
**FLYING SAUCER
LECTURER SAYS—**

**Those
little
men are
coming**

Denver, Friday

Flying saucers piloted by little men from another planet would land on the earth within a year, Silas Newton, geophysicist, told a Denver University class today.

"These men of a foreign planet have been sounding the earth's magnetic fields in exploratory flights," he said.

Newton declared that four flying saucers which had crashed on the earth were being studied by the United States Government. A fifth had now crashed in Africa.

The bodies of 34 men ranging

The bodies of 34 men ranging in height from 38 to 42 inches had been taken from the wrecks.

Newton believes the saucers are "interplanetary space ships operated along the lines of magnetic force.

"They dare not land until they safely map the magnetic fields of this planet," he said.

"I think that reported mass flights of saucers are evidence that the magnetic fields have been pretty thoroughly sounded and the saucers are now ready for landing.

"These men from a foreign planet, probably advanced beyond our scientific state by hundreds of years, have harnessed lines of magnetic force for propulsion like we harness the propelling powers of steam, oil, and jet."

Newton added that this made possible flying the 161 million miles from Venus in about one hour.-
