

Cameron UFO Types

Theoretical Types

1) Baby Moons or scout crafts - about 6 to 8 feet wide. They are saucer shaped and are about 3 feet high. These particular crafts were seen eight miles north of Cameron last year. These crafts check the area for people, landing areas etc. A major landing occurred in the area shortly after. These crafts ~~do~~ left a landing imprint about an inch and a half deep in a circle about 6 feet in diameter.

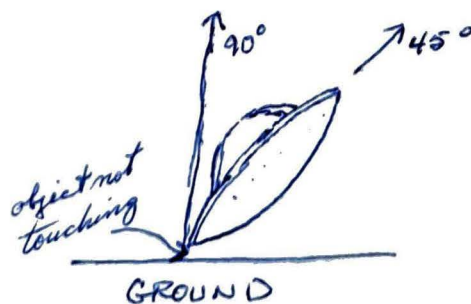

2) Observation craft - believed to be about 80 feet in length and thirty feet ~~wide~~ ^{high}. ~~Believed to be an observation craft~~ It is believed that "Charlie Red Star" is an observation craft. This craft landed numerous times but left no apparent ring or indentation in the ground. Instead it left high ~~and~~ ^{intense} radiation circles.

These radiation count in the center of the circle was 4x the count in the surrounding area, and the edge of the area 2x the surrounding normal.

The reason for the absence of imprints in the ground is that the object never touches the ground, but instead lands in an unloading position. In this landing the object lands at a 45° angle and hovers on one of the edges of the saucer just above the ground.

This craft "Charlie Red Star" usually flies at about 60-80 mph. but has been seen to increase that speed to many thousands of mph when in trouble.

3) Mother ship - theoretical ship which carries the observation crafts as well as the baby moons inside it. It is the headquarters for a earth expedition.

One ship in the Caumon area which might have been a "Mother ship" is the one called the furis wheel. People who described it stated it was at least 200 ft in diameter.

This however is under question as the mother ship usually rides high above the earth.
