Introduction to the Galactic Federation of Light
The Galactic Federation of Light was founded over 4.5 million years ago to prevent inter-dimensional dark forces from dominating and exploiting this galaxy. At present, there are just over 200,000 member star nations, confederations or unions. Approximately 40% are humanoids and the rest are varied forms of sentient beings. Most members of the Galactic Federation are fully conscious beings. To familiarize you with our space family, we will periodically present information about a Galactic Federation member species. We hope that this information will help you identify or validate any experiences you may have had with some of these beings. Our purpose is to foster goodwill and understanding of the star nations that are answering the call of Earth's Spiritual Hierarchy to assist us in our ascension/transformation process.

TAU CETIANS

.....

Subject: Galactic Federation Member Profile - Tau Cetians

Member
Name: The Star Nation of Tau Ceti.
Accepted into the Galactic Federation: Almost 2.5 million years ago. Bear-like mammaloids (the original inhabitants) permitted a human colony from the Constellation of Hercules to settle on their system's fourth planet some 2.4 million years ago.
Location: Closest star to Earth in Constellation of Cetus (the Whale).
Distance From Earth: Approximately 11.8 Light Years.
Life Form Type: Sentient inhabitants are a galactic humanoid and a bear-like mammaloid.
Physical Appearance: Galactic humanoids closely resemble humans from Constellation of Hercules. Three major skin colors: brown (including a copper tone), red, and green (light and dark). Brown-skinned humans have light brown to copper-colored hair, or black to red-orange hair. Eyes range from greens and blues to browns and grays. Males are very well-proportioned and 7 feet to 8.5 feet (2.13 to 2.59 meters) tall. Women range from just over 6.5 feet to almost 8 feet (1.98 to 2.40 meters) in height. Green-skinned humans have light green to blonde or brown hair with green, hazel or steel-blue eyes,

and are the same relative heights as brown-skinned humans. Red-skinned humans have red, orange or blonde hair with red, brown or dark blue eyes, and are also the same size as the other two types of humans. In all cases, females are quite buxom.

Bear-like mammaloids of Tau Ceti are huge, furry Beings with small furry tails and bear-like bodies covered in brown, black or blonde fur. Heads are bear-shaped but with a smaller muzzle. Teeth resemble those of a galactic human rather than of an Earth bear. Eyes are set forward and, like those of humans, are brown, blue or black. Ears, at the side of the head just above the eyes, resemble those of Earth's bears. Highly sentient Beings walk on two legs, hence have a higher center of gravity than bears on Earth. Two muscular arms with paw-like hands containing five stubby claw-laden fingers. Very muscular legs end in very short feet with five stubby toes. Range in height from 9 to 12 feet (2.74 to 3.66 meters).

Special Traits and Abilities: Known for their abilities to design some of most advanced ships in Galactic Federation's exploration fleets. Also considered some of best pilots and navigators in galaxy.

Average amount of sleep needed: Both species require only 1 to 2 hours per day.

Language: Human language is very guttural, like German or Arabic. Bear-like Being's language sounds similar, but is deeper and more guttural.

Mother Ship and Other Craft: Scouts are huge, diamond-shaped, plasma craft about 200 to 250 feet (61 to 76.2 meters) long. Mother ships are usually the command ships of Galactic Federation exploration fleets. They look like a series of multi-layered blood cells in stacks of 20 to 50 cells, and vary from 4 miles to 44 miles (6.44 to 70.84 kilometers) in diameter.

Subject: Galactic Federation Member Profile - Procyonans
Member

Name: The Procyon star-nations.

Accepted into the Galactic Federation: Some 3.5 million years ago. Initially settled over 3.8 million years ago by colonists from Sirius-B, as well as by Amphiboid-Reptoid hybrids fleeing galactic wars in the Constellation of Cancer.

Location: Just above the star Sirius in the evening sky. The brightest star in the Constellation of Canis Minoris, Procyon is a binary star with only the inner, or A, star having inhabitable planets.

The Procyon-A star system consists of six relatively small planets. The human colony occupies the fourth planet, while the Amphiboid-Reptoid colonies are located on the second and third planets from the star.

Distance From Earth: About 11.4 Light Years from Earth.

Life Form Type: Two types of sentient Beings. The first is a pure Lyran-Sirian humanoid type. As on Sirius-B, they are either blue- or white-skinned and are fully conscious. Amphiboid-Reptoid hybrids are slightly taller than humanoids and have green-, brown- or blue-colored skins.

Physical Appearance: Galactic humans of Procyon are typical Lyran-Sirian in appearance and look like typical Earth humans, with two major differences. First, eyes are much larger and appear more alive: color ranges through shades of blue, green and brown. Two smaller ears are attached slightly lower on head. Second, top and rear of head is enlarged to accommodate a larger brain capacity. Like other Lyran-Sirian humans, males are about 6 feet, 6 inches (1.83 meters) to 7 feet, 4 inches (2.24 meters) in height. Well-proportioned females are 6 feet, 4 inches (1.93 meters) to almost 7 feet (2.13 meters) tall.

Amphiboid-Reptoid Beings possess a lizard-like body covered with scaly skin. Bulgy brown, yellow or red eyes are set far apart from very thin ridge-like nose that ends in two small slit-like nostrils. Eyes can move independently of each other.

Ears are small 2-inch (5 centimeter) ovals set just behind each eye.

Mouth is thin slit that runs from ear to ear. Almost round head is well-proportioned to rest of body. Small, well-defined neck.

Very muscular body and appendices. Four thin, nail-less fingers.

Three long toes end in long sharp claws. Very small tail looks like bump at base of spine. Slightly larger females range from 7 to 8 feet (2.13 to 2.44 meters) tall. More compact males are 7 to 7 feet, 8 inches (2.13 to 2.34 meters) in height.

Special Traits and Abilities: Noted as avid explorers and consummate scientists. Have led some of the most successful expeditions into

previously unexplored parts of this and other galaxies.

Average Amount of Sleep Needed: Humanoids require only about 1-2 hours: Amphiboid-Reptoids need about 3-4 hours.

Language: Humanoid language is very tonal, with few guttural sounds. Amphiboid-Reptoid language is tonal and guttural.

Mother ship and other craft: Scout craft of Procyon look like either large tear-drops, or like a large beetle, and range from 45 to 200 feet (13.72 to 61 meters) across.

Deep space Mother ships are shaped like either huge snowflakes or enormous jellyfish, and are from 100 to 4,000 miles (161 to 6,440 kilometers) long.
