Incident #8 -- 2nd base road, German -- 28 June 1947

There appears to be nothing anomalous about this incident, according to the observer, the objects had a speed of 130 mph and were moving on a course of 120°. Now, since the plane was moving at 270 mph on a course of 300°, it is possible that the observed motion of the objects was only apparent (since 120° plus 180° equal 300°), and we can conjecture that a cluster of balloons (possibly hydrogen balloons) was observed, the motion of which was merely a reflection of the motion of the plane.
