

## “Flying Saucer Interplanet Space Ship”

DENVER, October 19.—Flying saucers piloted by little men from another planet would land on earth soon, Professor Silas Newton, Denver University geophysicist, said to-day.

He believes the saucers are inter-planetary space ships operated along lines of magnetic force.

These men of a foreign planet have been sounding the earth's magnetic fields in exploratory flights, said Professor Newton.

The saucers are ready now for landing.

He declared that four flying saucers had crashed on the earth and were being studied by the United States Government. A fifth had since crashed in Africa.

Professor Newton added that bodies of 34 men ranging in height from 36 to 42 inches had been taken from the wrecks.
