

SESSION SUMMARY  
28 JANUARY 1988  
SOURCE: 0095

Site is a rectangular structure with a dome like structure on one end. Colors associated with the structure are gray and silver. The roof has a pebbly/gravelly texture. Near the structure are rectangular stacks of wood.

Point one on the time line:

Site is several structures on flat brown ground. One structure is being laid out and has many angles and layers: blocks, cement and bars are present.

Point two:

Several big, flat topped structures are present. Inside one of the long structures is a large open area that is several stories high. The rest of the building is divided into stories and where the room connects to the rest of the building are walkways with safety bars. Power generation is associated with the room and there is a constant thick smell of oil in the room. In the room are several large pieces of metal equipment. One particular piece of equipment is curved and large and divided into partitions (see sketch), the outside of this is rough gray metal.

Point three:

The large room has a musty oily smell and people are present. There is a fresh paint smell. Cables are on the floor. Something is being connected together, and something is gimbaled. Associated with the idea of gimbaled are wide diameter (2+ feet) pipes, interlocking, swiveling, white, multidirectional, pathways and the idea of exit/endpoint. The site is involved in military defense and is pivotal. Associated with the idea of pivotal are the site, new, big, powerful, elaborate, costly, expensive, defense and area defense.
