

1
00:00:04,850 --> 00:00:08,890

Next time you look up at the night sky, just think: each point of

2
00:00:08,890 --> 00:00:13,300

light is a sun and likely has orbiting planets.

3
00:00:13,300 --> 00:00:19,060

In fact, astronomers searching one small sliver of the sky have

4
00:00:19,060 --> 00:00:24,430

found nearly 1,000 worlds so far.

5
00:00:24,430 --> 00:00:27,670

We're surrounded by solar systems.

6
00:00:27,670 --> 00:00:32,210

And as we learn more about the universe around us, NASA is developing capabilities

7
00:00:32,210 --> 00:00:36,430

on Earth and in space, to send astronauts farther into our solar

8
00:00:36,430 --> 00:00:45,069

system than ever before, to an asteroid, Mars, and beyond.
