Subject: Our Space Fleet.  
Aug. 3, 2011.

The person interviewed on this information seems to think we have a Space Fleet. I will attempt to correct the punctuation in this material so it will make a for better reading.

<http://thechaniproject.com/forum/index.php/topic,356.0.html>

Anyone have an opinion on this one?

I have cut and pasted the OPs replies to various answers. Questions are in italics, his replies are in bold.  
If he's bogus, then he is certainly smart, and VERY well read.  
Maybe any Ham Radio freaks out there might be able to shed some light on what he is referring to towards the end.  
D-ncan

Due to all the internet hype the Navy actually sent a recon mission to elenin. Let's just say it won't cause the excitement some think. But it may present a few surprises that no one expected.  
I'll be here for about 20 minutes to answer questions and then I'm off. Just trying to be nice because I know there is a lot of buzz about it.

How long does it take to get there?

From the moment the crew steps in the craft, preps, clears port, about 60 minutes. Actual travel time, about 20.

Go into detail about a few of these surprises.  
No doom from elenin. It's not a comet, or not totally just a comet.

What type of craft are you using (TR-B)?

No.

Ok, what exactly is it.

Check into the properties of E-type asteroids. Very similar. However if you connect the dots you 'll know that E types are codeword for something more interesting.

What effect does this elenin have on our earth, and what risks does it pose for us?  
It won't have any effects on earth. But it may be of interest to ham radio operators.

X-37, NOTE, Tin Can?

Sorry, can't go there.

Is elenin artificial? Is anything riding it so to speak?

Well if you aren't so cryptic, maybe someone would take you seriously.

Explain further.

Remember I don't want to lose my clearance buddy. Look at my response to captain (question directly above). Anyway my twenty minutes are up.. Gotta go. I'll check back in 45 minutes or so for one more session of questions. Have a nice weekend all.

What's your opinion op on the all.

N-sa employee's spilling the beans on everything they know since they are all getting canned?

NA-A is just a front for the public. their budget is miniscule. not enough money to really do anything but put a few probes in our solar system. The real space program falls in the mi-itary's domain, mainly airf-rce and na-y. But the nice chemical rockets sure are fun to watch. as far as NAS- spilling any beans. Very few people from -asa are actually in the loop. they don't know anything to spill

Lets just say if something or someone is riding it, would we have to worry as far as de-th and destruction go, or would it be more of a eye opener?

I personally don't have a opinion about Elenin, just asking questions.... as I said before, there is no doom with it. so no need to worry.

Might there be a lot of vehicles? Say 7000?

What do you mean by 'a lot of vehicles? That's all classified and I am not privy to the overall actual numbers other than the area i work in.

Might the "Item(s)" in question be able to carry a lot. Say 7000?

Ok now I see what you are getting at. I really don't know, sorry. I know there are at least 2 more missions planned and after the next someone will have that answer, maybe. but I probably won't be a part of it.

Did the US space command bring down the twin tower on 9/11 using some kind of powerful weapon?

I don't know anything about that.

So why are you telling us this? What can we benefit from what you know?

Just tell us what you obviously want to tell, but are afraid to go look up e class asteroids. also look up the ES-'s rosetta mission to steins. Where magically the high res cameras just happened to fail. and there is your answer. Sorry I can't be more direct. but this one is a bit more operational and is talking. Someone savvy will be able to 'hear' it pretty soon. There will be no denying that history isn't what we've been told. But much more interesting. no doom. Just something pretty neat coming. I have said enough.

If i were in the na-y space command and wanted to talk to the public I would use a conspiracy forum such as glp... why? Because no one will believe it lol.

Are you using gravitational wave propulsion ships.? And is it true that the -avy space command has stations on mars. And is there a collaboration with the grays?

P-sses me off that we have been putting astronauts lives in jeopardy with chemical rockets. when in fact we have been hiding a much more advanced safer spaced program all this time.. I have complained about this exact same thing. all in the name of national se-urity. Whatever.

Now you know why there is no replacement for the shuttle. but times are ah changin. and what we do may become a bit more open very soon. we are bankrupt. Can you imagine what giving the commercial sector some of this would do for the economy! They are considering it as we speak. Instead of taking 5 1/2 hours for a coast to coast flight it would take a matter of minutes. Interesting times. It's hard to bite my tongue. But keep the faith.

Soon, very soon.

E Class Asteroids-

A fairly rare, very reflective asteroid that is slightly red in color, probably due to the presence of some surface organic chemicals. E-class asteroids dominate the Hungaria family of the main belt, though some, including the two largest, (44) Nysa (see Nysa-Polana family) and (64) Angelina, are found scattered farther out. Their flat reflectance spectra in the

0.3 to 1.0 micron region and high albedos (usually above 0.3) suggest a connection with the aubrite (otherwise known as enstatite achondrite, hence the ) category of meteorite. However, this link is problematic because aubrites are clearly of igneous origin, whereas some E-class asteroids (including Nysa) show an absorption feature at 3 microns that points to water-and/or hydroxyl-bearing minerals and a nonigneous history. Basically that means its highly reflective, metallic.

Do you fly your vehicles fairly low at night and change direction at nano second speed?  
Not me. my CO is a hard a-s. But i've heard stories, some funny ones. If I did it I'd probably be court martialled.

Op what can you tell us about the program besides the fact that you went to elenin?

That they know they gotta tell everyone soon, because the gap between what we have and what we admit is increasing to a point that they can't keep it all a se-ret forever. Think 50 lightyears for a one or two day trip is easy. Listen to what Ben R-ch said. Its all coming out soon or else i wouldn't be posting. We live in the most interesting times ever. And the next 5 years will be the most amazing starting with this year. The the old f-rts running things realize this and h-te change, but its inevitable. thanks for participating guys. i'll check back later tonight.

I'd say one would have to be one bad mofo to drive one of those. Can they see me watching them? Are their eye pieces able to see the fly I swat? actually its easier than flying a jet. Most of it is automated. But they still pick the e-ite of the el-te for this stuff. And yes they can see the fly you are swatting, your facial expression, and who exactly you are via facial recognition.

Does the US Na-y Space Command always send recon missions to comets and neo's? Or was this unique? Does something concern them about this Elenin or is this more SOP?

If something is out of the ordinary than they will look at it using a wide variety of sensors. if there is still questions then yes they go out there and check it out.

One thing that I must point out that you just don't get from watching on a tv is the absolute beauty out there. The earth and other planets are simply magnificent and awe inspiring. I have even suggested to take various world leaders out there to take a look at the earth and see its beauty from space. When you see how amazing it is you wonder what all these w-rs are about and wonder why we can't concentrate directing our efforts towards lifting mankind up. Saturn close up, mind bogging. A few planets in other star systems would absolutely blow your mind. Its too bad they can make an IMAX movie showing some of this stuff. It is so sad the universe is hidden and most are stuck on a rock and can't see the universe in all its beauty and wonder. And the sheer number of stars you can see without any interference from the atmosphere. WOW!!!!!! its absolute paradise this universe.

OP have you or your fellow officers traveled to Nibiru/Planet X? If can say, will it come near to earth in a year or two?

I have never heard anything about nibiru.

Part 1.
