

Origin Of "Flying Saucer" Discovered

NEW YORK, Dec. 17 (A.A.P.).—A "flying saucer" found on top of a cliff in a West Orange (New Jersey) quarry on Monday has been identified.

It is part of the ceiling decorations of a nearby dance hall.

Reporting the find originally, the "New York Times" said that the silver-coloured

object, conical and six feet in diameter, was constructed of a heavy cardboard material and contained intricate circular wiring and a number of broken bulbs, but was without source of electrical or propelling power.

The newspaper said that the authorities in West Orange discounted theories that the disc was a hoax because of the inaccessibility of the cliff on which it was found.
