

BRITAIN PRODUCES THE "DISHED END"

NOT A "FLYING SAUCER." What looks like a real "flying saucer" is in fact, an important piece of equipment built at Stockton-on-Tees by the Power Gas Corporation for Imperial Chemical Industries. Technically referred to as a "dished end," this 11-foot diameter stainless steel shape is part of a pressure filter for the new I.C.I. works at Wilton, where the British wonder fibre "Terylene" will be manufactured on a large scale. Already "Terylene" looms large in the latest developments of synthetic fibres and fabrics. Garments made from it are shrinkproof, crease - resisting, quick-drying, and a unique quality among synthetic fibre fabrics — warm to touch.
