

## EYE ON THE WEB

### Build a better beer cooler ...

COMPUTER nerds got excited over an essay on the **Slashdot** website, posted by New Zealander **Michael**, on how to build a jet-powered beer cooler.

His idea attracted 141 responses between 2.29am and 9.30am on Sunday.

"Finally, rocket science put to good use," said one.

### UFO update

**THOSE** weird lights seen in the skies everywhere from Nunawading to Nantucket were most likely stray meteors.

NASA has its own **NEO (Near Earth Objects)** website which can give you the rundown on what's happening in our skies. Or you could join the International Meteor Organisation or the Meteor Hunters, who buy and sell meteor bits (a starter collection sells for as little as \$100).

And the Jet Propulsion Laboratory offers a calendar of asteroid, meteor and NEO activities in the galaxies so you can "pick a day and find out what's flying around".
