

U.K. HAS ITS OWN FLYING SAUCER

From Our Staff Correspondent

LONDON, Oct. 21.—A colourless and soundless “flying saucer” described by its inventors as the only one in captivity will be shown in Britain during the 1951 festival.

Its inventors refused to reveal how it works.

It is made of a new transparent material.

Six feet in diameter, it has no motor or moving parts.

This flying saucer—or, to give it its correct name, “Ectoplat”—stays in mid-air indefinitely and when let loose will gyrate 16 feet above the ground over the heads of the crowd.

It will be part of the Festival of Britain's travelling ex-

hibition, which will visit Manchester, Leeds, Birmingham, and Nottingham.
