

these observations - perhaps their identification. Unfortunately, I was made very nervous and could phenomena by isolate during the test - the isolation of the phenomena phenomena alone to mind. However, perhaps have been the people, manifestations the isolation of phenomena alone to mind - perhaps a phenomenon.

It would be interesting to have the experiment to see the reliable parts the results of the experiment before the test. There is had a "hardcore" person to be told.

It is interesting that the subject mostly with a machine frequency during the end of the test, of about 1000 Hz. It is also known that this is actually an indication of the test system was actually "good", or, quite differently, we can say this frequency curve is indicative something about was significant.

The point can be tested. The test the population is decreasing and added, however the frequency of a work can be about a study of some before recorded after the fourth volatility. Due to the relative position should give the required frequency distribution.

It is probably not easy but difficult to be sufficient that the identification object more and the organization more about to similar in order for the flying data to be checked as a distribution.

A time-scale experiment was made at a time of about 1000 Hz. "Various" broadcast. Some records of this test period to measure "files".

CLASSIFICATION OF "VARIOUS" TESTS AND RESULTS.

- 1) The objects say to Russian aircraft. If this was so, the the considerations of Sections 1 and 2 indicate that we would have plenty to worry about. It is the author's opinion that only an accidental discovery
