

Summary

Site involves a wide, barren, bleak area of land connected in some significant way with a large body of water. Structures are involved, as well as people. Of particular significance seems to be long, rounded, smooth, metallic objects that are light in color, moveable, and may taper at some point. They gleam dully and rest horizontally at an angle when in normal configuration. One, but probably more of these objects (they seem to be utilized not individually but in multiples of two or perhaps three) seems presently to be enroute somewhere (impression of being sling-loaded under a multi-rotor helicopter) somewhat north and west of originating location, which is a complex or compound, fenced, of large, flat-topped, drably painted utilitarian structures also in a bleak environment but in a location with a larger concentration of structures and people, perhaps near a major north-south transportation artery. While here, the objects were laying supported on a flat surface, like the trailer of a flat bed truck, covered by a flexible fabric-like covering suggestive of a tarp of some sort. They were transported from further away to be put into operation with many other similar objects already "deployed". The next destination of the objects being transported is similarly barren, but much more remote, slightly to the rear of a named range of low, eroded, dun-colored desert hills running north and south, with dark (umber) outcrops and striations, much nearer the large body of water, near a winding dirt road, and with a block-shaped, dense, solid concrete structure that is old and weathered (AOL of bunker on Bar-Lev line). Around this structure are dirty, dusty vehicles, trailers, and objects that suggest antennas and RATT-rig type equipment. The objects of interest are not intended to be here, but displaced at some distance; nevertheless they have some sort of connection with this place. There is a total amount of possible distance along which these objects could be located, and they presently will be located approximately 2/3 of the way down the length of that possible distance. Objects will be located on reverse slope of hills because they would feel to "exposed" on the open side. There is a lot of wind, dust, and sand here. The large body of water seems to be a few miles to the west. Person/people perceived at beginning of sessio were associated with a large, grey, metallic structure with projections, overhangs, and passageways.
