Subject: The Whale Of Lompoc, Calif.

Aug. 7, 2011.

I used to live in Lompoc, Calif. when I worked as junior engineer and teacher of the Atlas Missile to the US Air Force. I been on the property of mine they are talking about in the following information.

ARCHAEOLOGY NEWSFLASH NO. 259

John, this news is from Jonathan Gray -
www.beforeus.com

Hello John,

How could this happen?

How could a guy snorkelling in the ocean get burned to death?

It happened this way - some 14 years ago.

There was a forest fire raging. A helicopter dipped a giant bucket into the sea, then flew inland to pour its watery contents onto the fire. When the fire was put out, the charred body of the snorkeller was found among the smouldering trees.

Of course the helicopter pilot had no idea that he had scooped up a man in the water.

(by the way, someone did claim this to be just an "urban myth" but further investigation indicated that yes, it actually happened.)

My point, however, is this. Something in the sea can only end up far inland by some unusual event.

Here◆s something else. What if you were out in the mountains and you came across a deep sea whale? This really happened. (I◆ll tell you about that soon.)

But we both know that whales don◆t walk over land. Only some gigantic disaster could do it.

SEA AND LAND LIFE MIXED
TOGETHER, FAR INLAND

On all continents, bones of SEA animals and LAND animals are found together in great melees ◆ on land!

* East Africa◆s Tendaquru dinosaur beds alternate with seashell beds, just as one would expect if a catastrophe swept in from different sources.

* On England◆s Channel Coast, sea shales and limestones cycle with dinosaur-bearing land deposits.

* In Wyoming, aralia leaves appear with fish in Cretaceous rocks.

* In Oklahoma, sea creatures and land plants fill an asphalt pit near Sulphur.

Frequently, remains of WHALES and other examples of DEEP-SEA life are found far removed from the sea, MIXED WITH LAND plants, trees and land animals.

It is common knowledge that the deep floor of the ocean is so calm as never to have its ooze disturbed by the most violent surface storm.

Only some violent upheaval such as an inter-continental (i.e. global) Flood, would explain the MIXTURE of the deep-sea specimens with those of shore and land, all covered and preserved by sudden destruction and burial.

SEA LIFE SWEPT ONTO MOUNTAINS

Marine fossils are found on mountain tops hundreds of miles inland from any sea, or buried under hundreds of feet of clay, sand, gravel and other debris.

* In Antarctica, 85 mummified seals were found on a mountaintop 2,500 feet above sea level.

* The Himalayas, the world's highest mountains, contain skeletons of ocean fish, molluscs and marine animals. Toward the top of Mount Everest, are petrified clams in the closed position. When a clam dies, it opens. The only way to get a petrified clam in the closed position would be to bury it alive. There are places where clams are found in the closed position and they are piled ten feet thick!

* Fish fossils are found in the Alps of Europe; and oyster fossils are abundant in the Allegheny Mountains.

* Fossil sharks have been found in the Rocky Mountains, entombed by sudden catastrophe; and in the tops of the Canadian Rockies, seashells and even whales hundreds of miles inland from any seas.

* The South American Andes and the Urals of Russia likewise contain sea creatures.

* In Montreal, Canada, seals have been found far inland, several hundred feet above sea level.

* Bones and skeletons of whales have been found in hills of Vermont, Montreal, New Hampshire and north of Lake Ontario.

Now for the secret of Lompoc's quarry. But first, let me explain about diatoms. These are tiny sea creatures.

They say it takes about 1,000 years to accumulate one inch of dead diatoms on the seabed. At Lompoc, the diatomaceous earth is 1,500 feet thick in places.

At a diatomaceous-earth quarry in Lompoc, in 1976, a remarkable discovery was made during mining operations.

Workers of the Dicalcite Division of G-ecco Corporation uncovered the fossil skeleton of a baleen whale. The whale fossil was **STANDING ON END** in the quarry and was being exposed gradually as the diatomite was mined. Estimates put the whale fossil at about 80 feet long

And please get this. This whale penetrated a diatom formation that, according to evolutionary theory, is millions of years thick.

But we all know that a whale simply would not stand up on its tail for millions of years waiting to get buried while the diatom deposits were slowly forming.

Here, then, was Lompoc's bizarre secret. This baleen whale was the tragic victim of some enormous catastrophe. And in this event, diatoms for hundreds of miles around were scooped up and dumped on top of this whale, while the whale itself was being tossed on end.

Now glaciers don't carry whales. Whales do not stand on their tails. Whales do not climb hills. **THE WHALES WERE CARRIED THERE BY RUSHING WATER.** Then buried rapidly.

On July 22, 1988, my friend Kent H-vind visited the quarry. And the foreman told Kent, "One time we were digging on the night shift. And we had all the spotlights rigged up. We found a 60-foot wingspan pterodactyl."

"What happened to it?" asked Kent.

"Oh, we didn't stop and tell anybody."

"Why not? That would be big news."

"We didn't," said the workman, "because if you tell some university, 'We've got a fossil here,' they're going to make you shut down production while they come and dig out their fossil and you're going to lose money."

"We're here to make money. And so we just dug right through it."

So, along with this baleen whale and billions of fish fossils, was a giant flying reptile all caught up in this same huge disaster and now inside a mountain.

And something else. Many mountains on earth show evidence of wave action.

Here's my theory. There was the greatest mother of all global disasters. It brought water over all the continental land mass.

Then, as the Flood waters subsided, they left behind seashells and skeletons of small and large sea creatures scattered over all the present mountain ranges of our planet.

FOSSILS PROVE AN ENORMOUS FLOOD

Here, then, is the bottom line: fossils in every part of the planet testify to a global catastrophe.

Sometimes entombed in sediment a mile deep, land and sea forms are mixed together. In America, Europe, Africa, Asia and Australia in fact, everywhere they all shout one and the same story.

There was SUDDEN, VIOLENT UPHEAVAL, in which LAND and SEA were mixed up followed by rapid burial of animals in water-laid sediment, before organisms could decay.

This occurred from the North Polar region to the South. It was a catastrophe on a WORLD SCALE.

Only one force known to man is able to perform such a sudden, wholesale destruction, followed by an immediate burial. THAT FORCE IS WATER.

The evolution theory requires that the deposits were formed over millions of years of slow sedimentation. However, I believe the universal Flood fits the facts better, without difficulty. Judge for yourself.
