
“Saucer” A Meteor

Reports showed that the “flying saucer” reported on Wednesday night by many people in New South Wales and Queensland was a meteor, the Government Astronomer, Mr. H. Wood, said yesterday.

“Meteors are usually blue-green in colour, but are usually not as bright as the one seen on Wednesday,” he said.

Many people were under the impression that meteors were rare, but they could be seen every night if people watched the sky for an hour or so, he added.
