

"Flying Saucer" Was A "Meteor"

SYDNEY, Dec. 1.—Reports showed that the object seen in the sky on Wednesday night by many people in New South Wales and Queensland was a meteor, the Government Astronomer (Mr. H. Wood) said to-day.

"Meteors are usually blue-green in colour, but are usually not as bright as the one seen on Wednesday." Meteors could be seen every night if people watched the sky for an hour or so, he added.
