Incident #181, 182 -- S. Knoxville, Tennessee -- 20 June 1918

This incident agrees well to the description of a typical fireball's color -- white; apparent construction -- lines, almost -- "streamer of black sooty trailing" a number of appearances -- "over horizon"; and (in structure) "streamer emitted spines."

All of the above fit the typical phenomena associated with a stationary fireball.

The witness states that the object was in sight for three seconds and the other states for three seconds. The latter time estimate is clearly more in keeping with meteoric phenomena. It is also probably far more nearly accurate, since one is much more likely to greatly overestimate than underestimate intervals of time.
