Incident #20 -- ground #111, Washington on 2 July 1967

It is extremely unlikely that these objects were meteors, although their speed could argue for this interpretation. No doubt, however, one would expect much more brilliant light, a trail, and perhaps some detonation. Furthermore, their slight inclination argues against their being comets.

The number description #20 with a light phenomenon follows these material objects. No any material actually occurred in the region at the time. The description covers were closely to a detached material structure than to anything else, but this explanation is perhaps also far stretched.
