CHARACTERISTICS OF THE PLANET MARS

1. The atmosphere of Mars, near its surface, corresponds to that of our earth, which therefore accounts the growth of vegetable and animal life.
2. Altogether, the climate is divided into two yearly seasons and the environmental temperatures, near its surface, corresponds to that of the Earth.
3. The mammals which were discovered in 1950 by Andersonville, are actual mammals, interspersed by great bones, built by intelligent beings - by the Martians.
4. There is therefore inhabited, and by creatures who are more intelligent than we are.
5. They see us and are anxious to get into contact with us. Their physical build is like ours; however, they are stronger and taller than we are - six feet as an average. Altogether the planetary system of Mars is similar to that of the Earth.

CHARACTERISTICS OF THE FLYING MACHINES

1. The flying machines which have been seen in the last five years, are nothing but huge and powerful machines, built by the Martians launch on the Earth, in order to reveal themselves and to explore the Earth's surface, with the purpose of studying whether it is possible to land there.
2. I therefore exclude the possibility of these flying machines being secret weapons being experimented by States of this world, as it is well known that in no country exists sources of power such as to give such an extraordinary speed to so enormous and powerful devices.
3. The flying machines are piloted by the Martians, who would like to, and could, land; but they are deterred from this attempt by the terror of being compelled to remain here for the rest of their life, as on the earth there are no flying fields equipped in such a way as to allow them to take off again.
4. I therefore consider unacceptable the hypothesis that such machines may be radio-controlled, also because in all cases when the flying machines have been seen, they have shown such an extraordinary skill and precision of maneuvering which is possible only if an intelligent being is present within the machine.
5. The future development of the Martians' skill - particularly owing to the explorations effected on the earth - will allow them at some future time (which for the present I choose not to disclose) to land on the earth, carrying all the engines and devices necessary and sufficient to enable them to return to Mars.
6. The landing will be preceded by recovering waves of flying machines whose formations will take place more or less periodically. The first of these formations of flying machines - after the date on which this document has been presented - will be seen with substantial certainty about the end of the month of June next in the locality known by the name of Lago del Beccale in proximity of San Paolo.
