

# FLYING SAUCER' FINDS NEW ATOM PARTICLE

**With one of these balloons, Melbourne scientists have discovered a new atom particle (see Page 3).**

They said that other scientists were doing similar work in Britain and the United States — and that the balloons undoubtedly started the "flying saucer" scare.

The balloons photograph the private lives of atoms 7 to 22 miles above the earth.

Inside the balloon is an-

other balloon—and inside that is a third balloon containing photographic plates attached to a parachute.

Anybody finding part of one of these balloons must **NOT** open the package containing the plates.

They should get in touch with Dr. Hopper, of the Melbourne University Atomic Physics Laboratory.
