# MAN KIND CHILDREN OF THE PLANETS?

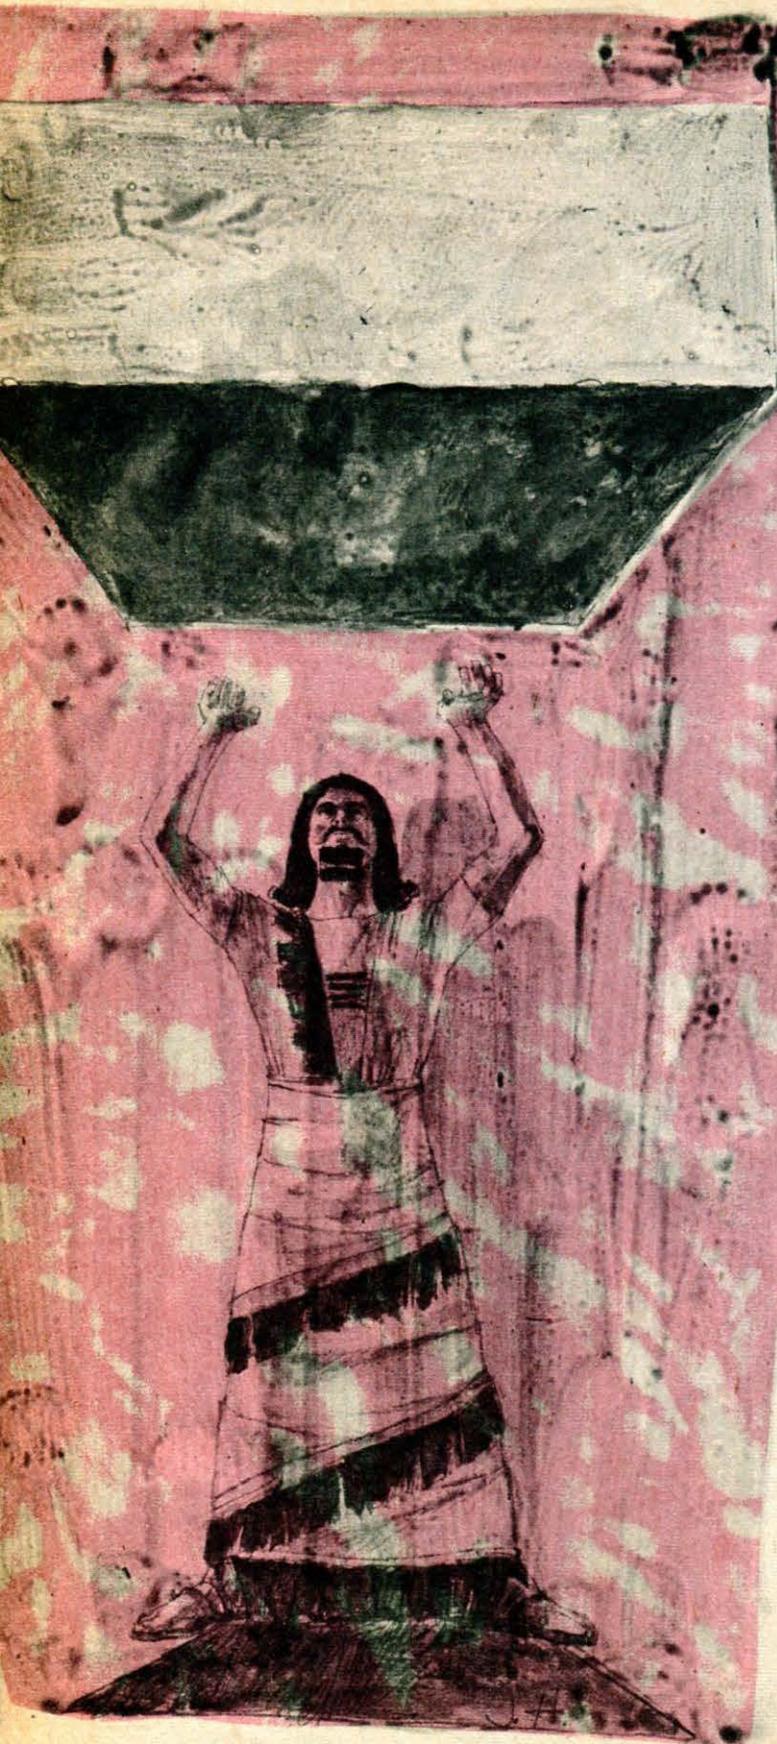

As bizarre as it may sound, there are some experts who believe that man may be the hybrid product of interplanetary crossbreeding—*and they have a wealth of scientific evidence to back up their theory!*

STORY BEGINS ON NEXT PAGE

By Anthony Ahearn

Illustrated By John Hanna

**H**ave you ever wondered what people from other planets look like? You may perhaps be able to furnish part of the answer yourself. Go to the nearest mirror and take a good long look. That familiar human image you'll see (and which you'll swear originated on our planet via eons of arduous hit and miss evolution) is believed by some to be the result of crossbreeding or planned hybridization by outer-space visitors with primates and early humanoids during prehistoric times.

Could such an incredibly way-out notion be possible?

It could, according to two of science's most respectable theories—Darwin's Theory of Evolution and Einstein's Theory of Relativity. For instance, Darwin himself stated that his Theory of Evolution *may not conclusively account for the appearance of Man*. Darwin's co-advocate of the evolution theory, Alfred Wallace, went further than Darwin and flatly stated that natural selection (the operation of biological laws) *could not have operated in the case of Man*.

Moreover, scoffers at UFO's and interplanetary travel like to cite the immense distances between worlds, solar systems, and galaxies which, they say, would make space travel so time-consuming as to be implausible, except, perhaps, to our nearest neighboring planets. For even if travelling at the speed of light (about 186,000 miles per second) the distances to the more remote planets of our solar system, not to mention our galaxy's other stars and those of other galaxies, are so incredibly vast as to rule out such space travel.

That is, if we assume the speed of light to be absolute. But such an assumption, though commonly held by many scientists, is by no means conclusive. *For Albert Einstein himself denied that he'd ever claimed the speed of light to be absolute.*

Ivan Sanderson, world-famed zoologist, knew Einstein personally. Sanderson has stated, "As a matter of fact, Einstein himself stated shortly before he died—and I have a tape recording of this—that he never said that the speed of light was absolute; but he did say that a round 186,000 miles per second mass would become infinite..."

Thus, the civilization that discovers and controls the profounder laws of mass-to-energy and energy-to-mass conversion would probably supersede the speed of light and develop power-systems capable of feats unimaginable to us—de-materialization, re-materialization, instantaneous teleportation, etc., thereby making even the most remote areas of the physical universe easily accessible.

Obviously, then, science cannot shut the door on the bizarre, way-out theory that outer-space scientists conducted bio-genetic experiments between themselves and prehistoric primates and humanoids, thus producing Man. What science *can* do is to ask the proponents of this new, fantastic theory for decisive evidence and conclusive proof.

And the evidence offered by the advocates of the hybrid-human theory is abundant, provocative, and bound to be disturbing to the scientific establishment.

For instance, there are recorded facts so weird, paradoxical, and unnerving, that scientific theorists and text-books have ignored them, apparently to protect the security of their own pet theories and dogmas. It is to

# Charles Darwin's co-advocate of the Theory of Evolution, Alfred Wallace, flatly stated that natural selection (the operation of biological laws) *could not have operated in the case of Man!*

these weird, unsettling facts that some scientists refer when they speculate that Man possesses genes that derive from outer space.

To start at the beginning, according to conventional scientific theory Man's evolutionary age (till now) is supposed to be 10,000,000 years—that is, 10 million years ago Man is supposed to have begun his evolutionary journey to his present state from the loins of his earliest primate ancestors.

For his first eight million years Man is believed to have evolved through a variety of forms before attaining (two million B.C.) a semblance of an upright stance. Australopithecus, Java, Peking, Aurignacian, Boskop, Piltdown, and Neanderthal Man, etc., were the forerunners during this two million year period to Cro-Magnon Man, who is believed to have appeared about 50,000 years ago. And Cro-Magnon Man is believed to be our (*Homo sapiens*) direct ancestor.

Now, all known fossil evidence reveals to us that Cro-Magnon Man was not capable of a technology able to machine sophisticated tools and artifacts such as iron screws, gold threads, engraved metallic chalices, etc. And needless to say, Cro-Magnon Man's predecessors were far less capable of such technology.

How then do we account for the following facts, which the scientific establishment has chosen to ignore?

In 1851, the *Scientific American* reported a mystifying object discovered by workers and engineers who were blasting rock in a New England community. The object was a metallic chalice that had apparently been split by the blasting. Bell-shaped, the chalice measured about 4½ inches high and 6½ inches wide. It was made of zinc pervaded by silver, and delicately worked flower designs that were inlaid with silver covered the chalice. The object had come from 15 feet down in solid rock. The rock, experts said, could not have been formed less than *several million years ago*.

And in 1869 a very unusual piece of feldspar (stone) was taken from the Abbey Mine, near Treasure City, Nev. This chunk of feldspar was unusual because imbedded in it was an iron screw. It had oxidized, but the hard stone which surrounded it preserved its contours. Clearly visible were the screw's taper and the regular pitch of its threads. The feldspar in which the screw was imbedded was *millions of years older than Man himself, as estimated by science (10 million years)*.

Tom Kenny, of Plateau Valley, Colo., was digging a cellar in which he planned to keep vegetables during the winter of 1936. Ten feet down his digging was interrupted by a level pavement. The pavement was handmade, of tiles, and each tile was five inches square. When the mortar which held the tiles in place was chemically analyzed, it was found that it was of a different composition than anything found in that valley. The tile pavement lay in the same geological strata as the fossils of the three-toed Miocene horse, which is believed to have lived *twelve to 26 million years ago*.

(Continued on page 64)

*Engineering feats, such as Zaculeu monument (above), prove Aztecs had access to space-age technology.*

*Stonehenge, England: Did the anti-gravity rays that may power today's UFO's help the Druids hoist these pillars?*

## MANKIND—CHILDREN OF THE PLANETS?

(Continued from page 25)

In 1844, near Tweed, England, a gold thread was discovered by workmen at the depth of eight feet below the surface of the stone strata in a quarry. Experts estimated that the thread dates back to *geological ages, or millions of years.*

In Salzburg, Austria, an obviously machined cube of steel was found in a large lump of coal of the Miocene strata (12 million to 26 million years ago). This remarkable steel cube is slightly rounded but otherwise utterly symmetrical. A thin groove is precisely cut all about its middle. Scientists, technicians, and steel experts all agreed that the steel cube was definitely an artifact made by someone (or something under intelligent control) and not formed naturally.

These samples of odd, unexplained, and uncomfortable artifacts are but a sampling from an imposing collection of similar items.

Hard-headed scientists unwilling to explore, or even recognize the possible truth of the hybrid-human theory are stuck with the realization that their pet theories about Man's tenure on Earth are seriously shaken by the previously mentioned artifacts.

Similarly, the scientific belief that life on this planet began about 500 million years ago (as "proved" by fossil remains) is challenged when we take a closer look at these remains. For these fossils (shrimps, sponges, etc.) are all *fully evolved*, and nowhere has there been found fossil evidence of the previous evolutionary stages of the shrimps, sponges, etc. How could they have begun their life cycle fully evolved when the theory of Evolution specifies that they must have evolved from lower life forms? Yet the same Theory of Evolution still claims that life began on Earth 500 million years ago with these same fully evolved fossils!

In discussing this provocative matter with a research biologist during an accidental meeting as we walked our dogs one night, I was surprised to discover he was one scientist who realized that the Theory of Evolution perhaps wasn't as solidly based as many other scientists believe. He said, "It's possible that previous fossil evidence beyond the 500 million year point has been lost to us because of world-wide cataclysms similar to the Biblical Flood . . ."

Then he looked me in the eye, pointed up at the stars, and said seriously, "It's also possible those first fossils were brought in from out there and . . . dumped . . . deposited."

Is it possible that several highly developed human civilizations existed back through the many thousands, even millions, of years, but whose existence has been largely wiped out because of world-wide catastrophes?

It is possible Earth had been visited and populated, millions of years ago, by spacemen from the stars?

Or are both notions possible?

Advocates of the hybrid-human theory include both notions in their speculations. They relate the unexplained, incongruous artifacts that have been

unearthed around the world to the fantastic feats of prehistoric—and historic—engineering, feats that to this day are not adequately explained.

For instance, take the case of the Baalbeck Platforms, in Syria. They are a gigantic collection of temples, seemingly constructed around the huge Temple of the Sun. Massive flat stone slabs, each believed to weigh 1,200 tons each, compose a roof that is supported by 54 huge pillars, each eight feet wide and 90 feet tall. The conventional (and questionable) archaeological theory is that thousands of slaves, using ramps and block-and-tackle, and eating up decades of time, constructed such edifices. But modern engineers will admit that no contemporary engineering apparatus could lift such tonnage without collapsing.

Then there's the Black Pagoda, in India. This shrine looms to the height of 228 feet, and on its top is a single slab of stone judged to weigh about 2,000 tons. Engineers seriously doubt that primitive people (no matter how many of them) could, with only primitive tools, have lifted the 2,000 tons even 10 feet in the air. As in the case of the Baalbeck Platforms, even our most modern lifting apparatus would risk probably collapse if tested against such a great weight.

But the proponents of the hybrid-human theory have a ready explanation for Earth's many mysterious ancient constructions—the lifting feats involved, they say, could easily be performed if *anti-gravity devices or power-systems were used, the same anti-gravity power-systems that are thought responsible for the incredible performance of UFO's in our skies!*

They relate the unexplained, incongruous artifacts that have been unearthed around the world and the mysterious ancient monuments with the fact that UFOs (flying saucers) have been recorded through the ages and at least into prehistoric times via modern and medieval astronomical records, journals, church manuscripts, the scriptures of the various religions of the world, ancient Egyptian and Chaldean scrolls, and cave paintings, carvings, and statuary done by primitive men in prehistoric times.

For instance, in 1965 *Time Magazine* (and other sources) reported that a Communist Chinese archeologist discovered carvings on a granite mountain in the Hunan Province, near Peking. The carvings showed men on the ground, and above them in the sky, men standing on aircraft. The archeologist estimated the carvings to be 45,000 to 50,000 years old.

Other Communist Chinese archeologists exploring the labyrinth of caves in the Bayan-Kara-Ula mountains discovered cave-paintings that show saucer-like objects streaming out of the sky to land in a mountainous area.

Japanese archeologists have discovered cave-paintings that depict humanoid figures seemingly clothed in space-suits with helmet-like globes over their heads. These globes have attachments that suggest air hoses for breathing apparatus. Also in Ja-

pan, space-suited statuettes (*Dogu*, in Japanese) have been discovered which are similar to spacemen with helmets equipped with eye-slits, antennae, breathing apparatus, and auditory mechanism.

Henri Lotte, leader of a French scientific expedition into the heart of the Sahara Desert, brought back the Tassili Frescoes, depicting humanoid figures which Lotte nicknamed "the Martians." The humanoid figures seem definitely to be space-suited men with hermetically sealed helmets clearly indicated. The helmets are attached to the necks of the suits as if for breathing purposes.

Vyacheslav Zaitsev, Soviet archaeological scholar, tells in the magazine *Sputnik* of the more than 700 stone disks found in the mountains at the Tibetan-Chinese border. These disks are estimated to be at least 14,000 years old, and are covered with Chinese pictographs. Still only partially deciphered, one disc tells of the Dropas, or "sky people":

"The Dropas came down from the sky in their gliders. Our men, women, and children hid in the caves but when at last they understood the sign language of the Dropas, they realized the newcomers had peaceful intentions. . . ."

Ancient legends are said by advocates of the hybrid-human theory to be virtually loaded with references to aircraft and visitors from the sky.

Ethnological scholar Y. N. Iban A'haron has translated two ancient documents from the Near East which are real shockers. The oldest document, some 7,000 years old, is in the *Hakaltha*, or laws of the Babylonians, and it contains this passage:

"The privilege of operating a flying machine is great. The knowledge of flight is among the most ancient of our heritages, a gift From Those Upon High. We have received it from Them as a means of saving many lives. . . ."

But the real bell-ringer is to be found in the Chaldean work, the *Sifr'ala*, for contained in this 5,000-year-old document are instructions on *how to build an aircraft!* From these instructions, scholar Y. N. Iban A'haron has freely translated such words as:

Equilibrium, copper coils, stability, wind resistance, crystal indicator, calibration, gliding capacity, etc.

There is even a reminder that the crystal control will change color during flight patterns which, remember, is a widely reported characteristic of modern day UFO's!

Whether or not these ancient instructions can, in fact, be utilized by modern technicians to produce an airworthy craft (or flying saucer), the mere fact that such instructions were recorded 5,000 years before Orville and Wilbur Wright is indeed incredible. It also seems to add to the growing evidence that airlift (and possibly interplanetary travel) was known to antiquity.

In his perhaps epochal book, *On Tiptoe Beyond Darwin*, Max H. Flindt, research biologist and formulator of the hybrid-human theory, points out discrepancies in conventional scientific ideas about Man's supposed evolution on this planet. For instance, the con-

ventional theory of evolution supposes Man to have developed from his earliest primate origins to his present state in about 10 million years. Remember, the last 2 million of the 10 million-year period was when Man is theorized to have begun attaining his upright stance (Australopithecus, Java, Peking, Aurignacian, Neanderthal, Boskop Man, etc.) and the last 50,000 years of the 10 million-year period was when our supposed direct ancestor, Cro-Magnon Man, is theorized to have appeared.

But, also according to conventional scientific theory, it took nature 500 million years to evolve the three great ape families! Why is Man's evolutionary period so short in comparison with that of the primate? This is an important question in the light of the following:

1) The maximum capacity of the primate brain is one billion neurons (brain cells);

2) The maximum capacity of the human brain is 10 billion neurons, which is 10 times that of the ape;

3) It has been figured mathematically that it took nature six months to develop each neuron during the primates' 500 million year evolutionary cycle;

4) Man, with his 10 billion neuron brain capacity (which, remember, is 10 times that of the ape), should have taken 10 times as long as the ape in order to develop his brain!

5) Ten times the 500 million year evolutionary period of the ape yields the number *five billion years*—in other words, Man shouldn't have appeared yet, but should still be evolving from lower forms toward his eventual appearance as *Homo sapiens* billions of years from now. How does conventional theory explain this seeming contradiction? It doesn't—it merely continues to assert that Man's 10 billion neuron brain evolved in the incredibly brief (and highly questionable) period of 10 million years from his earliest primate ancestry to ourselves, here and now!

This contradiction would seem to strongly support evolutionist Alfred Wallace's contention that *natural selection could not have operated in the case of Man*.

But what *did* operate, according to biologist Max H. Flindt and other advocates of the hybrid-human theory, was the bio-genetic experiments conducted by scientists from alien planetary cultures many millions, perhaps billions of years old who cross-bred some of their characteristics into those prehistoric primates and humanoids who survived the experiments, thus creating *Homo sapiens*.

*Some of these supposed characteristics are:*

1) *Man's singular ability to cry abundantly: No primate has tear ducts as highly developed as Man's. Tear ducts are useful not only to drain off painful emotion via weeping, but they are also highly functional as a protective mechanism against dust and other injurious particles. It is theorized that copiously flowing tear ducts may have been inherited from ancestors whose long exposure to dry, dusty, dying planets (such as*

*Mars?) stimulated them into evolving tear ducts adequate to protecting their eyes.*

*Such a theory would at least partially explain why Man alone, on a still richly vegetative planet, would have tear ducts so highly developed as to be an oddity when compared with apes and other animal life.*

2) *Man's ultra-sensitive—and relatively nude—skin: None of the lower-order animals have the sensitivity of touch that Man has, nor have they skin capable of giving such complex information about the outer-world. It is theorized that in a world of fur and hair-bearing mammals and primates, Man's relatively nude and ultra-sensitive skin would have taken far longer to evolve (according to Darwinian Theory) than the 10 million years allotted to it.*

3) *Man's slow swallowing time: In nature dog-eat-dog is the general rule. Because of potential enemies lurking about, animals literally bolt their food down. Even grazing herbivores and omnivores transport their food more quickly to their stomachs than does Man, whose swallowing time is estimated to be about six seconds as compared to the almost zero swallowing time found in the animal world. It is theorized that Man's longer swallowing time is a characteristic inherited from spaceman ancestors whose environments for many millions (even billions) of years were free enough of the dog-eat-dog rule to allow evolution of a leisurely swallowing process.*

4) *Mankind's breeding vigor: Science contends that the hybrid products of cross-bred vegetation or animals are often more prolific than either parent of the original stock—hybridized corn, flowers, fruit trees, mice, cattle, cats, dogs, etc., are all much more procreatively vigorous than Nature's original stock. It is theorized that no other unhybridized (pure-bred) creature has so hugely proliferated as Man, such proliferation (population explosion) being an indication of Man's hybrid nature.*

5) *The absence in Man of a penis bone: All Earth's other mammals have a strong bone that actively strengthens the penis before and during the sex act. Wild animals have to breed, often, in hostile environments and survival in such circumstances demands rapid copulation. Man's unique lack of a penis bone is theorized to be due to our hybrid ancestry. Advocates of the hybrid-human theory say that our alleged outer-space ancestors had so mastered their environments over many millions (perhaps billions) of years that the once-necessary penis bone gave way (evolved) to a more abundant flow of blood into the penis which heightened the pleasure response. And such a pleasure response, it is theorized, would be typical of highly evolved beings who used sex not only for procreation, but for pleasure.*

6) *The behavior of the fertilized human female ovum: The human female's fertilized ovum buries itself in the uterine*

*wall, and this is unique to Mankind—nowhere else in Nature does it occur.*

7) *Man's incredible brain: The mental capacity in all species of animals is believed to be strictly uniform, with only minor variations. But Man is capable of great geniuses, a general norm. "double-throwbacks," and moronic genius—Man is also capable of schizophrenia, an aberration which is believed to be unique to humans. The "double-throwback" phenomena, also known as "simultaneous regression," occurs in the infrequent appearance of a person who inherits the blunt, brutish physical characteristics of our prehistoric ancestors and the great mental capacity of our supposed outer-space ancestors. Examples given by theorists are Socrates, Lincoln, Steinmetz, etc. These theorists maintain that if our ancestry traced back only to primitive brutes (as believed by conventional evolutionists), any throwback would inevitably be both physically and mentally retarded, as per biological experiments with other pure-bred animal species—thus, it is theorized that "double-throwback" can occur only if Man is a hybrid, with an alien, great-brained ancestor on one side of his line.*

Moronic genius—the baffling capacity for some morons to solve fantastically complex mathematical problems, etc., is also theorized to be directly traceable to biological short-circuiting between the heritage of Man's brute ancestors and that of outer-space, "genius" ancestors.

Similarly, schizophrenia (withdrawal from reality into a personal fantasy world, resulting in "split personality") is theorized to be a short-circuiting (conflict) between the impulses and compulsions of Man's brute ancestry and his spaceman ancestry. This conflict leaves the victim torn by unconscious race memories of his outer-space origins and bio-genetic commitments to his brute Earth ancestry.

8) *Man and primates cannot naturally interbreed: Science has managed to interbreed diverse species like the chicken and turkey and the cow and buffalo (the turken and the cattalo), but similar experiments between Man and apes have all failed. It is theorized that the genetic influences of Man's alien ancestry prevents such interbreeding. The reader may ask: If Man cannot interbreed with apes, how then could outer-space visitors breed with prehistoric man and anthropoids? Advocates of the hybrid-human theory point out that when horticulturists wish to transform sterile hybrid plants into breeding types they simply use certain chemical activating agents which overcome the sterility inhibition. Man can, at this point, do this with plants and some species of animal life but he cannot overcome the sterility inhibition between Man and the ape, possibly because (it is theorized) Man is truly a hybrid with alien blood that is subtly charged with alien enzymes and gland products which reject such interbreeding. But outer-space visitors with a far more advanced science would find such a sterility-*

*inhibition factor between themselves and prehistoric humanoids and anthropoids a minor biological barrier to overcome.*

9) *Man's appearance on Earth:* It is speculated that the random evolution theorized by conventional evolutionists would occur randomly about Earth—but such seems not to be the case. For the known originating point for several successive waves of early Man was in the Middle East. Moreover, the supposed bio-genetic experiments carried out by our alien ancestors occurred (it is theorized) over many thousands, even millions, of years.

10) *Man's singular sense of destiny and his spiritual nature:* Scripture and literature are full of references to the awe-inspiring and just plain inspiring majesty of the heavens. Ralph Waldo Emerson began his essay "Nature" with the reminder that whenever a man feels spiritually exhausted all he need do is gaze at the stars. The fact is, most men (whether atheists, agnostics, religious believers) cannot contemplate the stars without having their imaginations strain a bit at the leash.

According to the advocates of the hybrid-human theory, imagination is unique to humans—and the *raison d'être* of imagination is theorized to be Man's sense of destiny and a spiritual nature that lifts his eyes beyond the sensual necessities of dog-eat-dog living and up to the sun, the stars, and the thought-level that contemplates one's origin and one's goal.

Man's natural capacity to envision not only global brotherhood but inter-planetary brotherhood as well is theorized to be directly traceable to his genetic relationship with beings who people planets in the vast reaches of the universe. This theory, by the way, in no way denies God (or Supreme Being, Allah, Nirvana, Brahman, etc.) as the creative force of the universe. Father Reyna, Argentinian Jesuit priest of the Roman Catholic faith and world-respected astronomer (who has publicly stated that he's photographed flying saucers through his telescope) puts it this way, "God has created the entire universe and all the beings in it. The day seems to be coming when we humans will have to enlarge our egocentric view of the universe to include relatives who come from homes on other planets, not only in our solar system but perhaps even from other galaxies."

Whether the hybrid-human theory is true remains to be seen—the advocates of this theory admit that their evidence is sometimes sketchy and, at this point, inconclusive. Yet the abundance of UFO's in our skies, indicates that the hybrid-human theory shouldn't be ignored by conventional evolutionists merely because the theory is unconventional. Moreover, those scientists who are inclined to scoff in automatic scorn at the hybrid-human theory would do well to remember all those previous scientists who were so inflexible they refused to explore a new theory which later proved to be true.

Suppose the hybrid-human theory is true. Why did the biogenetic experiments take place? Why were we hybridized?

Was the cross-breeding *accidental*? Was it the result of spacemen finding themselves far from home among primitive peoples. Suppose, ages ago, outer-space visitors copulated with early humanoid and primate females—suppose, also, that these outer-spacemen were so bio-genetically structured that they could produce (via the female humanoids and apes) cross-bred offspring who, in turn, however, *could not overcome the sterility inhibition factor between themselves and apes, as per our own modern scientific failures at achieving such inter-breeding.* In short, are we the *accidental* offspring of *random* sexual encounters between spacemen and prehistoric humanoids and primates?

Or (as some pessimists speculate) were the supposed bio-genetic experiments actually an incredibly long-range plan by outer-spacemen (with perhaps incredibly long life-space) to "program" hybrid-humans into becoming numerous enough (population explosion) and intelligent enough (10 billion brain cells) so that one day they can be commandeered as a "pre-conditioned" labor force to aid in colonizing expeditions throughout the universe?

Or, hopefully, have we been accelerated in our evolutionary journey because of some universal necessity that demands our inclusion into some kind of inter-planetary or intergalactic federation of intelligent life? So say the more optimistic advocates of the hybrid-human theory.

Only time—and the dedicated, open-minded research of cooperating scientists—will prove the still inconclusive hybrid-human theory to be either partially or wholly true, or not. Or, perhaps the occupants of the UFOs in our skies have some answers to the questions raised by the hybrid-human theory. ★ THE END
