

R.A.A.F. Has Saucer File

MELBOURNE, Wed.—
R.A.A.F. intelligence officers say that an accurate analysis of flying saucer reports cannot be made for at least two years.

They expect that it will take that long to build up a "full and accurate" file on which an analysis can be based.

An Air Force spokesman said today that, although reports on "aerial phenomena" were most welcome, many were not reliable or credible.

He said that many reports received from all parts of Australia had been checked and found to have a "quite logical explanation."

Saucers had frequently been discovered to be aircraft, optical illusions, or falling stars.
