of the cars like me who drove under this thing.) I watched it, directly underneath for at least 2 minutes, and friends have said "why didn't you watch it for more?" Without the proof where are we, I have some interesting video though, but when the time came and it really mattered, I was on the way to borrow a video camera. Such is life.

P.S I know the difference between a scrap metal yard and a film set and something truly unusual.

[End]

OK... UK subscribers, where was the Virgin 'flying saucer' hot air balloon at this time. ;)

If that's [probably] not the explanation - do we have any more info on a reported incident around this time?

Best wishes,

James Easton.

Yes it would. If the balloon was made from a material with metalized surface, then the radar reflection would be very strong indeed.

Birds even show up on radar. I once saw a film clip of starlings roosting at dusk which appeared like mass of small dots on the radar screen! In the good old days radar operators called these (at the time unexplained dots) "Angels".

Whadaya mean, untenable? My solution was to have the objects lower than the 9500 (or 10,000) ft that Arnold estimated. If they actually dipped below a peak of the ridge then they were as low as the height of the ridge, i.e. below 7000 ft (or whatever height is assigned to the ridge. This is clearly lower than 9500 ft. Also, this is much lower than Little Tahoma.

>Once again.  
>DRAW A MAP!

>Based on which scenario - Brad's or your own?

Pick any pelican scenario you like. It could have pelicans at appoximately Arnold's altitude, but you could have them above or below as you choose to make them seen to be flying at an altitude of 7000 ft or an altitude of 11000 ft.

How far above or below depends upon the angle you assume from Arnolds plane to the peak that they supposedly disappeared behind and it also depends upon how far from the plane you assume the pelicans were when they passed in front of

Arnold.

Simple!

>With Little Tahoma being established as the almost certain 'peak'  
>Arnold used as a distance marker - I did have the same doubts as  
>yourself, that's why I specifically checked them out - if you  
>could possibly now clarify what your scenario actually is, then  
.we can maybe make some further progress.

Sure. As I wrote above, draw a map showing the flight of pelicans and the flight of Arnold's plane. Make some reasonable assumptions about Arnold's speed toward the east or east northeast (if toward Rainier), then flight direction of teh geese, the speed of the geese, and the initial starting locations (Arnold at some position near Mineral and the geese no more than 5 miles from his plane in a direction somewhat to the north of the direction t Mt. Rainier). Let the geese be a bit higher than Arnold if you think the mountain peak they seemed to disappear behind was Little Tahoma. In fact, the angle upward from Arnold's plane (9500) to Little Tahoma (11,000 --rough numbers) at a distance of, say, 23 miles is about 0.8 degree. That means that if the pelicans were, say, 5 miles away when they were between Arnold and LT, they were about 70 ft higher than Arnold. If they were closer than 5 miles (hint... they were closer) then they were less than 66 ft above Arnold.

Easy to draw a map and see what happens.

John-

I'm not an expert here, but I think one needs to define "reconnaissance" balloon. If the balloon is made of the correct materials, it would indeed show up on radar, but RAWIN targets were used by the military to keep track of balloons with radar because they didn't show up on their own (at least reliably).

I had also thought that reconnaissance balloons were usually tethered, so they could be controlled as they gathered information. Otherwise, as James alludes to, the balloon would be subject to the whim of air currents.

What year is that clipping from???

The jet stream rarely blows west. Somebody has a hole in their head on that one.

This is typical of cases where either:

1. Atmospheric skip allows one RADAR set to receive pulses emitted by another like set which is normally too far away to cause interference.
2. Weather targets fool the early MTI systems.

The classic symptoms are:

- Blips "Larger than a plane." or "Clearer than any target I ever saw."
- Blips exhibits nonballistic behavior.
- Blips appear and disappear.

1. In the case of interference from a distant RADAR set, signals from that set (which is normally too far away to cause interference) are ducted by unusual radio propagation conditions in a way that the set reporting the UFO can pick them up.

When this happens, the distant set illuminates the reporting set once per revolution of the antenna. This causes the following effects:

- The blip seems to stay in roughly the same place from sweep to sweep. This is because both RADAR sets are using the same rotation rate and pulse rate. Slight variations in either will cause the blip to move.
- Assuming this was also in the year 1954, precision power supply regulation had not yet been invented. So a power sag would cause a momentary slowdown in the rotation rate of the antenna of one of the sets. While this did not cause problems within the operation of that set, it did cause the duct propagation UFOs to appear to move rapidly.
- Even today, the motor rotation rate of the antenna could be affected by a power sag, even though the electronics are rock stable. But the development of transponders allows a distant RADAR's interference to be immediately identified by the set and removed from the display automatically.

- Because this is a synchronized radio signal, not a solid object, ballistic behavior is not a requirement.

Because the RADAR set is receiving a direct signal from the other transmitter, not a relatively weak reflection from an aircraft, the following effects occur:

- The signal is strong enough to blast its way in through the back side of the antenna. So the UFO does not have to be in the direction of the interfering set.
- The blip is very strong, stronger than plane blips. This is a very important identifying clue.
- The position of the UFO on the screen depends on the direction the reporting RADAR antenna is pointing at the time the beam from the distant set strikes it.

2. In the case of weather targets fooling the MTI (Moving Target Indicator), knowledge of how this worked is essential:

When a blip was received, it was displayed on the screen and also fed into a delay line. On the next pulse, if a blip was received at the exact same time that the first blip came back from the delay line, it was prevented from reaching the screen, but fed into the delay line. The effect was to delete any targets that did not change their positions between pulses.

The effects of weather targets undo this neat little scheme, producing big fat targets that do unpredictable things:

- The displayed UFO was the difference between the reflected target on one sweep and the reflected target on the next. Since weather targets are variable, there would always be a portion that got through.
- Weak targets failed to activate the delay line on every pulse. Thus they appeared to be stronger than airplanes that did activate the delay line. When an airplane activated the delay line, the parts of it that were still at exactly the same range on the next pulse were cancelled out.
- Many weather targets result from ducting that bends the RADAR beam so it strikes the ground. But it strikes the ground in a different place with each pulse, again defeating the MTI.
- Often the target "moved" because the angle of ducting changed.

Notice that these events do not happen today. I found out a few weeks ago that most air traffic systems no longer have primary skin contact RADAR. Display is accomplished entirely through transponders. This means that anomalous propagation no longer shows up on RADAR

screens. Of course, the disadvantage is that airliners with failures, private planes and UFOs also do not show up.

The only remaining propagation problem is the 2nd trip echo, where a plane beyond the normal RADAR range is picked up. When this happens the transponder code shown is wrong, because the RADAR gets back the wrong answer - the answer to the question the set asked on the previous pulse, not the current one.

@ -----Original Message-----

@ From: James Easton [mailto:voyager@ufoworld.co.uk]

@ Sent: Tuesday, June 06, 2000 20:04

@ To: UFO Research List

@ Subject: Re: 1954 US Navy Photo

@

@ There's another historical newspaper report I've come across  
@ regarding a French UFO case and surely someone knows the  
@ background to this one.

@

@ It's amongst the undated clippings I have and can be seen at:

@

@ <http://www.ufoworld.co.uk/007.jpg>

@

@ If this was, as suggested in the article, a reconnaissance, alias  
@ 'weather' balloon launched by the US, why would it appear so  
@ large on radar and apparently have a fascination for aircraft  
@ landing and taking off at Orly airport. Interestingly, the object  
@ was also reported by another radar station south-west of Paris.

@

@ A general question - would a balloon show up on radar?

This depends on what it's made of. Many balloons are silvered to prevent early bursting at high altitudes. Those will show up. See the Ft. Monmouth NJ case of 9/10/51 for an example of RADAR sighting a balloon. Balloons carrying a RaWin target will also show up, as will metal parts of an instrument package.

@

@ Best wishes,

@  
@ James Easton.

Bruce,

To hopefully clarify this further, let's take Arnold's main  
account as published in his book:

I could see the formation was going to pass directly in front of  
me, as it was flying at approximately 170 degrees. I watched as  
these objects rapidly neared the snow border of Mount Rainier...

[...]

I observed the objects' outlines plainly as they flipped and  
flashed along against the snow and also against the sky. Since  
this formation of craft was at almost right angles to me and was  
traveling from north to south, I was in an excellent position to  
clock their speed. I determined to make an attempt to do so.  
[End]

So, apparently:

- the objects were about to pass directly in front of Arnold
- he observed their outlines "plainly" against the snow
- which confirms they didn't travel behind Mt. Rainier
- they were almost at right angles to his position.

He continues:

[...]

Even though they had a constant direction they swerved in and out of the high mountain peaks which are found on the hogsback of the Cascade mountains between Mount Rainier and Mount Adams. I determined my distance from their pathway to be in the vicinity of twenty-three miles because I knew where I was and they revealed their true position by disappearing from my sight momentarily behind a jagged peak that juts out from the base of Mount Rainier proper. Considering that I was flying all this time in the direction of their formation, this determination can be only approximately, but it is not too far off.

[End]

Our jagged peak, "juts out from the base of Mount Rainier" and Arnold states it was because they [seemingly] disappeared from sight "momentarily" behind this peak that he was able to determine their "true position". Significantly, he was "flying all this time in the direction of their formation", which surely tells us this 'jagged peak' simply had to be Little Tahoma.

Also note that re the "very high plateau with quite definite north and south edges", he states, "part of this chain-like formation actually dipped below the near edge". That's quite different - only some of the objects, or a 'piece' of the formation appeared to dip below the near edge. No comparison to all of the objects apparently "disappearing from my sight momentarily behind a jagged peak that juts out from the base of Mount Rainier proper".

This evidence is quite straightforward.

Therefore, Arnold's peak was almost certainly, if not in fact definitely, Little Tahoma and any other premise is by default untenable, unless it can be explained why it's not.

All evidence indicates that Arnold believed, as does Brad, the objects passed out of sight, fleetingly, behind Little Tahoma.

Arnold absolutely must have been mistaken and this is sustainable evidence why the objects had to be closer than he perceived.

It is of course possible to accept this and presume the objects were still far distant. However, it's equally plausible those nine undulating objects were only a few miles away.

Before we look at any other issues, can we reach a conclusion on this fundamental point?

In essence - Little Tahoma was the peak Arnold used as a distance marker and he was deceived that the trajectory of all nine objects went beyond, as he also confirms they travelled directly in front and on the western slopes of Mt. Rainier. I've set out the clear, evidential reasons why and if there's factual data which implies otherwise, please explain what that is.

Separately, I've come across an interview that Arnold gave and which may be largely unknown. It's available as an audio file on the 'Roswell Museum' web site at:

<http://www.iufomrc.com/arnold.htm>

This seems to be a much later account as he mentions the one object which was allegedly different and 'wraith-like'.

Personally, I remain unconvinced Arnold could have observed such detail, and that they were still 'flashing', when the objects seemed to have reached Mt. Adams in the far south.

If he did, can we say what size they must have been [how far was Mt. Adams from his viewpoint?].

Best wishes,

James Easton.

Subject: Re: Kenneth Arnold and Little TahomaStatus: O

James,

You are completely misinterpreting Arnold when he says the objects were going to pass in front of him. It doesn't mean in FRONT OF THE MOUNTAIN but in FRONT OF HIM -- meaning crossing his flight direction, 12 o'clock.

I'll respond to your other points later.

Brad

>height is assigned to the ridge. This is clearly lower than

>9500 ft. Also, this is much lower than Little Tahoma.

Bruce,

To hopefully clarify this further, let's take Arnold's main account as published in his book:

I could see the formation was going to pass directly in front of me, as it was flying at approximately 170 degrees. I watched as these objects rapidly neared the snow border of Mount Rainier...

[...]

I observed the objects' outlines plainly as they flipped and flashed along against the snow and also against the sky. Since this formation of craft was at almost right angles to me and was traveling from north to south, I was in an excellent position to clock their speed. I determined to make an attempt to do so.

[End]

So, apparently:

- the objects were about to pass directly in front of Arnold
- he observed their outlines "plainly" against the snow
- which confirms they didn't travel behind Mt. Rainier
- they were almost at right angles to his position.

He continues:

[...]

Even though they had a constant direction they swerved in and out of the high mountain peaks which are found on the hogsback of the Cascade mountains between Mount Rainier and Mount Adams. I determined my distance from their pathway to be in the vicinity of twenty-three miles because I knew where I was and they revealed their true position by disappearing from my sight momentarily behind a jagged peak that juts out from the base of Mount Rainier proper. Considering that I was flying all this time in the direction of their formation, this determination can be only approximately, but it is not too far off.

[End]

Our jagged peak, "juts out from the base of Mount Rainier" and Arnold states it was because they [seemingly] disappeared from sight "momentarily" behind this peak that he was able to determine their "true position". Significantly, he was "flying all this time in the direction of their formation", which surely tells us this 'jagged peak' simply had to be Little Tahoma.

Also note that re the "very high plateau with quite definite north and south edges", he states, "part of this chain-like formation actually dipped below the near edge". That's quite different - only some of the objects, or a 'piece' of the formation appeared to dip below the near edge. No comparison to all of the objects apparently "disappearing from my sight

momentarily behind a jagged peak that juts out from the base of Mount Rainier proper".

This evidence is quite straightforward.

Therefore, Arnold's peak was almost certainly, if not in fact definitely, Little Tahoma and any other premise \_is\_ by default untenable, unless it can be explained why it's not.

All evidence indicates that Arnold believed, as does Brad, the objects passed out of sight, fleetingly, behind Little Tahoma.

Arnold absolutely must have been mistaken and this is sustainable evidence why the objects had to be closer than he perceived.

It is of course possible to accept this and presume the objects were still far distant. However, it's equally plausible those nine undulating objects were only a few miles away.

Before we look at any other issues, can we reach a conclusion on this fundamental point?

In essence - Little Tahoma was the peak Arnold used as a distance marker and he was deceived that the trajectory of all nine objects went beyond, as he also confirms they travelled directly in front and on the western slopes of Mt. Brad wrote:

>You are completely misinterpreting Arnold when he says the  
>objects were going to pass in front of him. It doesn't mean in  
>FRONT OF THE MOUNTAIN but in FRONT OF HIM -- meaning crossing  
>his flight direction, 12 o'clock.

Brad,

I appreciate what you're saying, however, there are simply too many references that the objects flew in front of Mt. Rainier.

There's one remaining clarification from Arnold which is crucial and comes from the UFO Symposium transcript:

"And, of course, I was very puzzled by the fact that they didn't have tails, but I got a good look at their image on the snow. Now, when they gave off this flash they would appear to be round. When they turned lengthwise or flatwise to me they were very, very thin. And actually they disappeared behind a sharp projection on Mt. Rainier in the snow field to my eyesight and since I knew approximately where I was, flying of course toward the mountain, I knew where they had passed. I thought my judgement and my clocking could be within reasonable limits as to about how fast they were going".

This "sharp projection \_on\_ Mt. Rainier in the snow field" is probably in hindsight the most telling confirmation that it was Little Tahoma.

By definition, Little Tahoma is a "sharp projection \_on\_ Mt. Rainier".

The absolute fact that Arnold also confirmed how he viewed the objects against Mt. Rainier - which he naturally couldn't have if they travelled behind it - is clearly evident in all of his main accounts:

"but I could see them against the snow, of course, on Mt. Rainier...".

Source: Radio interview

"Very shortly they approached Mt. Rainier, and I observed their outline against the snow quite plainly".

"I am making a drawing to the best of my ability, which I am including, as to the shape I observed these objects to be as they passed the snow covered ridges as well as Mt. Rainier".

Source: Report to the Air force

"I watched as these objects rapidly neared the snow border of Mount Rainier, all the time thinking to myself that I was observing a whole formation of jets. In group count, such as I have used in counting cattle and game from the air, they numbered nine. They were flying diagonally in an echelon formation with a larger gap in their echelon between the first four and the last five. What startled me most at this point was the fact that I could not find any tails on them. I felt sure that, being jets, they had tails, but figured they must be camouflaged in some way so that my eyesight could not perceive them. I knew the Air Force was very artful in the knowledge and use of camouflage. I observed the objects' outlines plainly as they flipped and flashed along against the snow and also against the sky".

Source: 'The Coming of the Saucers'

"They seemed to be in an echelon formation, however, in getting a look at them against the sky and against the snow of Mt. Rainier as they approached I just couldn't discern any tails on them...".

"And, of course, I was very puzzled by the fact that they didn't have tails, but I got a good look at their image on the snow".

Source: UFO Symposium

It is overwhelmingly attested that Arnold claimed the objects flew across Mt. Rainier and also believed they briefly disappeared behind Little Tahoma, which he statedly relied on as evidence of how far distant they were.

As we know it's an impossibility they flew in front of the mountain and also behind the further away Little Tahoma, Arnold

was mistaken and the evidence confirming this is comprehensive.

Best wishes,

James Easton.

Arnold's testimony regarding the apparent location of the light path as it appeared from his position :  
You wrote

>He continues:

[...]

>Even though they had a constant direction they swerved in and out  
>of the high mountain peaks which are found on the hogsback of the  
>Cascade mountains between Mount Rainier and Mount Adams. I  
>determined my distance from their pathway to be in the vicinity  
>of twenty-three miles because I knew where I was and they  
>revealed their true position by disappearing from my sight  
>momentarily behind a jagged peak that juts out from the base of  
>Mount Rainier proper. Considering that I was flying all this time  
>in the direction of their formation, this determination can be  
>only approximately, but it is not too far off.  
>[End]>

>Our jagged peak, "juts out from the base of Mount Rainier" and  
>Arnold states it was because they [seemingly] disappeared from  
>sight "momentarily" behind this peak that he was able to  
>determine their "true position". Significantly, he was "flying  
>all this time in the direction of their formation", which surely  
t>ells us this 'jagged peak' simply had to be Little Tahoma.>

>Also note that re the "very high plateau with quite definite  
>north and south edges", he states, "part of this chain-like  
f>ormation actually dipped below the near edge". That's quite  
>different - only some of the objects, or a 'piece' of the  
>formation appeared to dip below the near edge. No comparison to  
>all of the objects apparently "disappearing from my sight  
>momentarily behind a jagged peak that juts out from the base of  
>Mount Rainier proper".

>This evidence is quite straightforward.

Yes, at least with regard to the "hogsback" chain of mountains south of Rainier. Even if only one of the group "dipped below the near edge" that would fix the distance. He says they were

swerving in and out of the mountains peaks of the hogsback chain of mountains. If this is so then they were much lower than Little Tahoma. Alternatively, if they were at the altitude of Little Tahoma as they flew over the hogsback chain of mountain peaks, they would not even appear to swerve in and out of the mountain peaks. At 11,000 ft or so they would CLEARLY be considerably above the 7000 ft or so hogsback mountain peaks. They would not be silhouetted against the hogsback mountains. They would appear ABOVE those mountains,

Now consider this: your argument is that the objects were nearer (several miles away?) and momentarily disappeared "behind" Little Tahoma because at the moment that each one passed the DIRECTION from Arnold's plane to Tahoma it tipped edgewise and was momentarily "invisible:" (too thin to see, I guess). That argument barely cuts the mustard as applied to Little Tahoma because at least they would have been momentarily silhouetted against the mountain peak, even if momentarily invisible because of orientation. This argument does NOT work as an explanation for the seeming disappearance of one or more behind mountains of the hogsback chain, however, if the objects were high enough to seem to disappear behind Little Tahoma. This is because the "disappearance altitude" for Little Tahoma is several thousand feet higher than the hogsback chain/

In other words, you can't have both: seeming disappearance behind Little Tahoma because of orientation change (edge on view or whatever) AND seeming disappearance of the objects or at least some objects behind the peaks of the hogsback by orientation change IF the objects maintained a constant altitude of 10,000-11,000 ft (to "disappear behind" Little Tahoma).

Arnold said they seemed to be maintaining a constant altitude. So what altitude?

I hate to repeat myself, repeat myself, but I say again: my solution is to have the objects low enough so satisfy the condition of real disappearance behind some mountains of the hogsback chain, and hence to look for a peak lower down on Mt. Rainier than Little Tahoma.

>Therefore, Arnold's peak was almost certainly, if not in fact  
>definitely, Little Tahoma and any other premise is by default  
>untenable, unless it can be explained why it's not.  
Almost Certainly. Almost Certainly NOT. Almost certainly what?

>All evidence indicates that Arnold believed, as does Brad, the  
>objects passed out of sight, fleetingly, behind Little Tahoma.

>Arnold absolutely must have been mistaken and this is sustainable  
>evidence why the objects had to be closer than he perceived.

>It is of course possible to accept this and presume the objects  
>were still far distant. However, it's equally plausible those  
>nine undulating objects were only a few miles away.

>Before we look at any other issues, can we reach a conclusion on  
>this fundamental point?

>In essence - Little Tahoma was the peak Arnold used as a distance  
>marker and he was deceived that the trajectory of all nine  
>objects went beyond, as he also confirms they travelled directly  
>in front and on the western slopes of Mt. Rainier. I've set out  
t>he clear, evidential reasons why and if there's factual data  
>which implies otherwise, please explain what that is.>

I did.

As for nearby objects , a.k.a. pelicans, Prove to me that  
pelicans flying along a horizontal trajectory several miles  
from the plane could seem to disappear behind Little  
Tahoma and short after that seem to disappear behind  
peaks of the hogsback mountain chain.

>Personally, I remain unconvinced Arnold could have observed such  
>detail, and that they were still 'flashing', when the objects  
>seemed to have reached Mt. Adams in the far south.

What detail? His original descriptions showed a general  
outline. We have already gone over, ad nauseum, his  
ability to see as gauged by his comparison of the UFO size  
with the spacing between engines of an airplane about 15  
(maybe 10) miles away.

>If he did, can we say what size they must have been [how far was  
>Mt. Adams from his viewpoint?].

All he could see as they passed Mount Adams was the flashing,  
no details of shape. The flashing could be seen at a much greater  
distance than he could see the surfaces of the objects.  
Again,. this was discussed ad nauseum in posts some months ago.

You may have seen the above story mentioned on UFO UpDates, based on a reference to the article at:

[http://www.MegaStar.co.uk/archive/today/news/latest/20000607n\\_encounter.html](http://www.MegaStar.co.uk/archive/today/news/latest/20000607n_encounter.html)

I've obtained a copy of the magazine and can confirm that both the full details of this report and actual UFO photograph are somewhat different to the extract and 'mock-up' photo portrayed above.

In fact, it seems a more intriguing and ostensibly genuine 'UFO' encounter than believed.

A scan of the report and original photograph can now be viewed at:

<http://www.ufoworld.co.uk/pilot.gif>

The UFO incident is a digression in an article entitled, "Across the USA in A Cessna Skymaster".

Although the objected depicted is, understandably, blurred, any ideas what it might have been?

I hope to shortly be able to provide a high-res scan of this photo.

[I'll also mention this information on UFO UpDates]

There are two mundane possibilities:

1. The sun is the light source on the object, causing halation. So all that remains is to identify that object. Could it be another light plane, flying obliquely away, with the sun reflecting from the fuselage and vertical stabilizer and hiding the details?

2. The "shadow" under the UFO is not natural. It suggests a double exposure or a double printing process. But it could be a result of a halation process inside the camera.

The suggestion that the roundness was an effect of halation implies  
excessive brightness against the bright sky background. This is  
consistent with shiny objects at a distance ... but not with  
pelicans at 4 miles or 3 miles or.....even mixed up in Arnold's propellor  
blades (really close! feathers flying all over the place)

It seems from the way he described this that Arnold realized the round  
shape  
was a result of th flash.

HOWEVER: one cannot tacitly assume that each time each object tilted  
it caused a flash thereby preventing Arnold from seeing the actual overall  
shape silhouetted against the snow, Note that the bright flash  
PROBABLY occurred only for a narrow range of angles of tilt. At other  
angles Arnold could see a perspective or oblique view of the shape.

Recall that Fred Johnsen, prospector in the Cascade Range who claimed  
he saw the same objects in the afternoon of the same day, reported last  
seeing them "standing on edge" going into a cloud. Now, this implies a  
considerable tilt of the flat surface, like from horizontal to vertical (on  
edge).

The flash reported by Arnold could have occurred as the objects tilted

but it might have been that the flash was finished by the time of the maximum tilt, which would have given him the best view of the overall shape.

Unlike pelicans, by the way (pelicans don't fly with the wingspan vertical except perhaps in a steep turning dive)).

This is the second scan of a UFO photo where I have seen faint images of automobiles in the background. Look just under the wing (and with the top touching the wing), and find the back of a station wagon. To its right appears to be a another car approaching. The object is below them.

When was this taken?

@ Subject: Re: RE: 'Pilot' Magazine, June 2000 - Report of UFO Incident

@

@

@ @

@ Double exposure cannot subtract light from an area of a photo

@ (e.g., adding a

@ shadow). It can only add light, increasing the density of

@ exposed silver

@ halide grains. Once exposed to light a second exposure

@ cannot take back any

@ of the silver halide grains that have already been exposed.

Right. But it can add more light to the other areas, causing the automatic film

processing to be offset by that amount. It reminds me of the time I took some

amateur astronomical photos, and sent the film off to be developed commercially. The color slides that resulted appeared to have been taken in the

daytime, jiggered around by automatic color correction in the film processing.

The new expanded scan shows that the object is blurred (and is thus close to the camera), and it also shows faint images of automobiles in the sky between

the object and the wing. That also suggests double exposure.

It also shows more detail in color variations on the object. Might the object be the

location where a mandatory vehicle sales sticker was removed, leaving the

sticky parts attached to a window?

@ Subject: RE: 'Pilot' Magazine, June 2000 - Report of UFO Incident

@

@

@ @

@ Larry,

@

@ I just demonstrated the fact of physical optics that it is an

@ impossibility for a double exposure to impose a DARKER image

@ (i.e., take away light) from an already exposed photographic

@ emulsion. You just go right on ahead and ignore what I proved.

It can be darker if automatic development compensates for the added exposure.

@ As for your imagining seeing automobiles you just posted the

@ statement suggesting as a "double exposure" image situation

@ that: "Might the object be the location where a mandatory

@ vehicle sales sticker was removed, leaving the sticky parts

@ attached to a window?"

@ How can another vehicle, with the "sales sticker" window

@ area, be under two other vehicles (note your statement below

@ that the "object" is below the station wagon and approaching

@ car)? If the "object" is an area of car window then the size

@ of the entire vehicle must overlap and encompass the other

@ two alleged vehicles. This is madness!

The photo is taken from inside the car or plane that was sold! That doesn't sound like madness to me.

@ There is another simpler explanation than a conspiracy to  
@ double expose car images: The photo James has posted appears  
@ to be from a PRINTED MAGAZINE and IMAGES FROM THE OTHER SIDE  
@ OF THE PAGE apparently are showing through. Whether they are  
@ ads for automobiles or something else entirely I can't tell.

That makes sense! I'll buy that, if the original page has them on  
the other side. Do we have it? And is the shadow part of the other  
side, or the original image?

Which means we don't have a "virgin" copy of the photo to look at.

And the original object could still be the remains of a new plane  
sticker (don't laugh, they're required in this state). It's even on the  
correct window.

@ Brad  
@

>swerving in and out of the mountains peaks of th hogsback chain  
>of mountains. If this is so then they were much lower than  
>Little Tahoma.

Bruce,

That's a consequential 'if'.

Your comments were written before I highlighted the further,  
important clarification Arnold made. To briefly recap, he stated  
at the UFO Symposium:

"And actually they disappeared behind a sharp projection on Mt.  
Rainier in the snow field to my eyesight and since I knew  
approximately where I was, flying of course toward the mountain,  
I knew where they had passed. I thought my judgement and my  
clocking could be within reasonable limits as to about how fast  
they were going".

>Alternatively, if they were at the altitude of Little Tahoma as  
>they flew over the hogsback chain of mountain peaks, they would

>not even appear to swerve in and out of the mountain peaks. At  
>11,000 ft or so they would CLEARLY be considerably above the  
>7000 ft or so hogsback mountain peaks. They would not be  
>silhouetted against the hogsback mountains. They would appear  
>ABOVE those mountains.

As our research has now identified Little Tahoma as almost certainly the peak Arnold referred to, shouldn't we be considering the probabilities from that basis?

>Now consider this: your argument is that the objects were nearer  
>(several miles away?) and momentarily disappeared "behind" Little  
>Tahoma because at the moment that each one passed the DIRECTION  
>from Arnold's plane to Tahoma it tipped edgewise and was  
>momentarily "invisible:" (too thin to see, I guess).

Strictly, no. The premise is that we have significant evidence which indicates Arnold believed the objects fleetingly disappeared from sight beyond Little Tahoma. That is an impossibility if, as we both agree, it's clear from Arnold's accounts how they flew in between his position and the mountain. The apparent momentary disappearance is noted by Arnold as a key indicator why the objects were far distant. If he was mistaken, it allows for the possibility that the objects were closer than he perceived.

>That argument barely cuts the mustard as applied to Little  
>Tahoma because at least they would have been momentarily  
>silhouetted against the mountain peak, even if momentarily  
>invisible because of orientation.

Not \_would\_ have, they \_should\_ have, if Arnold's perspective was accurate. If, as evidenced, it wasn't, then shouldn't we in fact expect further anomalies as a consequence?

>This argument does NOT work as an explanation for the seeming  
>disappearance of one or more behind mountains of the hogsback  
>chain, however, if the objects were high enough to seem to  
>disappear behind Little Tahoma. This is because the  
>"disappearance altitude" for Little Tahoma is several thousand  
>feet higher than the hogsback chain.

>

>In other words, you can't have both: seeming disappearance  
>behind Little Tahoma because of orientation change (edge on view  
>or whatever) AND seeming disappearance of the objects or at  
>least some objects behind the peaks of the hogsback by  
>orientation change IF the objects maintained a constant altitude  
>of 10,000-11,000 ft (to "disappear behind" little Tahoma).

That's not \_my\_ dilemma.

I'm only concerned with evidence, or at least trying to be, and what that explains about Arnold's experience, which was after all short and relied solely on his judgement. If new evidence, plus a fresh look at the overall circumstances, confirms Little Tahoma as the "jagged peak" Arnold noted, then that point is established.

Your argument seems essentially to be that if we accept Arnold's observation re the 'hogsback' peaks, then all nine objects couldn't also have travelled behind Little Tahoma unless he was greatly deceived. Well, yes, that's the only explanation and based on available evidence, the obvious conclusion.

Or, considered conversely, supposing Arnold had made such an error; your argument appears to be simply that he couldn't have.

>I hate to repeat myself, repeat myself, but I say again: my  
>solution is to have the objects low enough so satisfy the  
>condition of real disappearance behind some mountains of the  
>hogsback chain, and hence to look for a peak lower down on Mt.  
>Rainier than Little Tahoma.

We only need to do so in order to maintain the case that Arnold probably saw nine, undulating, alien spacecraft. We also have to dismiss all the evidence which so clearly identifies Little Tahoma, plus acknowledge there doesn't appear to be any other such peak as an alternative candidate.

What exactly is that a 'solution' to?

Doesn't it trouble you that these nine objects were flying with an undulating motion, a characteristic which is specific to birds and not manufactured aerial vehicles, especially at the speed Arnold later calculated based on his sole perceptions?

Why do you think these nine, 'extremely thin', alien spaceships were doing so? Was there some distinct advantage in this?

>As for nearby objects , a.k.a. pelicans, Prove to me that  
>pelicans flying along a horizontal trajectory several miles from  
>the plane could seem to disappear behind Little Tahoma and short  
>after that seem to disappear behind peaks of the hogsback  
>mountain chain.

What if they did, to Kenneth Arnold? Again, you're not allowing for any possibility he could make a significant blunder. I've

provided important evidence that his perceptions were in error and they absolutely must have been if Little Tahoma was the 'distant peak'. I would remind you that Brad agrees we have established Little Tahoma as the landmark Arnold relied on.

Furthermore, we have to keep in mind the larger context and recognise that any premise why Arnold observed an undulating formation of nine extraterrestrial craft (were they piloted by extremely thin aliens?) needs to critically address:

- the fact that Arnold's story was completely misconstrued and people believed he had seen 'flying saucers'
- the fact that there was suddenly an explosion of 'similar sightings', where people reported objects which looked like flying saucers
- the fact that hardly any of these were of the 'bat-like', crescent-shaped objects Arnold actually described
- the ensuing plethora of hoaxes and mythology which is the legacy of Arnold's misunderstood story
- the fact he was comfortable with publishing a subsequent sighting of those 25-30, 2-4 foot diameter, brass-coloured objects - almost certainly birds - that "had the same flight characteristics" of the nine objects previously encountered.

And much more.

So far as this pivotal case goes, the dilemmas aren't mine.

James Easton.

@ @

@ @

@ @ @ @

@ @ Larry,  
@ @  
@ @ I just demonstrated the fact of physical optics that it is an  
@ @ impossibility for a double exposure to impose a DARKER image  
@ @ (i.e., take away light) from an already exposed photographic  
@ @ emulsion. You just go right on ahead and ignore what I proved.  
@  
@ It can be darker if automatic development compensates for the  
@ added exposure.  
@  
@ COMMENTS: Nonsense! Developers cannot select out one  
@ exposure from another superimposed on the same piece of film!  
@ Nor can developers select one specific image on a picture  
@ from the others immediately adjacent or surrounding it on the  
@ same picture and develop it differently. Again this is utter  
@ madness.

I didn't say they did. What I mean is that the automatic developer adjusts the exposure time on the PRINT to compensate for an overly dark or overly light original image. So the double exposed item can make a "shadow" where the darker parts of the second image are, because the overexposed parts are reduced down to normal exposure settings. The machines also look for certain parts of the image to adjust color correction.

A manual printing of the negative would have been done through a similar procedure, using a light meter to set the exposure and color balance.

Some systems have an operator look at each image to check for wrong settings before printing. If the operator thinks something is wrong, he then

adjusts the exposure manually. Thus the color balance of a friend's photo was "adjusted" to make the dog in the picture a light brown. The dog had been dyed kelly green for a St. Patrick's Day party.

And, yes, an experienced film developer can adjust the exposure of one part if he wants to (but in a darkroom, not on an automatic system). The process is called dodging, and involves making part of the exposure with dodging tool waved across the parts of the print to be lighter. My late uncle taught me a lot about photography, and this was one of the tricks I saw him use. Those nice portraits that fade out at the edges are dodged.

The image could also have been caused by a light leak in the developer, if it jammed during that roll of film.

@ The photo is taken from inside the car or plane that was sold! That  
@ doesn't sound like madness to me.

@  
@ COMMENT: Since the photo is set at infinity (see distant

@ terrain) a window photographed from inside would be so out of  
@ focus and within the hyperfocal distance that nothing like  
@ the UFO image would be seen at all.

This depends on the camera, the exposure, and the distance of the  
photographer from the window. The focus seems about right for a person in  
the left rear seat taking the picture.

(snip)

@ @ It can be darker if automatic development compensates for the

@ @ added exposure.  
@ @  
@ @ COMMENTS: Nonsense! Developers cannot select out one  
@ @ exposure from another superimposed on the same piece of film!

The following part is a possibility in the UFO photo.

@ I didn't say they did. What I mean is that the automatic  
@ developer adjusts the  
@ exposure time on the PRINT to compensate for an overly dark or overly  
@ light original image. So the double exposed item can make a "shadow"  
@ where the darker parts of the second image are, because the  
@ overexposed  
@ parts are reduced down to normal exposure settings. The machines also  
@ look for certain parts of the image to adjust color correction.  
@  
@ A manual printing of the negative would have been done  
@ through a similar  
@ procedure, using a light meter to set the exposure and color balance.  
@  
@ Some systems have an operator look at each image to check for wrong  
@ settings before printing. If the operator thinks something is  
@ wrong, he then  
@  
@ adjusts the exposure manually. Thus the color balance of a friend's photo  
  
@ was "adjusted" to make the dog in the picture a light brown. The dog had  
@ been dyed kelly green for a St. Patrick's Day party.  
  
@ @ Nor can developers select one specific image on a picture  
@ @ from the others immediately adjacent or surrounding it on the  
@ @ same picture and develop it differently. Again this is utter  
@ @ madness.

The following part is not intended to refer to the UFO photo, but your  
comment above.

@ And, yes, an experienced film developer can adjust the  
@ exposure of one  
@ part if he wants to (but in a darkroom, not on an automatic  
@ system). The  
@ process is called dodging, and involves making part of the  
@ exposure with  
@ dodging tool waved across the parts of the print to be  
@ lighter. My late  
@ uncle  
@ taught me a lot about photography, and this was one of the  
@ tricks I saw him  
@ use. Those nice portraits that fade out at the edges are dodged.  
@

@ The image could also have been caused by a light leak in the  
@ developer, if  
@ it jammed during that roll of film.

@  
@ MORE COMMENTS: This is tantamount to hoaxing the photo since  
@ it is highly unlikely that the UFO image would be picked out  
@ by chance. What I was talking about was normal developer  
@ equipment unguided to select parts of the film and thus  
@ unable to reverse the light-addition effect of a double exposure.

I did not intend that part to refer to the UFO photo itself, but to the possibility of doing it.

@ @ The photo is taken from inside the car or plane that was sold! That  
@ @ doesn't sound like madness to me.

@ @  
@ @ COMMENT: Since the photo is set at infinity (see distant  
@ @ terrain) a window photographed from inside would be so out of  
@ @ focus and within the hyperfocal distance that nothing like  
@ @ the UFO image would be seen at all.

@  
@ This depends on the camera, the exposure, and the distance of the  
@ photographer from the window. The focus seems about right for  
@ a person in  
@ the left rear seat taking the picture.

@  
@ MORE COMMENTS: The focus is wrong and you know it. Someone  
@ taking a picture that far away from the window would either  
@ (a) obviously have the window frame in view with sky and  
@ ground below BLOCKED by the roof or cabin of the aircraft or  
@ auto, or (b) have to use a telephoto lens aimed through the  
@ distant window in order to eliminate the roof and cabin in  
@ which case the alleged "sales sticker" would comprise a large  
@ fraction of the view out the window and would be completely  
@ out of focus.

It looks very similar to pictures (which I still have) I took with a cheap camera under similar circumstances from a car. The door post (intentionally in the photo) has about the same defocusing as the UFO in this picture. It depends a lot on the lens opening and the depth of field.

List(s) Members,

I'd like to get some feedback on a video capture from some Hi8 Video I took while filming "rods". This 2 second video clip shows an astounding maneuver by some type of "orb". Any feedback would be greatly appreciated as I didn't put much effort into the study of "rods" until I started taping these myself. Any ideas what this could be?

Todd:

It seems as if the object performs its maneuver in unison with the cameras movement. Could this be some sort of reflection or artifact within the lens apparatus of the camera caused by the situation of the sun or light-source in the frame made noticeable by hand-held operation of the camera? Were it not for the object maneuvering in unison with camera motion, I would otherwise think it to be nothing more than an insect or even a cotton-like seed or dust particle moving through the wind at a fairly close range to the camera, which is what most of these 'rods' seem to be.

> KY

Kenny,

You are right about the camera movement, as I most likely tried following it when it crossed my view. I don't think it's an artifact within the lens as all filming sessions would have included this type of artifact and subsequent movement (abrupt change of direction). I've got some tape that was taken on a windy day when there were tons of "spores" in the air, all following the same direction of travel (in this case basically south to north), and displaying a smooth floating motion with no abrupt, or independent change of direction. There are objects that appear within this "spore" film traveling opposite of the

wind direction, and therefore also to the spores, and at a very noticeable difference(increase) in speed as compared to the spores.

I have noticed close range insects within some of the films and most follow a very erratic flight path, often in short quick arcing patterns across the cameras field of view with an erratic shape to their reflection caused usually by their wings.

Although insect(s) would be the most likely explanation, why would their reflective properties not be visible to the naked eye at such close range? We should be seeing intermittent flashes, caused by insects, more often during this time of the evening when the conditions are conducive to it. The "spores", in comparison, are visible both by the naked eye and via the video camera.

Todd

Hello Todd

I have looked at the video. Like others I can't tell what it is but have the following suggestion about visualizing the path of the object. On the 2-dimensional screen the object travels across the screen left to right and stops abruptly for a split second, accelerates vertically upward and then turns quickly back to a horizontal trajectory to the right. On the 2-D screen the first change of direction and "stopping" looks rather dramatic. However, think about the 3-D picture and instead of the object stopping, imagine that it is turning away from you and traveling away from you along your line of sight for a split second. On the 2-D image this looks like the object has stopped where in fact it could still be traveling at the same speed. You may have considered this already. I don't know if this helps but at least it sheds some light on the possible accelerations involved.

List(s) Members,

I've added the insect clip to the original site for comparison purposes. Very different flight characteristics, in this instance anyway, although the reflective properties are very similar. The insect seems to be at a much closer distance than the orb/rod.

Water Ice Found in Mars Crater in 1998  
Latest finding by NASA could confirm water on Mars

According to various media outlets, NASA will announce that water ice has been found on Mars at Valles Marineris. Since the ice would be at the bottom of a several thousand foot deep canyon, it would be far less accessible than the water ice found 3 years earlier in a shallow crater on the Cydonia Mensae and announced in poster sessions at the 1998 and 1999 American Geophysical Union Spring conferences.

The potential new discovery of water ice in the Valles Marineris region on Mars, while certainly of great interest, does not mark the first finding of water due to Mars Global Surveyor images. As early as the late 70's, scientists were examining Viking images and finding potential indications of water on Mars. In July of 1998, Geologist Harry Moore and the independent science team, SPSR (The Society for Planetary SETI Research), found a crater with clear indications of a water ice surface near the Cydonia Region. In poster sessions at the American Geophysical Union in 1998 & 1999, the SPSR reported on the Cydonian crater containing an ice bed, indicating a large quantity of water being present.

For more information and photos on this finding, in addition to links to various poster papers presented to the American GeoPhysical Union in 1998 and 1999, visit <http://www.destinationspace.net/frontier/mgsnews.asp>.

Join Geologist Jim Erjavec along with Harry Moore, discover of this ice crater in the Cydonia region and selected members of the SPSR team for a chat on Monday, June 26 at 6pm, PT in the #astrolab. You'll have an opportunity to discuss the SPSR's findings in regards to this crater as well as other indications of water on Mars.

#### MICHIGAN DIAMOND SHAPED UFO SPOTTED

MACOMB COUNTY -- Todd Lemire reports that six witnesses viewed a diamond shaped craft on April 28th, 2000. Todd says, "I received an e-mail report form from a witness reporting a "bright light in the sky with three  
airplanes near it at 9:30 PM, which disappeared and reappeared in a different spot in the sky." She goes on to state that six of us were outside at a friends house and we were looking up at the sky because it was a pretty clear night. We saw a very bright light in the sky, not moving much, with about three airplanes or helicopters around it. Then it disappeared. When my brother and I were walking back to our house, we saw it again with the airplanes around it once more.

Subject: Re: Kenneth Arnold and Little TahomaStatus: O

To All:

In the spirit of the 53rd anniversary of Arnold's sighting I camped at Mt. Rainier last weekend (since it opened early this year). As I painfully dragged my behind up two trails (one to the base of Little Tahoma)...a 1800 ft. climb in 2 hours and another on Sunday, doing 2,000 ft in 2 hours to the top of Sunrise. I was of course in my usual awe of this volcano. No matter how many times I go there, try different trails, get on the highest logging road my Jeep will carry me to get yet another angle of her, I am always reminded of the emense size of this mountain. Little Tahoma is NOT as Bruce mentioned at the base of the mountain. I was at 4,200 feet when I started and climbed to over 6,200 according to my GPS and not anywhere near Little Tahoma's beginning. Little Tahoma is an offshoot of the lower peaks. The snow fields were blowing last weekend and I could not help but notice they could not in any way shape or form be mistaken for anything other than snow or clouds just forming.

Last night I drove up to a remote spot on Mt. Rainier's Northwest side. If you look at a map I was close to what is known as Grand Park. I was with another UFO person. I shot some video as there was steam coming out of the top last night. Even steam could not be mistaken for anything other than steam, snow or clouds. This other person who is a private pilot and I debated how objects would appear over the mountain and from what elevation. He is in agreement pelicans was a definat NO-NO. He is a native of the Pacific Northwest by the way, pilot and has never seen a pelican in this area.

I think we need to have a get together to Seattle. Anyone is welcome. I'll gladly take you up there, show you different angles and views and then make a decision what possibilites Kenneth Arnold could have seen. How about it James?

Kathleen,

No argument there, Bruce has been suggesting that 'Arnold's peak' must be a 'jagged peak' lower on the mountain's slopes, otherwise there's a fundamental problem with Arnold's perceptions.

Bruce has however yet to suggest an alternative candidate for Little Tahoma being the "sharp projection on Mt. Rainier in the snow field to my eyesight" which Arnold claimed the nine objects travelled behind.

Evidently, he can't.

One thing we can be sure about is that Arnold didn't mistake drifting snow or clouds etc. as flying machines - I believe it was Menzel who proposed 'billowing clouds of snow' to be the explanation, which is a quite absurd and somewhat desperate solution, typifying the 'need to solve a mystery within our known scientific boundaries' that gives scepticism a bad name!

That's precisely the reason why Arnold conceivably wouldn't have recognised a formation of American White Pelicans and their distinctive undulating flight.

There isn't any debate that AWP's are documented in the locale and a specific, independent confirmation, which I might not have mentioned before, comes from naturalist Peter Kingsmill, Director General of the Redberry Pelican Project. It's correspondence I noticed on the 'Pelican Watch' message board and the question is posed by someone who is a known 'ufologist', clearly in response to my early suggestions of a possible explanation for Arnold's sighting:

Posted by Asgeir Skavhaug:

Hello,

I'm wondering whether any of you on this List know if American White Pelicans are observed in Washington State in May, June, July? Maybe in the Cascade Mountains, Mt. Baker, etc. How about 30 to 40 years ago? I'm also wondering whether they're flying in some sort of formation; a chain or step-wise formation, for instance, with the leader at the front, and higher up than the others.

Is it possible to show any in flight photos of these pelicans, included in a mail on this List, or maybe give some reference to a URL?

Regards,  
A. Skavhaug

In Reply to: American White Pelicans in Washington State posted by Asgeir Skavhaug:

Yes, AWP's are found in Washington State - your state Fish and Wildlife people contacted us a few years ago. As about the movies of them in flight... good idea! we'll work at it, perhaps not immediately, but soon I hope. Yes, they do fly in formation normally... undulating "Vs" or "Ls" with the leader flapping first, and the others following in a sort of wave. These birds are terrific at rising on thermals, soaring incredibly high before striking out in their direction of choice.

Cheers,  
Peter  
[END]

It's this undulating flight which I suspected Arnold was trying to describe by his use of bizarre similes such a 'fish flipping in the sun' and 'saucers skipping across water'.

In our discussions, a stated objection was that Arnold hadn't been portraying an undulating flight at all, it was much more violent, sporadic, etc.

However, tucked away in his UFO Symposium speech, Arnold corroborates:

"These craft seemed to be climbing a little bit as they were following this 170 degree heading and I knew that I was on a level with them because they were on a horizon with me, so my altimeter showed a little over 9200 feet, so they were flying at an elevation of about 9200, probably a little less or a little more as they sort of undulated, if you want to call it that, as they flew".

Yes, I'll certainly call it that.

This is of IMMENSE relevance and verifies a crucial point I have been trying to explain in perspective.

Although these could of course have been NINE alien spacecraft, there are compelling reasons to conclude this scenario - the most unlikely of all and infinitely so - perhaps merits a critical evaluation.

>"He is in agreement pelicans was a definite NO-NO"

He's proven to be wrong, Kathleen. Remember also that significant sighting of nine "big round discs \_weaving northwards\_" which occurred on July 12, 1947, somewhere between Spokane and Portland - by a crew who had "flown over the Pacific northwest's 'flying saucer' country for 15 years" - and which they found to be a formation of pelicans.

Rule number one - never overlook the most obvious clues. ;)

I emphasised 'weaving northwards' for a reason; didn't Kenneth Arnold also note in his formative radio interview how those nine unidentified objects were also "\_weaving\_ and going at a terrific speed across the face of Mt. Rainier" and how "they seemed to kind of \_weave\_ in and out right above the mountaintops"?

Rule number one - never overlook the most obvious clues...

Obviously, the most blatant of all is how the extraordinary 'flying saucer' mythology originates from the media's mistaken grasp of what Kenneth Arnold actually reported. Doesn't really matter what possible explanation we subscribe to, that misconception is an astounding legacy which beleaguered the US Air Force and still does to this day!

This is of course aside from all the references I've cited re the correlation between AWP's and Arnold's reported observation - the fluttering and sailing [be honest - do you really think alien spaceships flutter and sail?], documented comparisons to either a formation of

aircraft or a 'Chinese kite tail', etc.

>I think we need to have a get together to Seattle. Anyone is  
>welcome.I'll gladly take you up there, show you different angles and  
>views and then make a decision what possibilities Kenneth Arnold could  
>have seen. How about it James?

As I've said from the outset, Arnold's reported sighting can best be understood in context by replicating - so far as possible - the circumstances. It would be wonderful to reconstruct that flight path and answer so many questions. Considering this is essentially the foundation of 'ufology', ie. evidence that alien spaceships are regularly visiting Earth and the entire scientific world, except ufology, is completely oblivious to it - any such substantiation for 'flying saucers' would proverbially be 'earth-shattering'.

Or should that be... any such substantiation for 'undulating, weaving, crescent shaped alien spacecraft' would proverbially be 'earth-shattering'.

It surely can't, if either, be both...

Best wishes,

James Easton.

I don't know what statement you are referring to, but I didn't intend to imply that Little Tahoma was at the base... since it is at about 11,000 ft. However, Arnold claimed the objects or an object or whatever went behind a peak at the base of the mountain.

Wish I could join you. Drove up to Panorama (?) back in 1983. Hard to believe there is a rain forest at the base! (NOT a tropical rain forest.)

Jim,  
rule #0 (precedes rule #1)  
is

DRAW A MAP.

Prove it logically possible that Arnold could fly basically eastward while pelicans were flying basically southward and that he could see them along a sighting line to the north of Mt. Rainier, then watch them, pass Rainier and time them taking 102 seconds to go from being in the direction of Mt. Rainier to being in the direction of Mt. Adams.

go ahead. Be Bold. Draw a nearly vertical line on a piece of paper (pelican path) and a nearly horizontal line (Arnold's plane for at least a minute of travel which is more than a mile of travel at his speed). You can place these lines in such a way as to have Arnold 3- 4 miles from the pelicans when he first saw them. (Make them very shiny pelicans.)

Ignore for the moment his turn so that he could roll down the window and look out. Prove that he could not have gotten close enough to recognize pelicans and that his initial sighting line to the pelicans was to the north of Mt. Rainier and his final sighting line maybe 2.5 minutes later was toward Mt. Adams.

## Voyager Newsletter No. 12

In the last newsletter, I made available the previously unpublished, original US Air Force witness affidavit and accompanying sketches from Staff Sergeant Jim Penniston, subsequent to his pivotal involvement in the celebrated 1980 RAF Bentwaters and RAF Woodbridge/Rendlesham Forest 'UFO' case.

The newsletter is online at:

<http://www.ufoworld.co.uk/v11.txt>

This is a brief extract:

"When I acquired copies of the original witness testimonies, I provided them to various researches with an long-term interest in this classic British mystery. The pivotal statement of Airman Ed Cabansag was also made available on my web site.

Now, the equally important affidavit and accompanying sketches from Staff-Sergeant Jim Penniston are being published and for the first time ever, the UFO which Penniston originally portrayed can be seen.

Although I have previously confirmed details of this depiction, it may still be something of a surprise for those more familiar with the triangular UFO of Rendlesham lore".

Following publication, I received considerable feedback and correspondence, including the following comments:

James,

Just wanted to drop you a note to say how impressed I am with your research in showing what a sham the RAF Woodbridge UFO farce was.

For someone not in the USAF you did an admirable job in accurately describing the situation especially details such as getting the unit call signs correct (Police 4 and Police 5).

You get a big thumbs up from me.

Chris Arnold  
MSgt, USAF (Ret)  
[End]

Chris served with the 81st Security Police Squadron and was a close colleague of Burroughs and Penniston

It was Chris who reported initial concerns about 'strange lights in Rendlesham forest' - which was outwith the jurisdiction of the USAF twin-base complex - to local police at the Suffolk Constabulary. A more detailed background can be found on my web site at:

<http://www.ufoworld.co.uk/rend2.htm>

Chris has been scathing about the 'UFO tales' which emerged in later years and some of his comments are unprintable!

I appreciate Chris's kind words here.

Michael Lindemann wrote:

James,

Thank you very much for sending your latest release on Bentwaters. This is very significant material and certainly lends credence to the supposition that something very out of the ordinary did occur in Dec 1980. I will feature your new information in the upcoming June 1 issue of CNI News and will direct our readers to your web site.

Best regards,  
Michael Lindemann  
Editor, CNI News  
[End]

Michael expresses a different take on this material evidence and whatever anyone's viewpoint, I was pleased to see these historical UFO documents reach a wider audience.

Science writer Ian Ridpath, who was the first to suggest that the beacon from nearby Orfordness lighthouse had been mistaken for a UFO, wrote:

Dear James,

Thanks for sending me the latest copy of your Voyager Newsletter.

It was interesting to see Penniston's sketch which confirms the route taken into the forest (so much for turn \*left\* at East Gate).

However, I can't entirely agree with this quotation from your Newsletter: "Completely absent from this statement is any mention of having next pursued an unidentified light for some two miles".

Actually, Penniston does say (and I quote from his affidavit) "We then proceeded after it. It moved in a zig-zagging manner back through the wood then lost site (sic) of it. On the way back we encountered a blue streaking light to the left lasting only a few seconds. After a 45-minute walk arrived at our vehicle."

It is difficult to know how accurate the duration of 45 minutes is, and whether it refers to the total time since leaving the vehicle or the time taken to return from their most distant point. Either way, it is a shorter duration than that reported by Burroughs, and may suggest that Penniston gave up before they did.

As for the difficult-to-decipher writing on the sketch in Penn5 - it looks as though it might say "Couple of feet", possibly referring to the perceived size of the object.

Regards,  
Ian  
[End]

I accept this point and despite all those who were sceptical and tried to debunk the lighthouse theory, Ian was of course proven to be absolutely correct.

Renowned sceptic Philip Klass wrote:

Dear James Easton:

Thank goodness the "mysterious" lights that Lt. Col. Halt saw were "UFOs" and NOT Soviet covert craft--precursors to a Soviet nuclear attack on the UK. If Halt had seen aircraft with Soviet insignia flying over Bentwaters during daylight, he probably would NOT have reported it to his superiors because of all the then recent excitement about UFOs.

If Halt had indeed seen Soviet aircraft overhead, he probably would not have reported it to MOD--figuring that it was up to British military to detect Soviet overflights, NOT the USAF. (I'm

pulling your leg a bit.)

More seriously, surely Lt. Col. Halt knew the "official USAF position" that all UFOs have prosaic explanations and knew of the contrary position that some UFOs were ET craft. In view of Halt's subsequent (TV) accounts of laser-like beams, etc. IF the UFOs he was witnessing were Soviet satellites or aircraft--outfitted with lasers--he should have reported same promptly BOTH to USAF and MOD officials. And IF the UFOs he witnessed chanced to be ET craft, he should have done the same.

Yet the record shows that more than TWO WEEKS ELAPSED before he wrote his SKIMPY report. ACTIONS SPEAK LOUDER THAN WORDS. No wonder the person(s) who received Halt's Jan. 13 memo did not take any drastic action.

[End]

Adding to the public availability of evidence, I'm now able to provide online a copy of the entire 'Halt Tape', a microcassette recording which Lt. Col. Halt made on the night of the second 'UFO scare'

>DRAW A MAP.

Bruce,

We've come a long way from drawing a map, when as things stand it's evident, if not in fact proven, that Arnold's perceptions were comprehensively mistaken.

I do appreciate the points you make, however, in the context of other developments, I have to consider them secondary at present.

What's the point of impossibly trying to explain why Arnold could have made such errors of judgement when already on the table is significant evidence that he did?

The identification of Little Tahoma as 'Arnold's peak' indicates, if not more, that those nine, undulating, fluttering and gliding objects were never so far distant as he thought and the theoretical possibility he observed a squadron of nine 'alien spacecraft' is now even more unlikely than before.

I hope to have developed probabilities further in the newsletter I'm about to publish and which should clarify the overall context of evidence we have discussed.

Not for a nanosecond is it likely to convince Bruce Maccabee that either Arnold's non-flying saucers or flying saucers per se aren't real - which perhaps no-one will ever do.

However, I believe it does contain some important new research material.

James Easton.

## Voyager Newsletter No. 13

### CONTENTS

1. Kenneth Arnold, 'Flying Saucers' and Undulating Flight.
2. Historical Newspaper Articles and Clippings.

O0O~O0O~O0O~O0O

1. Kenneth Arnold, 'Flying Saucers' and Undulating Flight.

Reactions to a critical appraisal of the Kenneth Arnold case, as with most other cherished 'UFO' reports, has proved to be directly proportional to a conviction it's an unshakeable foundation of evidence that alien civilisations have long been visiting Earth.

It used to be that way with the Rendlesham case too.

Fair enough, I say. With that acknowledged, the following is largely devoid of any personal opinions and intended to present new evidence, plus a re-appraisal of some developments which have featured in the research I have previously published.

That preceding material is available on my web site at:

<http://www.ufoworld.co.uk/>

What I might now be able to add is significant evidence in support of the premise that Arnold may not have recognised the nine unidentified objects he witnessed was a rare Pacific North-west sighting of American White Pelicans - I'm a supporter of conclusions the explanation can't be sustained as aircraft, meteors, or any other bird species!

It's taken a long time to find the exact data I was looking for and I wasn't even sure this existed in print. It does and I hope will help to appreciate the overall probabilities.

A central aspect of the evidence is how those objects flew in an

undulating formation. Arnold related this distinctive characteristic, which puzzled him so much, in a peculiar manner, comparing the objects motion to a 'fish flipping in the sun' and 'like a saucer would if you skipped it across water'.

Not only was this latter remark misconstrued by the media and responsible for the mythology of 'saucer shaped' objects, as opposed to the 'bat-like' shape Arnold actually described, there's also been a misunderstanding that this simile related to each individual object.

It didn't; Arnold was attempting to explain how all nine flew in formation and confirmed this in his subsequent book:

"I was fascinated by this formation of aircraft. They didn't fly like any aircraft I had ever seen before. In the first place, their echelon formation was backward from that practiced by our Air Force. The elevation of the first craft was greater than that of the last. They flew in a definite formation, but erratically. As I described them at the time, their flight was like speed boats on rough water or similar to the tail of a Chinese kite that I once saw blowing in the wind. Or maybe it would be best to describe their flight characteristics as very similar to a formation of geese, in a rather diagonal chain-like line, as if they were linked together. As I put it to newsmen in Pendleton, Oregon, they flew like a saucer would if you skipped it across the water".

Again, the crucial realisation is how this undulating flight relates to the formation and not any one, or more, of the individuals.

There's little, if any, debate on this point and Arnold confirmed it in the speech he gave at the 'First International UFO Congress', Chicago, ILL, during June 24, 1977:

"These craft seemed to be climbing a little bit as they were following this 170 degree heading and I knew that I was on a level with them because they were on a horizon with me, so my altimeter showed a little over 9200 feet, so they were flying at an elevation of about 9200, probably a little less or a little more as they sort of undulated, if you want to call it that, as they flew".

Essentially, Arnold depicts an echelon, ribbon-like formation, undulating as it travelled and indeed - just like a kite-tail blowing in the wind.

Whatever those nine objects were, we can begin to sketch their profile.

There's another attribute they had and one which Arnold declared had a big impact on him, presumably concerning his awareness of how unusual the sighting was. As Arnold put it, they "fluttered and sailed" and recalled in his book:

"Another characteristic of these craft that made a tremendous impression on me was how they fluttered and sailed, tipping their wings alternately and emitting those very bright blue-white flashes from their surfaces. At the time I did not get the impression that these flashes were emitted by them, but rather that it was the sun's reflection from the extremely highly polished surface of their wings".

We can now expound on our profile and add the fact that these objects somehow gave the appearance of fluttering, before sailing - or, I think we can safely use the more appropriate term; gliding.

When I recently first read the full transcript of this UFO symposium talk - my thanks to Bruce Maccabee for providing same - I recognised there was another detail which Arnold, even 30 years afterwards, still remembered:

"I observed it seemed to... the first craft was at a higher elevation than all the rest of craft, which, of course, is not conventional, military formation at all, in either this country or Russia or Germany or anything that I had ever heard of before. So I just assumed, in a flash, that they were some new type of military missile or jet and possibly remote controlled. They didn't fly like airplanes actually. This brilliant flash that came from their surfaces, which I assumed was from the sun reflection at first, would pulsate and they would flutter like this and sail and they seemed to fly just as readily on edge as they did on a level. As I mentioned before they seemed like they were linked together in a sort of diagonal chain-like formation, similar to geese, but, uh (chuckle) they were not geese. I was very puzzled about that. However, I made a special note, they were all independent. Individually they were flying on their own, but every once in a while one of them would give off a flash like this and gain a little more altitude or deviate just a little bit from the echelon formation. And this went periodically on among them... alternately, I should say, not in regular rhythm particularly among all the nine craft I was observing".

In his book, Arnold wrote that when the objects fluttered they appeared to 'tip their wings alternately' and as they did so, this resulted in a flash of reflected sunlight. Then, the object

would glide.

He now elaborates and tells us that "every once in a while one of them would give off a flash like this and gain a little more altitude or deviate just a little bit from the echelon formation".

Arnold also claimed his total observation lasted for approximately two and a half minutes and this flutter-flash-glide sequence occurred on a number of occasions during the brief sighting. He confirms how, "this went periodically on among them", adding, "alternatingly, I should say, not in regular rhythm particularly among all the nine craft I was observing".

What does he mean by 'alternatingly'; it does of course also come up in his book; "they fluttered and sailed, tipping their wings alternately and emitting those very bright blue-white flashes from their surfaces".

Apparently, he is explaining that the flutter-flash-glide characteristic was expressed by individual objects "alternately".

"Alternately" is defined by my dictionary as "occurring in turns" and "interchanging regularly or in succession", which seems to also define the specific observation Arnold is trying to convey.

We can now paint a reasonably detailed picture of our nine mysterious aerial artefacts:

1. They were bat-like, or crescent-shaped, or as Arnold described in the formative radio interview he gave to KWRC on 25 June, 1947, the day after his encounter, "They looked something like a pie plate that was cut in half with a sort of a convex triangle in the rear".
2. They flew in an echelon, ribbon-like formation, undulating as they travelled.
3. They frequently and alternately appeared to flutter, resulting in a flash of reflected sunlight (although maybe not always) and this was followed by a period of gliding.
4. The flutter-flash, but not the glide, also caused an object to seemingly either gain altitude or slightly stray from the formation. Evidently, this was related to an action which produced momentum.
5. The flutter-flash-glide was seen several times during an approximate 150 second observation. However, it may have occurred

more often, as Arnold mentioned how during the incident he turned his aircraft around to obtain a clearer view of proceedings. Presumably the objects were lost from sight whilst he completed that manoeuvre.

If this is as intended, an accurate, in-depth analysis of the objects witnessed, then any theorised identification has to encompass an explanation for some, ideally all, of these distinctive characteristics.

When I first considered the Arnold case, my initial research ruled-out, as had others, by default the most likely explanation - that these were merely nine aircraft. Despite the striking similarity between Arnold's crescent-shaped depiction and the contemporary, tail-less, Northrop 'flying wings', or speculatively, the German Horten counterparts, there were reasons for discounting that any one of their aircraft could have been responsible, let alone nine of them.

There was one other possibility and particularly advocated by the number of objects involved - a formation of birds.

When brief, verbatim details of Arnold's accounts were provided to Pacific North-west ornithologists, several identified the same bird species as exhibiting, in formation, notably similar and quite distinctive characteristics to those Arnold related. Michael Price, an Ornithologist from Vancouver, first suggested:

"There's a possible candidate species in the area at that time of year, sporadically, whose color, size, flight profile and proclivity for formation flight at sometimes quite high altitude would even more produce every detail of the phenomenon which Arnold observed: a flock of non, or failed-breeder, southbound White Pelicans. They'd have been large enough to visible for a good distance, they fly in formation, and if the light were reflecting just right off a large nearby glaciated peak, their comparatively vast white underwing area would reflect a \_ton\_ [Michael's emphasis] of light in exactly the pattern described by Arnold".

Up to that point, I was entirely unfamiliar with American White Pelicans!

The objective now is to examine what exactly constitutes undulating flight, why would any birds or aerial vehicles want to utilise it and within this context, how do the specifics of American White Pelicans compare to Arnold's testimonies.

This calls on two new sources and the first reference is a

scientific paper entitled, "Bounding and Undulating Flight in Birds", by J. M. V. Rayner, published in the 'Journal of Theoretical Biology' [(1985) volume 117, pages 47-77].

Rayner notes that undulating flight is, "adopted by many larger birds" and that it's, "particularly marked" in a few species, including "various Pelecaniformes" [which includes American White Pelicans].

He writes:

"Although superficially similar to bounding in that the wingbeats occur in bursts, undulating flight differs markedly in its contribution to performance. Now, weight is supported continually, ground speed remains virtually constant, and only thrust is intermittent; the flapping phase is used to gain height rather than vertical acceleration...".

"The need for an undulating bird to be able to glide may restrict undulating flight to species with good gliding performance...".

At some 30 pages, it's an informative paper, however, the above extract will suffice.

The second reference comes from 'The Life of Birds', by Sir David Attenborough [ISBN 0563 38792 0, pages 47-48].

Discussing 'The Mastery of Flight', Attenborough writes:

"Beating wings demands such energy that it is clearly valuable to do it in as economical a way as possible. One simple method of achieving that is to stop every now and then...".

"Even a big bird can economise on its wing beats. If it stops flapping with its wings not closed but open, their surface area is big enough to impede its fall and it will glide. Pelicans regularly do this. How long they can glide depends on how high above the ground they are, how much height they can afford to lose, and how fast they are travelling. White pelicans have an additional way of saving energy, They take advantage of the turbulence in the air created by their own companions. The high pressure air created below a wing by its aerofoil shape leaks round the tip of the wing into the low pressure area on the upper surface. This slight upward current in the air remains briefly in its wake. A pelican flying in a group takes advantage of this by flying behind the wing tip of the bird ahead rather than directly behind its tail. The wing-tip station also gives it a better view of what lies ahead. So groups of pelicans often take up a V-formation. Furthermore, because the effect of the wing-tip turbulence is at its greatest immediately after the down-stroke

of the wing and rapidly fades, the pelicans will not only fly in formation, but beat their wings with the near precision of a well-drilled corps de ballet. The only bird of the group that does not benefit from this order of flight is the leader of the squadron and after having done its share, it will fall behind and allow another to take on the job. Geese also fly in this way to form those huge and unforgettable skeins across the sky".

Groups of pelicans will also fly in a "L" shaped formation and I've watched film of them in a loose, undefined echelon.

With previously evidence confirming the reflective capabilities of White Pelicans - they are after all the largest bird in North America, predominately all-white and with a 3m (10 ft) wingspan - we can apply all of the documented attributes to Arnold's objects and consider any correlation.

[1. They were bat-like, or crescent-shaped... "something like a pie plate that was cut in half with a sort of a convex triangle in the rear".]

White Pelicans, as with most other birds, obviously have a bat-like profile and unlike many species, are also tail-less, instead having a 'small triangle' rear-end.

[2. They flew in an echelon, ribbon-like formation, undulating as they travelled.]

An exact match.

[3. They frequently and alternately appeared to flutter, resulting in a flash of reflected sunlight (although maybe not always) and this was following by a period of gliding.]

As evidenced, White Pelicans viewed against a background of snow covered mountains could be expected to reflect light as they engaged those large, flapping wings.

If so, this is also a distinctive parallel.

[4. The flutter-flash, but not the glide, also caused an object to seemingly either gain altitude or slightly stray from the formation. Evidently, this was related to an action which produced momentum.]

As shown, the purpose of flapping is precisely to gain altitude.

[5. The flutter-flash-glide was seen several times during an approximate 150 second observation. However, it may have occurred more often...]

White Pelicans always fly with several wing-beats, followed by a long glide. Any observed repetition is to be expected.

There's simply no argument that in all of these respects, the nine objects which Arnold witnessed behaved remarkably similar to White Pelicans and distinctively so.

In summary, we can now better understand why a formation of pelicans fly in an echelon, ribbon-like formation. They employ a flapping and gliding motion as it conserves energy and the intermittent wing-beats will enable them to gain altitude due to upwards momentum. Their undulating flight is a direct consequence.

A fleet of nine, bat-like, technologically superior alien spaceships might fly in a kite-tail-like echelon formation and exhibit a fluttering and gliding motion because...

The fluttering might enable them to gain slight altitude because...

They continually employ this undulating, fluttering and gliding flight and the advantage of them all continually doing so at well over a thousand miles per hour is...

...perhaps somewhat implausible.

As we know, the extraordinary conjecture that these were ET spaceships grew, primarily in later years, out of Kenneth Arnold's story of large, far-off objects which went from Mt Rainier to Mt Adams in a short time, which he 'clocked'.

Arnold claimed that he could be sure they were so far away because they fleetingly disappeared behind a "jagged projection" or "sharp peak" on Mt. Rainier and he knew this was some 25 miles distant.

Following my recent enquiries of local expertise, we now also know that he was evidently mistaken about this and fundamentally so. The 'jagged peak' has been identified as almost certainly 'Little Tahoma' - looks like there aren't any alternative candidates - and as it's on the far side of Mt. Rainier from

Arnold's location, they couldn't have travelled behind the peak without also having disappeared behind the mountain for some time. As Arnold claimed the objects flew between his position and the mountain, something is terribly amiss.

The default answer is that Arnold was in error and against the snow-covered backdrop, misperceived the objects momentarily passing behind Little Tahoma when they absolutely must have been somewhere in front of it. If Little Tahoma is 'Arnold's peak' - as UFO historian Brad Sparks was adamant it had to be and before I obtained confirmation from expert sources - then Arnold's perceptions of speed and distance must be regarded as comprehensively unreliable.

Outwith considerable discussions which have taken place on the 'UFO Research List' - all material there is 'list only' unless otherwise designated - Brad has expressed his conviction that Arnold's sighting remains a highly credible UFO case and proposes an alternative scenario; the trajectory of Arnold's objects did take them behind Mt. Rainier. As I've pointed out, however, Arnold confirmed on many occasions that the objects were visible against the background of Mt. Rainier and that's how he could make out some detail about their shape.

An aerial photograph of Mt. Rainier, which seems to have been taken from the same perspective (although closer to Rainier) as Arnold's location over Mineral, Washington, can be seen at:

<http://mt.rainier.tribnet.com/photogallery/detail.asp?id=29>

The jagged peak to the right of Mt. Rainier is Little Tahoma.

Some further photos illustrating Little Tahoma:

<http://www.physics.georgetown.edu/~porezag/rainier98/rainier98-82.jpg>

[This URL might 'wrap around']

<http://www.nwlink.com/~dognose/rtahom.htm>

If this crucial evidential anomaly can't therefore be reconciled, then it remains a major factor in any premise why Arnold's objects could have been a formation of White Pelicans.

Other aspects which cast doubt on the unusual nature of these objects have previously been highlighted (see the aforementioned material on my web site) and especially relevant is Arnold's later aerial encounter with up to twenty-five, 3 or 4 foot diameter, brass-coloured objects which "looked like ducks" and

"had the same flight characteristics of the large objects I had observed on June 24". Arnold believed this, the second of some 8 'UFO' sightings he had, was also of enigmatic, unidentified objects.

During my research, UFO historian Ed Stewart uncovered a little-known newspaper report dated 12 July, 1947, in which a Pacific North-west aircrew encountered "nine big round disks weaving northward two thousand feet below us". Why didn't this become an important corroborative 'flying saucer' sighting? Because the pilot and co-pilot confirmed, "We investigated and found they were real all right - real pelicans".

Bat-like objects which flutter and then glide, that gain altitude when they flutter, which - comparative to the above report - "weave" and also utilize undulating flight like a formation of birds, and which the witness noted had the same characteristics to a formation of 25 flying objects that looked like ducks, a landmark which is used as a distance marker and turns out to be on the wrong side of the mountain...

If Arnold's puzzling objects were in fact a flotilla of nine, non-earthly, bat-like voyagers, it was something of a unique observation and unconnected to the media's popularised portrayal of 'flying saucers'. Other than, of course, being the misinterpreted foundation for them.

Some might conclude that even Scooby-Doo and Shaggy could eventually figure this one out.

Others will doubtless disagree.

Dear Jim.

I read your response to "draw a map."

Evidently after all these months (years?) you still don't get it.

Arnold might have been wrong on thinking that the objects disappeared behind

a peak. Therefore conceivably the objects could have been closer than he thought.

You want them to be within 4 miles (whether you know it or not) and even within 1 mile.

My argument is simple:

(let's ignore bright mirrorlike flashing for the moment and assume we have aluminized pelicans)

Even under these VERY GENEROUS TO THE PELICAN HYPOTHOSIS ASSUMPTIONS,

you cannot easily argue that Arnold wouldn't have recognized the pelicans.

In fact, he would have flown across their path, if he kept on a straight

line, in which case he never would have thought they passed close Mt.

Adams (Mt. St. Helens, MAYBE). If Arnold turned his plane to the right

and rolled down his window to look at these enigmatic objects (pelicans less than 4 miles away), he would have realized quickly that he was gaining on the pelicans (traveling twice as fast as they).

My challenge to the pelicans is simple: Arnold must have flown along SOME path and the pelicans must have traveled along SOME path so.....

think of a path that satisfies the portion of Arnold's sighting that you accept. And then demonstrate to my satisfaction (and Brad and probably numerous others that are dying with fatigue over this) that THERE IS AT LEAST ONE PATH FOR ARNOLD AND ONE CORRESPONDING PATH FOR THE PELICANS that

agrees with YOUR version of the scenario. Oh, yes. Please describe your version of the sighting.

If you want to ignore some portion of Arnold's report, such as the claim that the objects went "in and out of the mountain peaks" or whatever, then SAY SO!

We'll understand. :)

OK: this isn't vote.com, but nevertheless I would like a vote by readers of this list:

am I being too hard on James and the pelicans?

I don't recall noticing this before - it's something that came up whilst looking through some old case material:

On June 14, 1983, when Robert Todd acquired a copy of Lt. Col. Halt's memo by way of a FOIA request to the 513th Combat Support Group (who provided document management services for the Third Air Force in Europe), he was told that although the US Air Force's copy had since been "properly disposed of in accordance with Air Force Regulations", however, "through diligent enquiry, and the gracious consent of Her Majesty's government, the British Ministry of Defence and the Royal Air Force, the US Air Force was provided a copy for you".

Is it still believed (Jenny might know the answer), that the USAF's copy came from the Ministry of Defence's files?

I've just located some documented proof that it didn't, at least not directly.

Halt's memo was addressed to "RAF/CC" and I understood "CC" meant "Company Commander".

If that's correct, where would Halt's memo likely have been directed to at that time?

James Easton.

The incident Warren describes almost certainly took place on the same night as Halt's endeavours, i.e. the night and early morning of the 27th/28th December, 1980.

Aside from Warren, there are a number of personnel, e.g., Greg Battrom and Adrian Bustinza, who describe similar events and there might be a correlation to some of those which Halt mentions on tape.

Interestingly, Warren claims that initial UFO sightings that night were made by security police in the Weapons Storage Area tower - a scenario which ties-up with the account I published from Sergeant Randy Smith - see:

<http://www.ufoworld.co.uk/newslet4.htm>

Although Warren's evidence has long been known as untrustworthy - the later 'regressive hypnosis' and what he assumed to be true from that didn't help, I'm sure - I think there might be more to these events which didn't involve Halt's team.

My understanding is that the incident Warren portrays took place in the exact same location where Burroughs, Cabansag and Penniston had originally seen those 'strange lights' in the early hours of the 26th.

This would be the field in front of Capel Green farm.

Is that correct?

James Easton.

Hi,

We do actually address this question in 'Sky Crash' - and I'm fairly sure I refer to it in later books on the subject as well.

When the memo first surfaced and Barry Greenwood sent me a copy one of the first things that Brenda, Dot and I did with it was take it to the MoD (unannounced). This was before it got any publicity so its very likely this was a total surprise to Whitehall.

I explained on the door that I had a document denied by the MoD to its own citizens (I was aware of the report and had been requesting it since the end of 1982 and being fobbed off with all sorts of MoD UFO documents sent freely to try to shut me up - any EXCEPT the Halt memo). I explained its origin in the US.

This got access to the MoD and a very interesting conversation with Pam Titchmarsh (then in the Nick Pope role) occurred. This is described at length in 'Sky Crash'. As we report she did two things.

Firstly, she confirmed the apparent reality of the document.

Secondly, she insisted that the MoD did not supply it to the USAF as claimed.

A few months later I met with the RAF liaison (Squadron Leader Donald Moreland) in his office on Bentwaters. He had a copy of the memo. I have spoken with several others who met him and seem to confirm that he had this copy continuously from February 1981 to May 1983 (dates that we can be sure he did).

In addition Halt certainly had a copy on base before its release in the US as it was shown to several people in the spring of 1983 in his office. There was also a copy of the Halt tape on base through that period - although no evidence that the MoD ever had this (or knew about it). Halt told me he deliberately excluded reference to it in his summary report to Whitehall but would have revealed it to them if they had ever shown any interest and followed up his memo. They didn't so they never got the tape.

Now this does provide a conflict, as we have always noted, because the USAF allege they had routinely destroyed their own copy of the memo in the two and a half years between its receipt in early 81 and its release in summer 83.

This is not that ridiculous given their stated policy of no USAF interest in the subject but would be resolvable in one of two ways. Either it was true that the USAF did not have files (because they were passed on to another agency allowing USAF records to be 'routinely destroyed') or the USAF officially accepted the case was solved very early on and saw no reason to retain files.

The question then comes as to where the released Halt memo originated. The MoD stated (and I believed Pam Titchmarsh as she was shellshocked) that they had not released the file. So it did not come from what is now the Air Staff office I am pretty sure.

Of course it could have come from one of the other sources routinely sent copies of UFO reports (eg DSTI or DI 55) but there were subsequent on record MoD statements that denying that they supplied the memo to the USAF - something I suggested to the media pointing out the 'freedom of information' implications of denying records to UK citizens whilst releasing them in the US. I have always come to believe that the MoD never outright lie so this denial suggests they did not officially pass on the file.

My guess (and it's really just that) is that the memo came as a copy of the one from Bentwaters itself. We know that in May 1983 when the request was made in the US that both Halt and Moreland were still there. We know they were happy to discuss and even show the memo to UFOlogists (at least five people - myself included - during that few month period). It is likely that one of the first places the USA would have looked for a copy of an event involving Bentwaters was Bentwaters itself - especially given the continuity of staff.

Probably such an act would have to be okayed by Moreland, who was still tacitly in charge as this was an RAF base. And in any event if the memo originated from RAF Bentwaters (allbeit via USAF staff) and the USAF wanted to pass on responsibility they may well diplomatically phrase it in such a way as to indicate that they got it with the cooperation of the UK government - when in fact all they really meant was one of their bllokes on an RAF base sent them a copy of his own copy.

Best wishes,

Jenny Randles

Jenny,

Appreciated - I wondered if this was \_still\_ the understanding,  
or if further information had ever come to light.

If not, then what I'm about to reveal may be previously unknown.

Very interesting and appreciated thoughts.

Amongst all of the research material which I have acquired from several sources, much of which was kindly made available to myself from the US in 1997 - and which astonishingly included those original statements - there are documents relating to the CNN investigations, copies of 'Response to Query' forms (presumably these were obtained under the FOIA) from the base - which record media enquiries following the 'News of the World' article - and various sundry items of interest!

I also have copies of local maps in which Warren pinpoints the exact location of his adventures and I don't remember these being published before. I'll come back to this separately.

One of these official 'Response to Query' forms from RAF Bentwaters mentions where, apparently, that copy of Halt's memo was obtained - the Third Air Force at Mildenhall.

I've scanned this document and it can be seen at:

<http://www.ufoworld.co.uk/ftp/response.jpg>

The question came from Paul Durant at [looks like] EADT - presumably 'East Anglian Daily Times' and was apparently answered, as were many enquiries at that time, by Captain Kathleen McCollum, Chief, Public Affairs Division, 81st Tactical Fighter Wing at RAF Bentwaters.

She notes the questions as:

1. Is Lt Col Halt's report genuine?
2. [Looks like] If people had asked beforehand we had no info, where did the report come from?

And records her answers were:

1. Yes.
2. 3AF at Mildenhall under the Freedom of Information Act. We had no copies since the thing was so old.

So there you go...

This query seems to be amongst many which were answered following the 'News of the World' article, when as you know the Halt memo was first published, and is dated 3 October, 1984.

I'm now wondering if the 3AF/Mildenhall might still have other material on file. Most unlikely, however, I've written to them and we'll see what they have to say.

Does this mean that the MoD, Whitehall, may never have had a copy of Halt's memo and were never involved in any investigations?

Who exactly did Halt send the memo to? That seems to be explained in the following:

Project: watchfire

Original broadcast date: May 13, 1997

Topic: The Return of the UFOs to Bentwaters, December, 1980

Guest: Colonel Charles Halt, first-hand witness

RAYL: Okay. Now, two weeks later on January 13, 1981 you issued a memorandum to the British Ministry of Defense.

HALT: That's correct.

RAYL: And why did you do that?

HALT: At the request of the R.A.F. Liaison Officer or the R.A.F. Base Commander, as we called him, Don Moreland.

RAYL: Okay.

HALT: I went and approached him, and I said, "You know, this happened off base." Well, I did discuss this through our channels and the real answer from our channels was, "Hey, we don't want to

touch this with a pole. This was a British incident. It happened off the installation. Let them handle it." So, I contacted him. In fact, I contacted him earlier and the only reason the memo was dated that late was that he was on vacation and I wasn't able to find out what he wanted and how much detail he wanted and what he wanted to do with the information. When I finally caught up with him on the, about the 10th or the 12th, he said, "Well, write a brief memo. Kind of sanitize it and we'll send it to London. We'll see what happens." So, that's what I did.

[...]

It was given to Don Moreland to forward through his channels which was that Liaison Officer, Third Air Force, Air Force Headquarters in England, to the M.O.D. and see what their interest was. I really expected somebody to pop up in a day or two and want more details. To this day, it hasn't happened.

[End]

As previously noted, Halt's memo was addressed to "RAF/CC", so where did it actually end up - perhaps with the RAF at Mildenhall?

Any thoughts on this?

James Easton.

Hi,

Thanks for the comments on the Halt memo.

Firstly, I have a copy of the Chuck de Caro CNN material obtained via the FOI in 1984. This was one of various documents retrieved by Scott Colborn and Ray Boeche of MUFON in 1985 that they published around then. Several documents were denied to them and on appeal one was released. This was a teletype message in which the operator made a joke about aliens and put little symbols of a spaceship on the paper. There doesn't seem anything exciting about the routine text so I guess the original denial was purely on the grounds that more might have been made of this joke than was ever intended by it. What is on the data still denied (after appeal) is hard to say.

Also released was a briefing to the USAF as to how to answer questions posed in the wake of the release of Sky Crash!

As you may know I spent several days in East Anglia around this time with Chuck de Caro (who played himself in the TV series JAG a couple of times more recently BTW). He was a very interesting guy. Lots of stuff went on I dare not put onto an open list (nothing really sinister I should stress - although enlightening)

My take on the reference to Mildenhall in this release was purely that this was the USAF HQ at the time and the sort of head office for Bentwaters & Woodbridge. Any documentation obtained from these bases would be routed through Mildenhall and Halt told me that he dealt with Mildenhall in all follow up with the USAF immediately after the case. It was the next link up from him.

So, yes, it's true they would likely have copies of any records necessary. But it's also true that any documents supplied in 1983 via the FoI act will likely have been returned to the USA via Mildenhall even if they originated from Halt himself then on Bentwaters. I think this will likely just prove to be a chain of command thing as Mildenhall was in effect the main HQ and Bentwaters just a satellite base.

Indeed you will find reference to Mildenhall on data sent to the USA regarding other UFO cases in which they were not directly involved. I think, in effect, they were a bit like the head post office for the USAF.

As for what happened to the Halt memo in the UK, Moreland told me that he sent it to the usual source at West Drayton and included a cover note (this has never been released but he claimed it was uncontentious and said

little). It definitely was forwarded to the then equivalent of Air Staff 2A. Pam Titchmarsh positively confirmed to me in August 1983 that she had a copy on her file (or as she said looking at it 'I am sure it is this or something very like it'). Nick Pope accessed the Rendlesham file during his tenure around 1992 and told me when I first met him that both the Halt memo and the Moreland cover letter were still in the file. He confirmed this cover note was uncontentious and was unsure why it had never been released. We could only assume that as Moreland was retired it was considered not appropriate to involve him in the open debate by releasing a letter that might be construed as an endorsement of the case when it was really at best an endorsement of its sincere reporting, and not its status. Moreland had retained a copy of the memo in his office to the day he retired.

Recall that when Brenda and Dot arrived unannounced to see Moreland in February 1981 they caught him off guard. He later confirmed to me that for a few moments he thought they were civil servants from air staff as nobody else should have known of the memo just five weeks after it was sent by Halt at his behest and he had been waiting to hear from Air Staff for follow up.

As I have noted, Halt (after consultation with Moreland and in view of the jurisdiction conflicts between the US and UK authorities that had been the source of some discussion in base stand ups immediately after the incident) deliberately muted the memo and left out much key data - notably the existence of physical evidence, plaster casts, soil samples, photos and the tape. He has always insisted that he would gladly have made reported them and made this evidence available to the MoD if they had shown any interest in his report - but they never did.

To the best of my knowledge this material (eg the tape) was therefore never in the possession of the MoD.

As such when Brenda & Dot showed up on base in Feb 81 it was reasonable of Moreland to suspect they came from civilian air staff in Whitehall. He very quickly realised they had no authority to be there and politely dismissed them - but the error occurred only because the memo had been forwarded to civilian staff at the MoD just weeks before and that's who he initially expected to hear from. So two women out of uniform who seemed to know key details about an otherwise unpublicised and recent report concerning a case that the base still thought was secret were not immediately obvious to him as being UFOlogists.

Best wishes,

Jenny

You seem to be forgetting that it was Arnold who confirmed how the  
sequence was; saw bright flashes - made out objects - thought they  
were a flock of (snow) geese.

It wasn't; saw bright flashes - made out objects - obviously knew  
they couldn't be geese because of their metallic surface.

The 'Pendleton, Oregon East Oregonian' of 26 June, 1947 reported:

When first sighted, he thought the objects were snow geese.

"But geese don't fly that high -- and, anyway, what would geese be doing going south for this time of year?"

Next he thought they were jet planes. He said he had heard so many stories of the speed of this type of craft travelled so he determined to clock them.

However, he quickly realized "their motion was wrong for jet jobs."

[End]

I would think that's the most likely explanation.

However, Kathleen McCollum comments that, "We had no copies since the thing was so old". Presumably she couldn't therefore - at any time beforehand - simply have asked Halt or anyone on base if they still had a copy?

>As for what happened to the Halt memo in the UK, Moreland told

Indeed, it was likely to be merely a covering letter, the memo, "said it all".

>To the best of my knowledge this material (eg the tape) was  
>therefore never in the possession of the MoD.

That seems to be the situation.

>As such when Brenda & Dot showed up on base in Feb 81 it was

>staff in Whitehall.

Yes, a humorous story!

You will also recall the subsequent incident when Halt called security to detain certain ufologists he found in his house and who had been allowed entry by Halt's son.

If you haven't seen a copy of the three page 'Incident Complaint Form' which that generated, let me know if you would like to. ;)

I consider it another classic, official USAF, UFO related document!

James Easton.

Subject: Re: Kenneth Arnold and Little TahomaStatus:

James,

We've been over this before, it's very old ground. You have the sequence of events wrong with Arnold and you are retroprojecting the equation of FLASHES = OBJECTS back to the very beginning of Arnold's sighting. You are forgetting how very surprised Arnold was by the sighting -- it caught him completely off guard with something he had never seen before and was totally unfamiliar with. Arnold did not make the equation FLASHES = OBJECTS until later into his sighting, and for days after the sighting he did not think retroactively to make that equation apply to the initial FLASHES he saw.

If he was continually being asked to tell about the strangely-shaped OBJECTS he saw rather than amorphous FLASHES of light, and he had not yet mentally connected up every aspect of his sighting to equate FLASHES = OBJECTS back to the very beginning of his sighting, then this explains why in SOME of his early accounts he omits mention of the FLASHES (though he does mention the INITIAL FLASHES in his 2nd Known Interview, with the Chicago Tribune on June 25, and it is also evident that the Tribune reporter was unusually thorough in his questioning).

As you quoted from his 1st Known Interview, with the Pendleton East Oregonian, it is obvious he was being asked about the OBJECTS, NOT the FLASHES:

"When first sighted, he thought the OBJECTS were snow geese."

When OBJECTS were FIRST SIGHTED, Arnold thought for a moment they might be SNOW GEESE. This is NOT the same instant when he FIRST SIGHTED FLASHES, which was very likely 30 seconds earlier. Do you see the difference? And he had not yet connected up FLASHES = OBJECTS, leading to some very understandable confusion in the first days after the sighting.

Here is the correct sequence of events, as I have previously posted here, based on Arnold's most complete accounts, not on fragmentary reports:

1. Arnold's plane lit up by intense FIRST FLASH -- cannot see where it came from -- thought it was sun reflecting off an AIRCRAFT in near collision.
2. Arnold searches all around the sky for 20-30 seconds to see where the FLASH had come from -- cannot see where. Does see DC-4 airliner.
3. SECOND FLASH seen. Arnold can now localize approximately where this FLASH came from but STILL CANNOT SEE OBJECTS yet -- too far away. "This time I caught the direction from which it had come." (Arnold COTS)

4. After more searching in the direction of the 2nd FLASH, Arnold now spots some BRIGHT OBJECTS north of Mt. Rainier, approaching the mountain.

This is when Arnold momentarily thought these OBJECTS might be "snow geese." As he saw that this group of bright OBJECTS would give off intense FLASHES about an average of once per second from an object in the group of 9, he must have realized they couldn't possibly be geese or birds. He then thought they had to be fast-moving JETS reflecting sunlight and tried to see their tails, but couldn't.

This identification of FLASHES = OBJECTS was made at FLASH NO. 3. It is unclear just when Arnold realized that FLASHES 1 and 2 had also come from the OBJECTS, and it might have been hours or days later as he pondered over everything that had happened. And that is why Arnold's early accounts, when reporters asked him to describe the saucer-shaped OBJECTS, have some confusion about the earliest FLASHES 1 and 2, and in some cases Arnold just doesn't mention them, perhaps thinking it would complicate the story.

(The KWRC radio interview was on June 26 at 12 Noon, not on June 25, some websites continue to mislabel the date; Pierre Lagrange copied the correct date and time right off the tape in Arnold's files, and it is obvious from the content of the interview.)

Brad

My guess is that Halt was not that keen on getting too involved with the media publicity in 1983. He did actually try to get permission (I was involved in the negotiations with the News of the World and so saw what was being offered). I think he was either told or decided himself it was not wise policy given his continuing career, the hyping of the Larry Warren story (which as you know Halt has never been happy with) and either way he never did tell his story to the paper. As such I doubt he'd have gone out of his way in 83 to do anything official and the various meetings he had were all very much off the record at that time. But without question both he and Moreland had the memo and Halt had the tape on base in 1983 prior to, during and after the FOI release.

No, I've never seen this file, but know of the saga, of course. The day when I arrived at Brenda's house, knocked on the door and was greeted by a man in a bank robbers ski mask who looked furtively around and let me in is etched on my memory! This was, of course, Chuck Halt who (whilst his father was away) was trying to tell us what he knew in this guise (I did not that night know it was Chuck Halt - but it was pretty obvious to me that his story of being an airman who had been involved was - er - unlikely - as this was three years after the sighting, this chap was clearly then only about 15 and even I knew the USAF did not employ 12 year old security guards!) Chuck was definitely not being coerced into anything that night. He was really enjoying himself. To a kid it was probably great fun.

Not to mention the night that Nippon TV sent me on base with a hidden microphone to go knock at Halts house as they pointed a camera out of a hole in the back of a van. Thank God Halt was out that night. My only excuse is that - like Chuck - I was caught up in the excitement of the moment and I too was young!

Best wishes,

Jenny

However, he quickly realized "their motion was wrong for jet  
jobs."

[End]

.....

James,

You will recall his FIRST impression after the initial flash was NOT  
geese. His FIRST impression, he wrote, was that a "hot shot"  
AF pilot had buzzed his aircraft, getting so close as to cause  
a bright solar reflection.

.....

ARNOLDS WRITING:

(Letter to AF) "The sky and air was as clear as crystal. I hadn't  
flown more than two or three minutes on my course when a bright flash of  
light reflected on my airplane. It startled me as I thought I was too  
close to some other aircraft. (Book) I spent the next twenty to thirty  
seconds urgently searching the sky all around - to the sides and above and  
below me - in an attempt to determine where the flash of light had come  
from. The only actual plane I saw was a DC-4 far to my left and rear,

apparently on its San Francisco to Seattle run. My momentary explanation to myself was that some lieutenant in a P-51 had given me a buzz job across my nose and that it was sun reflecting off his wings as he passed that had caused the flash. Before I had time to collect my thoughts or to find a close aircraft, the flash happened again. This time I caught the direction from which it had come. I observed, far to my left and to the north, a formation of very bright objects coming from the vicinity of Mt. Baker, flying very close to the mountain tops and traveling at tremendous speed. (L) I observed a chain of nine peculiar looking aircraft flying from north to south at approximately 9,500 ft elevation and going, seemingly, in a definite direction of about 170 degrees.

.....

This indicates to me that he was impressed with the brightness of the first reflection and immediately thought of a way to explain such a flash. He DID NOT think of a "flash" of sunlight off a bird. Instead, he thought of a reflection from a metal surface as the only way to explain the brightness. . When he saw another flash this alerted him to the direction to look and THEN he saw the objects in the direction he was looking. I would guess that at the instant he initially saw the objects and for a few seconds thereafter there was no flash. It was at this time that the flight characteristic made him think he was looking at geese. ( You should give him high marks for IMMEDIATELY attempting a mundane (prosaic) explanation.)

If so, I'm sure he did NOT immediately suppose that he had found the source of the bright flash. He probably would have looked away from the objects, still looking for a source of the flash of light, if it hadn't been for yet another flash which, this time, he saw as coming from one of the objects. This would have been the first reason to reject geese. Furthermore, I would guess that he inferred a long distance because of the atmospheric haze effect on reducing contrast. Once he inferred a long distance he then had to assume a high speed.

However, the reason he gave for rejecting geese was the WRONG REASON according to your hypothesis... wrong because they weren't as far away as he thought, according to your hypothesis. You would claim that he made the correct identification and then threw it out because he thought the objects were far away and hence traveling rapidly. If they were in fact geese, then you would be correct.

Arnold clearly pointed out that he could see that these were the objects which flashed brightly. Again and again bright flashes of light came from individual objects as they tilted. they were much brighter than the sky and much brighter than the snow. Eventually, after they passed Rainier and had flown so far south that the sighting direction was toward Mt. Adams and all he could see were the bright flashes.

I claim, based on the optical physics of the situation, that if the objects had been white birds at a distance of a few miles he would not have referred to blindingly bright flashes. He might have referred to the

brightness as changing or pulsating, but that's not the same as blindingly bright flashes. This is because there would have been only momentary increases in reflection of sunlight from pelicans as they spread or flapped their wings. Arnold's descriptions imply reflections MUCH brighter than you could ever get from pelicans even if the birds were within a mile of his aircraft.

First of all, pelicans would have been about at the same altitude as Arnold, and hence he would not have seen the full extent of their wing span. In other words the "cross-sectional area" of the reflecting surface would not have been the area of full wingspan...probably not even half that (unless the pelicans flew with their wings vertical instead of horizontally oriented.). Any variations of brightness of the reflection would be related to wing flapping. The maximum brightness of a white surface would be not much greater than the brightness of the sky horizon. Recall the long dissertation I wrote before on brightness. Here are abstracts from it. I have made some modifications to clarify (since this abstract is taken out of the context of the original writing back in March)

\*\*\*\*\*.....

## BRIGHTNESS OF THE METAL FLASHES

Assume that the objects were approximately rectangles 30 m long (along the direction of flight) by 20 m wide (about 1 milliradian in angular length from Arnold's position about 20 miles away). When tilted, the 20 m dimension is seen foreshortened by perspective and the 30 m dimension is not foreshortened. The area that is effective in reflecting solar radiation is length times the width projected onto the line to the sun. The projected width is the cosine of the angle between the surface normal (perpendicular to the flat surface) and the line to the sun. In this case that angle is about 30 degrees. (Note: the sun was about 30 degrees down from the zenith. The surface normal would have been "30 degrees lower than" the direction to the sun in order to reflect sunlight along a nearly horizontal direction toward Arnold's plane.) Hence the effective area of the mirror surface is  $30 \times 20 \cos(30) = 520 \text{ m}^2$ .

Imagine there was a huge movie screen at Arnold's location about 20 miles away. The reflection from the mirror creates an expanding beam of light which, in turn, creates a patch of light on the screen which is essentially the projected mirror area,  $520 \text{ m}^2$  plus the area due to divergence of the sun rays. (Note: this is the sum of the "pinhole camera effect" size of the reflected beam plus the fact that the reflector is not a tiny hole.) The sun angular size is about 0.009 radians or 0.52 degrees. Over a distance of 20 miles = 32 km this angular size projects to a surface area of diameter about  $0.009 \times 32,000 = 290 \text{ m}$  or a circular area of about  $66050 \text{ m}^2$ . The total area is therefore this plus 520 or about  $66570 \text{ m}^2$ .

The illuminance from the sun at the earth's surface is about  $100,000 \text{ lumens/sq. m.} = 1\text{E}5 \text{ lm/m}^2$  when the sun is around 60 degrees in elevation. Multiply this by  $520 \text{ m}^2$  and by 0.9 reflectivity to get the luminous flux or "luminous power" that is redirected toward Arnold's plane:  $4.7\text{E}7 \text{ lm}$ . At a great distance from the reflector (20 miles) this is spread

throughout a beam of angular width equal to the angular size of the sun. The solid angle of this beam is  $2\pi(1-\cos(A/2))$  where A is the full beam angle, or about 0.52 deg = 0.009 radians. Thus the solid angle of the reflected "beam" is about  $6.5\text{E-}5$  steradians (sr). It is not spread uniformly; there is an intensity peak in the center. However, if it is approximated as constant over the area the effective luminous intensity of the metal reflector is

$$I_m = 4.7\text{E}7/6.5\text{E-}5 = \text{about } 7\text{E}11 \text{ lm/sr},$$

with the edge of the beam having intensities much less than this and the center having an intensity about twice this. (At Arnold's eye it would be about half this because of the atmospheric attenuation. See below.)

How much of this light did Arnold's eyeball intercept? The luminous intensity should be multiplied by the solid angle size of Arnold's pupil at a distance of 20 miles = about 30,000 m and by the atmospheric transmission factor, approximately 1/2 (see below). The diameter of Arnold's pupil was probably about 2 mm =  $2\text{E-}3$  m so the area of his pupil =  $3\text{E-}6 \text{ m}^2$ . The solid angle of his eye in steradians is the area divided by the square of the distance which is about  $3\text{E-}6/(3\text{E}4)^2 = \text{about } 3\text{E-}15 \text{ sr}$ . Hence his eye intercepted a flux F (from a flat, rectangular surface), of about

$$F_{\text{flat,rectangular surface}} = [7\text{E}11 \text{ lm/sr}] \times (1/2) [3\text{E-}15 \text{ sr}] = \text{about } 1\text{E-}3 \text{ lm}.$$

Atmospheric transmission reduces this by about a factor of 2.

THEREFORE I ESTIMATE THAT ARNOLD'S EYEBALL RECEIVED ABOUT  $5\text{E-}4$  lm FROM ONE OF THE OBJECTS.

THIS IS AN ESTIMATE OF THE LIGHT THAT ARNOLD SAW BASED ON MIRROR=LIKE REFLECTIONS OF SUNLIGHT FROM ONE OF THE OBJECTS ABOUT 20 Miles AWAY.

Now, regarding bird reflections:

James wrote:

"I trust it is now proven that birds can be reflective, like a mirror, and this equally applies when considering other 'UFO' cases where that explanation may have been ruled out."

(NOTE:IT IS NOT PROVEN THAT BIRDS CAN BE REFLECTIVE LIKE A MIRROR.... bird

reflections are NOT like a mirror. (In the special case of a bright reflection which James cited, the birds were nearly between the observer and the sun..... this is decidedly NOT the situation with Arnold!!!)

To which Bruce responded:

What about birds lit by the sun behind Arnold (sun was high and in the west as Arnold was looking eastward)? How bright would they be?

Suppose we have birds at 2 km, lit by the sun and with diffuse white surfaces.. One can assume an illuminance of  $1\text{E}5 \text{ lm/m}^2$  on the birds surface. It is kind of difficult to determine just what the cross-sectional area projected onto the line of sight to the Arnold would be since, if birds a few miles away, they were nearly or exactly at his altitude, but let's be generous and assume that the bird SEEN FROM THE SIDE is equivalent to a  $1 \text{ m}^2$  diffuse reflector. Therefore it reflects  $1\text{E}5$  lumens, but not into the  $1/2$  degree beam that a mirror would do, but into an effective solid angle of  $\pi$  steradians (assumption of lambertian reflection). Hence the luminous intensity of a bird, assuming unit diffuse reflectivity (better than the best white paper), would be  $(1\text{E}5 \text{ lm/m}^2)(1 \text{ m}^2)/\pi \text{ lm/sr} = 3\text{E}4 \text{ lm/sr}$ . The atmospheric transmission factor from the assumed bird 2 km away to Arnold's eyeball is given by  $e^{(-.025 \times 2\text{km})} = 0.95$ . Hence the intensity of a bird is

$$I_b = (1\text{E}5 \text{ lm/m}^2)(1 \text{ m}^2)(1)(0.95)/\pi = 3\text{E}4 \text{ lm/sr}$$

(Note: this is an overestimate since the bird does not reflect all the light that hits it. Some light is absorbed.)

The area of his eyeball was  $3\text{E}-6 \text{ m}^2$  so the solid angle of his eyeball 2,000 m from a bird was  $(3\text{E}-6 \text{ m}^2)/(2000 \text{ m})^2$ . Therefore we have entering his eyeball

$$F_{\text{bird}} = 3\text{E}4 (3\text{E}-6/2000^2) = \text{about } 2\text{E}-8 \text{ lm}.$$

This can be compared with the previous calculation of the lumens into Arnold's eye from a flat metal mirror of tens of meter size at the distance of Mt. Rainier, about  $5\text{E}-4 \text{ lm}$  (see above). If you shrink the metal mirror area by 100, making the equivalent flat mirror surface dimension only meters in size rather than tens of meters, the intensity from the metal mirror is still over 100 times greater than expected for birds at about 1.25 miles (2 km) distance

IN OTHER WORDS: there is hardly an comparison between bright flashes from even meter sized metal mirror surfaces at 20 miles as compared with "flashes" from white pelican surfaces as close as 2 km.

-----

Oddly enough, the number of lumens expected from a  $1 \text{ m}^2$  bird at 2 km is comparable to the number expected from the tens of meter size area ( $520 \text{ m}^2$ ) of snow on the mountain,  $1\text{E}-8$ . That means that the bird brightness would be comparable to, maybe a bit brighter than, the snow brightness from Arnold's perspective. They certainly would not appear as bright flashes against the snow. This assumes 100% reflectivity of the white surfaces of the birds, but, of course, this is unreasonable, so the bird brightness calculation here is too large.

.....

## SKY BRIGHTNESS AT THE HORIZON

Arnold was looking into a bright field of light. I have already estimated the luminous intensity of the the snow on Mt. Rainier. But Arnold was looking mostly at the white horizon sky if these objects were at his altitude or several thousand feet above or below. (The horizon is almost always white because of aerosol particles which are larger than the wavelength of visible light. Looking down from the horizon one sees ground. Looking up, the color of th sky changes from white to pale blue to deep blue directly overhead.... WHEN CLEAR, of course!).

I have a research article that indicates when the sun is at 42 degrees elevation in the west and the person is looking east from an altitude of 9000 ft the luminance,  $B$ , of the sky at the horizon is in the neighborhood of  $B = 7500 \text{ lm/sr/m}^2$ . The luminance decreases if you look up or down from the horizon. The general definition of luminance or "brightness" is the flux per unit area of the source projected onto the line of sight per unit solid angle of the receiver from the distance of the source to receiver. That is, the flux collected by the receiver is  $B \times (\text{solid angle of receiver aperture}) \times (\text{projected area of source})$ . But when one is looking at the sky this raises the questions (1) how far is the sky (the distance from the source is needed to calculate the solid angle of the receiver aperture) and "which square meter of the sky should I use for the area of the sky?" To solve this problem one writes the equation for flux received by an aperture of area  $A_a$  from a large angle (NOT a point) source of brightness  $B$  and (resolved) area  $A_s$ :  $F = B \times (A_a/R^2) \times (A_s)$ . This doesn't mean much for calculating the illumination from sky brightness until you shift the position of  $R$ :  $F = B (A_a) \times (A_s/R^2)$ . Now we have numbers that can be measured because  $(A_s)/R^2$  is by definition the solid angle of the source  $A_s$  "SEEN" by the receiver (aperture). The solid angle of the source is a "cone of acceptance" of light projecting from the aperture of the receiver out into the sky. This can also be considered to be the solid angle of a "pixel" on the focal plane. The source area, as projected onto the line of sight, must be large enough to completely fill the pixel angle. The light coming into the aperture over this cone angle is the integral over light sources "out there" in the sky. It is assumed that throughout the cone angle the brightness is constant.

Therefore the way to use this information is to assume a certain angular size resolution element in Arnold's eyeball and use this to calculate the "cone of acceptance" or solid angle of sky that would contribute light to that resolution element. Then multiply this by the area of his pupil to get the number of lumens hitting that resolution element. If we assume a resolution ("pixel") size of  $0.6 \text{ mr} = 0.034$  degrees (corresponding to about 20 meter resolution at 20 miles) the solid angle is  $2 \pi (1 - \cos(0.034/2)) = 2.2\text{E-}7$  steradians (where 0.034 is the "cone angle"). The area of Arnold's pupil was assumed to be about  $3\text{E-}6 \text{ m}^2$  so the lumens entering his eyeball and hitting a resolution element would be only

$$F_{\text{sky}} = \text{flux from sky at the horizon} = 7500 \times 2.2\text{E-}7 \times 3\text{E-}6 = 5\text{E-}9 \text{ lm.}$$

It is amusing...and somewhat gratifying....to note that this number of lumens is comparable to what was calculated before for snow on the mountain using a large surface area ( $520 \text{ m}^2$ ) that would be somewhat larger than a pixel size,  $1\text{E}-8 \text{ lm}$ . One expects these to be comparable because the distance to the mountain is considerable and in each case the source is sunlight scattered from a diffuse surface (the sky has lots of tiny diffuse surfaces...aerosol articles). (NOTE: the snow would be brighter than the sky to an observer close to the mountain. As one gets closer to the mountain the lumens from the sky stays the same (!) since the solid angle of acceptance doesn't change, but the number of lumens from the mountain increases as the range shrinks because the atmospheric attenuation decreases.)

.....

FROM THE ABOVE ABSTRACTS FROM MY BRIGHTNESS CALCULATIONS ONE FINDS:

the brightness of reflection from a nearby white pelican surface would be comparable to the brightness of the horizon sky (maybe 4 x brighter) and comparable to the brightness of the snow on Mt. Rainier ( maybe 2 x brighter) and NOWHERE NEAR AS BRIGHT AS A MIRROR REFLECTION FROM A SURFACE OF MANY SQUARE METERS EVEN IF THE MIRROR WERE 20 MILES AWAY. (Note that Arnold compared the brightness of the reflection to that of a welding arc!)

.....

VISIBLE AT Mt. ADAMS??

I wrote

>"He said the 'planes' remained visible by the flashes of  
>reflected sunlight for some seconds after they passed Mt.  
>Adams, perhaps for as far away as 50 miles.>"

James wrote

>COMMENTS: How feasible is this and if factual, which I  
>greatly doubt, what might it tell us about the objects'  
>size and reflectability?

This is an interesting point which I have alluded to in a previous post, namely that the light from the objects, whether solar reflections or generated by light sources at the objects, must have been quite great. However, the idea that he could see them as far as Mt Adams about 40 miles south is consistent with his claim of "blinding brightness." If they were "extremely bright" when near Mt Rainier about 20 miles away, then they certainly were bright enough TO BE SEEN (although not bright enough to cause temporary "spots before his eyes) at 40 miles. The luminous flux received by his eyeball is proportional to the (atmospheric transmission)/distance<sup>2</sup>. Previously I gave the atmospheric transmission factor as 0.46 for 32000 k (20 miles). At twice that distance the transmission is about 0.2 or about 1/2 of the previous transmission. The

distance was doubled so the  $1/R^2$  factor is  $1/4$  of the previous. Thus the flash brightnesses of the previous calculations should be multiplied by about  $(1/2)^4 = 1/16$ . The flashes were so bright at 20 miles that they would still be visible even if reduced in intensity by a factor of 8. Hence I conclude that they would still be visible at Mt. Adams..... unlike pelicans, of course.

I recent acquired from a second-hand CD and video shop, a 1993 video entitled, "The UFO Phenomenon", by Labyrinth Media Ltd.

Always curious if these older productions might contain worthwhile/little-known material, I've only got so far as the Arnold case - just after some interesting material about the 'Foo fighters' - and would you believe it...

Not only does this video feature some aerial footage of Mt. Rainier, Little Tahoma et al - and apparently taken from a comparable location to Arnold's position - the brief narrative, which is an actor's 'voice-over' and apparently supposed to be a verbatim Kenneth Arnold testimony, is an account I've never heard before.

Of even more interest and if actually drawn by Arnold, would be absolutely fundamental new evidence, is a sketch I've previously neither seen or heard about.

Using a digital camera, I've eventually managed to capture a flicker-free copy of the on-screen image and this can be seen at:

[http://www.ufoworld.co.uk/arnold/arn\\_new.jpg](http://www.ufoworld.co.uk/arnold/arn_new.jpg)

Can anyone identify this drawing/where and when it originated?

If a 'genuine Arnold', why hasn't it come up in discussions before now?

Best wishes,

James Easton.

Some of you may have seen on the ListBot site that there would be a lengthy power-off disruption over the weekend.

Although their status report indicates no known mail delays, there are messages in the archive that haven't yet been distributed.

Not even sure if messages sent during the downtime would be retained by ListBot, I sent a further query re the Arnold sketch and although that has been distributed, the original still hasn't.

Doubtless, it will sort itself out as always.

In the meantime, a couple of items which might be of interest.

Bruce,

Thanks - when I reply to Brad's confirmation of same I'll add some further details from the video.

>However, it is amusing to see that it shows only the one "double  
>crescent" type object and not the eight other "semicircular with  
>convex rear" type. Why is that?

Because there never were "eight other 'semicircular with convex rear' type".

>What is so special about the one object that it seems to get  
>"most of the press"?

Because it is in fact a depiction of the objects what Arnold believed he observed.

>Is it our natural tendency to separate out the "loner", the  
>"special one" and ignore the multitudes?

No, the answer is contained in the following, extracted from my reply to some mail on the UpDates list:

[START]

>These sketches bear no relationship to the first on record by  
>Arnold, in the Blue Book files, which do indeed look largely  
>disk shaped.

These sketches do however depict 'crescent-shaped', or 'bat-like' objects, which Arnold originally described.

These early descriptions are noted in my current Fortean Times article:

"Arnold described how those nine objects in formation resembled "the tail of a Chinese kite" blowing in the wind, or "speed boats on rough water". Using an unusual simile, he added: "they flew like a saucer would if you skipped it across the water." In the media frenzy that followed, this phrase, intended to describe their motion, was misconstrued to be a description of how the objects looked. So 'flying saucers' were born and the true facts swept aside in the ensuing hysteria.

It can hopefully add to our overall understanding, however it needs to be verified and dated first of all.

>It's hard to tell if the first image is meant to be a frontal /  
>tail-end cross-sectional view or a side view because the bulge  
>is in the center in either case.

That's true. I took it to be a direct, head-on view - which we wouldn't expect Arnold to have seen.

>Can you supply a transcript of this assertedly new Arnold  
>testimony?

As I said, it's very brief and may not be verbatim. It states:

"A horribly bright light flashed. It lit up the cockpit and the entire sky, it was like an explosion and this was on a bright afternoon.

And then it flashed a second time and I looked to my left and \_there\_ was a row of very strange flying objects. They flew in chaotic patterns and at more than 1200 miles an hour, twice as fast as any airplanes".

>Do the credits identify the producers and researchers who could

James,

The best estimate of the origin of the IUR drawing is that Arnold drew it on June 24/25, 1947, and possibly it is the drawing Arnold made and showed Al Baxter at Yakima airport when he landed right after the sighting. The drawing, partially published by IUR with some artistic enhancements (heavier lines, etc.), was done on the back of a large manila envelope of Arnold's Great Western Co. The reason for this dating is that the 1800 mph figure on the drawing dates from June 24/25 when he told the Chicago Tribune his 1800 mph estimate and it never occurs again -- the speed drops to lower values from this point forward, and never exceeds 1800 either.

The KWRC radio interview you like so much, on June 26 (NOT 25), already has the half-circle description.

The last drawing you're asking about I think was published in the Idaho Statesman on June 28, 1947, but I'll have to check my files to be sure.

Brad

<<

The investigative report has been posted online in regards to the sighting report that appeared in Filer's Files #17 below.

It can be accessed at <http://members.home.net/tlemire/macomb.html> >>

Todd and list, Sorry I did not get a chance to really respond on this one since I have been away. However, there are some things I find wrong with this report. For instance we read:

"Both witnesses agree on all basic aspects of this sighting such as size (7-10 times larger than a star), shape (diamond), color (white/yellow-white), sky location (approx. 5 degrees above the horizon as measured on site using a hypso-protractor) and an azimuth of approx. 210 to 235 degrees from magnetic north."

What is the approximate diameter of a "star" for comparison? A star is a point source and really has no angular size. However, if we make a star around 10-20 seconds of arc, 7-10 times is less than the size of the moon. It has been my astronomical experience that people do not have a good feel for angular sizes. They will also often confuse size and brilliance. So what magnitude was the star used for comparison?

Reading Allan Hendry's book, we discover numerous people describe stars in this similar manner. According to Hendry, the following was reported about shapes of stars.

Included among these shapes are: discs and discs with domes ("like two plates put together" - case 322; "Elongated, big as a distant plane" - case 377; "dome on top and bottom" - for one and half hours in case 332), domes, "a plate with a hole in the center," vertically oriented small triangles, ovals, a football...even "teacups," "Mexican Sombreros," and bananas as large as the moon, shrinking back down to the size of a star."

On page 28 we see a drawing of a star drawn by witnesses that appears as a pyramid shape with the notation "Appeared to be slightly larger than a star".

In case #778, we see that the witnesses described Venus as being 25 feet in diameter.

Hendry writes about emotional reactions of witnesses. One of the most telling is case 975 where police officers referred to stars as "never seen anything like it all our lives".

To make the following statement, "Size estimates given by the witness, and object length, as determined using trigonometry and hypso-protractor readings, make the above mentioned possibilities unlikely candidates for the objectsâ€™ misidentification," is to ignore the possibility of misidentification. Then we have the problem with using data from interviews conducted over two weeks after the event! The interview was conducted in daylight when a better event would have been to do the interview at night when one could have seen the effects of the witnesses when confronted with the night sky. Had the interview been conducted at approximately 8:30 PM (although twilight probably would have been a problem), the approximate sky pattern would have been visible for the witnesses (with the exception for the planets and the moon being out of position).

The star Sirius (the brightest star in the nighttime sky) is an excellent candidate for this event. Did any of the witnesses report any bright stars in the area of the observation? There lack of mentioning such a bright star in their sketches indicates they were more than likely seeing a very bright star. The fact the moon was incorrectly identified in the sketches indicate we are dealing with no exact observations that can clearly rule out a celestial object. I also found the selection process for the potential candidates for celestial IFOs poor. Mars is too far to the north to even be a likely candidate.

Lastly, the age of the witnesses comes into question. How old were they? It almost sounds like they are early teens or pre-teens. While such witnesses should not be eliminated based on their age, this must be taken into account in obtaining really hard data. Why weren't the parents alerted to this unusual phenomena? What is more imagination than fact?

While I applaud some of the efforts of the investigator, it seems he took great pains to reinforce this is "unidentified" than solve the case. A more rapid response on his part and a recreation of the scene with the night sky could have confirmed the star Sirius.

Todd should be commended for carrying out a highly energetic investigation, even if we may disagree on the interpretation of its outcome. Certainly he has put a lot more meritorious effort into this case than do most UFO investigators. He has checked aircraft flight records, weather data, astronomy, FAA, satellite decays, gone onsite to interview the witnesses and their friends and family, made angular size, azimuth and elevation estimates with the witnesses -- how many other investigators can say they do the same?

We can consider this an excellent training exercise. And so we can critique the effort and draw some lessons.

Tim is quite right about angular size. The report of angular size 7-10 times that of a star is meaningless as a star is essentially a point source. The other data suggesting a size larger than the full moon cannot be relied upon coming as it does from 6th and 8th grade school children. They would need to be calibrated against lights in the sky of known or determinable angular size.

There is a question about the date. April 26 is given but no day of the week which would help reinforce the witness recall. The astronomical data is computed for the wrong date: If the sighting occurred at 9:30 PM (EDT) on April 26 that converts to 0130 hours UTC on April 27 (NOT 26), unless of course the sighting date is the one that is in error.

There are several problems with the azimuths: Azimuths were reported as about 210 to 235 degs Magnetic, with no explanation for the 25-degree spread, which presumably is due either to witness disagreement or two differing positions in the two successive appearances of the object. However, the map draws the two lines with about a 12-degree spread, from about 193 to 205 degs True. The magnetic declination for that location is only -7.05 degs, which is the correction applied to Magnetic azimuth to get True, hence the azimuths on the map would be about 200 to 212 degs Magnetic, which is still considerably different from 210-235 Magnetic.

There is no DURATION reported nor any interval between the two sightings. It seems short in duration and the intervening interval brief. Timed reenactments could give fair estimates and would be better than just asking witnesses to estimate off the top of the head (really just guesswork).

I have to agree with Tim that the position of Sirius, at 232 degs azimuth (about SW) and 13 degs elevation above the horizon, is the most likely candidate for IFO explanation. One witness drew in the sighting among a field of at least 5 "stars" labeled as such, and it's likely that the other lights interpreted as "aircraft" and "helicopter" are also stars surrounding Sirius. There is no reliable quantitative info about behavior or appearance

that would distinguish these additional objects from stars. Disappearance is likely due to hazy cloud cover which can come in without being noticed.

The investigative report has been posted online in regards to the sighting report that appeared in Filer's Files #17 below.

It can be accessed at <http://members.home.net/tlemire/macomb.html> >>

Todd and list, Sorry I did not get a chance to really respond on this one since I have been away. However, there are some things I find wrong with this report. For instance we read:

"Both witnesses agree on all basic aspects of this sighting such as size (7-10 times larger than a star), shape (diamond), color (white/yellow-white), sky location (approx. 5 degrees above the horizon as measured on site using a hypso-protractor) and an azimuth of approx. 210 to 235 degrees from magnetic north."

What is the approximate diameter of a "star" for comparison? A star is a point source and really has no angular size. However, if we make a star around 10-20 seconds of arc, 7-10 times is less than the size of the moon.

It has been my astronomical experience that people do not have a good feel for angular sizes. They will also often confuse size and brilliance. So what magnitude was the star used for comparison?

Reading Allan Hendry's book, we discover numerous people describe stars in this similar manner. According to Hendry, the following was reported about shapes of stars.

Included among these shapes are: discs and discs with domes ("like two plates put together" - case 322; "Elongated, big as a distant plane" - case 377; "dome on top and bottom" - for one and half hours in case 332), domes, "a plate with a hole in the center," vertically oriented small triangles, ovals, a football...even "teacups," "Mexican Sombreros," and bananas as large as the moon, shrinking back down to the size of a star."

On page 28 we see a drawing of a star drawn by witnesses that appears as a pyramid shape with the notation "Appeared to be slightly larger than a star".

In case #778, we see that the witnesses described Venus as being 25 feet in diameter.

Hendry writes about emotional reactions of witnesses. One of the most telling is case 975 where police officers referred to stars as "never seen anything like it all our lives".

To make the following statement, "Size estimates given by the witness, and object length, as determined using trigonometry and hypso-protractor

readings, make the above mentioned possibilities unlikely candidates for the objects' misidentification," is to ignore the possibility of misidentification. Then we have the problem with using data from interviews conducted over two weeks after the event! The interview was conducted in daylight when a better event would have been to do the interview at night when one could have seen the effects of the witnesses when confronted with the night sky. Had the interview been conducted at approximately 8:30 PM (although twilight probably would have been a problem), the approximate sky pattern would have been visible for the witnesses (with the exception for the planets and the moon being out of position).

The star Sirius (the brightest star in the nighttime sky) is an excellent candidate for this event. Did any of the witnesses report any bright stars in the area of the observation? Their lack of mentioning such a bright star in their sketches indicates they were more than likely seeing a very bright star. The fact the moon was incorrectly identified in the sketches indicate we are dealing with no exact observations that can clearly rule out a celestial object. I also found the selection process for the potential candidates for celestial IFOs poor. Mars is too far to the north to even be a likely candidate.

Lastly, the age of the witnesses comes into question. How old were they? It almost sounds like they are early teens or pre-teens. While such witnesses should not be eliminated based on their age, this must be taken into account in obtaining really hard data. Why weren't the parents alerted to this

unusual phenomena? What is more imagination than fact?

While I applaud some of the efforts of the investigator, it seems he took great pains to reinforce this is "unidentified" than solve the case. A more rapid response on his part and a recreation of the scene with the night sky could have confirmed the star Sirius.

>Arnold's Great Western Co.

Brad,

Thanks. Arnold's notes are truncated in the published copy and I wondered if a copy which wasn't cropped might be available. Do we know where the original is now?

>The reason for this dating is that the 1800 mph figure on the  
>drawing dates from June 24/25 when he told the Chicago Tribune  
>his 1800 mph estimate...

That would make sense however, where is 1800 mph noted on this sketch? At the bottom, it looks like Arnold has drawn an arrow, then "1200".

>The last drawing you're asking about I think was published in  
>the Idaho Statesman on June 28, 1947, but I'll have to check my  
>files to be sure.

If that's not too much trouble, please. Can anyone decipher the notes therein? Was this sketch actually drawn by Arnold; if not, what was it based on?

For comparison, I've compiled a summary image showing Arnold's various drawings and this has been uploaded to:

[http://www.ufoworld.co.uk/arnold/arn\\_comp.jpg](http://www.ufoworld.co.uk/arnold/arn_comp.jpg)

To reiterate, at present it's believed these sketches are, in date order from left to right:

1. June 24/25, 1947. Possibly the drawing Arnold made and showed to Al Baxter at Yakima airport.
2. June 28, 1947. Published by the 'Idaho Statesman'.
3. Arnold's sketch which accompanied his 'official' report to the Air Force.
4. The artist's sketch which featured in Arnold's book.
5. An unverified sketch, apparently drawn by Arnold. Presently under investigation.

Does anyone know the exact date of Arnold's 'official' report and when the sketch and/or photograph which accompanied his book were first published?

James Easton.

I agree with your statements concerning the lack of a comparative value in which to base the witnesses luminosity estimations but what else do we have to work with at this point? Both witnesses couldn't come up with a comparative brightness during the interview, and I didn't want to go too far in "suggesting" possible comparative explanations, other than the basic "headlight", "full moon", "star", etc.

Again, I see the point you're making in the time lapse between the event and the interview. Also, I agree with you that another visit to the site should be made at the same approximate time the sighting occurred. There are many personal and other time factors involved as to why a second visit hasn't been made to the site. Mainly the fact I have a family, and am working 7 days a week.

The star Sirius was included as one of several possible explanations of this event. There were stars described by one witness but no reference to the brightness of these stars was expressed by this witness. The selection process was purposefully an inclusive one. My inclusion of that planet would possibly account for actual azimuth bearings during the sighting rather than relying on "witness recall estimations" provided later. The elevation would've been correct for the 5 degree measurement taken on site. Although it may be a poor potential candidate it must be included as a possibility.

The witness ages were 12 and 13 years old. Yes the mother was alerted after the sighting took place but did not view the object. The tape transcripts, which I didn't include within my website, show a definite influence on the children and predisposition towards the UFO phenomena by the mother. In my opinion there was a strong "lack of interest" displayed by the witnesses rather than strong imagination evident in this sighting.

I have to disagree with you on this point as the Sighting Evaluation is determined to be Borderline IFO, with my opinion that the object was some type of aircraft light, rather than a mistaken star with the size estimations being the decisive point in my determination. Where do you see the emphasis on the object being "unidentified"? Again, I state scheduling conflicts often prevent me from conducting my investigations when I desire to rather than when I have to. Another point to make is that often times, such as the case here, there was a delay in obtaining witness contact information, while a level of trust had to be developed between myself and the 2 witnesses as well as their mother before this information was made available to me. This point is further stressed especially when it involves children and the fact that a total stranger requests a visit to their residence.

Thanks for your feedback Tim and you've made some good points. I

have learned from them.

Sincerely,

Todd Lemire

Michigan UFO CENTRAL

<http://members.home.net/tlemire/UFOCENTRAL.html>

P.S. I've posted the correct celestial information on my website as pointed out by Brad.

Could you expand on this a bit Brad. What would be some other useful comparative objects if the interview is done during the daytime? Also, I need mention here that size "arm length" size comparison charts were shown to both witnesses, which were in turn used for size estimate calculations. These do not appear on my website but were included in the report I turned in to MUFON.

Could you explain the pertinence of the "day of the week" statement as reinforcing witness recall? The sighting occurred on a Wednesday April 26, 2000. Are you referring to what the witnesses were doing previous to the sighting event and after? I don't quite understand. Or are you referring to size estimation? You're quite correct about the astronomical data.

I've posted the correct data on my website for April 27, 2000 UTC time. Thanks for bringing this to my attention.

The 25 degree spread is due to two different viewing locations and the subsequent disappearance and reappearance of the object in a different position. I must admit that the mapping software used to draw these lines of sight is lacking, along with my plotting abilities. Any suggestions on the correct process of hand "redrawing" these lines of sight on the map would be greatly appreciated, rather than relying on software which provides no exact angular drawing capabilities.

No argument here, I should've gone through a complete re-enactment. Lesson learned... :)

No arguments from me on the above point. Both the aircraft light and the Sirius explanations both fit.

Sincerely,  
Todd Lemire

Status: Mime-Version: 1.0

Bruce,

Yes, here Arnold is actually comparing the first flash to an explosive flash in terms of its brightness and shock effect on him. Very un-bird-like, unless we hypothesize explosive methane outbursts -- but even so the bird "exhaust" explosions would be aimed rearward and not in Arnold's direction until the end of the sighting (<facetious grin>).

Bruce,

What James is trying to do is find one drawing of Arnold's that is most bird-like and then push it as "the" definitive depiction -- despite the fact there is an array of Arnold drawings covering a spectrum of shapes from a fat shield-like disk to a very slender bat-like crescent (which James likes).

Could you expand on this a bit Brad. What would be some other useful comparative objects if the interview is done during the daytime? Also, I need mention here that size "arm length" size comparison charts were shown to both witnesses, which were in turn used for size estimate calculations. These do not appear on my website but were included in the report I turned in to MUFON.

COMMENTS: Daylight comparisons of a nighttime sighting are very difficult for people to mentally transfer accurately. Paper comparisons of something seen in the sky are also difficult and usually tend to greatly overestimate angular sizes. The best comparison is to take the witnesses outside at night and look around for comparison

lights such as distant street lights, aircraft, stars, planets, etc., and have them compare angular size and brightness with what they remember. It's best to try to match brightnesses. BTW, it's possible that if they were shown Sirius low in the sky they might realize that's what they saw. But it's also possible to get a FALSE NEGATIVE, where they deny that Sirius looks like what they saw even if it in fact was Sirius (because cloud cover conditions change its appearance, it's not in the right direction at the right elevation angle, etc., from the night of the sighting). I had a Venus sighting when I was young, in which I recorded azimuth, ele!

!

vation, time, etc., and it looked like a moving triangle of light because of the motion of the thin haze when I observed through a telescope (but through plate glass which distorted the shape). Not until I calculated Venus' position did I discover what it was -- I thought the object's azimuth changed by about 7 degrees during the sighting but it was actually my measurement error and the azimuths exactly straddled Venus's position right in the middle of the range. The angular size was enlarged by the plate glass distortion, plus it's very difficult to estimate angular sizes of small objects or effective point-sources and these always tend to get overestimated. This is the nitty-gritty reality of measurement error and observational error in the field. This is why higher Strangeness is required otherwise a "UFO" label is made to hinge on one detail that could be in serious error.

- > There is a question about the date. April 26 is given but no day of the week
- > which would help reinforce the witness recall. The astronomical data is
- > computed for the wrong date: If the sighting occurred at 9:30 PM (EDT) on
- > April 26 that converts to 0130 hours UTC on April 27 (NOT 26), unless of
- > course the sighting date is the one that is in error.

Could you explain the pertinence of the "day of the week" statement as reinforcing witness recall?

COMMENTS: When a witness is recollecting something that occurred days earlier the normal anecdotal response is to say "It happened the night before last" or "It happened Wednesday night." I didn't see this in your report -- we found out the day of the week you did this or that investigative check, which is really irrelevant. A numeral date such as April "26" is subject to more witness error (do you know the number date every day of the week all the time? I don't always, and have to look it up) and to typos

The sighting occurred on a Wednesday April 26, 2000. Are you referring to what the witnesses were doing previous to the sighting event and after? I don't quite understand. Or are you referring to size estimation? You're quite correct about the astronomical data. I've posted the correct data on my website for April 27, 2000 UTC time. Thanks for bringing this to my attention.

- > True. The magnetic declination for that location is only -7.05 degs, which
- > is the correction applied to Magnetic azimuth to get True, hence the azimuths
- > on the map would be about 200 to 212 degs Magnetic, which is still
- > considerably different from 210-235 Magnetic.

The 25 degree spread is due to two different viewing locations and the subsequent disappearance and reappearance of the object in a different position. I must admit that the mapping software used to draw these lines of sight is lacking, along with my plotting abilities. Any suggestions on the correct process of hand "redrawing" these lines of sight on the map would be greatly appreciated, rather than relying on software which provides no exact angular drawing capabilities.

COMMENTS: How did you determine the 210 and 235-deg Magnetic bearings? Did you use a magnetic compass? Which one is which? Was the 210 angle the first or the second appearance? The 25-degree degree difference would seem to suggest large movement of the light, incompatible with a star, but more compatible with an aircraft. However, this depends on the accuracy of witness estimation of the object's location and in identifying it as the same object each time (could have been a different light), all of which is in some doubt. Note my remarks above on difficulties in estimating azimuth, even by a knowledgeable observer. Estimating elevation angles above the horizon is also quite difficult to get accurately.

- > There is no DURATION reported nor any interval between the two sightings. It

No arguments from me on the above point. Both the aircraft light and the Sirius explanations both fit.

>Arnold's Great Western Co.

Brad,

Thanks. Arnold's notes are truncated in the published copy and I wondered if a copy which wasn't cropped might be available. Do we know where the original is now?

COMMENTS: Original is at CUFOS. I will try to get a scanned JPG to you.

>The reason for this dating is that the 1800 mph figure on the  
>drawing dates from June 24/25 when he told the Chicago Tribune  
>his 1800 mph estimate...

That would make sense however, where is 1800 mph noted on this sketch? At the bottom, it looks like Arnold has drawn an arrow, then "1200".

COMMENTS: Even the IUR cover clearly shows 1800 with an arrow --> pointing to 1200. These were the figures Arnold gave the Chicago Tribune -- he calculated 1800

mph but arbitrarily reduced it to 1200 mph to allow for error (or maybe bad PR if the velocity was excessive).

>The last drawing you're asking about I think was published in  
>the Idaho Statesman on June 28, 1947, but I'll have to check my  
>files to be sure.

If that's not too much trouble, please. Can anyone decipher the notes therein? Was this sketch actually drawn by Arnold; if not, what was it based on?

COMMENTS: I think this is a drawing made by Arnold for Capt Emil J. Smith's sighting of July 4, 1947. The somewhat similar drawing I was thinking of is in the Boise Idaho Statesman for June 28, 1947.

For comparison, I've compiled a summary image showing Arnold's various drawings and this has been uploaded to:

[http://www.ufoworld.co.uk/arnold/arn\\_comp.jpg](http://www.ufoworld.co.uk/arnold/arn_comp.jpg)

To reiterate, at present it's believed these sketches are, in date order from left to right:

1. June 24/25, 1947. Possibly the drawing Arnold made and showed to Al Baxter at Yakima airport.

COMMENT: Partially published in IUR, with artist's touchups.

2. June 28, 1947. Published by the 'Idaho Statesman'.

COMMENT: See above. Incorrect. This did not appear in the Statesman so far as I know. This is of Capt E J Smith's objects.

3. Arnold's sketch which accompanied his 'official' report to the Air Force.

4. The artist's sketch which featured in Arnold's book.

5. An unverified sketch, apparently drawn by Arnold. Presently under investigation.

Does anyone know the exact date of Arnold's 'official' report and when the sketch and/or photograph which accompanied his book were first published?

COMMENTS: Best I can narrow down the date of Arnold's letter and drawings to the Army Air Forces (the USAF did not exist till Sept 18, 1947) is circa July 8-10, 1947. He sent a telegram mentioning the letter but the telegram is frustratingly undated as well.

The photo in his book was apparently based on a model made in 1947 or 1948. I can't document it. One of the clips you reprint from July 23, 1977, mentions Arnold's wife's necklace based on it.

Brad

James,

Your July Voyager Newsletter incorrectly states "Brad has expressed his conviction that Arnold's sighting remains a highly credible UFO case." I do not and have not for years. I think it's an IFO. And I do not believe in ETH. I have documented the existence of highly credible UFO cases, such as the RB-47 incident, recently endorsed in the COMETA report.

There is a degree of variance in Arnold's descriptions of his objects over the years. This might well be a normal perceptual and memory effect common to eyewitnesses of brief and unexpected events of unusual nature. The crescent shape and bat shape were mentioned by Arnold in 1947 and were reflected in the model/drawing that was done then. But before and afterward Arnold described and drew somewhat different shapes. In 1977 he called the objects "tadpole" shaped as well as "wraith" like.

Brad

Bruce,

Absolutely, yet this is distinctly different from his other claims.

>>Arnold didn't observe disk-shaped UFOs. Indeed, on at least two  
>>occasions he publicly acknowledged the flying saucer mythology:

>I know, I know. But he did observe semicircular craft with a

>CONVEX REAR

As above.

If Arnold recognised the bird-like profile as representing his observation, specifically highlights this by way of a photograph in his book and latterly confirms these were assuredly crescent-shaped objects, then we can only accept Arnold's confirmation.

>>In his book, Arnold relates how after the incident he stopped  
>>off at Yakima, on route to Pendleton, and it was there he told  
>>Al Baxter and fellow pilots about his sighting. Arnold further  
>>explains how after took off again, "I remembered that I had  
>>forgotten to mention the fact that one of these craft looked  
>>different from the rest, was darker and of a slightly different  
>>shape".

>ONE of them had a different shape.

Arnold never explains exactly how the shape was different. Again, this can't be significant to the crescent-shape described, as he says that's how all the objects looked.

>So now you think that 8 were double crescent shaped and one was  
>convex at the rear?

We really had to ask Arnold what exactly he was thinking.

>>It looks like Arnold isn't sure himself about any differences  
>>and there's nothing here which impacts on his initial reported  
>>statements that the objects resembled 'crescent-shaped planes'  
>>and were 'bat-like'.

>What? Seems to me Arnold is sure. He specifically compares most  
>of them to a tadpole shape with a protrusion at the rear  
>(compare Fred Johnson's description of having something  
>sticking out the rear that swung back and forth like a "big  
>magnet". Then he singles out a >particular one that was  
>different, the second from the last.

If he "couldn't quite positively determine if they were all the same design as this one I particularly noticed", then he's obviously not sure.

>Seems to me quite straightforward that most of the objects had a  
>convex rear (perhaps somewhat like the Trent object but more  
>exaggerated than on the Trent object).

No need for speculation, Arnold reportedly tells us, "the mysterious craft were shaped like crescents and appeared smooth

except for glass-like circles on top", which, as noted, is presumably why his wife's necklace was, "a miniature of the crescent-shaped saucer".

>>In short, we have considerable evidence why the artist's sketch  
>>accompanying Arnold's book is based on Arnold's sincere  
>>recollection of how these objects looked 'most of the time'  
>>(maybe during the gliding phase). In that 1977 interview, he  
>>confirms my conclusion and puts an end to any argument.

>I don't buy this at all. I would claim that we have plenty of  
>evidence that all but one object at [had?] a convex rear.

>Anyone else care to comment?

Kenneth Arnold seems to already have provided the definitive explanation.

Unless, of course, you think his testimony is unreliable.

How to reconcile this with the 'official' drawing he produced for the Air Force. I certainly can't and am only grateful I'm not trying to sustain this as a pivotal case for the premise that ET was here.

Just another fundamental anomaly to add to the list of those which have been identified and/or highlighted.

James Easton.

Several months ago I asked how big the objects would be in terms of pieces of tape or similar markers placed on the windshield of Arnold's plane...for comparison purposes, you could do it in your own car. I believe that Brad or Dr Maccabee stated that a rough equivalent would be something about 1/16th of an inch long at a distance of three feet...and the whole span of the nine objects would be something like 5 inches... the objects were just above the limit of resolution, so the whole controversy over these shape details seems moot, IMO...

The correct way to visualize the "objects" would be as tiny, scintillating glints of light, not birds, aircraft or anything comparable to an "object"...

I have to disagree with you on this point as the Sighting Evaluation is determined to be Borderline IFO, with my opinion that the object was some type of aircraft light, rather than a mistaken star with the size estimations being the decisive point in my determination. >>>

This is where we fundamentally disagree on the case. I feel that the size estimates are often a confusing point. Hendry showed that witnesses will make incorrect size estimates and 7-10X the size of a point source is probably not that large. Of course the size of an airplane light is not much larger than a point source from a distance. The fact the witnesses are 12 and 13 and were making sketches two weeks later also makes me wonder about their ability to accurately estimate size. If this is what you are using to make a decisive determination, I think you are putting too much weight upon it.

Date: Fri, 14 Jul 2000 11:33:45 EDT  
Subject: Re: New Kenneth Arnold Sketch?Status:

Joel,

It's much worse. The BEST or maximum angular size at the CLOSEST distance works out to LESS than 1/32 of an inch on a car windshield at three feet from the eye (2.6 arcminutes or 0.75 milliradian or 0.04 degree). In other words, during most of the sighting the objects were even smaller still. And the nine objects would have been spread over 8 inches on the windshield.

Because of difficulty establishing the initial sighting direction it is reasonable to estimate symmetry in appearance with disappearance, which would make the distances at those points about twice the closest distance, and the angular sizes therefore ONE HALF, or less than 1/64 inch on your windshield. And that is the WIDEST or horizontal dimension of the objects, which were 11 to 20 times THINNER still in vertical dimension (assuming Arnold could really even see such a thing which I doubt).

Tiny scintillating glints of light would be exactly correct. I agree that arguments over shape are moot if the objects were equivalent of less than 1/32 to 1/64 inch on a car windshield at three feet.

Brad

PS: The situation is much worse than even this because of the high angular velocity of the objects, about 2 degs/sec at closest approach, which would mean the objects moved horizontally about 3 times their width/length in the "flicker interval" of the eye, say it's 1/16 second (like typical movie cameras filming at 16 frames per second). I contend that this is absolutely impossible to see. Only by flashing enough light could any such tiny high speed objects be seen (if enough light registers on the retina it will be seen, it doesn't matter how fast or how small the object is, but it will be blurred and halated of course, no shape visible).

In a message dated 7/13/00 7:07:36 PM, ufx@mindspring.com writes:

<<

Several months ago I asked how big the objects would be in terms of pieces of tape or similar markers placed on the windshield of Arnold's plane...for comparison purposes, you could do it in your own car. I believe that Brad or Dr Maccabee stated that a rough equivalent would be something about 1/16th of an inch long at a distance of three feet...and the whole span of the nine

objects would be something like 5 inches... the objects were just above the limit of resolution, so the whole controversy over these shape details seems moot, IMO...

The correct way to visualize the "objects" would be as tiny, scintillating glints of light, not birds, aircraft or anything comparable to an "object"...

@

@

@ @

@ Some of you may have seen on the ListBot site that there would be  
@ a lengthy power-off disruption over the weekend.

@

@ Although their status report indicates no known mail delays,  
@ there are messages in the archive that haven't yet been  
@ distributed.

@

@ Not even sure if messages sent during the downtime would be  
@ retained by ListBot, I sent a further query re the Arnold sketch  
@ and although that has been distributed, the original still  
@ hasn't.

@

@ Doubtless, it will sort itself out as always.

@

@

@ In the meantime, a couple of items which might be of interest.

@

@

Invent shiny pelicans that can fly nonaerodynamically (so the reflections from the sun can actually rebound at the correct angle to strike Arnold's airplane).

We must realize that a flat disk or crescent would have to tilt at an impossible angle to reflect sunlight to Arnold's plane. That is, unless it had a flat paneled "canopy" like a B-29 had.

Take a look at the attached aircraft photos, and compare them to the Arnold sketches.

Due to the limitations of ListBot, I will send more posts with the other photos that won't fit here.

I could easily resolve 1 mm at 1 m. Twenty years ago!!!

And these figures are based on Arnold's own assumed sizes and  
range-to-object, is that correct?

What are the implications? Does it mean that they had to be  
closer/larger/slower than he assumed? Or just that the shape details must be  
his interpolations?

By way of an overall response to some recent comments -

The simple question is; can it be evidenced that White Pelicans could be highly reflective. The answer is an unequivocal affirmative and, as there should be, we can locate reasons why our gregarious birds are particularly likely to exhibit this characteristic:

1. Firstly, these are not seagulls. They are the largest birds in North America, amongst the biggest in the world and have a relatively \_massive\_, predominately white, wing-span -

"One of the world's largest birds, the White Pelican weighs 5-8kg and has a wingspan up to 3m [10ft]".

Source:

<http://www.gov.ab.ca/env/fw/threatsp/pelican/des.html>

This equates to a large surface area of approximately 3m x 1m, or greater.

2. Their specularity is known to ornithologists (although, apparently not 'ufologists') and references include:

a) "When flying, they seem to 'sparkle' as the light plays off of their white and black feathers".

Source:

[http://dqh.arc.nasa.gov/info\\_services/econotes/Issue\\_03.shtml](http://dqh.arc.nasa.gov/info_services/econotes/Issue_03.shtml)  
[Unfortunately, it seems this is no longer on-line.]

b) "...a companion and I, sight-seeing among the bubbling mud geysers on the eastern side of the [Salton] sea, observed a hundred white birds manoeuvring majestically in the sky.

Then they soared into the blue until only the sun, glinting on white feathers, flashed their location".

Source: 'Pelican Profiles', National Geographical, November 1943.

A significant point, also from the above article, notes:

"As they alighted on the water, their identity became apparent. White Pelicans, sublime in flight, seemed ridiculous on foot. Glossy-white wings, stretching eight to almost ten feet, were tipped with black".

A cursory glance at my word processor's dictionary, reaffirms that "Glossy", means, "surface shine, lustre, shiny finish, polish, shine, sheen".

Bruce challenged: "INVENT SHINY PELICANS".

No need to imagine them; it's evident they already existed in 1943.

Why is their plumage glossy? Perhaps because "pelicans anoint themselves with oil that they squeeze from a gland in the skin at the base of their tail".

Source: 'The Life of Birds', by Sir David Attenborough, [page 53].

Also possibly a factor:

"The surface structure of the feathers may affect a bird's appearance in other ways. In certain birds, including pelicans, terns and petrels, some black pigmented feathers in the wings may in fact have a silvery appearance. The silver gleam is caused by light reflected from very long, fine, non-pigmented fibres in the feathers".

Source: 'Collins Encyclopaedia of Animals', [p 438].

It should now be clear why ornithologist Michael Price first suggested:

"There's another possible candidate species in the area at that time of year (sporadically) whose color, size, flight profile and proclivity for formation flight at sometimes quite high altitude would even more produce *\*every\** detail of the phenomenon which Arnold observed: a flock of non- or failed-breeder southbound White Pelicans. They'd have been large enough to visible for a good distance, they fly in formation, and if the light were reflecting just right off a large nearby glaciated peak, their comparatively vast white underwing area would reflect a *\*ton\** of light in exactly the pattern described by Arnold".

The emphasised specularity is duly noted.

Considering Arnold's report of an initial 'bright flash of light' in this context and taking into account he confirmed how

'perfect' the conditions were - "The sky and air was as clear as crystal" - any objective assessment must surely conclude there is a possibility that these reflections could \_conceivably\_ have come from a formation of uniquely large and reflective White Pelicans.

Brad accepts that the peak Arnold relied on as a distance marker was 'Little Tahoma' and although Brad has yet to provide any rationalisation which isn't blatantly refuted by Arnold's own statements, it's still a surprise to see this attributed 'explosion' quote being championed. Not only is it unverified as verbatim, or in fact genuine, I did explain it originates from a German video production and some caution about a translation from any original might be advisable.

Still, perhaps there have been so many anomalies exposed in this absolutely pivotal UFO case - the foundation of 'ufology' - and realising the factual evidence which correlates key aspects of Arnold's account with a formation of nine White Pelicans (in addition to the contemporary, nearby, aircrew's sighting of 'nine weaving discs', which turned out to be Pelicans), then any proverbial straws are understandably a blessed relief to be grasped.

As previously emphasised, after the initial flashes of light, Arnold's stated rationale was how he might be observing a formation of geese and the press reported he \_later\_ dismissed this on the grounds that geese wouldn't be flying so high, or travelling southwards. Any assertions about the objects' reflective capability are directly proportional to the question of how Arnold couldn't comprehend how ridiculous it was that these might be a formation of birds.

As I have highlighted before, it's known how spectacularly reflective White Pelicans can be from a considerable distance, even 'out of sight'. The National Geographic article recalls they 'flashed their location', which is comparative to Arnold's comments, from the early radio interview:

"I could see them against the snow, of course, on Mt. Rainier and against the snow on Mt. Adams as they were flashing".

"They seemed to flip and flash in the sun, just like a mirror"

"I could see them only plainly when they seemed to tip their wing, or whatever it was, and the sun flashed on them".

Infinitely more significant from that enigmatic German video

segment is the purported Arnold sketch. Brad is, regrettably, mistaken to suggest, if not accuse: "What James is trying to do is find one drawing of Arnold's that is most bird-like and then push it as "the" definitive depiction -- despite the fact there is an array of Arnold drawings covering a spectrum of shapes from a fat shield-like disk to a very slender bat-like crescent (which James likes)".

In truth, as evidenced by my recent queries on the UpDates list and even [ugh...] Usenet, I have merely been trying to locate the source of this video sketch. I also explained to those who may be interested, how Arnold's various depictions are confusing, yet that earliest of drawings - as featured on the IUR cover - shows one profile which I highlighted was consistent with his 'official' report to the Air Force. In doing so, I have simply commented how it's difficult to make sense of this evidence and we can only note how Arnold subsequently confirmed the 'crescent-shaped/bat or bird-like' profile was accurate.

Arnold's explosive geese are irrelevant if that sketch proves to be his.

If so, on the left it's identical to the renowned 'squat' profile of a gliding Pelican, On the right, he portrays a shape which is so obviously similar to a bird's [an alien spacecraft? I don't think so...]. For fun, I could easily match this to a White Pelican in no time - see the example on my web site [the comparative Pelican image is directly copied from a photograph - notice how both left and right wing tips match exactly!].

Bruce states, "I am glad I'm not trying to prove it was pelicans!!!!".

I would have thought of immeasurably more concern was papering over the chasms which support the premise of 'flying saucers'. I seem to recall you have written one or two books about their 'reality'.

I have long been aware of the intrinsic problems with Arnold's claims, as noted by Joel and Brad. Aside from all this, Brad staggeringly proclaims Arnold's sighting was of Identified Flying Objects.

Brad, can we clarify, identified as what?

James Easton.

Subject: Re: New Kenneth Arnold Sketch?Status:

Hi Brian,

In Arnold's case, the sun was almost directly behind him, not at right angles to the objects as with your pelican. If pelicans can give specular (mirror) reflections, which I doubt, they would have to dive down or climb vertically to present a flat wing surface to Arnold -- this would ruin their linear 170-deg flight pattern to say the least.

Given the millions of pelicans out there surely someone would have movies or video of pelicans producing bright flashes like off a mirror. Why aren't there any known? Why isn't this alleged phenomenon known? It ought to be the subject of popular fascination -- birds like mirrors.

Brad

>>

>> 1. Is there a mechanism that allows the flashes to be reflected back

>> at Arnold's plane?

I was recently on vacation in Florida and was driving over a bridge to the keys. The bridge ran north/south, and I was travelling due north.

The morning sun, about 20 degrees above the horizon, was to my right at almost a right angle to my car. Suddenly, to my left, and similarly at a right angle to my line of vision, I saw a bright flash, almost like a flash gun or the reflection off a mirror. As I looked, I saw a pelican wheeling away from me, about 150 yards away over the water.

Many bird feathers have a semi-transparent aspect to them. Given the roughly cylindrical shape of most feather elements, is it possible for them to have some kind of prismatic lensing effect (a kind of natural fresnel lens) under the circumstances I have mentioned? Perhaps certain combinations of incident light angle and angle of reflection could produce a mirror-like sparkle.

Unfortunately, my own observation was too brief to draw any conclusions, but for whatever it's worth, I offer it here.

Brian

>a B-29 had.

It is interesting to note that Fred Johnson, prospecting  
in the Cascade Range near Mt. Adams (at about 5000 ft  
altitude) reported seeing these things that Arnold saw.  
They flew about 1000 ft above  
his altitude as he looked at them through a telescope.  
(He reported that his compass waved back and forth as the objects  
passed by). Johnson reported tha he last saw the objects  
standing on edge as they banked into a cloud.

This is quite an amount of tilt probably consistent  
with the needed tilt to reflect light toward Arnold.

Are you certain the flash came from the bird, or did the flash merely  
attract  
your attention to the bird? Was there a boat with a windshield off in the  
distance?

If it was a wet pelican I can imagine it might produce a brief flash as  
water poured off it.

(Reflection from the water surface). A coating of water can give  
anything a glint.

How far away was it? Obviously not so far that you couldn't  
recognize it.

(I am assuming that one of Arnold's objects didn't happen to  
be passing by and caused the reflection..... and that no hot-shot  
jet jockey flew over your nose).

Larry wrote:

>2. At what distance do the angular sizes of pelicans and Arnold's  
observations coincide? Work this out and we could learn something.  
<

The angular size of the objects Arnold compared with the spacing between  
the outer engines  
of a DC-4 at a distance he estimated at 15 miles. Depending upon the  
actual  
angle of observation (was the plane northwest of Arnold?) the projected  
spacing  
of the engines could be about 60 ft. This corresponds to an angle of  
about  
0.76 radians (3/4 of a milliradian or 3/4 of a mm at 1 meter).  
If he verestimated the distance, then the angular size would be larger. For  
example  
at 10 miles the angular size would have been about 9/8 of a milliradian or  
slightly  
more than 1 mm at a meter.

If we use the LENGTH of a pelican (not the wingspan, since Arnold couldn't  
have  
seen the full wingspan unless the pelicans stretch their wings and tilted  
90 degrees from the ordinary horizontal orientation ) we have about 1 meter  
I guess, which would be at a distance of  $1\text{m}/(1\text{ mr})$  or 1 km about. or about  
0,6 miles. (Arnold would be about 40 seconds of flying time away from the  
pelicans)

MY RESPONSE: SO WHAT!!!

Arnold could only see the full effect of their size if he flew directly  
above or  
directly below them. However, according to your own scenario they would  
have  
been at nearly the same height as Arnold. Hence, unless they tilted so  
their wingspan  
was vertical, he would only see a projected view of them when they had  
their  
wings fully stretched. Previously I have estimated that the depression  
angle  
could have been as large as 2 degrees (placing DISTANT objects, 20 miles  
away, at the about altitude of the higher peaks south of Mt. Rainier). A  
3 m wingspan  
viewed at a slant angle of 2 degrees appears to be only  $3 \sin 2 = 0.1$  m.  
If the objects  
were at Arnold's height then the projected area would be zero.  
How much would a bird tilt while flying a nominally straight line?

When the wings flap up and down, how far to they go?  
These are questions that must be answered before we can estimate the apparent

size (angular size) of the bird as seen by Arnold. But to suggest that the area would be 3 m by 1 m is taking the maximum possible when the birds are flying "on edge."

>2. Their specularity is known to ornithologists (although, >apparently not 'ufologists') and references include:

Reflectivity would be a better term. A specular reflector, by definition, has at most a tiny diffuse component. A specular reflector has an optically smooth or continuous surface (which could be a curved surface). That means from moving from one portion of the surface to another at a distance of a wavelength of light from the first you change in surface "height" by no more than, say, 1/10 of the wavelength of light. When this is true you have a "mirror" surface.

No matter how you describe it, a bird's surface is not "optically smooth", being created by numerous independent curved surface reflectors, all much larger than or comparable to (in size) a wavelength of light (feathers).

>a) "When flying, they seem to 'sparkle' as the light plays off of >their white and black feathers".

So what! Glancing light from curved bird surface can give a glint.  
So what!

>b) "...a companion and I, sight-seeing among the bubbling mud >geysers on the eastern side of the [Salton] sea, observed a >hundred white birds manoeuvring majestically in the sky.

>Then they soared into the blue until only the sun, glinting on >white feathers, flashed their location".

Not surprising. Sun glint. Near alignment between the direction to the birds and the direction to the light source (sun). Grazing incidence of the light? Even black paper has a forward gloss or seen or glint. Also, were these birds several miles away as required in your scenario (draw a map) or were they only hundreds or a few thousand feet away?

>"As they alighted on the water, their identity became apparent. >White Pelicans, sublime in flight, seemed ridiculous on foot.

>Glossy-white wings, stretching eight to almost ten feet, were  
>tipped with black".

>A cursory glance at my word processor's dictionary, reaffirms  
t>hat "Glossy", means, "surface shine, lustre, shiny finish,  
>polish, shine, sheen".

Yeah, sure. Once again, under particular lighting conditions that do NOT  
apply in the Arnold case, one can see a glint from a CROW, to say nothing  
of  
a pelican.

>Bruce challenged: "INVENT SHINY PELICANS".

>No need to imagine them; it's evident they already existed in  
>1943.

>Why is their plumage glossy? Perhaps because "pelicans anoint  
>themselves with oil that they squeeze from a gland in the skin at  
t>he base of their tail".

Even if a bird took a bath in oil it wuld not be a specular reflector.  
However, I wuld concede that a bird with a wet surface could, under  
proper lighting conditions, reflect more light toward an observer than  
would a dry bird. (Consider, for example the difference in reflectivity  
of wet and dry roads.) Perhaps Arnold's "birds" has just left the bird  
bath.

>Also possibly a factor:

>"The surface structure of the feathers may affect a bird's  
>appearance in other ways. In certain birds, including pelicans,  
>terns and petrels, some black pigmented feathers in the wings may  
>in fact have a silvery appearance. The silver gleam is caused by  
>light reflected from very long, fine, non-pigmented fibres in the  
>feathers".

Yes, yes, yes.... see above. Still not like reflection in a mirror.

>It should now be clear why ornithologist Michael Price first  
>suggested:

>"There's another possible candidate species in the area at that  
>time of year (sporadically) whose color, size, flight profile and  
>proclivity for formation flight at sometimes quite high altitude  
>would even more produce \*every\* detail of the phenomenon which  
>Arnold observed: a flock of non- or failed-breeder southbound  
>White Pelicans. They'd have been large enough to visible for a  
>good distance, they fly in formation, and if the light were

>reflecting just right off a large nearby glaciated peak, their  
>comparatively vast white underwing area would reflect a \*ton\* of  
light in exactly the pattern described by Arnold".

>The emphasised specularity is duly noted.

This paragraph is loaded with conjecture by a ornilogist who exaggerates. "Every" detail? Well, first, draw a map (bet he didn't do that). Next, to imagine that the birds could reflect light from a glaciated peak and to have such a reflection be BRIGHTER THAN THE LIGHT FROM THE PEAK ITSELF... is, how shall I put it... .... naive. You can NEVER have more light reflected even from a mirror than is incident on the mirror. A mirror reflection of the sun cannot be brighter than the direct

sunlight. A reflection from a diffuse surface, even if there is a "sheen or glint"

cannot be greater than the intensity of th light hitting it. Therefore one can deduce

the following:

IF ARNOLD SAW BRILLIANT FLASHES FROM BIRDS THAT WERE REFLECTING LIGHT FROM MOUNTAIN SNOW/GLACIERS, HE SHOULD HAVE

REPORTED \*\*\*EVEN BRIGHTER\*\*\* STEADY LIGHT REFLECTED FROM THE

MOUNTAIN SNOW/GLACIERS. Did Arnold report a more or less steady light hitting his plane that was reflected from the glaciers? NO.

So, my advice is to totally forget this line of reasoning.

>Considering Arnold's report of an initial 'bright flash of light'

>in this context and taking into account he confirmed how

>'perfect' the conditions were - "The sky and air was as clear as

>crystal" - any objective assessment must surely conclude there is

>a possibility that these reflections could \_conceivably\_ have

>come from a formation of uniquely large and reflective White

>Pelicans.

The sky conditions have nothing to do with this is the birds are nearby as you require. At 20 miles the mountain glaciers would appear about 1/2 as

bright as the horizon sky. Birds reflecting ONLY light from mountain glaciers/snow

would appear less bright than the glaciers themselves.

Birds reflecting sunlight MIGHT appear abou twice as bright as the mountain glaciers if the birds were close enough TO BE RESOLVED BY THE EYE.

I have already calculated all this. To repeat what I have published before:

//////////

FROM THE ABOVE ABSTRACTS FROM MY BRIGHTNESS CALCULATIONS  
ONE FINDS:

the brightness of reflection from a nearby white pelican surface would be comparable to the brightness of the horizon sky (maybe 4 x brighter) and comparable to the brightness of the snow on Mt. Rainier ( maybe 2 x brighter) and NOWHERE NEAR AS BRIGHT AS A MIRROR REFLECTION FROM A SURFACE OF MANY SQUARE METERS EVEN IF THE MIRROR WERE 20 MILES AWAY. (Note that Arnold compared the brightness of the reflection to that of a welding arc!)

//////////

>Still, perhaps there have been so many anomalies exposed in this  
>absolutely pivotal UFO case - the foundation of 'ufology' - and  
>realising the factual evidence which correlates key aspects of  
>Arnold's account with a formation of nine White Pelicans (in  
>additional to the contemporary, nearby, aircrew's sighting of  
>'nine weaving discs', which turned out to be Pelicans), then any  
>proverbial straws are understandably a blessed relief to be  
>grasped.

There is also factual evidence which "anti correlates" with a formation of 9 pelicans. For example, DRAW A MAP.....which you REFUSE to do!

And try as you might, you can't convince me that pelicans reflect like mirrors or that anyone could compare the brightness of a pelican seen under the conditions of Arnold's sighting (sun high and behind; pelicans several miles away at about the height of the observer) with the brightness of the sun reflected in a mirror or a welding arc.

Recall Arnold's FIRST impression was NOT of geese but that an aircraft had passed very close to his aircraft, reflecting a lot of sunlight into his cabin.

Before you get "blessed relief" by grasping at straw pelicans I suggest you try  
ex-lax.

>As previously emphasised, after the initial flashes of light,  
>Arnold's stated rationale was how he might be observing a  
>formation of geese

WHOA THERE! His initial reaction after the initial flash of light was another airplane. Metal surface. Reflective. Nearby. For him, an instantaneous and logical explanation. Bright flashes from geese was not a logical explanation.

>and the press reported he \_later\_ dismissed  
t>his on the grounds that geese wouldn't be flying so high, or  
t>ravelling southwards. Any assertions about the objects'

r>eflective capability are directly proportional to the question  
>of how Arnold couldn't comprehend how ridiculous it was that  
>these might be a formation of birds.>

I'm sure he could have dismissed geese on several grounds and  
that he only pointed out a couple to the press.

Had they been geese that were not recognized initially, then he  
would have realized they were geese after several minutes of  
flying. DRAW A MAP

>As I have highlighted before, it's known how spectacularly  
>reflective White Pelicans can be from a considerable distance,  
>even 'out of sight'. The National Geographic article recalls they  
'>flashed their location', which is comparative to Arnold's  
>comments, from the early radio interview:>

Even "out of sight?" How far away is "out of sight?"  
Did anyone compare the pelican reflection with a welding arc?  
(Note: from my experiments with sunlight reflected on mirrors at a distance  
I can confirm the validity of the comparison with a welding arc)

>"I could see them against the snow, of course, on Mt. Rainier and  
>against the snow on Mt. Adams as they were flashing".

GOT THAT, JAMES? LIKE A MIRROR!

>"I could see them only plainly when they seemed to tip their  
>wing, or whatever it was, and the sun flashed on them".

<Arnold's explosive geese are irrelevant if that sketch proves to  
<be his.

<If so, on the left it's identical to the renowned 'squat' profile  
<of a gliding Pelican,

Does a gliding pelican have its wingspan vertical.....  
or horizontal?

On the right, he portrays a shape which is  
<so obviously similar to a bird's [an alien spacecraft? I don't  
think so...]. For fun, I could easily match this to a White  
<Pelican in no time - see the example on my web site [the  
<comparative Pelican image is directly copied from a photograph  
<- notice how both left and right wing tips match exactly!].<

<

<Bruce states, "I am glad I'm not trying to prove it was  
<pelicans!!!!".<

<I would have thought of immeasurably more concern was papering  
<over the chasms which support the premise of 'flying saucers'. I  
<seem to recall you have written one or two books about their  
<'reality'.<

A known phenomenon, in this case pelicans, has to obey known laws of physics.... or, another way to put it is that it has known characteristics.

WE don't know what "unknown flying objects:" may be capable of, but we do know what pelicans are capable of. I am glad I am not trying to argue that there are pelicans capable of flying considerably faster than 50 miles

an hour (DAM)\* or that can cause extremely bright sunlight reflections at distances  
of several miles (under the optical conditions of Arnold's flight)

\*DAM = Draw A Map

Subject: Arnold & Angular SizeMime-Version: 1.0  
Status:

Since Arnold directly measured the angular size using a Dzus fastener or cowl tool held up against the sky while he looked at the objects, we do not need to speculate or depend on guesswork about the distance to the DC-4 he also used for comparison. We have his measurement. He reported the objects were 100 feet if at 20-25 miles. That comes out exactly the same as the figure from the DC-4 comparison as computed by Bruce -- about 0.76 to 0.9 milliradian. Since Arnold eventually settled on a 23-mile figure for the distance within that range, this would be about 0.8 milliradian angular size (about 0.05 deg or 2.8 arcminutes). There is no basis to speculate about a much larger angular size based on figures Arnold never gave.

In a message dated Wed, 19 Jul 2000 6:55:35 PM Eastern Daylight Time, bruce maccabee <brumac@compuserve.com> writes:

<<

Larry wrote:

>2. At what distance do the angular sizes of pelicans and Arnold's observations coincide? Work this out and we could learn something.

<

The angular size of the objects Arnold compared with the spacing between the outer engines of a DC-4 at a distance he estimated at 15 miles. Depending upon the actual angle of observation (was the plane northwest of Arnold?) the projected spacing of the engines could be about 60 ft. This corresponds to an angle of about 0.76 radians (3/4 of a milliradian or 3/4 of a mm at 1 meter). If he overestimated the distance, then the angular size would be larger. For example at 10 miles the angular size would have been about 9/8 of a milliradian or slightly more than 1 mm at a meter.

If we use the LENGTH of a pelican (not the wingspan, since Arnold couldn't have seen the full wingspan unless the pelicans stretch their wings and tilted 90 degrees from the ordinary horizontal orientation ) we have about 1 meter I guess, which would be at a distance of  $1\text{m}/(1\text{ mr})$  or 1 km about. or about 0.6 miles. (Arnold would be about 40 seconds of flying time away from the pelicans)

This one (the Vaught V-173) flew, starting in 1942. I even have a record of Charles Lindbergh flying one. And this was the first heavier than air aircraft that could hover for long periods (point it straight up). It was the F-5U that never flew.

The Vaught V-173 had just propellers. The F-5U had jet engines between the propellers, next to the cockpit. I have two photos of the F-5U, but they are too large for ListBot to send.

The confusion comes from a UFO book that shows a picture of the V-173 on the ground, but labels it as the F-5U.

>Below resolution?

Larry,

I have mentioned before that on video footage I've watched, you couldn't see their normally prominent beaks. I hope to capture some still images from this later today.

Another fact I noted early in discussions is that when flying, White Pelicans carry their heads back and resting between their wings. One reference is 'Birds of the World', by Oliver L. Austin Jr. [page 42], which states, "In flight, pelicans carry their heads well back on their shoulders, with the long beak resting on the folded neck".

Here's a photo which illustrates this profile:

<http://www.ufoworld.co.uk/arnold/pelican.jpg>

As with many photographs of aircraft, this doesn't demonstrate the scale and it must be remembered these are approx 3m [10ft] wingspans.

Arnold claims to have viewed the nine objects from above and this is what he depicts in the various sketches. As hardly anyone would ever be in a position to photograph these birds from overhead, it's proved impossible so far to locate a comparative image.

However, when it was first suggested by ornithologists that a formation of pelicans had strikingly similar flight characteristics to Arnold's objects and I then discovered how, in flight, these birds carry their heads "well back", I immediately realised this was comparative to the bird-like profile Arnold confirmed. The 'centre-spot' he shows appears to be consistent with the positioning of this bird's head as viewed from above. It's certainly not inconsistent, I know that.

I'm about to upload the aircraft photograph you forwarded and which was too large for an attachment - I'll provide further details shortly. I'll also fully explain the reasoning why Arnold could not have witnessed nine aircraft.

no, no, no, no, NO! The Vought V-173 could NOT hover with its 125 hp engines, and the XF5U-1 did NOT HAVE JET ENGINES. Those are cooling fans for the normal radial piston engines. And even though it had ten times the horsepower, the XF5U-1 couldn't have hovered either. With a shaft turbine it could have, but it was never developed.

I think I see what you're trying to get at, Larry, but I sincerely believe that there were no squadrons of supersonic flying wings or flapjacks shooting around Washington in 1947. The flight logs for the Northrop B-35 and B-49 wings are published in the recent Pape book on the Northrop wing projects, and it's clear that they never left California (other than for special trips such as the PR flight to Washington DC in early 1949.) There never were nine flightworthy ones in any case. I think that if you want to prove that the Arnold objects were aircraft you have to stick to conventional ones -- maybe P-80 jets. But I'd hate to fly with guys that had the kind of technique that the pilots of the Arnold objects had.

Joel Carpenter

James,

Arnold never "claimed" viewing the objects "from above"!!!! Where are you getting this stuff? He always stated that the objects were at about his altitude or on his horizon and he told McDonald in Nov 1966 that their altitude actually increased to 13,000 feet at the end of the sighting (whereas Arnold was at about 9,500 ft).

metallized pelicans tend to sink like a lead balloon....  
but while flying, we are told, they can "scream by" at 50 mph  
top speed. Whether they can do this speed at 2 miles altitude  
I do not know. we have been assuming they can.

Subject: Paper Presented by Michigan UFO CENTRAL  
Status:

An interesting paper has been made available to Michigan UFO CENTRAL written by Richard Spalding - Senior Engineer at Sandia Labs in New Mexico titled "Ion-Based Conductions in the Atmosphere - A Geophysical Explanation for Atmospheric Enigmas". It can be viewed in its entirety at the link listed below.

<http://members.home.net/tlemire/ibconduct.html>

Although there are some points of the paper that I disagree with, it does show an interest in this phenomena by a reputable government employee and scientist. His hypothesis, if ever proven, could also narrow down our search, and help concentrate our efforts, in studying those cases that defy his hypothesis. Overall his work is interesting.

Here's how the confusion starts. These were my sources:

This site says the F-5U flew in 1942:

<http://www.fsb.hr/~ah951096/avi/vought.html>

This page says there WAS a jet version:

[http://www.tje.net/para/news/military\\_disks.htm](http://www.tje.net/para/news/military_disks.htm)

This page is quite informative, but it says only one v-173 was built, and I have photos of two different ones.

<http://www.vought.com/sfcmv/sf173/sf173.html>

This site says the V-173 was developed after WW II:

<http://www.farshore.force9.co.uk/naziinfo.htm>

This page says the F-5U flew secretly, and jet versions were designed. It also says the Air Force let the flying saucer craze with its extraterrestrial hypothesis continue to hid its own development of disc planes.

<http://www.theporthole.co.uk/hufos/disc.html>

This site says the XF-5U was operational:

<http://www.ufomind.com/ufo/updates/1998/nov/m16-003.shtml>

I think this was where I read the v-173 hovered, but the link to the article is gone now:

<http://www.flug-revue.rotor.com/FRheft/FRH9801/FR9801in.htm>

Would you believe a FOO factor?

[http://www.vought.com/y40-50/prod\\_40/prod\\_40.html](http://www.vought.com/y40-50/prod_40/prod_40.html)

Here it is without the horizontal tailplanes. There is language in here that could make someone think it could hover, related by the test pilot:

[http://www.vought.com/y40-50/prod\\_40/prod\\_40.html](http://www.vought.com/y40-50/prod_40/prod_40.html)

Bloomington IN 47405-7109

@ no, no, no, no, NO! The Vought V-173 could NOT hover with its 125 hp  
@ engines, and the XF5U-1 did NOT HAVE JET ENGINES. Those are  
@ cooling fans for  
@ the normal radial piston engines. And even though it had ten times the  
@ horsepower, the XF5U-1 couldn't have hovered either. With a  
@ shaft turbine it could have, but it was never developed.

Actually, I was just commenting on the number of disk and crescent  
shaped aircraft around in 1947. I have actually seen the v-173 that is at  
the Smithsonian. But they restored it as the version without the horizontal  
tailplanes for some reason.

However, the small angular size now poses a question in the Kenneth  
Arnold case:

Is the perceived shape entirely due to halation? If so, why couldn't these  
be  
conventional planes, either propeller or jet, below Arnold's resolution,  
reflecting sunlight enough to produce an expanded image?

Take a private plane with an overwing, and let the sun bounce from  
the front of the fuselage. Add the wing. Halation would expand it  
into a crescent shape.

Halation rounds images, doesn't create sharper lines or crescents. Jets or aircraft just below visual resolution would be at even greater distance than 23 miles and hence higher speed than 1800 mph.

Looks like I may have come across another account of Arnold's - it's confirmed as his own voice and apparently taped from a TV program - in which he claims:

"I could see way off to the right, coming in the vicinity of Mt. Baker, a whole chain-like string of very... of aircraft..."

That's a different story!

Now, the objects were first noticed "way off to the right" and not, as stated elsewhere, to his left.

This could make sense and explain some things which I suspected were possible.

As previously noted, we have quite different versions of where Arnold actually was and his heading when the objects had first been noticed.

It's been a long time since I trusted the scenario depicted in his 'official' report, where Arnold states he was on a heading for Yakima and had been cruising for "two or three minutes" when the encounter unfolded.

In the radio interview, Arnold claims:

"I had made one sweep in close to Mt. Rainier and down one of the canyons and was dragging it for any types of objects that might prove to be the Marine ship, uh, and as I come out of the canyon there, was about 15 minutes, I was approximately 25 to 28 miles from Mt. Rainier, I climbed back up to 9200 feet and I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier".

In the report, he states:

"Unable to see anything that looked like the lost ship, I made a 360 degree turn to the right and above the little city of Mineral, starting again toward Mt. Rainier. I climbed back up to an altitude of approximately 9,200 feet.

[...]

I trimmed out my airplane in the direction of Yakima, Washington, which was almost directly east of my position and simply sat in my plane observing the sky and the terrain.

[...]

I hadn't flown more than two or three minutes on my course when a bright flash reflected on my airplane.

In his book, he recalls:

"It was during this search and while making a turn of 180 degrees over Mineral, Washington, at approximately 9200 feet altitude, that a tremendously bright flash lit up the surfaces of my aircraft".

If he was in fact coming out of a turn over Mineral, then the objects could at first have been seen "way off to the right".

It changes so much, though.

I had wondered if this is exactly what happened. Arnold was coming out of a turn near Mineral, noticed the bright flashes way off to the right and - depending on how wide his turn was - he eventually flew at right angles to them, before turning his plane "around"/"sideways". Arnold must have believed they passed the 'jagged peak' on Mt. Rainier quite early in the observation, as it wasn't until the objects left Rainier that he began to 'clock' them. By this time, as they had apparently disappeared behind a peak on the mountain, Arnold would have assumed they were far distant, as he confirms.

I also wondered if the DC-4 might have been responsible for the initial flash(es), although Arnold seemed satisfied they all came from those nine objects.

Still, unless we believe that Arnold made a gross mistake in this specific account, what do we make of it?

The interview is in Real Audio format and can be heard at:

<http://www.iufomrc.com/arnold.htm>

Maybe someone can date it.

James Easton.

>In that interview he added, "I could see them only plainly when  
>they seemed to tip their wing, or whatever it was, and the sun  
>flashed on them".

>Yet, that was also when the reflection had been 'almost  
>blinding'.

YUes, and it clear that at th instant of the flash he likely was  
temporarily  
blinded at a small spot on his retina.

HOWEVER.... (1) the TILTING could give him a view of the TOP  
surface even if they were about at his level (UNLIKE {PELICANS THAT  
DON'T "TILT"}) at times when there was not perfect alignment with the sun  
(2) in other words, there could have been tilts which did NOT result  
in a bright solar reflection. At these times he could have seen an  
outline of the objects.

How much tilt? I have presented this before. The sun was 30 degrees  
down from Zenith or 60 up from the horizon. Therefore a 30 degree tilt  
of a normally horizontal flat surface could reflect the sunlight  
back toward the sun. Another 30 degrees of tilt would cause the  
reflection

to go 60 degrees down from the sun (figure it out: mirror turns the ray of  
light twice as fast as the mirror turns). 60 degrees down from the  
sun would be horizontal or, in this case, basically toward Arnold  
(nearly at the altitude of the objects). Thus I would suggest that the  
objects tilted by as much as 60 degrees.

>In his 'official' report, Arnold claimed, "These objects being  
>quite far away, I was unable for a few seconds to make out their  
>shape or their formation. Very shortly they approached Mt.

>Rainier, and I observed their outline against the snow quite  
>plainly".>

>There seem to be contradictions - could he see them "quite  
>plainly", or only when the sun flashed on them and how was this  
>possible if he was almost blinded every time the opportunity  
>arose?

I agree there seems a contradiction. However, we do not know,  
as he did not state, that there was a bright reflection EACH time  
an object tilted. There may have been tilts without reflection  
But, lets suppose each tilt did result in a reflection. While the  
object was tilting there would be a period of time BEFORE the  
reflection occurred when Arnold could see an object silhouetted  
against the mountain. For example, if the object had to tilt to  
60 degrees to make a reflection, then all the time as it approached  
60 degrees Arnold could, one presumes, see the verall shape.  
AFTER the reflection he might not be able to see the shape becuase  
of temprary flash blindedness.  
when he could see the outline, then he could

>>In his sketches he presents a top view because, I believe, the  
>>objects tilted so much he was able to see the top or the basic  
>>overall shape.

>Birds do not 'tilt'. ;)

WE AGREE ON SOMETHING.

And since I have indicated a measure of the required tilt in the paragraph  
above, I guess we would have to reject birds!

(Note: if th top of a saucer were curved or had a "bubble canopy or  
cockpit" or something, then the required angle of tilt MIGHT be less.  
It all depends upon what was the largest reflecting surface and how it  
was oriented when the saucer was flying level (the angles of the  
surface elements... iof there were "surface elements").

>Some time ago I was driving in the region near Klamath Lake in

f>leetingly have passed out of sight behind Little Tahoma.>

>Could we now have an explanation why the objects, if of course a  
>formation of AWP's, momentarily 'disappeared'.

Are you suggesting that a flight of pelicans, while traveling southward, suddenly turned toward Arnold so that he was getting a "head on" look and at that time they seemed to disappear from view?

But, even if so, this still requires a simple proof that the dynamics could work.  
DRAW A MAP.

And, by the way, Arnold's FIRST or INITIAL observation was of a bright flash on his airplane. At that time hypothetical pelicans would have been a mile or more away. How could they possibly cause a flash on his airplane that could be so bright he would immediately think of a nearby passage of an aircraft?

I believe he made a "gross" mistake. just as he made a mistake when he said he made a 360 degree turn.... obvious nonsense because such a turn would have him continuing to head westward away from Mt. Rainier.

People have been known to "misspeak" or misunderstand.  
Sometimes I have been told, while driving to turn left and I am thinking of something else and absent mindedly start to turn right and my wife yells

,.... no, no, the OTHER left!!..

That certainly does not mean that I don't know right from left....  
(I think.... I have been told that when I hold my right hand out, palm down, my thumb points toward my left hand....  
that's easy!)

Anyway, I suspect that the explanation for his statement is that he momentarily got mixed up.

Now I don't agree. We have seagulls here, and I have seen bank angles

on them as high as 75 degrees in a tight turn. So birds do tilt. But they don't tilt while flying in a straight line. But their wings might tilt while they are flapping. But I still can't imagine, even as bright as seagulls and pelicans are, that they could light up an airplane with a specular reflection, unless a diffraction effect was responsible.

@ And since I have indicated a measure of the required tilt in

I have also eliminated the Granville Brothers' Gee Bee, because of the difficulty of getting 9 of them together. But I just found out that there was a racing class of under-190-cu-in single-engine planes at the time (I saw one such race of tiny little planes in 1957).

BTW, in my earlier post, I was assuming that only the canopy was halating, and that the wings of a plane were sticking out beyond the halation to produce the observed shape.

Brain,

An interesting account and much appreciated.

I was wondering if anyone would, intentionally or otherwise, have an opportunity to observe their specularity and flight characteristics first-hand.

Your sighting was low and over water. Image how reflective they might appear on a glorious sunny day, in perfect visibility and against a backdrop of snow-covered, white mountains. Viewed on the 'horizontal', their wing movements and any reflections coming from the slow flapping (apparently 1.3 times per second) of that large, glossy, predominately white expanse, would be particularly evident.

Almost like a flash gun, or mirror reflection, you say.

This agrees with all other evidence I've looked at and I think we may have underestimated just how 'brilliant' these huge birds can be.

>Many bird feathers have a semi-transparent aspect to them.

>Given the roughly cylindrical shape of most feather elements, is  
>it possible for them to have some kind of prismatic lensing  
>effect (a kind of natural fresnel lens) under the circumstances  
>I have mentioned? Perhaps certain combinations of incident light  
>angle and angle of reflection could produce a mirror-like  
>sparkle.

Unquestionably, this is something I've observed on many occasions.

Ufologists would benefit from becoming reasonably familiar with birds and their characteristics, especially large migratory species which might be responsible for UFO reports.

For example, even at night, White Pelicans can be highly reflective, as Ann Johnson, on the CompuServe 'Birders' forum, confirmed: "I can attest to the reflectiveness. When we were in South Texas last spring, a small flock was migrating after dark. The gleam in the moonlight was most evident".

I recently watched and taped a 'UFO' related documentary on satellite TV and which featured some of Jose Escamilla 's copious camcorder footage. There was video taken, near Roswell during 1991 if I recall, of objects which Escamilla declares are a formation of flying saucers, each one 30 foot in diameter, or some such nonsense. It is in fact a typical V-shaped formation of white birds - although difficult from the brief film to make out whether they are swans, pelicans, or snow geese.

Of course, you would never convince Jose (or many other ufologists) about this explanation!

However, you can see how specular these birds are, resembling, indistinctly shaped, anomalous mirrors in the sky, especially when they 'flutter'.

Anyway, although I can't locate a photo of White Pelicans taken from any considerable distance, I have come across one showing various formations or 'skeins' of migrating snow geese, taken in North America. These fly in formation similar to White Pelicans and the photo gives some appreciation about related perspectives of size and distance, etc. By a reasonably accurate comparison, White Pelicans are twice as large as snow geese. See:

I wonder if the proximity of the bird to the water could be a clue here.

(We are always looking for clues, aren't we?)

If the bird had just taken off from being on the water or diving in to get  
a fish

or whatever, it could have (a) created a momentary "sheet" of water falling  
from

it and/or (2) could have gotten wet. IN the case of (1) the water could momentarily create a bright reflection of sunlight. IN the case of (2) the water on the bird could increase its reflectivity (depending upon the thickness of the hypothetical water layer) and make it almost specular for a short time.

I don't know what video you are referring to and I wonder how an image that appears circular (if it does appear circular) could have a V shape. BUT aside from Escamilla's film.... whatever it shows... I was struck by your comment: "each one 30 foot in diameter or some such nonsense." Are you suggesting that the basic idea of a 30 ft diameter "flying saucer" is, by itself, nonsense? I thought that that was what one was trying to prove, whether or not such things exist. Do you rule out the possibility as nonsense a priori?

If so, how do you handle the report on the April, 1950 White Sands movie film which included a triangulation that showed there were 30 diameter objects traveling at high speed at an altitude of 150,000 ft over the White Sands Proving Ground? Was this nonsense? Or were pelicans of those days able to fly at 150,000 ft?

James, Bruce & List,

Since there must be millions of pelicans flying around, let's see some movies or video of "flash gun" sun reflections off of them, so "blindingly bright" as to be almost like "arc light" (Arnold). Such a spectacular effect would surely be the staple of National Geographic, Discovery Channel and BBC nature or science programs. It should be a well-known and well-STUDIED phenomenon to ornithologists who have spent their lives studying birds -- and not some poetic off-handed remark without any scientific investigation. I am puzzled as to why we don't have such solid documentation despite your (James') contacts with top ornithologists.

If pelicans "slowly flap" at about 1.3 beats per second, then how do we reconcile this with Arnold's data indicating that each object only flashed about once every 9 seconds (or about 0.1 beat per second)? That would be too slow to fly wouldn't it?

Also, I think Bruce earlier pointed out that the distance to such bird observations is much, much less than was possible with Arnold. Here the distance was estimated by Brian at about 150 yards. If Arnold had been at that distance from pelicans he would have overtaken them in his 110 mph plane in about 3 SECONDS!!!!

If pelicans have to get that close in order to reflect enough sunlight in order to appear "Arnold brightness," then inverse-square law tells us that at the initial remote range of about 6 miles that James has previously mentioned, they would have been about 5,000 times dimmer than at 150 yards. How on earth could they have "lit up" Arnold's plane from there????

I second Bruce's comment about the April 27, 1950, White Sands theodolite film and triangulation incident.

Larry,

My 'objection' was to the word 'tilt', in Bruce's comment that,  
"I believe, the objects tilted so much he was able to see the top  
or the basic overall shape".

This implies, as Bruce would intentionally do, a mechanical  
device. ;)

Yes, of course birds will frequently make turns and bank at sharp  
angles.

>But they don't tilt while flying in a straight line. But their  
>>wings might tilt while they are flapping.

White Pelicans are the most erratic, weaving flyers I now know of  
- rarely do they seem to fly in a straight line!

>But I still can't imagine, even as bright as seagulls and  
>pelicans are, that they could light up an airplane with a  
>specular reflection, unless a diffraction effect was  
>responsible.

It depends if this ever actually happened.

There's no question that in all other respects, the evidence  
indicates these nine unidentified "objects were simply White  
Pelicans:

1. They flew in an echelon formation, which was also chain-like  
and resembled a kite-tail blowing in the wind. That indicates  
straight away these were probably birds and either swans, geese,  
or pelicans.

2. They had a noticeable fluttering and gliding attribute. This is a distinctive flight characteristic of White Pelicans and together with the ribbon-like, or chain-like, or kite-tail like formation, identifies these nine objects as almost certainly White Pelicans.

3 They displayed undulating flight, which in some birds with a large wingspan, including White Pelicans, is a direct result of their flapping and gliding motion. The wingbeats enable the bird to gain height and it then glides on open wings, saving energy, although losing some altitude. This is continually repeated and produces the effect of a roller coaster, or a stone skipping across water.

4. When they fluttered, they flashed and also gained altitude, absolutely typical of White Pelicans flapping their wings to gain height and light being reflected from the huge expanse of glossy, white wing as they did so.

5. Some of Arnold's sketches depict an obviously bird-like profile and ultimately, it is what he claimed they looked like. That depiction is strikingly similar to the profile of a White Pelican.

We can demonstrate how Arnold's recollections changed and it's impossible to determine precise facts

However, if he had later exaggerated his recollections and even unintentionally, there should be an indication of this and there certainly does seem to be.

So far as I can see, the first time Arnold mentioned that the flash was so bright that it reflected on his aircraft came in the letter to the Air Force.

In that formative KWRC radio interview on 26 June, he states:

"I noticed to the left of me a chain which looked to me like the tail of a Chinese kite, kind of weaving and going at a terrific speed across the face of Mt. Rainier. I, at first, thought they were geese because it flew like geese".

Strangely, there's no mention of any initial flashes in this lengthy interview, however, he later adds, "And, they seemed to flip and flash in the sun, just like a mirror, and, in fact, I happened to be in an angle from the sun that seemed to hit the tops of these peculiar looking things in such a way that it almost blinded you when you looked at them through your plexiglass windshield".

WWWWWHHHHHHAAAATTTTTT???

ALL other respects?

This one statement proves you haven't got it yet, James.

You would if you seriously attempted to  
(yes, folks, here it is again....)

DRAW A MAP.

Prove that the DYNAMICS of the situation can make sense in some way  
that doesn't just change Arnold's story so much as to make the "new"  
version

vastly different from the old.

Go on, James, take a chance.... DO IT!

>1. They flew in an echelon formation, which was also chain-like  
>and resembled a kite-tail blowing in the wind. That indicates  
>straight away these were probably birds and either swans, geese,

>formation, identifies these nine objects as almost certainly  
>White Pelicans.

You are assuming that Arnold's description of skipping like a saucer  
on the water, etc.... corresponds to the birds "fluttering and  
gliding."

Perhaps Arnold was trying to portray a more violent sort of motion.  
AT least that's my interpretation.

>3 They displayed undulating flight, which in some birds with a  
>large wingspan, including White Pelicans, is a direct result of  
>their flapping and gliding motion. The wingbeats enable the bird  
>to gain height and it then glides on open wings, saving energy,

>across water.

At a rather slow rate. (Many seconds between "skips")

>4. When they fluttered, they flashed and also gained altitude,  
>absolutely typical of White Pelicans flapping their wings to gain  
>height and light being reflected from the huge expanse of glossy,  
>white wing as they did so.

How do you know that "when they fluttered they gained altitude?"  
You must be careful not to superimpose your solution onto the  
"raw data."

>5. Some of Arnold's sketches depict an obviously bird-like  
>profile and ultimately, it is what he claimed they looked like.  
>That depiction is strikingly similar to the profile of a White  
>Pelican.

And some DON'T depict a birdlike profile/. I suppose you would argue  
that we have to ignore the ones that don't agree with a birdlike profile  
and only accept those which do.

>We can demonstrate how Arnold's recollections changed and it's  
>impossible to determine precise facts

Recollections no doubt changed somewhat... and also the  
reporting was not completely accurate.

>However, if he had later exaggerated his recollections and even  
>unintentionally, there should be an indication of this and there  
>certainly does seem to be.  
Exaggerated? What was exaggerated?

>So far as I can see, the first time Arnold mentioned that the  
>flash was so bright that it reflected on his aircraft came in the  
l>etter to the Air Force.

Yes, a good time to put it into the record.

In that formative KWRC radio interview on 26 June, he states:

>"I noticed to the left of me a chain which looked to me like the  
>tail of a Chinese kite, kind of weaving and going at a terrific  
>speed across the face of Mt. Rainier. I, at first, thought they  
>were geese because it flew like geese".

>Strangely, there's no mention of any initial flashes in this  
>lengthy interview, however, he later adds, "And, they seemed to  
>flip and flash in the sun, just like a mirror, and, in fact, I  
>happened to be in an angle from the sun that seemed to hit the  
t>ops of these peculiar looking things in such a way that it  
>almost blinded you when you looked at them through your  
>plexiglass windshield".

So he didn't tell the whole story second by second. HE was not wrong  
in saying that he "noticed to the left of me a chain... etc." He  
apparently was not  
complete. Not surprising. People being interviewed hardly ever think to  
say everything that happened. On the other hand, his repeated references  
to  
"blinding" flashes are NOT characteristics of birds even close up (Brian's  
observation  
notwithstanding)),. In arnold's case the birds in your scenario (DRAW  
A... you know what)  
the pelicans were initially a couple of miles away. HARDLY VISIBLE... and  
certainly not  
creating "nblinding flashes."

Hi Guys,

Just exactly what does

" just enough for the sun to strike them at an angle that reflected brightly on my plane."

mean? Brightly ON my airplane? Brightly on my level?

If it is "brightly on my airplane", that does not, to me, say "lighting up the inside of my airplane brightly". It just says that from the airplane he could see it brightly. "Behold, and a great light shined down upon me and I was enlightened!"

If it is "Brightly on my level" it could be bright sparkles as from any dew drops that were directed, at various instants of time, to strike his eyes intermittently.

I seem to always have a hard time understanding what people mean when they are not specific and don't use redundant phrases to present the idea from all angles.

Don Piccard

Hi Don -

Could you comment on the theory that the Socorro, NM UFO encounter in April  
1964 was provoked by a hot air balloon?

Joel Carpenter

@ Subject: Re: New Kenneth Arnold Sketch?

@

@

@ @

@ James, Bruce & List,

@

@ Since there must be millions of pelicans flying around, let's  
@ see some movies or video of "flash gun" sun reflections off  
@ of them, so "blindingly bright" as to be almost like "arc  
@ light" (Arnold). Such a spectacular effect would surely be  
@ the staple of National Geographic, Discovery Channel and BBC  
@ nature or science programs. It should be a well-known and  
@ well-STUDIED phenomenon to ornithologists who have spent  
@ their lives studying birds -- and not some poetic off-handed  
@ remark without any scientific investigation. I am puzzled as  
@ to why we don't have such solid documentation despite your  
@ (James') contacts with top ornithologists.

@

@ If pelicans "slowly flap" at about 1.3 beats per second, then  
@ how do we reconcile this with Arnold's data indicating that  
@ each object only flashed about once every 9 seconds (or about  
@ 0.1 beat per second)? That would be too slow to fly wouldn't it?

Maybe most of the reflections from the flaps missed the plane.

@ Also, I think Bruce earlier pointed out that the distance to  
@ such bird observations is much, much less than was possible  
@ with Arnold. Here the distance was estimated by Brian at  
@ about 150 yards. If Arnold had been at that distance from  
@ pelicans he would have overtaken them in his 110 mph plane in

@ about 3 SECONDS!!!!

That's the big problem. I drew a "map", but I couldn't draw one that kept the flight direction, the direction of travel, and the orientation of the group consistent with Arnold's report. At least one of these has to change to a wrong value during the sighting if pelicans are involved (unless someone managed to invent a 70 mi/hr upgrade to the basic P-100 pelican).

A new theory has entered my thoughts: Could Arnold have somehow encountered a test or an exercise involving some small target drones? Radio controlled aircraft DO exhibit flight characteristics of undulation, due to overcorrections of a pilot on the ground.

(I know there weren't many R/C modelers out there at that time, because everything was tube, the FCC regulations required a ham radio license at the time, and the economy was still returning to normal after the war. Plus, model planes would be too small and slow.)

@ If pelicans have to get that close in order to reflect enough  
@ sunlight in order to appear "Arnold brightness," then  
@ inverse-square law tells us that at the initial remote range  
@ of about 6 miles that James has previously mentioned, they  
@ would have been about 5,000 times dimmer than at 150 yards.  
@ How on earth could they have "lit up" Arnold's plane from there?????

@ I second Bruce's comment about the April 27, 1950, White  
@ Sands theodolite film and triangulation incident.

One would wonder how much of the apparent diameter of those objects was due to grain size or halation in the film. In other words:

1. How big would a point source of light register on the film?
2. How big would that image appear to be at the calculated range?
3. How many grains across is the image of a 30 ft disk at that range?

@ Brad

Don,

Firstly, a warm welcome to the list.

[Although many subscribers will be aware of Don's background, for the benefit of those who may not, Don is regarded as the 'Dean of American ballooning' and no-one has contributed more to the development of sports ballooning, from the design stage and literally upwards!

A more detailed and comprehensive biography is easily located via any search engine].

The answer does seem to depend on when we might have asked Kenneth Arnold. One of the problems with his accounts is how the story demonstrably grew in the telling.

Initially, reflections from the objects were 'intensely bright' and by all original accounts, the objects had first been noticed crossing in front of Mt. Rainier.

However, in his 'official report' to the Air Force, he stated:

"I hadn't flown more than two or three minutes on my course when a bright flash reflected on my airplane. It startled me as I thought I was too close to some other aircraft. I looked every place in the sky and couldn't find where the reflection had come from until I looked to the left and the north of Mt. Rainier where I observed a chain of nine peculiar looking aircraft flying from north to south at approximately 9,500 foot elevation and going, seemingly, in a definite direction of about 170 degrees.

[...]

I discovered that this was where the reflection had come from, as two or three of them every few seconds would dip or change their course slightly, just enough for the sun to strike them at an angle that reflected brightly on my plane".

By the time of his book (1952), the story had become one where:

"It was during this search and while making a turn of 180 degrees over Mineral, Washington, at approximately 9200 feet altitude, that a tremendously bright flash lit up the surfaces of my aircraft.

[...]

I spent the next twenty to thirty seconds urgently searching the sky all around--to the sides, above and below me--in an attempt to determine where the flash of light had come from.

[...]

Before I had time to collect my thoughts or to find any close aircraft, the flash happened again. This time I caught the direction from which it had come. I observed, far to my left and to the north, a formation of very bright objects coming from the vicinity of Mount Baker, flying very close to the mountain tops and traveling at tremendous speed. At first I couldn't make out their shapes as they were still at a distance of over a hundred miles".

Latterly, in his other main account, given to a UFO conference during 1977, Arnold claimed:

"...it was a beautiful day, in fact the plane was very stable, I didn't have to fight controls or weather or anything - a

tremendous flash appeared in the sky and it lit up my whole aircraft, even it seemed the cockpit of the airplane and I was rather startled.

[...]

I looked all around below me and looked ahead of me. And then the flash came again and, uh, this very, very bright flash, it was almost like an arc light, was coming from a group of objects far up to the north of Mt. Rainier, in the area of Mt. Baker".

You pays your money and takes your choice...

What seems ridiculous is Arnold's assertion that 30 seconds after the first flash had 'lit up' his aircraft, it happened again and the objects were still over a hundred miles distant. Obviously 30 seconds beforehand and travelling at the supposed 1,200 mph plus which Arnold later calculated, the objects would have been even more distant when the initial 'tremendous flash' illuminated everything around, including his cockpit!

As an aside, five days later Arnold of course had a second close encounter, as recounted in his book:

"I recall looking at my instrument clock which read about five minutes to seven. As I looked up from my instrument panel and straight ahead over the La Grande valley, I saw a cluster of about twenty to twenty- five brass coloured objects that looked like ducks.

They were coming at me head on and at what seemed a terrific rate of speed.

The sun was at my back and to my right. These objects were coming into the sun. I wasn't sighting through the viewfinder on my camera but was sighting along the side of it. As the group of objects came within 400 yards of me they veered sharply away from me and to their right, gaining altitude as they did so and fluttering and flashing a dull amber color.

They appeared to be round, rather rough on top, and to have a dark or a light spot on top of each one. I couldn't be absolutely positive of this because it all happened so suddenly. I attempted to make a turn and follow them but they disappeared to the east at a speed far in excess of my airplane. I knew they were not ducks because ducks don't fly that fast.

I was a little bit shocked and exited when I realized they had

the same flight characteristics of the large objects I had observed on June 24".

As I have previously noted, ducks can actually fly circa 75mph and these 25-30 objects which resembled ducks were almost certainly just that.

Yet, Arnold describes them as "fluttering" - that's probably because they were birds - and "flashing a dull amber colour". Arnold's definition of "flashing" a "dull colour" is very odd.

If our theoretical nine White Pelicans did have exceptional specularly, I wondered if their natural ability to reflect light from those massive, glossy, white wings might somehow have been enhanced. It would be cold as they migrated over the Cascades - what about the possibility that ice crystals or water droplets, maybe tiny particles, on their thick plumage, might have amplified their already considerable ability to reflect light? This would not be not dissimilar to the 'Fresnel lens' effect which Brian Straight recently suggested on the list.

A difficulty is that we're getting into relatively unknown territory and few people have ever encountered White Pelicans at such altitude and in the perfect visibility Arnold related, plus later described their observations.

Any comparative experiences you may have had would be a truly invaluable insight.

James Easton.

Well, I recall meeting a fellow about that time that told of touring around with a home built unregistered balloon internationally. How he did it without running afoul of the various FAA's, I don't know but he said he had a ball. He gave me a picture of his balloon that I have seen in my junk pile recently. It is an all white outfit. I don't recall if the crew is in white coveralls or even visible in the picture. I don't think there were any logo's on the bag. Just a white "ghost in the fog" sort of picture. (When I was a kid, most of my pictures turned out to look like a black cat in the coal bin, or a dentist in a snow storm.)

I can look for the snapshot and e-mail it to the list as an attachment if you all approve. I am sure I can find it very easily.

Reading the peace officer's report brings to mind the old saying that if it looks like a duck...

I would say that the '64 NM UFO fits as a balloon. My logbook doesn't indicate that it was me, but there were a few other balloons already flying by '64. The above mentioned balloon was about then, or maybe a little later. I hope the snapshot has a date on the print. We'll see.

As long as it didn't "Follow" the cop, it wasn't a star or a rising moon....

Very interesting Don --

(By the way, one of the most outstanding pieces of research I've seen on Socorro is available at

<http://www.cufon.org/contributors/chrisl/socorro.htm>

-- I urge everyone interested in the case to look this over. An example for us all.)

Subject: Re: New Kenneth Arnold Sketch?Status:

Hi Don,

Your source for the Arnold quote was incomplete. That's why you are missing the requisite details reported by Arnold about the initial flash, call it Flash No. 1, lighting up his plane.

In his letter to the Army Air Forces of July 1947, Arnold said he saw:

"... a bright flash reflected on my airplane. It startled me as I thought I was too close to some other aircraft."

Arnold on the Edward R. Murrow broadcast of April 7, 1950:

"... I noticed a terrific blue flash pass the nose of my airplane."

Arnold in his 1952 book:

"... a tremendously bright flash lit up the surfaces of my aircraft. I was startled. I thought I was very close to collision with some other aircraft whose approach I had not noted.... My momentary explanation to myself was that some lieutenant in a P-51 had given me a buzz job across my nose and that it was the sun reflecting from the surface of his wings as he passed that had caused the flash. "

Arnold in the June 24, 1977, Fate Symposium lecture:

"... a tremendous flash appeared in the sky and it lit up my whole aircraft, even it seems the cockpit of the airplane and I was rather startled.

"I thought I had seen a plane that was very close to me, or possibly it had been a military plane that had dove over my nose and the reflection of the afternoon sun against his wing surfaces had caused the flash. Now this just, in less than one tenth of a second, I think, went through my mind."

By the way, Arnold could not localize the source of the flash, which he thought must have come from an aircraft, maybe a P-51 fighter, in near-collision with him. At Flash No. 2 he localized the \_general direction\_ and soon spotted a group of objects he first thought were geese, just for a moment, since he was not seeing them \_at that moment\_ flash like intense, blinding arc light. He didn't know for sure these were the source of the flashes until Flash No. 3 came directly from one of the group of objects. At that point he of course dropped the idea these could be birds and returned to his first impression, that of aircraft.

<<

Hi Guys,

Just exactly what does

" just enough for the sun to strike them at an angle that reflected brightly on my plane."

mean? Brightly ON my airplane? Brightly on my level?

If it is "brightly on my airplane", that does not, to me, say "lighting up the inside of my airplane brightly". It just says that from the airplane he could see it brightly. "Behold, and a great light shined down upon me and I was enlightened!"

If it is "Brightly on my level" it could be bright sparkles as from any dew drops that were directed, at various instants of time, to strike his eyes intermittently.

I seem to always have a hard time understanding what people mean when they are not specific and don't use redundant phrases to present the idea from all angles.

Don Piccard

@ To: UFORL@listbot.com

@ Subject: Re: New Kenneth Arnold Sketch?

@

@

@

@

@ James, Bruce & List,

@

@ Since there must be millions of pelicans flying around, let's

@ see some movies or video of "flash gun" sun reflections off  
@ of them, so "blindingly bright" as to be almost like "arc  
@ light" (Arnold). Such a spectacular effect would surely be  
@ the staple of National Geographic, Discovery Channel and BBC  
@ nature or science programs. It should be a well-known and  
@ well-STUDIED phenomenon to ornithologists who have spent  
@ their lives studying birds -- and not some poetic off-handed  
@ remark without any scientific investigation. I am puzzled as  
@ to why we don't have such solid documentation despite your  
@ (James') contacts with top ornithologists.

@

@ If pelicans "slowly flap" at about 1.3 beats per second, then  
@ how do we reconcile this with Arnold's data indicating that  
@ each object only flashed about once every 9 seconds (or about  
@ 0.1 beat per second)? That would be too slow to fly wouldn't it?

Maybe most of the reflections from the flaps missed the plane.

COMMENTS: ALL of the flaps, 100% of them, would have missed reflecting sunlight in Arnold's direction since the high-angle tilt required to reflect in his direction would mean the alleged pelican had DROPPED OUT OF THE FORMATION TO DO SO.

@ Also, I think Bruce earlier pointed out that the distance to  
@ such bird observations is much, much less than was possible  
@ with Arnold. Here the distance was estimated by Brian at  
@ about 150 yards. If Arnold had been at that distance from  
@ pelicans he would have overtaken them in his 110 mph plane in

@ about 3 SECONDS!!!!

That's the big problem. I drew a "map", but I couldn't draw one that kept the flight direction, the direction of travel, and the orientation of the group consistent with Arnold's report. At least one of these has to change to a wrong value during the sighting if pelicans are involved (unless someone managed to invent a 70 mi/hr upgrade to the basic P-100 pelican).

COMMENTS: It has nothing to do with the direction of travel or orientation of the group or drawing a map. The pelicans could be traveling in ANY DIRECTION and Arnold would have overtaken them in LESS THAN 5 SECONDS. Period!

A new theory has entered my thoughts: Could Arnold have somehow encountered a test or an exercise involving some small target drones? Radio controlled aircraft DO exhibit flight characteristics of undulation, due to overcorrections of a pilot on the ground.

(I know there weren't many R/C modelers out there at that time, because everything was tube, the FCC regulations required a ham radio license at the time, and the economy was still returning to normal after the war. Plus, model planes would be too small and slow.)

@ If pelicans have to get that close in order to reflect enough

@ sunlight in order to appear "Arnold brightness," then

@ inverse-square law tells us that at the initial remote range

@ of about 6 miles that James has previously mentioned, they

@ would have been about 5,000 times dimmer than at 150 yards.

@ How on earth could they have "lit up" Arnold's plane from there?????

@ I second Bruce's comment about the April 27, 1950, White

@ Sands theodolite film and triangulation incident.

One would wonder how much of the apparent diameter of those objects was due to grain size or halation in the film. In other words:

1. How big would a point source of light register on the film?
2. How big would that image appear to be at the calculated range?
3. How many grains across is the image of a 30 ft disk at that range?

@ Brad

COMMENTS: The Askania phototheodolites were used to track V-2's and Viking rocket at the altitudes and distances of the UFO's reported on April 27, 1950, and had the requisite magnification to do so. Hence, a 30-foot size is comparable to the dimensions of these rockets and -- without having the Askania performance data or film data -- must be presumed of sufficient resolution.

The painting looks like fairly flat ground - not what I think of as an arroyo. But if it were down below the observer in a canyon of some sort a hot air balloon could easily have that perspective shape appearance.

I'll look for my white balloon shot.

I agree. The failure to use precise language is another reason we should  
ignore Arnold's  
report as replete with errors and not worthy of further consideration.  
(smile)

But More Seriously,

He repeatedly emphasized how bright the flashes were. Brightness within  
the cockpit refers  
to light reflected from objects within the cockpit. All those "objects" in  
the cockpit were, of course,  
already reflecting sky light and sunlight that came in through the windows.

Whether the flashes noted by Arnold actually increased the brightness of  
these objects

by a noticeable amount or not is a question we cannot answer. Arnold  
apparently had the

IMPRESSION that the inside of his cockpit got a little bit brighter.

Hence his initial

"explanation:" was that a fast plane had reflected sunlight from its wings  
into his cockpit as

it buzzed his nose (a close shiny metallic airplane could reflect sunlight

into the cockpit)

This could explain the lack of a specular reflection at each "flap" ....  
but pelican wings do not provide specular reflections. The light  
is reflected from the wing into all directions.

Regarding White Sands Film of Objects triangulated at 150,000 ft and estimated at 30 ft diameter

Larry wrote:

>One would wonder how much of the apparent diameter of those objects was due to grain size or halation in the film. In other words:

1. How big would a point source of light register on the film?
2. How big would that image appear to be at the calculated range?
3. How many grains across is the image of a 30 ft disk at that range?

>

Brad wrote   COMMENTS: The Askania phototheodolites were used to track V-2's and Viking rocket at the altitudes and distances of the UFO's reported on April 27, 1950, and had the requisite magnification to do so. Hence, a 30-foot size is comparable to the dimensions of these rockets and -- without having the Askania performance data or film data -- must be presumed of sufficient resolution.  
<

First, halation would not affect the triangulation, so size is the only question.

Unfortunately I have found no specifications on the cinetheodolites.

However, one might make some reasonable assumptions. Consider that the size of the image is the angular size of the object in radians times the focal length  $30 \text{ ft}/150,000 \text{ ft} = 0.0002 \text{ radians}$ . Hence with a focal length of 1,000 mm, the image size is about 0.2 mm or 200 microns. Now, typical film grain for black and white movies of rockets could be, say 25 microns. Maybe as low as 10, probably not fine grained

as 5 microns. Hence the image size could be 8 times larger than grain size.

I'm sure the cameras were adapted to filming objects under the ambient light (shutter time and lens aperture set appropriately) and so, unless the UFOs were bright sources themselves, they probably caused negligible halation.

I don't know that the focal length was 1000 mm, but it certainly isn't difficult to get a focal length that long (or longer).

Main point: without technical data to go on, it seems reasonable that the cinematheodolites could have resolved objects of size 30 ft at 150,000 ft and that the images would not have been greatly increased in size by halation.

Moreover, I'm sure the employees of the "mathematical reduction unit" understood the capabilities/limitations of their instruments (telescopes).

It struck me that another form of Pacific Northwest wildlife hasn't been considered as the cause of the Arnold sighting. It should be so obvious.

Salmon.

Now, come on, don't laugh. Surely their general configuration is correct. They're shiny, they travel en mass, they jump and leap while shooting along at high speed, they're indigenous to the streams in the area, and ... they're shiny! Please don't argue that Salmon aren't commonly seen above, say, altitudes of 25 feet above the ground. If everything else about their behavior fits the sighting, they're a valid explanation! I can show you plenty of photos of Salmon glistening in the sun!

(gentle irony intended. I only \_wish\_ I was the Duke of Mendoza)

Joel,

Don't laugh. Arnold actually described the objects as like "FISH FLIPPING IN THE SUN." (See his First Interview in the Pendleton East Oregonian, June 26, 1947.) See? You can prove anything by creative use of imagery and metaphors! :)

Joel,

I suppose some people might also point out that after our Pacific-north west ornithologists identified those key characteristics in Arnold's descriptions as suggesting White Pelicans, there was new evidence uncovered which did in fact support Arnold's observation of disks, or disk-like objects.

A long-forgotten sighting, just two and a half weeks later of "nine big round disks weaving northward two thousand feet below us", was reported by an aircrew flying between between Spokane, Washington and Portland, Oregon - prime 'Arnold flying disk' country.

These high-flying disks, nine in number and weaving, just like Arnold's, would normally have been a key, corroborative sighting and would still today be championed as 'proof' of what Arnold witnessed.

Sadly, as you may recall, when historian Ed Stewart uncovered this significant 'British Columbian' article, dated July 12, 1947, it wasn't to be.

That aircrew had eventually been able to identify the 'big round disks' and, as Capt. Gordon Moore confirmed, "We investigated and found they were real all right --- real pelicans".

Still, doubtless all an astonishing coincidence.

Good job their identity was discovered at the time, otherwise to suggest now that these were probably nine White Pelicans, in a typical weaving formation, would naturally have been quite

ridiculous.

Sheesh... imagine an experienced pilot making \_that\_ mistake!

Also unknown to our experienced North-west ornithologists was that only recently a sketch of the objects, apparently drawn by Arnold and unfamiliar to most 'ufologists', would turn up and this would depict bird-like profiles, two of which are remarkably similar to White Pelicans.

Coincidental, of course.

My further research would locate a highly relevant scientific paper, "Bounding and Undulating Flight in Birds", by J. M. V. Rayner, published in the 'Journal of Theoretical Biology' [(1985) volume 117, pages 47-77] and this naturally featured a discourse on White Pelicans. That it was possible to correlate specifics of their distinctive flapping and gliding motion with the 'fluttering and gliding motion' which so statedly impressed Arnold re his nine undulating objects, was also purely chance.

Some people might however conclude otherwise!

What I don't understand, can't actually fathom at all, is how anyone who believes that Arnold's nine objects were alien spacecraft, rationalises the shambles of a 'UFO' case which remains.

As several key correlations between these ET formation flyers objects and White Pelicans have been comprehensively evidenced, what is the explanation? Why did our infinitely more advanced travellers design spaceships which looked like birds, that repeatedly fluttered and then glided, whilst undulating in a ribbon-like, echelon formation over the Cascades?!

Additionally, with Little Tahoma having now been identified as almost certainly the 'jagged peak' Arnold relied on as a distance marker and as it's impossible for the objects to have travelled behind it and also on the western side of Mt. Rainier - these are mutually exclusive - as he claimed, his acknowledged key indicator for being confident about distance and speed calculations is demonstrably a fundamental error of perception on his part.

Last I heard, Bruce and Brad continued to disagree about which side of the mountain was now the most likely choice to still maintain a premise for 'something', or nine 'somethings',

travelling rapidly.

As highlighted in the current 'Fortean Times' article and also the essence of their accompanying editorial, this was supposed to be the most important and dependable UFO case of all. For 50 plus years it has been the foundation of 'flying saucers' and countless related UFO reports, photographs and tales - although many are now accepted to be bogus.

Not only did Arnold's object's bear no resemblance to the popularised 'flying saucer' mythology, even as a 'one-off' sighting his evidence when critically and objectively examined is largely proven to be unreliable, explainable and leaves little in the way of an unsolved mystery.

As 'Fortean Times' questions; when will ufologists take courage and accept the blatantly obvious 'flying saucer' mythology?

With, as Bob Rickard also comments, ufology now being intrinsically a belief system, I can't see there's the remotest prospect of 'ufology' per se ever relinquishing any of its cherished, popularised evidence. Even the most transparent hoaxes still have almost fanatical support and this together with absurd, unverified 'evidence' now constitutes much of what 'mainstream ufology' 'believes in and its growing commercial activities - magazines, conferences, videos, etc. - keenly promote.

Perhaps it's this background which makes it somewhat irrelevant, in fact pretty much completely irrelevant, to mainstream ufology whether Arnold's founding experience or 'flying saucers', or anything which comparatively glitters, may be fool's gold.

The question is, where to go from here.

There is considerable evidence I might in due course publish and support as indicating a 'scientific enigma'. As things stand, those seeds will probably only get trampled underfoot or choked by the abundant 'ufological weeds' which compete for recognition.

Bob Rickard suggests that if ufology was to clear out all the garbage, then what remains could actually be worth something.

As some will declare that most of what comprises ufology is garbage and most would censure that only some of what comprises ufology is garbage, the suggestion is commendably idealistic and, as Bob will doubtless appreciate, utterly unrealistic.

Where to go from here, indeed.

James Easton.

Subject: Re: New Kenneth Arnold SketchMime-Version: 1.0  
Status:

James,

One crucially important factor you have not considered in all the argument about the Arnold case and your question of "where to go from here?" is whether the Arnold case would ever pass a reasonable OBJECTIVE set of criteria for UFO Best Evidence. I contend that it does not and that it is unfair to judge and condemn the UFO phenomenon on the basis of a case that fails to meet the standards for Best Evidence. For years now I have been posting certain Screening Criteria for UFO Best Evidence for basic visual sightings (not intended for instrument, radar, photo, landing trace cases, etc.):

- (a) Minimum Duration: 1 minute.
- (b) Minimum Angular Size: Full Moon (1/2 deg).
- (c) Minimum Number of Witnesses: 2.

Obviously the Arnold case would not meet these basic minimum standards. Without going into a long justification, let me just point out that Hynek had a requirement for MULTIPLE WITNESSES (see The UFO Experience) because there is just too much possibility of strange personal idiosyncrasies and with multiple witnesses one can calibrate the observations of one witness against another. Some UFOlogists object to these standards as too strict -- but surely there are many multiple witness UFO cases that meet a 1-minute minimum duration and half-degree angular!!!!

I would only allow exceptions in the extremely rare cases of witnesses with truly outstanding or exceptional qualifications where the criterion is not being relaxed much anyway, e.g., the 4-witness 2-1/2-minute 1/4-degree Daylight Disc sighting by the then world's leading aerial phenomena sighting investigator and full-time professional Ph.D. astronomer Dr. Lincoln LaPaz and his family on July 10, 1947, which is documented with a wealth of quantitative data including real-time angular size measurements, not just offhand b.s. of the "it looked bigger than a star" type.

If there aren't any lasting at least a minute and close enough to see some real detail then what in the hell are we doing in this field anyway???? But there ARE many such qualified UFO cases -- UFOlogists have never gathered them in one place and documented them exhaustively. UFOlogists would rather fritter away their time on poorly documenting and barely investigating 1,000 mediocre cases than in meticulously investigating and documenting 10 (or even 3) really good UFO cases.

For all the thundering that Bruce and I have done goading you to "DRAW A MAP" for the Arnold case to force you to work out what are in actuality unworkable and impossible details of your pelican theory (the real reason why you won't draw a map for a bird scenario, because you can't and no one can), it is ironic that NO ONE had ever drawn and published a detailed map of the Arnold case in 50+ years, not Arnold, not anyone. Even though Arnold did mark a map (he is photographed with one in

1947) he never published it. It is such a fundamental and elementary piece of investigation -- a map for a sighting covering an enormous geographic range and for which geographic landmarks (Mts. Rainier and Adams) are such a crucial and integral part of the case (the famous "clocking" that determined the impossibly high speed that made it an Unknown and put it on headlines around the world, launching the whole era of "flying saucers"). Yet it had never been done in 50 years of UFOlogy (or at!  
! least not until Bruce did one and posted it, last year I think, 1999).

Your pilot-pelican sighting in July 1947 of course fails the Screening Criteria and would never have qualified for UFO Best Evidence. In fact, it's just an UN-INVESTIGATED newspaper clipping in which no one really knows if it was a prank deliberately designed to discredit Arnold by "copycatting" him with a b.s. story. There are NO QUANTITATIVE details of duration, angular size, size, altitude, distance, even time of day.

Lastly, I already posted a detailed analysis of how Arnold's sighting does NOT match bird flight patterns, based on your own posted bits of data and allegations, and that was months ago, yet you IGNORE it. I've seen nothing from you today that even approaches the rigor of my detailed POINT-BY-POINT analysis of more than a dozen inconsistencies with bird flight and appearance. I hereby challenge you to post the actual COMPLETE pelican flight characteristics from the 1985 Rayner paper in the Journal of Theoretical Biology and PROVE it POINT-BY-POINT. I bet it will turn out almost entirely UN-Arnold-like.

Brad

My further research would locate a highly relevant scientific paper, "Bounding and Undulating Flight in Birds", by J. M. V. Rayner, published in the 'Journal of Theoretical Biology' [(1985) volume 117, pages 47-77] and this naturally featured a discourse on White Pelicans. That it was possible to correlate specifics of their distinctive flapping and gliding motion with the 'fluttering and gliding motion' which so statedly impressed Arnold re his nine undulating objects, was also purely chance.

Some people might however conclude otherwise!

What I don't understand, can't actually fathom at all, is how anyone who believes that Arnold's nine objects were alien spacecraft, rationalises the shambles of a 'UFO' case which remains.

As several key correlations between these ET formation flyers objects and White Pelicans have been comprehensively evidenced, what is the explanation? Why did our infinitely more advanced travellers design spaceships which looked like birds, that repeatedly fluttered and then glided, whilst undulating in a ribbon-like, echelon formation over the Cascades?!

Additionally, with Little Tahoma having now been identified as almost certainly the 'jagged peak' Arnold relied on as a distance marker and as it's impossible for the objects to have travelled behind it and also on the western side of Mt. Rainier - these are mutually exclusive - as he claimed, his acknowledged key indicator for being confident about distance and speed calculations is demonstrably a fundamental error of perception on his part.

Last I heard, Bruce and Brad continued to disagree about which side of the mountain was now the most likely choice to still maintain a premise for 'something', or nine 'somethings', travelling rapidly.

As highlighted in the current 'Fortean Times' article and also the essence of their accompanying editorial, this was supposed to be the most important and dependable UFO case of all. For 50 plus years it has been the foundation of 'flying saucers' and countless related UFO reports, photographs and tales - although many are now accepted to be bogus.

Not only did Arnold's object's bear no resemblance to the popularised 'flying saucer' mythology, even as a 'one-off' sighting his evidence when critically and objectively examined is largely proven to be unreliable, explainable and leaves little in the way of an unsolved mystery.

As 'Fortean Times' questions; when will ufologists take courage and accept the blatantly obvious 'flying saucer' mythology?

With, as Bob Rickard also comments, ufology now being intrinsically a belief system, I can't see there's the remotest prospect of 'ufology' per se ever relinquishing any of its cherished, popularised evidence. Even the most transparent hoaxes still have almost fanatical support and this together with

absurd, unverified 'evidence' now constitutes much of what 'mainstream ufology' 'believes in and its growing commercial activities - magazines, conferences, videos, etc. - keenly promote.

Perhaps it's this background which makes it somewhat irrelevant, in fact pretty much completely irrelevant, to mainstream ufology whether Arnold's founding experience or 'flying saucers', or anything which comparatively glitters, may be fool's gold.

The question is, where to go from here.

There is considerable evidence I might in due course publish and support as indicating a 'scientific enigma'. As things stand, those seeds will probably only get trampled underfoot or choked by the abundant 'ufological weeds' which compete for recognition.

Bob Rickard suggests that if ufology was to clear out all the garbage, then what remains could actually be worth something.

As some will declare that most of what comprises ufology is garbage and most would censure that only some of what comprises ufology is garbage, the suggestion is commendably idealistic and, as Bob will doubtless appreciate, utterly unrealistic.

Where to go from here, indeed.

James Easton.

>A long-forgotten sighting, just two and a half weeks later of "nine big round disks weaving northward two thousand feet below us", was reported by an aircrew flying between between Spokane, Washington and Portland, Oregon - prime 'Arnold flying disk' country.

These high-flying disks, nine in number and weaving, just like Arnold's, would normally have been a key, corroborative sighting and would still today be championed as 'proof' of what Arnold witnessed.

Sadly, as you may recall, when historian Ed Stewart uncovered this significant 'British Columbian' article, dated July 12, 1947, it wasn't to be.

That aircrew had eventually been able to identify the 'big round disks' and, as Capt. Gordon Moore confirmed, "We investigated and found they were real all right --- real pelicans".

Still, doubtless all an astonishing coincidence.

Good job their identity was discovered at the time, otherwise to suggest now that these were probably nine White Pelicans, in a typical weaving formation, would naturally have been quite ridiculous.

<

Hmmmm.... where are the descriptions by the crew of bright flashes from the pelicans which were "2000 ft below) (below what?)

Here was a sighting from above, I presume. And the plane apparently easily overtook the pelicans. Unfortunately this sighting is not as well reported as Arnolds. Perhaps you can say what was the location, time, date, sky condition, direction of travel of the aircraft, direction of travel of the pelicans, altitude of the aircraft, whether any deviation was made to investigate the pelicans, the initial azimuth and depression angle to the pelicans, the closest approach, the final direction, etc.

But I doubt it.

Comparison with Arnold?

Not really.

One crucially important factor you have not considered in all the argument about the Arnold case and your question of "where to go from here?" is whether the Arnold case would ever pass a reasonable OBJECTIVE set of criteria for UFO Best Evidence. I contend that it does not and that it is unfair to judge and condemn the UFO phenomenon on the basis of a case that fails to meet the standards for Best Evidence. For years now I have been posting certain Screening Criteria for UFO Best Evidence for basic visual sightings (not intended for instrument, radar, photo, landing trace cases, etc.):

- (a) Minimum Duration: 1 minute.
- (b) Minimum Angular Size: Full Moon (1/2 deg).
- (c) Minimum Number of Witnesses: 2.

Obviously the Arnold case would not meet these basic minimum standards. Without going into a long justification, let me just point out that Hynek had a requirement for MULTIPLE WITNESSES (see The UFO Experience) because there is just too much possibility of strange personal idiosyncrasies and with multiple witnesses one can calibrate the observations of one witness against another. Some UFOlogists object to these standards as too strict -- but surely there are many multiple witness UFO cases that meet a 1-minute minimum duration and half-degree angular!!!!

>

I second Brad on that. My beef about the Arnold case isn't that it is the paragon of all sightings (there were, after all, about 2 dozen other sightings on the same day, one of which was Fred Johnson.... did he see pelicans?)

My beef about that is..... garbage explanations that contradict basic aspects of the sighting information. If we had NO information on sighting duration, direction to objects and flight paths of airplane and objects.... as with your often cited 9 pelican sighting ..... then we could move away from the Arnold sighting and consider it only as the "bell ringer" that alerted the nation to strange things flying around.

There certainly ARE better sightings.... some of which may have even popped up on this list (e.g., White Sands, April 1950., Rogue River, Oregon, May 1949, C. B. Moore of Mogul fame - April 24, 1949, etc.)

SNIP

>

For all the thundering that Bruce and I have done goading you to "DRAW A MAP" for the Arnold case to force you to work out what are in actuality unworkable and impossible details of your pelican theory (the real reason why you won't draw a map for a bird scenario, because you can't and no one can), it is ironic that NO ONE had ever drawn and published a detailed map of the Arnold case in 50+ years, not Arnold, not anyone. Even though Arnold did mark a map (he is photographed with one in 1947) he never published it. It is such a fundamental and elementary piece of investigation -- a map for a sighting covering an enormous geographic range and for which geographic landmarks (Mts. Rainier and Adams) are such a crucial and integral part of the case (the famous "clocking" that determined the impossibly high speed that made it an Unknown and put it on headlines around the world, launching the whole era of "flying saucers"). Yet it had never been done in 50 years of UFOlogy (or at least not until Bruce did one and posted it, last year I think, 1999).

>

Yes indeed. the Arnold sighting was never really "investigated". It was only reported, on would hope reasonably accurately, by the witness. (McDonald got close to an investigation. Others dd, of course, ask some questions. But no one established a real complete time line or map and the best we can do now is make some reasonable guesses based on wat Arnold reported.)

You might be interested in this statement on the case prepared by UFOIN

Best wishes,

Jenny Randles

Hi,

In light of extensive requests for information and comment about the widely promoted 'Cheshire Video', the UFO Investigators Network has agreed the following statement which is being sent in reply.

The Cheshire Video:

In recent weeks there has been much discussion about what has been hailed as a highly significant piece of video taken in Hartford, Cheshire, UK on 9 July 2000. Press releases by Tim Matthews and Eric Morris of the BUFOSC, a small Cheshire based UFO group, have reported that these daylight images are amongst the best footage ever taken.

UFOIN has been carefully investigating the circumstances surrounding this case since before the press releases were sent around the world and been collecting considerable evidence. Whilst we are willing to accept that this case may have been sincerely reported we are not able to endorse the significance of this footage in terms of useful scientific evidence for anything unexplained.

In our opinion a fairly typical piece of daylight video of an undefined object has been promoted well beyond its importance . We would not speculate on the motives for this, of course, but would point out that very little hard evidence of investigation or useful case data has been made available and that we have seen nothing as yet that persuades us that the object could not be a balloon. The object appears of only modest size, is below low cloud and moves slowly in a manner not inconsistent with this possibility. It is the opinion expressed to us by over 90% of experienced UFOlogists who have seen the footage. Other comments include 'it could be anything' and 'not up to much'.

Even if the balloon diagnosis ultimately proves incorrect, the footage cannot, in our opinion, justify the label of being important scientific evidence and resembles many other similar pieces taken all over the world - few of which have been given such a degree of spin doctoring.

Allegations in some sources about air band radio messages and an aircraft possibly being scrambled out of the way have not been verified by our investigations with nearby Manchester air traffic control. They informed us that they made no radar tracking, were advised of no sightings by inbound or outbound air crew and had no knowledge of air traffic being moved out of the path of any UFO that day. In the absence of contrary evidence such information seems to suggest that this aspect of the case should not be considered of further interest.

UFOIN intends to keep on top of this case and has uncovered many other enlightening details. We suggest that you observe our web site [www.ufoin.org.uk](http://www.ufoin.org.uk) in order to see new messages that update our findings. And in the meantime observe a cautious approach to this case beyond considering it as just another piece of unverified evidence.

UFOIN (UFO Investigators Network)

Pierre Stromberg's 'Pacific Northwest Skeptics' web site currently features a paper which may be of interest. The 'Coso artifact', sometimes touted as evidence of an ancient, highly advanced civilisation, or something that fell off an alien spaceship, etc., seems to have been positively identified.

The full story can be read at:

<http://www.eskimo.com/~pierres/coso/coso.html>

As an aside, the web site also carries a notable, short article entitled, "Washington State's UFOs of 1897 and 1947 - Lessons from History", by Robert Bartholomew - see:

<http://www.eskimo.com/~pierres/washufo.html>

Larry Robinson S/AP/EIS lrobin@indiana.edu  
Indiana University (812) 855-5073 Room 42  
Kinesiology Dept http://php.indiana.edu/~lrobin  
1025 E 7th St Rm 112 HDTV and taxes killed RCA.  
Bloomington IN 47405-7109

@ Quite some story - a UFO which could manoeuvre at 'fantastic'  
@ speed, could easily outrun a helicopter, which appeared to fire  
@ three times at the helicopter and all of this was observed by  
@ multiple witnesses, who were highly experienced police officers.

Here are some more such cases. In both cases, the identity of the fire  
balloon was later confirmed:

10/20/73 Baton Rouge Louisiana. A police helicopter chased a UFO  
that turned out to be a fire balloon. Thousands in a stadium saw the  
chase. Police on the ground recovered the fire balloon when it landed.  
Here is another case I suspect to be another fire balloon:

4/17/66 Atwater Ohio to Conway Pennsylvania. Two deputy sheriffs  
chased a UFO from Atwater Ohio to Conway Pennsylvania. Along  
the way, two more police officers joined the chase.

@ Difficult to see how this could easily be explained.  
@  
@ Who would have thought the UFO was simply a 'fire balloon'.  
@  
@ Apparently that is the explanation (makes a bit more sense than a  
@ small, pear-shaped, aggravated, alien spacecraft) and it was  
@ published in Paul Fuller's excellent 'Crop Watcher' magazine -  
@ see:.  
@  
@ <http://www.overflite.com/news11.html>  
@  
@ If someone can confirm the exact date of this 'close encounter'  
@ and whether there were any further developments in the case, I  
@ would be interested to know.

2/26/93 Jefferson County Kentucky. A police helicopter, sent to  
investigate a UFO report, tried to catch up to an object the officers  
said was larger than their helicopter. They also said that the UFO  
made "ramming attacks" on the helicopter. Meanwhile, people on the

ground reported that the helicopter kept flying past the object. That alone showed me it was a probable fire balloon.

Once the sighting made the papers, the person who launched the fire balloon for a weather experiment came forward.

I looked into this one when it happened, but the balloon launchers came forward with the solution before I had all of the data.

The Coyne case was:

11/18/73 Cleveland/Mansfield Ohio

@ What might have caused the three 'fireballs'?

Candles melting free from the crossbars and falling. See my diagram at:

<http://php.indiana.edu/~lrobbins/candbal.htm>

@ Has anyone else realized how this relatively little-known case  
@ contains notable elements of the more celebrated October 18, 1973  
@ 'Coyne' helicopter incident?

@

@ Is it just a coincidence that two of the ground based witnesses  
@ reportedly described the Coyne UFO as "like a blimp" and "sort of  
@ pear shaped"? See, for example:

@

@ <http://www.nwlink.com/~ufocntr/interlink/Coyne.html>

@

@ Could it have been a balloon or blimp - perhaps similar to the  
@ "multicoloured spaceship" which was seemingly part of a 'UFO  
@ flap' occurring in October 1973 - see:

@

Subject: Re: The Coyne Helicopter IncidentStatus:

The case is strangely missing date and exact location; needs duration data etc. It's possible the "three fireballs" were three candles flaming out or three balsa struts catching fire. It's hard to imagine a flimsy fire balloon made of dry cleaner bag being able to withstand the turbulent force of a helicopter and if traveling at 100 mph the ballloon certainly could not keep up. Without duration data there is no comparison to the Coyne helicopter case.

I have the original newspaper articles. I will look up this item and respond.

Here's what happened:

The officers decided to investigate the UFO.

They assumed it was much bigger and much farther away than it was.

They tried to close in on it.

The UFO appeared to make "ramming attacks" on the helicopter at fantastic speeds.

Actually, the helicopter rapidly closed on it and passed it. Since the crew greatly overestimated its size, they also overestimated the speed and distance.

The avoiding action the helicopter took to prevent the collision kept it from destroying the fire balloon.

Meanwhile, the people on the ground saw the helicopter repeatedly pass the UFO, as though it couldn't find it. They did NOT see the violent motions the helicopter crew reported.

Just an aside here on balloons and helicopters.

Margaret Burke-White, LIFE magazine photographer, once circled my 35,000 cubic foot helium balloon with five officers on board at about 150 foot radius. After one or two cycles, witness said the helicopter stood motionless, turning as the balloon circled the helicopter. Then both descended slowly until the chopper saw the altitude loss and broke off. The evolution was repeated twice with the same effect.

Now imagine the case of a very small candleloon and how the turbulence could make it react...

By the way, she was wearing a knee length skirt and sitting on the floor between the two pilots, with the chopper point directly at us all the time.....

Compare that

Well, one was in Ohio, the other Kentucky. One fits the profile of a meteor fireball excepting certain details, the other fits the profile of a hot-air balloon excepting certain details. Other than that they're both really "fantastic."

From: Andy Roberts <Brigantia@compuserve.com>  
Subject: WWII UFO Study?  
charset=ISO-8859-1  
Content-Disposition: inline  
Status:

Hi,

Does anyone have any information on the following:

In the somewhat murky early history of the UK government's involvement with UFOs it is often mentioned (latterly by Good & Redfern) that the whole cover up kicked off with a study from WWII.

This study was allegedly carried out by someone called General Massey name.

In trying to track this story down all roads seem to lead back to Frank Edwards' 'Flying Saucers Serious Business' book. But Edwards doesn't reference his source and indeed worsens matters by referring to the alleged 'disc' sightings on the Schweinfurt raid of 14/10/43 (which, incidentally I have found nothing on in the PRO and the PRO reference he gives is gibberish).

So, does anyone out there have any other sources for this tale about 'Massey' and his foo-fighter study, or indeed any other useful references to the UK Government's early UFO involvement (besides the obvious stuff).

Also, has anyone any suggestions how best to contact any grouping of UK aviation historians?

Thanks,

Happy Trails

Andy

In a message dated 8/7/00 10:07:20 AM Eastern Daylight Time,  
voyager@ufoworld.co.uk writes:

<< Police Chopper Attacked By UFO In Kentucky! >>

Hi all. I do believe this appeared in the book "UFO Invasion" and was written about by Joe Nickell (The article originally appeared in the skeptical Inquirer #18 - Fall 1993).

The article begins as :

"UFO Fires on Louisville, Ky. Police Chopper" was the Headline on the Weekly World News's May 4 cover story, complete with fanciful illustration.

I am not so sure if I can reproduce the full article here but it is pages 194-5 of the book. Apparently the incident occurred on February 26, 1993 and was initially published in the Louisville Courier-Journal on March 4, 1993. The Louisville Courier-Journal did a follow-up on March 6th and discovered the source of the fire balloon was that of Scott and Conchys Heacock. They had made it out of a dry cleaning bag, balsa wood, and a dozen birthday candles. The Nickell article then reads:

"The encounter was a comedy of errors and misperceptions. Likened to a cat chasing its tail, the helicopter was actually pushing the light-weight device around with its prop wash. In fact, as indicated by the officers own account, the UFO zoomed away in a response to the helicopter's sudden propulsion - behavior consistent with a lightweight object. As to the "fireballs", they may have been melting , flaming gobs of plastic or candles that becam dislodged and fell, or some other effect. (Heacock says he used the novelty "relighting" type of birthday candles ass a safeguard against the wind snuffing them out. Such candles may sputter, the abruptly reflare.)..."

"...a television reporter asked Scott Heacock how certain he was that his balloon was the reported UFO. Since he witnessed the encounter and kept the balloon in sight until it was caught in the police spotlight, he replied: "I'd bet my life on it."

I hope this helps.

>useful references to the UK Government's early UFO involvement

>(besides the obvious stuff).

Andy,

Although you may have seen this before, there's some related material on the CUFON web site at:

[http://www.holman.net/ufo/archives/mfiles/History\\_of\\_UFO's\\_During\\_WW2.html](http://www.holman.net/ufo/archives/mfiles/History_of_UFO's_During_WW2.html)

>Also, has anyone any suggestions how best to contact any

>grouping of UK aviation historians?

If you're looking for information about the Schweinfurt raid on 14/10/43, there's a book which apparently has some 50 first hand accounts from aircrew members who participated - see:

<http://www.airpower.maxwell.af.mil/airchronicles/bookrev/kuhl.html>

l

[These URLs will wrap around]

Also noted from a brief Internet search was another mention of a UFO related aspect to the Schweinfurt raid. Unfortunately, I don't know if it's of any value as this is located on a

Czechoslovakian web site and it isn't in English! See:

<http://www.ufo.cz/pozorovani/nemecko.htm>

Maybe someone can help translate this.

James Easton.

For anything to do with WW2 aviation stuff, your first stop could be the RAF Museum at Hendon.

Steve

Sent: 07 August 2000 20:09 Subject: WWII UFO Study?

Hi,

Does anyone have any information on the following:

In the somewhat murky early history of the UK government's involvement with UFOs it is often mentioned (latterly by Good & Redfern) that the whole cover up kicked off with a study from WWII.

This study was allegedly carried out by someone called General Massey name.

In trying to track this story down all roads seem to lead back to Frank Edwards' 'Flying Saucers Serious Business' book. But Edwards doesn't reference his source and indeed worsens matters by referring to the alleged 'disc' sightings on the Schweinfurt raid of 14/10/43 (which, incidentally I have found nothing on in the PRO and the PRO reference he gives is gibberish).

So, does anyone out there have any other sources for this tale about 'Massey' and his foo-fighter study, or indeed any other useful references to the UK Government's early UFO involvement (besides the obvious stuff).

Also, has anyone any suggestions how best to contact any grouping of UK aviation historians?

Thanks,

Happy Trails

Andy

I think that's the stuff which regurgitates the 'Sonderburo', alleged German foo fighter study. CUFON need to change it because Henry Durrant admitted he'd made it up as a hoax for his book back in the 1980s.

[http://www.space.com/sciencefiction/phenomena/russian\\_ufo\\_report\\_000808.html](http://www.space.com/sciencefiction/phenomena/russian_ufo_report_000808.html)

By Jim Oberg

In an special report obtained by SPACE.com, two of Russia's leading UFO investigators have summarized the results of the Soviet Union's official 13-year study of UFO reports.

They maintain that the Western media claims of "secret KGB files" and "captured aliens" are untrue.

"One can hardly imagine a greater absurdity," they write, although they do admit that their own research program (1978-1990) was indeed classified "SECRET" at the time and that there remained cases that could not be explained.

The investigators, Dr. Yuliy Platov of the Academy of Sciences and Colonel Boris Sokolov of the Ministry of Defense, wrote up their conclusions for an issue of the official Reports of the Academy of Sciences journal, published in Moscow. Dr. Platov forwarded an advance copy of the report to SPACE.com.

"Many people are the eyewitnesses of strange things," the writers report, "which cannot always be precisely identified with natural or man-made effects. However, this amount is very insignificant, and from this there does not follow even a 'hint' of the probable interference of extraterrestrial forces into our lives."

...

The official groups did not use the term "UFO" (or "NLO" in Russian). Instead, they referred to "paranormal phenomena." But everyone involved in the project knew exactly what this meant -- any apparently unexplainable aerial apparitions.

Military secrets

Platov and Sokolov explain that from the start, the teams "assumed a high probability of a military-technical origin of the observed strange effects."

This was based in large part on the iron-clad identification of the "Petrozavodsk UFO" with the launching of a spy satellite from a secret nearby base. But this factor dictated that the study be kept secret because most of the suspected causes were already military secrets.

Another reason for secrecy was "to decrease a public resonance" regarding

the reality of UFOs -- a "resonance" that would only grow if the government's formal interest were known.

Finally, there was the possibility of military application of discoveries regarding some of the perceived properties of UFOs such as radar invisibility and high maneuverability.

Sokolov himself is widely quoted on Internet UFO pages endorsing this last possible benefit of UFO research. However, his more prosaic explanations for some "classic" Russian UFO cases failed to show up on several search engines I tried.

The biggest UFO network ever

In January 1980, the Soviet Ministry of Defense issued a directive to all military forces to report "any inexplicable, exotic, extraordinary phenomenon". Sokolov described how this essentially converted millions of military personnel across one sixth of the Earth's surface into a sensory network for UFOs. "It is not likely that anybody could organize such a large-scale research," he boasted, "and practically with no financing."

Over the course of more than a decade, Platov's and Sokolov's teams together collected and analyzed about 3,000 detailed messages, covering about 400 individual events.

A pattern soon emerged.

"Practically all the mass night observations of UFOs were unambiguously identified as the effects accompanying the launches of rockets or tests of aerospace equipment," the report concludes. These sightings were mainly associated with activity at the secret rocket base at Plesetsk, north of Moscow.

In about 10-12 percent of the reports, they also identified another category of "flying objects," or as they clarified it, "floating objects." These were meteorological and scientific balloons, which sometimes acted in unexpected ways and were easily misperceived by ground personnel and by pilots.

Specifically, Platov and Migulin describe events on June 3, 1982, near Chita in southern Siberia, and on September 13, 1982, on the far-eastern Chukhotskiy Peninsula. In both cases, balloon launches were recorded but the balloons reached a much greater altitude than usually before bursting. Air defense units reacted in both cases by scrambling interceptors to attack the UFOs.

"The described episodes show that even experienced pilots are not immune against errors in the evaluation of the size of observed objects, the distances to them, and their identification with particular phenomena," the report observes.

...

## Nobody's abducting Russians

The official investigators also point out a striking absence of certain types of reports from their files. "In contrast to numerous descriptions of various kinds of contacts with aliens," they write, "there has not been obtained, within the framework of the project which involved the great observational potential of the army and civilian organizations, any message about UFO landings, any message about contacts with pilots of UFOs, any message about the abductions of individuals by UFOs."

"This means," they conclude, "that either the territory of the USSR was, due to any reasons, closed for alien visitations during, at least, 13 years, or that the hypothesis of an extraterrestrial origin of UFOs is inconsistent. Any serious investigator of the problem of UFOs should, at least, face this reality."

Platov and Sokolov clearly are aware that popular press reports, both in Russia and in the West, will undoubtedly still refer to "Soviet UFO secrets." In the harsh economic conditions of post-Soviet Russia, many people, especially military veterans, will continue to be willing to tell any story that other people are willing to pay for.

But their insider positions in one of Earth's greatest government UFO investigations, and their evident lack of any motivation aside from telling the truth as they found it, will make their report a significant contribution to our understanding of what really has been happening regarding this mysterious and fascinating subject.

This study was allegedly carried out by someone called General Massey name.

In trying to track this story down all roads seem to lead back to Frank Edwards' 'Flying Saucers Serious Business' book. But Edwards doesn't

reference his source and indeed worsens matters by referring to the alleged 'disc' sightings on the Schweinfurt raid of 14/10/43 (which, incidentally I have found nothing on in the PRO and the PRO reference he gives is gibberish).

So, does anyone out there have any other sources for this tale about 'Massey' and his foo-fighter study, or indeed any other useful references to the UK Government's early UFO involvement (besides the obvious stuff).

Also, has anyone any suggestions how best to contact any grouping of UK aviation historians?

Thanks,

Happy Trails

Andy

Is anyone here familiar with how to interpret "Flight Strips" and decode some of the acronyms that appear in a ACT Log? I would appreciate any help anyone here could give me, or a shove in the right direction for obtaining this information.

Thank You,

I had presumed any references to the purported 'UFOs' might be  
couched in different terminology - 'unusual anti-aircraft  
artillery', 'possible German secret weapons' or such-like.

If there is no mention of anything remotely in that category and  
given this does seem to be a comprehensive first-hand account, it  
does seem reasonable to perhaps conclude the claims of related  
'disc sightings' are a myth.

Rotsky,

I've scanned pg. 2 of 4, which can be obtained at  
<http://members.home.net/tlemire/misc/flitstrp.bmp>

To give you an idea of the area, these were strips obtained from  
the Toledo, Ohio ATC on July 1, 2000 between the hours of 10:00  
p.m. and 1:00 a.m. July 2, 2000

2 related links for interpretation are located at

<http://www.ivpa.com/vta/faao7110/65Jtx02b.htm>  
<http://www.cyberair.com/tower/dpa/atc.html>

Thanks,  
Todd Lemire

Larry,

I actually printed out that entire page and brought it to work with me in order to interpret what I could of these flight strips. Of all the information available on these flight strips I can find nothing on aircraft bearings. It seems that within the image I've posted online for review, there are a few, what I'm assuming to be directional headings for a few overflights of the Toledo Airport expressed in terms of NW, NE, etc., but nothing on the arriving and departing flights.

Todd

Maybe that's because you misunderstand the purpose of the flight strip. It is not there to keep a record of everything about the flight. It is there to keep a busy controller from forgetting that he has that flight under his control. If a controller forgets an airplane he has control over, the results can be terrible.

In the days of manual block control of railroads, the worst thing a signalman could do was to forget a train. If he did so, and then accepted another train on the same track, a terrible disaster was the result. The solution for this was the train register. Every time the signalman accepted a train from another station (required before the train is allowed to leave the station), he entered it, and the time, in the train register. Stoppages and diversions onto sidings were recorded too. When the train leaves, the time the train was accepted into the next station's block, and the time it actually left the area under his control are entered into the book. Incomplete entries mean that the train is still under his control (for example, if it is shunting in the yards).

Air traffic control is very much like the control of trains on a railroad. Notice that the important entries in the flight strips are the TIMES: when the airplane was accepted by the controller, when RADAR fixes occurred, and when the flight was handed off to another control center, or to approach control. The practice of the train register book made its way into the practice of air traffic control. But since there are many controllers at one site, the book is divided into tear-out strips, and each strip is given to the controller given charge of its flight. As the flight is handed off to another control center, the time of that is noted, and the strip is collected by a runner, and placed in the day's records.

Notice that, if the plane lands, there could be as many as 5 strips for it, especially if the various controllers are not located in the same rooms (or buildings). ATC normally hands the flight off to approach control, which keeps its own strips. Then when the plane lands, ground control either gets the approach control strip, or keeps another strip on it. When the plane is ready to take off, ground control then hands the plane off to departure control, which either gets the strip from ground, or makes another one. Finally, when departure control hands off the plane to ATC, a new strip for it is made at the ATC center.

If the plane is taken in for maintenance by the airline at that airport, even more strips could be generated.

For regularly scheduled flights, the direction that particular flight takes is repeated day after day, or week after week, so it is unnecessary for the controller to write it down. The flight designation is usually enough. Only in the case of charter or special flights will that information normally be on the strip.

I learned something very interesting a few months ago. Most air traffic control systems no longer have primary skin reflection RADAR capabilities. They rely entirely on transponders. This means that they do not detect any planes without transponders. They also do not detect UFOs anymore.

What a frighteningly primitive 19th century system! Thousands of people's lives hinge on such a cumbersome, error-prone system -- I mean, what if a runner/messenger has to use the restroom on his way to another control building? What if he loses a strip among possibly dozens at a busy airport like Chicago's O'Hare? And here we've been misled to believe that air traffic control has high-tech display screens to graphically keep track of every flight and electronic intercoms to communicate between buildings, not \_runners\_ for God sake!

In a message dated Fri, 11 Aug 2000 1:41:29 PM Eastern Daylight Time, "Robinson, Larry" <lrobin@indiana.edu> writes:

You misunderstand. The runner picks up the strips AFTER the controller is finished with them, and deposits them in the records. Actual acceptance of the flight is handled by radio. If the offering controller is in a different location, the accepting controller is given a new strip shortly after accepting the flight. The single coordinating controller has the exclusive job of making and coordinating the flight strips in that room, so that two controllers don't inadvertently accept the same flight. Only if the controllers are in the same room are strips ever handed from one controller to another, and the coordinating controller does that. And whenever any controller has to take a break, another controller is on standby to replace him.

No electronic device has the tangible safeguard of the flight strip. Possession of the flight strip means that that controller has exclusive control of that aircraft, until he closes it out by filling out the part where the aircraft is accepted by another control center. Its purpose is to handle WHO is in control of a given aircraft, not what instructions are given to the aircraft.

And guess what: It works even during an electrical failure!

The lives of hundreds of passengers of, say, a 747 depends on one little strip of paper!!!! What about backups and failsafes? You talk about the paper strips somehow "working" even if there is a power failure but if the outage is that bad then there is no communications or transponder-radar data to even know there is an aircraft out there to record on a paper strip.

This is the first I ever heard of a problem of air traffic controllers "remembering" what flights are up there in their jurisdiction, and having to be reminded by little papers. If someone told me this was how the Soviets did it I could believe that. But here it is 31 years after we landed a man on the moon and this is how controllers "remember" whether they have 500 passengers up there in a 747 or not?????????

You have turned the question around. I was not answering the question: "Why are UFOs investigated?" I was answering the question "Why does the military do the investigating?"

The stock answer was "Because THEY are invading."

But the main reason the military has a mechanism in place for the quick reporting of UFOs is still the reality of foreign military threats. And that's why they have the job.

You still misunderstand the purpose of the strip. It is to make sure that one, exactly one, and only one controller is in control of a flight. If a second copy of the strip existed, then it would be possible for two controllers to give conflicting commands to an aircraft. It is similar to a deed or the title to a car, in that there can be only one.

Having that strip of paper gives the controller authority to control that aircraft. Without it, he can't intervene except in an imminent crash. It's like a legal document.

What do they use when the RADAR goes out? A chalkboard and radio reports of GPS positions - and the flight strips. They do have backup radios.

Why do controllers have trouble remembering whether or not they have a flight? They work the same flights day after day, and sooner or later, a controller will "remember" yesterdays flight, or forget one. With the paper in hand, the chance of error is greatly reduced.

You seem to think that maybe each controller has only one flight at a time to handle. The number is closer to 12, and they keep changing minute by minute. That little strip has the airplane's call sign on it too - the identifying link between pilot and controller.

I'm grateful for all responses to my queries and note Don's informative first-hand experience!

It seems proven - Larry and Tim's references being of immense value - that the 'UFO Fires on Louisville, Ky. Police Chopper' incident is explained by a 'fire balloon' and the three fireballs were probably candles, perhaps being expelled due to turbulence, or simply falling to ground.

Quite extraordinary that such an ostensibly dramatic UFO encounter, especially involving experienced personnel, has an incredibly simple solution.

I suspect if the source of our 'UFO' had never been revealed by Scott and Conchys Heacock, any suggestions the helicopter crew might have encountered a fire balloon would have received due ridicule. It's similar in this respect to the July, 1947, aircrew's sighting of "nine big round disks weaving northward two thousand feet below us", which would, guaranteed, have been a celebrated 'flying saucer' sighting, contemporary to Kenneth Arnold's, if it had never been discovered, at the time, that they were a formation of pelicans.

How many other seemingly inexplicable cases have a comparatively mundane explanation - 5-10%, 50%, 95%, all of them... who knows.

A prime difficulty is, as evidenced by these two of certainly many examples, that UFO cases rarely leave us with anything other than anecdotal evidence. Yet, these can often be relatively (all things considered) accurate and detailed accounts, it's the interpretation, both during an incident and particularly afterwards, which can result in the 'UFO' status.

A comprehensive report on the October 18, 1973, Coyne 'helicopter' encounter with a 'UFO' can be found at:

[http://www.jse.com/ufo\\_reports/Zeidman/toc.html](http://www.jse.com/ufo_reports/Zeidman/toc.html)

This is a copy of by Jennie Zeidman's paper, published online by the 'Society for Scientific Exploration' and which in 1998 formed part of the 'best UFO evidence' presented to the 'Sturrock panel' - see:

[http://www.jse.com/press/PR\\_UFO\\_98.html](http://www.jse.com/press/PR_UFO_98.html)

As I previously noted, the object encountered near Mansfield, Ohio seems to have resembled a blimp and my further, cursory research notes that Goodyear have a large facility at Akron, Ohio, not that far from Mansfield.

I may have missed this in a brief review of the case evidence, however, was it determined that Goodyear, Akron were not flying blimps or anything related during October, 1973 and if they did, that there was definitely no connection?

James Easton.

James,

Your blowing smoke again. You claim these MARGINAL, virtually uninvestigated incidents are relatively "detailed and accurate." Yet we don't have DURATION or ANGULAR SIZE or virtually any other meaningful quantitative data for either one! The alleged pelican sighting and fire balloon-helicopter incident would never qualify as UFO Best evidence under any reasonable quantitative criteria such as I've proposed.

Brad

In a message dated Fri, 11 Aug 2000 7:20:32 PM Eastern Daylight Time, "James Easton" <voyager@ufoworld.co.uk> writes:

<<

I'm grateful for all responses to my queries and note Don's informative first-hand experience!

It seems proven - Larry and Tim's references being of immense value - that the 'UFO Fires on Louisville, Ky. Police Chopper' incident is explained by a 'fire balloon' and the three fireballs were probably candles, perhaps being expelled due to turbulence, or simply falling to ground.

Quite extraordinary that such an ostensibly dramatic UFO encounter, especially involving experienced personnel, has an incredibly simple solution.

I suspect if the source of our 'UFO' had never been revealed by Scott and Conchys Heacock, any suggestions the helicopter crew might have encountered a fire balloon would have received due ridicule. It's similar in this respect to the July, 1947, aircrew's sighting of "nine big round disks weaving northward two thousand feet below us", which would, guaranteed, have been a celebrated 'flying saucer' sighting, contemporary to Kenneth Arnold's, if it had never been discovered, at the time, that they were a formation of pelicans.

How many other seemingly inexplicable cases have a comparatively mundane explanation - 5-10%, 50%, 95%, all of them... who knows.

A prime difficulty is, as evidenced by these two of certainly many examples, that UFO cases rarely leave us with anything other

than anecdotal evidence. Yet, these can often be relatively (all things considered) accurate and detailed accounts, it's the interpretation, both during an incident and particularly afterwards, which can result in the 'UFO' status.

A comprehensive report on the October 18, 1973, Coyne 'helicopter' encounter with a 'UFO' can be found at:

[http://www.jse.com/ufo\\_reports/Zeidman/toc.html](http://www.jse.com/ufo_reports/Zeidman/toc.html)

This is a copy of by Jennie Zeidman's paper, published online by the 'Society for Scientific Exploration' and which in 1998 formed part of the 'best UFO evidence' presented to the 'Sturrock panel' - see:

[http://www.jse.com/press/PR\\_UFO\\_98.html](http://www.jse.com/press/PR_UFO_98.html)

As I previously noted, the object encountered near Mansfield, Ohio seems to have resembled a blimp and my further, cursory research notes that Goodyear have a large facility at Akron, Ohio, not that far from Mansfield.

I may have missed this in a brief review of the case evidence, however, was it determined that Goodyear, Akron were not flying blimps or anything related during October, 1973 and if they did, that there was definitely no connection?

Larry,

I wonder if these call signs are a permanent part of that aircraft's identification? In other words does that particular aircraft's call sign stay with that aircraft \_wherever\_ it flies? Could it be similar to a "license plate"?

Brad,

No question about this and even moreso - which seems to be rarely appreciated - the USAF has acknowledged some cases were so puzzling they could not be explained.

Are you familiar with former Air Force Chief of Staff, General Curtis Le May's comments in his autobiography?

>Other countries have admitted likewise, e.g., France as  
>indicated in the COMETA report, etc. Even the secret Soviet  
>military-scientific investigation of 1978-90 has now revealed  
>that it operated on the basis of three main theories of UFO  
>origin: manmade, natural and ET civilization. To deny this  
>indisputable fact as you have done is ludicrous.

It's a natural consequence that countless UFO sightings or reported incidents will remain enigmatic, however, it's surely recognised by now that 'UFOs' are of insignificance to the USAF, RAF and science per se.

It's certainly not advocated they should be, however, they are.

As long-standing ufologists have highlighted elsewhere, the COMETA report is hardly an objective, critical assessment of the most significant 'UFO' evidence.

It cites the 1956 Lakenheath, 1976 Teheran and 1981 Trans-en-Provence cases as 'best evidence', all of which are far removed from critical indications of alien encounters - the most unlikely explanation of all.

Incidentally, an in-depth dismissal of the latter, can be found at:

'Trans en Provence : le mythe de l'OVNI scientifique'

<http://zetetique.ldh.org/tep.html>

Devastatingly worse than this, the COMETA report recommends that the farcical claims of 'Colonel Philip Corso' should be taken seriously.

As Dennis Stacy, former editor of the 'MUFON Journal' (I'm sure you appreciate how Dennis was 'sacked' as Editor because he had the courage to critically appraise 'Roswell') commented on UFO UpDates:

"There was a genuine Col. Corso, if that's what you mean.

Unfortunately, that doesn't necessarily mean that even 10% of his book is true, never mind its "core."

What is its core, BTW, that virtually all the major American technological breakthroughs since 1947, were seeded out to industry by Corso himself, from UFO debris he found languishing in a file cabinet in the Pentagon? That he almost singlehandedly won a spurious Cold War and saved humanity from alien invasion?

It helps sometimes, you know, to take a step back from some of this stuff. And that would apparently include a few high-ranking French military officers".

If all of this represents 'best evidence', we can only be thankful of being spared the worse.

Unfortunately, we seldom are and that's the essence of contemporary ufology.

Choose any current 'UFO' magazine or recent/impending conference and highlight, if you can, something which resembles ufology's scientific approach to the subject, as opposed to the promotion of absolute, gullible, yet recognised to be profitable, nonsense.

You have, as they say, the floor...

James Easton.

Brad,

No question about this and even moreso - which seems to be rarely appreciated - the USAF has acknowledged some cases were so puzzling they could not be explained.

COMMENTS: I think the number of USAF unexplained cases was about 700.

Are you familiar with former Air Force Chief of Staff, General Curtis Le May's comments in his autobiography?

COMMENTS: Please remind me.

>Other countries have admitted likewise, e.g., France as  
>indicated in the COMETA report, etc. Even the secret Soviet  
>military-scientific investigation of 1978-90 has now revealed  
>that it operated on the basis of three main theories of UFO

>indisputable fact as you have done is ludicrous.

It's a natural consequence that countless UFO sightings or reported incidents will remain enigmatic, however, it's surely recognised by now that 'UFOs' are of insignificance to the USAF, RAF and science per se.

It's certainly not advocated they should be, however, they are.

COMMENTS: UFO's are not insignificant to the French military and that's why I cited the COMETA report, not because I was endorsing its UFO case evaluations. UFO's are still required to be reported, under USAF operational reporting regulations OPREP-3 and CIRVIS regs, ordered by AFMAN (AF Manual) 10-206 para. 5.7.3. This is still in effect and has effectively superseded AFR 200-2, AFR 80-17, AFM 55-11, AFR 55-88, and indirectly superseded the now canceled US-Canadian JANAP-146(E) by apparently continuing the CIRVIS regs. Also the OPREP-3 procedures provide for reporting events or incidents of importance to the national-level, called OPREP-3 PINNACLE (OPREP-3P) reports, which include PINNACLE NUCFLASH reports (OPREP-3PNF), which includes in para. 3.3.2 of AFMAN 10-206:

"Detection of unidentified objects by a missile warning system or interference (experienced by such a system or related communications) that appears threatening and could create a risk of nuclear war."

This is in addition to the existing regulations for CIRVIS UFO reports and PINNACLE reports of anything that an AF reporting unit thinks requires reporting (i.e., including UFO's).

As long-standing ufologists have highlighted elsewhere, the COMETA report is hardly an objective, critical assessment of the most significant 'UFO' evidence.

It cites the 1956 Lakenheath, 1976 Teheran and 1981 Trans-en-Provence cases as 'best evidence', all of which are far removed from critical indications of alien encounters - the most unlikely explanation of all.

COMMENTS: The COMETA report also cites my RB-47 case analysis which certainly does qualify as Best Evidence, even if COMETA's evaluations of other cases does represent a consistent or articulated level of evidence.

Incidentally, an in-depth dismissal of the latter, can be found at:

'Trans en Provence : le mythe de l'OVNI scientifique'

<http://zetetique.ldh.org/tep.html>

Devastatingly worse than this, the COMETA report recommends that the farcical claims of 'Colonel Philip Corso' should be taken seriously.

COMMENTS: I have already published several devastating refutations of the Corso nonsense, first on the Web in Nov 1997, then in Skeptical Inquirer in Feb 1998 (both while Corso was still alive; his coauthor was confronted with some of my evidence in Dec 1997), and now in a book chapter on Roswell.

As Dennis Stacy, former editor of the 'MUFON Journal' (I'm sure you appreciate how Dennis was 'sacked' as Editor because he had the courage to critically appraise 'Roswell') commented on UFO UpDates:

"There was a genuine Col. Corso, if that's what you mean.

COMMENTS: Actually there wasn't a genuine "Col. Corso," he was actually LT. Col. Corso.

Unfortunately, that doesn't necessarily mean that even 10% of his book is true, never mind its "core."

What is its core, BTW, that virtually all the major American technological breakthroughs since 1947, were seeded out to industry by Corso himself, from UFO debris he found languishing in a file cabinet in the Pentagon? That he almost singlehandedly won a spurious Cold War and saved humanity from alien invasion?

It helps sometimes, you know, to take a step back from some of this stuff. And that would apparently include a few high-ranking French military officers".

If all of this represents 'best evidence', we can only be thankful of being spared the worse.

Unfortunately, we seldom are and that's the essence of contemporary ufology.

Our own UFO historian, Giuseppe Stilo (whom I turned your message over to), advises me that the first known source for the Massey tale was not Edward's 1967 book but a 1960 military memoirs book by an American author, Martin Caidin: "Black Thursday", published by Dutton. We got a copy of the Italian edition, but would be interested in getting a photocopy of the relevant pages in the USA edition (if anybody reading this can get a copy of it).

Also, it would be interested to learn more about that author. All we know is that he was in the air industry, after WWII, but before his death he'd claimed he had taken part in a flying saucer investigation by "USAF Continental Air Command" as early as 1948. Does this sound as a known or as a new fact to our US fellows more versed in government files? Can anybody check?

Very good information Larry!

But I didn't mean to get an "argument" going.... :) Anyway, I found an interesting sight that will let you plug in the Aircraft ID #'s from these flight strips (ex. N3448S), and it will give back all the registration information, aircraft type, owner etc.

<http://www.flightdata.com>

It was a very helpful site, but I'm still lacking information on those aircraft which carry a different identifier such as T/SF34/A I know what the "T" and "A" stand for but I can't find any information on the SF34 for instance.

>>

Kenny,

I don't know about the other services, but the big one is the DD214. This will identify that the individual was discharged. It also provides codes on the type of discharge. Having recently retired from the Navy, I keep my DD214 in a safe place. Some others may have just allowed their 214s to get lost but if someone is serious about proof of military service, this would be a start.

Whatever that is in the top photo, it's not the sky.

I do believe that, from the descriptions given, that the Hillsdale sighting (and JUST the Hillsdale one) WAS swamp gas.

My pet theory for the main Dexter sighting is that they surprised a bunch of poachers in a camouflaged shelter or swamp buggy. Of course, when the son blurted out his remark, they doused their lights immediately and beat it before the cops came.

And I think most of the police sightings were fire balloons.

Published I believe for the first time, I've uploaded the scan of a map which claims to show exactly where Larry Warren had his supposed encounter in Rendlesham forest.

This was amongst some unpublished case material obtained from the US and I presume the map reference was provided directly by Warren.

It's online at:

[http://www.ufoworld.co.uk/ftp/warr\\_map.jpg](http://www.ufoworld.co.uk/ftp/warr_map.jpg)

So far as I can see, the 'landing site' shown here is not where Warren later claimed the action had taken place. Instead, 'x' marks the spot in almost exactly the same location where Burroughs, Cabansag and Penniston had previously reported the 'UFO' in the early hours of 26/12/80 and also where Halt and company had started their investigations on the night of 27/12/80.

Although Warren's tale itself is arguably not worth spending time on - he's hardly told the same story once - there are some aspects which might be helpful in clarifying another issue.

I would like to know; am I correct in thinking that this is not the same 'landing site' as he later claimed? Also, where exactly in relation to this 'marker' is the farmer's house, which Halt noted was 'glowing' and thought was on fire?

Is it directly east, in front of the field and the same farmhouse which Ian Ridpath photographed - see:

<http://www.ufoworld.co.uk/ridpath1.jpg>

There's a more detailed and similar scale Ordnance Survey map on my web site at:

<http://www.ufoworld.co.uk/bases2.jpg>

As can be seen, the location of Halt's team - confirmed on Halt's microcassette recording - at the same time as Warren's remarkable adventures, encompasses Warren's 'landing site'.

In the previously unpublished 'hypnotic regression' transcript revealed in the last Voyager newsletter, I didn't mention that when Warren describes the UFO, he initially says it's a house! He also thinks it could be on fire.

Another notable difference from his story in 'Left at East Gate' is that whilst therein he describes seeing an airman crouched down and crying, according to Warren's 'regression' the airman is sitting down being sick.

Maybe too much Christmas spirit...

Incidentally, I have had it confirmed that "drugs were rampant" on the base and "easily available".

Also now online are documents I obtained from Trinity House Lighthouse Service re Orford Ness Lighthouse and which definitively confirm the specification others have previously obtained details of, together with an accompanying factsheet - see:

<http://www.ufoworld.co.uk/ftp/orford1.jpg>  
<http://www.ufoworld.co.uk/ftp/orford2.jpg>  
<http://www.ufoworld.co.uk/ftp/orford3.jpg>  
<http://www.ufoworld.co.uk/ftp/orford4.jpg>

Incidentally, an 'informed source' advises:

Georgina Bruni's forthcoming book is called 'You Can't Tell the People' and it will be published by Sidgwick & Jackson on November 10. Amusingly, the publisher has put it in their Religion & Spirituality category!

The publisher's blurb reads as follows:

"The first full investigation into "Britain's Roswell", with a foreword by UFO writer Nick Pope. The world's only officially-recognized UFO sighting took place in the UK. This casebook is an exploration of the "lights in the sky" incident, and possible alien encounter that ensued, of December 1980 at the RAF/USAF Nato airbase near Woodbridge, Suffolk. Previous accounts of this Rendlesham Forest incident have been flawed: a ufologist with an axe to grind or little access to primary sources, or a discreditable single eyewitness account. Georgina Bruni has had access to police, Ministry of Defence and US military sources, along with fresh interviews, and her casebook reveals other never-before-reported incidents in the area, and the treatment meted out to those who wavered from the "don't ask, don't tell"

line of officialdom."

I think you can tell this is going to be a rational, critical treatment, and above all will offer generous credit to all those who have researched the case before.

Or perhaps not.  
[End]

No wonder 'UFO World' is now a 'Skeptic Ring' web site...

I'm pleased to announce the creation of a new Webring:

Scientific UFO Research [SUFOR)

As briefly described therein:

"This web ring features sites which embrace principles of scientific investigation. Participating sites must exhibit a critical, yet objective appraisal of UFO related evidence and demonstrably distance themselves from the non-scientific, often ludicrous, claims promoted to the subject's detriment.

It's expected that comparatively few will meet these standards, however, the objective is to highlight those which do and ensure they are easier to locate amongst the many others in existence".

The criteria and objectives are hopefully self explanatory.  
Applications are welcome and should be made via:

<http://edit.webring.org/cgi-bin/membercgi?ring=sufor;addform>

That basic criteria should of course be unexceptional, especially for any subject which expects to be taken seriously by the media and scientific world.

Please feel free to forward this notification elsewhere.
