

## **PLANET VENUS ATTRACTED ATTENTION**

On Saturday morning word was sent to the "Irrigator" Office that what might be a "flying saucer" was visible in the sky. Upon closer investigation the bright object high up in the sky was the Planet Venus which appeared to be sitting close up to the tip of the new moon.

The star appeared exceptionally bright for the day time (between 11 a.m. and 12 noon), whilst the clouds fleeting across the sky made the star appear to be moving fast. Actually it was almost stationary. It was an interesting phenomenon even though it disproved another flying saucer myth.
