regulation is subservient to fitness. All is subservient to fitness (including fitness itself). So, there are networks that improve fitness, and networks that dont. Whether or not there is control is ... irrelevant?
----- (12/18/2013 11:27) -----

Andy: I'm not sure anyone can hear me, which is fine; here's a comment. In terms of the roadmap, bringing together these *awesome* theoretical discussions and the notion of implementation via synthetic biology perturbations would be powerful. Small molecule stuff is fun (and I think there are new systems via DNA nanotechnology that more or less fit the bill in vitro), but they're pretty much limited. If we want to have some real, significant crossover, we should try to cross-fertilize the notions presented here with synthetic perturbation and concomitant modeling, including of fitness.

Eric Smith: Yes, certainly agreed.
