

NAZIS "FIRST WITH FLYING SAUCERS"

London, Nov. 21.—German engineers produced a type of flying-saucer as one of Hitler's secret weapons, according to Herman Klein, a German now living in Switzerland.

The Zurich correspondent of "The Times" quotes Klein "It is wrong to suppose that story as told to the Zurich newspaper "Tages-Anzeiger" of an illusion."

Klein says the model was He says he can believe that when a flying saucer was released from Prague in 1941 it soared to a height of 30,700ft. in three minutes. The stability of flying saucers is attained with a gyro-compass.

Construction of a pilotless saucer began in 1941 and within two years it was possible to launch the first experimental flight.

One of these discs, released from Stettin, crashed on Spitzbergen.

Klein says the model was produced at Peenemünde where he was concerned with a production of secret weapons, including the V

(flying bomb) and V2 (rocket).

He says that two types of flying saucer are being produced today, one with a diameter of about 52ft. and the other of about 130 ft.

"This is why observers have seen in the sky sometimes small and sometimes large flying saucers.

"It is wrong to suppose that

First reports about flying saucers came from the United States because it was there that experiments are being intensively carried out, Klein says.

A scientist named Miethe, who worked on Hitler's secret weapons including the flying saucers, now lives in the United States.

Klein says that the U.S. Air Force has orders not to shoot down flying saucers.

If they are of foreign origin, he says, the United States would have great interest in forcing them to the ground.

Klein says he hopes to pro-

Mein says he hopes to produce in Switzerland a type of flying disc powered by electricity, and capable of carrying two or three people.
