

“INVENTED FLYING SAUCER”

SYDNEY: Following claims by six people that they saw “flying saucers” in the sky over Sydney last night, a Sydney man to-day asserted that he and a friend had invented them.

Eustace McGill, of George Street, Sydney, said there was no mystery about the “flying saucers.” He and a friend had invented them.

The “saucer,” he said, was a four-bladed propeller with a ring round it.

It worked by perpetual motion.

“It is very simple,” he said, “and is powered by a few wheels and some ball-bearings.”

He said his mate had taken the idea out of the country on a ship that went to Siberia, or maybe northern Finland.
