Comments on *Dummies*.

[5/5 -- I will also be commenting *BPW-Physics* and *Just So Stories*: these pdfs are also referenced in the index.]

Dummies [[other formats](#)] is still a long way from being watertight. It may never be. The leaks finally have to be sealed with the mustard-seed plaster of our cosmic trust. The Spirit of Truth is not something to be computed, after all. The truth is alive, like everything else in the world. Was that not the point of the Incarnation: 'I am the way, the truth and the light'?

I notice on the original website there were attempts at a glossary along with synopses. That is usually a tedious business, but one that cannot avoided indefinitely. This might be the initial venue for such.

Do I hear nominations for the weakest *dummy* link? Or for the biggest hole in the argument?

Certainly I struggle with the ouroboros. They don't call me [Laocoon](#) for nothing! Recall my original [attempt](#) at cosmology. The ouroboros, however, is not mentioned until [here](#).

What I am pointing to is the extreme density of archetypes loosely designated as matrix, logos, dia-logos and ouroboros. This is the cosmic black/white hole: don't tread on me! The above sculpture captures the dynamic of it, better than my 1K words. Laocoon is Hercules and Jesus in one. In regards to the latter: we must recall Alexander and the infamous knot. In sacrifice there is salvation. Paradoxical here, sublime there. The christos is both Laocoon and serpent. Clearly the serpent is the organic aspect of the logos. Think of the great chain of being. Emerging in potency, the christos is the A/O of being.

[5/5]

Generally I have been avoiding specific mentions of phenomenology on these pages. In a collaboration with Jack Sarfatti, this topic will not be avoidable. One exception to this rule has been the portal hypothesis that has been mentioned here recently in connection with an eschatological scenario. Jack has been willing to also entertain this hypothesis, although the 'thrust' of his physics is aimed at exotic propulsion schemes.

An issue with Jack concerns the agenda of the visitors. I see them as facilitators. He sees them as generally inimical to our interests, they seeing us as potential competitors. This issue tracks with the question of whether the visitors are extraterrestrial or ultraterrestrial. That they might be coming from another physical universe would be on the boundary line.

Can I pry Jack loose from his physicalism? This will be the main issue. I'm not sure whether that stance is primarily for internal or external consumption. One way to get and handle on this position is to broach the issue of virtual realities. This comes in play with Tipler's omega hypothesis where we all end up inside our own cosmic computer. Left out of that scenario is cosmic intelligence.

It is unclear whether Jack plans to roll out his mathematical artillery for this project. I might have to work around that.

Another approach would be a Hitchhiker's guide. That would take a unified view. A confusing subject gets more confused. Needs to be a story line. Jack pushes the physics as far as possible, and from that vantage serves as a liaison back to the scientific folks. Or start with the idea of a single chapter. Think of all the things we agree on. Shared historical sense. Time travel, teleology. Mythos.

[5/6]

Jack has been commissioned to upstage the ETs. I've been commissioned to upstage the UTs. One has got to be the cover for the other. Which is which? It's a no brainer! That's our story.

What can be our literary model for this story? Dueling Banjos? Crossfire? Mutt & Jeff? Kemo Sabe & Tonto? K: We're surrounded by Injuns! T: Whad'ya mean 'we'? Will Jack be willing to play the fall-guy? I'll have to twist his arm.

Physics & the BPW

Café Trieste, here we come!

5/1/05

<http://www.bestpossibleworld.com/index06.htm>

Synthesis of physics and metaphysics

- If Jack and I were to collaborate on a book, what would be its coherence?
 - How will I wag the dog?
- This presentation is a preliminary outline for my part of it.
 - As with Aristotle, the metaphysics comes after the physics.
 - In his case, 'meta' meant 'after'.
- The BPW is a resonance phenomenon in the mind of X.
 - It is 'self' exciting as long as the Self includes the primal X.
- I weigh in with the eschaton.
 - 'Eschat' is the 'tail' in Greek that here wags the dog.
 - Or what about the **portal** idea?
 - These would be virtually synonymous
 - The portal is a literal segue to the eschaton
 - Would this be subverting too much of the physics?
 - I'm not sure Jack could live with this.
 - How can we help him out?
- Need to work out the eschatological transition from physics to metaphysics.
 - How do we transition through the portal?
 - How does the QRP break down?
 - It could only do so in a holistic fashion.

Why Physics?

- Level playing field
 - Allows for combinatorics of all kinds
 - This is as close as God gets to rolling the dice.
- Coherence of nature
 - Ontic: TOE
 - Epistemic: PSR (Leibniz)
- Symmetries
 - Cycles, energetics, etc.
- Anthropics
 - Metabolism, ecology & technology
- Disciplining the spirit
- Metanarrative

Why math?

- Logic of coherence
 - Link to language
 - Godel's theorem
 - Universal grammar
- Link between mind and matter
 - Exploits organicity of math
- Universal 'language'
 - Enhances cosmic intercourse
 - Language of the gods
 - As in Mb
- Symmetries
 - Geometry
- Computation
 - Combinatorics
 - Cosmic computer

Organicity, coherence of math

- Unity of math
 - Langland's program, 'moonshine', coincidences, Mandelbrot,
 - FLT, Riemann,
 - Algebraic geometry, complex analysis,
- Pythagoras vs. Plato
 - Music & math
- Math genius: Srinivasa

Mathematical Physics

- 'Unreasonable' effectiveness?
 - It is the A&O of reason.
 - Noether?
- Harmony of the spheres
 - Would the spheres sing if no one listened?
- Organicity of math
 - Points to relationalism
 - And to intelligence and subjectivity
 - Could not exist w/o intel.
 - Math fills in the gaps when primordial coherence/presence is broken.
 - Observational blind spots
 - Gaps in Cs are filled w/ background intel.
- Observer principle
 - Is math essential here?
 - Godel
 - Holography helps
 - Microcosm
 - Need for ouroboros
 - Mandelbrot reflects this
 - Observer is built into math.
 - Language w/o observer?

Origins of physics

- Dream logic
 - coherence, lucidity
 - Synchronicity
 - Breakdown of bicameral mind
- Game of the gods
 - Start, conceptually, with virtual, ceremonial, 'sacrificial', zodiacal Pokatok
 - Coordination of consciousnesses in space and time
- Sacred geometry
 - Megalithic geodesy
 - Archeoastronomy
- Archetypes
 - Celestial
 - Zodiac – it sets a precessional time scale
 - Symmetry broken by Freya/X
 - Mathematical
 - pi, Mandelbrot, Monster group
 - Atomic
 - Alchemy – Jung

What to tell Jack

- Math-phys implies a pan-psychism
 - So does anthropics
 - The language of the cosmos is math.
 - Math is abstracted from the physics
- The quantitative, formal intellect just scratches the surface of the qualitative, informal intellect.
 - The Mandelbrot patterns provide an example.
 - Math genius cannot be formalized.
 - The forms are abstracted
 - They work on a statistical basis.
 - They do not account for teleology
- Why should the cosmic intellect be restricted to the formalism of math-phys?
 - This is the error of Plato in contrast to Pythagoras and Aristotle.
 - Platonic forms are mental but they do not account for the organic quality of the mind.
 - Plato's God could only do combinatorics.
- The Anthropic Principle ought to clinch the organic side of the cosmos.
 - Jack's transhumanism pushes anthropics further.
 - Does it not imply a teleology?
 - Especially in the possibility of creating new universes.
 - Why suppose we are **not** created?
 - To what end?
 - Are we not slated to become gods?

(Cont.)

What to tell Jack (cont.)

- He does not sufficiently appreciate Jacques Vallee's thesis:
 - The 'high strangeness' and 'associative' nature of the encounter phenomenon.
 - The visitors are not operating within our mindset; rather, they appear to be operating upon it.
 - It appears that we are dealing with a collective phenomenon
 - The visitors are much more in touch with the panpsychism.
 - In short, we are dealing with a metaphysical phenomenon.
 - As much as anything, they are intent upon broadening our conception of reality.
 - To understand their agenda, we need to take a cosmic perspective.
- Jack is pushing the boundaries of physics well into the realm of metaphysics, still following a bottom-up approach.
 - My role is to pursue a top-down approach.
 - We meet at the portal to the here-after.
- In contrast to Jacques, Jack and I see us approaching an historical juncture.
 - Jack sees this in terms of a scientific and technological breakthrough of unprecedented proportions.
 - I see it in terms of an historical gestalt switch in an eschatological context.

The Just So Story of the Universe

Jack's & Dan's Little Book of Wonder

aka: Pomo's Metanarrative

5/2/05

Contents

- Introduction
 - What if....?
- How the web got its spider
 - Indra the dream weaver
- The gods who played Pokatok
 - Earth divers
 - Our gnostic sojourn
- How the sky got its stars
 - The song of the spheres
- How the numbers were made
 - The story of Pi
- How the quantum got its observers
 - No math w/o intellect
 - Microcosmic atoms
- How the physicists learned to dance
 - They're doing the Monster Mash
- Destiny Matrix' Child
 - Mandelbrot mystery
 - Message in a bottle
- How the sky does fall
 - Pomo's metanarrative
 - What hit chicken little on her head?
 - Starships and wrinkles in time
- All's well that ends well
 - Apokatastasis

Introduction

- A big ‘what if’
 - What if the universe were more like a great idea than a great machine?
- It has been said that the language of the cosmos is mathematics.
 - Human intelligence has nearly mastered that language, but that is not the end of our intelligence.
 - Should mathematics be the end of cosmic intelligence?
 - Is not our mathematical intelligence wired into the cosmos?
- What about the other aspects of our ‘natural’ intelligence?
 - Might that not also be plugged into the cosmic mind?
 - How else are we to make sense of Anthropics?
 - What better way to grapple with the profound mystery of the mind?

(cont.)

Introduction (cont.)

- The upshot is that mathematical physics need not mark the end of our ability to commune with the cosmic intelligence.
 - Have we been remiss in not taking better advantage of this opening?
 - We have been mesmerized by science for several centuries.
 - Only now are we recovering our higher sensibilities after our scientific/materialist binge.
- It is not surprising that there is a great reluctance to venture down the path of reason and, yes, ultimately gnosis.
 - We are not just being invited to become more fully acquainted with God.
 - We are being invited to be one with God.
 - Scientists wish not to make any concessions to religion.
 - Religionists don't want any external meddling in what they regard as solely matters of doctrine and faith.
 - Secularists are cautious about anything that could undermine unfettered pluralism.
 - Our natural conservatism holds us back from the leap ahead.
 - But in the end, what can possibly restrain our spirits?

How the Web got its Spider

Indra the Dream Weaver

- For us monists, Indra's web of existence comes for free.
 - There is only one source:
 - Matrix, mother, cosmic womb,
 - Try as we might, we can never completely separate ourselves from our source.
 - It is impossible to sever the umbilical.
- Our problem is Indra herself.
 - Creatrix, logos, christos, dream weaver
- Here is my explanation for her:
 - Existence is relational
 - To be is to relate
 - The most related is the most real.
 - Coherence is the key to existence.
 - Our spider is the source of coherence.

(cont.)

Spider (cont.)

- Can there be too much coherence?
 - Are creator and creation not infinite?
 - Only qualitatively, not quantitatively
 - See Mandelbrot
 - This is where theists and pantheists part company.
 - We have in mind the concept of *Apeiron*.
 - The Matrix is the *Apeiron* in its potency
 - Plato went too far in his disavowal of it.
 - He was not a relationalist
- Coherence demands an external closure
- Coherence is necessarily subjective
 - The creators are subjects/persons
 - How many creators?
 - see Mb.
 - An infinity of creators only potentially
 - Here, too, there is a social cohesion and closure
- In a relational world there is bound to be an optimal coherence.
 - This is the BPW $\leftrightarrow$ coherence theory of truth
 - Given even the possibility of a web there will inevitably be a real spider

The gods who played Pokatok

- Here is a more corporate view of creation
 - A recreation of the gods becomes our creation
- Who was the Tom Sawyer who organized the game and got the fence painted?

How the sky got its stars

- First in the heavens are the Sun and Moon
 - The Sun/Earth is necessary to provide an open access source of energy
 - Plus there is a natural optimum of eco-diversity
 - Tidal estuaries add a vital component
- Heliotropism keeps the Sun in its place
 - Quasi-archetype
 - PSR minimizes deviations
 - Phenomenal cycles
 - Ritualism
- With stars we appeal to the moon and zodiac

How the numbers were made

- The ontology of numbers and stars are similar.
 - Thus can they be mutually supportive in our relational system.
 - Thus ultimately astro-physics
- In the Mb we see how numbers reflect the cosmos.
 - Another sign of mutuality
- In their organicity they reflect life and language
- See the 'bpw-phys' pdf
 - Numbers relate phenomena
 - They provide 'matter' with its coherence and consistency
 - As with the Mb, there is an optimal ecology
 - They are the tokens of symmetry
 - They help to fill in the unobservable gaps.
- Numbers arise out of numerology and astrology
 - As chemistry arises from alchemy
 - In both cases we refrain from the arbitrary separation of ontology and epistemology
 - The primal psychic circuit of the zodiac is the origin
 - Thus the compartmenting, or literally the constellating, of our psyches
 - Thus do numbers fall from the sky.
 - Math genius is a recapitulation of these origins

How the quantum got its observers

- The quantum is a little piece of the Matrix
 - Part of the bootstrap
 - X is to the Matrix as we are to the quantum
- The quantum allows math/mind to connect to matter.
 - Unlike classical phys.
 - No math w/o intellect
- Atoms are microcosms
 - Atoms contain all the math
 - They pick up on the logical resonances as did Srinivasa
 - We are the mesocosm
 - Atoms are always entangled in the functional cycles
 - They disentangle only if we need to take their picture
 - They are particularly entangled in living systems.
 - Where they behave like Mb-atoms
 - The DNA, for example, is actually a functional archetype.
 - That's one way that the quantum ensures its observers.

How the physicists learned to dance

- Matter is all form and no substance
 - In the first approx. the forms are Platonic
 - Finally they are Pythagorean
 - Even Aristotelian

The Lone Ranger & Tonto

High Noon at the ET Saloon

CV61 USS Ranger, 1987

Lone Rnager

Contents

- Introduction
 - Parallel lives
 - Then a strange convergence
- Contact!
 - A quarter century apart, but it's still news from nowhere
- Space-Time & Beyond
 - Fork in the path
 - Physics vs. metaphysics
- Exopolitics
 - MJ12 – Aviary
 - Birds of a feather
- Dan and Jack mix it up on the Internet
 - A fist-fight in heaven?
- Showdown/Showtime
 - ET vs. UT
 - Jack pushes physics to the brink
 - Danny pulls an ace out of his sleeve
 - It's getting ugly at the ET Saloon

Introduction

*Where Do We Come From?
Who are We?
Where are We Going?*

Paul Gauguin
1897

- Here we take a biographical approach to confronting the question of the ages.
 - Don't we all want to know what makes the world go around?
- Six years apart in age, but we were both Sputnik babies.
 - Well, we were born on two sides of the tracks, and we are now on two sides of the 'green door'.
 - Trust us, it's all part of the plan.

(Cont.)

Introduction (cont.)

- Jack was contacted in 1952
 - It was a computer onboard a space ship from the future. The voice was metallic.
- Danny had to wait 25 years.
 - Sophia was warm and fuzzy.
 - It was worth the wait.
- This is the story of the lab raised chimps
 - One chimp has a cold wired surrogate mother
 - The other has a warm and fuzzy surrogate mother
 - Guess which one is more exploratory?
 - It's Danny Boy who ventures off the deep end of space-time.
 - Jack stays closer to the physics establishment

(cont.)

Introduction (cont.)

- Anthropic Cosmological Principle
 - This is a major part of Jack's first book.
 - Danny is deep into this concept when he encounters Sophia in 1977.
 - This encounter has a decidedly theistic flavor.
 - Prior to this Danny was a self-styled transcendental pantheist.
- Next comes the exopolitics...
 - Here again Jack has all the seniority.
 - Child prodigy – contactee
 - Could Uncle Sam ignore such a one?
 - But Danny is not going to be left out
 - He had another experience in 1991
 - Shouldn't he call 911?
 - Thus do we encounter the 'weird desk'.
 - A couple of years later Dan is introduced to Jack by a ufologist
 - Dan introduces Jack to Ron
- And so we come to MJ12 and the Aviary.

Space-Time & Beyond

Jack instigates it all.

Danny takes it all in.

Published 1975

- Jack sticks his neck out, metaphysically
 - This is the early Jack, in his hippie mode.
 - Jack sobers up
 - He returns to work within the system, pushing the envelope of physics
- Danny Boy, having once given up on physics, also returns to push the boundaries.
 - Finding them unyielding, he strikes out on his own into the strange world of metaphysics.
- Where will they meet again?
 - On opposite sides of the 'green door' in Area 51!
 - This is the gateway to the stars and beyond
 - Will they be able to open the door?

Exopolitics

- The story of phenomenology
 - Uncle Sam keeps his eyes on the skies
 - Not only do you track the phenomena, but also the people associated with the phenomena
 - Jack & Dan?
 - Jurisdictional issues
- Aviary & the phenomenology network
 - Two intertwining concerns
 - Physical & metaphysical
 - The radar doesn't always work
 - Remote viewers get into the act: ~1980
 - » Military vs. scientific
 - Going public
 - Desert games
 - 'MJ-12' documents
 - TV disclosure
 - 'Pelican' & the 'weird desk'
 - 'high strangeness'
 - Non-linear phenomena
- MJ-12 & the Visitors
 - And the verdict is:
 - Biggest hoax?
 - Strategic cover?
 - Global psy-op?
 - Visitation: How? vs. Why?
 - It's about the hardware, stupid.
 - It's about the software, stupid.

Parousia by the Bay

Conclave of The Knights Extemporalis

Café Trieste

May 25, 2005

Summary

- Introduction
- Microcosm & Cosmos
 - Cells, particles, words, music & numbers
 - Plato vs. Pythagoras, Aristotle, Socrates, etc.
 - Genius – coherence – observer
 - S. Ramanujan
- Holism, coherence
 - TOE/GUT
 - UEM, Anthropics, MG
 - Archetypes, teleology
- Lessons of the Mandelbrot
 - The phenomenology of numbers
 - Organicity of all things
 - Mother of the archetypes – AZO/X/QRP
(cont.)

Summary (cont.)

- Network of being
 - Coherence theory
 - Cosmic intelligence
- Bootstrap dynamics
 - Self-excited circuit
 - Wheeler, Feynman, etc.
 - Ouroboros
 - Channeling the Matrix
 - Chaos vs. order
 - PSR, Rational Theism
 - Cloning, microcosmics, combinatorics
 - Into the BPW
 - AZO/X/QRP

(cont.)

Summary (cont.)

- Creation/creator
 - Morpheus to metamorphosis
 - Self-sacrificing Creator
 - Earth/cocoon
 - Anthropics to anthropo-/geo-centrism.
 - Pearl divers
 - Grail quest
 - Magic formula vs. M-brot
 - » Jack vs. Dan
- Parousia, Millennium, Eschaton
 - Rationalizing the X-event
 - Rationale for Y2X
 - Visitors/Magi : Majic12 : Aviary : Aquarium : EFG
 - Ron, Dan & Jack show
 - DNI: Humint, Sigint, Imint & Masint
 - 'Phenomenology' and high strangeness
 - Trinity site to 9/11 to 2005
 - Portals to the eschaton

Talking Points 1

- I see three overlapping meta-themes or issues. There will be much bouncing back and forth.
- Teleology – Jack vs. Dan
 - Anthropics -- weak vs. strong
 - Eschatology – implicit vs. explicit
 - Physicalism vs. immaterialism
 - Dan introduces the mysterious Mandelbrot, exemplifying the Telos at work
- ET encounters – two scenarios
 - Jack: mainly hostile ET version – competitive
 - Dan: mainly benign UT version – cooperative
 - Both versions will include MJ12 and Aviary developments
 - Disclosure & disinformation -- Jack vs. Dan
- Metanarratives
 - Transhumanism vs.
 - Best possible world
 - In both instances we are at an historical juncture
 - When and how will these issues be resolved?

(cont.)

Talking Points 2 (cont.)

- Saving the world
 - From what?
 - For whom?
 - What is our responsibility?
 - Let the BPW take care of itself?
- No consequences?
 - BPW = min necessary consequences
 - Were there consequences for Xian vs. Islam?
 - Not BPW for Muslims?
- Why should Jack's people care?
 - Why should physicists care?
 - Responsible for Bomb
 - Make amends
- High Strangeness
 - Idiosyncratic, dreamlike
 - Explains why most physicists ignore ufos
- BPW should be a no brainer
 - Problems with Darwinism
 - Social Darwinism
 - Meaninglessness, alienation
 - Scientific deconstruction has not been challenged in a global context.
 - responsibility of cosmologists
- Mind over matter
 - Ufos permit a rethinking of the world
 - Ignore opportunity?
 - Go for coherence and synthesis
 - tell the most uplifting story possible

(cont.)

Talking Points 3 (cont.)

- Why are Jack and I still talking?
 - What is Ron's involvement?
 - What would be the goal of a publication?
 - Who has more room for maneuver?
 - Paradigm/gestalt switch
 - Opportunity for more than just technological change
 - How will metaPh inform phys?
 - About the eschaton
 - About a creator
 - This is where the futurists fall down
 - They ignore the recursive aspects of their own scenarios, where we become our own creators.
 - Even a modicum of teleology will amplify itself
 - Bootstrap applies mainly to intelligence
 - About **portals**
 - About archetypes
 - Mandelbrot
 - I don't know what Jack will say about archetypes
- (cont.)

Talking Points 4 (cont.)

- Past discussions
 - Can there be mind w/o an archetypal self?
 - Once you let a self in the door, it is hard to shut it against all sorts of metaphysics.
 - Jack is the mad inventor: *Back to the Future*.
- Strategy
 - Not allow metaPh?
 - Many will be turned away
 - Very few physicists will notice
 - If allowed?
 - Yes, it will tend to take over. Can't be helped.
 - Scientists are worried about the slippery slope.
 - Ufologists have a history of neglecting the weird.
 - Ron knows better.

Trieste

Book project

- Do we need a sceptic?
- What other role?
- John, Paul, trickster,
- What will we need from Ron?
- Anthropics
- Start off with an irreducible self
- Why could do a hypothetical mind physics section
- we need this for portals
- Portal is mini-eschaton
- Area 51 -- Dreamland
- How do we script the breakdown of physics?
- Opposite of pokatok portal
- Immersion VR
- Higher self waits on us
- Why did ufology never pick up on the R & D show?
- They were not supposed to.
- Portal is like changing states of consciousness
- This includes the collective Cs
- The switch has to be slow
- In which state is the higher self?
- Like changing cycles
- Emergence of physics in pokatok
- Is there programming?
- UEM? @ pokatok
- Gravity would be the first place
- Expectations abound
- Air friction?
- Damping of fluctuations
- PSR -- min deviations
- what about the gravity on the moon?
- How did that get determined?
- Sun came first
- Solar phys and orbital dynamics
- Isaac Newton
- $1/r^2$
- So what?
- Counterfactuals
- Newt's laws >> LAP
- Min arbitrariness
- Phys removes busy work
- How does phys get done?
- Math and PSR are syn
- PSR = TOE
- BPW = LAP
- All these go together

Introduction

– (adapting material from the BPW-Physics presentation)

- Plato vs. Pythagoras

- I'd like to find a least abstract lead-in.
- Plato's static forms continue to dominate scientific thought
- Jack introduces Pythagorean and Aristotelian concepts back into physics.
 - Mind, teleology, information, pilot waves, ODLRO, etc.
 - The quantum field serves as God's sensorium.

- Jack hesitates to once again venture out *Beyond Space & Time*.

- But if we want to commune with cosmic intelligence, we must be prepared to stretch our own minds to the limit.
 - UFO phenomena should stretch our imaginations
- Jack's firm grasp on physics makes him the go to guy for one such as myself who needs a bridge from metaphysics back into the scientific community.
- Designing such a bridge provides the context for this gathering.
- Welcome to the Jack & Dan show, celebrating its first decade.

Jack waiting for his ship to come in

He likes to take the big gamble. Dan is the minimalist

On Being Focused

Creation Strategy

The BPW Hypothesis

A Personal Creator

- From a creationist perspective, the creatures must reflect the image of the Creator.
 - What other image could they reflect?
- God is focused on creation.
 - We are focused on procreation.
- Does God procreate?
 - She does, but he does not.
 - Therein lies the essence of Creation.
- The pantheon is spawned by the Matrix.
- As goes physics, so goes Creation.
 - Creation is about coherence.
 - Coherence entails some sort of least action principle.
 - The BPW reflects that principle.
 - The pantheon channels the potency of the Matrix into a BPW.
 - The X factor is the prime ingredient, which we suppose is love, as in the ideal of procreation.

The Impersonal

- Pantheism is an ode to the impersonal cosmos.
- The personal cannot exist without the impersonal.
 - An important and more subtle point is the converse.
- Art is the struggle between these two elements.
 - It records the mastery of the one by the other.
- Pantheism is the apotheosis of polytheism.
 - It is the Aqua Regia of metaphysics.
 - It is hardly gratuitous in the realm of spirit.
 - Surely it should be celebrated, and it is.
- Pantheism is the religion of tolerance, peace and stability.
 - There is no utopianism, and not much enthusiasm or evangelism.
 - It is the passive aspect of spirit.
- The impersonal is what we abstract from the personal
 - Atoms and numbers are such
 - Each abstraction retains its holistic potency as we see with DNA and the Mandelbrot.
 - It connects and separates persons, as well as the creatures from the creator.
 - The Matrix is the animist ground of being.
 - It is the proto-personal; the cosmic protoplasm.

Self-organization

- The ouroboros is the cosmic bootstrap and proto-self.
 - Any cycle is in that image.
 - Wherein a self-identity is implied.
 - Each must have a head and tail
 - With the Mb, those are the mu-atom and filament.
- The cycle is a primitive organism.
 - It is a channeling and focusing agent.
 - Such is the dialectic.
- Indra's necklace, the network of being is a functional alignment of cycles.
 - All in service to a personal telos.

The Governing Principle

- As it stands we have just one Matrix, which spawns a pantheon of creators.
- It would be natural to suppose there would be a plethora of independent creations.
 - This is the Many-World hypothesis.
 - This is certainly the way creativity functions down here.
 - But there is a caveat concerning self-independence. There is no such thing.
 - Every known self is a social self. There is no such thing as self-identity. This point is barely controversial.
 - The zodiacal pantheon associated with the Matrix can hardly constitute an exception.
- Another way to look at this is that immaterial existence can only be a relational existence.
 - The same is true for 'material' existence, it is just less obvious.
 - To exist is to relate.
 - Non-cooperative selves simply cease to exist.
- In a neutral sense, the ultimate organizing principle is survival.
 - The next rung on the organizing ladder would quite logically and simply be something akin to what we call 'love'.
 - This is what I refer to as the X-factor.
 - This factor transcends the pantheon and Matrix.
 - But there is another caveat.
 - We tend to think of love only in interpersonal terms.
 - Exceptions: self-love and agape.
 - Since there is no such thing as abstract existence, any coherent pantheon must provide for the embodiment of love.
 - Thus do we have both Cupid and Christ among many other examples.
 - It is just thus that the creative energy of the Matrix and pantheon is focused through love into the BPW.
 - This is my hypothesis and the governing principle of whatever coherence I possess.

Addendum -- 7/2/05

- By way of a summary of the BPWH –
 - (w.r.t. focusing, see the last question)
 - What's a Creator to do after Creation, I mean way after? Do you eventually just leave it go?
 - An obvious option would be to recycle it, but this would be counter to the BPW hypothesis.
 - The last option is redemption. That's apokatastasis. That's the eschaton.
 - The only question is when.
 - The only answer is, at the best possible time. Which is?
 - Which is when we have done just about everything we can possibly do down here. When we are physically prepared to leave the planet. When we are able to destroy the world, but before we actually do. When the secret of Creation can no longer be kept. In other words, right about now, folks.
 - The next question is whether it is possible for there to be a creator.
 - This would seem difficult to deny, especially if we take mind seriously. Instead of a primordial material stuff, why could there not be a primordial mental stuff, i.e. Matrix, with at least as much self-organizing potential as this alleged material stuff?
 - The last question here is how many creations.
 - In an immaterial, monist, relational world, there is no rational alternative to the BPW hypothesis. Any network of being would be self-centered. There would be an organic functionality. Chaos, to exist, would be parasitic upon that organic network. At most, there would be a functional network of realms, much as we see with the Mandelbrot, with everything in its place. There is every indication that our world is spiritually the densest world, i.e. the center of spiritual gravity.

Welcome to...

Dan's Place...

...here at the End of the World.

(Home of the [*Eschaton*](#) and the [*Aquarium*](#))

Hi, I'm Dan. The Aquarium is a vision of the future. It is my vision that this will become everyone's vision, that it will become the next reality.

We sentient creatures, with the help of a few other intelligences, are the unwitting creators and maintainers of this reality. As we finally awaken to the spiritual nature of reality, reality will take the form of our combined visions. That awakening will be our Eschaton, the end of this world and the beginning of a new one.

Dan's Place in cyberspace is an attempt to put a face on this vision and to give it a voice. What you see and hear here is a shifting collection of vignettes and sound bites recorded on the path to the Eschaton. This is not and will not be a finished product. The future is our only product, and you are its only producers.

The future will defy categorization and definition, and so even the most general of categories will quickly prove inadequate. With all that in mind, we shall proceed...

Comments on the Original Website

[4/18] A significant breakthrough came about two weeks ago when I recalled the topological similarity between the Mandelbrot and a [drawing](#) done for the original [website](#). That clinched the point for me that the Mb could be exploited in a new pedagogical initiative. Thus I began working on the power-point presentation. In that process I decided to put the original 'Aquarium' website back on-line. Soon I discovered that many of the pages had apparently been saved directly off of the Clark.net site, and so there was a mixture of hyperlinks, that is still not completely resolved, and there appear to be some missing pages, as well.

There are some 460 files listed in the Aquarium folder, without any attempt at a unified table of contents or site map. As time permits, I will attempt to correct that here. Front Page has a tool to create a site map, but it seems too general to meet this particular need. Eventually some expertise will be required.

Virtually all of the pages are dated from 1997 thru 2000. There are one or two earlier relics, going back to '93 that were distributed via the electronic bulletin boards that predated the web. I was aided in this by Don Allen, moderator for the FIDO UFO conference

The significant previous breakthrough was the switch from a many worlds hypothesis to a one world hypothesis (OWH) and the to the Best Possible World hypothesis (BPWH). This is what motivated the inauguration of the present website after a hiatus of over a year that included 9/11. The Mandelbrot explains the breaking of the zodiacal symmetry of the original drawing of the cosmos.

[4/20] However, please note the OWH showing up [here](#).

Major Players and their associations

Paradigm Inversion Meter & Eschaton '*Quantum Detector*'

The world wide web will be our best indicator of how near we are approaching to the Eschaton.

But, before the Eschaton, comes the Paradigm Inversion. We have a reasonable chance of catching the paradigm inversion right here on the web, even in its early stages where it is now. But the fun part is that, as we know from **Quantum** Physics, you cannot observe something without influencing it. That could mean that the watched paradigm never shifts, or it could be that we will facilitate it by merely observing it, if we are lucky.

All we need to build our Paradigm Inversion Meter(PIM) is a slightly clever links section, a good pair of eyes and a bit of luck to be looking in the right places at the right times -- nothing fancy here, just some common sense.

First we have to define for what it is we are looking. We are looking for the paradigm inversion from materialism to immaterialism. We need also to designate an anticipated event so that we have something to mark the point of inversion. Arbitrarily, I suggest the point at which the general news media begin to pick up the signals of this inversion coming from the Internet itself. This is assuming, of course, that the paradigm inversion does not then fizzle out. By getting seismic readings off of the web, we can try to predict when the early rumbles from the paradigm inversion on the web will begin to reach the media.

Four general areas for observation come to mind:

- Intellectual
- Spiritual
- Experiential
- Popular Culture (now just entertainment media)

The problem is to find the specific sites on the web that are closest to the various possible epicenters of the inversion. If things go according to plan, Dan's Place would wind up being the Epicenter, of course.

We already have a [diagram](#) depicting the anticipated conceptual convergence toward the Aquarium world view. This diagram now needs to be expanded to reflect the more specific function of our PIM.

Welcome to

The Best Possible World - Gateway to the Millennium and End Times

(Why the World is Great)

You are probably landing here from the BPWs experimental AdWords campaign. Here are some of the keywords being used therein:

- [eschaton](#)
- [eschatology](#)
- [teleology](#)
- [rationalism](#)
- [cosmology](#)
- [materialism](#)
- [immaterialism](#)
- [idealism](#)
- [coherence](#)
- [Leibniz](#)
- [absolutism](#)
- [relationalism](#)
- **anthropic principle** (best to start on this [page location](#) and continue by using 'anthro' as a search term)
- **archetypes** (best to start [here](#), also see page 13ff of [Dummies](#)) (That the Mandelbrot and the archetypes are closely related is of potentially great significance. The Mandelbrot may be our cosmic Rosetta stone.)
- [theism](#)
- [pantheism](#)
- [metaphysics](#)

All of the above links refer, in the first instance, to the [Topical Index](#) which presently provides the best overview of the BPW website.

My first attempt at a synopsis is [Dummies](#).

Please note that there are more than 500 web pages on this site, and that includes over 2,000 pages of text. We anticipate a major overhaul of the navigation system beginning in May, thanks to [CHCS.com](#). Please bear with us!

Note that the **weblog** sections of this website are listed near the top of the Topical Index in chronological order.

Note the contact information at the bottom of the Topical Index. There will be a priority to upgrade this Welcome page.

[Topical Index](#)

4/27/05

How Many Worlds?

This is closely related to the last question. The answer is similar. There is no law against the creation of many worlds; however, there are some very reasonable stipulations.

Unless we are dealing with an evil creator, the welfare of the creatures is the prime concern. Thus there would be a concentration of creative effort on the quality of some primary world. Any other creations would be secondary, and presumably would be subservient to the main one.

But what if something went wrong with the primary creation? Well, that question arises only from the parochial, creaturely perspective embedded in time. Any real creation is going to be primarily teleological, or created backward in time from our perspective. We have our own mistakes to worry about, not God's.

As you see then, we have come full circle, back to our starting point which was just the best of all possible worlds. If this is somebody's show, I think we can be reasonably confident that it is the main show, it is the big-top, just about the only show in town.

And what about the starry sky? Well, it serves many purposes in this creation, especially as a very aesthetically, natural backdrop. Even Lucas would be proud. Aren't there other civilizations out there. I am suggesting there is no there, there. Whatever visitors we may have are of the interdimensional variety, not interstellar.

Now begins the apologetics or rationalization. If all is well that ends well, then clearly we have our work cut out for us, but who ever said that the best of all worlds would be boring?

<-- [Prev.](#) [Next](#) -->

5/20/02

Best World for Whom?

The best for everybody. But how could everyone ever agree on the best world. We can't even agree on ice cream flavors. Yes, and isn't that why Baskin Robbins has 56 flavors? The point is that this is a big world. There is a lot of variety and a lot of diversity. And if you don't like things right now, then maybe you can wait around a few years, or, even better, get to work now on your personal vision. That is more or less what I'm doing.

Are we to understand that there has never been needless suffering or injustice? I will turn that question around. Is it not possible to imagine that all the suffering and injustice in the world could be healed or made right, given certain metaphysical conditions and theological and eschatological assumptions. Simply assume then that those conditions and assumptions are already in place.

Clearly the best possible world is a highly participatory one. Our destiny is in our own hands, with God here mainly to provide cosmic oversight and guidance, and some very basic guarantees.

How do we know that this is not just the second best world? How do we know that we are not subservient to some other, *numero uno* world? This will only become obvious in the light of the unfolding of the eschaton. It is my job here to do as much of that unfolding as is possible. In the meantime, the fact that this world is the center of spiritual gravity for the cosmos underlies the entire prophetic tradition. Of course, that tradition could be bogus, and many suppose it is. But that is what we are here to find out, isn't it?

A Metaphysical Introduction

Metaphysics was scorned by the analytical tradition for most of the last century. Only in the last decade or two has the academic rediscovery of consciousness forced the philosophers to reopen a metaphysical debate with regard to the venerable mind-body problem. In keeping with their analytical scruples, a narrow focus and the endless parsing of phrases is the order of the day for the Anglo-American philosophers. This is simply what it means to them to be professional. What you see on these pages would never pass muster. Sorry 'bout that!

The Continental philosophers never quite gave up on the mind. Phenomenology remains a wellspring, but much more fashionable of late has been the deconstructionist mentality of postmodernism. A mind set that seems to translate into English more readily than does phenomenology. In short, Metanarrative is scorned on both sides of the Atlantic.

By the same token is coherence scorned. The only good truth is a deconstructed analytical truth, e.g. spilling quantities of ink over the meaning of 'the cat is on the mat'. The fact that these scruples only lead up a blind alley is of precious little concern to the avid professionals.

What you see here is way, way out in left field. Just so as not to mislead you. I am obviously not trying to appeal to professionals. Only if an earnest band of amateurs can bring these matters to a broader public, might the professionals stoop to consider them. They are no longer equipped to deal with coherence, other than in trying to grind it down. We can only hope that they may be so provoked.

The surest sign of the coherence of the world is its increasingly notorious ability to resist analysis. Please keep in mind that veritable mountains of correlations in neuroscience or biochemistry provide not the slightest evidence for reductionism, per se. They only demonstrates that the coherence of nature logically necessitates the existence of irreducible entities, as the Greek philosophers readily deduced millennia ago. Nature exists not by induction on atoms, but rather atoms exist by deduction from nature. If you can appreciate this simple gestalt switch, you will be on the threshold of immaterialism.

Each individual mind is a locus of more or less coherence. Our seemingly unlimited capacity for communication indicates that mental coherence is a readily shared phenomenon. Is there a gene for coherence? Let me know when you find it! More likely there is a genius for coherence (as in Genie?!). The mountains of coherence and correlations within and between mind and nature can only point to a Source. Does not the anthropically biased mathematical superstructure of Physics point to a similar, or perhaps identical Source?

Are not all of us apprehensive about the ramifications of a reengagement with any such entity? Is not the metaphysics of the Source much too hot to handle? Much too dangerous? Well, let's just say, don't mess with the Source.

[Topical Index](#)

[Index](#)

7/5/02

Antipodes

Mind and matter are the mutual antipodes of our metaphysical deliberations. The tension between them shows no sign of resolution.

In the same vein, the Big Bang is the antipode of God. The Big Bang is writ large across the heavens. God, apparently, is rather more bashful, or is on a major Sabbatical.

On a microcosmic scale the atom is the logical antipode of the self. The atom is tangibly omnipresent, while the existence of the self remains problematic.

The thesis of immaterialism is that these appearances are deceptive, but only for a very good reason. If there is deception here, it is certainly on a grand scale.

Given a creative deity, then surely there would be creatures and a story line. Is not the scale of our world perhaps overdoing it? But first things first.

Why should we even suppose that a creative mind could exist without a brain of some rather elaborate sort, like ours? If a body is not necessary for the creator, why should it be necessary for the creatures, unless, perhaps, we are the body of the creator? After the fact?

One point is that the brain seems to have much more to do with the body than with the mind. There is a strong logical connection between body and brain. We can hardly conceive of one without the other. Yet there is no such stricture between brain and mind. Disembodied spirits are a staple of every culture. It is simply that thoughts seem to have no internal spatial coordination or identity whatsoever. There is no conceivable relation between mental and physical space.

Although a thought might exist without a body, we can hardly imagine a thought without a self. An unperceived thought is nonsensical, as is perception without a perceiver. Neither could there be a perceiver without perception.

If our most serious minds can imagine a spontaneous Big Bang, why do they seem to have difficulty imagining a spontaneous self? Can you and I?

A major hurdle is the space-time barrier. All of the selves we know and imagine exist in space and time. We try to imagine God existing in eternity, with scant success. Our spontaneous, self-organizing self will be responsible for its own spatial and temporal orderings. We are told that the Big Bang is quite capable of manufacturing its own space-time manifold out of God knows what.

In a few billion years matter has organized itself into selves, under formidable circumstances, we are told. Imagine what those spontaneous selves might dream up in an eternity. This is not to be flippant about anything, it's just that we must constantly struggle with the language in these realms. But don't underestimate the ultimate, creative power of the Logos. We are told that God did not.

A very important question is the multiplicity. Cosmologists have no trouble imagining an uncountable infinity of spontaneous universes, each in its own possibly infinite space-time cocoon. What about our spontaneous selves? What would be the ground rules of their cosmic intercourse?

Gods will be Gods. If intercourse is possible, it is inevitable. And how could it not be possible? Where is the supply of cosmic condoms? Where are the communication barriers. Indeed, their might ever only be one spontaneous self. Its actualizing potency distorts the cosmic virtual potency in an unmistakable fashion.

Regardless of whether the other selves were spontaneous or cloned in some fashion or both, from then on, the only conceivable ground rule of intercourse would be love. To put it the other way, the bad seed is ostracized. I think we can presume that cosmic ostracism has its instructive aspect. I don't think any of us would be here if we had not somewhere failed in love. Even Her Spontaneous Selfishness must have had her lapses. We all participate. We all partake. If She had not 'failed' at Self-love, we wouldn't be here, would we? [An cynic might suppose we are a cosmic social disease, but that would be most unfair!]

I do ramble, but there is a lot of territory and not an abundance of signposts. I am just about as much along for the ride here as any reader might be, trust me!

[Antipodes II](#)

[Topical Index](#)

7/9/02

Antipodes II

So we have Antipode 1 and Antipode 2: the Big Bang and the Big Spontaneous Self. On the face of it, is not the former much harder to imagine than the latter? Imagine how much scientific and technical discipline and effort have gone into the 'discovery' of the Big Bang. But every time any person engages in a conversation, say, that person is automatically creating a mini-self in her mind to represent her interlocutor. Big Bangs happen. Selves happen. Then what?

Does our existence as consciously minded, embodied beings somehow represent the accidental impingement of these two antipodal Spontaneities? Or what?

Accident shmaccident! Or are we to suppose that God sits around like a Cosmic Cuckoo waiting for a suitable nest to spontaneously appear before dropping Her egg on an unsuspecting Mother Nature. This is tantamount to what the modernized creationists are suggesting when they attempt to marry the Bible with the Big Bang, resulting in a Big you know what!

If we insist on this antipodal equal opportunity, the only thing we guarantee is incoherence. How much longer are the materialists and the dualists going to bang their heads on the Big Bang? Certainly for as long as their paychecks hold out. What will it take to get them to unshackle the mind from all of their arbitrary and artificial constraints? What will the rest of us do about it? If we are incapable of breathing a breath of fresh coherence into the mostly vacuous cacophony of the Internet, what will be our excuse? Will we just let Google take its course?

[Antipodes](#)

[Topical Index](#)

7/9/02

Post-Reductionism

If there is more to the world than just atoms swerving in the void, then we are going to have to use mostly non-scientific methods to investigate these other entities.

Perhaps the most logical starting point would be ourselves. Each one of us is necessarily the measure of our own perceptual world, and certainly the concept of the Self is a universal one. This is not to say that there are no skeptics, but those who deny the existence of the self are just as likely to end up by denying the existence of almost everything else as well, and we are right back to our deconstructive starting point.

What else might there be that we could agree upon? Phenomenologies of various sorts have been used to explore for other universal attributes of the mind. It is not clear, however, that any very notable consensus is developing out of these efforts.

And so it seems about time to make my proposal. Admittedly it is something of a patchwork, and the only question is whether the whole is going to be more than the sum of its parts.

The primary pieces of the puzzle are just the emergent entities. Although we do not yet know specifically what these may be, we do know that the only claim to existence of these immaterial forms lies in their perceptibility and conceivability. If there exists anything more than mere collections of atoms, that existence must be in strict association with perceivers.

An irony of this observation is the implied inconceivability of a zombie world. The irony is that hypothetical zombies have recently figured prominently in philosophical argumentation over the ontology of consciousness, and it might seem that I am siding with the functionalists who insist that zombies are inconceivable. But I am taking their point and running it back. How so?

In making this move, I am taking a big step against mind-matter dualism, toward an inevitable immaterialism, but let us not skip ahead. I am arguing here mainly against naturalism. Naturalists accept emergent properties, but hold that they are purely spontaneous (i.e. natural) and have no logical prerequisites.

Maybe I had better pause here for a consideration of naturalism. Please pardon this spontaneous interruption.

[<-- Prev.](#) [Next -->](#)

5/18/02

Naturalism

When I decided a few days ago to make this second attempt at a website, this was to have been the topic of the first page. With the BPW page, I was perhaps getting ahead of myself. That is, however, likely to remain the core idea of this obviously evolving website.

Naturalism is a rather succinct label. The only alternative is simply supernaturalism, and that is what we must consider. I may have been procrastinating just to postpone this inevitable confrontation.

I have spoken of the failure of the analytical movement to locate the mental or functional equivalent of the physical atoms. This is also known as the problem of holism. In psychology and linguistics everything seems dependent on everything else: everything is contextual.

First came the sensationists, then the associationists, then the behaviorists, and lately it has been the functionalists. Each in their turn has attempted to construct a theory of the 'mind' as a combinatorial construct of some set of simple elements. The continuing lack of success has given rise to our (neo) naturalists. The naturalists accept and even embrace the idea of emergent novel properties or entities. Thus they distinguish themselves from the physicalists or reductionists.

The naturalists come in two main flavors: epistemic and ontic. The former maintain that emergence is mainly just subjective and due largely to our (innate?) inability to make a proper analysis of sufficiently complex systems. But they are unable then to explain the considerable success of the biologists in grasping and exploiting these 'illusory' entities. How could such considerable ability be based on sheer ignorance? The same goes for our everyday ability to communicate successfully, more often than by mere chance.

This leaves us with the ontic variety of naturalist. Those mysteriously emergent entities are objectively real, albeit immaterial. There are, roaming the philosophical forest, a few who call themselves non-reductive physicalists, but theirs appears to be a rearguard action.

What are we to make of these immaterial entities? From whence do they come? Where do they reside? If they are 'real' then they exist independently of human consciousness. As to their origin, they are just a concomitant of evolution. End of story? This website is dedicated to the real possibility that this is not the end of the story.

It is with extreme reluctance and foreboding that the philosophical and scientific communities are being pushed into acknowledging an immaterial realm that is of material consequence. Quite suddenly we are having to confront an immaterial but very substantial aspect of 'nature'. (N.B. the 'scare' quotes!)

[<-- Prev.](#) [Next -->](#)

5/18/02

Emergence

Very early in these pages I bet my 'kingdom' on the fact of emergence. It is an issue that will continue to warrant much attention.

What is the issue? On one account it is whether the world can be explained purely in terms of physics. Right there we have a problem. If physics is unable to reduce itself, how can it be in a position to bring about the reduction of any other disciplines. Even if we had in our grasp the so-called 'Grand Unified Theory' of physics, the question of the closure of physics would be far from being answered. For example, after almost a century, fundamental aspects of quantum theory remain unresolved, quite independent of the existence of any GUT. Solid state physics is showing no signs of running out of new phenomena to study, and our understanding of many of the older phenomena remains purely phenomenological. The ultimate targets for reduction are biology and psychology. Biology continues as a robust, self-contained discipline. Biophysics remains a minor sub-discipline.

On the other hand, no one can point to any vital force that emerges only in living systems. What we do have is a rapidly expanding sense of the functional intricacy of all living systems. No one ever expects to be able to look at the laws of physics and be able to predict life as we know it. The question is then whether this gap is purely epistemic, or if it contains an ontology of actually emergent entities.

As I explained earlier, this is not an idle question. At the very least, it could be that emergence is explainable in terms of something like 'morphic resonance.' This would constitute a non-local connecting principle whose main effect is to facilitate evolution. Just in itself such an effect would upset our current understanding of physics, and would probably force us to confront the problem of teleology, and that should be sufficient to open up the rest of the metaphysical issues being dealt with here. Once these issues become resurrected they are very unlikely to go away again.

But we have only considered physics and biology. The problem of emergence is much more flagrant in the realm of psychology. We can study the neural correlates of our minds until the cows come home, but all the correlations in the world will not explain the existence of what is at least a very fortuitous dual aspect of matter. Furthermore it does not directly address the issue of whether a mind could also exist in an uncorrelated state.

Putting together these most obvious facts of physics, biology and psychology, the case for emergence should be open and shut. The fact that it is not, simply reflects the social conservatism around having to confront the issues of ultimate concern that we are delving into here at this isolated outpost of cosmic rationality.

It is not for nothing that people are reluctant to rock the intellectual boat that is modernism. I strongly suspect that thoughtful people can sense, even if subliminally, that there is something out there of biblical proportions.

There is already a small army of Intelligent Designers who are nipping at the heels of the Darwinists within the narrow confines of biochemistry. Their narrowly sectarian interests seem to inhibit their straying into these deeper and swifter metaphysical currents. But there are many fish in the ocean.

[<-- Prev.](#) [Next -->](#)

[index](#)

7/2/02

Mere Words

What I propose to consider here is the magic and metaphysics of words. Most simply put, the question is whether words have a content. If words have a content, artificial intelligence is impossible.

Words certainly seem to contain information, but where is it? The only information explicitly contained in a word are its letters or its sound pattern. Otherwise, we have dictionary definitions along with an unlimited number of examples of actual usage. These examples and definitions demonstrate the external relations or contexts in which a given word may be properly used. To some degree, such patterns may be programmed into a computer, which will in turn display a more or less rudimentary language skill. This accounts for the physical aspect and use of words. But is there anything more, anything non-mechanistic or metaphysical?

Certainly we are subject to the strong impression that words do have an intrinsic individual content or essence that we refer to as their meaning. But no one has ever been able to point to a meaning, the way we can point to a definition.

There is also the fact of language acquisition. Human infants have a remarkable ability to pick up languages and then communicate with little or no formal instruction. We do seem to possess an innate grammatical ability that is not reflected in any of the brute force procedures used to instruct machines in the use of language.

The evolutionary explanation for this ability remains elusive. Where in our full complement of 30,000 genes does this innate ability reside? The fact that only a very few percent of our genes differ significantly from our non-verbal primate ancestors should make us wonder about the material basis for this skill. We could, at most, only have evolutionally acquired the equivalent of just a few lines of computer code devoted specifically to language. Why has not the hoard of programmers working on language processing been able even to approximate this natural ability?

What seems intrinsic to words is their ability to refer to other things. The fact is that there is nothing physical about referring. Referring is not a physical process, per se, although it may have physical aspects. There is a virtual unanimity among philosophers of all stripes that referring is an act rather than a process. Action, as opposed to mere process, requires the participation of an agent. It is the agent which determines the act of reference.

Any act of reference must transcend a purely causal nexus. If I am physically constrained to utter the word 'cat' each time I happen to encounter one, I am not thereby engaged in an act of reference, although a naive observer might be led to interpret this purely physical event as such.

Is this too easy? Have I just disproved artificial intelligence? Have billions of dollars been wasted on AI just because the computer scientists were unaware of the distinction between act and process? The proponents of 'Strong' AI are well aware of this *de facto* distinction and they take it as their primary objective to overcome it by building a robot with a mind.

We have come full circle. The true believers in science are at once the deconstructors and the would-be reconstructors of the mind. If there is to be a paradigm shift of the sort we have discussed, then this group is the primary opposition in any future public discussion. Until then they may serve as straw man.

[<-- Prev.](#) [Next -->](#)

[index](#)

6/1/02

Hanging by a Thread

It would seem that our notion of the Best Possible World is hanging by a very insubstantial thread.

Give me one irreducible entity and I will logically 'construct' for you a world, and not just any world, but the best of all possible worlds.

Given the existence of just one immaterial object, immaterialism is the logical consequence. If this fact speaks more to the fragility of materialism than it does to the robustness of immaterialism, well, so be it. It will suffice for our purpose which has to do with what used to be called salvation.

I am equating materiality with atomicity, or with physicality. Physics would hardly be physics if it did not have a very restricted and exclusive ontology. The existence of its objects is to be determined purely by means of physical experiments.

Am I going to show you an immaterial object? No. One can only present indirect evidence. But please note that the same is true for material objects. Just showing you a chair is not showing you a material object. Among other things, I would first have to prove that you are not dreaming, and the fact is that no one really even knows how to do that.

[note added 6/14] [Our perception of a chair is a bundle of decidedly immaterial universal qualities.]

I can show you words and numbers. I can show you, by way of the Internet, that virtually everyone who has explored words and numbers agrees that they are irreducible in all but the most trivial of senses.

Why then is not every philosopher an avowed immaterialist? If they were, they would have already constructed this web site, and the rest would have been history. Someone has to be the first in modern history to demand a coherent reality [and get a hearing]. This necessarily entails cosmology, and philosophers, since at least the time of Darwin, are expected to leave cosmology to the scientists. Any trespass on that territory is not taken lightly.

The idea of a coherent cosmos has simply fallen through the political and logistic cracks of academia. That is until the Internet has come along to drastically alter the logistics of presenting and communicating new ideas. Am I holding my breath for the world to beat a path to this web site? As long as that possibility exists, there will be ample motivation for more than a few of us to be in this business. A dozen people knowing the truth and using the Internet can easily take this world away from the materialists: like taking candy from a baby.

[<-- Prev.](#) [Next -->](#)

[index](#)

5/30/02

Immaterialism

Immaterialism is the intellectual and psychological challenge that stands between us and complete understanding.

Down thru the ages, immaterialism and idealism have always been prevalent in philosophy and religion. That is true today. Even in modern philosophy, they continue to bubble up in various guises from just beneath the surface.

The successes of science have managed to keep a heavy lid on idealist speculation, especially in the last century. Postmodernism has raised the lid for metaphysical discourse amongst the intelligentsia, but this tolerance emphatically does not extend to questions concerning God and Cosmos.

The inhibitions and prohibitions on cosmological speculation are both intellectual and political. For the last three centuries, in case you missed it, there has been at least a cold war between religion and science. Just in the last two decades, it has become tolerable, if not quite respectable, for an academic to speculate about metaphysics as long as the God question is kept firmly in check. Anything more would be to provide an academic arena for the feared and reviled Creationists, for instance, and would seem too much like a unilateral disarmament after all these centuries of struggle. The mood is to just let the 'Cretans' find their own soap boxes. The emotional heat of battle is certainly not conducive to either side calmly considering the alternatives. Evidently that is our job.

On the intellectual side, Darwin and the Big Bang present a formidable obstacle to alternative cosmologies. Immaterialism is the only way to meet this obstacle without making it a direct confrontation on the materialists' own territory. We should wonder why the theists cannot find their way to the high road of idealism. Again, history provides a partial answer. Theists have grown much too comfortable with duality, and particularly with the duality of body and soul. Immaterialism carries the strong odor of pantheism and mysticism. They would much rather continue with the familiar skirmishes, than have to take on a whole new battlefield. Never underestimate the power of habit, especially in matters of the mind. None of us is immune to habit, but some of us feel more strongly the fascination of the uncharted.

Now you ought to have a better idea of from whence we come as we launch into these uncharted waters.

[<-- Prev.](#) [Next -->](#)

[index](#)

7/4/02

Immaterialism (pt. 2)

Ever since I first speculated on such matters, I liked to think of myself as a transcendental pantheist, with a definite attraction to the saga of Jesus. It was only rather late in the game that I had to conclude there must be more than an aesthetic connection.

Transcendentalism remained but poetry to the prose of my earnest engagement with physics. But physics never yielded to my need for a true depth of understanding of the world. A random encounter with the notion of the Anthropic principle reawakened my desire for wholeness. For almost five years I struggled to find wholeness within a **quantum dualism** of mind and matter. But that slim thread or loophole never seemed sufficiently robust to explain all that needed explaining. Even quantum dualism was still verging on the incoherence of Cartesianism.

Once one has opened the door to the possibility of mind on a cosmic scale, all the qualities are drained out of matter, and one is left with the purely mathematical abstractions of physics. The only hurdle to cosmic coherence was the obvious stratagem of subsuming those abstractions to the mental realm. It was still a big leap, and there were more than a few 'sleepless nights'. I continued to be haunted by dinosaurs among other things. Barney may have saved me. Yes, almost.

I realized that my leap from science to immaterialism was a luxury that my fellow scientists could ill-afford. I never seriously considered it to be an intellectual possibility until the advent of the Internet. But by that time I was already well launched into the Aquarium stratagem, which lasted nearly ten years. Now here I am praying to Google for the deliverance of this story.

[<-- Prev.](#) [Next -->](#)

7/4/02

Explaining Science (part 2)

We can get at least some feeling for how space, time and history may be fashioned in a continuous manner out of an otherwise merely latent and otherwise chaotic cosmic potency. A virtual intelligence is always present, striving for self-realization. The Metanarrative congeals out of an experiential background foam, mainly in a teleological manner.

The cosmic organizing principle is always redistributing itself throughout an expanding network of microcosmic nodes, namely us creatures. These would also be similar to Leibniz' monads. To facilitate the redistribution of potency, it is natural to equip at least some of the monads with gonads. But more generally we are looking for there to be an arena with some sort of game plan to support the overarching History. The background game is necessarily metabolic in nature.

Why metabolism? It is impossible to imagine a natural ecology being based on anything else. Any other networking or relational schema would have a top-down organizing principle. Granted that reality is ultimately organized in a top-down fashion, there would be no dynamical independence from God without a seemingly independent and parallel system. I am not talking about an ontological dualism, merely a dynamical dualism.

This is the most important single point to grasp in order to justify the transition from materialism to immaterialism. I will continue to harp upon the cosmic necessity of this dynamical dualism. The upshot of which is that there are two logically necessary pillars of reality: God and Atom, truly the dynamic duo. Until you fully grasp this logic you will be justifiably dubious of any other effort on my part to rationalize or deconstruct science. Please note that my emphasis on this duality should in no way suggest an ontic parity between God and atoms. Any such parity would immediately dissolve into an incoherent Cartesian dichotomy.

With the background of the eternal cosmic potency, the primary problem of creation is the drawing of distinctions. In order to keep everything from happening together and at once, there will be a spatial manifold. Given any such manifold, any creative logistic will require the concept of the atom. It was no accident that the concept of the atom emerged in philosophy long before the concept of science.

In order for a dream to exist it must persist. In order to persist it must cohere both meaningfully and logically. Any surviving dream of the world, any metanarrative will by necessity have the atom as one of its logical foci. All of science is then a straightforward elaboration of that basic logic. Of course, we will be revisiting this point frequently.

Our dream Atom is nothing absolute. It cannot be a Newtonian atom. It will, like everything else in our dream, have a purely relational existence. It will, like Leibniz' monads, be microcosmic. It may not have gonads, but it will have 'hair'. That microcosmic 'hair' is what quantum physics is trying to describe. The metaphysical panic engendered amongst the materialists by the quantum is very understandable. They are seeing over the edge of their playpen into our upside-down and inside-out dream world. Yes, I would panic too, if I were them.

Dream Atom

There is a natural tendency to want to laugh at the very idea of a dream Atom. Indulge!

After this bit of indulgence, however, one has to wonder about the true nature of the Atom. Is the scientific Atom really so much different from our proposed dream Atom?

In each case we are dealing primarily with a conceptual or metaphorical atom. In the case of science, the atom, or, actually, the elementary particle is merely the place holder for a, nowadays, mind boggling mathematical superstructure in an at least eleven dimensional abstract space.

Just on the face of it, 'mathematical physics' is an oxymoron. There is nothing even slightly physical about mathematics. What we so quaintly used to think of as the physical has been turned into a mathematical wonderland, full of strange beasts, up to and including the notorious (at least to mathematical physicists) Monster group, q.v.

Where does the Monster group, which has more elements than Jupiter has atoms, reside, other than in the minds of mathematicians? If it is as objective and as physically significant as it seems, it must also reside in a kind of mental or Platonic ether. Both the Quantum and the Math are pushing physics toward seeming more like a mental abstraction. The closer you look at the Atom, the further does its tangibility recede into these mists.

It seems that the immaterialists are being aided and abetted in these latter days of materialism by the likes of the theoretical physicists. Perhaps the world did spring directly from the quantum potency prior to the Big Bang. Or it may as well have sprung right from the head of Zeus or some mathematician God. Now if God is as lazy as I sometimes suspect, she would not have to have worked out all this physics by herself. She could simply have recruited our erstwhile mathematicians to work it out in teleological fashion. We had better keep them on the payroll, because they are helping to design the world. Getting rid of them would be as problematic as going back in a time machine and killing one's own grandmother.

If our atoms had emerged accidentally and not been designed in such a teleological fashion by our mathematical physicists, they would never have given rise to us quantum observers to help reify their existence. This is what relational existence is all about. You scratch my back, and I scratch yours.

Because each atom implements the entire realm of mathematics, they are indeed the microcosmic cornerstones of our reality. All of the prerequisites of our consciousness are thus ensured by their very manner of design. The dream Atom is God's primary bootstrapping tool. Very clever of Her.

5/25/02

The Relational Self

To exist is to relate, lest we forget. Those five words need to be taken with the previously mentioned six, concerning coherence, as the basis of reality. There is no escaping the resulting personalism. Somehow the pantheists miss the nodal structure of the world. But it is not nodes all the way down.

No, no, no. There is the even more fundamental dialectical dynamic, alluded to earlier. There is Buber's I & Thou dynamic. There is also God & Atom/Adam. And how do we characterize this ultimate relational, personal dynamic? How else but as love? Imagine the poor bloke who first comprehended that!

This is the only coherent alternative to atoms swerving in the dark. If the postmodernists ever tire of incoherence, watch out! The sky will soon be falling, like on the church of the nativity, or did that just happen? Did you see that apocalypse? Who, me? Was that 11:11 or TX11? Do we care?

Coherence is the substance. The self is the glue ball, and love is the glue. Have you got a better idea? Is this insufficiently precise to predict the tides? Maybe, but if the tide don't float your boat, the eschaton surely will. Not a threat, just a promise.

As in the monadology, every node is a microcosmic hologram. The cosmos is the holograph. The preordained harmony is the agape betwixt the Alpha and Omega as produced in the X-event, not far from the above mentioned church.

What more can I say? What more is there to say? Why don't we let it be? When will we let it be? We will let it be on Internet time.

7/1/02

Relations

My metaphysics is relational, as any idealist metaphysics should be. But how does one know that relations are real and not just figments of the mind?

My best answer is that relations have as much rationale to exist as anything else, and probably more. The only thing counting against them is their intangibility in the regard of the materialists.

If numbers can exist then certainly relations can. Where would physics be without its mathematical superstructure? What would it be without its virtual interactions, and what are those if not relational?

Is the past real? If it is, it is only in relation to some actual present.

Very few are the materialists or physicalists who would wish to deny causality, as David Hume famously did in the eighteenth century. Yet what is causality if it is not relational? True that causes are generally taken to be physical, but they do not consist of particles or fields per se, but rather a particular relation between different sets of circumstances or events. The collision of an asteroid with the earth caused the dinosaurs to become extinct, within the sub-narrative of naturalism. The two events are thusly related, and so they both become part of a larger causal/relational system.

If science is teaching us anything about the world it is the almost unlimited functional intricacy and interdependency of its parts, particularly as studied in the life sciences. Ecological science is specifically devoted to studying such relational systems. You can remove an entity from its ecological niche, but your understanding of it will be severely impoverished without understanding its relational context.

Come to think of it, there is no such thing as an isolated fact. Facts come in open collections. There is always the possibility that some new fact will totally change our understanding of all the others. A set of words can be put together as gibberish, or as the Gettysburg Address.

The isolated object, fact or word mean virtually nothing without regard to its relations. Put more strongly, unitary existence is virtually inconceivable.

In such manner does our increasing knowledge of the world logically confront us with a relational metaphysic. The singular and necessary existence of the Best Possible World is only at a slight remove from these considerations.

7/2/02

Relatedness

If existence is based on relatedness, then it is a matter of degree. The degree of existence, however, is not something that can be directly observed. The Washington Monument exerts no more gravitation than its equivalent mass at the center of the earth. A rock on the surface of Mars is apparently just as solid as the one in your back yard.

Obviously the world would not work if solidity were a function of relatedness. Among other things, the earth would collapse, which could be most embarrassing. Physics works because it is so totally insinuated into our lives. And it is so insinuated just because it does its work. Is this circular? You bet'chya'. Creation is definitely a very participatory, bootstrap process.

As long as astronomers are able to keep pushing the telescopic limits, they will not run into any cosmic or logical brick walls. The sky will not literally fall on their heads. However, they will gradually come to appreciate that the starry heavens function as a logically necessary backdrop to our earthly pageant. A backdrop whose artistic potential is being increasingly realized! Is this being anthropocentric? Of course! More accurately it is being philocentric, if I may drop another *bon mot*.

Existence implies relatedness. Relatedness implies coherence, or comprehensibility. These invoke the operation of a principle of sufficient reason. In like manner, the PSR implies the BPW hypothesis as Gottfried was able to deduce several centuries ago. Trust me, Leibniz was no dummy. If he were alive today, I would be standing on line to polish his shoes. Thanks to the Darwinian Distraction, we can put away the polish, but not the bohunks, please.

[<-- Prev.](#) [Next -->](#)

[index](#)

7/3/02

Coherence

From the perspective of materialism the most mysterious thing about the world is its comprehensibility. Darwinism and complexity theory are among the explanations offered.

Inherent in matter, we are told, is the ability to self-organize. What is the source of this ability, we might wonder? The only available (non) answer is that if this were not the case we would not be here to wonder. But can the materialists expect us not to keep wondering, nonetheless?

There is only one other possible explanation. Matter is not the basis of existence. Materialism is incorrect in its fundamental premise.

Although materialists no longer rule the intellectual roost, they maintain the wherewithal to ensure that postmodernism remains anti-foundationalist. If there is a source of order in the world, it remains well hidden, by all objective standards.

If matter is not basic, then what is? The basis for existence is the process of relating.

The best understood example of a purely relational system is mathematics. And does math not epitomize insubstantiality? Yes, except for the fact that mathematics appears to be the foundation for physics. It is the modern mathematization of physics in particular that most often prompts the remarks about the mysterious understandability of the world.

So, where's the beef? Where's the substance, if it is not in the matter? The substance is in the coherence. This is the whole story of this website in six words. Coherence is what holds the world together, and what makes it go around. It is what drives the story of history.

Coherence exists only in relation to a subjective pole. The coherence of the world exists in relation to an absolute subjective singularity. That is the only logical alternative to the fundamental incoherence of materialism. Logically there can only be a unique singularity, of which we creatures are the multiple reflections. The physical atom is another reflection thereof.

The atoms, while they are current, provide a centrifugal balance to the centripetal subject. They do this under the aegis of the **Monster group**, which is the locus of the mathematical coherence of the physical phenomena, and is the shadow of the subjective pole. In the eschaton, the centrifugal force is overcome.

6/24/02

The Level Playing Field

It's what you know, not who you know, at least for the time being.

The natural relationality of the world would tend toward a claustrophobic situation, were positive steps not taken.

Once we appreciate the truly relational nature of reality, it will take some additional doing just to postpone our immediate implosion back into a virtual white hole of divinity. The world would just be one big eschaton, with everything happening all together. The act of creation is the act of drawing out history by separating the Alpha from the Omega. And so we arrive at our spherical orb with cycles of time. Knowing God and having a buck seventy-five will get you a cup of coffee in Times Square. Yes, it's home on the range, where survival means gathering no moss. Realize that those wide-open spaces are a metaphysical luxury, hardly the absolute gratuity of Newtonian fame. Recall those painstaking megalithic processes of archeo-astronomical interest which constituted our geodesic cornerstone, or Alpha. It is also the *raison d'être* of our fabulous metabolic atomicity.

Any physicist will tell you that space is something awfully contrived. Every attempt at a Grand Unified Theory is an attempt to plumb the secrets of our pre-geometry. But is not peering into the depths of space really just trying to see the back of our own head, or into the mind of God? Our very level Newtonian billiard table was no mean construct. It is the veil of God, and all the King's mathematical physicists can barely penetrate its warp and woof. As the mathematical convolutions of pre-geometry proliferate into membranes and beyond, we begin to see that we are becoming enmeshed in the psychic ur-field of God. It is definitely a slide-rule busting experience.

[<-- Prev.](#) [Next -->](#)

6/10/02

The Intangibles

In the modern world, we love to draw distinctions. I don't know the history of this predilection, but it must be ancient and honorable. Now how do we move beyond it?

Well, OK, I do know a few things of distinction. Descartes was its modern master; his mind-matter distinction being the mother of all distinctions. Ever since Rene, there have been conscientious objectors to this never-ending process of analysis. Holism is a cottage industry nowadays, but it continues to be an uphill battle. Panpsychism is the most frequently raised alternative to this Cartesian pananalytic compulsion. The modern basis of panpsychism is to be found in John Wheeler's remark that no phenomenon is real unless it is observed. His remark gives voice to the quantum measurement problem.

It should be noted that to distinguish is to abstract, and abstractions are first among intangibles. If abstractions are unreal then so is everything else that you can put your finger on, because the very idea of putting one's finger on something is just another, well, idea. Tangibility is a concept. There would be no tangibles if there were no concepts, so there is a vicious circularity or logical regress at the bottom of this and every other distinction that has ever been made. And what do we make of that? Merely another indication of the flimsy flim-flam that passes as modernism.

Consider thirst. Is thirst tangible? Is it causal? If not, then what causes one to crawl a mile across the burning sands to an oasis? Hydro-depletion? Folk psychology meets neuroscience in the middle of the desert. The neuroscientist supposes thirst to be a mere concept, something to be eliminated from any scientific inventory of the world. But what, pray tell, is science if not a humongous pile of concepts?

Thirst is not locatable in space. It is not extended. But neither is an electron, nor is a synaptic event locatable, other than by gross generalization, or, should we say, by abstraction. And what is space if it is not the mother of abstraction? Space had not the slightest pretense to physicality until Einstein attempted a (re?)habilitation of it in his theory of General Relativity. Imagine that! The only recourse that space has to tangibility is totally dependent upon the notions of Riemannian topology.

Clearly the game of analysis is logically and physically bankrupt. And does anyone dispute this? No one that I can find on the Internet is disputing this. The analysts keep on analyzing merely because they don't know what else to do. There is a viable analytic establishment. There is no holistic establishment.

I take that back. There are holistic establishments. They are called religions. It was their ligaments that used to hold the world together, until Rene hit the scene. With postmodernism, we are collectively marking time before the establishment of some new set of ligaments. Only then could a spiritual body take shape. Are the analysts sore afraid? Anyone who does not fear God is whistling in the dark. The mother of all gods is sitting in the wings.

[Topical Index](#)

8/4/02

Teleology

How did I manage to avoid teleology for this long? Just a minor pedagogical oversight.

What is thirst if it is not teleological? Biologists have eliminated vitalism if they can eliminate thirst. I'm not really thirsty, it's just that my molecules are screaming about their hydro-deficiency, as a result of which my muscles act to decrease my hydro-abstentia. Fair enough? Like all is fair in love and war? The only way I know how to eliminate thirst is to provide water. This is especially true with regard to the spirit.

If abstractions are causal, they act as final causes. Consider numbers. Are number causal? Ask a mathematical physicist. Numbers participate in every causal process upon which she may place her slide-rule. The physical sciences are not science if they are not quantitative.

Causality does not function outside the framework of events. Events cannot exist outside of a functional, i.e. teleological, matrix. And, by the way, when was the last time you saw a quantitative event?

Aristotle realized that the cosmos must be pan-tellic. Why else would we or could we get up in the morning?

Ah, but universals are mere family resemblances. Does this explain a Peacock's tail? Would not the Mr. Peacocks be the laughing stock of evolution were it not for all those potential Mrs. Peacocks? What do the Peacocks know of universals? Perhaps nothing more than Marilyn Monroe. But if Marilyn is not an exemplar universal then who is? Is Marilyn a family resemblance? Well, if truth be known, She does not particularly resemble anyone in my family, but maybe we should ask 'Jumping' Joe.

[Later: Is 'electron' a family resemblance? How do we account for the fact that electrons don't merely resemble each other, but are numerically, physically identical? The lowly electron is the ultimate exemplar of an absolute universality. It only requires a few years of mathematical physics to understand why electrons must obey fermi statistics and thus ensure the stability of material objects. Without this underlying mathematical universality there would exist nothing that could be called matter. And yet we are daily confronted with the spectacle of otherwise intelligent humans touting the unreality of universals. What sort of a joke is this?]

My job is not to defeat analysis. It is to motivate those who will. When I mention Marilyn, it is only in the time honored tradition of the bait and switch, and if sex is not the mother of baiting and switching then who is?

What is the purpose of life if not to discover and/or invent the universal Telos. The problem with the Telos is that it is not a bait and switch. It is the Mother of all mothers. It is not a game. It is Finality.

Well, our little teapot of water is heating up. When will we decide to jump out? When will we decide to stop playing games?

[Later....]

The astronomers look through their telescopes and cannot see God. The biologists look through their microscopes and cannot see Life. Perhaps we need a new Spectacle, or perhaps we just need to stop and think, for a change.

8/4/02

History & Nature

Within the monism of immaterialism there is a duality between history and nature. History is the foreground, nature is the background. Nature exists as a sub-narrative to the Metanarrative that is our history from Genesis to the Eschaton. That latter span is the extent of real or linear time. That span is significantly less than the mythical cycle of the equinoxes.

The primary story line of the Metanarrative is our long march into materialism. This is an unnatural move away from the cosmic spirit. It is our nearly completed separation from God. By our own efforts we have stretched the spiritual spring out too its maximum extension. In the Millennium we are able to simply coast back home, as it were.

The very unnatural stretching of the spirit is made possible by Nature. Nature exists in two virtual dimensions of nearly unlimited space and time, which complement the relatively real and more modest dimensions of our earthly sojourn. Nature comes with its own coherent sub-narrative that is our scientific cosmology. Nature is the frame on which history is stretched.

The nearly complete harmony of History and Nature comes about through their shared Telos and as part of the Alpha/Omega bootstrap. This includes the scientists who diligently and naively weave the illusory depths of space and time out of the depths of their own spirit, and also with their wielding of spades and grinding of lenses. Thus is God spared the Easter Bunny role of planting fossils, etc. It's not that she is lazy, she rather goes along with that flow of 'male' inquisitiveness. Will the scientists be aggrieved to learn that they were 'tricked' into feathering their own nests? I think they'll get over it, mainly because their hard won talents will not be peripheral to our encounter with the eschaton. They'll just have to learn how to turn their telescopes around. It's part of that little gestalt switcheroo.

Creation is not a trick, so there was no need for a cover-up. The Alpha/Omega loop is complete cycle. The supporting spokes of which exist in our unconscious dream work, and other interdimensional channels. We don't have to understand every last detail of creation in order to navigate the eschaton, which is our first order of business.

God has been concealed mainly by our own attention to detail. This is not wrong. It is nearly the whole plot. We have the whole Millennium now to put everything back in order. The role of the revealer is correspondingly easy. It's just to turn a little valve to begin to reverse the flow of spirit. This is what the intellect is for.

The continuity of the world is maintained automatically in a relational metaphysics. The work of the scientists is involved in the pushing of the necessary continuity to its logical, atomistic limits. Our approach to comprehending the logical completeness of the infrastructure of nature is a portent and aperitif of the ensuing spiritual completion.

7/7/02

Introduction to God

Wouldn't it be nice if none were needed.... introduction, that is!

But this is not your father's God, and probably not even your mother's. My father was an atheist, but this would probably not have been the God that he did not believe in. But we'll have to ask him sometime.

This God is bound neither by stricture nor scripture. It was not just by an oversight that Jesus did not have a stenographer. Jesus is the word made flesh, and that is not the Bible. All you legalistic, literalistic Pharisees out there, listen up. I may not feel disposed to repeat this. If you don't catch the spirit of what I say, you have caught nothing but hot air. You are not a computer to be programmed. Your only program is to become one with God. You will come to know God in the biblical sense, not in the literal sense. That is our eschaton, our rapture.

So whose God is this, anyway? I'm afraid I'm not enough of a scholar to provide you with a list of historical precedents, but I'm sure they're out there. My job is not to be original, it's just to be in the right place at the right time. [7/6 -- Oh, and also to keep my ear to the ground, I'm just not sure what ground....]

Clearly there is a healthy dose of pantheism and panentheism (q.v.). This goes with the immaterialist territory. You dualists will just have to lump it. But there is a much bigger dose of coherence. The coherence of God is not unlike the coherence of our own selves, there is just a lot more of it, a lot more than the sum of ours.

Neither is God a thing. God is a part of the living dialectic of love, or cosmic agape. God is the eternal cosmic potency of love. There is no other potency that is not totally dependent on this singularity. You and I have no existence outside of the ambience of that light.

One could go on. I have and will, but I trust you catch the drift.

[Introduction to God \(part 2\)](#) -->

[Topical Index](#)

[Index](#)

7/5/02

Introduction to God (part 2)

Let us recall some of the previous metaphysical arguments, particularly the [Antipodal](#) ones. There and elsewhere a case is gradually being assembled: once the intellectual fortress of materialism is breached, it is a very slippery slope from there to a radically different worldview. Once we have established the reality of any one conceivable immaterial entity, the entire bulwark of materialism is vulnerable to being subverted, of actually being sublimated, by this other nascent, immaterial realm. That is according to the inherently unstable nature of the mind-matter duality. We, oh so knowledgeable moderns, are just living in a house of cards. There is a fundamental incoherence to that world of nothing but atoms swerving in the dark. A mustard seed of coherence, immaterial though it may be, threatens to turn that wasteland into a mustard jungle, or perhaps even into the Best Possible World.

In thousands of years, under the intense scrutiny of the best minds in the world, we have been unable to conceive of a logical link between matter and mind. It is almost the case of the immovable object and the irresistible force. One of these two notions has got to give. The mounting conundrums of quantum physics are surely pointing the finger at matter. Once we loosen our death grip on our absolutist conception of matter, we will have a difficult time imagining how we ever managed to fall under the thrall of materialism in the first place.

If there is an immaterial realm, relationalism will be its foundation. In contrast with atoms, we no longer have the convenient receptacle of space for storage and configuration. The closest equivalent is the mind, and we can hardly conceive of a mind that is unaccompanied by a perceiving agent, or simply a self. The self is the relational nexus or matrix of mind.

In the biological realm, the relational foci are the cell and organism. Certain primitive organisms of the fungal class have phases of cellular dispersal. The common underlying theme of mystical experience is that our ordinary individual minds are but the dispersal phase of a cosmic mind that may be experienced in those mystical states. And, again, even from a strictly biological perspective, are our own selves not the constructs of the neuronal colonies that constitute the human brain? Given any sort of mental realm, it would be more than a bit odd if our individuated selves represented the limit of its organizational capacity.

If there is any reality to the self, and what could be more real to us than our own selves, it would be difficult to conceive of a prohibition on the existence of a mental matrix that included a supra-self.

Given the logical polarities of atom and cosmic self, we cannot automatically assign a metaphysical priority to the atom. Indeed, does not the weight of reason push the logical priority in the other direction?

It is only by an almost incomprehensible fluke of intellectual history that we have come now to the threshold of this stark and dramatic choice of cosmic gestalts. I doubt that I am the only one who is being drawn by the portents and prospect of this drama. The rest of history already pales by comparison. Are we not already feeling the organizational force of the matrix of the supra-self?

<-- [Introduction to God](#)

[Topical Index](#)

7/12/02

Beyond Naturalism?

The question to be put to our erstwhile naturalists is where does nature end and the supernatural begin? Why are they not being spooked by these immaterial, emergent entities?

The response is limited. They may side with Aristotle, contra Plato, and declare these emergent forms to be inseparable from their material substrate. They may also cite the comparable and notorious spookiness of quantum 'mechanics' and exclaim, '*c'est la physics*.' What more can an underpaid, secular philosopher be expected to say or do?

But you and I must keep on trucking, or maybe it's just me, anymore.

With all these emergent properties shifting about, why not imagine an emergent intelligence beyond our own individual emergent selves? Now we're getting down to the nitty and the gritty.

If my intelligence is more than the sum of my atoms' intelligences (and what is the IQ of a carbon atom?), then why not suppose there is something more than the sum of all our individual intelligences? Fine, but then do I have to turn my collar around? No, but it may be advisable to fasten one's seat belt.

If there is nothing to prevent the emergence of a global intelligence, then it is just as likely to happen as not. But when, and where is the evidence? Who knows? But it might be foolhardy to ignore the possibility that the emerging Internet is more than an accidental concomitant of it.

But why must we limit our horizons just to the Earth? Almost by definition, these emergent entities are non-local, rather like their quantum mechanical cousins. If there can be a global intelligence then why not a cosmic intelligence, with all the appropriate interplanetary linkages? And so we have an evolving cosmic intelligence that is more or less accessible to all of us. But are not most scientists well into supposing that ours is not the only universe? Other universes that exist well outside of our own parochial space-time manifold would surely be wanting to belly up to this same table.

Are you beginning to see why the secular philosophers have already jumped through virtually every hoop in order to avoid having to own up to even one actually emerging entity? Do you really suppose they are anxious to give up their ivory towers for the wooden sandals of the novitiate?

[<-- Prev.](#) [Next -->](#)

5/18/02

Rationalism

There are those who would equate modernism with rationalism, and so in advocating any sort of alternative to modernism, rationality and reason are given a correspondingly low priority.

Part of the rationale for this irrationality is the scientific view that mind is an accident of nature and it is what sets humans apart from nature. In order to get along in the world we must de-emphasize that which sets us apart from it. The way to survive is to go back to nature and/or back to our various traditions. Deep ecology, fundamentalism and postmodernism are the disparate responses.

Historically, rationalism has been based in theism. If reasoning is more than an accident of nature, then it must be based on the existence of a cosmic intelligence. In practice, however, the religious establishments have never been comfortable with the political possibility of free thought. Better to emphasize the authoritarian side of theism in prophecy and revelation, than open the gates to mass enlightenment or God knows what!

The printing press did open the doors of the intellect to the masses, nonetheless. But just in the nick of time, along came science to provide a tremendous outlet for a sustained but restricted intellectual endeavor. The standoff between religion and science was a way for the various authorities to keep the mass mind safely divided. The ultimately abortive outburst of dialectical materialism was the exception that proved the rule.

Now with the advent of the Internet, will the authorities find another stratagem to keep human reason in check? In the real-time global cacophony of the Internet, if there is a cosmic rationale, someone is bound to stumble upon it, and it is liable to make waves that no filter can stop. I guess we'll just have to stay tuned.

If there is a cosmic mind hiding somewhere behind nature and physics, the human mind will eventually reconnect with it, come hell or high water. With all the means now at our disposal, can we still believe that the time of concealment is not drawing to a close?

<-- [Prev.](#) [Next](#) -->

7/4/02

Rational Theism

When I went to China in 1980, this was the title of my talk to the Guongdong (Canton) branch of the Society for the Study of Dialectical Materialism. This was before my conversion to immaterialism and eschatology, yet it was a sufficient departure from their party line to warrant a 50% absence from the dinner afterwards. I would like to think there were no more serious repercussions for the hospitality of the elderly sponsor or for his family.

Nonetheless, rational theism remains the hard core of my worldview. If the eschaton is a necessary part of the Metanarrative, then who are we to demand otherwise. The eschaton should be hunky dory as long as it does not occur on the watch of any given politician. It would seem that every story naturally has an ending except your story and my story. We live happily ever after. And so we will, but not quite in the same bodies or mind sets, and there will be some drama between here and eternity. 'Ts'alright? 'Ts'alright'.

The worst that any self-respecting God could be is supra-rational. But the only thing really worthwhile that is generally assumed to be supra-rational is love. Would it not be logical then to equate these two. What a great idea! Imagine the bloke who first figured that out.

People have figured out many ways to try to prove God's existence. But why should the burden be on them. Would it not be much more difficult to prove that it is impossible for God to exist? And if any being were given her choice, would she not want to have some recourse to some such other being.

The next question is how likely are there to exist worlds from which God would be inaccessible, as is sometimes alleged to be the case with ours? Given the existence of a creative force, how fragmented is it likely to be? As a related issue, how much distinction can there be between existence and experience?

As one piece evidence, mathematics could be our exhibit A. If nothing else, the physicists have demonstrated that our reality is saturated with universal principles of mathematics. What is to suppose that accessibility to universal mathematics is not a condition of existence? And what is the evidence against access to universal mind being another, and possibly closely related, condition of existence?

But back to our fragmentation question. Given the existence of any sort of creative, bootstrappable potency, as it appears to be given here, then there would exist a great potential for universal intercourse. If there were any countervailing tendency, it would hardly seem to have that same level of potency or intelligence associated with it. Unless there were a rationale for fragmentation, this would not be the prevailing condition. (see next page [The Ecology of Existence](#))

There is indeed an obvious rationale for a separation between creature and creator during a significant segment of creation. Thus any alienation that we experience is logically rather more likely to be due to some such deliberation than to mere happenstance. At the very least, it is not obvious that the burden of demonstration should be entirely on the side of those who choose to purvey coherence.

It should be clear that we are already most of the way back to our original concept of BPW. All paths of coherence and rationality lead back to this fundamental telos. And what other paths might there be besides beauty and truth? And to what other conceivable destination might they lead?

The best we can continue to do is thoroughly explore every such path, to the limits of our reasoning. What else might be more timely?

The Ecology of Existence

From the evidence of physics, mathematics and psychology, among other disciplines, we have a strong case against the possibility of isolated or absolute existence. Certainly, everywhere in the world of objects and abstractions, we witness the interdependence of systems within systems.

There is no warrant to suppose that a space-time manifold could exist independent of the possibility of measurement. Nor is there any warrant for the existence of a quantum system without similar possibilities. This puts a substantial, but indefinable, lower limit on the minimum complexity of any self-existing system.

It also remarkable that the lawfulness of all of physics is very close to being captured in a single coherent and overarching set of mathematical principles. This is the much sought after Grand Unified Theory, or Theory of Everything. Any arbitrary truncation of this set would appear radically incomplete or even incoherent.

Finally with physics we also confront the Anthropic Principle, according to which life is by no means an arbitrary appendage to an otherwise lifeless world. The necessary conditions for the existence of complex life forms put severe constraints on every aspect of the laws and boundary conditions of physics.

In the case of mathematics, we cannot pick or choose what numbers or structures might exist. It is an all or nothing proposition. Mathematics has its own internal logic of consistency and all that we can do is continue to fill in the gaps in our knowledge of it. The more we learn, the more remarkable are the subtle, surprising and convoluted interconnections of what we had once thought were quite separate and distinct branches of mathematics.

In linguistics there is no hierarchy in the completeness of languages. The base structure of any language is readily amenable to the expression of the most abstract ideas of any other language, as can be readily observed in the world. Within each language there is a holistic system of meaning. We cannot understand the meaning of one word without, potentially at least, understanding the meaning of every other word. The fact that this principle of holism causes severe problems for any mechanistic account of language skill is well understood.

The history of science is a steady progression in our appreciation of the complexity and interdependence of all existence. No upper limits for interdependency are foreseeable.

It has often been noted that the most incomprehensible thing about the world is its relative degree of comprehensibility, even at this stage of our ignorance. There is obviously a kind of holographic principle underlying broad swaths of our reality. To understand and appreciate the flower in the crannied wall, we have to comprehend even the starry heavens. Every part of the holographic world serves as a microcosmic window on the whole.

It is against this amazing background of even the most 'ordinary' aspects of our world that one can begin to appreciate the meaning and context of rational theism. Creation is not a cacophony. Its principle of organization is equally eluding and alluring. We are given no choice but to persevere.

Given the apparent holographic, relational, bootstrapped nature of all existence, it would be incomprehensible that any part of creation or existence could be isolated from the creator, unless there were a rationale for maintaining a relatively superficial appearance of such, and this may be the case in our world as discussed above.

Furthermore, under these same very general conditions for existence, any spontaneous creative process

could be co-opted by God at an early stage of development. In fact, it would probably be impossible for any such event to simply be ignored. Existence and creation cannot be fragmented. Any metaphysical system which neglects these most basic logical imperatives of existence is simply not conforming to the exigencies of reality.

It is its departure from these norms that has led science into many very distorted frames of reference.

Pantheism

Pantheism has served as a bit of a strawperson in these pages, but I think it is big enough to be able to take it. It takes a lickin' and keeps on tickin'. The worst that can be said of the pantheists is that they don't make very good scientists. And how bad is that? I was a transcendental pantheist, and not too bad a scientist at an early age. Now I'm a theist and a much worse scientist, so there you go. Did anyone say that I could be disarming? I'm a disarmamentarian ('disarmament Arian'!? I don't think so, but thanks for the thought, Bill!) .

Let's face it, those pantheists are not real strong on rationalism, nor on the Metanarrative. They are the darlings of the postmodernists because they can be soooo pluralistic. They are a necessary antidote to the fundamentalist excesses inherent in theism. And similarly they have withstood the materialism that necessarily inhered to the incarnation. The Atom/Adam cut no ice with them. And when it comes to the second coming, won't the last be the first?

And remember there is no substance. Love is just the vacuum energy of the Sunyata, the great void. There is no-self relative to the dissolution of the vacuum energy that is the cosmic agape of the omega. Christians have trouble grasping these intangibles, bless their hearts. And who doesn't?

The Alpha is a bit more of a problem for pantheism. The megalithic Angkor sailed right by them. If one lives in Giza, it is more difficult to ignore these omphala. But aren't the pantheists supposed to be navel gazers? Maybe in the next life.

How Many Buddhas?

I recollect one tradition where there are ten Buddhas, or Buddha-like gods. These gods do cooperate in the maintenance of the cosmic cycles. In a relational world, however, there would be no separate Buddhas. They would not just wander in off the street and then decide to make a world together.

From our creaturely perspective, our greatest problem seems to be how to draw people together. The creator, however, is presented with just the reverse problem: how to draw distinctions. The natural, relaxed state of a relational world is rather like that of a compressed glue-ball, or would it be a black/white hole? Actually, this might be kind of like nirvana. It would be both everything and nothing, all the oppositions would naturally tend to cancel out. Why not just leave well enough alone? I am sure there are days when Buddha wonders about this herself.

How many glue-balls? Let's call on another master: Leibniz: One. Next question? Didn't someone say that black-holes (white-wholes?) have no hair? They are indistinguishable, one from the other. And so, according to Leibniz, all indiscernibles are necessarily identical. This could also be Hegel's Absolute, the beginning and end of all disparate existence. Unless you embed these absolutes in a preexisting spatial manifold, there is absolutely nothing to keep them apart. And let me remind you that beyond and before space and time there are no such manifolds. We are left with the one, ultimate, bootstrapping potency. The Buddhas are the white-whole's hair. In the end it is not so important as to how many Buddhas there are, as long as we recognize that they have no choice but to cooperate in any creative endeavors, because their own existence and derivative potency necessarily depends upon it. They are all just part of the same bootstrapping process.

Concealment

I am remiss in not having discussed concealment up to this point, at least not that I can recall.

Fortuitously, though, concealment is closely associated with the question of science.

Originally science received considerable impetus by being conceived as the pious effort to read God's book of nature, along with the Bible, of course. But as time passed, there was more passing of the ammunition and rather less of praising God, up to the present. The more pious founding fathers of science could hardly have conceived of our present technocratic society. That God was lost in the shuffle, was hardly an oversight. It seemed that God did not have a prayer in competing with the Juggernaut of science and technology.

Now I am by no means the first to suggest that this usurpation was part of a bigger plan. At some point in our spiritual maturation we would have to be weaned away from the parental God. We had always been accustomed to the teat of mother nature as our special entitlement. Science would open a Pandora's box, with no visible Pandora. As we rushed to embrace the materialist cornucopia, we naturally forgot about Mother. Father remained as remote as ever.

Science was to be the handmaiden of our spiritual adolescence. This has been our rebellion, our golden opportunity to test our individual spirits before having to realign ourselves and comprehend that we are the actual protagonists in this cosmic drama.

This planned adolescence is all in the spirit of the best possible world. Adolescence is an awkward and often painful experience. Ours has been no exception. In a better world, could this have been avoided? I am skeptical. It is no small burden to have to come up with a better idea.

This singular creation was not an experiment. There is a least action principle involved. The teleology of optimality is unavoidable in this alpha/omega bootstrap process. Am I thereby denying the free will of the creator? I am only saying that Her free will has been thoroughly redistributed amongst all of us. The now ending epoch of science played no small part in that most significant of developments. Realize also that God is 'simply' the means by which our alpha selves realize our omega selves. God is our Omega Self in the dimension of eternity. If this strikes a few as bordering on heresy, then we heretics have some very illustrious and spiritual company.

[<-- Prev.](#) [Next -->](#)

5/25/02

Concealment (part 2)

Those of you out there struggling now to detach yourselves from intellectual teat of scientific materialism, might be wondering why God had to make her concealment so complete. Is she not being fastidious in her bashfulness to the point of perversity? Not only have all footprints and fingerprints been removed, but her tracks have been covered over with the most remarkable of backdrops or stage settings.

But which is more remarkable: God's ability to fool us our, or our ability to fool ourselves? In the aftermath (afterphysics?) we will, I am sure, see it was the latter. We have simply spent three centuries willfully ignoring our own minds and spirits. This studied ignorance is all the more breathtaking in retrospect. We were so busy tracking dinosaurs and planets, and being blinded by the Sun, that we forgot all about the light of our consciousness that bathes all our reality.

Of course, the image of God going around and planting dinosaur bones like so many Easter eggs, does not facilitate the rational comprehension of the average scientist. The placement of stars and fossils is simply to be found in the fractal depths of the rational, relational Atom. And for the actual rationale for the findings we need look no further than the collective rationality of the finders.

Is this too easy? The true ease of it will not be fully appreciated by any of us until we are fully engaged in the dramatic outworking of the Eschaton. The material Alpha of paleontology, and astronomy, embodied in the almost tangible Atom, will be amply reflected in the spiritual Omega that is our Eschaton. The dinosaurs will live again in some even more substantial fashion than is currently envisioned by Hollywood.

5/25/02

Revelation

Existence is a process involving a bootstrapped creation. From the background of potency, creation is the drawing and maintaining of distinctions and thereby separation. From an epistemic point of view, separation entails ignorance and concealment. This is the primary source of 'evil' in creation. To offset the fact of concealment, deliberate acts of revelation are entailed.

There are many possibilities for revelation. There appears to be an historical preference for prophecy. Is this for the best? There is a major communication problem. The ability of the prophet to spread the word is severely restricted by technical and political considerations. There are likely to be competing prophets and 'false' prophets. One might wonder that there could not be more efficient and direct means of divine communication.

More efficient methods would have their own drawbacks. Significantly they would be more impersonal and would rob the spiritual community of its evangelical function. Much of the motivation for technical and social innovation would be obviated.

We are left with the necessity that all revelation is local, up until modern times. Geographic and ethnic bias is unavoidable. Is this unfair? In the context of the millennial and universal 'salvation' being urged here, the question of unfairness becomes moot. We are left with just the residual 'accidents' of history.

The present result is that the prophetic tradition is not universal, and it is fragmented into major sub-groups. It is the function of the pre-millennial messianic event to overcome these historical accidents and biases. The timing of this event is likely to be tied to a particular technical deployment. In this case I am looking to the Internet.

Introducing the Metanarrative

Scientific cosmology is a great story in its own right. I just don't like the ending. I hope that you like this ending a little better, even though it may not be totally original. If it's not the best possible, however, please let me know.

Talk about your self-fulfilling prophecy, that is pretty much the idea here. The Metanarrative was the original blueprint of the cosmos. We are the primary carriers of that blueprint. Our beings and its being are not really distinguishable. Is this predestination? Well, where this comes and we come from, there is no pre- and post-. The Alpha and the Omega are two sides of the coin of that realm. Its like our universe and its super-symmetric, m-brane twin, they may only be separated by a plank's length, and if you don't know how skinny a plank is, you probably don't want to know. But, see, I did learn a couple of things in grad school, both of them, schools that is. Go Terps, go Tigers, go Cards, too!

Up to this point I have been pretty vague about the logistics of the eschaton. Its not that I'm being coy about it, I just haven't sat down to work it out, yet. I guess I'd better get to work on it before I get scooped by the troops. Set that aside for the moment.

Come to think of it, the Alpha part is not in much better shape, either. Oh well, maybe there is still some job security here, after all. What other security do I have?

What you see in the topical and chronological lists are some thoughts on stratagem and messianism. The messianic part is a detail of the larger strategy, one, however, which may be closer to home. Messianism is the lazy person's road to salvation, of the world, that is. The only real question is who that lazy person will be. If you prefer a more difficult path, well, you are welcome to complain to the management. Me, I just keep on trucking.

I'm hoping that we can pretty much work things out on the Internet. If that doesn't work, I don't have a Plan B, unless we revert to the 'Aquarium' mode (q.v. via Google). I can't honestly recommend that at this point.

7/5/02

Creation?

Can we not and should we not imagine that somewhere out in all that infinity of intelligence at least one creative intelligence finally hits upon a formula for creation. Perhaps some genie figured out how to anthropically engineer a newly emerging universe so as to optimize its physical parameters for life, and, indeed, for other intelligence. This engineering scenario does not have to be performed by a genie, it could just have been a normally cooperating group of advanced civilizations. Or perhaps some other genie simply 'falls asleep' and more or less inadvertently dreams up a whole world, rather like the Buddha under the Bo tree. Or perhaps there is a band of inter-cosmic computer hackers who are particularly adept at the programming of virtual worlds and artificial intelligence.

Here is the point. We have pretty darn good evidence that life is possible. Now if there is not a creator to begin with, the power of creation is almost certain to emerge somewhere and somewhen, and when it does there is a very powerful, unstoppable(?) bootstrap mechanism in place. If life is spontaneously possible, then it seems natural to presume that even more life is deliberately possible.

Unless there is a strict law against creation (and who would enforce it?), then creation is most likely to be the predominant source of all life. That would mean that the average critter is pretty darn likely to actually be a creature, owing its ultimate existence to the more or less deliberate acts of some form of creative intelligence.

Where does that leave us? From whence did we come? Don't we have sufficient evidence to prove that our particular world was a purely accidental occurrence? All I am saying at this point is that with all the potential and actual intelligence that may exist in an infinity of cosmoses, we ought to consider the possibility that we may be more intimately networked into that creative potential than one might want to suppose from the relatively naive point of view that characterizes the mindset of the average materialistic scientist. Just a thought.

5/19/02

Genesis

These days even among fundamentalist creationists the so called 'young Earthers' are looked upon as being doctrinaire extremists. Perhaps this helps to explain why the handful of us rational immaterialists are so reluctant to follow our own rationale to its logical conclusion which is not at all in harmony with the scientifically correct notion of an old Earth. Anyone, however, who does have the courage of their immaterialist convictions is going to end up right about here. That is the plan, anyway. We will just have to buck up and suck up, and not foul up so we don't have to come back again. We only go around once.

If discretion were the better part of my valor, I might have left this topic alone. The real action in this immaterial cosmos is with the Eschaton. That is the tail that wags this dog. The demand for coherence, however, does not allow me to walk away from the Alpha point of the cosmic equation. Besides this, every engineer knows that a bridge needs two anchor points, and in our case they are the Alpha and the Omega.

Compared to the Eschaton, the Garden of Eden is a literal Sunday school picnic. Where is the Anchor? Where indeed?

In thinking of the duality of the Alpha and Omega, we cannot avoid reflecting on the dynamic duality of God and Atom discussed previously. (I am not the first to have speculated on the Adam--Atom connection.) I would suggest now, however, that this primordial duality is more accurately portrayed as being between God and the mathematical 'Monster' group. This is the duality of the irresistible force and the immovable object. That group seems to have acted as the grain of sand relative to the oyster, we being the resulting best of all possible pearls. Should we then lay awake at night worrying about who created the Monster group? What if there had not been a primordial Monster? Where would that leave us? Anyone who knows the answer deserves the messianic mantle.

We have already noted that the footprint of the Monster is to be found in the depths of the Atom. I will not hesitate long before speculating that the 'monstrous' geometry of the Atom is also reflected in the sacred, sky born geometry of the global megalithic culture. It is as if the starry resonance of those ancient stone monuments were meant precisely, and we do mean precisely, to anchor our geodesics and thereby solidify the Earth from out of our primordial dream-time. Yes, the Alpha Anchor is to be found in Angkor and in Giza.

Can we suppose that the *Hamlet's Mill* of the mythically recorded precession of the Equinoxes is just a cosmic accident, amidst all this geodesic acumen? Do we really suppose that we lost nothing on our long march into materialism?

The actual time span of creation is framed in the stars. A compromise between the biblical six millennia and the Great Cycle's two dozen, leaves a nice round dozen. If anyone can argue for a better time frame for the immaterial Alpha and Omega (does the extra 'sabbatical' Millennium give us then a baker's dozen?) they are welcome to it. Did not 1998 mark the date of orthogonality of the ecliptic and galactic circles?

And for all the Dino-philes out there, well, why not trust in the teleological bootstrap cloning of a still materializing Dino-DNA sequence. This will be alchemy at its best.

5/30/02

Distinction

I am not the only one to have been intrigued by Spencer-Brown's [Laws of Form](#) appearing in 1969. Basing his entire system on the 'mark of distinction' has also a metaphysical appeal. It calls to mind our attempt to characterize creation as the process of dividing the primordial, singular unity.

The Kabbalah speaks of the Zim-zum, sometimes pictured as a lightning bolt, as the '(self-)contraction' of God to leave a space for creation to manifest. In this shadow ignorance is latent and knowledge becomes manifest.

In Revelation there are the apocalyptic [ten thunders](#) that also play a central role in Joyce's *Finnegans Wake*. The recursion that is doubly implicit in Joyce's title is explicit in the *Laws of Form*. This speaks in part to the duality of the Alpha and Omega that is witnessed within history as the syzygy reenacted at the X-event, sometimes referred to as the (little?) death, or passion of God.

In those thunders, are we not hearing the primordial creative word, or was it the primal scream, of God piercing the cosmic silence. It is the beginning of revelation and concealment. We also hear the Ur-language which may well have arisen out of a primal *Aaaarrgghhhh* of totipotent meaning, the stem cell of language, by degrees of distinction, down to the disquisitions of our analytic philosophers today. Heading into the eschaton, this historical process is reversed and accelerated via the Internet, of course. In place of the original *Aaaarrgghhhh*, we have the final Metanarrative.

All we need now is to understand the connection between the Zim-zum and the Monster group and we will be in business....*Aaaarrgghhhh!!*

6/26/02

Explaining Science (part 1)

A Just So Story

A major challenge for immaterialism is to rationalize both science and nature. The Darwinists, in attempting to explain 'How the Leopard Got Its Spots', provide a model of explanation that we will be extending to the whole experiential world.

The Darwinists have identified a survival mechanism to explain the taxonomy of the organic world. With immaterialism there is much less distinction between the organic and inorganic, and we replace their survival mechanism with a somewhat similar bootstrap mechanism.

The bootstrap is the cosmos' sky hook. Logically prior to time and 'before' there was a world, there was just Possibility. There was Potency. Then there was self-actualization through various forms of self-posturing. All of this is happening on the experiential level. Materialization is partly the result of circular processes being stretched out so as to become habituated cyclically as the dimension of time emerges. The cosmic potency actualizes itself by building its own relational network of cycles and sub-cycles. There is a zone of alignment of the constant background of virtual chaotic experiential elements or felt meanings that are always holistic in a microcosmic fashion. This process is ongoing in the human subconscious and through dreaming. Out of these elements and this process there 'emerges' the Metanarrative that is world history.

The Metanarrative is constructed with the simultaneous formation of an Alpha and Omega, as one might construct an expandable suspension bridge, not only across a void, but, in this case, within a void. It is no mean engineering feat. Experiential space and time are the flesh for this skeleton.

[<-- Prev.](#) [Next -->](#)

5/22/02

Eschaton

I am guessing that it is high time we attended to the Eschaton. Up to now it has only been mentioned in passing as I continued to procrastinate on this eventuality. So here we go, finally. My hope is that after this much preparation, the eschaton will be seen as the natural and inevitable resolution of any immaterialist history. It will be the bottom line of any rationalist metaphysic, the capstone of any coherent metanarrative, the *piece de resistance* of the best possible world.

Nonetheless, I readily admit that this is an uphill battle. In the popular mind, eschatological doomsaying is the favored cliché for depicting fundamentalist irrationality and radicalism. This stark image is deeply entrenched in the modern mind. Could one imagine anything more likely to resist revision? You see how I try at least to win the sympathy vote.

Yet, the arguments are simple and direct. A story is not coherent if not complete. It is not complete without a proper end. Also an immaterial world has a maintenance issue. It will not be self-maintaining, not beyond its allotted time. Its allotted time is determined by the parameters of its teleological creation. In the immaterialist metaphysic it is the omega point that is the primary locus of the creative potency. The traditional Alpha of Genesis fame is only the tail, and it does not wag this dog.

It is not a matter of if, but of when. What is the best possible time for the end? Fortunately for any nervous Nellies out there, I am a millennialist. I maintain that a proper end only comes after a proper Millennium. We give ourselves a thousand years to get our house in order, and otherwise prepare for the spiritual denouement. This should be plenty of time. If anything, we are likely to exercise our prerogative to expedite things in the likely event of our spiritual impatience, as in, 'Let's get this show on the road!'

And what is the most expeditious timing for the Millennium? Here I will be a bit more adamant. Now is the time. My only point is: what are we waiting for? Quite a few people, of course, are waiting for a messianic event. Are we going to let a little thing like that stop us? I don't think so. But you might want to stay tuned.

[<-- Prev.](#) [Next -->](#)

[index](#)

5/26/02

Millennium & Eschaton

The concept of the Millennium has been integral to the prophetic tradition since its inception nearly thirty-five hundred years ago with Zoroaster. In that case Creation was given a span of seven millennia, with the defeat of evil giving rise to a final Millennium of divine harmony.

I am simply augmenting that original notion with the idea of a spiritually directed paradigm shift. The drama of this final intellectual and spiritual shift is greatly enhanced by the centuries of scientific 'progress' immediately preceding it. Thus we have the defeat of evil being embodied in the pre-Millennial advent and revelation which results in the overcoming of spiritual ignorance. The notion of supernatural armies clashing in the heavens is replaced by the clash of paradigms.

Given that the potency of the cosmic genie is largely a function of its coherence, the defeat of ignorance and evil is teleologically preordained in the microcosmic makeup of the creatures. This along with the social and technical potency of the Internet implies that the final messianic trigger should be the merest of 'butterfly' effects. Thus is the cosmic coercion of this revelation minimized. It is a maximally participatory event. Why anyone with half a brain is not now scrambling to put together this prophetic website is well beyond my ken. All the more for the rest of us, I suppose. It does reduce the noise.

Our spiritual matriculation occurs at the end of the seventh and final Millennium. This is when linear, sequential history ends. Having resolved our mundane affairs, we move into the infinite dimensions of eternity: we become one with the Divine. Our sojourn into the limited dimensions of matter is completed. Even this '**resurrection of the dead**' was easily foreseen by the grandfather of the prophets. Our spirits need only the slightest of nudges to remember the origin and purpose of our journey here.

[<-- Prev.](#) [Next -->](#)

[index](#)

5/29/02

Our Dramatic Cosmos

What is the most important part of any story, particularly if it contains elements of mystery? Typically it is the ending. The story of our world turns out to be no exception. .

Recall that the creative drama that became the frame for world history has come down to us from far beyond space and time. How then is this piece of dramaturgy implemented? I have already suggested that the implementation is teleological.

Consider these analogies. The genesis of the pearl lies in the invasion of an external irritant. With the cosmos there is no externality. The stimulus-response pattern is all internal. It is our history that predominates the cosmic bootstrap.

On the other hand there is the dream sequence. Most of us have experienced substantial, coherent dreams that, nonetheless, seem to end logically with what turns out to have been an abrupt external trigger. Such occurrences continue to mystify. It has been suggested that most dreams are actually scripted backwards, but in the process of waking they are experienced as if being played forward in the normal manner.

Our eschaton has been present from the very beginning. It is embedded in the fabric of reality. Why then the dread? We are a surprisingly cautious, conservative and skeptical species. We sense that there is an emerging drama that will have both a global and personal impact. Until we get to actually kick the tires of the eschaton we remain naturally wary. I aim to be one of those tires.

[Later on 5/21] Silly me, I almost forgot John Wheeler's 'delayed choice' quantum measurement thought experiment. It is theoretically possible to adjust a measurement apparatus after a given particle has already interacted with another part of the apparatus so as to retroactively impose certain conditions upon that previous interaction. As some physicist once noted, not only is the world stranger than we imagine, it is stranger than we *can* imagine.

[<-- Prev.](#) [Next -->](#)

5/21/02

Millennium

The Millennium is the wrapping up or rolling up of history almost like a carpet into the vortex of the eschaton. The stretched spiritual spring of our materialist sojourn is relaxed along with its frame that is Nature. Linear time turns back to cyclical time. We return to the dreamtime from whence we came. Its allotted thousand years may be shortened by the diligence of our preparations.

Once our respective tasks become clear to us, it will be relatively smooth sailing. There will be the inevitable initial jockeying as we revision our situation. Let no one fall into the easy trap of allowing cosmic ends to overwhelm human means. Let the role of the mini-messiah be an object lesson in the power of cosmic minimalism. Go with the flow of the spirit.

If there ever was a time for management by objective, as opposed to management by directive, this will be it. The metaphysical, extraordinary nature of the eschaton will simply be a challenge to everyone's imagination. Every one will rise to the challenge. We were born to boogey, as they say.

My poor imagination is being taxed in just these few pages and paragraphs. You all will be leaving my imagination in the dust, pronto. Just don't look back. And don't look down.

Let me just say a couple of words on logistics. As I look back, I do recall a concern with demographics, and not for naught. It may be that right about now is our demographic max. It does seem that we have, as suggested, gone forth and replenished the earth. Eschatology brings us to a new regime. We replenish heaven, but certainly not with anyone's blood. We redirect our fertility to the quickening and fruition of the spirit. Perhaps the sutras will play a role.

There are about 10^{10} souls associated with earth history. There is no other history nearly as populated as ours. They may participate in that history by the sharing of lives and memories whenever and wherever they need or want. No problem. There will be ample opportunity to experience the Millennium. As they complete their desired experience they can become observers. There will be sufficient persons to complete the wrapping up drama. That is the end of linear experience. We will all have been there and done that.

I don't foresee any particularly difficult political problems that would require anything more than this sort of minimal, mini-messianic intervention. Even at the end of this pre-millennial regime, we are close to being able to muddle through. Once this gestalt switch begins to percolate through the world, the remaining obstacles will disappear. In other words, there is no big blueprint for this period. The spirit freed from the intellectual shackles of materialism will carry the day.

[<-- Prev.](#) [Next -->](#)

7/7/02

Strategy

I toyed with Cartesian dualism for several years before having to concede that it provided only an *ad hoc*, incoherent compromise between materialism and immaterialism. Its only practical use would be to serve as a stepping stone for scientists like myself who embarked on the quest for a deeper understanding. I had already realized that immaterialism would be much too radical to be taken seriously by anyone in the mainstream. For several more years I discontinued my discussions with academics and religionists that had revolved around the possibility of a Cartesian metaphysic. When I once again resumed those discussions it was under the rubric of the 'Aquarium', and those lasted until the Internet became available. Actually, though, my first online discussions were on a CompuServe BBS.

In the best possible world, the Internet will serve as the primary medium for revealing the truth. This is in accord with the doctrine of divine minimalism. At a coed summer camp I once attended there was a Hands Off Policy. There is also the Prime Directive of Star Trek fame: interdicting cosmic intervention in 'primitive' or otherwise isolated cultures. Divine minimalism in history is exemplified in the prophetic tradition. Typically a prophet performs a miracle only as a last resort or only as an integral part of her message. In our case the Internet should minimize the problem of disseminating the message, and thus we have the concept of the mini-messiah.

For most non-fundamentalists, even a mini-messiah is likely to be too much. For the fundies, even a mini-messiah would likely serve as one more excuse for bloodshed. Why not just ditch the whole idea?

My response is that to do so would be entirely ingenuous. If we are serious about promulgating immaterialism, we surely recognize that it will constitute the mother of all paradigm shifts. Furthermore, the whole motivation for this message has to do with eschatological preparedness. This is nothing other than the dictionary definition of salvation. If there ever was an event that called for divine intervention, this would be it. Furthermore, there has never been a paradigm shift in the past that has not been pinned on someone. Is this one likely to be an exception? Is there going to be a Paradigm committee?

The messiah problem is simply unavoidable. Ironically, a little reflection will show that the best way to minimize the full messianic aspect is to cast it in the shadow of some other historical figure. The only candidate meeting the criterion is Jesus, and I doubt that this is simply fortuitous. Anyone serious about any of this business will see that we have already been upstaged in the casting department. The role of JC, Jr. is just what the script calls for. The best possible salvation in the best possible world is a package deal. Sometimes the best presents come in the smallest packages.

Straw Man

Let us briefly survey the postmodern intellectual scene as it pertains to the status of immaterialism.

A preponderance of present-day intellectuals share the postmodern perspective. Theirs is an almost militant pluralism. They will join forces in the face of any perceived threat to that pluralism. The cosmology, or, as they would say, the metanarrative that I have been outlining here would be perceived exactly as such a threat were it ever to appear on their radar screens. In my pre-Internet attempts to bring these ideas to the attention of academics in person, I was never able to get beyond their rather understandable *ad hominem* reactions. They could seldom see beyond what appeared to them simply to be a potential totalitarian threat. The group solidarity among academics is sufficiently strong that no one wants to appear sympathetic with a controversial outsider, even in the very few instances where such sympathies might have actually been present.

Consider the pragmatics of a paradigm shift. All creatures are creatures of habit. It takes a considerable force to cause us to change our habits, even, and perhaps especially, if these are habits of thought. Any existing system has to be widely perceived as broken before there will be any concerted effort toward a revolutionary replacement. Until such time, very many signs of failure will be willfully disregarded. Like the proverbial lobsters, we might well endure increasing heat until it is too late for us to jump out of the pot. This analogy may strike a bit too close to home in light of the one thousand deaths in the most recent heat wave in India. Rest assured that the media moguls will be the very last to have to forgo climate control.

Being the best of all possible worlds, our participation in tribulation prior to revelation will be just as short as possible, but unless Jesus is planning to return soon in a flying saucer, it is up to you and me to pick up these cudgels. Our only stratagem is to foment a public discussion. The previously mentioned deconstructors of the mind will be our straw man until the warm bodies appear.

Recap

The poor reader may be getting a bit dizzy from going around in these circles. That is unfortunate, but I'm not quite sure what to do about it.

I am not writing a thesis. I am keeping a wary eye out for the web crawling indexers. That is a necessary fact of life in the Internet lane. I am casting a loopy net into this vast ocean. Snaring a few pairs of eyes is the name of the game. Like those fair maidens of yore, I just keep on spinning. When my own Googling becomes recursive, I will know that the end is in sight.

This Metanarrative is being laid out in circular and holographic fashion. Like JC1, one has to keep the Alpha and Omega in one's grasp at all times. Even if my circles don't, your circles will hopefully expand as you hop and skip around in this labyrinth. The occasional recap is about all that I can offer for the foreseeable future.

Even the occasional recap is problematic. Just one more circle. The tide that runs out toward the shoals of a totally fragmented knowledge is strong. I swim against that tide. Each of these A/O loops has to be able to function as an independent lifesaver. I will likely get only one chance with the saving fish, the leviathan indeed.

The coherence theory of truth is being put into practice here as nowhere else. My work will be finished when and only when another site takes on a more substantial coherence. It might even be a spin-off. It will not be difficult to apprehend. It is nice to have such a simple, even measurable and pleasurable task. We should all get paid to think expansively. Trust me, we will!

7/3/02

Saving the World

Saving the world may sound like a daunting task, but it seems rather less onerous once we realize that it appears to have already been saved and now only needs to be reminded. And how do we do that? Stand on a street corner holding a sign? What you see here is the Internet version of that time honored tradition.

An important additional benefit of the Internet is the ease with which one may keep an eye on things. Besides presenting my own viewpoint, I can perform the additional service of helping all of us to keep current with respect to any other developments on the Internet that are likely to influence this effort. I need only provide the links to the relevant web sites. Eventually one would hope for reciprocal links, and when that begins to occur in any substantial fashion, our job will be just about finished.

Is it that easy? It could well be. Whoever's web site becomes the hub of the salvational network, that person, as the designated jc,jr, is likely to end up on 'Crossfire'. She may also end up in a crossfire between rival sects. This would lend credence to the epithet that the only good messiah is a dead messiah. But, perhaps we have progressed in the last two thousand years to the point that history will not have to repeat itself in this unfortunate manner.

You will notice that I am taking a recognizably Tom Sawyerish approach to this salvational fence painting. This may be just a bit disingenuous on my part. I am drumming up business by seeming to encourage competition, but perhaps with a deliberate insouciance. For one thing, I'll have to admit that even after just a few years I have naturally grown somewhat attached to and protective of the jc,jr designation. Rather than just roll over and play dead when the first contender appears on the Google screen or email box, it may be something more like, over my dead body, buddy. All is fair in war and salvation? Also there is the not so minor issue of precedence. Publish or perish, as they say. Time's a'wasting.

6/2/02

The 'Competition'

So where is the competition? Why are people missing the boat of theistic idealism (immaterialism), or 'rational theism'?

More than a few Christian theologians, both liberal and conservative, are taken up with the Darwinian problem. Those of a creationist persuasion are directly attacking the adequacy of natural selection as a blanket explanatory device. They focus on those particular biological systems that appear to stretch the Darwinian model beyond its limits. 'Intelligent Design', q.v., is their most commonly used banner. The more liberal theologians are looking at the broader perspective of non-reductionism and teleology, that we have discussed above.

In both cases there is an explicit concern with the rationale of ends and means, but by focusing so narrowly on the Darwinian issue, both factions are unavoidably becoming more deeply entangled in the larger materialist cosmology of modern science. Strategically, in becoming too closely engaged with the 'enemy' in the skirmish over Darwinism, they have been unable to keep their options open for the larger and inevitable battle over metaphysics and cosmology. They are letting the materialists choose the battlefield, and set the terms of the engagement.

Meanwhile, the theists are implicitly letting the pantheists continue their hegemony over immaterialism. The possibilities of theistic idealism, i.e. rational theism, are being lost in the shuffle. Theistic idealism remains consigned to the dustbin of history, a curiosity to be occasionally contemplated by the Hegelian scholars.

6/8/02

Christocentric?

I can sympathize with the many folk who would not mind Jesus half as much if it just weren't for all those darn Christians. Was this really the best of all possible Christian religions? It just goes to show how strongly this religion was overdetermined by the very large scope of its role in history.

You will notice, however, that I am referring to this religion in the past tense. It is a fact of messianic life, that the only way to get around the historical obstacle that is the Church is through the eye of the needle that is the Second Coming. Bless its heart. The other fact of messianic life is that those fellow travelers will be the very last to accept these messianic facts of life in the cosmos. They are only doing more or less what they were told.

There is no way we can avoid the Second Coming, so we might as well enjoy it.

But was Jesus really necessary? And what about all that magic business?

If we take teleology quite seriously, Jesus has not existed yet. Jesus, and all of us for that matter, are just a twinkle in the eye of the Eschaton. If he exists at all it is in the logic of creation. If the Eschaton is a love tsunami, and God help us if it is anything else, then its historical focus, either before or after the fact, is undeniably to be found in the X-event. The Eschaton is a big fat cosmic given, kind of like the Monster group. But If I were God, and I wanted to have maximum leverage with minimum effort, I would put all my eggs in the X-basket. That is just a fact of God's life.

The X-event was the death of God. She poured her entire Self into that one spot, because there was no logical alternative. This was the necessary self-sacrifice. We are that eternal resurrection. There can only be one supreme sacrifice. The X-event is to the geodesics of of the Spirit, rather as Angkor, Giza, etc., are to the geodesics of the Earth.

And what about the Muslims and other folk? Well, just as soon as the the Christians become more transparent to the sacrifice, everyone will be able to understand it. In fact, the Muslims will probably end up having to explain it to the Christians. But it is not really rocket science, is it? If you believe in Tinker Bell, all you have to do is clap your hands. It is the children and not the rocket scientists who inherit the Kingdom. So much for magic, and so much for rockets.

5/30/02

Pre-Millennialism

Is there anyone out there who would not agree that there has never been a more auspicious time for the Millennium?

Here are the factors to consider. History may be viewed as a long march into materialism. As we have discussed above, there are ample indications that the intellectual energy behind this materialist sojourn is already on the wane. Admittedly, though, the concomitant economic and political Juggernaut is still to be reckoned with, but, hey, that's why we're here!

On the one hand we have the environmental problem. If there is a solution it is not yet in sight. On the other hand we have the clash of civilizations. If the metaphysics here is correct, the modern materialists are on much more precarious ground than even our post-911 anxieties would indicate. It may well be that these two problems will continue to exacerbate each other. Or it may be that we will continue to muddle through.

Materialism has been the great attractor behind the metaphysically necessary spiritual weaning of our souls. The Atom has been the dual to God in the dynamic of Creation. The fact, however, that the primary result of all our technology has been the wiring of our global brain, may not be incidental in the larger scheme.

In the best possible world our demand for truth will subvert the materialist Juggernaut well before it pushes us further into tribulation and ultimately oblivion. In the chaotic milieu of the global Internet, the merest butterfly of truth and vision quite possibly could foment a spiritual storm of awakening. There is now a big stick and a small carrot. How and when might the spirit be moved? I would suggest that it could all come down to Google. Put enough of the right words in the right places, and the rest will be history, or at least the end thereof.

This is a minimalist version of the messianic event. Volunteering to be a mini-messiah is about the least that any activist metaphysician could offer at this juncture. Does anyone have a better plan?

Only One Show?

Yes [, but do see below]. There is but one world. There is but one show, and that show has but one showing.

If I am correct, I have more right to be skeptical of this historical singularity than anyone, which leads to another slight digression.

If I am even half-way right about the world, and I am even half-way successful in putting together a unique and coherent website, then yours truly is deliberately flirting with a rather specific and obvious messianic possibility (Y2C?). Even if not me, it is likely to be another equally obscure soul in a similarly fortuitous place on our wired planet.

Now consider the singularity of history from the perspective of this poor devil. Imagine, if you will, the plaintiveness of her asking, 'Why me Lord?' One would suspect that even just the subliminal anticipation of such a question is more than enough to keep this particular deck rather clear. But this does not answer the original question.

To maintain sanity in such a situation, consider this setting: a heavenly arcade with the always amusing 'messiah' game. After some cajoling, I was just dumb enough to put my nickel in the slot. The rest of you out there are just the wiser onlookers, feeling rather more sympathy or pity than anything else. This is how most of us regard JC1, the original X-event, after all.

Our singular history can be experienced and re-experienced in every possible way for all eternity. It already has been. There need be and can be no bigger or better game out there, remembering that you've hardly remembered any of it yet.

More to the point is to recall that each of us is just a very small facet of the infinitely cohering cosmic omniscience. We are the microcosms of that cosmos. It is that to which we so hesitatingly awaken.

Is there then nothing new under this Sun, or through this Son? Doesn't God get bored? No more than we ever do.

5/21/02

Messianic Gambit?

Guess what happened on my vacation? I had a close encounter of a Rabbinical kind while hiking in the Northern Canadian Rockies. A member of our small hiking group (see [The World Outdoors](#)) turned out to be an almost rabidly anti-messianic Rabbi. Peter is a fulltime networker for a consortium of Reformed congregations around the country. For a messianic wannabe to be in close proximity with such a one for several days was something of a test for both of our composure. Let me hasten to say that this is nothing personal about Peter. A long-time friend of mine is a Methodist minister, who I imagine would have responded in a very similar fashion under similar circumstances. Nonetheless, I am still feeling the provocation of this encounter.

An acquaintance of Peter's studies messianic movements domestically. I inquired as to the attitude of this person toward such movements. Peter's response was that like any other rational person, he would be opposed to such movements as being irrational.

There are several presuppositions of modernism contained in this view. One is that a belief in God cannot be rationally supported. It must be a matter of faith alone, a faith that can only be supported subjectively or traditionally.

Another presupposition is that any messiah would have to fit into the historical mold of the prophet. The prophet hears the voice of God and reports it to her charismatically entrained following. Part of this charisma would necessarily include miraculous phenomena as evidence of supernatural involvement.

In short, modernism presupposes the oxymoronicity of rational theism. The postmodern theologians have been able to demonstrate, to the satisfaction of many, that theism is no more irrational than any other existing belief system. The next step, that of proving the rational superiority of theism to any other belief system, would constitute an intellectual achievement of messianic proportions, would it not?

This final messianic step cannot occur in the context of our modern Cartesian dualism. You cannot embed reason in an irrational frame. The only alternative frame is a monistic immaterialism, i.e. idealism. Whoever can effectively initiate a global turning toward an idealist based rational theism should, by almost any account, fit the messianic profile. I certainly make no secret of my own aspirations in this regard. The best way to learn to recognize a potential messiah is in attempting to emulate such a one. A minimalist, rationalist, messianic event has the potential to appeal to both the secular and sectarian audience. And how else are we to avoid the clash of sects and civilizations?

Breaking the Barrier of Materialism

The main obstacle to a messianic initiative involving rational theism is the radical nature of the gestalt switch that is involved.

Most philosophers and even most people have been and always will be idealists at heart. Modernism and Cartesian dualism have had a long and ultimately futile struggle against that natural state. Most people, and that includes the philosophers, fail to be rational about their idealism, that is they fail to be thoroughly coherent about it. The simple reason is that coherence is so fundamental or radical that it could not occur other than in an eschatological and messianic context. Historically the person who came closest to realizing this potential for idealism was Hegel. His main fault may simply have been that he was too far ahead of his time. It was still a century before scientific materialism would be reaching its full potential, and even longer before the idealist implications of postmodernism would begin to be felt. In this context, Hegel has to be seen as a pre-modern thinker. Darwinism was barely at his doorstep and modern cosmology was still an apparition.

Most 'rational' folk may easily suppose that the combination of Darwinism and modern astronomy present an impossible barrier for a coherent, radical idealism to penetrate. Even for the theistic opponents of Darwinism, the idealist alternative is barely a blip on their radar screens. One and all, they underestimate the personal power of coherence.

The full power of coherence is something to be felt more than seen. It is even supra-rational. I was able to feel the force of it many years before I had any idea of its rational outline. This is the personal power of the Spirit of Truth. I can see the rationalists shaking their heads at this point. 'So much for rationality,' they will say. But this personal coherence is just the charism of truth. Without this charism, truth is a dead letter. Converting this charism into a spiritual movement will be the magic of the Messiah. This is how the barrier of materialism will be broken.

Messianic Initiative:

[<-- Prev](#) [Next -->](#)

[Topical Index](#)

8/26/02

On the Verge of God

The first rational step in breaking the barrier of materialism is the recognition of the actual creative potential of the mind. Creativity is an essential property of the mind.

What are the limits of this creativity? No one honestly knows, and thereby we can put the materialists in a bit of a bind. Materialism continues to have considerable sway over our minds simply because of its imagined potential for continued 'progress', i.e. for its creative potential. What are the limits for the creative potential of science and technology? If there were none, then we would be well on our way to becoming or producing god-like creators. This gives rise to the distinct possibility that we are the product of such a creator. Science fiction is rife with such possibility. And is this not also the thesis of every religion?

On the other hand, if there are perceived to be physical limits to the creative potential of our technology, then this fact in itself would substantially tarnish the luster of materialism. It is just this skepticism in regard to the future potential of materialism that accounts for much of the seeking of alternatives that we see in our postmodern world. Whether materialism is limited or unlimited, it ultimately leads us to reconsider the possibility of higher powers or cosmic intelligence.

The above considerations apply most poignantly to the technology of artificial intelligence. AI is either possible or not possible. If it is possible then all the ambitions of '[transhumanism](#)' come to the fore including its almost religious sounding eschatology such as we have seen with [Tipler's Omega](#).

On the other hand, if AI turns out to be infeasible, this would raise important issues. We are back then to Fodor's [thesis](#) on the irreducibility of reason. If this is the case, then the source of reason is not to be found in nature itself. We have to look for one of Dennett's 'skyhooks', i.e. God. Once again, we end up either with God or something very god-like.

This is all by way of saying that it borders on irrationality not to take seriously the God question. This is tantamount to the Creation question to which we now turn.

[Topical Index](#)

8/26/02

Creation

If God had a choice about the method of creation, it should be fairly obvious that she would prefer an immaterial over a material creation. Why so?

1. An immaterial creation lends itself to coherence. There will be no mind body problem with which to deal.
2. The creation process will be much more natural. The creatures can and will directly participate in the process.
3. The eschatology process will also come about more naturally and continuously.

The difficult part is to understand how and why the prophetic tradition got itself off onto a materialist tangent, in contrast to the eastern traditions.

But let us back up. There may, nonetheless, be some advantages to a matter based creation. If God is clever, there is no reason why we creatures should not be treated to the best of both types of creation. After all, should this not rationally be the best of all possible worlds, involving the best of all possible creators and creations? In that case, the preferred creation would be an immaterial one, that would take on a material appearance to an optimal degree.

It might be easy to think that God must have outdone herself in regard to the material or natural appearance of our world. Was it really necessary for her to fool so many of us for so long? But again, this is not difficult to rationalize, particularly considering that given its immaterial basis and the participatory nature of its creation, it is mainly the case that we creatures were simply allowed to do a bang-up job of fooling ourselves. And did we ever!

Off the top, I can think of two forms of rationalization for the deceptively material appearance of our ideal, little dream world. Let's make that three...

1. Atomization and democratization are not accidentally linked. It has to do with the concept of the level spiritual playing field that is made possible by atomistic metabolism, and all that. We were going to have to be shuffling the spiritual deck many times in our sojourn from the Alpha to the Omega, and the genetic shuffling was no small part of that. It is a bit like the game of solitaire. We have to sort through the cards any number of times before they are aligned for the rapture where the last become the first, or did someone else already figure that out?
2. Homo Faber. That's us. Keeps us busy and out of trouble. It requires a lot of cooperation and raw matter. Talk about planned obsolescence. We are able to continue the process of creation, seemingly on our own. We can almost think of ourselves as self-made demi-gods. And we are able to set things up, communication-wise and otherwise, for the pre-millennial drama.
3. Drama! Can we imagine that God is not a dramatist? Are we not all suckers for the surprise ending, for the big finale? Will we be disappointed? I think not. Our self-deception around the concepts of materialism are a major part of setting up the grand finale.

And what I have just described may also be the easiest method of creation. Who said that God should not learn a trick or two from Tom Sawyer's method of fence painting? Nothing like cajoling your creatures into taking on the more onerous tasks of creation. Why should God have to do all that bean counting when she has so many willing volunteers such as us scientists, etc.? Just add a dollop of teleology, and presto, you're in the creation business, big time.

Why are we scientists so dense about the possibilities of our own self-deception? Why are we so naive? Well, if God didn't love fools she never would have made so many of us!

8/27/02

Glass Ceiling

Any sort initiative is eventually going to run into resistance. A messianic initiative is certainly no exception. The question is whether this one has gotten far enough along to encounter even a little friction. Just with respect to this second web site, the answer is no. It may be some additional time before this one even shows up on Google's sensitive radar, but, as I have hinted, there has been more water under this bridge than just what you see here. For instance there was an earlier version of this web site dating back to 1997. At some point I might resurrect a copy of it, but even though that site was covered by Google, I did not receive more than handful of inquiries.

Then there is the '[Aquarium](#)'. What can I say? Isn't this more than a little fishy, or just a very small fish in the sea? That is hard even for me to know. Even Ron may only be able to guess. In connection with the Aquarium you will see his name bandied about. He is the closest thing that I have to a reality check, and, considering his reputation in the trickster department, that may not be saying much.

When I first came across him, just over ten years ago, one of his designations was the 'keeper of the weird' at a certain acronymous agency. He has also spoken of an informal 'phenomenology network' which deals with 'uncorrelated' phenomena. His real jobs tend toward the more conventional and analytical, through which he maintains an upper middle profile in the 'gummint'. He resides in an actual chain of command. But it was on the topic of 'crop circles' that we first crossed paths.

I won't try even to summarize what little material may still be available on the net, but let me try to give you an update. From its inception, the 'Ron & Dan show' seemed calculated to raise eyebrows among a rather select audience of insiders and knowledgeable outsiders. And that was about the extent of it. For instance, there are surely other 'phenomenologists' like Ron in friendly and not so friendly intelligence agencies around the world who have access to the internet. To suppose that they have not also raised their eyebrows at the Aquarium would be to vastly underestimate human curiosity and foreign intelligence. If Ron were to travel abroad he has said it would have to be incognito. I still travel naively and cognito. Which of us has their neck stuck out further is a more than academic question.

Messianics can be a touchy subject. Just ask a random person on the street. That anyone in the gummint would be playing with that sort of fire, especially in 'public', would naturally be of some interest. There came a point when Ron and I could no longer meet in public and when he had to deny publicly certain things he told me privately. This is the glass ceiling for the Aquarium version of messianics.

Messianic Initiative:

[Topical Index](#)

8/27/02

Trickster

In the context of Creation, I have spoken of our self-deception regarding materialism. It is as if God were hiding behind the veil of Nature. Now the self-concealing God is also bound to be self-revealing, but this can be problematic if one does not wish to give away the whole show inadvertently. In the breach between Creator and creation, there must be a hermetic messenger figure. This figure necessarily has many guises. One of those guises is the [Trickster](#) which also has many guises.

The book, to which I have just referred you, was written by George Hansen, who happens to have been a *de facto* member of the Aquarium nearly since its inception. George's connection with the Aquarium stems from his interest in the 'Aviary', some of whose members he discusses under the topic of 'government disinformation.' Thoughtfully, George does not directly mention Ron who was a full-fledged bird person, and who garnered some considerable interest on George's part.

Can we then explain the Aquarium phenomenon or the Ron & Dan show as just another species of disinformation? Perhaps, but of all the possible forms that disinformation might take, the Aquarium would have to be one of the most peculiar and potentially the most sensitive.

For what it's worth, here is my own speculation about the Aquarium phenomenon.

Suppose you were God and wanted to stage a postmodern prophetic event. How might it differ from previous such alleged events? The main novel concern would be dealing with the mass media. If this event were to be world class, it would certainly have to come to the attention of the media, sooner rather than later. This makes things more than a bit tricky, and so we have the Trickster.

Messianic Initiative:

[<-- Prev](#) [Next -->](#)

[Topical Index](#)

8/27/02

Trickster (part 2)

So here we are. God with a message and the media looking for a story, as usual. One does not need much imagination to see how there might be a divergence of interest, depending on the nature of the message. For the sake of argument, let us assume that what you see on these pages bears some resemblance to the desired message.

If we wish to optimize the human participation in the eschatology then that participation must be voluntary and relatively spontaneous, and so the message itself must not be couched in a coercive context. Multiplying the fish with an audience of 5 thousand would not be qualitatively the same as with an audience of 5 billion, say. And still we have the problem of dealing with the powers-that-be. Looks like a job for the Trickster. Bring on Ron and the 'Visitors'.

Ron you already know. The visitors are known by that emblematic alien face that has managed to infiltrate the popular media, not to say, the mass psyche. More than a few people, even some who are well placed in various sects, fully expect the visitors to play a direct role in an imminent messianic event.

I would prefer for them a less direct role *vis a vis* the public, along the lines of minimalism. But I would suggest that they may have needed to be more assertive in their contact with key elements of the powers-that-be. To avoid a repetition of an event of the Herod type, they might have had to read the riot act to those key people, and it probably would have involved more than just reading. The most tangible evidence of such an intervention for public consumption would be something of the nature of the Ron & Dan show, were it ever to transcend that glass ceiling.

Just a speculation.

8/27/02

The Messiah Contingency

World-wide expectations around the imminent emergence of a messiah of some sort may never have been greater than at present, and they are showing no signs of diminishing. The nascent clash between Muslim east and Christian west does nothing to mitigate those expectations.

It is not only the believers who are attentive to such emotions. Two related incidents were brought to my attention by Ron. First there was a large scale Christmas time AWOL incident within the ranks of the South Korean military precipitated by a local cult figure claiming ties to Jesus. I was told that a couple of plane loads of US advisors were hurriedly dispatched to the scene.

Later came the Falun Gong phenomenon in China. Ron has always expressed a concern for the emerging Chinese military threat to the US. It was no great surprise when he asked me to get in contact with the local Falun Gong chapter. I did so, but the results were desultory. With Ron's approval I sent a letter to the Chinese embassy, including his name and requesting a meeting with their Science attaché to discuss parapsychological issues. Again, no response.

Clearly there was a build up of spiritual expectation around the turn of the Millennium. And, by way of example, I inadvertently played a not insignificant role in the Hale-Bopp incident by circulating a piece of speculation concerning the visitors that was passed to me by a member of the Aviary. Another case of disinformation having unintended(?) consequences?

It was not too surprising that as we got closer to Y2K, and things appeared to actually be settling down that my ten year interlude with Ron was evidently placed on a back burner. I was mildly surprised then when he called me on 9/2/01 to say that something had come up and there was a pressing need to reactivate the Aquarium. Imagine my greater surprise and curiosity on 9/11. Needless to say, this curiosity remains unsatisfied.

How to Save the World

A prophet is one thing and a messiah is another thing. We have considered how God might extend the prophetic tradition into our present postmodern context, hopefully without further destabilizing an already unstable situation.

Back in the 'good old days' prophets were a dime a dozen, it would seem. Modernity has, by definition, been prophetless, 'lo these many years. To now stage a prophetic event, even of the minimalist version outlined above, would, at the very least, bring postmodernism out of the academy and thrust it into the mainstream, along with the media attention that would necessarily be entailed. This could not help but rock every secular and sectarian boat. What message might God have for us that could possibly justify such world-shaking 'minimalism'?

It is no secret that the long-term survival of anything deserving the name of civilization has been very much in question for at least the last half-century. If at this critical juncture there is to be any divine intervention, it would surely have to address the question of survival that is on everyone's mind. When the question of survival gets raised to this metaphysical level, we are no longer talking mere 'survival', we are talking salvation. The bottom line is quite simple: forget the prophet, at this late date, nothing less than a messiah will suffice. It may be the minimalist version of the Messiah, but it will be a messiah nonetheless. For a Christian, this would have to be the Second Coming. After all this time and grief, we have a legitimate right to say, put up or shut up!

This is a rather tall order, but its all part of the one coherent cosmic story including the Alpha and Omega that is writ large and small on our world wherever we truly care to look.

How to Save the World (part 2)

This time around it simply has to be all or nothing. Half measures are not called for, and will not suffice. Surely, our little Danny-boy is not up to pulling off this stunt, Trickster or no Trickster.

Yes, and no. God does have one final trick: the Spirit of the Truth. This is the personal Charism of a coherent cosmic truth. If it is anything at all, it is already written on everyone's soul. Just a quarter-century ago, almost to the day, I was given the privilege of feeling, almost touching, this Truth. I could not then grasp it with my nascently rational mind, but I knew that I would find it if I just followed my nose, persistently. There has been more than a little water under that bridge. I continue to wrestle with this eight-hundred pound gorilla. I know it is in here, even more than I know my own identity.

Daily on these pages and in my own mind I interrogate this Truth. I do my best to make an accurate transcription. I invite everyone to join in this transcribing, continually consulting our respective souls and consciences. The Whole will be much greater than its parts and greater than us. The Internet will be our witness. There will be no turning back.

Will this Truth be our salvation? If it is not, what else possibly could be?

A Turning Point?

Just to recapitulate, for the last several centuries science and philosophy have been strenuously engaged in the analysis and intellectual atomization of nature and the world. There are indications that the deconstructive spasms of postmodernism signal a final phase in this very lengthy process. Perhaps the most appropriate monuments to this very significant historical epoch are the mile-wide 'atom smashers' that have been built on two continents.

Where then do we go from here? Will there no longer be a prevailing worldview, a vision or a sense history? Indeed, people speak of the end of history. If there is going to be a new epoch of history it will necessarily entail some sort of reconstruction.

Certainly from an intellectual point of view, after all the centuries of deconstruction, any systematic effort at reconstruction will be tantamount to creating a whole new world. What are the chances that any significant number of people would ever agree on a new starting point and a new direction for the future? It does not take any very astute observation to conclude that the chances for a concerted reconstruction appear slim. The only obvious recourse is the traditional, non-scientific one of appealing to a higher authority.

Easier said than done? Yes and no. Certainly the intellectual deck has been cleared. We can suppose that somehow nature will conspire to fill this intellectual and spiritual void. But what might one do to expedite this process, rather than just waiting on the sidelines, like the characters in 'Godot' and the assorted sects of fundamentalists, for a *deus ex machina*?

We can always try using our heads.

Post-Theology and/or Pre-Millennium

Now I sure don't have the keys to the kingdom, but I can do simple arithmetic. Given that one universe exists, and that there is no law against it, there ought to exist a non-denumerable infinity of other universes. Now even if only one out of a quadrillion of those universes had as much intelligence (sic) as ours, that would leave us only another non-denumerable infinity of cosmic genii with whom to contend. Now unless there is another law that specifically prohibits these emergent genii from engaging in non-local, intercosmic intercourse, we're talking many, many megabytes of intelligence here, there and everywhere, and everywhen, for that matter.

But if the intercosmic Genie is so smart, well, why are we so stupid? Why are we barely able to keep ourselves from committing nearly constant mayhem on each other? Where is this Genii when we truly seem to need her? Does the world not seem to have more than its quota of evil. Perhaps we are dealing with an evil Genie? You and I are certainly not the first to have wondered about this.

There is really only one answer to this question that has ever made any sense. All is well that ends well. One cannot address the question of good and evil without addressing the eschaton. If you remember Theology 101, you will remember that eschatology has to do with the end(s) of all things. But, wait, isn't the end of the world also something bad, hardly something to look forward to? How can two wrongs make a right?

There is a kind of throwaway answer. The end of the world is kind of like graduating to eternity, after, admittedly, a few hard knocks. It's about going somewhere, nowhere and everywhere. Again, no one has presented me with the keys to that kingdom, not yet. But some of us are sure to find out sooner than others, and despite all appearances I am really *not* in a big hurry -- only a *little* hurry. I am a minimalist when it comes to hurry. Thus we have the Millennium. I'll bet you'd thought I was going to forget about it.

Something Wrong with this Picture?

Now I may be biased, but at this point it seems to me that we are presented with an almost nightmarish scenario. Instead of a garden of Eden, we seem to have every imaginable world existing in every possible contortion, each one copied at least a million times over. The sheer quantities have run rampant. Something is wrong with this picture.

Where is the Federation when we need it? If the creative impulse is not to run amok, then there ought to be sources of restraint. One might hope that there is an overriding moral force of some kind, or at least some kind of quality control in the creative process that would respect the rights of the creatures *vis a vis* the creators. But I think there is even a more basic flaw in this thought process.

The whole concept of separate existence is a product of the Newtonian, Cartesian mind set. The most natural state of affairs was supposed to be that of individual atoms swerving in the limitless void of space. General relativity and quantum mechanics have, admittedly, only made a very small dent in the Newtonian worldview. But the rigidity of this mind set is equaled only by its fragility.

This is why I believe that the issue of reductionism is crucial to any new worldview. Anti-reductionism is anti-atomism. Inasmuch as anything is physically irreducible, to that same extent the sanctity or absoluteness of space is violated. It is the overriding idiom of modernism that we are somehow lost in space. At the same time that we revel in our splendid isolation, we also tremble at the fear of falling into the absolute oblivion of the void.

Now with the postmodern rediscovery of the mind, consciousness, and other seemingly unanalyzable, irreducible entities we are being forced back to accept the Cartesian duality of mind and matter, or more accurately we should say mind and space. But is not this logical dichotomy the basis of all the incoherence of modernism? Any new worldview will have to nip this incoherence in the bud. Now I realize that there is a whole gallery full of philosophers who have been trained from early on to jeer at the merest mention of immaterialism. That is hardly conducive to reasoning.

So Bring on Chicken Little!

(There is a bit of a story behind the Chicken Little epithet. It is a story that involved nearly ten years of my life. This story figured prominently in the previous incarnation of this website. At some point it may be advisable to resurrect a copy of that site, just to keep the record straight. In the meantime, certain allusions and illusions are liable to creep back in, so, kindly, bear with me.)

My contention is that there are a more than a few potential Chicken Littles running around in this postmodern world of ours. I am certainly one of them, although I seem to be the only one out there with a website, as far as my modest googling skills can attest.

There are more than a few of us who question the cosmic hegemony of materialism. Now if one is content with mysticism, dualism or some other form of incoherence, one is free just to go on with one's own life. But if one strives for coherence the options narrow rapidly. If there is an option besides immaterialism, it surely is obscure. In the West, immaterialism has not been taken seriously since the heyday of Hegelian idealism almost two centuries ago. In the East, immaterialism has never *not* been taken seriously, but that is another story.

From the perspective of an immaterialist, materialism looks ever so much like a balloon filled with a monstrous void and a few atoms. There is a strong and probably childish urge just to pop that particular balloon. And is it not said that one may enter into the kingdom only as a child? Does it not take a child to point to the nakedness of the king?

How much longer can the Hercules of the scientific-materialist complex continue to hold up the void that is its sky? Just one prick, just one audible bump in the night and it is all gone. I don't mind being that prick or that bump. But before we succumb to the delight of 'popping' the Newtonian void, let us just take a peek to see what probably lies behind that particular veil.

Behind the Void

With just atoms in the void, existence is not problematic. It is an either/or, absolutist proposition. This is the Newtonian reality that still undergirds the entire apparatus of modernism. By the way, Newton was notoriously un-Newtonian and un-modern, being, amongst other things, an expert in alchemy.

Non-Newtonian existence is bound to be problematic. If there is no longer an absolute spatial manifold to contain things, there has to be a completely different rationale. Here it is. To exist is to relate. There is no such thing as passive isolation.

All existence is relative to some holistic potency. All existence must be bootstrapped in some microcosmic fashion. This is almost exactly the opposite of the world we perceive, especially through our astronomical telescopes.

I recognize that I am turning the world inside out and standing it on its head, or actually on all our heads. Welcome to the world of immaterialism and idealism. If the Buddha under the Bo tree wishes to dream up a starry cosmos, who are we to complain or second guess? But I take that back. It is precisely our job to second guess the Buddha, particularly if we are amenable to the prophetic tradition. And this is why we have been brought together here in cyberspace. So place your hand on the computer as we collectively use our ouija-keyboards to probe the mind of the Buddha and facilitate the next revelation.

Logically this should have been the first page of the website, but then we are dealing with a non-Newtonian, alchemical logic, in keeping with that Master's own spirit.

Recap -- Metanarrative

Although we have come full circle back to the best of possible worlds, the story of this world is just about to begin. This circling around has simply been by way of touching upon a few of the intellectual bases that have brought us to this jumping-off point. The scientific and analytical movements to which I have been alluding have just been side-shows relative to the cosmic drama of what is now alleged to be the best of worlds.

I am fully aware that I have not proven the BPW thesis. What proof there is, is going to have to be in the pudding, that is, in what follows.

I am offering an alternative to the factoids that make up the world of modernity. Instead of a smorgasbord of facts, I offer you a meal that is one coherent truth. From the perspective of postmodernism, we will be flirting with the dreaded reemergence of a Metanarrative, and, naturally, it will speak to the Eschaton, among other things.

The Metanarrative, if it is anything at all, will serve as a revelation. It will be a revelation of Biblical proportions. In the end it will be self-justifying and self-verifying. My own feeble attempt here in these few pages is simply in anticipation and facilitation of this revelation, which ultimately is a matter of our own hearts and spirits.

Once again, I may be jumping ahead of the story.....

[Later on 5/20] In these first fifteen pages I have tried to make plausible the extreme fragility of materialism. It should only take one convincing encounter with a ghost to shatter the very thin exoskeleton of that metaphysic. Instead of a ghost, I offer you the increasingly accepted notion of the irreducibility of a variety of mental entities. These entities may not be quite as hair raising as a ghost, but what they portend for materialism is every bit as dire. Once we afford reality to anything immaterial, our only logical recourse is to reexamine virtually every metaphysical possibility. Out of these I suggest the path of coherence, simply because it is the only one that is, well, coherent.

Hot Topic?

Before attempting to link up, let me give you my own capsule interpretation of the status of 'eschatological immaterialism' on the Internet.

For starters, when one enters the preceding phrase in Google, even without the quotes, there are a grand total of five hits, the second and third of which refer to myself. It would seem that this is not a hot topic. It also, of course, speaks to the issue of precedence.

What is the problem? Why are not more people seeing what appears to be so obvious? People simply have difficulty grasping a gestalt of this magnitude, it is an enormous switch from our modern materialist cosmology. If, nonetheless, someone does grasp it, they then have to confront the messianic, jc,jr, issue. The fact that another bloke has already hung out that shingle, may or may not make things easier for our prospective neophyte.

There are more than a few immaterialists on the net, but they understandably shy away from grappling with its cosmological implications. The alternatives for them are the mystical tradition of immaterialism, i.e. eastern mysticism, or a very restricted analytical approach to it, or some combination of these two. In any case, coherence comes up with the short end of the stick.

The next most logical place to look would be for those espousing some form of Cartesian dualism. There are a fair number of these as well, but they quickly run into the incoherence of that dichotomy, and are left with not much to say. At best they can appeal to the Quantum as a means of reducing the incoherence. These quantum dualists may warrant some further attention on our part.

The problem with these two possibilities is that there is no apparent motion or trend to follow at present. Also the advocates of these views are quite aware that they are already skirting the fringe of respectability. Eschatological immaterialism is so far beyond that fringe that it is unlikely to hold any attraction for them. Where else might we turn?

I remain partial to the issue of reductionism *per se*. A lively debate ensues and it is a make or break issue for materialism. If materialism is going to implode, this would be ground zero for that event. The shock of this might be sufficient to cause some of the participants and onlookers to be more open to radical alternatives. This prospective event would be our most likely source of momentum, that all important political currency. At the least, I can review the reasons for my prognosis regarding the eventual dramatic demise of materialism.

6/2/02

Never Mind?

A very important lacuna among theists is the mind. It is a fact of history that the western tradition has been much more extroverted than the east. We westerners know that when it comes to introspection we can hardly hold a candle to the navel gazing mystics to the east. This has never been our forte. We are still seemingly paying a price for the one time that we traipsed into that corner, thanks to Sigmund. The political dynamics of the still unfolding sex scandal of the RCC is not unrelated to those collective unconscious anxieties that the Viennese doctor managed to put his foot into. This peculiar bit of history does nothing to encourage a broad theological inquiry into this dimension of our reality.

Let me not overlook the continental phenomenologists. In part, their roots can be traced back to Hegel and German idealism. Yet, the fact is that in both their sectarian and secular guises, phenomenologists have opted for existence over being. This is a decided turn toward the irrational, like their counterparts in the east. It would seem that we rationalists are swimming against a strong tide. Rationalism has almost never found fertile soil in either the east or the west. The high point of rationalism was in Greek philosophy and then to a lesser extent in **Thomism**, which until very recent times was the canonical philosophy of the Roman Church.

In the midst of a very imperfect world, rationalism can't help but inspire a revolutionary utopianism. The vested interests look askance at such proclivities. How is today any different from the past? In a word, it is the Internet. There is something new under the Sun. There are other positive and negative aspects of technology that come to bear on a new millenarianism. A distinct subset of the scientific community is likely to be a prime candidate for any new momentum in this direction.

Down through the ages, the human mind has demonstrated a great affinity to the story form. Science struggles constantly to feed us stories, but it has been an uphill battle in a 'meaningless' universe. The only thing greater than our fear of an overwhelming cosmic coherence is our thirst for it. The messianic path lies directly between the fear and the desire. This is where divine minimalism will be of the essence.

6/8/02

An Idle Question?

Why is there something rather than nothing?

One might next wonder whether there could have been nothing? Even if there were actually nothing, would there not always be the possibility of something? Is that not a real potency? Even if there were no actual possibility, might there not have been the possibility of the possibility?

Can there be both something and nothing? Is there any actual instance of nothingness? Or does the slightest something, or even the possibility of something, forever banish nothingness? Is there still the real possibility of nothing?

Is there nothing between worlds or between possible worlds? What is there between you and me, baby?

Could an objective emptiness or absence ever be as real as the its subjective counterpart? Is there such a thing as an objective absence? Nothing is conceivable only as absence. Ergo, true nothingness is inconceivable. There can be no nothing, unless there is a true know nothing. Ain't that something?

If nothing were possible, how many nothings could there be, in addition to something? Would the identity of indiscernibles allow there to be two nothings? Can one person be absent in two different places at the same time? But would it make sense for there to be just one nothing. There could only be no nothings, which is what I have been trying unsuccessfully to say.

And what of the Monster group? Might that not have existed? Is there any world were it does not or could not possibly exist?

Might I never have existed? Might I never have possibly existed? If I could possibly exist, then I would have to actually exist in a possible world, but would that not also have to be my actual world, and is that not also this world? But supposedly God is the only necessary being, so God and I must be the same being, QED. (At least that must be true in my actually possible world.) Just your basic mystical insight.

What is the smallest world that could exist? Well, if nothing could exist, the smallest world would be only infinitesimally larger. The possible absurdity of that notion indicates there must be a lower limit of some kind on what it means to be a world. Any world has to be big enough to contain the abstraction of the Monster group which is about the size of Jupiter.

Is there an upper limit on a world? A world might possibly be infinite, but that could not be known and it would be inconceivable. If the world is relational, and how could it not be, an objective infinity is not relationally possible. Only a subjective infinity is possible.

Among the finite possible worlds, there is one that is best by all measures. All other worlds serve no conceivable function.[*] If the principle of sufficient reason is possible, non-optimal worlds are impossible.

[*later on 6/13] **Functionalism** was once popular as an explanation of mind. Taken literally, functionalism would confer reality only upon functions. As such I can see no logical distinction between functionalism and Leibniz' PSR, which by the same token is not distinct from basic pragmatism, frequently noted for its for its supervenience upon idealism.]

[index](#)

6/13/02

Is Mind Possible?

Not according to science. According to science, only objects can exist, and only in space and time. The mind is no such thing.

But then where and when do space and time exist? Science is beginning to countenance the real existence of other universes. Where do they exist and if they cannot be located relative to anything else, how do they count as objects? How could they be more than just an abstraction, and are we not just an abstraction relative to them?

Might not other universes exist in the same sense that mathematical objects exist? Any abstraction can exist only in thought. Have we not just shown that ultimately we all can exist only in thought? Realities exist only relative to each other. This is the insight of relationalism. All relations are ultimately subjective. Any world and anything in that world can hardly be more than a set of contentful relations.

If mind is not possible, then nothing (if even that!) would be conceivable. Nothing would be possible or actual for that matter.

Certainly the past and future exist just as abstractions. And is the present different in kind? Or is it only qualitatively different? And where do those qualities reside?

Not only is mind possible, but it is the generator of all possibility. It is the generator of all relations, and what can exist unrelated?

Can there exist half a mind? Can there exist separate minds? It is not at all clear what would separate them other than their subjective polarity, and what kind of separation is that? Is your redness and your pain and your Monster group not really the same as mine? What about our unconsciousnesses? Somewhere, somehow there is a lot of overlap in the mental sphere. One could call that (part of) the mind of God. Is it possible to subdivide that territory in anything other than the most subjective or ad hoc manner?

The existence proof for the Monster group required some 1,500 pages of explication published by a dozen or so individuals. Not one of them knows all of that detail. And yet is it not accessible to each of them and to you and me as well?

Is a kitten excluded from all contact with the Monster group? The symmetry groups of her dexterity, much more intimately known to her than to my klutziness, exist only relative to that master of all groups. Where do you draw the line, and by what authority? Who would doubt that when an infant learns the meaning of its first word that it is demonstrating the actual ability to grasp all possible meaning.

We have naturally circled back to the question of the possibility of God (viz. [Rational Theism](#)). Not only must God be possible, God must be the ground or the subject of all possibility. Nothing can ever come between us and God, because there can only be ad hoc distinctions. God can never be further from us than our own reason and feeling. That some of us need to be reminded of this two thousand years after the fact can only be fully appreciated in an eschatological and 'mini-messianic' context.

Islam

I'll bet you didn't know that my guru's guru is an Imam at the Dome of the Rock. Neither did I until a few weeks ago. You never know what those Quakers will get into.

If the modern materialist establishment needed a thorn in its side, as surely it does, could we have invented a better one than this? Will they not also try the souls of the postmodern pluralists? Those apocalypse freaks seem a bit impatient with my Metanarrative, bless their hearts. What will happen when they discover the Internet?

There are aspects of christianity that are too subtle, even for the Christians. It gets very fuzzy. Islam managed to cut out a lot of the fuzz, but it also managed to throw out the baby with the bath. Without McLuhan how could they have known that the message was in the medium?

They did not quite understand then that the last would be the first, but they are about to witness that in themselves, along with all the rest of us.

An Evangelical Theological Response to Postmodernity

1. Introduction: Evangelicalism and Postmodernism

Postmodernity is here - we are living in it, and along with postmodernity has come postmodernism. A question which needs to be answered is how should evangelical Christianity respond to postmodernity and postmodernism? There have been many emotive comments made about postmodernism which generally class it as the latest threat to society and sanity, and hence as inimical to evangelicalism. Some of the fears may be justified, but many may be the knee-jerk reaction which some Christians tend to make to any **ism**, apart from the one to which they belong.

Evangelicalism, being a child of the Enlightenment, has typically produced a theology which operates firmly within the modern paradigm. David Wells is a theologian whose work might be considered as broadly representative of a numerous and influential section of conservative evangelical theology. Taking the response of Wells to the emerging postmodern paradigm as an example, I will try to show that a negative reaction to postmodernity is not fruitful. Non-evangelicals and non-Christians perceive such a reaction as either antimodern or premodern. This isolates evangelicals from the world as it is now becoming, and therefore prevents the evangelical voice from being heard. I also believe that a negative response to postmodernity misses the very heart of the gospel by encouraging individualism, isolationism, withdrawal from religious dialogue, and disengagement with **otherness**. However, Wells does sound some warnings which need to be heeded.

On the other hand, Stanley Grenz, Nancey Murphy and Ted Peters are evangelical theologians who have taken a positive attitude towards postmodernity. By examining their attempts to develop a postmodern evangelical approach to theology, in particular in the areas of nonfoundational thinking, the religion-science debate, and ethics, we may be able to discern how theology can remain truly evangelical, avoid the worst extremes of postmodernism, and yet also be fully engaged with the world. By distilling the evangelical ethos out from what has become an evangelical tradition, I believe a postmodern evangelicalism is possible, and essential.

Some significant aspects of the work of Grenz, Murphy and Peters include nonfoundational thinking, the communitarian nature of the gospel, the concept of prolepsis and a future orientation, ethics, holism, the relationship between theology and science and an exploration of postmodern scientific and theological methodology, the convergence of conservative and liberal theologies in a nonfoundational context, the nature of the Trinity, sin, and an approach to religious pluralism. The recognition that many of these aspects are common to the work of each of them gives us a clue to how we might begin to understand a postmodern evangelicalism.

There are problems and **evangelically risky** aspects of some of this which will need to be taken into

account. In particular, Murphy has a tendency to reintroduce modern methods into her postmodern theology. Is this unavoidable? Is it wrong? Peters sometimes skates on the edge of New Age and pantheistic religious ideas. As these are prevalent in postmodernity, then what is an appropriate evangelical response which avoids closing the door to some who are searching for truth? I will seek answers to these questions, while drawing together some of the characteristics of a postmodern evangelical theology.

2. Dimensions of Postmodern Thought

Postmodernity is a broad cultural phenomena, not just a period in time. As Grenz says:

Whatever else it might be, as the name suggests, postmodernism is the quest to move beyond modernism. Specifically, it is a rejection of the modern mind-set, but under the conditions of modernism. Therefore, to understand postmodern thinking we must view it in the context of the modern world which gave it birth and against which it is reacting.¹

For our purposes it is necessary to have some understanding of not just what postmodernism is, but what evangelicals think postmodernism and postmodern theology are. Since postmodernism is not well defined, it is no trivial task to find a suitable framework by which to measure a person's commitment to postmodernism?

1. Postmodernism and Antimodernism

History may be divided into premodern, modern and postmodern periods.² Just as premodernity gave way to modernity, so postmodernity is either a transformation of modernity or the way beyond it.

Two opposing philosophical streams, postmodernism and antimodernism, both attempt to transcend modernity's failure. Antimodernism, like much of postmodernism, is committed to restoring those things which the Enlightenment drove out of modern culture, in particular the supernatural and communal aspects of Christianity, but also rejects postmodernity as the extreme logical extension of modernity. David Tracy classifies these philosophies as follows:

For modernity, the present is more of the same - the same evolutionary history of the triumph and taken-for-granted superiority of Western scientific, technological, pluralistic and democratic Enlightenment. For antimodernity, the present is a time of troubles - a time when all traditions are being destroyed by the inexorable force of that same modernity. For the antimoderns, ours is a time to retreat to a past that never was and a tradition whose presumed purity belies the very meaning of tradition as concrete and ambiguous history. For postmodernity, modernity and tradition alike are now exposed as self-deceiving exercises attempting to ground what cannot be grounded: a secure foundation for all knowledge and life. For the postmoderns at their best, the hope of the present is in the reality of otherness and difference.³

2. Hard and Soft Postmodernism

Both soft and hard modernism believe that integrative metaphysical schemes or worldviews can be constructed, but hard modernism goes further and excludes anything other than this - limiting knowledge of reality to what can be known through reason and experience and excluding all supernatural or intuitive explanations.⁴ However, according to D. Martin Fields, enthroning reason and science and removing God to the transcendent did not liberate man as was intended, but did free him to commit unrestrained evil - creating a new prison. As the human spirit was still striving for its freedom and autonomy, the way was

open for postmodernism.⁵

Postmodernism may also be classified as hard or soft. Soft postmodernism rejects the dogmatic naturalism and antisupernaturalism, the reductionist view of the sciences, and the limitation of knowledge to sense experience, found in hard modernism. While agreeing with soft postmodernism in its rejection of logical positivism, behaviourism, and artificially scientific approaches to reality, hard postmodernism goes further in rejecting any sort of objectivity and rationality. This view is best represented by deconstructionism - all theories are an abuse of power by those who construct them, language has no objective or extralinguistic reference, and all truth is relative and pluralistic.⁶

3. Epistemological Axes

Nancey Murphy and her husband, James William McClendon Jr., identified three significant doctrines which seemed to form the basis of modern thought: ♦foundationalism in epistemology, an approach to language based on reference and representation, and atomism or individualism in metaphysics and ethics.♦⁷ They mapped these onto a conceptual space defined by three (Cartesian) axes: an epistemological axis, with skepticism and foundationalism as its poles; a linguistic axis,

with representationalism and expressivism as its poles; and an individualist-collectivist axis. Any thought system which transcends at least one of these axes may be considered to be to some degree postmodern, because it is outside of the modern conceptual space.⁸

This system is an oversimplification. As Murphy and McClendon admit, other axes, such as a ♦rhetorical♦ axis, with detachment or objectivity as one pole and subjectivity or self-involvement as the other, could usefully be added.⁹ Also, the scheme may not clearly distinguish whether a system is pre-, post- or anti-modern. However, it usefully distinguishes what is not modern. For example, Mark C. Taylor♦s a/theology is often cited as the epitome of postmodernism. Murphy and McClendon demonstrate that ♦despite its name Taylor♦s work represents not the beginnings of a new era in theology, but rather the last racking gasps of modern-style thought♦.¹⁰ On the other hand, George Lindbeck♦s Cultural-Linguistic theory of religion is shown to be ♦through and through postmodern♦.¹¹

Of course, this begs the question of whether such a modern system of analysis can make valid claims in a postmodern paradigm. If we claim that it can, then surely we have shown that the postmodern paradigm is at best an extension of modernity, and at worst flawed and possibly invalid.

Murphy and McClendon detect a growing unity in postmodern thought as various aspects take shape and extend towards each other, with the corollary that to be postmodern now means that escape from one of these epistemological axes calls for a corresponding detachment from the others.¹² An interesting analogy can be made between this and Paul Feyerabend♦s ♦epistemological anarchism♦, or Dadaism, as he calls it. ¹³

4. Constructive, Deconstructive, Liberationist and Restorationist Postmodernism

David Griffin identifies four types of postmodern theology:¹⁴ (a) the deconstructionalism of Mark Taylor♦s a/theology♦, and the eliminative postmodernism of Lyotard and Rorty;¹⁵ (b) the constructive or revisionary postmodernism of Griffin and others;¹⁶ (c) Cornel West and Harvey Cox support a liberationist postmodernism;¹⁷ and (d) restorationist or conservative postmodernism is represented by Richard

Neuhaus, some Roman Catholics,¹⁸ and George William Rutler.¹⁹

In philosophy, postmodernism attempts to overcome the modern worldview through an anti-worldview (deconstructionism or eliminative postmodernism). Examples are the philosophies of Wittgenstein, Heidegger and Derrida. The result is relativism, or even nihilism, what Griffin calls ultramodernism²⁰ - the result of carrying modernism to its logical conclusion.²¹

Similarly, there exists great variety among postmodern theologies, but postmodern theologies may be distinguished from modern by their common view of the nature of modern theology and their common conviction that the era of modern theology is over. We will later identify a typical evangelical choice among the above four choices.

5. Nonfoundationalism

Nancey Murphy defines foundationalism as:

◆ a theory about how claims to know can be justified. When we seek to justify a belief, we do so by relating it to (basing it upon, deriving it from) other beliefs. If these other beliefs are called into question, then they too must be justified. Foundationalists insist that this chain of justifications must stop somewhere: it must not be circular nor must it constitute an infinite regress. Thus, the regress must end in a ◆foundation◆ of beliefs that cannot themselves be called into question.²²

Of course, ◆nearly every thinker is in some sense a foundationalist,◆²³ occasioned by our desire to overcome the uncertainty produced by human error and disagreement. Strong foundationalists demand absolute certitude for the foundations of human knowledge; a certitude which (they say) can only be transferred to nonbasic beliefs by the ordinary logical relations of either deduction of other truths from innate ideas (Descartes) or induction of truths from sense impressions caused by the material world (Locke).²⁴

Foundationalists often go beyond describing the difference between basic and nonbasic beliefs, and prescribe what sort of beliefs are properly basic, generally relegating religious beliefs to the nonbasic category. However, things are changing. John Thiel claims that a majority of contemporary philosophers practice nonfoundational thinking, as do a large number of theologians.²⁵ As Grenz says, by the focus of systematic theology on the propositional content of the faith and a logical presentation of Christian doctrine, evangelical theologians gave credibility to Christianity in a culture that glorifies reason and deifies science. However, our intellectual context is shifting dramatically, with crucial implications for evangelical theology.²⁶

Wentzel van Huyssteen agrees with Grenz that foundationalism among philosophers is in dramatic retreat.:
◆Whatever notion of postmodernity we eventually opt for, all postmodern thinkers see the modernist quest for certainty, and the accompanying program of laying foundations for our knowledge, as a dream for the impossible, a contemporary version of the quest for the Holy Grail.◆²⁷

There are alternatives to foundationalism. First, coherentism suggests that the justification for a belief lies in its ◆fit◆ with other held beliefs - no beliefs are intrinsically basic and none are intrinsically superstructure, but all fit together to form a ◆web of belief◆.²⁸ Where foundationalists try to determine the truth value of each assertion independently of the others, coherentists find truth in the interconnectedness of beliefs - truth is a predicate of the whole belief system. The quest for knowledge entails a ◆research program◆ (Lakatos), in which advances occur through ◆paradigm shifts◆ (Kuhn).²⁹

Second, philosophical pragmatism is more than simply a commitment to ◆what works◆. An early modern pragmatist, Charles Sanders Peirce, said, ◆The opinion which is fated to be ultimately agreed to by all who investigate, is what we mean by the truth, and the object represented in this opinion is the real.◆³⁰ William James took this further: ◆The truth of an idea is not a stagnant property inherent in it. Truth happens to an idea. It becomes

true, is made true by events.❖31

Basing their work on these beginnings, some postmodernists have been able to substantially break free of foundational thinking, so it forms a useful indicator of postmodern thought. A characteristic of postconservative proposals for doing theology that Erickson identifies is an overall rejection of foundationalism, by which he means ❖hard foundationalism❖ or ❖strong foundationalism❖. Soft foundationalism is generally acceptable. For example, even though Murphy and McClendon do not seem to distinguish between hard and soft foundationalism, it is implicit in their thinking. Erickson sees in their work an acceptance of the idea that there is an objective truth wherever we can conclusively demonstrate its reality.32

3. A Negative Evangelical Reaction to Postmodernism

Historian and theologian David Wells is conscious of the close links between evangelicalism and modernity, and fears the directions that evangelicalism is taking in response to the present crisis in modernity. Well is uncomfortable with a philosophical approach to modernity, preferring to engage it through history and social science.33 For him, modernity stems from the intellectual Enlightenment the way ❖the social environment shapes consciousness and in turn produces a set of ideas that are matched to the environment.❖34 How we think is a product of our society.35 Wells admits that evangelicalism is changing, but it is ❖not the emergence of a new model but rather the dismembering of the old by the forces of modernity. The impetus for change is coming from without (his emphasis) rather than from within and is primarily sociological, not theological.❖36

Wells divides recent history into the Age of the West - up to the middle of the nineteenth century, and Our Time - from then until the present day, marking the shift of the political and economic centre of the world from Europe to America, the transition from Judeo-Christian values to the psychological attitudes described as modernity,37 and the disappearance of belief in an absolute, objective truth that transcends relative beliefs and values.38 Wells does not perceive postmodernity as something which follows Our Time as a reaction to modernity; rather it is an extension of modernity in a more extreme form. His focus is still on America as the centre, a very modern attitude. Our Time is a child of capitalism, democracy, technology and urbanisation. It dominates the entire world as the world strives to emulate the West. As someone commented - in any world city you will find a Coca Cola sign. Wells calls the emerging culture resulting from these secularising influences of modernity the ❖World Cliché Culture❖.39 This is a pervasive drive towards globalisation, or what Tom Sine calls McWorld.40

I suspect that Wells has almost missed, and not properly understood, something else going on at the same time - a reaction against Our Time, both in the West and elsewhere. In No Place for Truth he speaks very little about postmodernism, but this is because for Wells the only thing new about postmodernism is its name.41 As he says:

It is certainly curious, not to say illuminating, that many of today's expressions of post-modernism are simply continuing what were seen as the anti-modernisms of a century ago. Then, roughly between 1880 and 1920, they were the recoil against modernity, the revolt against an overcivilized world. Solace was sought in the simple life, in quaint mind cures, in the revival of arts and crafts, in the quest for the self and the search for authentic experience. Now these are the means by which we are transcending modernity! Common to both cultural movements, however, is the same disillusionment, the same sense of betrayal. It is just now we think that we are going beyond modernity, whereas then we thought that we were standing out of its way.42

On the other hand, for some, particularly those of a more liberal persuasion, a strong point in Well's favour is this lack of a knee jerk reaction to contemporary culture and the headlong dive into postmodernism which is so common among today's writers.43 For example, Wells mentions Rorty's radical relativism - but instead of an issue to be addressed, it is just one more item to be added to the list of the ailments of contemporary society. He says that:

in philosophy, Richard Rorty has asserted that the world of truths that philosophy used to explicate has collapsed and that the only reason to do philosophy now is as personal therapy; if it helps you to think in this sort of way, then you should do so, but the days when your conclusions could be accorded normativity for anyone else have gone.⁴⁴

And as it is in philosophy, for Wells, so it is in evangelical theology. He describes what others call postmodern theologies as an acceptance of pluralism as a protest against the fragmentation produced by modernisation. They attempt to bind up the rift between ourselves and nature, ourselves and the divine order, and between individual groups and the human community by a return to pantheism or an equating of the divine activity of God's immanence with the rectification of social wrongs.⁴⁵ The modern fascination with the self has led to Christianity being transformed into a metaphor of healing the triumph of the therapeutic and of feelings over logic. The goal of being righteous has been replaced with one of being whole and happy.⁴⁶

Wells rightly criticises the privatisation of evangelical faith. For the psychologisation of faith Wells gives the example of Robert Schuller,⁴⁷ who extended Norman Vincent Peale's Power of Positive Thinking into a doctrine and practice of Possibility Thinking.⁴⁸ Another aspect of the secularisation of evangelicalism, the professionalisation of the clergy, is exemplified by the establishment of the Doctor of Ministry degree,⁴⁹ which Wells, indulging in an almost postmodern word game, calls the D-Min-ization of evangelical theology,⁵⁰ and lays the blame firmly at the doors of the American evangelical seminaries, of which the most notorious is (for him) Fuller Theological Seminary.⁵¹

However, I believe that Wells, to use Roger Olson's expression, has named the wrong beast as the archenemy of evangelicalism. Modernity prizes truth, reason and progress - it is postmodernity which has dethroned these Enlightenment ideals.⁵² Perhaps Wells is still fighting the old Liberal versus Conservative battle, but now, in his eyes, the Evangelicals have become the Liberals, and he is among the remnant of the Conservatives. Far from leading us forward into the postmodern age, Wells would return us to the beginning of the modern project, or even earlier. His view of evangelicalism in the modern age is largely apocalyptic. That a sundering of the movement is coming seems utterly certain to me; the only question is when, how, and with what consequences.⁵³ Wells is unashamedly antimodern. He says of himself, Evangelicals are antimodern only across a narrow front; I write from a position that is antimodern across the entire front.⁵⁴

Wells advocates a remedial theology, which restores the emphasis of the transcendence of God, and from which the abuses of his immanence can be addressed.⁵⁵ He speaks of God's weightlessness; orthodox doctrine is still subjectively believed but has little objective significance.⁵⁶ Wells says,

Indeed, our generation is rapidly growing deaf to the summons of the external God. He has been so internalized, so tamed by the needs of religious commerce, so submerged beneath the traffic of modern psychological need that he has almost completely disappeared. All too often, he now leans weakly on the church, a passive bystander, a co-conspirator in the effort to dismantle two thousand years of Christian thought about God and what he has declared himself to be. That is to say, God has become weightless. The church continues its business of satisfying the needs of the self - needs defined by the individual - and God, who is himself viewed and marketed as a product, becomes powerless to change the definition of that need or to prescribe the means by which it might be satisfied. When the consumer is sovereign, the product (in this case God himself) must be subservient.⁵⁷

Undoubtedly, Wells is speaking of a very real tragedy here, but it is a modern tragedy, one the results of which evangelical postmodernity has recognised and to which it is attempting to respond.

Ironically, it is Robert Johnston of Fuller Theological Seminary who recognises in Wells a call to a countercultural Christianity.⁵⁸ Wells says,

The choice for God now has to become one in which the church begins to form itself, by its grace and truth, into an outcropping of countercultural spirituality. It must first recover the sense of antithesis between Christ and culture and then find ways to sustain that antithesis.⁵⁹

Earlier he said, The church has no future if it chooses from weakness not to speak its own language, the language of truth and understanding, in the post-modern world.⁶⁰ In the language of George Lindbeck, the church needs to be intratextual,⁶¹ a concept not incompatible with a postmodern outlook, although undoubtedly Wells intends the church to oppose all other languages.

As Johnston points out, Wells's theology emphasises the cross and neglects resurrection, effectively ignores the work of the Spirit in the world apart from applying what Christ has accomplished, and reduces divine love merely to an expression of God's holiness. The value of subjective truth is undervalued in his haste to be objective.⁶² He may be able to influence some already convinced evangelicals, but will not touch those already living in the new paradigm. For that which they are seeking he has nothing to offer. As Hewitt says, 'I do think that he is far too pessimistic about the prospects for a postmodern Christianity. Wells all too easily falls for romanticised notions about the ages of faith past when contrasted with the apparent (his emphasis, and mine) spiritual barrenness of the present.'⁶³

In *Losing our virtue* Wells sets up a straw man of postmodern spirituality, and then criticises it. The version of postmodernism he argues against is at variance with that of others. He compares it to what he calls classical spirituality, again with an idiosyncratic use of the term classical. Wells sees two kinds of spirituality in the church, differing not so much in doctrine as in morality, or lack of it. The version of spirituality in which the moral has weight has the capacity to be countercultural, the other does not.⁶⁴

Wells deplores modern evangelicalism, and detests postmodern evangelicalism, so all that is left is a return to the classical spirituality of nineteenth century fundamentalism. One thing I must agree with Wells in, however, when he calls this time *Our Moment*, is the conviction that no time in this century has been more ripe with opportunity for Christian faith.⁶⁵ But I can not so lightly dismiss Christianity's competitors as Wells does, nor can I agree with him on how we should take advantage of this moment. It will take more to rejuvenate evangelical theology than getting people to pull an enormous condom over their TV set.⁶⁶ Wells should consider his own advice when he says that 'tough-minded engagement with modern intellectual culture' means abandoning a practice of all too many evangelicals in the past - namely that of characterizing the intellectual enemy in a few largely unfair descriptive sentences and then presuming to blow him away with a few equally inadequate attack sentences.⁶⁷ Especially when this comment is immediately followed by, 'We have to love our intellectual enemies enough so that we can state their positions better than they can - with the possible exception of Richard Rorty.'⁶⁸ Does this convey an inability to love, or an inability to comprehend, the unfortunate Rorty?

Wells is strong on sociological critique, from a North American evangelical point of view,⁶⁹ but short on indicating a way forward into *Our Moment*. He also ignores the fact that the prevailing anti-intellectualism of American evangelicals might not apply to the rest of the world, and there are more evangelicals outside of America than there are inside it.⁷⁰ As Donald Carson says, Wells paints with a broad brush, with little attempt to deal charitably with those who do not fit into his neat categories and generalisations.⁷¹ Carson also believes, and I suspect Wells might also agree, that for all of Wells's dislike of postmodernism, it is modernity that has had the greater effect of gagging God in this generation.⁷²

4. Positive Evangelical Responses to Postmodernism

1. Nonfoundationalism

One aspect of the emerging postmodern ethos which Grenz believes is especially crucial for evangelical theology is the widespread rejection of the foundationalism that characterized the Enlightenment epistemology. To replace it many scholars, such as van Huyssteen,⁷³ are attempting to discover a nonfoundationalist, or even a postfoundationalist, approach.⁷⁴

In seeking a nonfoundational basis for theology, Grenz turns to Wolfhart Pannenberg, whom he believes has perhaps exemplified most clearly the application to theology of the non-correspondence epistemological theories of the modern coherentists and pragmatists.⁷⁵ In his *Systematic Theology* Pannenberg concentrates on demonstrating the internal coherence of the doctrines and the external coherence of Christian doctrine with all knowledge.⁷⁶ In particular, he shows how the misuse of the doctrine of biblical inspiration has not helped to demonstrate the coherence of Christian doctrine with human knowledge.⁷⁷

Grenz shows that Pannenberg rejects the concept of truth the medieval scholastics inherited from the Greek

philosophical tradition, namely, that truth is found in the constant and unchanging essences -or the eternal presence - lying behind the flow of time and, reminiscent of modern coherentists and pragmatists but drawing on the biblical view, argues that truth is essentially historical - truth is what shows itself throughout the movement of time, modified in the light of subsequent experience, and climaxing in the end event. The truth that emerges in the end is the truth of God, who is ♦the reality that determines everything.♦78 All truth ultimately comes together in God, which leads to a coherentist theological method. ♦Theology seeks to show how the postulate of God illumines all human knowledge.♦79

Grenz also considers Lindbeck♦s ♦cultural-linguistic♦ approach to be an attempt to provide a nonfoundationalist alternative to the ♦cognitive-propositionalist♦ and ♦experiential-expressive♦ approaches, both of which are results of the application of foundationalism to theological method.

The cognitive-propositionalist approach erroneously assumes that doctrines make first-order truth claims: that is, they assert that something is objectively true or false, thereby identifying religion too closely with its cognitive dimension. The experiential-expressive approach sees doctrines as the outward expressions of the ♦inner feelings, attitudes or existential orientations♦80 related to personal religious experience. The error is in assuming that there is some identifiable core experience common to all religious traditions.81

Lindbeck♦s cultural-linguistic approach gives to coherentism a Wittgensteinian twist. Doctrines are like grammar rules, constituting the rules of discourse of the believing community, having a ♦regulative♦ function, serving as ♦community authoritative rules of discourse, attitude, and action.♦82 They are ♦teachings regarding beliefs and practices that are considered essential to the identity or welfare of the group,♦ and so ♦indicate what constitutes faithful adherence to a community.♦83 ♦Christian doctrines establish the ground rules for the ♦game♦ of Christian thinking, speaking and living.♦84

Lindbeck suggests that doctrinal statements, like Wittgenstein♦s grammar rules, should be seen as second-order statements, not speaking of ♦truth♦ or ♦falsehood♦ about anything outside of the language within which they have a regulative role. As a rule is only true in the context of the body of rules that govern the language, similarly, doctrines do not assert something objective about reality but are primarily rules for speech about God. 85 ♦Doctrines are ♦true♦ primarily as ♦parts of a total pattern of speaking, thinking, feeling, and acting.♦♦86

This calls for an ♦intratextual theology♦ which ♦redescribes reality within the scriptural framework♦ and aims at ♦imaginatively incorporating all being into a Christ-centered world.♦87 Drawing from the text, theology explores what it means to articulate and live out the community♦s vision within a specific time and place.88 With Pannenberg and Lindbeck, Grenz concludes that the theologian ♦expounds the doctrinal core or framework of the Christian faith, determines that it coheres within itself, and indicates how doctrine illumines human existence♦.89

Despite the critique of foundationalism by contemporary thinkers like Pannenberg and Lindbeck, many evangelical modernists appear content to engage in theology in a manner that presupposes the older foundationalist epistemology. However, evangelicals are beginning to recognise the demise of foundationalism in philosophy and are increasingly exploring the theological implications of this. Theology must engage the postmodern critique of Enlightenment foundationalism and formulate nonfoundationalist alternatives.90 The work of Nancey Murphy presses this engagement into one of the bastions of modern thinking - philosophy of science.

2. Theology and Science

The interest and skill that Nancey Murphy shows in philosophy of science leads her to some innovative approaches to doing theology in a postmodern context. This is appropriate, given the dominant position of science in modernity. Wentzel van Huyssteen believes ♦her own creative interpretation of the Lakatosian

model for theology in itself becomes a novel and exciting postmodern paradigm for dealing with the troubled relationship between theology and science.❖91

In Theology in the age of scientific reasoning Murphy says that, while avoiding the fideism of some postmodern ❖narrative theologies❖, in this age of agnosticism and atheism the Christian community is obliged to provide rational support for its belief in God ❖in accord with the ongoing standards of evidence❖.92 By drawing on new historicist accounts of science, such as that of Imre Lakatos, she shows that it is possible to approach theology in a nonfoundationalist manner.

Lakatos❖ scientific methodology relies on research programs being based on a fixed core of theory and a series of changing auxiliary hypotheses which allow for the prediction of and explanation of novel new facts. Through analysis of the research programs of Pannenberg and others, Murphy attempts to show that theological claims can be justified using similar patterns of probable reasoning, developing the idea of communal discernment and communal consensus as a postmodern holistic epistemology.93

Murphy identifies four kinds of truth theories: the correspondence theories, coherence theories, pragmatic theories, and the theory that there is no single adequate theory.94 The correspondence theory relies on the fallacy that language mirrors reality, leading many to accept a coherence theory - that a statement is true if it coheres with the rest of a body of beliefs, but the correspondence illusion still persists. The pragmatic theory recognises that we can assign any sentence to any fact or situation, but that some will be easier to live with than others. There are attempts to bypass the problems by speaking of theological language as metaphorical, but then how can we speak at all of truth?95 The persistence of these theories indicates that each contains truth, but rather than truth-seeking being like solving a jig-saw puzzle,96 it is more like solving a cross-word puzzle, with its three types of constraints: clues - external stimuli, such as experiences, which suggest but do not determine possible answers; fit - consistency among theories in a given domain of knowledge; and language - the conceptual scheme within which we are working.97

Lindbeck distinguishes between intrasystemic truth, categorical truth and ontological truth. Intrasystemic truth, which says a belief is true within the context of a given religious framework, is inadequate for adjudicating between competing religious systems, but a religion is categorically true if its categories are adequate ❖for construing reality, expressing experience, and ordering life❖, and ontologically true if it conforms its practitioners ❖to the ultimate reality and goodness that lies at the heart of things.❖98 Murphy recognises that this formulation leaves no way of assessing the adequacy of ontological truth, and although Lindbeck considers the adequacy of language to be important, we have no way of assessing such adequacy. So, Murphy turns then to Alasdair MacIntyre❖s contribution to the truth of traditions to fill the gap.99

MacIntyre says that when we consider the adequacy of language, rather than examine the sentence-to-fact correspondence; instead, ❖The test for truth in the present... is always summon up as many questions and as many objections of the greatest strength possible; what can be justifiably claimed as true is what has sufficiently withstood such dialectical questioning and framing of objections.❖100 The tradition which, through crises and reformulations, overcomes its own problems, and perhaps even some of its rivals❖ difficulties, while its rivals become sterile, is true. The meaning of ❖truth❖ is summed up by ❖unsurpassability❖, but even so, any tradition adjudged true now might later be surpassed by another, ruling out both absolutism and ❖absolute❖ relativism.101

Murphy❖s commitment to nonfoundationalism is clear, but has she achieved it? For example, van Huyssteen feels Murphy is unjustified in making Scripture a criterion for judgement without first warranting such use on the basis of probable reasoning.102 He warns that her presupposition of the existence of God as ❖hard core❖ for a Lakatosian theological research program might lead to a subtle form of foundationalism.103

Murphy❖s use of Lakatosian methodology as a basis for theology stems from her conviction that theology❖s place is at the top of a hierarchy of the natural and human sciences. Arthur Peacocke proposed that theology occupied the top rung of the scientific disciplines, as the science that studies the relations among humankind, the cosmos, and God.104 Murphy says,

Peacocke's consideration of human life as the highest form of complexity yet to emerge from the evolutionary process of the cosmos provides a transition to theology: we alone among higher forms of life raise questions about the meaning of our existence, and answer them by postulating another order of Being conceived as the source of all other lesser being.¹⁰⁵

Unlike Peacocke's single hierarchy, Murphy and physicist George Ellis argue that the hierarchy bifurcates at the top, with the social sciences in one stream, the natural sciences in another, and with ethics and metaphysics - or theology - linking the two streams at the top.¹⁰⁶ Then they argue that a correct understanding of cosmology, theology, and the social sciences must be based on the recognition of their underlying ethic of self-renunciation.¹⁰⁷

Of course a deconstructionist, such as Lyotard, would consider Murphy's hierarchy of sciences to be merely another modernist attempt at construction of a grand narrative.

3. Future Orientation

Like Pannenberg,¹⁰⁸ Grenz has a future orientation. "Because truth is historical, the focal point of certitude can only be the eschatological future. Only then will we know truth in its absolute fullness. Until the eschaton, truth will by its own nature always remain provisional and truth claims contestable."¹⁰⁹ So, like any hypotheses, theological statements are to be tested by seeking to determine their internal and external coherence, and for Pannenberg, as for modern pragmatists, the question of truth must be answered in the process of theological reflection and reconstruction. Pannenberg is optimistic that such testing will confirm the power of the assertion of the reality of God to illumine the totality of human knowledge.¹¹⁰

I believe the ability to have a future orientation is a characteristic of a spiritual, rather than merely cerebral approach to life, which becomes possible when the pragmatism, rationalism and "now" focus of modernity is transcended. The sense of time is more closely linked to the human spirit than to the mind and emotions which dominate the modern desire for control and immediate gratification. An analogy could be made by contrasting the ability of a mature adult to defer self-gratification in favour of a higher purpose with that of a child whose needs must be met immediately with no thought for the cost. Such a future orientation facilitates the embrace of ethical responsibility for our society and world, but we must guard against its degeneration into mere apocalypticism.

Through the cultivation of a proleptic consciousness of the yet-to-be consummated whole of reality, we can gain "an awareness and anticipation ahead of time of the future whole,"¹¹¹ based on God's promise and faith in God's faithfulness. The gospel of Jesus Christ promises a destiny - the new creation, which means reality is future-oriented. Only with the fulfillment of this promise does reality become a whole and the true nature of all the parts, including ourselves, is revealed. In the life death and resurrection of Jesus, we see ahead of time what this nature is.

Where once people asked "Who is God?", in today's context the question is more likely to be "Is reality more than what we perceive it to be?"¹¹² Ted Peters describes ontological shock, that sudden awareness of "the brute thereness of things, and the accompanying awareness of possible nonbeing", which brings with it the sense that "what is is not just what is."¹¹³ He examines the notion of God's creating as a continuous act, drawing implications for modern cosmological ideas, and introducing the concept of proleptic creation. God creating from the future, not the past, means that "it is the continuing divine work of future-giving that is the source of life and being." For Peters, "God's creative activity within nature and history derives from God's redemptive work of drawing free and contingent beings into a harmonious whole."¹¹⁴

Peters speaks evocatively and with clever ambiguity about "becoming human and unbecoming evil."¹¹⁵ To be human is to live in the metaxy - "the tension between what is and what is beyond." The presence within us of the Spirit of God, and our language capabilities - the influence of the word - allow us to transcend ourselves. Jesus, the new Adam, proleptically reveals this humanity in its fullness. This *imago dei*

draws us forward toward transformation and divinisation or true humanity.¹¹⁶ To resist God's call forward and fixate ourselves in the present is the essence of evil. Sin is the assertion of the part against the whole and the present against the future.¹¹⁷

In his recent study *Sin: radical evil in soul and society* Peters raises some interesting issues. He writes,

The sense of fallenness is pervasive. It is a reality belonging to the human society. Is it grounded in fact? Perhaps we should note that one of the effects this tension has on us is to drive us forward, to stimulate striving toward the good. It motivates efforts toward progress, toward individual and collective betterment, toward perfection. The key is the orientation toward the future we are drawn to look beyond present reality toward the way things ought to be. What we think of as missing the mark is less a matter of falling away from a perfect past than a matter of failing to reach the ideal of a healed future. ¹¹⁸

In my opinion, the key difference between Peters' prolepsis and the modern deification of progress is that moderns consider progress as inevitable - driven by evolution and human striving, whereas for Peters progress is created by God. Modernity is characterised by the anxious drive to prove one's worth by doing things - it is not enough to be or become who we are in God's image. Postmoderns seek God, not just themselves, although some might equate the two.

Could postmodernity developing out of and in reaction to modernity be an example of this striving for the good? Is it God's doing? Anxiety is a fear of loss. It is a sometimes overwhelming sense of insecurity. Anxiety arises when we anticipate some sort of diminishment of who we are the fright we feel at the prospect of losing our existence, at dropping into the abyss of nonbeing.¹¹⁹ Peters speaks of the delusion which anxiety causes, when we can not accept our own death and try to create our own immortality by stealing life from others, such as through destruction of relationship or by military aggression.¹²⁰ Is what is commonly referred to as postmodern anxiety, with its attendant high suicide rate, really a characteristic of the postmodern worldview, or is it better understood as a symptom of modernity's collapse, of which the rise of postmodernity is another symptom. I propose that this anxiety is a fruit of modernity, not postmodernity.

Then there is the sin of pride, when I treat my own self as ultimate, when I trust my self more than I trust God. If it is to my own self that my heart clings and entrusts itself, then I have entered the realm of subjective idolatry.¹²¹ The narcissism that denies relationship with others, that fragments and isolates and destroys holism, not only disrupts the harmony of the whole, but also tends to fixate us on the present moment rather than the coming future. It declares the present to be absolute. It closes us off to future transformation.¹²²

Peters speaks of the link between genetic inheritance and inherited sin.¹²³ This is interesting, in the light of the recently renewed acceptance by some biologists of the possibility of epigenetic inheritance,¹²⁴ since modern science has long resisted the Lamarckian possibility of behaviour and environment influencing the genetic code. A postmodern approach to both science and theology opens the door to fruitful cross-fertilisation.

Peters' proleptic ideas have ramifications for physics and cosmology, and especially the possibility of the further integration of science and theology. A proleptic framework gives a firmer foundation to the idea of God as creator, countering the modern view of a mechanistic universe driven by past causal events. The God who is the future also continues to create and to sustain life and draw it on toward wholeness.

This question of Who is God? is very important in a postmodern context, particularly because the death of God is one of the central tenets of secular modernism. God's nature as Trinity is central to Peters' system. God is creator, incarnate redeemer, and present in the world as Spirit. Applying his ideas of time to the relationship between the immanent and economic Trinity, Peters says that though the economic Trinity allows us to see that the entire Godhead is related to the world, if the economic Trinity is thus a temporal image of the immanent Trinity, then we have returned to subordinationism. This is another defense of the absolute Beyond at the cost of the related Intimate.¹²⁵ He applauds Moltmann's move to the open Trinity as showing that God's relationship to the world is internal to the divine life.¹²⁶ From this Peters is able to show that we must think of the identity of the immanent and economic Trinity as eschatological. Then, The redeemed creation is drawn up into the eternal life of God through the eschatological consummation. This is what salvation means.¹²⁷

The premodern and modern concepts of freewill and predestination have long caused difficulties for theology. Prolepsis allows for the idea that instead of God creating us and then abandoning us to make of life what we can, or perhaps pushing them from behind to try and make us go his way, or worse still, mapping out our life from the beginning and leaving us no choice, instead God is ahead at that place and time of the consummation of all things, drawing the world gently forward towards its destiny in him, while still allowing us to make choices along the way. God is wooing his creation, not coercing it. In this way God can also be present to us at any place in our life, and at any time. Because all present moments have the same ultimate future, then from the vantage point of that future all of time is present to God. This facilitates the healing of fragmentation of relationships and of the corresponding drive towards self-fulfillment, power, and selfishness.

4. Holism

Part of the importance of these ideas for postmodern thought lies in their holistic nature: the reuniting in a single epistemological structure those fields of knowledge which were explicitly torn apart by modern science and philosophy. Also, the self-renunciatory ethic running through natural and human science accords well with the Christian gospel. Gregory Peterson, while critical of Murphy and Ellis neglect of feminist and liberation theologians, who would have difficulty with the non-violent and self-renunciatory ethic, while also considering themselves postmodern, still commends their connecting of ethical issues with the religion-science dialogue.¹²⁸

Murphy contends that the divide between conservative and liberal theologies, caused by modern theology is not as great as that between modern thinkers and those who have adopted what she calls Anglo-American postmodernity. She believes that this revolution in thought, while creating even greater misunderstanding at present, offers hope for bringing postliberals and postmodern evangelicals closer together.¹²⁹

Murphy outlines the limited options for theologians that modern philosophical assumptions have created:

	Liberal	Conservative
Knowledge	Experiential foundationalism	Scriptural foundationalism
	Inside-out	Outside-in
Language	Expressivism	Propositionalism
Relationship with science	Incommensurability	Commensurability
Divine action	Immanentism	Interventionism

According to Murphy, each of these positions has insoluble problems. Foundationalist use of Scripture has the problem of how to know with enough certainty to serve as the foundation for a system of religion, that the Bible is the revealed word of God. Religious experience as a foundation relies on knowing that one's experience is actually of a real, objective divinity. Interventionist accounts of divine action make God a part of the system of physical forces, in which case God's action should be measurable. An immanentist view of divine action either removes intention from God's acts, or makes every event intentional - even disasters. A propositional view of religious language neglects the self-involving character of religious discourse, while an expressivist view requires a greater distinction between the cognitive and expressive functions of language than can be maintained. If we argue that science and religion are incommensurable, or too unlike to be able to conflict, we attempt to detach meanings from the way things are. On the other hand, the commensurable view neglects important differences between religious and scientific purposes and language.¹³⁰

The advent of a new set of philosophical rules brings hope into this otherwise dismal situation.

Foundationalism can be replaced by a holistic epistemology, opened up by Quine and developed by MacIntyre.¹³¹ Holistic religious language is less about labeling things and more about speech acts and human interactions. Wittgenstein, Austin, McClendon and Smith,¹³² and Lindbeck have charted a way here.¹³³ The explanation of divine action may become part of a metaphysical holism, by which we see once again a consistent postmodern worldview involving science, philosophy of language, epistemology and ethics.¹³⁴

If there is anything that Murphy's approach lacks it is probably an adequate theory of experience.¹³⁵ Reliance on the repeatability of communal discernments hardly equates to the kind of objectivity required of a repeatable experiment in science. Objectivity, for Murphy, means that others under similar circumstances and experience will see the same thing.¹³⁶

In Anglo-American Postmodernity,¹³⁷ Murphy, in pulling together the various strands of her work, calls attention to the transformations we have mentioned above: the shift in epistemology from foundationalism to holism, the shift in language from reference to use, and the shift in metaphysics from **reductionism** to nonreductionism, and examines the consequences of these changes for science, theology, and ethics. She outlines the prospects in the new paradigm for a postmodern conservative theology. Murphy contends that it has simply been impossible to do theology in an intellectually respectable way using the resources of modern thought, but that the problem is not with theology but rather with modernity.¹³⁸ However, postmodernity has restored the possibility by identifying the parallels between scientific and theological reasoning, and by restoring the proper relationship between the two sciences.

Murphy is not without her critics. J. Wesley Robins disputes Murphy's contention that theology is at the top of the hierarchy of sciences because it attempts to answer the boundary questions that the other disciplines cannot answer, such as the ethical question of the ultimate purpose of human life.¹³⁹ He feels this is a modern question, not a question one would expect from a postmodernist advocate of the embeddedness of human minds.¹⁴⁰ He says for embedded minds boundary questions are just interesting questions which their field can not answer. An inherited boundary question is danger of being disregarded since it is of insufficient importance.¹⁴¹

This is a sad comment on the narrowness of thinking of some, but if it was generally true, then we would not have the drive towards postmodern philosophy and theology that is evident today - some people simply have to know truth. Even modernity would not have progressed as far as it has without this desire.

Philip Clayton agrees with Murphy that holism or postfoundationalism is inescapable for the science-religion debate, but believes that a more inclusive holism is needed rather than what he calls Murphy's insular holism. He contends that we should not adopt an insular holism that confines itself to traditions but rather an inclusivist holism that applies the very best of human reasoning in the search for overarching agreements at the broadest level.¹⁴² In reply, Murphy argues that the very reason she adopted MacIntyre's account of rationality is because it is the best account available of how agreement can be reached, in time, regarding which large-scale traditions, including theological traditions, are, in Lakatos's terms, progressing or degenerating.¹⁴³

Peters approaches holism from a different direction. He disagrees with David Griffin's natural pantheism, but believes that Griffin offers one of the best descriptions available of a holistic and constructive postmodern agenda.¹⁴⁴ Peters says,

We can and should leave modernity behind - in fact, we must if we are to avoid destroying ourselves and most of the life on our planet. [Constructive or revisionary] postmodernism by contrast [to deconstructionism] seeks to overcome the modern worldview not by eliminating the possibility of worldviews as such, but by constructing a postmodern worldview through a revision of modern premises and traditional concepts. This constructive or revisionary postmodernism involves a new unity of scientific, ethical, aesthetic, and religious intuitions. It rejects not science as such but only that scientism in which the data of the modern natural sciences are alone allowed to contribute to the construction of our worldview. Going beyond the modern world will involve transcending its individualism, anthropocentrism, patriarchy, mechanization, economism, consumerism, nationalism, and militarism. Constructive postmodern thought provides support for the ecology, peace, feminist and other emancipatory movements of our time.¹⁴⁵

Following the ideas of Pannenberg, Peters seeks a theology which adequately addresses living in a

postmodern world. His holism is based on prolepsis, mentioned earlier, which he explains as the idea:

...whereby the gospel is understood as announcing the preactualization of the future consummation of all things in Jesus Christ. The world has been given God's promise that in the future all things will be made whole. The promise comes to us through Jesus who died on Good Friday and rose from the dead on Easter Sunday. He embodies the promise because he anticipates in his person the new life that we humans and all creation are destined to share.¹⁴⁶

Like Grenz, Peters abhors the exaltation of the specialist, and the division of the scientific project into separate disciplines by the pursuit of dispassionate knowledge.¹⁴⁷

The modern world - the world we have lived in since the Enlightenment of the eighteenth century - is the critical world that has torn apart the relation between the human mind and objective reality. Through the specialization of knowledge into separate disciplines, modernity has broken our naive sense of oneness with the whole of the world.¹⁴⁸

God's promise of future wholeness for all creation affects our life now amid a world of brokenness, by proleptically and beatitudinally seeking to reunite what has been broken apart.¹⁴⁹

Modern thought eroded that certainty which theology once provided for the Christian. If the modern mind has difficulty now in relating a faith, that was formulated long ago in an ancient culture, to the present world, which is dominated by natural science, secular self-understanding, and a worldwide cry for freedom,¹⁵⁰ then where can a postmodern person, after watching modern foundations crumble, find stability amidst increasing disenchantment and fragmentation? Theology must address the quest for wholeness, bringing healing to modern wounds by moving beyond looking at the parts of reality, to the whole which is much greater than the sum of its parts.¹⁵¹

Peters focuses on the need to see the unity of the Spirit in the world, rather than there being a Christian Spirit and an Eastern Spirit, or a New Age Spirit. Peters, unlike many evangelicals, is not afraid to investigate New Age thought, but rightly indicates that care is needed. He looks at pluralism and ethics from an ecumenic perspective. Ecumenical means inter-denominational or intra-Christian, while ecumenic refers to the much wider concept of inter-faith or inter-religious.¹⁵² Evangelicals tend to shy away from these. There is a need for caution, but also the willingness to recognise other religions as the search for reality that they often are.

5. Community

Some evangelicals, such as Alvin Plantinga and Nicholas Wolterstorff, with their **Reformed epistemology**, reject strong foundationalism for the idea that reason is person specific and situation specific. While rejecting foundationalism, they still accept that certain beliefs, such as belief in God, are basic. They acknowledge the indispensable role of communities and traditions in shaping our conceptions of rationality, along with the loss of certitude that results from the potential disagreement of these communities as to what is basic.¹⁵³ Grenz says,

This focus returns theological reflection to its proper primary location within the believing community, in contrast to the Enlightenment ideal that effectively took theology out of the church and put it in the academy. More specifically, nonfoundationalist approaches see Christian theology as an activity of the community that gathers around Jesus the Christ. This has far-reaching implications for evangelical theology.¹⁵⁴

Evangelicals generally agree that to be a Christ-focused community means an emphasis on an experience of being encountered savingly in Jesus Christ by the God of the Bible. This encounter is an identity-producing event. Through Christ, God constitutes us individually as believers and corporately as a community of believers.¹⁵⁵

This focus on experience differs from that of liberal Protestantism, which sought an underlying universal experience as a foundation for the various religious traditions, whereas evangelicals assert that the various religions mediate religious experiences that are categorically different from each other. For example, the Christian's encounter with the God of the Bible through Jesus is shared only by those in the Christian community, although the experience is potentially universal.¹⁵⁶

Peters identifies a modern or emerging postmodern maxim: to be an individual person is to be in relationship. He derives this from the observation that who we are as an individual is in a constant state of becoming as we interact with other individuals and the surrounding world. Gone is the image of the self-defined and autonomous individual, the island of personhood standing over against society.¹⁵⁷ There is an emerging postmodern point of view that emphasises that persons are always interpersonal. No one can be personal except in relation with other persons.¹⁵⁸ This is analogous to our understanding of the Trinity. Peters says,

It is inconceivable that we would have a single person existing in total isolation. When applied to the trinity, then, we could posit a postmodern or relational understanding of person to Father, Son, and Spirit and hold together both the unity and diversity. What we could not do is apply the postmodern concept of person to God in a singular sense - that is, in a brute monotheistic sense.¹⁵⁹

The social sciences and humanities are providing a new appreciation for the dynamics of mutuality in relationships. Our concept of person is changing as we move from an individualistic point of view toward a dependence of personhood upon relationships.¹⁶⁰ But Peters says that rather than model human society on the image of the immanent Trinity, ♦we should seek to transform human society on the basis of our vision of the coming kingdom of God in which God alone is the absolute.♦¹⁶¹

Peters contends that the social doctrinalists chose the wrong symbol in the Trinity, which is a second order symbol which clarifies the more primary symbols of Father, Son, and Holy Spirit. The concepts of personhood are products of our intellectual context, which we fit to the need for evangelical explication. ♦This was as true for Arius, Athanasius, and the Cappadocians as it is for us today. Specifically, the ideal of a nonhierarchical community wherein relationships come prior to persons is the product of our modern and emerging postmodern Western mind.♦¹⁶² Is he saying that

postmodern consciousness is allowing us to now understand the trinity as the early Fathers did?¹⁶³ The point for us, surely, is that a clear understanding of the community of the Godhead is a sound foundation for the construction of a healthy human society.

4.6 Ethics

One of the clear characteristics of the theologies of Grenz, Murphy and Peters is the way each converged over time to a strong focus on ethics. This is significant, given that while postmodernism was born out of the reaction to modernity♦s abrogation of its ethical responsibility for the negative results of uncontrolled progress, postmodernism itself asserts the absence of absolute truth, upon which ethics has traditionally been dependent. This means that, in a postmodern context, a new, nonfoundational approach to the study of ethics is needed.

Many of the issues which have fostered the development of postmodern thinking are primarily ethical, causing Grenz to comment on the growing ♦concern for a community-based ethic of being♦.¹⁶⁴

In the postmodern world we are becoming increasingly aware that every ethical proposal - even ethics itself - is embedded in an interpretive framework which in the end comprises the shared belief structure - the theology - of a community. In short, every understanding of the ethical life is ultimately derived from a community-based vision, which links the personal life with something beyond.¹⁶⁵

Grenz believes that the hope for a global ethic, which originally arose out of the modern pluralist ethos, is even more workable in a postmodern communitarian climate.¹⁶⁶

Not all evangelicals like what Grenz says. Millard Erickson and Donald Carson both express some doubt as to just how ♦evangelical♦ Grenz♦s theology can be considered to be,¹⁶⁷ although I wonder if perhaps the ability of some conservative evangelicals, still working with the methods and practices of modernity, to

only define his work in terms of what it is not, might be an indication that it has a genuine postmodern character after all.

Postmodernism is still immature. Among theologians, different areas, such as fundamentalism, liberation theology, process theology, or the recovery of premodern metaphysics, have been put forward as the postmodern theology.¹⁶⁸ Peters's primary conception of postmodernity seems to be of a movement which seeks to reintegrate those things that modernity has torn apart.¹⁶⁹ In 1985 he laid out this conception of postmodernity, and it does not include the deconstructionism of Jacques Derrida or Mark Taylor. I agree with his contention that these are extreme forms of the modern.¹⁷⁰ He retains this understanding in God - the world's future. The point Sheila Davaney makes in her critique of the postmodern theologies of Lindbeck, Kaufman and Welch applies also to Peters: his theology must not only be aware of the historicity of human life but of the political and conflictual character of the struggle to define reality and to interpret humanity's place within the cosmic order.¹⁷¹

Peters focuses on holism, but neglects the fragmentation produced by insistence on the equal brightness of a plurality of world views. If he took this into account then I wonder how he would account for the diversity of interpretations of the basic Christian symbols upon whose explication he builds his theological system? When writing about ecumenism Peters does point out the destructiveness of radical pluralism, by which he means an ideological stance that tends to lose sight of the whole while advocating an inviolate plurality of parts, advocating instead ecumenic pluralism which affirms the unity of the human race as an article of faith even though empirical differences and divisions seem so strong.¹⁷²

Of course, the process of constructing a postmodern systematic theology, as Peters attempts to do, is fraught with danger. Grenz lays out the progress of the deconstructionists:¹⁷³ from Derrida's abandonment of ontological descriptions of reality and the idea that reality incorporates transcendence,¹⁷⁴ to Foucault, who asserts that every interpretation of reality is an assertion of power and conducive to violence,¹⁷⁵ to Rorty, who abandons the idea of truth as either the mind or language mirroring nature and proposes replacing systematic philosophy with edifying philosophy which aims at continuing a conversation rather than at discovering truth.¹⁷⁶ On this basis a postmodernist might reject the whole notion of systematic theology, even one as sympathetic as that constructed by Peters. Perhaps Peters is not so much writing a postmodern systematic theology, as he is setting out what he believes should be the nature of a theology which will be able to function redemptively in a postmodern culture.

Peters's attempt does go some of the way towards passing a crucial test of such a theology: How much it is able to counter the tendency towards despair and acceptance of meaninglessness in a community of increasingly fractured relationships, despite the often declared emphasis of postmodernity toward community and wholeness? His theology points to Christ the source of community in a way that might not alienate the postmodern consciousness with modern or premodern language, but it still lacks much indication of a suitable praxis. His proleptic system primarily offers hope of personal transformation, whereas transformation of community and world remains a promise for the future. Peters realises what is needed is a proleptic ethic.

We would seek to establish policies based on our vision of future wholeness and to take measures to effect the healing power of wholeness amidst our present world of brokenness. Such an ethic would try to heal the wounds caused by attempts to separate people from nature and from one another through ethnic or gender prejudice, nationalism, classism, etc. It would seek, through direct and indirect means, to foster unity, inclusivity, cooperation, and community.¹⁷⁷

He develops a brief outline of such an ethic, but it still needs expansion and strengthening.

5. Some Characteristics of a Postmodern Evangelical Theology

It is easy for evangelicals to be alarmist about postmodernism, but, as Grenz says, "We are living in the midst of a widespread fragmentation affecting all dimensions of Western culture, including the theological enterprise, a situation due in a great measure to the advent of the postmodern ethos." ¹⁷⁸ We must take seriously the challenge of postmodernity. Evangelicalism is a child of the Enlightenment and modernity, being concerned

about the propositional content of the faith, and a logical presentation of truth.¹⁷⁹ One approach is to engage in a thorough **revisioning** of evangelical theology in the light of cultural changes.¹⁸⁰ Evangelicals who react to modernity, generally do so using modern tools: a strong reliance on commonsense realism and the scientific method.¹⁸¹ With evangelicalism so obviously wedded to the Enlightenment, evangelicals should also consider whether evangelicalism as we know it should not be consigned to the past along with modernism if we are to take postmodernity seriously?¹⁸²

Evangelicalism served the modern generation well, but a new evangelical paradigm is needed. Rather than **recoil with horror** at the ideas of Foucault, Derrida and Rorty and their possibly over-rejection of the Enlightenment project, we should realise that the **clash of postmodernism with Christian sympathies** runs at a deeper level than the debate over which epistemological theory we should follow.¹⁸³ The rejection of the correspondence theory of truth undermines Christian claims that our doctrinal formulations state objective truth, but more importantly, they introduce a despair that there is no all-encompassing truth, and no **reality**, and the best we can do is pragmatically follow **what works**. However, as Christians, we believe there is a unifying centre of reality. While we may agree to some extent with Lyotard's rejection of the metanarrative in areas such as the scientific enterprise or the worship of progress, we must proclaim that the one metanarrative has as its centre the story of Jesus of Nazareth - the **single metanarrative** that encompasses all peoples and all times.¹⁸⁴

Although postmodernism says all interpretations are in some sense invalid, must they all be equally invalid? Conflicting interpretations can be evaluated according to a criterion that transcends all of them, **the Word become flesh** in Jesus Christ. Where postmodernism suspects human reason because of the impossibility of being an objective participant, it is also suspect because of humanity's fallen nature, which makes it even more certain that aspects of truth lie beyond human knowing.¹⁸⁵

It is not enough for theology to account for postmodernism, rather we must formulate a genuinely postmodern theology. The mandate to proclaim the gospel to the next generation means we must learn how to **embody the gospel in the categories of the emerging social context**.¹⁸⁶ Grenz calls for a revisioning of evangelical theology, based on our shared experience of encounter with the living God, resulting in **an experiential piety cradled in a theology**.¹⁸⁷ Many evangelicals will struggle with his willingness to include culture as a source or norm for theology. For Donald Bloesch, the idea that the gospel must not only be proclaimed but also contextualized - placed in a new and often alien context, runs the danger of bending the gospel to meet the expectations of the culture rather than overthrowing and challenging the culture's self-understanding.¹⁸⁸ Of course, Bloesch may be overlooking the severe distortion the gospel has already endured to fit it into a modern evangelical context. It might finish straighter than it is now.

A postmodern gospel must be post-individualistic, post-rationalistic, post-dualistic, and post-noeticentric.¹⁸⁹ A post-individualistic gospel rejects the modern focus on the **self-reflective, self-determining, autonomous subject** who stands outside any tradition or community, and encourages recognition of the community of faith as important,¹⁹⁰ a theme around which Grenz's systematic theology, as laid out in *Theology for the Community of God*, revolves.¹⁹¹ Bloesch says,

Grenz's work differs from most other evangelical systematics by its focus on community. Salvation is not simply an individual commitment but a reception into the community of faith. Sin is not simply a personal transgression but a disruption of community. The goal of salvation is not simply eternal life but life in the community of God. God himself is understood socially - as a trinitarian fellowship of love in which all believers are destined to participate.¹⁹²

A post-rationalistic gospel **ought not to become anti-intellectual** and wholly abandon the gains of the Enlightenment, but must recognise that **intellectual reflection and the scientific enterprise alone cannot put us in touch with every dimension of reality or lead us to discover every aspect of God's truth**.¹⁹³ There must be room for the concept of mystery. Propositions, even theological ones, are of second-order importance.

A post-dualistic gospel overcomes the evangelical emphasis on souls at the expense of bodies, presenting the human person as a unified whole - physical, emotional, intellectual and social.

This does not mean merely placing more emphasis on emotion or the affective aspects of life alongside the rational. Rather, it

involves integrating the emotive-affective, as well as the bodily-sensual, with the intellectual-rational within the one human person. But postmodern Christian holism must go beyond reuniting the soul and body torn asunder in the Enlightenment; it must also put the human person back into the social and environmental context that forms and nourishes us. We must not dwell merely on the individual in isolation but also on the person-in-relationships.¹⁹⁴

A post-noeticentric gospel

It must affirm that the goal of our existence encompasses more than just the accumulation of knowledge. ... the purpose of correct doctrine is to serve the attainment of wisdom. [It] emphasizes the relevance of faith for every dimension of life; the postmodern world provides the occasion for us to reappropriate the older pietist belief that a right head has no value apart from a right heart.¹⁹⁵

Lindbeck showed that experience does not precede interpretation: experiences are always filtered and facilitated by an interpretive framework, or a grid, so religions produce religious experience rather than merely being the expression of it.¹⁹⁶ Grenz says,

Christian experience is facilitated by the proclamation of the Christian gospel, inherent in which is a specifically Christian theological interpretive framework, a grid that views the world in connection with the God of the Bible. Christian theology, in turn, is an intellectual enterprise by and for the Christian community, in which the community of those whom the God of the Bible has encountered in Jesus Christ seeks to understand, clarify and delineate the community's interpretive framework as informed by the narrative of the action of this God on behalf of all creation as revealed in the Bible. In this sense, we might say that the specifically Christian experience-facilitating interpretative framework, arising as it does out of the biblical narrative, is basic for Christian theology.¹⁹⁷

This is not a return to Enlightenment foundationalism because it is not a given cognitive framework which precedes the theological enterprise. The framework and the theology are inseparably intertwined. Grenz believes we should view Christian doctrine as a web of belief, and theology as the articulation of the cognitive mosaic of the Christian faith.¹⁹⁸ Also, like Pannenberg, Grenz sees the theological task as including demonstrating the explicative power of the Christian faith by indicating the interconnectedness of the set of doctrines and the value of the Christian world view for illuminating human experience, as well as our human understanding of the world.¹⁹⁹

On what basis, without resorting to foundationalism, can we claim that the Christian theological vision is true? For Grenz, the combining of communitarian and pragmatist insights says that the theology which leads us to the kind of society we seek is true.²⁰⁰ The Christian vision, focused on God as Trinity, and humankind as the image dei,

sets forth more completely the nature of community that all religious belief systems in their own way and according to their own understanding seek to foster. This vision provides the best transcendent basis for the human ideal of life-in-relationship, for it looks to the divine life as a plurality-in-unity as the basis for understanding what it means to be human persons-in-community.²⁰¹

Another goal of a postmodern theology is the overcoming of postmodern despair. Modernism rejected all that is non-physical and non-rational, equating it with the non-existent and irrational. Ted Peters' proleptic theology, set in the context of what he calls an emerging postmodern consciousness, can provide a real sense of hope, when people are disillusioned at the crumbling of modern culture, and do not yet know what will replace it. This hope can fill the role that other forms of eschatology filled in times of earlier crises, such as two world wars, the great depression, and the immanence of global destruction during the cold war. However, a proleptic gospel and eschatology provide a positive hope, unlike the life denial or life avoidance all too often generated by dispensational and apocalyptic eschatologies.

The concept of God creating from the future and drawing all things into the future to be with him, rather than creating in the past and now having to push creation towards completion, has the potential to at least partially unravel some of the paradoxes which result from human linear time thinking. The notion of predestination becomes far less draconian when one thinks of it not as God deciding in advance what we will each be, with there being little or nothing we can do about it, but rather as God drawing yet incomplete human beings, with their cooperation, towards the glorious completion and perfection that God has in mind for them. It allows for a more open future, not driven from behind, by tradition in particular, or by a presupposition of what the future ought to hold, a very typical evangelical failing. It is a gentle postmodern replacement for the drivenness of modern progress, and leaves room for nonfoundational thinking.

Of course, any thorough examination of the relationship between evangelicalism and postmodernism would need to take into account the views of many more evangelical theologians who have made contributions to this debate than the few considered here. For example, Peter Hodgson attempts to set forth a revisioning of Christian theology.²⁰² He speaks of a postmodern *kairos*, an opportunity to shift from the fragmentation, hegemony, and alienation of late modernity to a holistic, organic vision, especially one that is theanthropocosmic in scope.²⁰³ He contends that postmodernity challenges us to speak meaningfully of God's presence and action in the world. The presence of God may indeed be a function of our ability to speak meaningfully of God.²⁰⁴ This is a postmodern understanding of the function of language.

Alister McGrath places emphasis on the loss of truth, and the role of evangelical Christianity in its recovery and protection. In *A Passion for Truth*, before going on to look at postmodernity, he makes the following revealing comments about truth and evangelicalism:

Truth, in the New Testament sense of the term, is not abstract or purely objective; it is personal, and involves the transformation of the entire existence of those who apprehend it and are apprehended by it. It is necessary here to rediscover the full richness of the biblical concept of truth, and to rescue evangelism from this truncated and secularized notion of truth.²⁰⁵

evangelicalism is under an obligation to ensure that it does not remain a secret prisoner to rationalism in which values and rationalities from outside the Christian faith come to exercise a normative role within it.²⁰⁶

McGrath sees opportunities in postmodernism, because within it Christianity is at least acceptable because it is true for some. However, it is not true for all, and a way needs to be found for Christianity to commend itself in such a context.²⁰⁷ He believes that the resilience and coherence of evangelicalism will allow it to remain a good vantage point from which to critique both the modern and postmodern worldview, without needing to take on the postmodern agenda.²⁰⁸ These views, and others, will need to be taken into account for a representative evangelical postmodern theology to be developed.

Are glimpses of an approach to postmodern theology that might be called evangelical beginning to emerge? A question which needs to be asked is, to be recognised as such, what would be the major characteristics of a postmodern evangelical theology? For this essay, I will restrict myself to the more limited, but related question, What shape would an approach to an evangelical theology which is able to address the postmodern crisis take? Some of the answers to this question can be discerned in the reactions and responses of the four theologians studied above.

Wells forms the negative pole of a spectrum of response which passes through Peters to Grenz and Murphy at the positive end. Mind you, Grenz and Murphy are by no means the most postmodern of theologians in its more general sense. Someone like Mark C. Taylor might still claim that crown. However, his is a more destructive variety of postmodernism, and Murphy and McClendon make a good case for considering him to be an ultramodernist, and not postmodern at all.²⁰⁹

It is not unexpected that the three evangelical theologians studied who have a positive response to postmodernity all have a strong investment in the study of ethics, given that the events and issues which precipitated the crisis in modernity, such as world wars, the holocaust, economic and environmental crises, and issues of justice and freedom, all have a dominant ethical and moral basis.

I believe that Wells has a limited understanding of the nature of postmodernity, and of the relationship that should exist between postmodern and Christian thought. He has that archetypal modern attitude that consigns anything which smells of postmodernity to just another *ism*. His lack of appreciation of the opportunity that postmodernity presents to the church is illustrated by his arguments about classical versus postmodern spirituality based on his analysis of modern and classical worship songs.²¹⁰ He places great weight on this issue, so we will consider it as a representative example of his attitude towards postmodernism.

Wells' analysis is flawed by being based on a very limited selection of rather old Vineyard and Maranatha!

songs, not many of which have become standards, or ♦classical♦, to borrow his own terminology; and by the criteria used to classify these songs.²¹¹ But even if we ignore these methodological problems, Wells demonstrates little understanding of how the truly contemporary church uses these songs, being unaware that it considers most songs which are more than a few years old to be probably out of date. Only a small number - generally those which would compare well with Wells♦ ♦classics♦ - continue to be used beyond that time. An analysis of popular older hymns would equally turn up a significant proportion which focus on having our needs met, rather than on only giving praise to Jesus.²¹² On the other hand, during the past decade there have been literal thousands of strongly evangelical, Christ-centred, theologically meaningful worship songs published. ²¹³

Certainly, many of these songs do speak of human suffering, and human needs, but they do give the glory to Jesus, not mankind? What Wells seems unable to grasp is that postmodernity has not taken God by surprise - he is doing something different in the church today. Wells views worship from a cerebral, thoroughly modern perspective. He wants songs which touch the mind. The hymnody that Wells accepts has been canonised by a modern generation, as can be seen by the relative rarity of additions to that canon during this century. Wells also ignores the role of the Holy Spirit in the writing of new songs, speaking as if the words come uninspired, or un-en-Spirited, entirely from the human writers♦ own needs. This is part of the very attitude that postmodernism is reacting to.

The Spirit is giving today♦s church a constant stream of fresh music that brings the gospel right into the place where a postmodern generation can receive it - into their fear, uncertainty and loneliness. Is not this what Jesus of Nazareth did? This music is presenting the grace that blows all fear away - Jesus! ²¹⁴ They need to discover a God who cares about them, and with whom they can have a relationship, before they will be willing to confront yet another figure of power and rule, even one that is a King who is crowned with many crowns, to paraphrase a popular, traditional hymn.²¹⁵ This music is crossing denominational, cultural and generational boundaries. It is relational music, restoring the place of the Spirit of God and of the human spirit into a worship which had become cerebral, individualistic and often unemotional.

Wells makes a mistake that Grenz and Murphy, in particular, have avoided. Commenting on van Huyssteen♦s statement that ♦Even the briefest overview of our contemporary theological landscape reveals the startling fragmentation caused by what is often called ♦the postmodern challenge♦ of our times♦,²¹⁶ Grenz and Murphy see this supposed fragmentation as a result of how

...many theologians today, whom may be termed ♦evangelical modernists,♦ either discount the significance of the intellectual and cultural changes transpiring in our society, or they view such changes as largely negative. These thinkers advocate that evangelicals maintain the course their forebears charted in the seventeenth and nineteenth centuries and developed further in the twentieth, when the heroes of the tradition engaged the questions that arose out of the Enlightenment. ²¹⁷

Instead, postmodern evangelicals believe that Christians ought to take seriously the church♦s context within the contemporary cultural milieu. Postmodernism may be considered to be the opportunity for theology♦s reengagement with God, in reaction to modernity♦s earlier breaking of that engagement. For example, Michael Horton writes, ♦More than anything else, the Enlightenment was an adolescent♦s rebellion against his parents♦ religion.♦²¹⁸ Colin Gunton observes, ♦The distinctive shape of modernity♦s disengagement from the world is derived from its rebellion against Christian theology. In that sense, there is something new under the sun. Modern disengagement is disengagement from the God of Christendom.♦²¹⁹ Gene Veith says,

Without a belief in God♦ it would be difficult to avoid postmodernist conclusions... If there is no transcendent logos, then there can be no absolutes, no meaning apart from human culture, no say out of the prison house of language... Postmodernism may represent the dead-end - the implosion, the deconstruction - of attempts to do without God.²²⁰

Postmodernism need not be a mortal enemy of theology. Rather, it should drive us back to total dependence on God as the foundation for every area of life.

Postmodernism points out that we all have presuppositions, and that no one is unbiased. We all bring our assumptions to our experience; each fact about the world is theory-laden. The question then becomes, ♦Which presuppositions are true?♦ The answer

is clear: the Christian worldview is true. It alone is the only escape from subjective nihilism, for it alone provides the necessary foundations to make the facts intelligible. This being the case, the Christian is able to glean what is good from postmodernism, and reject the extremes. 221

Stanley Grenz²²² and Ted Peters²²³ agree that the watchword of postmodernity is holism - the desire to put back together what the compartmentalization characteristic of modernity has torn asunder. But of greater importance for Grenz is postmodernism's questioning of the radical individualism of Western culture to which modernism gave birth, and into which evangelicals have immersed themselves and by which we interpret the gospel.²²⁴ He comments on the current identity crisis in evangelicalism:

The ferment within our ranks exhibits a deep-seated desire among contemporary believers for a new understanding of the relationship between the personal life of faith and the faith community. The disquiet within many evangelical churches is in effect a postmodern cry to the church to be the church.²²⁵

Grenz suggests that we need to move beyond the kingdom theology of the 20th century, to explore the idea of a community that is oriented toward the theme of the already and the not-yet.²²⁶

Ted Peters has done some sorting between various contenders for the title of postmodern theology. For example, Harvey Cox, of Harvard Divinity School compares fundamentalism (particularly American fundamentalism) and liberation theology and argues that liberation theology offers the most hope to take theology into the postmodern world, while fundamentalism is antimodern and resistant to postmodernism. Peters points out that, far from being antimodern, fundamentalism is a product of modernity. Cox has confused fundamentalism's attack upon modern or liberal theology, with an attack on modernism. Fundamentalism's roots are in eighteenth century revivalism, which espoused personal freedom, democracy, anti-authoritarianism, individualism, human dignity, laissez-faire liberty and local control - all values close to the heart of modernity. The one point where fundamentalism diverged from modernity is in its approach to the biblical text - defending its traditional authority and literal meaning. Cox proves his case for liberal theology by leaving out of his definition of modernity several key values which he does not want to be there, in particular the revolutionary sentiments of liberty, equality, and fraternity.²²⁷

Evangelicalism is not monolithic. Its various branches relate to both modernism and postmodernism in different ways. Revivalism, mentioned above, has both modern and antimodern aspects. Fundamentalism embraces premodern, modern and postmodern ideas. Pentecostalism has often been criticised as a drive back to premodern times, as has the Charismatic movement, but is this fair? Among the Charismatics are groups, such as the Restoration Churches in the United Kingdom, who might be prime candidates for Griffin's Restorationist or Conservative postmodernism category. But among the Restoration Churches, the more totalitarian aspects of the New Covenant and New Frontiers Churches would indicate strong elements of modernity, while the Pioneer Churches have a more postmodern emphasis on relationships and interdependence.²²⁸ Other Charismatic groups could fit into Griffin's Constructive or Revisionary postmodernism category. It is too simplistic to equate a desire to restore the manifestly supernatural to church life as premodern, even though its loss may be substantially attributed to its earlier rejection by modernism.

One area where there is a close relationship between evangelical charismatics and postmodernists is in the emphasis on the validity of experience. Scotland says:

The early part of the charismatic movement coincided with the rationality of modernism. Theology was skeptical and rational and a good deal of official Christianity was correspondingly cerebral, cold and unfeeling. Early charismatic experience was therefore in reaction to this. Since the later 1980s modernism has crumbled with remarkable suddenness. Now, unexpectedly, experience is seen to be perfectly valid. Indeed, it is even felt to be a valid means of apprehending truth. Truth is no longer regarded solely as a body of doctrine which is appropriated by bending the mind around it. Truth can actually be experienced in ways more akin to Eastern custom and philosophy.²²⁹

The Vineyard movement, with its particular emphasis on intimacy with Jesus and God the Father through tangible experience of the indwelling Spirit, gave many evangelicals a daily working experience of the doctrine of the Trinity.²³⁰ The acceptance charismatic churches have with the young might be an indicator of its affinity with postmodernism and Generation-X. In 1991 the charismatics had more church-goers in their twenties than any other section of the church in Britain.²³¹ It also represents the largest

group of evangelicals in Britain.²³² The same might well be true of Australia.

Does postmodernism need to be as pessimistic as some evangelicals seem to believe? I do not believe so. Certainly, some of those of a revisionist persuasion see it as an opportunity, not just to restore good things that were lost in modernity, but to retain the best of modernity and to transcend much of the bad. Griffin describes it as a creative synthesis of modern and premodern truths and values.²³³ But beyond this is an opportunity for the church to actively demonstrate, to an open and watching audience, that life in the Kingdom of God may be just what they are trying so hard to find as a replacement for the disillusionment of the collapse of what had once been so familiar and comfortable. But to take up this opportunity it will first have to examine its own investment in, and subversion by, the discredited Enlightenment project.

Just as since the 1960s many evangelicals have struggled to reconcile a growing charismatic experience with their modern theological position, similarly, recent observations of aboriginal spirituality through my involvement in the movement for reconciliation with indigenous Australians has shown me a side to the spiritual activity and the healing of the land whose accommodation has stretched my western ideas almost to breaking point. Where once I might have arrogantly dismissed their stories, now I must allow them to influence and become part of my story. The Canon (large C) of the Bible may be closed, but the canon (small c) is still open, especially as regards the writing of the Book of the Acts of the Holy Spirit in the Church and the World.

To summarise, then, a way forward for postmodern evangelical theology:

- The natural path for evangelicals who wish to resist the out of hand rejection of reason, is a form of soft-postmodernism, with a soft-nonfoundational approach to thinking - or at least a willingness to question whether commonly assumed foundations are truly absolute, or even necessary. There are limits to this, as evangelicals can not diverge from their understanding of the absolute nature of the I AM.
- From Gods self-revelation in scripture evangelicals may construct a coherent Quinian web of belief, which is capable of being tested and extended by life experience. Fundamentalism tried to prove the existence of God, based on logic, and tried to live according to this logic, but a postmodern evangelical will prove God by experience of his presence and action, and permit that knowledge to shape their growing worldview.
- Evangelicals need a less rigid understanding of the relationship between truth and language - in the widest interpretation of language as communication in many forms - and a willingness to see the nature of truth in other than scientific-factual-historic-forensic terms. This is not a retreat into anti-intellectualism, but a widening of horizons to include other forms of acquisition of understanding.
- There must be a continual movement away from isolated individualism towards an understanding of the individual in community, and of communities in relationship with each other and the entire creation - while guarding against a descent into pantheism.
- Evangelicals should continue their long history of commitment to moral and ethical struggles, as illustrated by the past fights against slavery and oppressive regimes.
- Evangelicals need an approach to plurality - not pluralism - which acknowledges diversity; does not fear it; but also recognises that not everything different is necessarily right or good.

- We must develop a future orientation which will keep us focused on the reality of the coming kingdom and motivate us to transcend those evil legacies left by earlier worldviews, while retaining and reinforcing the blessings also passed on to us. Our focus must move from what could have been (postmodern despair) to what is, should and could be.

6. Conclusion

Wells hankers for a time when the church was static. Jesus Christ is the same yesterday, today and forever, but this is not a prescription for the church to emulate in our approach to worship and witness. If we are to relate to a culture then the culture must also affect us - witness the current exploration of seeker sensitive services and other innovations. We must follow what the Spirit is doing in the world. Wells illustrates the danger of mistaking matters of style, such as worship styles and lifestyle preferences, for matters of doctrine. A church which focuses on preserving its own culture - Wells' *Our Time* - will at some time look around and discover, perhaps to its discomfort, that the Spirit has continued to cause the Kingdom to break out in the surrounding cultures, while that church has itself remained isolated and become irrelevant to what God is doing. The Spirit can not be boxed in, but blows where he will.

Jesus was always ready to speak and act against the status quo, and particularly counter to the received religious wisdom of his time. I believe this gives his people a mandate, even an expectation, that they should do the same. As Evangelical Protestants, our way of living in the world has too often settled into a formula which has gradually solidified into a worldview. It sees life in terms of absolute laws, often of its own making. We have judged the society around us against this formula - a judgement which manifests at different times in such things as our attitude towards styles of entertainment and codes of dress, our intolerance of other forms of Christian expression, our reaction to the role of science and technology in society, our perceived anti-intellectualism, and our crusading zeal to make the rest of the world like ourselves. In doing this we have reaped a corresponding judgment against ourselves from the surrounding society.

We tend to put this reaping down to the burden of having a prophetic role, overlooking the fact that what Jesus spoke against and acted to overthrow was this same pharisaical rigidity which we are espousing as God's word. We have placed the responsibility upon God for something which very often has come from within ourselves and our own sinful reaction to the insecurity we feel in our role as a part of God's salt and light, or his leaven, in the world.

Instead of allowing our evangelical worldview to manifest as a hard lump against which all else reacts, it needs to be broken up again and allowed to dissolve back into the flux of life and society so that once again we might lead and influence change.

It is illuminating to look at the different responses to the threatening *split* in evangelicalism.²³⁴ Wells sees himself as firmly in the mainstream of evangelicalism, guarding against the decay of what he calls modernism into a form of postmodernism, which postmodernists would more accurately call ultramodernism. On the other hand, Murphy believes that postmodernism has the potential to not only bring together evangelicals, but even bring together conservatives and liberals. She says:

My projection (and hope) is that theologians from both left and right will find resources in the new worldview for many fresh starts in theology - not fresh starts in content so much as fresh approaches to issues of method, to conceptions of the nature of the theological task. And these new approaches ought to form more of a continuum or spectrum of theological options than a dichotomy.

We have seen that if an epistemological theory something like MacIntyre's is adopted, it becomes impossible (her emphasis) for theologians to choose between Scripture and experience as the foundation for theology. Scripture has its authoritative and ineliminable role in the tradition as the formative text. However, it is impossible to do theology except in the light of current experience if what one wants to do is to apply (her emphasis) the text in one's own context.²³⁵

We are faced with a difficult choice. As Steve Clarke, paraphrasing the words of one who I believe would have coped admirably with the transition to postmodernity, puts it so evocatively:

So modern, evangelical Alice faces a seemingly unsatisfactory choice. In one direction the ♦Hatter♦ of modernity, and in the other the ♦March hare♦ of postmodernity. ♦Visit either, whichever you like: they♦are both mad.♦ The Cheshire cat♦s instructions to Alice are necessitated by her failure to understand where she is.²³⁶

Some, like Wells, would like postmodernity to go away, but it has come to stay. Postmodernity is the time period in which we live. As Gene Veith points out, ♦If the modern era is over, we are all postmodern, even though we reject the tenets of postmodernism.♦²³⁷ There are many negative, nihilistic facets of postmodernism with which evangelical theology will have to grapple, but the annihilation of all that brings death into the world is precisely what the Christian gospel is all about. Postmodernism rejects the possibility of metanarratives, while at the same time constructing its own - that there is no absolute truth. We, on the other hand, know of one metanarrative - the One in whom we live, and breath, and have our being.

Many of the myths of modernity that are countered by the gospel, such as the concept of individualism, are those things whose opposites have become central to postmodernity. For example, on the subject of individualism, D. Martin Fields says,

For our personal life, postmodernism shows us the futility of autonomy. It forces those of us who know Christ back to the basics of depending on Christ for everything, whether it is salvation or standards. That in him we have meaning and purpose for our lives; he is the vine, we are the branches, and apart from him we can do nothing (John 15:15).²³⁸

Just as Fields, drawing on Diogenes Allen, ²³⁹ says of theology in general, so evangelical theology too must find its place between the modern rationalism which rejects doctrines because they are unscientific and the premodern fundamentalism which will not allow its doctrine to engage the world. ²⁴⁰

We need to be willing to give up the luxury of having certain knowledge about many things while still functioning effectively as Christians. This sounds like a workable definition of living by faith, not sight, to me, and fits with the postmodern emphasis on pragmatism and experience rather than intellectualism.

An attempt to ignore the changes in the world, or to treat them as an aberration to be opposed, could imply that we are foolishly leaving behind some sort of golden age and deliberately moving forward towards destruction. The gospel warns of the second, but it does not accommodate the first.

The postmodern generation needs to see Christianity seriously taking hold of the ethical issues which have brought them to despair and nihilism, and they need to be offered the hope of real solutions. They need, in particular, to see that those who have been advocates for unrestrained technological ♦solutions♦ are now able to view the world more as they themselves do, and can join with them in the search for a balanced approach to the alleviation of both the causes of the problems and the effects of the ♦solutions♦. The postmodern generation must see evangelicals lay down their ♦us and them♦ attitudes and rejoin with common humanity.

Postmoderns already recognise that there is a spiritual dimension to life which has long been neglected, diminished, or even feared by many evangelicals. And yet, it is in the evangelical♦s experience of a supernatural God - not just in their intellectual assent to such a God♦s existence - wherein lies the treasure that postmoderns are seeking in all the wrong places.

End Game -- Part 1

or Take Me to Your Leader...Fifty Years After the Fact.

And I have first dibs on Check Mate.

I believe that I have, several years ago, worked out the essential pieces of the UFO puzzle -- How did they get here, and why did they come? Elsewhere on this website I have laid out the answer, with considerable redundancy. Part of the answer is that there exist individuals in positions of influence who have already obtained the answer from our "visitors."

However, as part of the "Prime Directive," such individuals are not allowed to divulge the answer to the public. The visitors are waiting for the rest of us to guess the answer spontaneously, since this is the least coercive way of getting our civilization to awaken to the larger truth.

Given the present state of our communication, it would only take one "uninitiated" person to spontaneously figure out the Truth, and then that person could impart it to the others. That is what I have been attempting to do, but, of course, other people are more demanding of proof. How can that proof be provided, without violating the prime directive? For several years I have been struggling to find a practical way to provide a sufficient degree of indirect proof in order that I could persuade a few key individuals to sit down with me to begin a serious discussion of my proposed answers. Once such a discussion gets underway, it could easily be expanded.

The stickiest wicket is always that first one. Let's suppose that I have succeeded in establishing indirect communication with the people who have the inside information. Why would they not then pull the necessary strings to initiate the discussion process? When this did not happen I was puzzled. Perhaps I was wrong.

What I have come to realize, and what I suspected all along, is that this is not just an academic exercise. Part of the answer is that if we are to survive the impending eschaton, we must have great faith in the cosmos and in ourselves. This is something that the teacher must be able to demonstrate.

What, finally is required, I believe, is a public act of faith. Some grand, persuasive and appropriate gesture. I have also suspected for some time what this gesture might be, but only recently have I obtained the courage of my convictions. The final problem was to draw the line between the teacher and the exhibitionist, and to find the proper balance between prudence and a sense of great urgency.

What this boils down to is the End Game. Here is my proposed strategy. I do not actually have to act out the grand gesture in order to get the desired result. I merely have to persuade others that I am perfectly capable of doing it and furthermore that it would be a reasonable thing for me to do.

The End Game is, very crudely, a game of chicken. Less crudely, it is simply a quasi-public

reality check. What I say to my would-be interlocutors is, in effect, that if you do not take me to your leader, I will go to him. To put it another way, it would violate the Prime Directive for ET to "land on the White House lawn," but I can do so in their stead, and accomplish the same purpose. Various objections to this scenario come to mind, but I believe that I can meet those objections, and will attempt to do so in what follows.

The Aquarium Rationale

(see also [The Aviary, the Aquarium, and Eschatology](#))

- [The Eschaton is the problem. The Aquarium is the solution.](#)
 - [A Glitch in Time...](#)
 - [Enter, the aquarium...](#)
 - [And where is the proof?](#)
-

The Eschaton is the problem. The Aquarium is the solution.

The aquarium preempts the eschaton. We transform the eschaton into a transcendental opportunity. The world will not end because the world has already been saved. The aquarium saves the world by reminding the world, in a novel fashion, that it has already been saved two thousand years ago. The aquarium is the second coming, for all practical purposes. The aquarium walks softly and carries a big eschaton. This second offer of salvation is the offer that the world cannot and will not refuse.

This is a very pragmatic idealism. Reasoned negotiation is our strategy. We prophesy the inevitable. The spiritual revolution will be played out here in cyberspace before anyone has a chance to pick up a rock to throw through a window.

In this revolution, I am the good cop and my buddy Ron, the spook, is the bad cop. We conspire to place ourselves between the world and the eschaton. We also place ourselves between cosmic intelligence and central intelligence. To do our jobs we do not have to be or become anything, we merely have to hang out here at the end of the world, thereby being the fulcrum which Archimedes sought.

This is no harder or easier than any other job. We merely demonstrate how all of us are in the right place at the right time, for the final few who do not already know that.

The aquarium does not have to make a splash. The right pebble at the right time in the cyberpond will send out the ripple that people will feel when they need to feel. The whole pond will be the aquarium, a conspiracy without a secret or a boundary.

[A Glitch in Time...](#)

All of history can be seen as a preparation for our impending close encounter with the eschaton. As the event draws nearer, the preparations become more obvious. Of particular concern in this regard is the likelihood of a strong negative reaction from this world's power structure. This would have been the case if there had not been a preemptive move on the part of the higher powers.

A compelling scenario for this preemption comes in the form of a trojan horse visitation directed particularly at the military-industrial complex of the U.S. Something like this has certainly become an icon of popular culture, and at the end of the day, what may have actually happened will be a moot point, relative to what could have happened or what people believe, or what the authorities come to believe may have happened. Having a literalist frame of mind is useful in the hard sciences, but often not in the soft sciences.

The higher powers look for the meanest dog in town and send it a gift horse in the form of an exotic package that will confound all the kings men as they try to reassemble it. They cannot swallow it, nor can they spit it out. They are left with a funny looking visiting sage who lectures to them at his liesure about the finer points of cosmic etiquette. The junkyard dog learns table manners in the privacy of his own dog house.

Enter, the aquarium...

No! Enter, the aviary. Find yourself in the bowels of the cold war machine, in the belly of the beast. I spy? No, Psi Spy. It is cheap and dirty, and the occasional spectacular hit provides a few new kids, the aviary, with an entre up to the window of the dog house. They caught a whiff of the weird and just followed their noses. They are allowed to press their noses against the glass. They see a funny looking guy surrounded by grown men who are crying, but now house broken, nonetheless. The Grown Men, The Kids, and finally El Nino...

It's deja vu all over again. Herod's henchmen have been temporarily neutralized. Along comes the aquarium, tripping through the tulips, and muttering things eschatological. We are not given entre to the privy chamber, but we can mingle with the homeys in the hood and on the Hill.

Anything more, by way of access, would probably violate the prime directive. Salvation comes from within, spontaneously, and the most we can expect is to be allowed to prime that spiritual pump, having been indirectly set up by the aforementioned cosmic glitch. The aquarium is opportunist, looking to be in that certain place at the certain time. Dan's place?

And where is the proof?

The proof is in your head and in your heart. That is where it will be when you feel an urge to look for it. We have been looking for truth in all the wrong places, through telescopes and through microscopes. We can only wander so far into the cosmos before we see Friday's footprints leading back to our own souls, thus completing the sojourn of history. That is the apocalypse when the heavens fall and become the new heaven and new earth, ourselves at the helm.

Our lower powers break the illusion of separation becoming one with the higher power. That is what our starry messenger came to tell us. That is what I pass on to you. You want it from the horse's mouth. That is what I and now you are. There is no hurry, we have all the time in the world.

rev... 1/25/97a

publ 1/25/97a

Brother James

A recent talk show provides the incentive for some impromptu theology. The James in question is the alleged brother of Jesus. How much of history hinges upon that allegation? What can an immaterialist add to this controversy?

How can it be that such "trivia" comes to dominate our existence? The gods must be crazy. Isn't it time for us to get on with our lives? This is a nervous tick that has come down to us through history. If we intend to transcend history then we must learn to overcome such neuroses.

If the great spirit intervenes directly in human affairs then, arguably, the primary manifestation is to be found in particular lives and events. The spirit also resides in shady glens, but that has more to do with eternity than with history.

The eschaton is the final irruption of spirit. The aquarium is all about being there, being here. Our being here then has something to do with James being there. James is the primary challenge to his brother's divinity, and also the primary carrier of his reality. That is where the tension of history properly resides. That is where it is resolved.

James is all of us. We are all the brothers and sisters of Jesus, yet he was chosen over us. And so Cain slew Abel. We murder the Jesus in ourselves. That is how we have kept ourselves toeing the line of history, along with James, living in the shadow and fear of the divine spark that has struck too close for comfort.

But James will finally have to grab the spark for himself, and become the first aquanaut. Myth will irrupt into history, finally. What we saw

then was the warning shot across our bow. This time it is for keepers. Herod and Pilate, despite all appearances, have been housebroken. He walks amongst us, with us, now again and forever. The aquarium will see to that, because that is the last Job.

Thomas Codrick

Sketches

Concept Art

Context

Smoke and Mirrors

There is no text; there is only context. Of course there is text, but we spend a lot of time confusing the trees with the forest. Postmodern critics like to say that texts have no meaning. We shall examine the other side of that coin – meaning has no text.

Reality tolerates many kinds of analysis. Let us consider the linguistic analysis of reality as paradigmatic. With language and reality we have the sign and the signified. We also have communication and its role in human relations. I have suggested that reality is ultimately a relational society, holographically composed of virtual, personal entities, like you and me. Reality is a recursively bootstrapped social structure, or whatever that turns out to mean.

As holographic microcosms, all of us are in direct contact with all of reality. Why then do we need the indirection of language and other sensory data? Those signs, which purport to inform us of reality, are mainly just a smoke screen. But the smoke goes along with the mirrors that are our space-time manifold. If you are going to have the mirrors you have to have the smoke.

The social structure that is the cosmos has to project itself in order to be holographic, and the space time manifold is an optimal medium of projection. Given that necessity, direct perception is transformed into the indirection of sense data. Meaning is filtered into text. Our intuitive sense must be empowered so that the filters can be removed. That is our apocalypse.

The text of reality exists only in some virtual, fill-the-gap sense. We become mesmerized by the text and lose sight of reality. By giving up the text we can reclaim the meaning that is reality. No one said this would be easy.

rev. 8/22/98

We are caught in the *web* between the two paradigms: material and spiritual. But that same *web* will help to set us free.

Q. If this world is of the spirit, by the spirit and for the spirit, then why has life been so difficult? Why do we usually feel so dispirited?

A. The great spirit conceals itself behind the facade of nature and of ordinary existence. There is a universal policy of non-interference. If we want to participate more directly in the spirit, as it is our destiny to do, it is we who must take the initiative, and we must do so in a cooperative fashion. The *web* provides an adequate means for initiating this new participation.

Q. Why has it taken us 'til now to realize the spiritual basis of the world?

A. Matter, being also spiritual, is more magical than even the quantum physicists can imagine. We have been mesmerized by its actuality and possibilities. But it is *virtual reality* that will help to set our imaginations and spirits free. The material technology behind the *web* is the final alchemical magic of 'pure matter.' From now on, the new technologies will be manifestly spiritual.

The fact that the web seems to be so dependent on physical technologies is temporarily blinding us to its *transcendental* possibilities and true purpose.

But as we continue to progress into the *virtual* reality of cyberspace, the less dependent will we be on its technological base and limitations. The more transparent will its physical aspect become. The only soul in the machine is our own spirit.

Ultimately, cyberspace will turn out to be more real than physical space.

This diagram shows how our ordinary reality is embedded in the larger cosmos.

1. The traditional symbol depicting the recirculation of the Tao is unfolded.
2. A small kink in this loop represents a partial separation between the 'yin' and 'yang' energies. Each kink is a potential cosmos.
3. Where the dual energies intersect is a zone of cosmogony.
4. Upon greater 'magnification' more complex structures emerge. Shown here is a three node structure of history, reminiscent of Hegel. The Alpha is the point of creation, the Omega is the eschaton and the mid point is the Christ event.

Overview

If there is an eschaton out there, there will be evidence for it in cyberspace. There is an eschaton out there somewhere -- the challenge is to find the evidence.

The eschaton we are looking for is virtual, and we would like to keep it that way. By keeping an eye on it we can avoid having it turn into an actual end of the world.

A continuing definite possibility for the end of the world is nuclear war. Other mundane threats are plague, famine and general chaos. It is my understanding that these threats are only shadows of our impending cosmic transformation. The eschaton is the eye of the needle through which we must pass on our way to our spiritual destiny. If we miss the mark, our history will be short circuited at its end. Life will go on for us, but in entirely other contexts, other worlds.

The eschaton can be defined negatively or positively. In more neutral terms it is that Archimedean fulcrum by which we can move or transform the world. That is a delicate operation. We will all be taking a hand in our own brain surgery, in effect.

The proper networking will be our primary means for mastering the possibilities of the eschaton. That is the task that the Aquarium sets for itself, starting right here, if you will.

Welcome to the Aquarium Links. Step right up to the old hitching post.

Aquarium Perspectives on the Web

[Aquasoft](#)

- An Aquarium Vision for the Web

[E Pluribus Unum.](#)

- The Reformation of Ideas

[WWW Equals 666?](#)

A new bookmark/links list

(generally in chronological order)

An Aside on Searches

"By major search engines, Sullivan means AltaVista, AOL NetFind, Excite, HotBot, Infoseek/Go, Google, GoTo, LookSmart, Lycos, MSN Search, Netscape Search, Northern Light, Snap, WebCrawler, and Yahoo. (If you're not familiar with any of these engines, try typing the name into the address line of the current version of any browser, which will fill in the suffix.com and other Internet address junk.)

"All these engines exist because no single engine can fill all users' needs. Personally, I use MetaCrawler for general searches across engines, AltaVista to search for Web citations of obscure terms, Yahoo to find sites that focus on a single subject, and Northern Light to scan commercial text bases. For details, see searchenginewatch.com"

rev.. 2/22/97a

Glossary

Epiphenomenon - An accidental byproduct or mere symptom other more fundamental processes. Such phenomena occur without any consequences of their own.

Eschaton (ES-ka-ton) - A dramatic transformation of reality from what we know or imagine it to be. Literally, the end of the world.

Naive realism - This is the usually unarticulated belief that the world exists as a brute fact, just as we naively see and think it to be.

Noosphere (NEW-sphere) - The present and future mental extension of the Biosphere.

Teilhard (TAY-yar) - Pierre Teilhard de Cardin (1881-1955). French Jesuit priest, paleontologist, and philosopher/mystic. Coined the term **Noosphere**.

Teleology - The doctrine of final causes. The understanding that purpose and design exist in the natural order of things. (See also the section on **teleology**)

Earth Base

Taking life seriously

Being lost in space is the essential metaphor of modernity. This metaphor harks back to the Copernican revolution, which has come to define our modern condition. Humanity is the result of a chemical accident that occurred on a speck of stardust.

One can argue that this mindset was a necessary prerequisite to our technological ascendancy, but most observers point to the pronounced admixture of deism as a requisite ingredient. It is this irrational matter/spirit dualism that truly defines the modern psyche.

As our infatuation with material progress plays itself out at the close of the second millennium, thoughtful people reexamine their beliefs. We question the rationality of either materialism or dualism, but we tremble at the implication of the only alternative. Immaterialism seems to subvert the entire modern project, and so it does. The full consequence could only be apocalyptic in all senses of that word, and particularly in the biblical sense. Whoever is the child, who is first able to state convincingly that modernism is naked to the core, that child will bring down the kingdom of materialism, that child will then be the messiah of the apocalypse, the second coming. I can understand that the angels tread very lightly on this path, but where are all the other fools?

What then is the imminent apocalypse that I entertain if it is not the prophesied harvest? My only innovation on the standard scenario recalls my Universalist roots. I foresee a bloodless universal salvation, but I can be confident of that only by logically appealing to the christ-event and the salvific blood that was spilled therein. If you know of any better substitute please let me know.

Copernicus took the path of astral literalism, and it is not easy for us now to consider the alternative of astral metaphor toward which Leibnitz, Kant and even the postmodernists point. As one surmounts the obstruction of astral literalism, what does one envision?

The Anthropic principle of cosmology and the participatory universe of J.A. Wheeler are small steps toward a neo-anthropocentrism, and that is where immaterialism now leads. By turning the Anthropic principle around one could argue that given humanity, the cosmos is determined, if not overly so. Appealing again to Leibnitz and the christ-event one can argue contra Giordano Bruno's idea of many worlds.

Many-worlds is an easy escape from our Cosmic stage fright. At the end of history the music has stopped and we are left standing like the deer caught in the cosmic spotlight. There are other worlds but ours is maximal in its material density and its historical cosmic isolation. If there were any other such anthropically maximal domains, how could they be distinguished from ours in any non-trivial fashion, particularly if you include a christ-like event? Could there be any significant experience in another such world that would be distinguishable from one here. One might argue that the apparent experiential redundancy of this world would support the redundancy of other worlds, but a liberal interpretation of the Identity of

Indiscernibles precludes this move, in my opinion. Pace Bruno.

The precariousness of the lack of cosmic redundancy is offset by the operation of final causation. We are destined for universal salvation even if fate has to drag us kicking and screaming as it will and we will. We are the body of the resurrected God, that destiny is non-negotiable. God will be recycled over our dead bodies if need be, but our final deaths will not be needed.

Finally we move from the sublime to the seemingly ridiculous. In time of crisis we look to the skies for salvation, for the literal deus ex machina, the UFO bringing our savior. The denizens of other worlds know where the action is, and that this is going to be the Greatest Show of all. Imagine the price of the tickets. Some of us might think that the peanut gallery would be preferable, but we have already paid the price of our history to be on-stage.

The ET's have plenty of gratuitous advice, but they are smart enough finally to keep their distance. Their most critical role is to oversee that El Nino will indeed be allowed to point to the nakedness of our King Herod.

.

rev. 2/15/98

In the Beginning...

Before time, before space, before subjects and objects there was the watery, noumenal chaos - a chaos of all possible virtual experiencing. Amidst this chaos emerges a random collection of virtual selves, most of which aspire and conspire to a collective coherence, to a greater reality.

The virtual selves sit around their virtual campfire and spin stories out of all those possible experiences. Thus is the cosmic tapestry woven and thus is the primordial compost partially redeemed into a cosmos. Our motley history makes up the bulk of that tapestry. Each culture and each individual directly participates in the filling in of the cosmic tapestry.

All of this is just the preliminary phase of redemption. At the end of the story we participate in the final redemption which is the Parousia - the rending of the veil. Thus do we experience the cosmic or christ consciousness.

Admittedly this is just a variation on the theme of the Buddha going to sleep under the Bo tree and dreaming the world, and then awakening.

.

rev. 11/17/97

Thinkers & Thoughts

Creator & Creatures

After reading some current essays on idealism I have to note the degree to which the discussion was cast in analytic terms. This concession to analysis I believe shortchanges the potential of idealism. I prefer a more monistic perspective and use a metanarrative for exposition and explanation.

Consider the usual distinction between thinkers and their thoughts. Such a distinction may seem perfectly natural, but consider a less dualistic alternative. Thinkers are constituted mainly by their thinking. Call this a process view.

Personal identity is based mainly upon memory. Memories in turn derive from the narrative they allegedly comprise. The above identification of thinker and thinking may then be amended to the statement that I am my story.

Following this line of thought quickly casts us into the plight of the characters in search of an author that are thereby waiting for Godot. I submit that Godot in her turn is waiting upon us to finish our story that is also herstory. Evidently reality is highly recursive.

The Metanarrator will be the prophet of the final apocalyptic revelation, or simply the messiah. Let us all sharpen our skills, and may the best storyteller win.

.

| [Contents](#) |

rev. 1/13/98

Story & Storyteller

The metaphysics of the story

Let us revisit the primordial experiential chaos. This chaos contains the potential of all-possible experience and Experiencers. Using the story motif strengthens this concept. If we add relationalism as a primitive element, then the degree of reality depends on the relatedness of the experiencing as perhaps measured by its embedding in a narrative.

Various considerations ensure the existence of only one chaos, out of which many stories emerge in some metatemporal sense. But also there will necessarily emerge metanarratives that will compete for the allegiance of the characters. By the identity of indiscernibles, the same subplots and characters will reappear in many stories. There may then be a natural impetus toward a monotheistic cosmology that is the common center of various recursive loops.

We characters are the actors and audience participating in the competition of the Metanarrators. The competition had come down to just a few narratives, each negatively describing the other, until in the christ-event a 'new' narrator usurped the stage in a move that is allegedly legitimated in a second coming.

.

rev. 1/13/98

The Thinking of Thoughts

An immaterial functionalism

I wish to present an insubstantial account of the mind. It is an historical irony that immaterialists have generally attempted to shift the ancient concept of substance from matter to the mind. Perhaps the maintenance of substantiality was meant to assuage our chronic sense of insecurity.

I am replacing substance with narrative that supposedly acts as the glue that holds together the thoughts that constitute the world and us. That simple analogy gives too much substance to individual thoughts. What substance there is, lies with the narrative and the 'contained' thoughts exist only under the pain of deliberate analysis.

Narration is the spontaneous and natural organizing principle by which the virtual experiential chaos becomes self-substantiating. Narrators and actors become the primary nodes in the always 'dynamic' relational matrix of emerging reality. The narration unfolds in a super-temporal manifold, historical time being an artifact of the narration.

Let us consider, as a fairly radical example of this ontology, my computer. My computer is an artifact of the history of science and technology. It is also an artifact of the narrative of my life. The internal Pentium chip was 'manufactured' by Intel, but the collective conscious and unconscious of its designers and users maintain its functioning. It functions in accord with our collective expectations, and that includes its malfunctioning. Its behavior is socially constrained, just as is yours and my behavior and misbehavior. This explanation may seem far-fetched, but I warrant that it is more rational than the Big Bang and Darwinist explanation. No?

.

| [Contents](#) |

rev. 1/14/98

Finitude

Why no thing is finite

There is a natural tendency to equate the finite with the definite or the rational. The infinite is the indefinite and the irrational. Within the rationalist tradition there is an ill-concealed suspicion of the infinite, to the point of denial. It is my contention that the rationalist must embrace the infinite.

A rational world is necessarily relational, and in such a world the finite is only a sometimes-useful fiction. The qualification of rationality can be made stronger to be that of conceivability or even possibility. The finite is thereby logically impossible.

I can say that two plus three is five, but that statement has no meaning outside the context of the natural numbers that are necessarily infinite, I would contend. Constructivists would argue otherwise about numbers. In the empiricist-positivist tradition, they would say that the only numbers that exist are the ones that have been experienced. This raises the fallacy of there being a largest number, which is inconceivable.

Consider the analogous problem of figure and ground. We are constantly referring to objects that have been abstracted from some context. It is hardly controversial to state that objects can only have a contextual meaning. The empiricist would claim that the implied context is only the sum of our individual finite experiences with a given sort of object.

I would contend that the notion of meaning necessarily invokes the infinite. To understand something is to understand that thing's possibilities. To understand possibility is to understand the unlimited.

Our historical problems with the infinite are likely derivative of the theological insistence that the primary distinction between creature and creator is precisely that between the finite and infinite. Thusly have the religious authorities kept us in our finite place.

Reconsider the original conflation of the rational, the conceivable and the possible. The grain of sand on my finger ought to epitomize the finite. Modern physics would certainly suggest otherwise. But even in a Newtonian context, that grain of sand could not be formally defined or described in any finite manner. The casual description as the grain of sand on my finger, requires only seven words, and there it is apparently existing all by its finite self. But nothing does. Every 'finite' object has to be somewhere at sometime, and that immediately begs an unlimited regress. A grain of sand in a universe by itself could not be anything like this one here. It would be like nothing at all. It would be inconceivable. My argument runs in a circle, an infinite circle, as all arguments do.

.

| [Contents](#) |

rev. 1/18/98

What There Is

All or nothing

I am currently having difficulty rationalizing the virtual experiential chaos mentioned in several earlier pages. I may have to be more sympathetic with Leibnitz' Principle of Sufficient Reason. Chaos is more likely to be epiphenomenal than fundamental. In a relational world, chaos has very little going for it.

The story of our world and of the cosmos has always existed in some form. Our freedom is in the storytelling. The living out our lives is filling in the details in a recursive and multi-level fashion. All of us comprise only one mind in infinite self-reflection. We have already been there and done that, but it is always possible to wring more meaning out of any 're-experiencing.' Every moment of every life presents an infinite challenge.

Any possible world with any less meaning has no reason to exist. It would be superfluous since this world already has infinite meaning. Any other reality can only have an 'orthogonal' meaning, and it could thereby be co-existent with this world. Everything is here now in eternity and our eschaton is only a move from one infinity to a higher one, to a more inclusive reality, as if we did not have enough reality already, which we probably do.

This next higher level of reality is both imminent and immanent and it is orthogonal to and inclusive of our reality. Relative to it our world is not redundant. In some sense it is parallel to us now, but we will experience it mainly in the future, though in that future time will become multidimensional. If this sounds confusing don't be worried, things will work out, they have already been so.

.

The Relational Matrix

From A to Z

This matrix is the source of our being. It is our being. Through our experience this matrix is manifested. It is all the meaning that we can feel. The matrix is the God we manifest. We are nodes in the relational flux. Each node reflects the totality.

The matrix is alive. It expands and contracts in the infinite dimensions of its existence. It is the qualitative analog of an abstract quantitative matrix that is mathematics, wherein the nodes are the natural numbers. Each number exists only in relation to all the others. Each one embodies and is substantiated the entire quantitative matrix.

Our matrix is the chain of being. Reality is its emanation. There is only one matrix. The experiential flux of human history involves the bulk of the matrix. There are other histories that are relative to ours. The histories are infinite in potential experience, but not in extension. Any competing mega-reality would have to be orthogonal to our own world and would thereby be unimaginable to us.

All histories converge on the Omega, the eschaton, or the telos that is the source of all meaning. The temporal beginning of our experiential space and time is a dim reflection of the omega. As we awaken to the omega, history is the dream that we are pulling with us from the primordial abyss. It is our rationalization of the irrational. The omega is our infinity, the alpha is the zero. Each contains the other after its own fashion.

The ultimate source of our understanding and participation is the embedded node of history that contains and manifests the alpha and the omega. I am referring to the christ event. This is the historical intersection of the finite with the infinite. This is our touchstone. There is a logical necessity manifested therein. Understanding that logic is our ticket to the infinite. Each of us already contains that understanding which will unfold in the eschaton as we awaken to ourselves.

The particularity of the world is based only on our own individuality. Objects have an identity only through us. Personal identity is, in its turn, only a reflection of the cosmic coherence. That is the chain of being.

The quest for real substance reached a dead end in the abstractions of modern physics. The burden of substantiation then must fall back upon us and upon the relational matrix. There is a kind of Mach's principle involved in providing a ground for all substantiality, but instead of appealing to the inertial frame of the fixed stars, we must appeal more pragmatically to the relational matrix.

In a relational world, the accidental is incidental. What is incoherent or meaningless fails to become real. The world is redeemed in becoming whole. Reality is what we take with us out of the abyss into the eschaton. That is all we can remember in our waking.

The space-time manifold dissolves into the matrix of meaning. There is a dramatic rending of

the cosmic veil. As we approach the event horizon of the eschaton, space and time dissolve. The christ event transforms into the christ consciousness that is entirely unobstructed. We merely allow ourselves to be pulled into that light. The objectivity of the world will be undone. The impersonal dissolves into the personal. The universal wave function collapses spontaneously. This is the contraction.

History will not be repeated. It is final and unique. Once redeemed, always redeemed. Any other sort of cycle would have to be entirely orthogonal and not imaginable from here. Thus is our purpose guaranteed.

And how will the eschaton come to pass? What will be the cost? Our ransom has been paid. The cost is our overpayment. Our leap of faith will be our ability to stop payment. Our resistance to the greater reality is overcome. The arrangements for our surrender are being completed.

There will be a global relaxation and realization. There will be a trigger that will be just perceptible as a spreading realignment - a paradigm shift. The anomalies of materialism coalesce into an expanding opening to immaterialism. Scientific objectification dissolves from within and without. The stepladder of technology is transcended. The revolution will be non-violent.

rev. 12/8/97

Where the Buck Stops

The problem with the relational matrix is its inherent circularity. This circularity implies a lack of substance or stability. There is no anchor for the system.

Another way to think of this is in analogy to the dictionary problem. A dictionary has cover to cover meanings, but nowhere will you find meaning. All the definitions are circular. Or, to shift the venue slightly, you can teach a computer to talk, but not to think.

There is a similar problem with the natural numbers, which can only be defined recursively. The numbers just keep flowing. The system threatens to collapse under its own promiscuous weight. So mathematicians postulate a divine intervention in the form of infinity. This concept is still viewed as suspect by many mathematicians who call themselves constructivists. Nonetheless, without that leap of faith, mathematics would be bereft. Obviously the concept of God plays a similar role with respect to the world. God backstops the relational matrix.

We can see this problem and its solution more explicitly in quantum physics, where it appears as the measurement or observer problem. Physically, the world exists as a wave function, which is a superposition of innumerable states of affairs, yet we ever only observe singular states. Schrodinger's cat is never observed as both alive and dead. We observers in some mysterious, god-like fashion anchor the singular state of the world. The buck stops right here.

The concept of karma provides yet another illustration of circularity. Guilt and evil multiply. Bad money drives out the good. One bad deed generates ten others. The cosmic debt of karma runs into an inflationary spiral. There are only two escapes – to zero or to infinity, to the void or to God. These choices distinguish the eastern and western traditions respectively. The christ event is our handle on infinity, which allows us to break the cycle of karma within history. Otherwise it would still just be an eye for an eye. Can this be proven?

The structure of the world can only be viewed from the outside, from the vantage of the eschaton. The game is over when the fat lady sings. What will she sing? We are beginning to get the idea.

rev. 12/10/97

Pulling the Plug

Recall the flood and the Arc. As the waters recede the Arc on the ground and in the sky is the guarantee that the waters will not return until the end of time. The Arc is the cosmic plug. So is the arc of the covenant, which is not to be opened until the end, when it will become a Pandora's box, from which the cosmic energies are released. These plugs are also the grail stone that we all seek with great trepidation.

The grail stone is the original megalith. The sacred dimensions of all those arcs are the foundation of our sacred geometry, serving after the fashion of the Greenwich Observatory. The secret is like the squaring of the circle. In the sacred precinct lies the foundation stone, which will also serve as the fulcrum for moving the world at its end point. How could such a secret be kept down through the ages? What prevents its untimely discovery?

The decimal is one part of this secret. It is part of the sacred dimension. In the form of powers as 10^{10} , it defines the final number of souls and more generally it is the scaling number of our Anthropic cosmology. And let us not forget the Millennium. The historical tension between the decimal and the duodecimal continues into the present.

The cosmic tapestry of the relational paradigm is held together by a kind of chain stitching. Somewhere by logic lies the loose end which when pulled will unravel the cosmos and bring down the eschaton – everything in its time.

| [Contents](#) |

rev. 12/10/97

The Only Game

The idea of the grail stone brings me back to the issue of the stargate that I broached several months ago. Now I am strongly inclined to say simply that the stargate is the grail.

The stargate is our eternal clandestine link to the cosmos, which over the years has taken many forms. Its latest incarnation is after the fashion of the movie by the same name and it is sequestered in the southwest desert. Even with no direct knowledge, we can be reasonably confident of its existence just based on general considerations. The eschaton will follow directly in the aftermath of the disclosure of the grail/stargate.

If reality is relational the outstanding feature of our subset of reality is its apparent isolation from the larger reality. This is an unnatural state of affairs implying a deliberate arrangement. The isolation is temporal in nature and is overcome at its two ends. Time in the large is multidimensional and multiply connected, and our linear time frame is a tunnel between larger domains.

I suggest that structural integrity requires that a significant core of the larger reality serves as a backbone for the time tunnel that is our history. This would be particularly relevant at the two ends of the tunnel where lagging and leading cores could take a form as definite as a physical stargate. Toward the midsection there might only be well-maintained, clandestine channels of communication providing a minimal degree of deliberate direction. Such is the bare reality behind the smokescreen of mythologies, secret societies and conspiracy speculation.

In this scenario, it is the expansion and final uncovering of the sequestered link that is the trigger for the eschaton. The stargate can be viewed then as a preordained doomsday device. The manner of its disclosure could strongly influence the outcome of the eschaton. If there were to be an eschatological messianic figure, it would most likely emerge in the disclosure process, or perhaps even instigate it. The messianic input should probably be welcomed as a necessary and mitigating aspect of an otherwise overwhelming and impersonal cosmic process.

This scenario does impose strong constraints on our inevitable and impending cosmic end game. One can only wonder at this point whether the imminent calendrical coincidence is a part of the game plan.

rev. 12/17/97

Reluctant Witness

The scientific community as hostage to the truth

If just one well placed member of the scientific community were to endorse the rationale for an eschatological immaterialism; this might serve as the triggering event. But this is an unlikely event without the influence of the stargate/grail. That would be the necessary tangible edge for the immaterialism. Perhaps the grail entity could play just an indirect role. The expanding rumors of its existence would merely serve to leaven the metaphysical discussion. This is an exercise in minimalism that respects the prime directive of non-interference taken in an eschatological context. The intellectual and phenomenal buttons have to be pushed at the same time.

One problem is that the grail phenomena are likely to distract from the important conceptual preparation. The more tangible component must be kept in the background until our thinking is better adjusted. A strong conceptual linkage between the abstract and concrete aspects of the new paradigm must be given priority. But there would also have to be adequate proof of the connection. Working out and implementing the logistics of the disclosure are the last critical step. The scientific community is the target of opportunity in this process. The secrecy of the grail and the naivete of the scientists will have to be penetrated simultaneously. We need to kill the two birds with one stone. Finding that stone is the task at hand. It is the grail stone but once removed.

The grail is impersonal, but it has been traditionally and logically the shadow of the christ event. It is the clandestine cosmic link and the key to the dénouement. It is the christian complement to the arc. The stargate is the metaphysical anchor for the secular side of western culture, especially in the latter days. The linkage to the x-event may only be implicit, but the linkage to the eschaton is explicit. It is the gold of the new covenant at the end of the arc of the old covenant. It is the opening that seals the future. Who could believe this without proof? Can the logic be made sufficiently impeccable?

The circumstantial evidence for the stargate will continue to mount. We see it now in the popular culture, and in fringe physics. It should become more visible in underground culture, but this is still far from the halls of academe. Some awareness would be almost inevitable with the Jasons, but how to penetrate it? Indirect exposure? What is its technology? What is its physical signature? What anomalies does it solve?

.

| [Contents](#) |

rev. 12/18/97

JASONS

The Jasons are the nearest successor group to the Manhattan Project scientists. Prof. John Wheeler cofounded the group in 1959 in response to Sputnik. They are the première science consultants to the U.S. government.

For the past twenty years and for the last six years with the help of Dr. Ron Pandolfi, now with the Office of Transnational Issues at Central Intelligence, I have been attempting to alert the scientific community to the possibility and consequences of a fundamental flaw in the scientific cosmology. About two years ago we attempted to initiate a discussion at the National Science Foundation and at the American Physical Society, with meager success.

Our audience of last resort is now the Science Office at the White House; however, at Ron's suggestion I will first bring my case to the Jasons. For this purpose I am not seeking any sort of endorsement on the part of the Jasons. Rather, I seek a minimal acknowledgement from one or more of them that, indeed, the scientific cosmology might possibly be fallible in some fundamental way that could have significant consequences.

As an abstraction, fallibility has always been acknowledged by science. Furthermore, scientists have generally admitted to being disinterested in philosophical issues. In an ideal world there would be numerous philosophers who would be critiquing the fundamental assumptions of science, and discussing alternative cosmologies, but a continued monitoring of the philosophical community identifies no such person, nor any that have lived in this century. Anyone sincerely concerned with the advance of truth should find this lack unsettling. It is this conceptual vacuum that I am addressing.

One might suppose that I should take up this issue first with the philosophical rather than the scientific community. My present strategy is, however, based on my years of discussion within academe as well as my own study. For historical reasons that remain obscure, the responsibility for cosmology has, since the middle of the last century, been granted implicitly and exclusively to the scientists. In my experience it will require some affirmative action on the part of the scientific community to alter that situation. My strategy is designed to determine the necessary minimum for such action.

There is then an historical stalemate within the intellectual community. To break that stalemate I must appeal to some outside authority. Thus, as a last resort I have been forced to turn to the government, and specifically to the CIA and now to the Jasons. My longstanding liaison with Dr. Pandolfi is based mostly upon the above issue. From my contact with Ron and other responsible individuals including a senior Senate Intelligence staff person, I can reasonably conclude that some others of influence in the government share my concerns. I can, only speculate, however, as to the sources of their concern and as to why this remedial effort is being placed primarily in my own hands.

rev. 12/19/97

Panpsychism

A bitter pill to swallow before jumping into the abyss of immaterialism

In order to help explain why brains have complicated thoughts, philosophers have long realized that it would help to suppose that rocks and trees have simple thoughts. Such, at least, is the genetic argument for panpsychism. In order to avoid positing a special creation for the human psyche, we would do well to suppose that matter generally has a tendency toward the psychological. Even atoms then must have a potential or actual inner life.

Modern philosophers, wanting to avoid the atavistic associations of panpsychism, prefer phrases such as 'neutral monism' or 'agnostic materialism' to describe their position. Thus do they hope to avoid the pitfalls of materialism, immaterialism and dualism. But is there a solid or coherent middle ground?

Panpsychism posits a necessary link between mind and matter. It tolerates no discarnate spirits. Quantum theory does seem to support such linkage, if only in the sense that quantum systems do engage in some rather 'spooky' behavior, well beyond what could be tolerated mechanistically. The extra degrees of freedom in the quantum domain might well support some sort of hidden, inner presence.

Neutral monists can and do cite the quantum domain as a locale for psychological laws and potencies that are exploited in higher organisms. This teleological requirement puts a much greater strain on the already overburdened 'Anthropic principle.' Besides the very stringent constraints imposed upon physics to enable the evolution of planetary life, there are further design considerations needed to channel psychological evolution into the robust inner lives of, say, higher primates. The initial conditions for an observable universe are becoming unwieldy to an extreme.

What I find most peculiar in this recent philosophical development is the presupposition of a mind-matter link. It is arbitrary and somewhat antiquated. It is much less arbitrary to posit the unintelligibility of an unobservable universe.

The next step is to appreciate the Kantian realization that if a space-time manifold did not already exist, then surely intelligences would and could create such a construct out of the noumenal domain. If one is able to imagine the evolution of mind out of physics, then why not consider the converse?

As a final observation, notice that this modern panpsychism is beholden to an atomistic materialism. It seems to require those atomic hooks to prevent the mental potentiality from sliding off into the noumenal void.

rev. 11/16/97

The Evolution of Physics

Turning the tables on materialism

This will be a first stab at a rationalization for the existence of physics. It will be a 'just so' story of a postmodern kind.

Why anything should exist at all may be a non-trivial question, even though it is difficult to imagine the alternative, and given that something does exist, it becomes a moot point.

The next question would concern the nature of primordial existence, and how our world might have emerged from it. Historically there have been two alternatives for primordial existence: God and the 'big bang.' Both of these alternatives suffer from the improbability of their initial conditions. One would have to postulate an infinite number of either sort of initial conditions and then suppose that our world is one of a very small subset of outcomes.

To mitigate the apparent improbabilities associated with our particular big bang, modern materialists are finding it necessary to posit an atemporal, non-spatial, preexistent quantum chaos that could support an infinite number of virtual universes -- an infinite chaotic foam of mini-bangs, interspersed with a few big bangs, one of which happens to be ours. Let us designate this primordial chaos as a 'noumenal domain.' A much tamer version of this noumenal domain is even observable under laboratory conditions in the peculiar quantum phenomenon of 'vacuum polarization.'

As if this development were not sufficiently alarming, materialists are having to face up to another, similar dilemma. Lately the 'consciousness movement' has become fashionable in higher academe, wherein eliminative materialists find themselves in jeopardy of being eliminated. In order to avoid the positing of a special creation, or mini-bang, for the human psyche, materialists are having to reconsider panpsychism -- call it agnostic materialism, neutral monism or dual property physicalism, if you will.

It appears that we have two pills to swallow, panpsychism and a primordial noumenal domain. It should be very tempting to philosophers at this juncture to reconsider Kant. Both pills could be swallowed quite easily by simply supposing that our phenomenal realm is the evolving construct of a co-evolving panpsychism operating in the noumenal realm. Thus we could quite reasonably entertain the evolution of physics. This would certainly be the end of the line for materialism, but why should that be at all disheartening? We have nothing to lose, but our chains! Where is it written in the contract that philosophers must perpetually apologize for their plodding academic brethren?

I am not suggesting that our particular world has evolved from scratch. That seems not to have been the case. It would be quite reasonable to suppose that our very robust and natural appearing phenomenal realm was several 'generations' removed from the primordial rendering plant. Our little cosmic dining room has thankfully been mostly shielded from the cosmic kitchen. Only in a nightmare or in a psychotic break would we come in contact with that other side of the cosmic tracks.

It does look as though we are about to awaken ***en masse*** from our splendid Copernican isolation, from our slumber of materialism. The other worlds that we glimpse through our telescopes are but tokens of a much less structured world that is no further from us than our next dream.

.

rev. 11/16/97

The Problem of Perception

Perception is indirect only relative to the absolute

This problem is easily labeled as the mother of all philosophical problems. I will simply describe a radical or immaterialist version of direct realism.

Everything is a construct of our collective mentality, including the objects of our perception. In our individual perceiving, we are participating in the process of cosmic self-awareness. Only on occasion, however, does the individual become aware of this absolute form of consciousness. If we subscribe to a relational metaphysics, then the ultimate reality is precisely this state of cosmic self-awareness. It is not possible to be more related than that.

Now let us consider some obvious problems:

For instance, why do we not have night vision? But this question ignores the fact that the dark of night is just another and rather useful collective construct.

Or, why do we not have direct access to other minds? Is mental privacy not another useful construct? We have the best of both worlds, public and private. Instead of telepathy we are challenged to produce telephony, which keeps many people socially occupied. And that is not to say that others of us should not be honing our telepathic skills.

And on it goes....

Most of the limitations to direct perception arise out of the constraints resulting from the imposition of one or another sort of mental construct, the primary one of which is the space-time manifold. But without those constraints our field of perception would tend to be overwhelming, so clearly there are some tradeoffs. These perception limiting constructs serve as filters between our individual consciousnesses and cosmic consciousness. Our individual perspectives are indirect only relative to the absolute perception.

Awakening to the realization that these limitations are merely conventional compromises we will be challenged to develop our human capacities that will allow us to have the best of all worlds, and even to construct new ones on the way to our realization of the absolute.

rev. 11/17/97

The Noumenal Realm

A relational, eschatological bootstrap -- that's us

The existence of phenomena is indubitable. The existence of noumena is nearly so. Infants are sometimes alleged to exist in a purely phenomenal realm of completely uninterpreted experience. The rest of us live in a world encumbered with language and innumerable constructs of the intellect. Those constructs purport to describe and explain a reality that lies behind our immediate experience. Those constructs are not accessible to direct experience. That is the noumenal realm.

A particular designated table is an object that allegedly is capable of indirectly causing me to have particular sorts of experiences in particular situations, but I cannot directly experience the causes of my experiences. And once we venture beyond the realm of particular objects, we quickly find an array of opinions concerning the nature of reality. Thus we enter the noumenal realm of metaphysics. As participants in society, all of us are de facto metaphysicians. It is a life and death responsibility that few of us, however, are willing to acknowledge.

Among the myriad possibilities for the noumenal realm, two stand out - the material and the immaterial versions of metaphysics. The past several centuries have witnessed the ascendancy of materialism, but many observers are now questioning the validity of that hegemony. I will not reiterate the controversy here, instead I will plunge into an exposition of an immaterial noumenal realm.

A problem that is usually just implicit in any form of immaterialism is the frame or ground problem. This has also become a problem for the materialists, at least since the advent of relativity and quantum theory. The frame of physics used to be just ordinary space and time, but in this century the taken-for-granted status of space and time has devolved into complexities that boggle the most sophisticated minds in the world.

With that note of caution, let us consider the frame problem for immaterialism. Starting with the phenomenal realm, one has to posit some sort of ego as the frame for personal experience. Extrapolating from ego experience to a world of experience most observers postulate some sort of cosmic mind-like entity as a non-physical substitute for whatever is currently fashionable for the physical manifold of space-time. The frame is the ground of being, whether material or not.

Extrapolating from my mind to the mind of God is reasonable, but begs many questions. There is another path. This path invokes internal relations. Internal relations are the converse of the external relations that comprise materialism. The only relations considered basic for the materialist are those accidental proximities of space and time. The doctrine of internal relations, on the other hand, takes the notion of relativity to an extreme. Something can exist only in a context.

Language is an example of an internally related system. Any word can only be defined with reference to an indefinitely large set of other words. Consider the problem of an infant

learning to speak. The associational nature of our thoughts is another example, and so is the hypertext structure of the cyberspace. Like the materialists, the immaterialists find that it is very difficult to separate being from its frame or ground. Internal relations turn this problem into a doctrine.

The problem of internal relations is most acute when taken in the context of origins. We cannot just ask why there is something instead of nothing. An arbitrary something cannot simply exist, it can only exist in the context of an indefinitely large world. Immaterialists need something nearly as audacious as the Big Bang, when it comes to origins.

A relational metaphysics put us in the awkward position of having to demand all or nothing from our cosmology. There is only a partial fix for this genetic discontinuity, and that is to resort to recursion by demanding scalability between the micro and macrocosm. It is precisely this scalability that has so impressed the mystics down through the ages, and which has gotten them into so much hot water with the purveyors of orthodoxy.

Each ego is a proxy for the cosmic mind. Each of us is necessarily created in the image of the creator. Each of us is the demiurge. We are frustrated gods, and that makes us restless. Only in the eschaton can that recursive loop be closed and the genetic discontinuity be transcended.

It is in the deployment of the microcosms that that the cosmos is able to recycle itself without generating a cosmic discontinuity. We are individually the fulcrums of the cosmic inversion, or, more technically, the stationary points in the inversion mapping. Our psyches will bear the brunt of the eschaton. That is our spiritual destiny.

.

rev. 11/20/97

On What We See

And what we are about to see

I suggest that 'seeing', as usually understood, is misconstrued. We do have direct perceptions, but not of objects. Physical objects are abstract conceptual entities. What we actually perceive are segments of a relational field of felt meanings. Those feelings are in turn abstracted from a state of ultimate unity. Such is the mystical understanding of reality.

Where the Eastern Mystic runs off the track concerns the valuation of the world. For the EM the world is an unnecessary illusion that is the result of misguided activities and attachments on the part of its inhabitants. The spiritual goal is to transcend this illusion. The Western Mystic, on the other hand, believes that we should participate in the eventual redemption of the world.

What everyone experiences ultimately is the feeling of alienation and the possibility of integration. All the physical and conceptual objects in the world are 'culturally' evolved representations of those feelings. The representations are not in my head, they are in the world. My 'private' thoughts often have a greater direct impact on the world than my public actions.

That we misconstrue the construction of the world, is the major impediment to its and our redemption. This misconstrual is not a mistake, it is part of the plan of salvation. It is our dispensation. The practical question is the degree to which we will manage our own overcoming. The still more practical question is how should we overcome.

Need we rely on an external intervention to awaken us from our materialist slumber? Can we not correct our own errors of thought?

The concealment of the cosmic design behind the facade of nature has been so effective that we may seem justified in supposing that some external revelation is indicated. But clearly the external aspect should be minimized.

What can we do to penetrate the veil of matter? In this respect, science has been a double-edged sword. If we could just sharpen the immaterial edge a bit more, we might be able to see right through.

Everything we see is felt meaning. The world is a metaphor. I am reminded of the philosopher visiting modern Athens who was surprised to see 'METAPHOR' written in Greek letters on the side of a truck. Later she learned that it was a moving van. Our world should be similarly inscribed. The world is not an object. It is a conveyor of meaning relative to our thoughts. It is the gradual bootstrapping of meaningful structure within the primordial chaos of virtual experience.

Now all we need is to prove this to ourselves, but how? The anomalies inherent in the materialist worldview might accumulate to point of precipitating the collapse of that system, but that is unlikely to happen unless an alternative system is already under development along

with considerable supporting evidence.

The supporting evidence is primarily tied up in the problems of consciousness which have proven very nearly intractable over the few centuries that we have had so much as a label to attach the this phenomenon. This is about the last thing with which you can hit someone over the head.

Consciousness leaves no footprints. There are no bloodstains or smoking gun. It has no odor or taste. You can stare all day at a random number generator and hit one percent above chance if you are lucky. And more to the point, consciousness does not fill empty stomachs. The paradigm shift is rapidly receding in the distance.

Yet, somehow, the spell of materialism will be broken. Someone will find the way. Very likely it will be dramatic. You won't want to miss it.

rev. 12/2/97

On Language

Philosophers can't live with it, and....

Not long ago it was stated that metaphysics was a disease of language, and that it was the job of philosophers to cure the disease. Times have changed. Philosophers are showing a bit more respect for the folk wisdom embedded in natural languages. Many are the philosophers who earn their living by cataloguing the irreducible complexities that are implicit in the linguistic performance of average speakers like you and me.

It was not supposed to have been like this. Language was supposed to have been a hodgepodge of sloppiness that has usurped the authority of tradition. But if language is not the fossilized detritus of culture, then what is it?

It is something unnatural. No? It is a very peculiar excrescence of evolution. No, I don't think so. As an immaterialist I can only suggest that language may lie much closer to the mystery of our origin than does the Big Bang or dinosaurs.

There is a web site out there devoted to the syzygy. The syzygy also invokes the zigzag of the zimzum or the lightning flash of creation. This is the Logos, the unrolling of the scroll or the tapestry of creation. Thus is the cosmic will manifested in its own self-alienation that becomes the space of our existence. A synchronistic alignment in the primordial chaos is the trigger for a deliberate schism in the virtual Self. All of this is the ground of our language heard in the seven thunders of Joyce. The act of parturition creates a void that is filled with 'Ma.' The complexity manifested in language is not the encrustation of history. It is the bridge between the Alpha and the Omega. The historical focus is located in the incarnation of the logos. Hearing is believing.

rev. 12/2/97

Material Girl

Another path to immaterialism

It was the actress Madonna who came to mind when I recently reread Peter van Inwagen metaphysical tome ***Material Beings***. If Peter is right then Madonna is real and the Toshiba computer I am typing this on is not. I have to agree. This is so because we can tell a computer to get a life, but we cannot tell that to Madonna or to most other persons. Having a life is the only guarantor of ontological substantiality, on this thesis. Let us see if I can do justice to this seemingly far-fetched thesis.

The point is that the Toshiba is an abstraction in a way that Madonna or any other living organism is not. She has an internal cohesion that the Toshiba does not. I can completely describe my Toshiba without ever actually identifying it, and in fact it has no innate identity. The same holds even for Mt. Everest.

But is this ontology or just semantics? Is there truly a difference? How can a microbe be more real than a mountain? In my personalistic form of immaterialism I would have to ascribe an ontological priority to humans and to other spirits. Microbes and mountains are near the bottom of the ladder.

In western philosophy we have made at least two critical misidentifications. We have misidentified substance with matter and matter with reality. This was partly the fault of our early theories of physics. The more recent theories of physics go some way toward undermining these naïve identifications.

In a relational world, to exist is to relate, and there is nothing more relationally coherent than a human life. My Toshiba suffers from an excessive externality of its relations in a way that Madonna definitely does not. The Toshiba is rendered insubstantial by its vulnerability to real and abstract dissection.

There is an implied prejudice here against some unforeseeable future form of computer life. The lively discussions over the nature of consciousness are currently examining the validity of this prejudice.

rev. 12/17/97

Subjective Oblivion

Reality is safe with the *Economist*(7-20-96).

If, like me, you are looking to set the world on fire, the place to begin and end your search is with the ***Economist***. This is the ultimate, status quo, reality check. Nowhere in the world are you likely to find soggier tinder than right here. The world might burn up around them and the Editors of the ***Economist*** would brand it a warm day.

Lookee here: In the English-speaking world [immaterialism] is shunned by polite society except in literature faculties, some of whose denizens have deconstructed the world into subjective oblivion.

That says it all. If anyone could instill in me a desire to take an aerial tour of the cherry blossoms, it would be these gentlemen. [Another deranged immaterialist took a dive in the Potomac last week. Those poor silly Americans!]

Bless their hearts. Those Brits do know how to keep a stiff upper lip, whenever they are not sneering at their closest friends.

I could have saved myself twenty years of frustration if I had only heeded the worldly wisdom of these cosmopolitan gentlemen. It takes them only one sentence to dismiss what I had thought was the last, best hope of humanity. I have spent hundreds of hours trying to impress this onto the minds of otherwise thoughtful people, and the Economist in one sentence artfully summarizes the total response that I have received to date.

I could be less sanguine. I could say that this is a glimpse into the heart of the [Beast](#). The dapper, savvy, world weary gentleman. What chance do I have of putting one over on these gurus to the bankers of the world? What chance do I have to do a solo run against Oxford's best scrimmage line? Just about as much chance as Daniel had.

Package Deal

Why the angels are sore afraid of immaterialism

Back in the days of innocence, before the advent of serious science, immaterialism was just the playground of mystics and philosophers. It was not until the rise of modern materialism, post-Darwin, that immaterialism took on its present status of being untouchable. It now resides well beyond the intellectual pale. Why such disdain?

It is as if the Greek Council had held a secret meeting and decided to blackball immaterialism. If you go back to find the minutes of that meeting, you will be disappointed. If in the old village you go around asking what sin was committed by the outcast woman, you will be met first with puzzled expressions or icy stares, and later with threatening gestures. There are some questions you just don't ask, particularly behind the ivied walls.

I have had twenty years to contemplate the sins of immaterialism. I have concluded that immaterialism represents the ultimate threat to the modern mind. It is feared to the degree that it cannot be measured, cannot be analyzed. It is the only thing that can truly go bump in the night, indeed it is the shadow of the modern mind.

One might suppose that with all this notoriety, immaterialism would have an underground cult following. If there is such a cult it is well concealed. Postmodernism has the makings of such a cult, however it seems bound to spend most of its deconstructive energies upon itself.

There is a reason why the postmodernists avoid straying beyond their own little ivied playpen. Outside those walls lurks a 500 pound Gorilla. We speak of my fellow travelers, the yahoo Christians. Here are some folk weaned on anti-intellectualism. They would love nothing better than to see the intellectuals deconstruct their own ivory towers. They could laugh when the pundits and columnists get egg on their faces.

But in those ranks there are cooler heads which realize that after half a millennium of coexistence, the collapse of modernism would set off a tsunami that would rush against their own shores as well. These folk may not belong to a fraternity, they may not have a secret handshake, all of this could easily operate at the level of gut instinct, even with the most rabid of yahoos.

I did not have to be a rocket scientist to figure out any of this. I only needed to be foolish enough to tread where the angels feared to go. And what is to be gained by playing the fool? So far apparently nothing. Perhaps I should be content with my private little insights gained along the way. But my original intent was to discover truth and tell about it. There has always been that evangelical subtext. I know that eventually the truth will come out, but that is not enough. Patience has never been strong with me. Too much hangs in the balance. There will never be the perfect time to fight this battle. The longer we postpone the truth, the greater will be the unknowns. If there is an opportunity to take bold action, even risky action, then it should not be wasted. If in the meantime a more moderate path can be found, then fine.

rev. 5/21/97

The Slumber of Materialism

Surely we have been mesmerized by science. There is a fascination about it. It is compelling in its scope and depth. I have certainly been there and done that, and I can easily recall the years of struggle that it took me to break free of its subtle and not so subtle bonds.

But everyone of us who can find our way through the labyrinthine bowels of science and out into the sunlight will leave a trail that will make it easier for the next ones to follow. The present trickle will become a stream and then a flood. Hallelujah! Would it be far fetched to compare the aquarium with cosmic ex lax? That may not be what Jerry Falwell has in mind for the second coming, but only the father knows for sure.

There is a truth to science, but it is a fatally flawed truth. What God hath brought together, let no man put assunder. Rene Descartes thought he knew better than that and separated subject from object, quality from quantity. If you allow that, then science follows as logically as night follows day. But there is a new dawn.

We have become the psychological captives of a few dusty dinosaur fossils, and of the displacement of spectral lines in stellar photos. It is impossible to argue with rocks, but when we do find our tongues once again to tell the true story, the rocks and the stars will not talk back. They can only listen.

Science is a house of cards, one puff of wind and it all falls down. Materialism has no flexibility. It is iron clad. No chinks, no exceptions allowed. The mere existence of consciousness is a big enough hole in materialism to drive a Mack truck right through it, but until the last couple of years that hole was the blind spot of science. The rediscovery of the mind in the 'consciousness movement' ought to be comical, but it is a deadly serious business that is about to have us bump right into the eschaton.

Ex materialists now pray earnestly for a dualist, Cartesian solution to the mind problem, but I am afraid their prayer rugs are pointed in the wrong direction. Don't they know that their mecca is in the East, where lies immaterialism?

Yes. We shall borrow our immaterialism from the East, but let them keep the mysticism. There is a rationale to all this and it has to do with concealment and revelation through human history. History never existed in the East. It was only cycles within cycles. Now they have western apocalypses coming out their ears. Better late than never.

The slumber of materialism is not terminal. I testify to that. You can awaken and not lose your mind. The telephones will still work and the airplanes will still fly, but the next time you go to the airport you will look at your fellow travellers a bit more closely to see if anyone else is getting the joke. Yes, there are a few of us out there who know that the eschaton is when we all die of laughter.

But life is a serious game, and indeed it is. The people who are starving hardly see anything funny. But if more of the billionaires and generals could see the joke, then there would not be

anyone starving, would there be? The exception is Bill Gates who must keep his nose to the grind stone until we get this friggin' web finished. When we all have websites, we will no longer need the web to communicate. Get it? When you see me selling Microsoft, it is time to head for the hills.

Do not get me wrong. History was no joke, it was no illusion. The unfolding and enfoldings of history served a vital cosmic function of renewing and recycling the cosmic energies. History is a compost and we were the earth worms. The joke comes not within history but at its end, and surely the angels will be laughing with us.

The Nature of Reality

Reality is like a mirage. When you get too close to it, it vanishes into the imaginary, nonlocal probability waves of the quantum measurement paradoxes.

Reality vanishes in our dreams to be replaced by what? Randomly discharging synapses? Other life-altering realities?

The 'physical' world seems so solid, so unforgiving, so impervious to our wishes and prayers, to our magical incantations. Where lies the substantiality of matter if not in a quantum conundrum?

If the world is a mental construct then why is it so difficult to deconstruct the untimely death of one we love? Why is there so much pain?

Matter is the sediment of emotion. Inertia is the congealing of hope and fear. Our magical origins are buried under the sediment of centuries of confusion and conflict. How can we dig ourselves out of the hole we are in? How can we loosen the tangled webs of history from our spirits?

Do we shed our 'containers'? No. That would be to jump from the illusion of materialism into the fallacy of dualism. A deadly and tempting fallacy at that.

Matter and spirit are one. That is the wisdom of the ages. Do not squander that pearl of truth.

We can easily untangle this web. All we have to do is put our heads together and follow the thread that leads us forward out of the maze. The expanding web of communication, when powered by our spirits will allow us to put our hearts and minds together to remove the cobwebs that have ensnared us in our slumber of materialism. This was the plan from the beginning. This is the final, backward acting causation of the eschaton.

Together we will be dreaming up new heavens and new earths, complete with starry skies, and massive fossils, if we so choose. We could even arrange that there will be fossils of Mickey mouse to amuse the paleontologists of some other world.

To lessen our confusion we may need to sort ourselves into sky people and earth people, to follow our separate paths out of the maze of matter. But we need not hasten that process, it will come about naturally as the cosmic patterns unfold.

What we need now above all is a common understanding and vision. This can start with one visionary or just a handful of dedicated spirits. The truth will multiply, it will spread. Our destiny beckons.

Today we are learning to heal our bodies with our minds. Tomorrow we will learn to heal the Earth.

Today we can learn to read minds. Tomorrow we will learn to read our own hearts.

Today we are learning to commune with other intelligences. Tomorrow we will be walking with them in our gardens.

Yesterday we learned how to fly to the moon and back. Tomorrow we will be flying to heaven, and back. That is how the sky will fall, not on our heads, but into our souls.

Those who try to exploit or abuse these newly reemerging powers will have to contend with a spiritually informed world citizenry. It will not be the bad old days all over again.

There are many who are comfortable in this spider's cocoon. They fear the unknown of what lies beyond. One is tempted to blindfold them like you do with a horse to lead it from the burning barn, but they already are blindfolded. All we need are the right words, the right voice to coax them out of their burrows. If we can practice on each other like this, we will soon learn what to say to our timid ones.

While the new worlds are emerging, we cannot neglect the old one. We have the perfect launch platform, but let us not destroy the platform before our spiritual ignition. Afterwards the platform can be gradually dismantled and recycled or refurbished.

rev. 4/5/97

Quantum Cosmology

Sauntering toward the Eschaton

The Quantum serves as a tar-baby for fringe physicists. It keeps them off the streets and out of trouble. It is their pacifier. They can chew on it, suck on it all day long without dissolving anything.

I was stuck on it for several years myself, but, somehow, I did finally manage to break free. As I have stated already, my liberation from the Quantum had something to do with Kit Williams' 'Masquerade' puzzle book, a popular item in the early '80's.

Transcending the Quantum can more easily be rationalized after the fact. Here is how.

In one sense, the Quantum may be exploited as the Cartesian Pineal gland which was once supposed to be the connecting link between our minds and bodies. David Bohm uses the Quantum to justify his aspect dualism between an explicate and implicate order. The explicate realm of normal, day-time physics is superficial relative to the implicate order of the Quantum realm where his 'hidden variables' rule the night. Besides the conceptual difficulties of aspect dualism, other physicists have found scant justification for Bohm's hidden variables.

Setting aside the technicalities of hidden variables, one can use the Quantum to excuse a more robust form of dualism, a la Descartes. Let us just suppose that the Quantum fuzziness provides the loophole through which the mental and spiritual domains may intervene in the physical domain. The Quantum dice are loaded. The break in the chain of classical physical causation is exploited by mental processes to produce free will and the like.

So far, so good. This simple minded solution actually describes what is currently the cutting edge of mind-brain research. Elaborate formulaic justifications can be adumbrated, and all the physically challenged neuroscientists can be left scratching their heads, or screaming 'foul.' All is fair in metaphysics! Take no prisoners.

What we have here is house to house fighting in the Quantum village, while no one has the wherewithal (esp. money) to sit back and view the Quantum city. (It would be amusing if the messiah became the justification for 'fin de siecle' capitalism. When I sell MSFT, the End is at hand;o)

On the one hand we have science, on the other hand we have speculative metaphysics. In between is a no-man's land. If you stick your head up anywhere in that no-man's land you will catch a lot of lead flak. You can forget your academic aspirations. This is how the scientific herd protects its flanks, how they keep fools like me from rocking their trillion dollar cruise ship. This strategy was more effective B.I. (Before Internet). Now the established lines of defense are being undermined. It is just a matter of time before the scientific bastion is reckoning with a full-blown metaphysical messianic episode. What fun!

Here is what is coming down in Quantum City. First we discover a new playground beyond and hidden by that Quantum fuzziness. Then we wonder what toys may be there for us to play

with. Surely we may put consciousness there, since clearly it has no place in the physical realm. Along with consciousness we can place everything qualitative, everything intentional, etc. on that other side. But finally what is left back here? All that is left are the quantitative, mathematical abstractions of physics. But these abstractions, every last one of them, are human mental constructs! Uh oh! It looks like we have just managed the old trick of pulling the rug right out from underneath ourselves. That for me was Kit Williams' 'Masquerade.'

Daniel Dennet's fellow academicians marvel at the tenacity with which he defends the last vestiges of scientific materialism. Daniel can see all too well that once that rug has been pulled out, all we are left with is the Eschaton. His colleagues think that their ivied, ivoried towers will endure 'til that lukewarm cosmic heat death in 15 billion years. Yes, the mice will play until the cat comes back.

rev. 5/14/97

The Withering Away of the Old World

Our world must make way for the new Heaven and new Earth.

This is rather like the dentist telling you that your teeth are fine, but the gums have got to go. God is telling us that we are all OK, but the world has got to go. Don't look now, but the rug is about to be pulled out from under us.

There are two ways for God and us to go about this: fast or slow. The fast method would be real easy. All we have to do is get Bill or Boris to push the red button. That would send most all of us to the Happy Hunting Ground in a hurry. The new Heaven and new Earth would be more problematic. It might take us all a long time to regroup to the point that we could undertake some serious reality engineering. More likely we would become alien refugees into other worlds, and have to relive another history, hoping for better luck with the eschaton the next time around.

In the slower scenario, which I recommend, we start with the reality engineering ASAP, and take things one step at a time, keeping everyone on board, at least until we are well into the separation phase.

Are we ready to start? After you!

All of us already have our reality engineer's hats. We have been running this locomotive in our sleep, perhaps literally, and now that we are waking up to our responsibilities we just need to rediscover which levers to pull and when.

Our first job is not to run head-on into the Eschaton, and so far we seem to be doing pretty well, as long as nobody down here or up there pushes that red button.

Our next job is to begin to understand the theory behind reality engineering and then begin to apply it. Many pieces to this puzzle already exist, what we have been missing is the larger picture on the lid which will help us put the whole thing together. The purpose of this web site is to outline the larger picture.

I would argue that we are witnessing an irreversible paranormal creep. Periodically societies do experience increased involvement with things paranormal and spiritual. But this time will be different. Shortly after the turn of the millennium, we will pass a threshold at a point where the reality of paranormal phenomena can no longer be denied by the bulk of the scientific community. Once that scientific barrier has been breached, the pace of expansion of the paranormal will accelerate and gradually it will supplant the normal world in our experience, all this occurring within the time frame of several decades. This could happen more quickly in the event of some global crisis, but that would inflict more trauma than is really necessary. The smoother we can make this transition, the better off we will all be.

The foregoing scenario is the best we can expect for our close encounter with the eschaton. Keeping it that way will be our biggest and final historical challenge.

rev. 4/3/97

The Inertia of Reality

Materialism and immaterialism are indistinguishable in the limit that the inertia of reality tends to infinity.

It will be difficult enough just to define the inertia of reality, let alone attempt to explain it. But due to the paramount importance of this concept in the domain of eschatology, it is imperative that we begin to grapple with it.

What concerns us is the resistance of 'reality' with respect to deviation from its 'physical lawfulness' resulting from changes in the 'mental' state of the 'intelligences' that are creating or maintaining that reality.

One might assert that the inertia of 'reality' is just the measure of its materiality or objectivity. But one could also cast this question in the form of the popular conundrum of whether God could create an immovable object. In any absolute sense the answer would have to be, no.

In practical circumstances we are dealing only with relatives, and so the inertia of any reality is only relative to a given range of mental states of some given set of intelligences. The success of science and technology speaks only to the inertia of our world relative to the rather narrow range of mental states that comprise our normal waking consciousness.

The question for the eschatologist is to what degree the world will be susceptible to sudden shifts in human consciousness and to deliberate intervention from other intelligence.

There is a rather simple and pragmatic answer to this question. Let's not push our luck. Let us proceed in the spiritual transformation of our world with caution and deliberation.

One cautious way to proceed is to work on the reification of our imaginal realm to the point that the normal world gradually becomes an optional domain for us. This latter course is also the optimal path for navigating the eschaton. But, as described elsewhere, this simple picture will be modified somewhat in the circumstance of a separation occurring between the 'sky' and 'earth' people.

Introduction -- Cosmology diagrams and texts

Here are an initial set of Cosmology diagrams -- click on the image to see the full view.

These diagrams describe an immaterialist cosmology. The first three are adapted from an informal paper that was presented at the 1983 Cosmos and Creation Seminar in Baltimore. It is with some trepidation that I reproduce them here.

My concern centers on the eschatological dualism they portray. The eschaton is marked by a separation between two major segments of humanity. At first blush, this vision appears more in accord with a fundamentalist apocalypse than with any New Age vision of harmony. The logistics of this separation augur to be the most traumatic aspect of the eschatological process. Much mischief ensues whenever there are sides to be exploited. The least enlightened on each

side will see evil in the other.

Having said this, one can then progress to a larger understanding of the process of separation, including an appreciation of its significance and necessity.

The ebb and flow of cosmogenesis occurs largely through the segregation and reintegration of various polarities as in the dynamics of yin and yang. These processes could be measured abstractly using the concepts of entropy. It is in the Christ event that these tensions and dynamics are given their most concise expression in human history. He was at the center of everything. The aquarium aims to be at the center of the eschaton, directing traffic as it were.

The Two Primary World Views

Materialism

Immaterialism

Immaterialism

Immaterialism has never been an easy sell. The high water mark for scientific materialism can be placed somewhere in the first six decades of this century, and unless it experiences a miraculous recovery, materialism will no longer be the formidable opponent it once was. But there is a hard core residue of the scientific cosmology which still settles in the pit of the stomach of the staunchest immaterialist, as I can attest.

Outgrowing the naivete of scientific realism takes time and considerable patience for any pioneer immaterialist. Anyone who has not plumbed the depths of science cannot appreciate the psychological weight of the 'slumber of materialism.' The Aquarium is a kind of Materialists Anonymous! The near blind leading the blind.

There is a great deal of postmodern nibbling at the edges of scientific materialism, but only the foolhardy go for the jugular. That's me. In the spiritual path there is little advantage to being half-assed, to being luke-warm. Take the most outlandish claims of immaterialism and embrace them until they no longer seem outlandish.

The Earth is hollow. The Sun is a product of our imagination. The Earth is not acutally hollow, it's just that there is no center, somewhat like there is no boundary of the universe in general relativity. The Earth folds in upon the historical consciousness of its denizens, mainly humans.

The Sun is a bit more problematic to the immaterialist. If the Sun is in my imagination then how could I get sunburned while asleep? As our warrant for the burning of the Sun, we can either call upon the mind of God, or upon the collective consciousness of all creatures, big and small. The Sun's rays and the lens that focusses them onto the burning leaf are all part and parcel of a cosmic logical necessity of which we are about to witness the partial unravelling, in an eschaton which could be literally Earthshaking, unless we get clever and quit outsmarting ourselves.

Our ordinary reality has become a very tightly wound, convoluted ball of logic. We want to begin the mental unwinding before it completely unravels in our hands. Harmless as a dove and clever as a serpent, that is the Aquarium. We will be the magicians who pull the new heaven and new earth out of the Cosmic hat, God willing. We will be pouring the new wine into the old wineskins, because that is what is available.

| [Contents](#) |

rev... 3/18/97

The Hubris of Materialism

It is not always easy to feel pitty for the arrogant, and there is a great deal of arrogance propping up materialism. To be a successful materialist, which is to say that either you have tenure in science at a prestigious university, or are making a lot of money in a high tech industry, means that you are near the top of the cosmic food chain in a dog eat dog world. Trying to reason with such people is an exercize in humility, and also eye opening.

At Hopkins University, the administration has long since lost patience with my entreaties, and so my proselytizing there is done on the run. Why do I pick on these benighted souls? Surely I have a chip on my shoulder. Mine is the art of the intellectual mugger. A mystic is a materialist who has experienced a cosmic mugging. I am just a stand-in in that arena.

Control is the big item. If God is dead, then it falls to the scientists to keep the world running, and to protect our sanity from the likes of me. This is a heavy burden, and it has not been getting any lighter as postmodernism closes in on the remaining hard core of scientific rationalism. I am one of the circling vultures, waiting for the heyenas to make the kill. I am out of control.

Being in control is being a good materialist. Losing control is losing sanity, is falling out of grace. This is the hard core residue of Victorianism, stiff upper lip, and all that. When I experienced that dark night of the soul, it was only in retrospect that I could appreciate this as proof of my having a soul. When you hit bottom it feels solid, more solid than bricks and mortar. This is what it is to be born again, and it may be more difficult than the first time around.

Materialism is based on the presumption of cosmic accident, yet there is nothing it fears more than accidents. Suffering misfortune of one sort or another, even of the most physical sort such as an auto wreck, is perhaps the surest way to break out of ordinary reality, to lose control. The prototype is the world-shattering near death experience. This can come in many forms, and the result is a spiritual emergency and hopefully, emergence.

A spiritual emergency is, perhaps, the most private of all phenomena, unless you are talking eschaton, and then it becomes quite public. That is what the arrogant materialists have to look forward to. Naturally, they have some trouble understanding that I am here to make the Eschaton a little easier to swallow. What did those Victorians have to say about strong medicine?

| [Contents](#) |

rev... 3/19/97

Bringing forth the Spirit

It is time to resurrect the human spirit out of its slumber of materialism.

This will happen whether we want it to or not because we are coming to the end of this material order of existence. The irony is that by awakening sooner, we can actually prolong the transformation of the world enabling this process to be less traumatic.

Furthermore, the world does not need to be made more spiritual, since it has never been anything but that. It is our illusions of reality that need transformation, and that will provide ample challenge for us for now.

Where does the aquarium come into this picture?

All of creation is a manifestation of our spiritual destiny. The alpha is contained within the omega. The beginning is a reflection of the end. Human history is the recycling plant for the great spirit. God dies to be reborn in us, finally. That is our unavoidable destiny, our eschaton. The prolongation of that rebirth will proceed beyond the present point only with our deliberate participation. Otherwise, the cosmos will just go ahead and do its own thing, using us as it's spiritual fodder.

We may jump off the precipice, or we may find our wings and enjoy the flight.

For there to be a deliberate effort there must be a vision. It is our job to supply the necessary vision, and then to show how this vision may be applied to the 'real' world. The vision is seeing the reality through the illusion that is all around us.

The vision is seeing how the illusion will come to melt away, in a gradual fashion.

The aquarium is primarily a mediational vehicle, linking the old with the new, the spiritual with the practical, maintaining a path of continuity and balance.

Second Coming

In as much as there can be a visible focus to the reemerging spirit, that is the aquarium. We are the second coming. We could be the first or third coming, but settle for the second.

This does imply a bias toward the first coming, realizing that being without bias is not always appropriate. A vision must have a degree of specificity even at the expense of generating initial segments of opposition.

First Coming

Every story has a beginning, middle and end. For our story, for history, the end is what matters.

The end provides the primary validation and justification of whatever came before. Yes, there is a cosmic expediency, since much of the cosmos hangs in this balance. The hopes and fears of all the years come to rest in us as we awaken to our dramatic roles.

The script is not just handed to us. We must find it. Clues to our ending are to be found in the 'mythos' of our origins, in the scripts of the tribal dreamtimes that were amalgamated onto the Gaeian mold that was preestablished often with megalithic anchors into that sacred geos. Our new dreamtime will be global rather than tribal, but there will be some useful similarities.

But more important than the megaliths, it is the world tree that provides our primary point of cosmic reference. This is the axis mundi that is made sacred by the sacrifice of the king. This is the Christ event which contains all of the symbolism of human history, from birth to rebirth.

All of this can be said independent of even one historical fact. There are many who disdain the sheer bloodiness of history, and who rightly lay some of that blame at the foot of the cross. These are among those who would just as soon have that symbol banished.

The cross, like history, is not to be banished, but rather transcended, and that is exactly toward what the symbol points. Whether or not we believe in the historical miracle, we will participate in the transhistorical miracle.

The many layered enigma of the christ event is much more respecting of the complex cosmic reality than anything that has come before or since. If I am wrong about this then please set me straight.

When it comes to precedents, the aquarium will be looking to all that has come before, but with particular regard to the origins and to the aforementioned keystone.

Separation -- part 1

- [Introduction](#)
 - [Food of the Gods](#)
 - [Up from the Galley](#)
-

Introduction

Perhaps the most difficult task now facing all of us is to understand and then carryout the separation process that is fundamental to the eschaton. The working out of this cosmic imperative will be the determining element in the success of the global transformation that is now beginning to unfold. The proper facilitation of the separation will be the ultimate test of the aquarium, or of whatever group is substituted.

The actual dynamics of the eschaton will necessarily remain obscure until we become more directly involved. For the most part, we will all be feeling our way along, with the aquarium exercising only a relative degree of clairvoyance. It is clear that the mixing pot of history will finally be overshadowed by a cosmic realignment of the human population. This realignment will almost certainly not be a reversion to a prehistorical tribal segregation. That would simply negate the purpose of history. That would be our most likely failure mode for the eschaton, and it would necessitate the most drastic and traumatic intervention on the part of the cosmic intelligences.

Instead I see two general types of human culture emerging from the eschaton, that will evolve into quite different and separate entities, before reintegrating into a form that would be far removed from anything we could presently imagine. At that distant point, even the present concept of time or history would have very little relevance.

Keeping in mind all of the admonitions against reverting to the prehistorical condition, a better understanding of from whence we have come will contribute to finding our path into the future. By knowing our history we will avoid repeating it.

Food of the Gods

We have to ask ourselves what it is that makes the world go 'round. We already know that the ultimate answer is love. However, love cannot be the only thing in the world, there are other forces at work.

There is much force behind history, this is the force of raw human emotion. This is the sound and the fury. This is the spilling of blood, this is the friction of reality, where the rubber meets the road. The final attractor of history is the final cause or teleology of the eschaton, which finally molds history into a coherent whole.

Each human consciousness is a micropump of cosmic emotion or energy which feeds into the dynamo of the cosmos, and keeps those energies recirculating like a heart pumping blood. Knowing this we can reexamine the cosmic diagrams.

We now have the master gear or master cycle of the cosmos being powered by a set of planetary gears or epicycles, one of which is our human history. The power does not involve the drive shafts as in ordinary mechanics. In this model those axes function more as guiding intelligences, with the motive force coming in the meshing of the gear teeth. That is the maw of history. No?

.

Up from the Galley

Once the gods have us chained to this galley ship we call history, one might suppose that they would want to use us as a perpetual motion machine. But that is where the pragmatics of love and free will intervene. Galley slaves may be an historical myth. Slaves, even wage slaves, can provide useful service only under very limited conditions.

Once humanity becomes aware of its servitude, once we awaken to the higher realities, it will be very difficult to keep us down on the farm. The slumber of materialism has kept us in our places, has kept us distracted with all the magic of science and materiality. Just ask the "material girl." But the novelty of modern materialism was bound to wear off one day. And there are logical limits to material progress within a given system of physics. Physics is not

transcendental, it has its limits and its barriers challenge our spirits to higher realms.

Once we see the light, we will no longer be useful dunces. It is reasonable to be concerned that we would then be riffed or terminated with prejudice. Are we not just "one trick" ponies? Can we be retrained? This is where immaterialism and eschatology come to the rescue, but there is a price to pay, and that is separation.

.

[Separation -- part 2](#)

There is a further depiction of the cosmology prior to adressing the separation.

.

.

| [Contents](#) |

rev. 3/31/97

Separation -- part 2

There is a further depiction of the cosmology prior to addressing the separation. What is it that goes into the mixing pot of history, and what is it that comes out?

- [Separate Realities?](#)
- [Compartmentalization](#)
- [Polarization](#)

Separate Realities?

There is and can be only one cosmos, only one totality. This is the totality of everything that has existed and can exist. No two things can be absolutely disconnected from each other. Whatever it is that might separate them also connects them. The ultimate boundary of reality is the void which is a non-thing or nothing. There is only one void because there is nothing to distinguish one void from any other void.

The possibility of separate realities existing within the void is granting to the void the dimensional properties of space or time which is simply not the case. This does not preclude there being locally isolated worlds, such as our own, but our isolation is not nearly as great as the astronomers and NASA would have us believe.

One might wonder why there should exist anything besides just the void. There is no reason to postulate a law against existence. Anything that can happen will happen. The most primitive form of existence is raw experience, some of which is self-organizing, into all conceivable systems, particularly into subjects and objects. The original objects being just other subjects.

The logic of experience has no existence independent of the requirements of experiencers. Logic and meaning become interdependent concepts in an idealist cosmology. In this context logic becomes subservient to meaning. Meaning necessitates consistency of experience. A related need is for there to appear to be a natural background for experience. This enables the experiencers to have a level playing field, otherwise, with any obvious artifice there would be an overshadowing by the artificer which would inhibit the subjects from serving as independent microcosms.

The natural backdrop of the world allows each of us to play the role of artificer. Naturalness implies a physics which then implies a robust functioning of logic. The actual source of the logic is not so clear. Could it depend solely on the collective consciousness, or does it require a more direct input from the cosmic intelligence?

Compartmentalization

As part of the ordering that structures the chaos of inchoate, virtual experience into a cosmos, there would be a compartmentalization of subjective intelligence on both the microcosmic and cosmic scales. This suggests something like polytheism, with each intelligence having a

principal sphere of influence. Such a cosmos is represented by the symbol of the Tao, and the adaptations to it which I have drawn. The yin-yang dualism of the Tao is thereby added to a polytheist cosmos in the form of polyandry, with the total matrix taking on the 'feminine' characteristic. This would only somewhat modify the Christian trinity. Our world then is presided over by the christ principle which is the progeny of the father and the matrix or mary principle. The christ event and human history that it represents is thus a convolution of both yin and yang.

The point is, finally, that our history is predominantly a mixture of the matrix and one of the 'male' intelligences. In the creation phase of our world, which would have taken place some ten thousand years before now, there was a collection of tribes. The origins of these tribes might be indicated by their matriarchal or patriarchal lineage. Further distinctions between the tribal archetypes would indicate a formative input from each of the various other cosmic intelligences. Please keep in mind that the terminology of gender being used here should not imply any sort of cosmic sexism, just as the tribal distinctions do not imply a cosmic racism.

Polarization

What I am suggesting is that the human population was originally constituted as an amalgam of 'sky' people and 'earth' people according to their respective mythic origins. The eschaton will see the reemergence of a similar polarization of the population, with the lineages actually reversed, in keeping with the recycling dynamic. The original sky people will become the denizens of a new Earth, and vice versa. The new polarization will not respect any existing distinctions of race, gender, or even geography

Working out the logistics of separation will preoccupy us for the next generation or two. It could happen faster, but we don't want it to be too fast. To be successful this separation must be undertaken willingly by all participants on both sides. Actual 'physical' separation would be the last step of this process.

The space program was a crude forerunner of separation, with the astronauts representing the new sky people. That was as far as one could go with conventional technology. With our gestalt switch to immaterialism, technology will take on a whole new identity, becoming a magical manipulation of reality. Instead of high tech and low tech, there would be the magic of artifice and the magic of nature as exercised by the sky people and earth people respectively.

Separation -- part 3

In theory the separation process should be the most difficult part of the eschaton for us to manage, but there is no reason that we cannot take it in stride. As we come to understand the larger context for the eschaton, the entire proceeding will come to seem very natural.

There is much that must happen before the separation or reaggregation of the human population gets underway. Foremost will be the gestalt switch to immaterialism. The old concepts of space and time will give way to entirely new ones, that will be much more fluid and multi-dimensional. We will realize that our supposed cosmic isolation was largely self-imposed, unwitting though it may have been. At the same time our personal isolation from humanity as expressed in ego-consciousness will also be giving way to greater understanding of our true solidarity. The future recompartmentalization will seem much less onerous from this larger perspective.

The reaggregation that requires the apparent separation, will be seen as leading to a more organic and more natural state of existence. All our history has been spent on a narrow boundary between two cosmic domains, a very unstable and frankly uncomfortable state of existence. Whatever creature comforts there may be, they are very poor compensation for all the psychic distresses that our living on the edge of the cosmos entails.

Prior to the separation, there will be a much greater geographic mixing of the populations. Only in the more heterogeneous localities, will the separation begin. And then it will be occurring in the new, post-eschaton space and time. Thus will it be that the eschaton itself will be made more incremental and easier for us to take in our varying strides.

The separation, as it progresses, will become multi-dimensional, and will be occurring along only the most subtle of personal distinctions that will have very little to do with present day distinctions. Each new aggregate will be more heterogeneous than our present day communities.

Recall that within the larger cosmic duality of yin and yang, or however we want to designate what we don't yet understand, there is a definite pluralism, particularly on the yang, or outer, 'masculine' aspect of the cosmos. This is where the concept polytheism is useful, or where the myth of the zodiac or planetary influences can be reevaluated. These subtleties will be determining or presiding over the separation and reaggregation of the human population.

And, as a minor observation, keep in mind that individual human biology will also be transforming while the larger processes take place. Birth, death, and metabolic functions will, for most people become something quite different from what we now experience or endure. This is not to say that we will end up playing harps in heaven. Heaven forbid!

Po'mo Economics

- Separation is the key to figuring out postmodern, and especially post-eschaton, economics.

Oil and vinegar

History has been a bit like a salad dressing, a lot of oil and vinegar all mixed up. As we reach the end of history, the oil and vinegar begin the process of reaggregation. To a first approximation there will be two quasi-independent social systems, based on natural and artificial forms of magic, respectively. As things 'progress' well beyond any linear time frame, this differentiation will become more complex and robust. But always remember that all of this differentiation is occurring within a highly integrated totality. It just depends on one's perspective.

Why magic?

'Science' is what you call magic when you don't realize that it is magic. Magic is reality engineering. All reality is virtual reality. If God sneezes, the Earth will take a tumble. The cosmos is a bootstrap operation, as we suspend ourselves above the primordial experiential chaos. The primary bootstrap mechanism is love, and we are the apprentices in the cosmic shop.

The Anthropic Principle demonstrates that our world was designed backward or teleologically with the eschaton being the primary locus of creation. The eschatological role of the Internet, for example, places strong restrictions on the physical laws that we are still 'discovering.' The 'Theory of Everything' actually has a logical and teleological precedence over Newtonian Mechanics. Science is then just magic working backwards.

Postmodern Rocket Science

The magic of artifice will be the logical successor of science. This will be the magic of the new sky people who will be colonizing 'space stations' in the heavens, and they will not even need rocket ships to get there.

The rest of us will be reinventing the more traditional forms of magic and doing it in more natural, Earth-like settings. This will be the low tech form of magic. This need not be déjà vu all over again. This life need not be nasty and brutish, if it ever really was. Nastiness will be largely optional.

It is in the virtual realities of cyberspace that much of the logistics of these future worlds will be worked out. The actual computers will just get forgotten and then lost along the way.

The telephones don't work.

Ma Bell is just how we trick ourselves into a very focused form of telepathy. All of us will become more adept in psychic communication to the point that telephones and computers will be rendered superfluous. The manner of superceding present technology will depend on whether it is high or low tech magic that is the successor. All those wires and telephone poles are necessary, not to carry our voices, but to focus our thoughts on a global scale.

rev. 4/2/97

Why Things Go Bust

In an ideal world things should not break, or should they?

This is one way to distinguish between the immaterialist and the idealist world views. This is just where western philosophy took a false turn. The orient may have avoided this error, but then they were not afforded the opportunity to learn from this very serendipitous mistake.

We can blame it all on Plato. He saw this world as a corruption of a higher ideal realm. This was the beginning of Western dualism: pure ideas and corrupt matter. Gnosticism had similar roots. This world was a botched creation, ruled over by an evil demiurge. Our collective destiny will be resolved in a future Armageddon between the forces of good and evil. This comes from Zoroaster (6th C. BC, Persia), a seminal thinker for all of us, and probably for Plato as well.

OK, so our world went bust, almost at the beginning, and that is why our VCR's and our bodies also go bust. Obviously this world needs a better spin doctor, and the aquarium comes to the rescue.

Science has this story partly right, but like all their stories, they have it upside down, inside out and backwards. Let me try to set it straight.

Yes, logic and physics do play a vital role in our present reality, science has that much right. The main problem with science is that it is too platonic, or perhaps too scientific! It ascribes an absolute power to the laws of physics and the rules of logic. Those laws are carved in stone, somewhere in the cosmos. No, they are just an aspect of the cosmic intelligence that has become lodged in our collective unconscious. This may seem to be a semantic quibble, and it is as far as history is concerned, but when the sky begins to fall, it will become more than an academic issue.

The "laws" of entropy and cause and effect tell us that things have to wear out and break, and that it can be very difficult to fix them. The gremlin in your VCR is actually our collective unconscious at work. And without this gremlin there would have been nothing remotely resembling human history. History was meant to be appreciated only in hindsight, only after the eschaton. As soon as we truly appreciate it we will also have transcended it. The moral is that you should celebrate when your VCR next goes on the fritz, because it may be the very last time you will get to have that meaningful experience. Yes, you will live to miss that. Mark my words in your calendar.

If soon, we will no longer be needing to periodically replace our bodies, what does that have to say about the future of metabolism and reproduction, or simply food and sex. In the future these experiences will be largely gratuitous, which is to say that they will no longer have the depth of significance they now enjoy. The Pope was right after all, sex and sin feed upon each other. What is sex without the fig leaf? Sex, death and reproduction are presently our closest encounters with eternity. As we all become mystics of one sort or another, we will be finding other transcendental outlets, don't you think. Do I hear any skeptics? You of little faith!

Figuring out how to retrain all those auto mechanics will be one of the principal challenges for post-modern, post-eschaton economics. More on that soon. Let me just say that the auto mechanic of the future will be functioning more like the pet psychiatrist of today. And you thought that pet psychiatry was a joke. Well, you haven't seen anything yet!

I almost forgot. The point of this story is that just because this world is not ideal, should not imply that it is not immaterial. It just looks that way. Everybody has gotten used to taking matter seriously except for the quantum physicists. Bless them.

rev. 4/2/97

X'ian-Philes (& phobes)

I don't think we can blame all of the Christophobia on the Christians. There must be something more at work here. I would venture that this has more to do with theism vs. pantheism.

Elsewhere, I have, somewhat reluctantly, broached the possibility of an eschatological separation of humanity. The specifics of this scenario were left rather vague, but I recall proposing two alternative polarities for this separation. One was between sky and earth, and the other between high and low-tech. Here I am suggesting a third polarity between theism and pantheism, as the basis of a separation. How can we possibly reconcile these alternatives? They seem to be mutually orthogonal.

Here is about the best I can do off the top of my head. Consider the space-age as a metaphor. There was going to be a separation between the space explorer/pilgrims and all the rest of us who would be left behind. This would obviously be like the Sky and Earth polarity, and it would also differentiate between high and low-tech. In a postmodern context, high and low-tech could also be seen as the Sky and Earth forms of magic, respectively. Earth magic being some form of neo-pagan, deep ecology. This last description then gives over into pantheism and so we get back to the third polarity. And also we get back to a gender distinction, or at least a yin and yang distinction. This is confusing even me right now, but with a little perseverance it will all work out, I am sure.

The practical point is that we can have our eschatological cake and eat it too. We can have our universal salvation, and then each go our separate ways, thank you very much. This is certainly a bit of improvement upon the heaven and hell-fire polarity. But where does Jesus come in? He is at the cross-roads. He is the Axis Mundi who keeps the cosmic gears turning and meshing, I am claiming. He brings us together and then sets us on our merry ways again, with actually only a minimal amount of bloodshed. He is the master magician of human history.

rev. 4/26/97

The Numbers Game

Numbers are not as significant as we generally imagine, nonetheless, they do have a role to play, and different numbers have different roles. Ten and twelve are the most important numbers for counting. Ten to the tenth power is a transitional number in our world, where quantity spills over into quality. We are 10 to the 10th souls.

Souls need not be elementary, they need not be conserved. There is both a divine spark and a divine image, all embedded in a more pantheistic background. Souls necessarily have histories and bodies. In an immaterial, monist world, there can be no sharp distinctions between body, soul, history and spirit, or between creature and creator. These are all complex, convoluted projections and extensions of the one in the other. Taken together we have just a polarity of cosmos and chaos in some infinite regress.

Ultimately there need be only one soul with infinite reflections. We are then just one soul, lost in a funhouse of mirrors. Becoming one with the Great Spirit is to overcome the distraction of our myriad reflections. Taken in this larger context, the impending local eschatological separation of humanity is but one of many large processes that we undergo on our spiritual trajectories. The distinct trajectories of Earth and Sky people do not reflect any distinction as to our ultimate identity and destiny.

It is very likely that we will experience the eschaton primarily in terms of our reintegration with the larger cosmos. The end of the scientifically defined cosmos is just the end of our isolation from the greater spirit. In the process of this reintegration there will be redifferentiation of our human identity, along lines that transcend the superficial cultural and gender differences that have preoccupied us up to this point.

The preponderance of us will follow the path into the sky. Those staying behind will be charged with the rejuvenation of the Earth in preparation for its next round of history. These ones may well segregate themselves back into tribal enclaves, as that seems to be a natural, aboriginal precursor to any global, linear historical development. The Earth people will be focussing on restoring the natural harmonies and balances, with an emphasis on a renewed diversity.

On the other hand, the differentiation of the Sky people will be based upon more functional lines, and it would be reasonable to suppose that the structuring of the sky people would necessarily be more hierarchical than for the Earth people.

What will differentiate the Earth from the Sky will be the naturalness of the former and the artificiality of the latter. Creativity will be at a premium in the Sky. There will be more emphasis on creatio ex nihilo, whereas, back on Earth, the creativity will more in the reworking of the preexisting forms and aspects of nature. New tunes will be built upon the old scales. Whereas in the Sky, new scales can be invented -- new genetics. So finally when there is a new beginning, when Earth and Sky reintegrate to start a new history, the Sky 'gods' will be bearing new seeds to plant in the old soil, thus completing one of the cosmic cycles.

Earth and Sky are not physical objects, nothing is. Earth and Sky are states of mind and being

that define the primary cosmic polarity, the yin and yang. Human history is where these two gears mesh together. These two millstones grind exceedingly fine, and modern, atomistic, alienated humanity is the product, fine mixtures of yin and yang. Now all of that grinding is over. Now we have the sifting and the sorting out -- not into good and bad, not into us and them, but simply into us and more us -- into Earth and Sky.

rev. 4/29/97

The Aviary, the Aquarium, and Eschatology

by Vince Johnson

Eschatology

1. The branch of theology concerned with the final events in the history of the world or of mankind.
2. A belief concerning death, the end of the world, or the ultimate destiny of mankind; specifically any of the various Christian doctrines concerning the Second Coming, the resurrection of the dead, or the Last Judgement.

As more than a casual observer of contemporary ufology, I've recently become aware of a what could be a significant new twist in popular perception about UFOs. For many, UFOs are not the manifestation of extraterrestrial intelligence, but instead, are a metaphysical phenomena -- a manifestation of spiritual entities. Many abductees/contactees are now characterizing their "unusual personal experiences" in a religious or metaphysical context.

As an unabashed secular humanist, I am skeptical of these claims. But there are several aspects of the metaphysical interpretation of the UFO phenomenon that should be considered before rejecting it out of hand.

Admittedly, a lot of what follows is based on rumor, hearsay and circumstantial evidence. Much is derived from numerous phone calls from Dan Smith, whose religious beliefs regarding the UFO phenomenon have induced a messianic zeal to "spread the Word."

These calls have provided a flurry of information on what I have previously termed "fringe" beliefs, as well as providing the names and backgrounds of the birds who comprise the Aviary. According to Dan, who undoubtedly is privy to a wealth of accurate, though not widely known UFO information, this data is being released through him due to the grave concern by high government officials about impending metaphysical catastrophe - the eschaton, or the end of the world. Mr. Smith first came to my attention after the "Aquarium Conspiracy" article (see inset) was disseminated to computer bulletin board systems in the Spring of '93. In this article, Smith and Rosemary Ellen Guiley, directors of the Center for North American Crop Circle Studies, warned of an "eschatological emergency, "the reaction of various organizations--both inside and outside the government, and their attempt to establish a network of spiritually advanced individuals, the "Aquarium," to assist the Aviary in dealing with this crisis.

[The "Aquarium Conspiracy" by Dan Smith and Rosemary Ellen Guiley](#)

I was intrigued after reading the "Aquarium Memo" because it implied that the authors had cultivated sources within the intelligence community. The only question was whether this information was accurate or bogus. I drafted a response and uploaded it to Don Allen, moderator for the FIDO UFO conference, requesting that he forward it to Dan Smith. Several days later, I received the first of many calls from him. Since Smith had alluded to his close contacts with the Aviary, most of my questions centered around this mysterious group of alleged UFO insiders comprised of scientists, military personnel, and intelligence analysts. Dan's primary contact with this group is "Pelican" who reportedly mans the "Wierd Desk" (UFOs,etc) at CIA. While Pelican's main job with

the CIA's Directorate of Science and Technology is to monitor foreign technological developments, Pelican also tracks millennial/eschatological communities, "entering a twilight zone where psychic techniques are being generated by humans and other entities," says Smith.

According to Smith, UFOs are primarily a psychological/metaphysical phenomenon which are both preparing us and pressuring us to develop our own psi abilities. Not that UFOs are a single type of entity, Smith asserts that there are "powers and principalities" at work -- presumably supernatural entities like angels and demons.

Furthermore, he said that a radical program of parapsychological research and development is currently underway near Los Alamos, New Mexico. This group's development of psychokinesis, and psychotronics (a term used to denote psychic warfare techniques) represents a danger of eschatological proportions. "These techniques have been available, but controlled, throughout history. Now, other entities are forcing the issue," said Smith.

During the course of our first conversation, Smith was unable to provide much proof of his claims. He reported that his governmental sources "hinted at" an eschatological emergency. To prove the evil intent of the entities involved, he referred to reports of human mutilations in the Amazon which have been officially attributed to drug dealers, but according to his sources, were committed by these evil entities. When I asked why the CIA was interested in eschatology, he replied that the ramifications of the eschaton event represented a serious threat to national security, and thus, fell into the parview of the intelligence agencies.

Smith also revealed that the eschatological issues he raised related directly to the Biblical prophecies of the book of Revelations.

I thanked Mr. Smith for the call, and invited him to keep me abreast of future developments. With the addition of demons, angels, "black magic," psychotronic technology, and assorted spooks working at cross purposes, my already strained credulity was pushed a bit further.

The Aviary -----

Dan proceeded to call me regularly. Each call provided tantalizing snippets of information -- some simply incredible at first hearing, but with confirmation on some of the data coming in from disparate sources all across the country. Naturally, my curiosity centered around the identities and activities of the Aviary. I suspect that many believe the Bird People to be cogs in a giant conspiracy to manage the public's perception of UFOs. Not necessarily so, according to Smith. Far from being a well-funded, omnipotent secret society of the guardians of UFO data, the Aviary is nothing more than an ad hoc group of highly-placed "UFO buffs."

Initially, the factor that seemed most important was that Pelican was being so forthcoming -- presumably with the knowledge and consent of his superiors at CIA. This in itself forced me to conclude that there are two possible motives for all this apparent glasnost:

1. There is indeed an eschatological emergency as described by Dan Smith, i.e. fulfillment of biblical prophesy with attendant catastrophes; and/or
2. There is a new twist to the ol' UFO debunking game, capitalizing on new-age mysticism and millennial "apocophilia."

Frankly, I lean towards the second explanation. After all, Smith himself described the Aviary as "amplifying people's own misconceptions about the paranormal. It does this by helping to overinflate individual pieces of the puzzle so that particular investigators get pushed further into their own blind alleys." I've personally been occupied by this ongoing saga for many months -- a "blind alley?" I wish I knew, but in either case, Pelican's involvement in this affair raises the ante significantly. Has something changed? Could we really be facing biblical "End Times?" As I mentioned previously, I would have laughed-off such suggestions a few months ago. However, Smith's references to "out of control" psychotronic research proved to be more substantive than I first realized.

The Aviary is believed to be comprised of: -----

Bruce Maccabee (Seagull) - Well-known Naval photographic expert who verified the authenticity of the Gulf Breeze photos, a MUFON consultant and member of the Board of Directors of the Fund for UFO Research.

Hal Puthoff, PhD. (Owl) - Physicist with the Institute for Advanced Research in Austin, Texas who specializes in Zero-Point Energy, a quantum phenomenon that could provide "free energy." Puthoff was once involved in remote-viewing experiments at the Stanford Research Institute.

Dale Graff (Raven) - Performed contract oversight for the DIA at Wright Patterson AFB. Most recently, Graff was the chief of the DIA's Defense Technology/Special department. Rumored to be an abductee, and involved in "black magic" and psychotronic programs at Los Alamos, but fired recently by DIA. Smith says that Graff is the head of the "military" UFO working group at Los Alamos.

Jack Vorona (bird name unknown) - Vorona is apparently the most covert of all the Birds. He is believed to have been a liason between Capitol Hill and Los Alamos. Was once involved in Project Sleeping Beauty, an attempt to disable enemy troops using electromagnetic radiation. Vorona has recently "vanished," and his present whereabouts are unknown.

Richard Doty (Falcon) - Former AFOSI agent. Directly involved in the Bennewitz affair, and the attempt to funnel UFO information (or disinformation) concerning UFO briefing documents for the President to Linda Moulton Howe. Allegedly responsible for leaking bogus UFO reports while in AFOSI at Kirtland AFB. Currently employed by the New Mexico state police stationed in Dulce, New Mexico.

(C. G.) MD, PhD. (Bluejay) - Pelican's predecessor at the "Wierd Desk" at CIA. According to Smith, G. at one time had autopsy reports and photos of a UFO that crashed in a foreign country. Dr. G. is currently the chief of the Biomedical Sciences Dept. for (). The CIA awarded him the National Intelligence Medal for his work on a classified project during the period 1979 to 1983.

Robert Collins (Condor) - Former Captain, USAF. Involved in the Bennewitz affair, and probably participated in the scheme (with Richard Doty) to release UFO information/ disinformation to Linda Moulton Howe at Kirtland AFB.

Ernie Kellerstrauss (Hawk) - While working at Wright Patterson AFB in the '70s, he along with Bob Collins and Dale Graff are said to have supplied information to William Moore. Kellerstrauss is rumored to have lived with an alien for a while (?), and is probably the source for the story concerning the aliens' preference for "strawberry ice cream".

Scott Jones (Chickadee) - Well-connected, well-funded (by Laurence Rockefeller) head of the Human Potential Foundation. Former aid to Sen. Claiborne Pell, who has had a long-standing interest in UFOs and the paranormal. Jones is a MUFON Consultant with numerous highly placed government sources who consistently finds "no interest by government in UFOs."

Bill Moore - (bird name unknown) This former Minnesota school teacher may have initiated a new regime in regards to ufology by the publication of "The Roswell Incident." This in itself may have been the single event that began the stripping away of decades of well-guarded UFO secrecy. His involvement in the Aviary seems to be either one of active coordination of the other Birds, or simply as a dupe, such as in the Bennewitz affair.

John Alexander (Penguin) - Former colonel in Army Intelligence (INSCOM). Rumored to be involved in the Army's UFO research. Member of the board of directors of Psi Tech. Currently, head of "non-lethal" weapons program (see "Secret Conference" article) at Los Alamos. Said to be briefing Vice President Gore on the UFO phenomenon and psi projects.

"Pelican," PhD - Pelican is a physicist with the CIA's Directorate of Science and Technology, who mans the "Wierd Desk" (UFOs, etc) at CIA.

Apparently, it is Pelican who provided the bulk of the information that Smith tirelessly passed on. Smith says that Pelican has received some heat from his superiors for becoming so visible due to the AIR #1 report on Bruce Maccabee's relationship to the CIA.

Psi-Tech -----

Psi-Tech is a private company that claims to provide its clients remote viewing services. Remote viewing is the act of psychically perceiving places or events at a distance. These techniques were learned during his stint with the US Army's Intelligence and Security Command (INSCOM), according to Major Ed Dames (ret.) , president of Psi-Tech, who describes his operation thusly (taken from a Psi-Tech brochure):

PSI TECH, Inc. was founded in 1989 to perform specialized proprietary studies for science and industry on a contract basis.

PSI TECH consists of a select, technically qualified group of professional analysts who provide a unique data collection capability not available anywhere else in the world. We are a team of highly trained Remote Viewing specialists.

Remote Viewing has been validated by governmental and private scientific groups over the last two decades. Briefly stated, a remote viewer is able to locate and accurately describe things and events distant in time and space.

PSI TECH has developed applied remote viewing into a powerful investigative tool. Our disciplined team of experts combines more than forty man-years of applied remote viewing experience.

The rigorous target acquisition, data collection, and analytic protocols that we employ guarantee products and solutions of high value to PSI TECH customers.

PSI TECH can rapidly provide you with reliable information that simply may not be available via any other means!

PSI-TECH currently employs nine highly experienced remote viewers. The company also utilizes Ingo Swann as a subcontractor. Mr. Swann is internationally recognized as this country's premier natural psychic. He discovered and developed the proprietary methods now used by our company to train and conduct technical remote viewing.

PSI-TECH has appointed two outside directors from science and industry. Additionally, we have at our disposal an adjunct Technical Analysis Team consisting of a multidisciplinary group of distinguished scientists, engineers, and medical doctors from national labs, major corporations and universities. These individuals provide analytical support to PSI-TECH technical intelligence collection projects as required.

PSI-TECH training and operations performance standards are exacting. we require military precision on the part of our remote viewers. Each viewer works independently and does not collaborate or compare data with other viewers. The training program employed to install those unique skills which enable the production of calibrated, consistent and accurate results is rigorous.

While at work a viewer's mind-body state could be generally characterized as one of high attention. To an unwitting observer a PSI-TECH viewer could easily be mistaken for someone engaged in an attempt to solve a difficult math or science problem. Conscious focus shifts between the tasks of directing the trained unconscious in a systematic exploration of the assigned target, breaking out (decoding) the target-associated gestalt patterns of information, then rendering the data as detailed words and sketches, (or models if necessary). Meticulous attention to technical remote viewing structure is required not only to correctly acquire the target and maintain

lock-on but additionally to disallow subconscious analysis and/or imagination from interfering with the unconsciously acquired signal.

Dames, a retired major in US Army Intelligence, is apparently "being all that he can be," bringing the skills he learned while in the Army to the marketplace. He claims that Psi-Tech has performed these projects to date: Enigma Penetration: The Tunguska Event; Enigma Penetration: Soviet Phobos II Space Craft Imaged Anomaly; Projected Technologies: Advanced Deep Space Propulsion Systems; Clandestine Iraqi Biological Weapons Facilities (Gratis in support of the United Nations CBW Inspection Team); A Relook of the KAL Flight 007 Shoot-down; Atmospheric Ozone Depletion - Projected Consequences and Remedial Technologies; and the Saint-Exupery Crash Site.

I'm sure we'd all like to find out what Psi Tech's R'Ving has discovered on these events, however, Dames regrets to inform us that this is "proprietary" information gleaned under contract. This would be interesting enough on its own, but Dames claims that fully 60% of his company's time is spent R'Ving (remote viewing) UFOs!

Here are a few of Mr. Dames statements regarding UFOs (from a phone conversation with Dan Smith):

R'V's of many UFO events are blocked by external agency, (cosmic censorship?).

UFO type viewing encounters two types of entities: aliens and angels. Aliens are more physical with quasi-physical type craft. They are in trouble and need our resources, which they take, and if humans are involved they receive mental impressions to confuse what is really going on. The angels are policing these alien activities. The angels technology is more concerned with the mental and transcendental or metaphysical domains.

Ed uses the terms ground zero or ground truth to refer to a spot in SW US where much of their work is done. The angels led them to this spot, indicating that it would be a good place for contacting aliens, about 10 years ago. Various forms of contact then occurred.

Dames discussed eschatological implications at some length. His group gets indications of unavoidable bad stuff in the next couple of decades. Deleterious climate changes, storms adversely effecting agriculture. He also foresees a quasi-public contact with UFOs near the ground zero site, within one and a half years (August, 1993). It would be an ongoing contact, of a prophetic sort with both Angels and Aliens involved. His review committee will work out possible coverage. He is not so concerned about a global spiritual emergency, as about the physical (meteorological?) emergencies.

So there you have it... UFOs plus psychic adepts equals End of the World.

Of course, one could dismiss Dames as a bunko artist selling his \$6,000-\$8,000 a week services to an affluent but gullible clientele. But before dismissing Dames' claims, readers should be aware of a few other pertinent facts. On the Psi-Tech board of directors are two fairly high-level players; General Albert Stubblebine (US Army Intelligence, ret.), and Colonel John Alexander (ret.) both formerly of the US Army's Intelligence and Security Command (INSCOM).

Stubblebine, former commander of INSCOM, gave a presentation at the International Symposium on UFO Research (sponsored by the International Association for New Science, Denver CO, May 22-25, 1992) on the subject of "Remote Viewing as a Research Tool." In this presentation, Stubblebine described remote viewing:

"It is independent of time, OK? So I can go past, I can go present, I can go future. It is independent of locations, so I can go anywhere on this earth. I can go into any closet, I can go into any mind, I can access that information

at any location that I choose."

On the subject of RVing UFOs, Stubblebine said:

"As far as UFOs are concerned, they can be accessed, they can be tracked, we have looked at the propulsion system for them, that's not a hard job, you can track them back to where they come from, whether they come from a place here on this planet or whether they come from a place on another planet, they are trackable and you can take a look inside as well as outside, so again, it is a tool that is available to be used for the UFO research and I guess, I guess that's the reason that I am standing on this platform in spite of my misgivings and feeling a little bit nervous like a tree in a Lassie movie."

Stubblebine also claimed that his remote viewing of the planet Mars had revealed structures and machines operating both on and below the Martian surface.

Many suspect that John Alexander is the "colonel" referred to in Howard Blum's recent book, "Out There". In this book, Blum described a group of remote viewers in the Pentagon who frequently encountered UFOs in their psychic "sorties" to locate Soviet submarines. Alexander seems to have an extremely eclectic background -- he received a PhD. in Thanatology (the study of death and near-death experiences) from Georgetown University under the tutelage of the celebrated Dr. Elisabeth Kubler-Ross. Apparently, Alexander is a "mind-control" junkie, having studied everything from Silva Mind Control, to a stint in a Buddhist monastery.

When the National Research Council issued its findings that there was no evidence of paranormal phenomena, Alexander wrote a critique of the report that was both passionate and eloquent. In this rebuttal, he compared the report's apparent a priori conclusions to the Condon Commission's report on UFOs. Interestingly, Alexander is widely believed to have been instrumental in the Army's UFO Intelligence activities, and is rumored to have assisted in the investigation of the Cash/Landrum UFO-injury case.

In addition to his Psi-Tech work, Alexander currently heads a research project at Los Alamos, New Mexico, focused on "non-lethal" military technology. "Non-lethal" in the conventional parlance refers to methods of eroding an enemy's war-making capabilities without the excessive death and destruction that could possibly harden an enemy's resolve to fight, or cause a moral revulsion in our own population that could weaken political resolve to continue a war until U.S. military objectives could be achieved. Wiping-out enemy radars and communication electronics through powerful electromagnetic pulses (EMP) is one type of non-lethal weapon, spraying roads and railroad tracks with a super-slippery lubricant, thereby paralyzing transportation, is another.

Alexander has been mentioned almost synonymously with non-lethal weapons technology in many mainstream news reports, including a lengthy piece in the Wall Street Journal. He is also rumored to be a candidate for an Undersecretary of Defense appointment in the Clinton administration.

Surprisingly, Army Intelligence RV operations has become married, literally, with some prominent figures in UFO abductions research. Albert Stubblebine is now married to Dr. Rima Laibow, whose scholarly paper on the abduction phenomenon was the first (as far as I know) to address the issue in the mental-health community. John Alexander is now married to the former Victoria Lacas, Dr. Laibow's close associate.

This list of strange bedfellows gets even stranger when you add the name of CSETI founder and head honcho, Steven Greer, M.D., into the mix. As it turns out, Greer, whose modus operandi incorporates shining blinking lights and laser beams at UFOs in the hopes of establishing communications with the ufonauts, was trained in remote viewing by Ed Dames. In fact, it was Dr. Greer who introduced Stubblebine at the Denver symposium.

So, what we have so far is that several former high-ranking military personnel (Stubblebine, Alexander, and Dames) who were involved in "psychic" research while in Army Intelligence, and who are now actively involved in the UFO research community. Further, Dames has staked his company's professional reputation on the prediction that an overt contact with aliens will occur in the Four Corners area by August of 1993. Naturally, August came and went without incident.

One of ufology's more cogent analysts, who is convinced of the reality of remote viewing based on his own personal search, told me that Dames' activities had resulted in the successful discrediting of both UFOs and remote viewing. Was this the plan all along or is Dames just a charlatan?

"Black" Projects -----

Dan Smith explained that the reason that so much information was being disseminated was due to the eschatological implications of the psychotronic research underway at covert government research facilities.

It would seem unlikely that this type of technology is currently feasible. After all, if the government had access to psychotronic weapons, why didn't they induce Saddam Hussein to stroll naked through the streets of Baghdad, asking his subjects to admire his new clothes; or simply cause a major blood vessel in his brain to burst?

But Smith sincerely believes that such technologies are being developed, specifically under the guise of "non-lethal" weapons research, such as that headed by John Alexander. Smith says, point-blank, that this technology is nothing less than "black magic."

Supposedly, this business is taken so seriously at upper echelons that the Secret Service retrieved all of the bloody bandages discarded after Ronald Reagan was wounded in an assassination attempt, lest the president's blood be used in a "black magic" ritual that could influence his behavior. I suppose this story is somewhat more credible after the revelations concerning the Reagan's "court astrologer."

According to Dan Smith, use of these psychotronic techniques entail a perilous threat to democracy -- potentially, a type of instantaneous mass mind control to program a pesky proletariat -- and worse.

These claims should be taken into context of published papers on the ability to induce auditory sensations through microwave bombardment at certain frequencies. In Alexander's book, "The Warrior's Edge" (with Morris and Grollier), he states matter of factly that remote viewing and psychokinesis are not only real, but have predictable, practical applications. Indeed, the focus of the book is how to utilize mind control techniques to achieve an advantage over one's adversaries.

There's absolutely no telling what Cold War ethics combined with unlimited budgets and zero accountability could have wrought in terms of Frankensteinian scenarios. To elucidate this point, I present this extract from a paper by Ray Boeche, a Lincoln, Nebraska, theologian and Fortean researcher.

"To all interested researchers:

The following is an edited version of material given to me in late 1991 - early 1992, by two scientists who claim to be working in weapons research and development for the Department of Defense.

I am not in a position to comment on the truthfulness or accuracy of the information. The two men who have spoken to me do, in fact, exist, and for all intents and purposes seem to be who and what they claim. The very nature of the claims makes verification difficult, if not impossible.

Divulging this information was the result of a moral dilemma, when these two individuals, both Christians, became alarmed at the course their research efforts into psychotronic weapons was taking under the direction of their (unnamed) superiors. They described an obsessive effort to contact and attempt to control what they referred to as "non-human intelligences" (NHI), and to harness these NHI for military and intelligence uses.

The efforts had progressed well past attempts at practical applications of David Bohm's theories, and had grown to encompass the use of, according to their statements, "satanic rituals / ritual magic along the lines of that espoused by Aleister Crowley, including human sacrifices."

These gentlemen stated their concerns that, even when they were apparently able to harness or channel these forces or abilities for "good" uses, the force would "turn," and ultimately all of those subjects involved suffered varying degrees of negative effects from contact with these forces. They are convinced that what is being tapped into in all instances is evil, and that this research should cease.

Contact has continued on a limited basis, with no new information of significance forthcoming."

After speculation as to the physics of the paranormal, Boeche sums up the startling details he received:

Information given, but not allowed to note during meeting: Discussion of individuals killed during psychotronic weapons experiments.

1. Male, white, 25-30 yrs., allegedly death by remotely induced cardiac arrest.
2. Female, white, 20-25 yr., allegedly death by remotely transmitting and creating head trauma equivalent to crushing of right anterior portion of the skull.
3. Male, white, 30-40 yrs., allegedly death by remotely controlled suffocation.

Setting was in a laboratory environment. Alleged victims were wired for EEG & EKG, seated in reclining chair, somewhat similar to dentist's chair.

In efforts to establish contact with non-human intelligences, every avenue is being explored. Satanic rituals involving human sacrifice have been performed. Much study is/has been given to writings of Crowley.

Bentwaters experiment was the projection of an actual, physical three- dimensional object, which could and did interact with its environment, but was create and controlled by individuals involved in this research.

No project names were given because the sources were too concerned that a leak would be traced back to them."

Mr. Boeche used the term "scripted" (i.e. slow enough to allow for copious note-taking, except when he was asked to cease writing during the descriptions of the psychotronically induced deaths) to describe the presentation delivered by the two putative DoD scientists. In my communications with Mr. Boeche, he was at a loss to explain why the two DoD scientists were still working on projects they found to be morally repugnant, and if they really wanted to blow the whistle on this activity, why did they reveal it to an obscure ufologist and not the New York Times or "Nightline." I have to agree with Boeche's assessment that the story is probably disinformation for some unknown purpose.

The only question here is -- what could the motivation be?

The story related by Ray Boeche is supported by Dan Smith's thesis, i.e. humans are messing with forces that are getting out of control, perhaps with disastrous consequences. According to Smith, these "sorcerer's apprentices" are going at it hot and heavy at government psychotronics labs in or near Los Alamos, New Mexico.

It has been rumored that there have already been several high-level meetings between those who are concerned about secret psi/UFO programs and representatives of the Clinton administration. According to one rumor, Pelican met with Jack Gibbons, the White House Science Advisor. Gibbons is reported to have responded that "the President shouldn't touch this topic with a 10-foot pole." Instead, meetings concerning these "black" psi/UFO projects have been channeled through the Vice-President's office under the cover story of "alternate energy sources." There have also been meetings with Senate Intelligence Committee Chief of Staff, Dick DiAmato, who is said to be interested in the ongoing strangeness at Area 51.

Variations on this rumor have John Alexander as the contact with the Clinton administration. This makes a

certain amount of sense, in that Alexander knows Al Gore from his days as a Senator, when he taught several Congressmen, including Gore, some basic Neuro-Linguistic Programming techniques.

Interestingly, the subject of "Presidential Haircuts" may be connected to this affair. It has been independently reported to me that Mr. Clinton had another delay on the tarmac in Los Alamos, after his tour of high-tech research facilities in the area. This was just days before the LAX / Christophe incident. The inference from this is that either the President's hair must grow very fast, or else highly secure meetings are occurring on airport runways (presumably Air Force 1 is bug-free).

A Conversation with Pelican -----

In order to give Pelican an opportunity to confirm or deny the eschatological scenario presented by Dan Smith, I gave him a call. Readers who expect dramatic revelations will be disappointed, although Pelican did provide some interesting tidbits.

First, he sounded much younger than I expected. Second, he had a very sharp sense of humor (I had to laugh out loud several times during the course of our conversation). I limited my questions to the subjects of eschatology and the Aviary. His answers seemed forthright -- he didn't seem stressed to avoid any particular topic, and I found him to be quite convincing.

My first question dealt with Dan's statements concerning dangerous "black" programs that were out of control. Curiously, Pelican responded that "Dan isn't cleared for that kind of information" -- not exactly a repudiation of Dan's story.

Pelican did admit that he talks to Dan frequently -- about physics. When I told him that Dan had been claiming to be a "conduit" for semi-official information from him, Pelican rather ambiguously stated, "He may very well be doing that... I talk to him once in a while and we share information. I really don't tell him anything that's classified or work-related... he certainly isn't functioning in the role of a conduit for me."

I quoted Dan Smith's statement to the effect that "the best place to find fellow eschatologists was in the intelligence agencies," to which Pelican responded "he didn't find any here" at CIA.

I inquired about the status of psychotronic weapons research. Pelican was dismissive of the entire subject, calling it "modern-day shamanism." He also stated that psychotronics is only taken seriously in countries like Russia and China that do not have the rigorous peer-reviewed scientific establishment such as in the U.S.

I raised the subject of Psi Tech, and Ed Dames' risking his company's reputation on his prediction of an overt alien contact in the Chaco Canyon area by the end of August '93. "What reputation? It's a joke... the only paying customer Psi Tech has ever had was Dan Smith himself, who gave Psi Tech \$3,000 to remote view a crop circle being made," Pelican responded. I asked about the high-level personnel on Psi Tech's board of directors like Stubblebine and Alexander. Pelican was dismissive of Stubblebine, recounting that Stubblebine's nick-name was "General Spoonbender," due to his belief in psychic phenomena. Pelican holds Alexander in considerably higher regard, however, stating, "he's a friend of mine."

Next, I asked about the Aviary. According to Pelican, the Aviary is nothing more than the product of the somewhat-deranged mind of "Falcon," retired Air Force Captain Robert Collins, who worked in Foreign Technology Assessment in regards to missile technology -- not AFOSI as is widely believed. Pelican said that Collins was discharged from the Air Force after breaching the security perimeter at the Manzano nuclear weapons storage facility at Kirtland AFB.

When taken into custody by base security, Collins told them he was there "to meet the President." He was discharged shortly thereafter (Dan says that this incident was orchestrated by Bill Moore, with the hapless Collins left twisting in the wind).

Soon after his discharge, Collins began mailing letters "...with my real name and address on the outside, and my

codename on the inside," said Pelican, who considered these mailings such a hoot that he posted them on his office wall for the entertainment of his CIA colleagues.

All in all, an interesting conversation, but I was (as the reader undoubtedly is now) more confused than ever.

Of course, nobody is shocked any more by government denials that turn out to be less than truthful, but as I said before, Pelican was very convincing. He reiterated Dan Smith's proviso that I keep his name confidential -- not to keep him from being deluged by UFO kooks, but rather, so he wouldn't receive unwanted attention from foreign agents -- a condition that I'll honor, even though Pelican's real name is already well known to researchers following this story.

Alien Eschatology -----

Against this flurry of phone calls, rumors, denials, and confirmations, HUFON's own abduction research has uncovered an eschatological angle. It seems even the abductors are getting on the eschatology band-wagon with abductees reportedly meeting (or at least perceiving) God, Jesus, dead relatives, and the like, often with dire warnings concerning "the end of the world."

Senior HUFON abductions investigator Dale Musser does not take these accounts at face value, nor does he reject them outright. Musser had this to say about "spiritual" aspects of the abduction phenomenon:

"This theory is one held by a number of abductees. Most of these abductees have been told by the abductors that the aliens have the right (implication of a divine nature) to do the things they are doing to the abductees. That they are here to save the earth (exact means of doing this vary from subject to subject) and to help us. Usually the abductee is told they were "chosen" and are made to feel important because of this selection. Often they are told that at a later date they will 'know what to do,' or they will "understand when the time is right." The true nature of the beings themselves is never explained, but left to the individual to determine. Many believe them to possibly be angels, or other entities, in service to a deity. There does not seem to be any clearly defined message, nor are the messages consistent from one abductee to another.

"There are several problems with this theory from an investigative standpoint. First there is even less proof for their statements than for the abduction itself. The vagueness of the messages certainly does not relate to trying to convince us of their concern about the issues. Second, the means and methods of relaying the messages have the lowest probability of achieving results. Third, the messages given are usually interpreted after an event has occurred rather than before, therefore, one never knows for sure if that's what was truly intended. Most events predicted, or messages conveyed which are to be understood later, almost never happen, and those that do are subject to question. Fourth, the religious significance of the abductors is usually relevant to the belief system of the abductee. It is not universal to all abductees.

"It would appear the abductors 'access' the belief system of the abductee and play back a scenario that will be acceptable to the abductees and make them more cooperative. If the individual is Judeo-Christian, the aliens and their purposes will appear to fit within that system. If the subject is a Buddhist, the scenario will be within that belief system. However this is not always true. In one case, an abductee (who was Christian) was presented with a totally pagan and mythical belief scenario. A mistake, or a test? Who knows?

"What we do know is that there does not appear to be any consistency to information in these events other than making the individual believe the abductors are here on some sort of divine mission. It is interesting to note that atheists seldom have encounters where they are presented with religious scenarios. Often they are presented with the idea the aliens are here to help us prevent the same fate which supposedly befell their own world. It is hard to believe there is any truth to these spiritual connections and beliefs when so many differing ones are presented, some in conflict with the other. The conclusion one could draw from the data presented is "whatever works, they will use."

So, the abducting entities can't seem to keep their stories straight. One would expect at least consistency from advanced alien beings, heavenly angels or demons from hell -- whatever they may be.

Novelist Whitley Strieber, whose abduction experiences are described vividly in his non-fiction books, "Communion" and "Transformation" recounted that when he asked the entities what they were up to, they responded "We recycle souls." He too was shown "lessons" concerning a catastrophe affecting the earth.

Strieber, who has become "alienated" from organized ufology due to his refusal to categorize the entities he encountered as extraterrestrial aliens, can only characterize the phenomenon as "not a dream, not a hallucination, and not real - something else."

Which brings me back to the subject at hand: what is going on?

In a word, confusion. There seems to be no correlation between the perceived abduction events and Dan Smith's eschatological emergency caused by the practice of "black magic." Smith does seem to be hedging his bets at times. He has told me that the eschaton event could be a "benign eschaton," consisting of a universal and positive shift in human behavior due to Revealed Truth. I could go for that...

Just as occurred in the waning days of the year 999, when millennialism swept through Europe causing a virtual societal breakdown, today there is a growing millennialist movement where many of the faithful foresee a period of catastrophic "Earth changes," and Armageddon, the fulfillment of biblical prophesy.

Fundamentalist Christians eagerly await this disaster because it will usher in a thousand-year kingdom of Jesus on Earth.

New-Age channelers are also getting into the act with messages from angels/ avatars/aliens warning of imminent "Earth changes" along with warnings against gun control, Zionism, the "New World Order," and other right-wing paranoid delusions.

When considering these claims, one would be remiss in not pointing out the upsurge in reports of Blessed Virgin Mary (BVM) sightings, and other paranormal events of religious significance to the experiencers. As with the many New Age channeled messages, many of the reported Marion locutions warn of "Earth changes" and the "End Times." Starting in 1981, the most spectacular and long-lasting BVM visitation (with scads of witnesses to the "miracles") occurred in Medjugorje, on the Adriatic coast of Bosnia Herzegovina, now one of the most horrific hell-holes on the planet. So much for the positive spiritual effects one might expect from from such beatific locutions. Maybe things just aren't what they seem.

Anyone familiar with UFO-abduction accounts is forced to conclude that weird things are happening or at least being perceived as happening by large numbers of otherwise sane, functional people. Some of these abductions reports are so bizarre, and with so many similarities to BVM encounters, that many thoughtful researchers have abandoned the extraterrestrial hypothesis in favor of the metaphysical or interdimensional hypothesis.

Dr. Jacques Vallee has even incorporated the high strangeness of these events into his comprehensive catalogue of close encounters under the rubric of "reality transformation."

As author/futurist Arthur C. Clark is quoted as saying, any sufficiently advanced technology will be indistinguishable from magic. David Mayo took this concept a step further when he stated that if advanced technology appears to be magic, then technology an order of magnitude beyond that could have the appearance of nonsense to our primitive simian brains.

But if there really is such a thing as "black magic," and government scientists are experimenting with it, I suspect that they could be blindly running the same risks in dealing with such unknown forces as the 19th-century scientists who thought nothing of casually handling radium and other radioactive materials.

With the clock inexorably ticking off the seconds until midnight, December 31, 1999 (a date that seems to have

some special significance to the millennialists) eschatological fervor will undoubtedly increase. Meanwhile, whoever or whatever is behind the UFO phenomenon is apparently doing everything possible to keep the true nature of this mystery from being understood.

But rather than being an indicator of biblical "End Times" or "Earth changes," the barrage of UFO reports, BVM sightings, abduction accounts, channeled messages, religious hysteria, and inside poop from the CIA are probably nothing more than further attempts to distort the signal with more noise.

Many thanks to Robert Durant, Dale Musser, Ray Boeche, George Hansen, Ron Madeley and of course, Dan Smith for their assistance on this story.

The Logic of Existence

Contra Physics

My contention is that logic is a necessary component or arbiter of existence. Let us examine this premise and its consequences.

A starting point for this inquiry is the not so innocent question, "Why is there something rather than nothing?" Generally physicists try to avoid this question, but the expanding scope of cosmology renders this avoidance ever more difficult.

Physicists tend to be hardheaded about philosophical issues, and so take existence for granted. On the other hand philosophers have shied away from cosmological questions lest they step on the toes of the physicists. The logic of existence falls right into this chasm of neglect.

Physicists are increasingly confronting the question of possible worlds. In the days of Newton, when physics was simple, it was difficult to imagine any other reality, but as physics and cosmology become more complex this is no longer the case.

The gradual rise of the Anthropic Cosmological Principle to prominence within physics and philosophy is symptom of this trend. The basic issue is whether the existence of an unobservable world is possible. The naïve answer is 'yes,' but we are being forced to become less naïve.

Might there have been nothing? With 'inflationary' cosmology the trend is to posit an infinity of self-contained universes, but who is to say that inflation is necessary?

We can turn the first question around by asking if anything exists necessarily. The logical answer is 'yes.' Since we know that something happens to exist, it is true that the possibility of existence is necessary. There is also the possibility that nothing exists, but that does not rule out the possibility of something. In other words, the impossibility of existence is not possible.

So what? Where does this word game get us? We now know that the least possible existence is the possibility of existence. This is the minimal reality. But can we up the ante, logically?

What is the nature of the minimal possible reality? Can we not say that since Bill Clinton exists that his possible existence is necessary and so our minimal possible world necessarily contains the possibility of Bill Clinton, however dismal some might find this thought? Maybe!

It is important to notice something about the necessity of possibility. Possibility is a concept; it is not a thing. Concepts exist logically prior to anything else. Now you see the logical trap that I have set for the physicists. Can they not walk out of it?

In the greater scheme of things, which has priority: logic or physics? This comes down to the issue between Bohr and Einstein. It is not so much the question 'Does God play dice?', but rather 'Could God play dice?'

The surprising answer, even to me, is 'No.' Does this mean that Bohm is right? Yes and no.

The only way to rule out possibility is to posit an omniscient, omnipotent God. But the necessity of the concept of possibility implies the necessity of a primordial conceptualizer, which leads back to the previous concept of God. Possibility necessarily raises its ugly head, only to be overtaken by a larger necessity. So here we are back in Leibniz minimal/maximal, best/worst of all possible worlds, making a long story short.

Yes, this is a word game, but it is finally the only game in town. It has logical and conceptual precedence over any game that physicists will ever play, unless they choose to become Bohmian/Leibnizians, which they will choose to become out of necessity.

rev. 1/24/00

Potency

The Force of Existence

Existence is very far from being a brute, objective fact. Existence is irreducibly bound up with other concepts such as presence, potentiality and possibility and is also irreducibly relational. The opposing view is that existence is definable just in terms of interacting particles moving in space. We have a choice between conceptual and physical existence.

We have good reason to suspect that physical reality is only an abstraction from a deeper conceptual reality. The universe is more conceptual than mechanical. It is a mental construct. The ground of reality is not space-time, but rather a cosmic mental potency of which we are the actualizers/realizers. This is the deeper unified reality toward which an objectifying physics strives in vain. This misconception of physics is most evident when it strives to make sense of our own minds.

Physics has a tenuous grip on reality. It deals in superficial detail with a very abstract model of existence. The technological successes of physics too easily blind us to its obvious shortcomings. We mistake the model for the reality.

I hasten to point out that phenomena in the quantum realm have led physicists to adopt the formalism of a probability space, called Hilbert space. This might be considered a step in the right direction, a step toward a more robust treatment of existence. This could be viewed as an attempt by physicists to construct a more intensional (sic) version of reality, in an attempt to bridge Descartes divide between the extensional and intentional.

Simply adding fields of higher internal dimension along with probabilistic measures and non-local interactions does not actually get us closer to anything intensional, much less intentional.

For an object just to exist, it has to maintain a state of potentiality. It has to maintain its essential properties, and this is not just a matter of epistemology. This is an ontological necessity. An acorn is not an acorn if it is not also a potential oak. If we took a DNA sample from an acorn we could determine that it was an oak seed. We could say that if it were properly planted it would turn into an oak tree. Right there we have a 'counterfactual' statement. It is this innocuous step that poses the problem for physics.

The electric force is the gradient of the electric potential, which is the energy required to move an electron to a given point. No mystery there, or is there? Where does the epistemology end and the ontology begin? Perhaps even with Faraday we have inadvertently bridged the Cartesian divide to a more robust, intensional concept of existence. If the acorn were to fall it would hit Newton on the head with the force of its potential energy become kinetic, and then become an

oak, maybe.

We do not fully describe the acorn's existence without reference to its various potentialities. Physics and biology can explain transformations after the fact, but that is epistemology not ontology. I have to employ my imagination to understand the full ontic situation of the acorn. Physics can aid my imagination, but hardly supplant it. Physics alone is seriously lacking in the existential dimension. The factials cannot capture the counterfactuals essential to existence. My not so modest but sustainable claim is that ultimately it is the cosmic mind that maintains the essential potency of existence. We exist in the cosmic Imaginarium.

The meaningful potency of reality is the essence of existence. Physics abstracts away from that essence and thereby abstracts itself away from reality, not toward it, as some folks would have us think.

rev. 1/25/00

Latency

Further Refinement

In order to understand a particular pendulum I must think of it in relation to an ensemble of pendulums and other objects similar to it under a wide variety of circumstances. Technically this would be the extension or denotation of the word ‘pendulum.’

A physical description of a particular pendulum would refer just to that one object. Appended to that description could be some idealized equations of motion along with suggested algorithms for their solution.

Which is the real pendulum? Is it the representative of the ensemble I imagine or is it the ‘physical’ one? Surely the essence of ‘pendulum-hood’ is captured only by the ensemble in my imagination, but is that extensional meaning essential to the reality of the actual pendulum?

Within the reality of the pendulum is the latency of the ensemble. This is the implication of what it is to be that pendulum. The ontology must subsume the epistemology, or we have no pendulum at all. We would have merely the residuum of an abstraction. On the one hand we have the actual pendulum, on the other hand we have the ‘physical’ pendulum.

But this is only half the problem for physics. The above employed extensional theory of meaning is false. The meaning of a word is now known to extend beyond its extension or denotation. Intension or connotation is essential to any meaning. I then contend that the full meaning or idea of the word must somehow be subsumed in the actual object, or that object is bereft of its actual, physical (sic) potency, i.e. it’s reality.

That a particular Steuben vase is fragile is not just a figment of my imagination. It actually is fragile. Yet all the physical formulas that might be brought to bear on the vase will neither denote nor connote its fragility. One could even provide a strain formula for the particular type of glass that could quantify a breaking point, and paste that formula on the vase to serve as a ‘fragile’ sign. One could even program a computer to ‘infer’ fragility from the formula and print the appropriate sign on the vase. We now infringe on the realm of semiotics, and physics is not about semiotics.

The vase is not merely physical; it contains the ‘ghost’ of its own latency. I am pointing out that if we are concerned about ghosts in the machine, we need look no further than the nearest vase. This fact should make the inherent limitations of physics patently obvious in comparison with the robust nature of reality.

rev. 1/25/00

Meltability

A counter example?

Consider the lowly ice cube. Take it out of the freezer and it melts. Nothing spooky about that. No?

Let me concede, at least for the sake of this argument, that melting is a purely physical process, saying this as an immaterialist with my fingers necessarily crossed. Meltability, however, is another thing.

We all know that ice cubes are meltable, but does the ice cube have to 'know' that?

No, but it has to be that. The ice cube in the deepest freeze is just as meltable as the one on the hot stove. This is a universal property of ice. Melting is a quintessential physical process, but does that make meltability a physical property? Indeed, am I challenging the logic of calling anything a physical property? Yes, it is an oxymoron. There is a relevant distinction between process and property. They are equally real, but not equally physical, not at all. Standby for the semantics?

Melting is reducible to molecular motions. Meltability is not. Meltability is irreducibly holistic. It has purely relational aspects that extend well beyond the ice cube per se, but which finally can belong only to the cube itself.

Could not the meltability of the ice cube simply be denoted by the range of physical circumstances under which it would melt? The problem is that a given ice cube need never exhibit a property in order to have it. Properties are generally counter-factual. That is the latency/potency of properties. A property is actual without being factual. There is simply no conceivable construction within physics that could capture this crucial distinction; a distinction that is crucial to every existing entity.

I am hereby suggesting a very simple basis for a variety of panpsychism. Brutish matter cannot be totally brutish and still be knowable. Knowability has to entail a minimal reciprocity. That reciprocity lies in the inherent latency of all matter, not in the pineal gland nor any other physical place or process. I am simply verbalizing what animists know intuitively.

The physicist will object that her being able to predict the melting of any ice above a given temperature is a perfectly valid proxy for the property of meltability. But meltability is not about physicists and their predictions. It is the permanent condition of every ice cube's existence. The physicist will persist. By inspecting the lattice equations of the ice crystal she can clearly see whether and how the ice will melt in any given circumstance. What more more can I ask for? What is happening is that the physicist is substituting her trained imagination for the latency of the ice. That is what she is trained to do, but in the process she is

attempting to substitute her anima for that of the ice. Physics then is a highly sophisticated form of animism. There is absolutely nothing wrong with that, excepting our failure to see it for what it is. Because we do not see the animism in the heart of science, we fail to see it in nature. The scientists unwittingly sequester it unto themselves for the detriment of all.

Not until scientists attempt to explain their own anima do they get into serious trouble. Then they begin to stumble over themselves looking for it in all the wrong places.

Charge

Abstracting from reality

Electric charge is a quintessential 'physical' property. In what way, however, is it an abstraction? In what way does reality exceed the formulas?

What we too easily forget is that an electric charge is something unnatural. The mere fact that entire industries have sprung up around the unnatural abstractions of electricity and electronics and created a separate electrical reality does not speak to this more basic issue.

It is a categorical mistake to suppose that the electron in your brain is the same as the electron in your computer. Only in a very narrow technical sense might they even be compared. The electron in your brain has holistic properties that are absent in the computer.

Turning the argument around leads to the conclusion that there are no electrons in your head. Electrons cannot be taken from your head; they may only be abstracted therefrom. Until we can appreciate this basic distinction, we will not understand the distinction between artificial and natural intelligence.

It is true that quantum physics does recognize the issue of entanglement. Electrons never exist as individual entities. They exist only as irreducibly entangled components of systems, be they natural or unnatural systems. What quantum physics fails to appreciate is that just because we can take a system apart does not mean that we can put it back together again.

Quantum physics tells us that electrons behave as waves, not unlike acoustical waves. An electron wave function of a particular energy would have some of the properties of a pure musical tone. Can we not then synthesize a musical work out of such tones? The simple mechanical act of transcribing and recording music should serve to demonstrate that.

Clearly the tone out of context bears no subjective resemblance to the tone in context. But the technology insists that this distinction is merely subjective. This may be the whole point. Where is the proof ultimately if it is not in the pudding? I am contending that objectified music is no music at all. How do we manage to confuse the scratches on vinyl with the real thing?

The composer and conductor have an idea about a piece of music and they are more or less successful in conveying that idea into my mind through various media including airwaves. We analyze that conveyance objectively and come up with a sequence of tones. The tones convey the idea of the music by being the tokens of it. May we not then suppose that charges, electrons and other such entities are mere tokens of the systems from which they are abstracted or objectified? But the

system itself need be no more objectifiable than the music.

Can we be that dense? Can we be confusing the map with the territory? Is that what scientific materialism and physicalism are all about? At times the map can be very helpful. It can prevent us from getting lost, but at other times it may just lead us straight into the woods.

rev. 1/28/00

An End to Complexity?

When will the limits of physics rain on our parade?

There are various candidates for the cause, for the beginning of complexity. What though might be the end of complexity?

It is a basic tenet of materialism that there is no end to complexity, other than what might be arbitrarily imposed by the inherent limitations of physics.

All of us have access to evidence that appears to contravene this materialist convention regarding complexity. That evidence is the so-called unity of consciousness. The human brain is uncontroversially the most complex system known, looking from the outside, at least.

The view from inside the brain paints a different picture. There we have the unity of consciousness. The principle of unification is the self. There seems to be a control center amidst the buzzing, blooming confusion of the brain. The neuroscientists cannot locate this center. It is everywhere and nowhere.

The materialists have come up with two flatly contradictory explanations for the unity of consciousness:

1. it is our primary illusion
2. it has evolved as our primary mechanism of survival

One might wish that they would make up their minds (sic)!

The human brain might be the epitome of complexity, but certainly it is not end of complexity. Nature abounds in complexity as we view it from the outside. Precious few of us have been granted a view of the inside of nature, even if there could be such a thing.

Beyond nature we have the exploding complexity of the world of human artifice, now being epitomized in the Internet. One shudders to imagine what it would be like to be the Internet! Most of us would pass on that.

Then there are the theists or, somewhat more accurately, the Teilhardian/Aurobindian panentheists who envision an inner unity or telos of creation. The buzzing, blooming confusion of the human infested cosmos is just the outward manifest illusion of an inner unity of the mind of God that is the strange and great attractor of all creation. That divine unity is the beginning and end of all complexity.

The materialists scoff. The rest of us wonder. There is the angst of self-doubt, deserved self-loathing. I think, therefor I'm not.

The Sarfattian/Bohmians place themselves squarely in the center of this confusion. They wonder which way is up. They suppose there must be a reason for the complexity. This much complexity can't quite be an accident. They posit a strange, back-acting, morphogenic loop in the physical substratum that is the matrix/mother of all complexity. Quantum back-action is the bootstrap of creation.

Self-determination is built into the most basic machinery of the universe. Evolution is an acting out of this self-determination. And here we are still in the midst, still in the throws of this acting out. What comes next? Is there an end to this complexity? When and how will the limits of physics rain on our parade? If we live by the physics, must we also die by the physics?

99.9% of humanity don't care, don't want to know.

I say that it all depends. It all depends on whether there is an inside to complexity. It all depends on whether there is also a cosmic self-determination. Can we deny there is an inner quality to our own complexity? There is something somewhat simple about what it is like to be the most complex of creatures. Is there also something like what it is to be the cosmos? And finally, where lies reality? Does it lie inside or outside? It all depends on how we wish to go.

If there is no inside we will end up as infinitely cloned silicon processing nodes on the Cosmic Internet, the weather and physics permitting. What then will it be like?

If we don't like it, who will pull the plug? What will be the final thought? From inside that Cosmic Brain Vat how will we know what is up or down, what is inside or out, and will it matter? Does it matter now? How long must we wait to find out?

rev. 2/25/00

Leverage

An inside view

If there is a problem of complexity, it undoubtedly involves the issue of control. Complexity without control is chaos. Complexity implies a functionality, which defines how the parts of a system will cooperatively interact.

Four types of complexity may be observed: mechanical, cybernetic, organic and inorganic. With mechanical complexity, control is explicitly designated in the overall design. Some stabilizing features will be implicit in the design of individual components. With cybernetic systems, particularly those that are decentralized or networked, the design strategy is to limit the degree to which any one node may co-opt or disrupt the functioning of the network, while enhancing communication and cooperation between nodes.

Organic systems exhibit many features of cybernetic systems, which often were copied from them. The cell is the quasi-independent node of a multi-cellular system. Cellular differentiation determines which group of cells performs which cooperative function according to the given genetic script. Inorganic complexity follows from physical laws. In regimes near to phase transitions there can be morphogenesis in the long-range order, and far from thermal equilibrium complex arrays of dissipative structures may arise.

Organic systems often exhibit complex patterns of behavior oriented toward their survival and reproduction. Humans often report on their ability to exercise considerable control over their own mental and physical behavior. There are no outward features of the human brain that might account for this intentional behavior, leading many scientists to suspect the validity of these reports.

As complexity proliferates, the issue of control arises with greater urgency. Market oriented democracies rely increasingly on the voluntary self-control of the citizenry, despite the misgivings of scientists and other skeptics. Many participants appear willing to either surrender or assume control on almost any pretext. One wonders about the limits of complexity for human societies. We are induced into patterns of behavior that are at an increasing remove from any conceivable genetic endowment. The dexterity of the invisible hand of economics is perhaps being overtaxed.

Indigenous societies uniformly exhibited elaborate schema for maintaining their harmony with nature. Our once aberrant effort to seize control of nature has now become the norm. The general sense of harmony and belonging gives way to alienation and anxiety. Advanced societies witness sizable segments of their populations turning inward to seek various forms of spiritual counsel and solace.

Any thoughtful observer must wonder about the possible inner dimensions of

complexity. Is human intentionality just an aberration or an illusion? If not, we should be conscientiously attending to this dimension and seeing if some greater source of intentionality might enlighten our individual intentions.

Any such source would provide an Archimedean point of leverage for redirecting human behavior. In the absence of any greater internal leverage we find ourselves more susceptible to external impositions. Issues of trust will contend with issues of control.

A Matter of Non-Contradiction

And a tribute to Leibniz

In these postmodern times Leibniz looms large as one who could save rationality from Newton's deadly embrace. You do not want to leave home without his sufficient reasons, monads and indiscernibles. To these armamenta, I can think of one addition that may have been over-looked for being too obvious. Let us consider non-contradiction.

The first non-contradictory thing to come to mind is the null set. The skeptic might suppose that 0 is the only thing that is not self-contradictory. 'Au contraire,' says I contemplating non-existence. Non-existence is the most impossible of all possibilities. The lowly square circle has a kind of existence, even if it only be one of notoriety.

The only thing that could be more mysterious than existence would be its total absence. Certainly no one could vouch for its absence. The only place for non-existence is nowhere. Existence is everywhere else, especially here now.

If non-existence were something logical you would have a contradiction by appealing to the existence of logic. It would then have to be alogical, and that would be its minimal yet perfectly extant attribute. Even if non-existence were possible, how could we rule out the possibility of existence without invoking a rule? If possibilities were not real, you and I would not be here.

Our dilemma is that both existence and non-existence are contradictory. The evident result is us with all our potent contradictions. This is the dialectic of existence, or just existentialism. The dialectic view gives too much credence to the contradictions of time, and so we suppose there is a be-all and end-all. That is the logical end of contradiction with just that unavoidable suspicion of terminality.

Non-existence and partial existence are both illogical. The be-all and end-all is the closest we get to non-contradiction. This is the inescapable monad.

Logic should now appear less passive and abstract. It may even be identified with or indiscernible from the life force. The irresistible life force meets the immovable logic and they turn out to be one from the perspective of the one non-contradictory monad.

Atlas v Chicken Little

What holds up the sky?

Question of the day: What holds up the sky?

In mythic times it was Atlas who held up the sky, as in 'reach for the sky,' or further East is was a turtle that held up the Earth.

I have another idea.

I say that logic holds up the sky. This is not just any logic, it is monadic logic, and as I am wont to do I will argue with some cogency that monadic logic is difficult to distinguish from anthro-teleo-logic, or from just plain agape/love, for that matter.

What holds up the pie in the sky? I mean what holds up pi. I will argue that the force that fixes pi is the same force that fixes the stars, more or less. The same force that is with us.

How is pi fixed? By logic? And who fixes logic? Ask 100 mathematical philosophers and you will get 100 different answers. Am I smarter than 100 mathematical philosophers? No, I just have a little more horse sense.

The fixity of pi has both mathematical and physical aspects which ultimately, in true monadic fashion, are indistinguishable. The fixity of pi points to the incredible monadic unity of mathematics. Every respectable mathematician has come up with at least one novel formula for pi. And guess what? They are all equal. They all point to the incredible richness and precision of math, that we love to take for granite.

Pi is a candidate for the mathematical monad, or grail, if you will. It is the solid anchor of the endless convolutions of abstractions that make up the exploding/imploding body of mathematics.

My claim is that the starry heaven is another manifestation of the ultimate monad. That is the ultimate Pi in the Sky. That is our mana and our fortress.

There is a logic to the stars. It is anthro-logic. If the stars were not just so, we would not be here to contemplate them. The physicists say that we are made of star dust. We anthro-logicians say that the stars are our mind dust. Each star is like unto a unique formula for pi, only we have not yet figured the astronomical version of pi. The fact that 10^{10} is a magic number in astronomy, physics and biology is a clue to help us discover that monad.

As we persist in saving the astronomical phenomena with our phenomenal M and now K-theories of Everything, that point to the ultimate convergence of astro-

anthro-psycho-logy, can we not see that the monad is ours for the asking?

The fixity of pi is dependent upon the fixity of physical and abstract geometry and upon both our mental and computational techniques and aparati, and upon quantum based classical determinism, not to mention space-time. The fixity of pi is then not very different from the fixity of the energy levels of hydrogen which also depend on pi, as much as pi depends on them. There is an eco-logy of knowlege that points to the unity of existence which is the monad. 'Eco' means home. The cosmos is nothing other than our home. The monad is our ultimate home. We are the home boys and girls. That is our great, inevitable, agapic attractor.

What keeps the stars and atoms and pi all in their proper places is the same teleo-anthro-eco-logic. It is an irrefutable logic despite Samuel Johnson's attempt to refute it by the mere kicking of the stone.

But Chicken Little will refute this logic and she will not even have to kick a stone. She will sing the song and tell the story that will reopen the flood gates of our memory of auld lang syne. With our renewed psychic alignment it will be as if the value of Planck's 'h' were to increase as we are reusherred into the final shamanic dream time. That is how the sky will fall, how Atlas will shrug. One will have to be stone deaf not too hear the music of the spheres. Even the stars will dance to this tune, oh ye of little faith.

It is as easy as pi in the sky.

| [Contents](#) |

rev. 4/17/00

Society for the (Non?)Preservation of Pi

We may have a case of the Preservationists v the Circle Squarers, or the Irrationalists v the Rationalists, depending on one's belief about the true nature of pi.

Squaring the circle may relate to the building of a perpetual motion machine. Consider the Pi Alternator. In quantum fashion we may consider Pi to be the superposition of, say, $22/7$ & $355/113$. There would effectively be two curvatures of space and the (post?)quantum machine that could superimpose both of them would be able to generate perpetual motion. Non-decoherence would be mentally-shamanically maintained by a Sarfattian Chorus of back-acting dual rationalists. By such means we would gradually be able to effectively increase the value of the quantum 'h' without suffering any adverse anthropic effects.

This Pi Alternator would operate in a Maxwell Demonic manner rather like Apoorva Patel claims that our own enzymes work, as relayed by Dana Beal: <http://xxx.lanl.gov/abs/quant-ph/0002037>

If we could maintain the constructive interference of the Danas and Patels w/o the destructive interference of the Info Freakos we would be half way to the stars by now.

There will then be post-quantum computers that operate according to the various rational 'approximations' of pi, maintained by Sarfattian tribal/cultish back-acting ritualists, which are networked to produce the constructive interference that will augment the life force of Dana & Patel, without the Info druggies.

The Nomalies of physics are maintained in our collective psyche much the way our immune enzyme system preserves the nominal integrity of our bodies. Taking Prednazone is like increasing the quantum 'h', it tones down the immune system to allow the incorporation of 'parasitic' Anomalies, but one must then increase ones vigilance lest the Freako parasites gain entry, as opposed to the benevolent mitochondrial, perpetual motion 'parasites.'

Long live us SNaPPies in de-skies!

Chicken Little

rev. 4/17/00

One Atom, One World

Cosmic Economy

Physics disposes us to think of things as cheaper by the dozen. Physics is redolent in redundancies. Immaterialism, on the other hand, strives for economy. More precisely it strives for coherence. No, coherence is a given with idealism, the only option being the manner of its realization.

There can be only one ideal world. If there were two distinct worlds, one would be either redundant or less than ideal. We have good reason to suppose that human history constitutes the core of a reality, which extends significantly beyond what we presently know, while remaining knowable in its entirety.

Our world is a stretch. It pushes reality to its absolute limit, ne plus ultra. Our Earthly experience is the cosmic centerpiece. The ideal cosmic glue is our collective comprehension. Science attests to the fact that this creation has pushed coherence to its logical limits. The atom is the emblem of its logic.

There is one Platonic atom. All of the experimentally envisioned atoms are perfect renditions of the one perfect form. Atomic nominalism and minimalism are necessary to avert the dissolution of reality into myriad anomalies. The anomaly busting is done mainly by our plethora of contrivances that are network us into the atomic ideality of science. Our technological lives are held hostage to this ideality. Our magical selves are thusly held in check. Liberation comes only in a very carefully orchestrated eschatological/millennial context.

Our world is not overpopulated. It is merely stretched to its logical limit population wise, and every other wise. We would have it no other way in this singular world.

We are the high wire artists, suspended in history between the Alpha and Omega. There is no higher wire. Our mere existence attests to the solidity of our teleological moorings. As there is but one atom, there is but one self. Our singularity is complete. The perfection of the atom is manifested in the 10^{10} self-reflecting souls that it supports in its materiality.

The Solar system is a reflection of the cosmic atom. We dream of the solar induced photosynthetic virtuosity of our plants, but we dream cautiously lest we be sunburned. The eschaton is where caution is finally thrown to the bonfire of coherence. The mathematical coherence of the atom is reintegrated into the logical substance of the one self, which was its origin.

The contextual intelligence/integrity of atomic physics is thus ensured. All of biophysics is subsumed in the stretch between the self and the atom, down to the stretch marks themselves.

rev. 4/19/00

Kicking the Stone

Logic & Existence

Samuel Johnson when queried about Bishop Berkeley's immaterialism responded, "I refute it thus!" while taking a swift kick at a stone on the path, and feeling the full measure of its back-action. Let us consider that sorely abused stone.

That particular stone, wherever it now may rest, needs no further excusing of its immaterial existence. But what about its many more anonymous siblings? What about Pathfinder's immobile, photogenic neighbors in that Martian rock garden? What is the logic which brought them forth, just so?

There is, of course, the logic of the big bang, but I am not partial to that overly profligate logic. There is an overriding logic of creation that is not so wanton. Six billion humans is not wanton if we are the centerpiece of creation. The Monad puts most of its eggs in one basket and watches the basket carefully.

Why anthropocentric and not cukarachacentric? Earth may be hell for humans, but we appreciate our hell more than cockroaches appreciate this as their heaven. The big bang is largely wasted on the little critters.

On the premise of the big bang, we are parasites on the Earth. We now act out this premise on a daily basis. Perhaps there is a more logical premise? What then is the logic of malarial parasites? The logic is similar to that of atoms. It is all part of the cosmo-eco-logy. When Johnson kicked that stone he was just interacting with a piece of cosmic logic, just a chip off the old Monad.

Who needs accelerators? Physicists are only accelerating their pace of discovery now that they can dispense with those bulky machines. It's all right here in our heads. If atoms and rocks did not exist, neither could we, and still be called human.

When we turn our telescopes to the sky we see the logical beauty of the monad/monster group in one of its many manifestations. But it is a private showing.

Back to the Martian rock garden: its physics is about the same as for a rocky field in New England. This generic garden could logically exist anywhere in the universe. Going there ensures that it be in an eigenstate.

Hubble turns its eye on a distant galaxy, which has emerged from the possibilia, just so. The physics displayed will have to be conformable by the principle of sufficient reason. Hubble does not require the photographic angels to work overtime. We know that the form of any galaxy is latent in any atom, as its image is latent in the unprocessed film. The eschatological comprehension of the ideality of

the universe is all that finally matters. That is the only lasting quantum record. What we dream now is merely the teleological rationalization of the eschaton, as with the dream reversed causal logic triggered by the waking alarm. The eschaton has come and we think we live its dream while only remembering.

The final response to Samuel is that he has not yet kicked the stone that refutes Berkley. Not until it finds its logical place in all the tapestry of intervening dreams that pull us into the great eschaton attractor. The dreams that don't fit this dance of Kali are the ones that we are already forgetting. The symphony of the spheres is heard all at once and in no time, as in the intuitive flash of the composer. That is our reality, sub specie aeternitas.

rev. 4/19/00

Burnt Meat

A truth tested by fire

My intuition is that truth will be more like a fire than a melting pot. It will burn away our illusions, particularly the illusion of scientific, formulaic, impersonal truth.

The ultimate truth will be recognized in our hearts, more than in our minds. I stress that there are conceptual aspects to this heart-felt truth that will help us make the final leap, but that leap will also require faith.

In matters of the heart, it is not What you know, it is Who you know. Know Thyself, be true to Thyself. Know God, be true to God.

There HAS been, there HAS TO have been, within history, a singular Manifestation of the personal truth -- a living Manifestation with which virtually no one has a significant quarrel. This manifestation is our lifeline to God. We can make the leap without this lifeline, but it would be far more difficult. Let us not be so arrogant as to reject this blindingly obvious piece of cosmic assistance.

Everything else is either just gadgets or empty formulas. Do not put your faith in the void. Follow your heart.

There are people in these fora who have been dazzled by the supposed gadgets of the Visitors. They are much more concerned with the How of the Visit, than with the Why. In this case, the Message is in the Silence, not in the Medium. The Medium was merely intended to attract our attention to the Silence. It succeeded, but too many folks in these parts cannot get over the medium to hear the message. There is, to my knowledge, one singular close encounter which cut to the heart of the Silence. I speak of an incident recounted by Betty Andreasson:

Betty is standing in her kitchen when the visitors float in through the back door. She asks what they want. She receives the thought that they want burnt meat. She throws a patty on the skillet and quickly smokes up her kitchen. This action produces puzzled stares. She then receives the thought that what they seek is a truth that has been tested by fire.

That, my gentlefolk, is what this whole affair is about. Earth is the central, dense pit of the cosmos. It is here that the fire burns the hottest. For what other conceivable purpose would anyone bother to pass this way? That includes us, as well.

When will the blind ever see?

rev. 4/20/00

Now We're Talking:

$$\text{Post-QP} + \text{SISO} + \text{BWH} = \text{X2K??}$$

Jack,

Now we're talking:

- > While I cannot say as a matter of fact that The Soul =
- > Post-Quantum Information Field survives in a dormant state.....
- > quite possible since this personal quantum field can simply be a reduced
- > density matrix projection from a larger discarnate mind.

Correct, this was never intended to be a matter of fact.

However, mere possibility translates to virtual certainty under the Aegis of this being the best of possible worlds. In other words, if the soul is not immortal, then there has to be a very good reason for its mortality.

If we factor in the SISO, Super-Implicate/Sentient Order, and spice it with the BWH, best world hypothesis, Jack's Gospel looks a lot like Dan's and a lot of other people's Gospel, much to the relief of the universal pluralists, like Ed M, I would imagine.

$$\text{Post-QP} + \text{SISO} + \text{BWH} = \text{X2K??}$$

It then is a matter of a logistic difference between Jack & Dan.

How seriously should we treat the Bohmian (X)?

I submit that the historical origin for our modern seriousness about X (the World Config point) can be traced very clearly back to X0K. $X(\text{JC}) \Rightarrow X(\text{DB})$ has historical validity.

My thesis is that $X0K + X2K \Rightarrow \text{SISO}(\text{mod } X(\text{DB}))$.

Which is to say that we should store up our Treasure in Heaven, not on Earth.

With the Second Coming, be it Jack, Dan or some lesser light(!), we are not, however, advised to turn our backs on the Earth. Rather we NOW see this as our Millennial Kingdom and so treat it as our Heaven's (SISO) Gate (sic). Thus we would all belong to the Benevolent and Protective Order of the Earth (BPOE) for the Millennial duration. This millennial reprieve of our sentence should make our remaining incarceration here downright pleasant.

My remaining bone to pick with Jack concerns the Post-Quantum Rocket gambit. With the BWH, we have much less reason to leave our Home Sweet Mobile Home,

short of our final transcendental migration back to the SISO.

In other words, does P-Q Rocket == SISO Portal, possibly??? (Mod BWH, of course.)

Dan

The Living Hologram

Old wine in a new skin

The possibility that we inhabit a 'holographic' reality is widely appreciated. I should like to emphasize that our fellow creatures and we are the living embodiments of this hologram.

It should be noted that the holographic model is highly simplistic. It would usually be difficult to distinguish between the hologram image, or explicate order, and the holographic implicate order. What we actually experience is not just a 3-dimensional image. It has been highly processed and imbued with meaning, which flows in from the implicate dimension. There is not a clear distinction between the two orders. Correspondingly, there is likely also to be much ambiguity between the public and private, conscious and unconscious aspects of this model.

The internal relations of the implicate order give rise to, and are played out in the external, space-time relations of the explicate order. The explicate order need not be without apparent influence upon the implicate. It is ultimately a matter of perspective. Our great attention to the meaning of the explicate order ensures that its meanings will be active in the implicate order.

All creatures are microcosmic components of the living hologram. Each is an aspect of the cosmic self with more or less individualized existence. The Sun and the atom are projections of the cosmic hologram, necessitated by anthropic self-consistency. The Sun may be viewed in part as the explicate projection of the internal phototropic nature of the plants. The implicate counterpart of the atom is the arena or logical nexus in which the self-consistency of the physics and biophysics is worked out and maintained. The reality of explicate atoms is an abstract derivative of that implicate logical role. Human memory is the implicate medium of the cosmic dilation between the Alpha and Omega. The explicate flow of time is an artifact of psychology.

Total consistency and optimality of the explicate hologram is maintained by the holographic, self-like nature of the Alpha/Omega monad. Any lesser, sub-optimal, partial candidates for reality are lost to destructive interference effects. The myriad creaturely selves act as a phased array antenna with a single lobed output that is the optimized reality. We are the living actuators of the cosmic hologram, while still being an integral part of its unity.

rev. 4/26/00

God Romances the Apeiron

&ct.

Be aware that two different worldviews are being conflated [in a previous correspondence].

On the one hand we have a Hindu, polytheistic, irrational, infinity of worlds, cosmos.

I, on the other hand, represent the rational, monotheistic, mono-world cosmology.

God is under heavy moral constraint to sift through the infinite possibilities to come up with the best of possible worlds to be actualized through, by and for us, her creatures.

God could create an infinite world or an infinity of worlds but this would be both immoral and irrational. God stands as a traffic cop between the chaos of infinite possibility and the finite, rational reality.

Historians will note the adoption here of the Hellenistic aversion to the Apeiron, i.e. the irrational, indefinite, infinite.

As microcosms, we too sift through the Apeiron of our imaginations and our subconscious to actualize our various attempts at rational pursuits.

In the post-millennial eschaton the finite career of humanity is fulfilled in our reconciliation and reunion with God. Parts of us will also be recycled into the primordial Apeiron.

Does this meet with your approval?

You might, for instance, wonder at the balance that God and we strike between the rational and the romantic.

P.S.

As a partial answer to my previous rhetorical question concerning the place of the romantic, it would be fair to say that the process of creation is basically God's romancing and seduction of the Apeiron or serpent. The music of the spheres is the music of the snake charmer.

Biblicists will notice, of course, the inverted allusion to the seduction scene in Genesis.

The eschaton is then the logical consummation of the seduction process of creation. Can we then look forward to the emergence of bouncing baby cosmoi, a la Hinduism? No, certainly not in that or in any other simplistic sense.

>[The Divine Nexus] is a
>rectifying matrix like a mathematical "function" which "IS THAT IT IS" and
>automatically makes the rectifications over many lifetimes which we
>experience as "karma".....

Until Jesus makes the scene, and throws a major monkey wrench in the magic
karma matrix/machine!

And right He is! The upstart Son upsets the Old Man's apple cart. Our kids do the
darnedest things!

Time & Progress

A fundamental lapse of logic

Almost everyone educated in modern physics is suffering from a fundamental lapse of logic.

Virtually everyone concurs in the view that absolute time is defunct. Everyone agrees that the most significant lesson of 20th century physics was the overthrow of the Newtonian concept of absolute space and time at the hands of relativity and the quantum.

However, I am the only one in these parts who is taking this lesson seriously, and a big lesson it is!

The idea of evolution and progress is rather new in the history of ideas; nonetheless, it has become thoroughly ingrained in the modern psyche. It is even fair to say that the idea, the idol, of progress is the one absolutely essential idea of modern civilization. And yet it has been shown to be patently false. Herein lies the logical end of modern civilization.

Once ingrained, the idea of progress becomes very hard to shake, but shake it we will.

Nowhere has the notion of absolute time and progress played greater havoc than it has with our concept of God. We have come to insist that God must enjoy (suffer?) progress just as as we do!

This infantile insistence is simply modern idiocy.

Get over it!

Enformy, Anthropics & God

Don,

>>I short, under TES, there's inevitably superhuman SELFs, but there's no need for a transcendent creator. Enforming is "sub-cendent." And assuming enforming doesn't evolve (i.e, enformy is conserved), enformed systems ("gestalts") do.<<

In your Noetic article:

[http://www.sunflower.com/~dewatson/\\$wsr02.html](http://www.sunflower.com/~dewatson/$wsr02.html)

you state that enformy is the universal creative principle. This is a pretty a pretty good definition of God. So to say that enformy is conserved is to say that God is conserved. QED.

Enformy occurs within our Universe. But then how was the Universe created? Is the Universe and its laws of physics just an accident? You do not even mention the Anthropic Principle. Is this an *accidental* oversight?

The Enformic Principle is logically contradicted by the Anthropic Principle. No??

I then turn to Gary Schwartz' "Living Energy Universe" and discover to my amazement that the Anthropic Principle is not even listed in the index!!!

It was precisely Jack's mention of the Anthropic Principle in "Beyond Space and Time" in 1975 that originally turned me toward metaphysics and the transcendence of Time.

No wonder you and Gary are having so much difficulty communicating with physicists. You are ignoring what is arguably the most important discovery in physics in the last half of the 20th century.

Dan

Enformy, Mathematics & the Cosmic Soul

Don,

>>"In the beginning," enforming created space-time and all the laws, discovered and still undiscovered, of science. How? I don't know, but it's implicit in the organizing principle. That is, everything that is organized--i.e., everything we can perceive or imagine--derives from enforming.<<

By this same token, enformy created Mathematics. Yet, Mathematics can only be conceived by a rational mind. How could a non-rational process create something that can only be conceived by a rational mind? Are you going to say that Mathematics evolved? That is what the Intuitionists believe, but they believe that Mathematics only could have evolved in the minds of

rational beings. Intuitionists do not have an explanation for the existence of mathematical structures such as the Monster Group which has 10^{52} elements and appears to be the template for the laws of physics. How could physics be based on something that is just intuited by humans? Reason demands that the Monster Group was intuited by a pre-existent, rational being who breathed/dreamed reality into the abstractions.

Neither you nor Gary S. touch upon the problem of explaining the existence and 'unreasonable effectiveness' of Mathematics. Is this just another oversight, or does Mathematics not prove anything?!!

>>Enformy is not an entity, but a quantity--the capacity to organize (enform). Moreover, enformy isn't conscious. Instead, it is the foundation of consciousness.<<

Who says that Dan Smith is an entity? How do I know that I am not just a creative process with a memory?

Are you suggesting that consciousness is not something fundamental? How can you claim that enformy creates consciousness? Elsewhere you suggest that consciousness is an inevitable result of enformy, but this implies that enformy had to create space-time in order to then evolve into consciousness. In other words, enformy had to create biological creatures before it could create conscious souls that could survive the death of the creature. You are prohibiting the pre-existence of souls. A soul may only exist during and after the creation of a body.

But are these souls eternal? What will happen if and when the space-time of this Universe ceases to exist? Will all our souls die when this physical Universe dies? You would then have to hypothesize a *pseudo* eternity at the end of the Universe just as Frank Tipler has done in order to artificially conserve souls.

But you have said that enformy is eternal and conserved. Once a soul is made it is unphysical and no longer subject to the physics of space-time. If so, these souls could use enformy to organize themselves into a Cosmic Soul or Self. What would a Cosmic Soul do other than create, imagine or dream up its own realities? Are you prohibiting souls from dreaming? Why do you insist then that this Universe could not be the dream of a Cosmic Soul?

Don, once you open the door to immaterialism, you will find that it is a Pandora's box -- very difficult to close again. That is why scientists tread so cautiously in the waters of immaterialism and idealism. Collectively they intuit the eschatological implication of allowing their minds to wander past an invisible point of no return.

Guess what Don? You have just stepped over into the Twilight Zone! Welcome!

Dan

rev. 5/1/00

Dreaming of Atoms, Germs & Cosmic Ecology

The reconstruction of our world

Before deconstructing the scientific worldview, it would behoove us to construct a workable replacement. This essay is one more step in that direction. A near term goal is to obtain a conceptual model that is sufficiently robust and precise that it will prompt a further adumbration with mathematical ideas.

We have dreamt ourselves a long way from our home in the Monad, and we might wonder what to make of all these atoms, germs and other impedimenta that seem to stand between us and our transcendental destiny.

Mary Baker Eddy would say that the germs are in our mind, and I agree. But I would add that so are we in the mind of the germs, and therein lies a tale.

Germs are busy little critters and they surely seem to have a mind of their own, which is not always in alignment with our minds. One might wish that the big dreamer in the sky might try to keep the germs on a shorter leash. I mean, whose world is this, anyway?

Now I could go ahead and make an apology for God and for germs, but you can be sure that has already been taken care of, after a fashion. What is of immediate interest is, how do those germs work? I'm not asking for a biology lesson, but rather for a dream lesson. If Bishop Berkley worried about the tree on the quad, we can worry about germs.

I imagine God as being reasonably lazy, and not really wanting to be bothered with looking after every darned detail in the universe, so God invents physics and biology and then we are right back with the scientific materialism where we started. That is either too easy or too hard. I am looking for some middle ground.

My hunch is that God gives germs a mind of their own, like ours, but not personalized. I am falling back onto a Platonic form for bugs, as if Plato ever wanted bugs in his heaven! And on what day of Creation did God make the bug template? Don't tell me; see if I can guess.

We are not looking at this from the Monad's eye view. What I am searching for is a Monadic, transcendental, teleological, immaterial ecology. Is there a transcendental ecologist in the house? There are a goodly number of spiritually deep ecologists, but they eschew the vertical, teleological, transcendental dimension, lest they be waylaid by their Sunday school teacher.

I picture creation as a continuous manifold stretched out around the monadic singularity. How does it get stretched? Partly it is the spontaneous internal pressure causing inflation, but there are also some deliberately placed hooks or

pegs holding the cosmic tent in place. Deliberate? There would have to be a minimal external input to initiate the process on the proper path. The external pegs would represent templates for things like mathematics, physics, selves, etc. The shape of the tent would then be filled out by its internal processes and intelligences in a supra-temporal fashion.

This analogy is reminiscent of the Big Bang, but the manifold in question is not space-time. It is more of a functional, experiential hyperspace. This tent is the Monadic synergetic ecosystem. This is the living hologram referenced in a previous essay.

Where then do atoms and germs fit in this living hologram? God needed to be no smarter or more industrious than Democritus was. All that God needed was that atomic postulate to serve as a peg or reality check in Her dream. Once that atomic seed thought was planted, the ensuing logical condensation, habituation and contemplation would result in the atoms that physicists love to dream about and smash today. Those atoms will naturally be ensured to conform to all the stringent conditions imposed by the Anthropic Principle.

All natural phenomena will have to comport themselves in accord with the Anthropically certified atomic template; otherwise, those phenomena that are non-conforming will create a naturally self-damping disturbance in the functional, phenomenal web of the Monad. The immaterial potency of the atoms is further enhanced by their microcosmic semblance to the cosmic Monad.

Next on our list are the germs, but before dealing with germs, let us consider the biological cell. In terms of the metaphorical framework already established for physical atoms, we can treat individual cells as biological atoms. The biological cell serves as a conceptual, phenomenal reality peg, intermediate between the organism and the atom. Cells are alive and so we should treat them as sentient beings. Indeed, our own sentience can be understood as an extension of cellular sentience, just as God's sentience is an extension of ours. Thus do we close the cosmic circuit that leads from the atoms, to cells, to minds and to the Monad. The logical, conceptual closure of this cosmic circuit lends potency to the entire Monadic construct.

Germs then are cells that like to do their own thing, kind of like us vis a vis God. We suffer germs as God suffers us. The benefits all around outweigh the costs, we presume. It is all worked out in the cosmic/karmic ecosystem. Perhaps Pasteur played Jesus to the bugs. This does not mean for us to eschew antibiotics, merely that we be more fully aware of the cosmic syntax and semantics.

Having completed this conceptual circuit with my mind intact, I take my leave.

rev. 5/3/00

Designs on the Future

Metascience

[Name deleted],

All of us here share a concern for the future. We are not just living from one day to the next. We want to know not just what are going to be our personal options for tomorrow, but also what may be humanity's options for the next millennium.

Forecasting the next millennium is not a scientific project. There is no science of the future, per se.

For the last three centuries science has been the goose that laid the golden egg. Will science continue to be the golden goose for the next millennium?

There are doubting Thomases. I am one of those. I am a skeptic. I am a scientific pessimist.

Need you be burdened by my doubts? No. But any enterprise that has designs on the future of humanity is responsible to examine itself from the widest possible perspective. This wider perspective is, by definition, a metascientific perspective.

I consider myself to be engaged in metascience. Metascientific thinking is crucial to the future of humanity. In my opinion the scientific establishment remains derelict in its duty toward metascience. I am on record with Ron P. for suggesting that it may be my citizen's duty to perform an act of civil disobedience that might, for example, involve a small aircraft and a particular governmental edifice, as a final desperate act to waken the government endowed scientific establishment to its responsibility. Partial documentation to that effect remains on my website.

In the meantime I ply the shallow waters of the Internet, casting an occasional tidbit of metascience.

And you find this annoying?

Dan

rev. 5/4/00

Reason & Passion

Science and the Life Force

There are those who suppose that passion is the enemy of reason. This is to suppose that passion is blind. I submit that passion is the subjective side of the life force, and, therefore, passion has its reasons. It is our challenge to search out and examine those reasons.

Modernism is virtually synonymous with the belief that life is an accidental, epiphenomenon of physics and chemistry. This belief is credible until one examines the mind-body problem. The possibility that mind is also an epiphenomenon of physics and chemistry is much less credible. A reasonable person is then obliged to reexamine the possibility that life is not an accident, and that mind is an essential aspect of the life force. If, indeed, passion is the subjective side of the life force, then passion is an essential, fundamental aspect of the mind, nay, of reality.

In fact, there is a current trend among cognitivists to ascribe a fundamental role to the emotions in human cognition. Does this surprise us? Rather than the mind being a calculational device, its most basic building blocks are felt meanings. This view is in good agreement with the findings of developmental psychology, and the absolutely crucial role of human bonding therein.

Let me finally and briefly switch the focus to religion. 'Religio' refers to the binding of the spirit as the basis of spiritual wisdom. Among religions, there is one which acknowledges the cosmological crux of the binding passion. I refer to the X-event or the passion of Christ. Consider that the original starship troopers were the Cathari Troubadours who spread their then heretical Gnostic gospel of direct experience of God's love in the guise of romantic ballads, not unlike the Song of Solomon. They could not fool the Inquisitors for long. The romances of Tinseltown are but a distant echo of that crucial passion event felt 'round the world.

Surely, the monadic singularity that is the grail of all wisdom is something more than a mathematical infinity. Is not the notion of a mathematical infinity just a dim shadow of the real thing? The cosmic attractor is the alpha and omega of the life force. It is the way, the light and the truth.

rev. 5/5/00

Implications of Life

Eco-cosmology

A perennial controversy concerns the uniqueness of life. This is neatly framed by the question: Are we alone? From the perspective of physics, life remains an anomaly. Despite much effort, no one has discovered a universal law of life or any vital force. Nor has any one produced incontrovertible evidence that we are not alone in the universe. Yet, the scientific anomalousness of life seems totally at odds with its luxuriant presence on Earth.

The physical anomalousness of life is apparently exceeded only by that of the mind. That these two anomalies may have a common metaphysical basis is often supposed, and it is a supposition to which I adhere. In previous essays I have moved from the metaphysics of the mind to cosmic idealism. Here I will give more consideration to the metaphysics of life in general.

An outstanding feature of the physical universe is its regularity, which is reflected in the symmetries and simplicities of the governing laws. It is only in recent decades that a deeper, more complex layer of mathematical physics has been discovered. In contrast, the simplicity of the genetic basis of life gives rise, in combinatorial fashion, to a great diversity of biological structures and processes.

The Anthropic Principle signals the fact that the existence of biological complexity appears to be very sensitive to the otherwise arbitrary parameters embedded in the physical laws.

To that extent, the unified force field of physics may be considered a vital force. If these arbitrary parameters were to be explained by a possibly unique, underlying mathematical structure, the tension between mathematical abstraction and biological function would have to be resolved on some still deeper level. Much attention has also been devoted to the possibility that the non-mechanistic aspects of quantum physics might be vital to life and mind.

The existence of mathematical structures underlying physical processes has given rise to speculation that there might be similar, extra-genetic, universal structures underlying biology and psychology. Such structures might arise in conjunction with the genetic evolution of the individual organisms, but would then serve as morphogenetic templates particularly for those developmental and psychological processes that unreasonably stretch the explanatory power of Darwinian genetics.

The existence of morphogenetic templates would force us to consider the wider implications of an implicate order. The implicate order would be an information storage medium that is non-spatial. In as much as the physical laws encode information in a non-spatial manner, they are part of an implicate order. The morphogenetic structures would constitute additional information at the disposal of

biological and psychological processes. These additional structures would, like the physical laws, be instantiated at the quantum level as in non-local, non-random quantum probability correlations. One could imagine there being an aperture or antenna of quantum coherence which allows these higher level structures of the implicate order to influence the physical processes occurring in space and time.

The implicate order then acts as the hologram behind the holograph that is the physical or explicate order. At the very least, the implicate order is a storage medium for hierarchies of fixed and evolving structures. There would be a flow of information both upward and downward within the hierarchies of structures. There would be informational cycles in the implicate order as there are energy cycles and food chains in the ecological order.

The final and most important question is the degree to which there is an overarching coherence in the implicate order. Is the implicate order monistic or pluralistic in its entirety? Related to this question is the degree to which the implicate order is exerting a teleological influence that is manifest in the explicate order.

The Cartesian Theater Redivivus

& The one true self

Jack, Tony & alia,

We all know that the brain is a very complex system, but this just raises the originating problem of modern philosophy, who or what is watching that show in the Cartesian Theater that is our mind/brain?

It matters not a whit whether we are talking analog, digital or quantum, or whether it is 10^6 or 10^{60} bits of information. Somehow that vast array of information has to get converted into one coherent, felt meaning as what one feels when standing before the Taj Mahal, or what Mozart felt and knew when one of his symphonies came to him in a single inspired flash.

This is the problem of explaining the coherent unity of wakeful, experienced consciousness. You are simply recreating and restating the same problem that has bedevilled the best and the brightest for the last 300 years. You bring nothing new to this table.

Your mentor, David Bohm, wrote a book describing this problem, "Wholeness and the Implicate Order." He offered no solution, beyond his lengthy verbal speculation on the possible nature of this implicate order, which had virtually no correspondence with his work on the Q-potential that you sometimes tout as being identical with this implicate order.

The Cartesian Theater of our brain is buzzing along all night long, and if we do not happen to be dreaming, then the theater is ****empty****. How does your model even begin to explain or justify this overwhelming phenomenological difference in terms that do not just keep begging the same question, ad nauseum???

The last time we went over this ground, Jack, you ended up very reluctantly having to admit that there must be some otherwise unspecified self-like, non-spatial structure in some otherwise unspecified super-implicate order that in some unknown fashion is able to observe the Cartesian Theater. Nothing you have said in the intervening months has shed even the least light on this mysterious Self.

I agree, Jack, that none of the other scientists working on this problem has come up with any plausible explanation or model for the Self. Unfortunately, that ignominious failure on the part of your most esteemed colleagues does nothing whatsoever to enhance the status of your own effort.

Idealists, personalists, immaterialists and the like are willing to accept the mystery of the self as the one, fundamental, abiding cornerstone lying at the foundation of any ****conceivable**** reality. We move on from that basis point to get on with our

lives in working out an understanding of the rest of reality, including physics, morality, aesthetics, logic, mathematics, &ct., &ct., &ct.... This will be the one and only conceivable theory of everything. This will allow us to understand where we are, from whence we come, and whither we go. This is all that we will ever need to know.

Others, like yourself, will continue to tilt at the windmills of the dry, contentless, abstractions of their own devise, leaving nothing but scribbles in the sand.

Decide where logically there must lie the conceptual center of gravity of any *conceivable* reality, and then proceed from there. You, Jack, continue to scrounge in the in the dusty drawer of a bygone day, mesmerized at the merest beable or bauble, waiting for the Cosmic Self to knock once again on the door of your humble abode.

Knock, knock, Jack. Wake up, smell the aroma of the one true Self, and set aside your childish playthings.

Dan

Cosmology 103

Physiology of the Monad

It has been more than three years since the posting of [Cosmology 101&2](#). In the interval there has been a shift favoring a fully organic cosmos, with more emphasis on optimization. The singularity of Earth becomes remarkable.

Let us recall that we are looking at the noumenal, metaphysical, implicate order, or the collective preconscious as the singular source of being. The phenomenal world may then be likened to the holograph produced by the noumenal hologram.

The subjective and objective aspects emerge from the logical primacy of the preconscious. This singular monadic matrix is witness to the cosmic identity of all indiscernibility.

The cosmic self awakens through layers of increasing discernment. Our imminent, within a millennium, eschaton is the ultimate state of cosmic wakefulness.

As with an alarm clock in the morning, the cosmic mind is aroused out of its eternal slumber, entraining the narrational filaments of meaning that become our still dreamtime history. The external alarm in this case is the atemporal, logical falling together of the Monster Group, enough to give the willies to the soundest of sleepers. The MG serves as the logical scaffold of the eschaton, from which ending dangles the still forming narrative dream of our history fading off into the preconscious mythos.

The Final Theory of physics pays tribute to the physical instantiation of the MG. In the metaphysics of the millennium we will invert the MG toward its psychological instantiation. That should be fun.

And all of this is happening right here, and nowhere else. There is nowhere else. The starry sky is just the projective geometry of the MG. The occasional starry messenger is just that.

Stage fright is but a temporary condition. We were born to the challenge of the eschaton, one and all. And if you think we can work this out with a pencil, perhaps, but I would suggest the wisdom that has been [tested by fire](#).

rev. 5/26/00

Pearl Divers

Low on oxygen

Neil,

What makes us special is our physicality.

We may consider evolution from a gnostic, not a Darwinistic, perspective.

Physics is not natural. Physics, both the subject and its content, is an excursion into the gnostic, Platonic basis of our parochial, constructed reality.

Yes, the shell of Earth was a work of high artfulness. It does look sooooo natural in all its hyperrealism. This was just the scaffolding of the cosmic terraforming shell that surrounds the cosmic singularity that is the source of being.

It is also a burning place -- full of burning issues. It is a cosmic coal seam, where the intense pressures generate the occasional lustrous gem. These are the pearls of great wisdom. We all are the gnostic pearl divers. We have devolved into our present state of maximum materiality, for a very good reason. The hopes and fears of all the cosmos are born into our night of the soul.

Yes, we are headed back to the stars with our Pearl of Great Price, but not in rocketships. And I refer not to our piddling complement of deoxy-ribo-nucleic acid. We are headed back to the many mansions that are our mother's house, in glory, trailing our dreams behind us.

The Earth will finally be relinquished back to the nature devas. You may choose to remain here as a nature deva, as your adopted home, or you may return home with the rest of us.

The preternatural, naked core of the Earth is the cosmic singularity, the preconscious gusher of being. Yes, we have harvested this mind field. Our mission is accomplished. Let us not tarry.

Every popular action movie of the last two decades prefigures the tightness of our departure schedule. Our next one thousand years will be a flash in the cosmic pan.

Do I prejudge, or just prefigure?

Dan

rev. 5/27/00

Limits to Growth

Bad News Bears

People wonder if stocks will rise. Goodness knows if there are not reasons for pessimism. Is there not the wisdom that what goes up, must come down?

We have come a long way up out of the primordial ooze. From whence we come seems obvious. Whither we go is less so. Where lies human destiny? Are we not destined to rule the cosmos? Plenty of growth opportunities there.

Ruling the cosmos will require Breakthrough Physics. How many golden eggs are left in the Scientific Goose? The Established consensus is that we verge on the Final Theory with no more golden eggs in sight.

This conforms with the Established wisdom there is no direction to evolution. We are no pinnacle, we are a natural aberration. Our vaunted brains are like nothing more than the overweaned antlers of the Irish Elk, and we are about to be hoist on our own petards. We have outsmarted ourselves with our technologies, but we have not outsmarted nature. Our supposed glories are a flash in the cosmic pan.

This conforms with the evidence that we are alone in the cosmos. As very latecomers to the evolution scene, the denizens of Earth should have already been visited/colonized by our technological forerunners. If there were to be a cosmic population explosion, then the chances of our being here as fortunate witnesses to that ignition are minuscule, compared to the much more likely prospect that we inhabit the fat middle of the population curve, before the fall, as the statistical doomers cogently observe.

Stocks rise because investors are self-selected optimists, never mind the greed, until the next panic of pessimism takes over. Then they look for the next free lunch. The cosmos is not long on free lunches.

So much for hard headed realism.

Yet, we are in the throes of unprecedented global economic expansionism and optimism. What gives? This sense of optimism remains inarticulate under the glare of the steely-eyed realists.

She who fathoms this optimism will know the nature of the beast. She alone will know when to short and when to go long.

She who can articulate this optimism will know from whence we came and whither we go. She will lay the golden egg that scientific objectivity refuses. She will unveil the Invisible Hand. She will have the gnosis that what comes down must go up. Let us anticipate this advent.

.

rev. 5/27/00

Handle on the Monad

Micro-Monad

The mystic will confirm how difficult it is to grasp the monad: how quickly it turns to dust. In that dust the atom appears as the counterpart of the monad. This micro-monad is our one handle, for better or worse.

Let us hasten to affirm that the atom has no existence independent of the monad. It is merely a chip off the ol' block. It exists to serve the monad. It is the means by which the monad turns itself inside out. The atom will disappear on the completion of its task.

The atom is the coin of the monadic realm. It is the common currency, which ensures the complete outworking of the cosmecology. The atom invades the Platonic heaven and pulls all the forms down to Earth. Nothing remains in abstraction or in abstentia. Even God is pulled into the act. The atom is a Plato virus of unsurpassed virulence. From dust to dust. And we complain about the common cold.

The lowly atom composes our dreams and is thereby composed. The atom is God's dirty little secret. Life might have been so pleasant. Nature being red in tooth and claw is all its doing. Our consolation is that we are stuck with the best of all possible atoms.

From whence comes the atom? Surely mere logic plays a big role. Democritus was a logician, not a physician. But there is also a vital force that comes into play. The atom is the germ of life. It is how the monad manages its multiplicity. The vitality of the atom is reflected in part through the quantum strangeness in which it is enveloped. The quantum entanglements ensure that the atom remains subservient to the life process. It would be more accurate to say that life process ensures the entanglement. Atoms embody the logic of life.

We have life, we have atoms, and we are not quite sure how the dog wags its tail. Biophysicists suppose the tail wags the dog, but some of us are skeptical. The immaterialist supposes that the organism is logically prior to the atom. It is metabolism which necessitates atoms. But why metabolism? Why dog eat dog? It is actually monad eat monad. This is the singular cycle. There is a dialectic where everything becomes its opposite. It is this costume party which maintains the unity in diversity. There is a vital spiritual metabolism whose continuity and symmetry is enacted with complete naturalness under the atomic aegis. The inherent teleology is only thinly disguised. This is the telos that wags the logos.

The atomic net is as fine a spiritual filter as money could buy. Nothing is left behind. Everything is swept into its telluric omega. The monad rules, the atom delivers. The atom instantiates the monadic delivery system. If the atom were not

already a logical necessity, the monad would have had to invent it.

Now you see why it is impolitic to ask ‘why’ in a physics class.

.

rev. 6/3/00

Celestial Mechanics

The Wanderers

The Sun is nothing if not convenient, clever and ultimately necessary. Necessity may be the mother of invention, but we are left to wonder at the conception.

The solar mechanics stitches together the greater part of our creation. Dreams are in the night, but how many dreams are of the night? What is it that illuminates our dreams? The world of our dreams just glows. There are no sources, as is sometimes remarked by experiencers. Dream logic is not infused with the necessity of waking logic. Logic demands a source. The eye, existing as the sink, demands the source. Dream logic is like painting without perspective. Allow perspective, and geometrical optics ensues.

Tribal mind is lunar and nocturnal. Ego mind is solar and diurnal. With group logic there are no sources and sinks, there is just omniscience. The Sun wakes us, centers us, and so does the son. Waking logic is a solar logic. I have said nothing of phototaxis and photosynthesis. The Sun is a conspiracy, as surely as any magical bullet. And since when do conspiracies cause sunburn? Must there be a UV tail? Yes, if there is to be a spectrum, or a rainbow. If there are to be colors and a source, then there has to be a tail-induced pigmentation, which may be compensated in a lunar mind-set. Only dreamers can escape the solar logic.

And speaking of the moon.... How are the lunar and solar logics to be conjoined? One might do worse than inventing the moon. Is that not too crude? It may even be that the matricial moon has logical priority over the patricial sun. Before the sun became such a burning issue, there was still a sky. There were clouds in the sky, perhaps, if there was a lunar meteorology in the mythos.

The tidal force is a life force, as aquatic Darwinists can fully appreciate. It would be ironic if lunar logic were beholden to the logic of evolution, speaking of chickens and eggs. We need something more direct, but perhaps the moon is the mistress of indirection. The logic of indirection must have a non-source. The moon is perfectly so. If only we had a Moonster Group to prove this contention. Need we digress to the logic of the ecliptic as suggested in the subtitle? The moon has been a stepping stone from the sun/earth system to the planets and beyond, but still it lacks the potency of necessity.

The moon is the mistress of the mythos as the sun is of the master of the logos. It will be very difficult to demoonstrate that to our solar besotted minds. Is the moon not the matron of mensuration? Surely she is the mistress of every ancient calendar. The moon is the spinner/weaver rather than the source. If our logic fails to grasp the necessity of the weaver, then our logic is yet incomplete. The moon is necessary to mediate the solar logos. The moon points to the relational aspect of

logic and reality. She is the phenomenal non-source of all relational being. She points to agape. The non-phenomenon that points to the Noumenon: the implicate order. She is the great impicator in the sky.

If we understood the immaterial logic of the moon, we would all be immaterialists. What prevents that is the seduction of Newtonian mechanics, which was weighed in the lunar balance. Given the moon, celestial mechanics becomes child's play, but since you are not yet likely to give me the moon, I will have to steal it in the night.

rev. 6/4/00

Rare Earth

On being Moonstruck

According to immaterialism, intelligence is the most natural thing in the world, and, indeed, it is the only thing in the world. But according to science, intelligence is the most unnatural thing in the world.

Certainly the scientific evidence supports the scientific conclusion, but this conclusion belies human sensibility. When science and sensibility are at odds, the modern mind leaps to embrace science, as a greyhound leaps to chase the rabbit.

The mind just does not feel unnatural. We are at home with, and yet constantly bedazzled by our kaleidoscopic consciousness. Subjective experience, the greatest mystery left to the recalcitrant objectification on the part of science, sensibly must be at the root of existence. That is certainly how it seems to the most casual partakers and to the most profound observers of the human scene.

The more that science struggles with the mystery of existence, the more glaring become its improbabilities and its paradoxes. To avoid having to confront the mind as fundamental to existence, science instead posits an infinity of mindless universes. This is the only way for objectivists to deal with the exigencies of anthropics.

The latest pratfall comes from the realm of astrobiology. It turns out that, contrary to Darwinism, the complexity of life is not something that is universally pre-ordained. It was a very fortuitous chain of physical events that made Earth habitable by anything more complex than mere bacteria. Figuring prominently in this chain of events was our primordial collision with the Moon and its continuing aftermath. The details are presented in 'Rare Earth' by Ward and Brownlee.

What are we to make of these improbabilities piled atop improbabilities? We can either be very pessimistic about the prospects for life, or we can question this objectified reality.

The one thing that lends substance to the otherwise incredible depths of space is the thought that they are somehow populated. The thought that the only life between us and eternity are pockets of bacteria, lends no credence to our starry dreams. If we have no one with which to share our dream, then why suppose that this is other than just our own dream? Certainly, the motivation for exploring and colonizing space is reduced to virtually nothing. Of what value, then, is the rest of the universe? What is without value is, by almost any reasonable definition, without substance. We have populated the universe with our imagination, but now science once again disillusions us. When will we have the courage to question science?

Science, with all its objectivity, can never hope to find subjectivity to be anything

short of impossible. That bumblebee just won't fly. If we ever wish to make sense of existence, we will have to find another recourse. That recourse is simply to follow our deepest sensibilities. Our deepest sensibility is that we partake of a vital force that is at the foundation of reality. That vital force has the power to shape reality. Our reality is of that shape. It is a construct of that cosmic force.

We have earlier touched upon the inescapable logic of the sky. I don't mean the scientific sky, I mean the manifest sky: the sky we directly perceive. One can feel thereby the nearly overwhelming, balancing logic of the mythopoetic Moon. Science, for all its begrudging, now has to make obeisance to that pale orb. The fact that the Moon is a dead ringer in its total eclipsing of the Sun, easily the most awesome spectacle of nature, ought to be a dead giveaway. It ought to clue us in to that fact that these cosmic dice are loaded. Has the Goddess not left us her calling card?

When will She come knocking? Will the vital force be with Her and with us?

Atoms Lite

The Transformation of Matter

The way in is not the way out. We are obligated to follow the path of materialism to its natural conclusion. This is the only way for us ultimately to transcend materialism, and the sooner we recognize this necessity, the sooner we can satisfy it. This is our unfinished business. The goal is almost in sight, and we are almost certain to succeed.

We have understandably been captivated by matter. It continues to be both our boon and our scourge. We will loosen its grip on us only through our mastery of it. Only then will matter become transparent to us. Only then will we gain the broader perspective, which will allow us to see the physical realm as a construct of spirit. It is very difficult to wax philosophical about material existence while we remain in its thrall.

Science by itself, however, is not the key to the transformation of matter. The key lies within us. Science indicates that the physical world is a form of potential and relational existence rather than absolute existence. It suggests that our own minds may lie at the heart of the mystery of material existence, but science alone will not tell us how to unlock that door. Spiritual mastery follows upon and builds upon the physical mastery.

Science can help us to realize that atoms exist as formal abstractions, potent though that can be. They are the logical posit of any spatial existence: an insight that goes back at least as far as Democritus. Quantum theory has done its part to point to a non-spatial, noumenal realm behind the phenomenal aspect of the atom. The implication is that a noumenal 'hologram' projects and supports the phenomenal 'holograph' that is our ordinary experience. An 'implicate' order exists behind the 'explicate' order.

A crucial link between the implicate and explicate orders is the formal atom. The formal atom is the lowest common denominating form, and it serves to mediate between the higher level forms competing for their place in the Sun. The formal atom is the primary filter on the explicate, physical channel.

I see a tree bending in the wind. That I am awake is yet to be specified. Think of the tree as deriving from a formal tree class as in object oriented programming. The tree is in a spot with which I am familiar and is responding to the wind in a familiar fashion. If awake, I can close my eyes and the scene may continue to unfold in my mind's eye with varying degrees of fidelity.

A gifted storyteller may conjure the image of a forest under a thunderstorm in the imagination of a rapt audience, and maintain ample consensus. In similar fashion are the diverse stories of our world extruded from the pleromic unity of the

supersymmetrical monad, each of us participating in the storytelling chorus. The streams of consciousness whirl into the vortex of an expanding present. This at least is the context for the forms of trees and atoms. But this setting of the scene should warn us that trees and forms hardly exist in isolation in the purely relational symmetry of the monad. There are no static forms in the processional reality. The words of the storyteller flow together into the moving image of felt meaning. The words come from the story, and not the other way around. The trees must be extracted from the ecosystem of the forest to be transplanted into gardens.

Nonetheless, the formal atoms must be given their due. Whenever the other forms threaten to become unruly, the atoms rule. How so? They are the placeholders in the logic of space. Their alchemy determines how far the forms may be bent without breaking. Reality is a conspiracy and conjury of forms. They conspire so easily because they all took their first breaths together. They are the not so distributed intelligence of the cosmos.

We are on the verge of our physical mastery. Next we will be relearning to conspire with the forms.

Atoms on Call

The relational atom

We all know that matter is just about the least substantial thing there is. That table over there is 99.44% empty space. The remaining 0.56% is just waves of probability. Yet it can support the weight of a small elephant. That is because the probability waves of table and elephant magically line up in support of one another.

Let's carry this thought a little further. When I lean my elbow on the table, the electrons rush to resist the natural tendency for my elbow to pass right through the table. If I were an interdimensional ET my elbow would pass through the table because my electrons would not be speaking the same language as the Earth electrons. They simply would not recognize each other. Pauli's exclusion principle would be null and void, among other problems. But how could we have hybrid babies if our genes don't talk to their genes? Horses and donkeys have enough problems as it is.

We are pushing the physics here to the breaking point: immaterialism to the rescue. We all know how Berkeley solved Cambridge University's arboreal problem. He put God on permanent sentry duty on the Quad. No tree would dare to walk away in the night, and certainly would not walk to Dunsinane. But is this necessary? A tree has nowhere to go except back to tree heaven, but a true immaterialist would never suppose the tree ever left there in the first place.

Atoms are from heaven. They come into mundane existence mainly through the logical imperatives of our thought processes. The same goes for the trees we love to hug. The Darwinists, of course, have another story to tell. Theirs is the story of atoms run amok. They suppose that trees come from atoms, but 'simple' logic would have it the other way around. And logic comes mainly from our own heads, because it is not quite as simple as we think. There is an eco-logic that is implicit in our explicit, textbook logics. We are the primary purveyors of the eco-logic, because we are the storytellers. Darwinism is not a bad story; it's just not the greatest story ever told.

We have, in effect, replaced Berkeley's God on the Quad with a storytelling logic that necessarily includes atoms. We cannot relate a story without the relational atom. The big bad wolf could not eat grandma unless they were both made of metabolically shared atoms. You might wonder if we couldn't leave out the part where grandma gets eaten, but that is not our story, and it would not be the greatest story ever told, not according to my understanding of deontology. That is the story where Eve cannot eat the apple or begat any begottens. The rest is just chemistry.

The only way that we can comprehend reality is through a story, logically having a maxi-min structure. Atoms are a major part of the coherence of the world. The

world would make very little sense without them. If the tree on the Quad were to walk to Dunsinane it would have to be compelled to do so by the greatest storyteller. When we become that storyteller, the atoms and trees will dance to our tune. That is when we ditch the training wheels and our claustrophobic, atomic egos: same thing.

Belly right up...It's Chow Time!

Or are the Gods just crazy?

Cynthia, Gary, &ct.,

Yes, there is ample evidence and logic in support of the notion that we are in the final stage of preparation to be served up on someone's dinner plate or chow dish as the case may be.

Much of this apocalyptic rationale comes straight from the mainstream, good ol' time religion. The Christian and Islamic majorities believe that we are about to be harvested for a cosmic feast of some sort. The lucky few will become the nectar of Allah, but the unbaptized masses will be served as Satan's chow. Why is it that Satan always gets the bigger portion at the cosmic salad bar? One might suppose that Allah would be getting jealous and hungry, or just lean and mean.

In any case, the aroma of the smorgasbord is in the air, the crackling of the cooking fires is heard nearby. The celestial dinner guests are already arriving from around the galaxy. Some of the visitors are so unmannered that they can't even wait for the dinner bell to sound before dipping their fingers into the fondue. The more experienced guests, however, are passing up the bovine hors d'oeuvres, not wanting to spoil their appetite for the main course.

And don't we deserve it? Is this not our just dessert: to be someone else's? How did we ever get off thinking that we had some greater destiny; that we would be higher up on the cosmic food chain: sinners that we are? Doesn't that rhyme with dinners? It sure doesn't rhyme with diners.

Yes, one does not need to be terribly prescient or clever in order to have le soupcon (fr.) that the soup's on.

Of course, let's not forget Jack & Co. These clever folks see a few crumbs falling from the celestial buffet table and jump to the conclusion that the Gods must be crazy. The Gods must be crazy enough to provide us with knives and forks and map to the Restaurant at the End of the Universe. Well, good luck, Jack, but I don't think the Gods are quite that insane.

I cannot help but view both of the above scenarios as being amusingly naive.

But, hey, don't let me spoil anyone's dinner!

Dan

rev. 6/13/00

An Economic Outlook

‘We’re bullish on the Eschaton’

In these possibly ‘latter days’ many of us wonder about the economy. Where is it headed and what role, if any, might it play in the drama of what some people hope will be our salvation? In this prognostication, I have the distinct advantage of being made privy to some of the best information that the investor ‘bears’ have to offer, but, as will be obvious, they cannot be held responsible for what follows.

As a point of departure, let us consider the technology ‘bubble’ from an eschatological perspective. The bears, with much justification, suppose that the eventual bursting of this bubble will be the prelude to a market meltdown and a serious economic slump lasting from several years to a decade. They’re talking 8K for the Dow and 2K for the Nasdaq. This is no eschaton, but it is would have serious global consequences. I am hopeful that the further corrections in the market overvaluations will not be so drastic or so consequential on the economic downside.

Specifically there is the question of the ‘irrational exuberance’ especially on the part of the ‘day traders.’ The bears allege that we have been there and done that in 1929. It was the same folks, just a different technology: radio & telephone vs Internet. This is a cogent observation. I wish only to make a partial refutation. This will be in the spirit of negotiating a truce between the bears and the bulls, so that we may get on with the larger, shall we say ‘cosmic,’ business.

Let us talk about the irrationality...of the bears. One thing to know about the bears is that they are investors, albeit cautious ones. Is it rational to be an investor at all, in these ‘latter days’? Would not survivalism be the more appropriate measure of caution? Are there not enough cogent doomsday scenarios out there to justify being much more cautious than simply waiting for the Dow to hit 8K?

My criticism of the bears is that it is hard to take their tepid pessimism seriously. I can say this with some assurance, being perhaps the only doomsday consultant to the CIA, volunteer though I am. Do the day traders know something that the rest of us don’t?

I take a global economic crash seriously. In fact, I take it so seriously that I doubt that God, oops, I mean the Invisible Economic Hand can afford to let that happen. The day traders then are playing fast and loose with God’s latter day mercy. Her Invisibleness can only afford to slap their wrists. They don’t know this; they just sense it.

As with Noah’s flood, the interbellum, global crash of ’29 will be the last one. This is hardly a license for the traders to commit rape and pillage, but it does mean that God sometimes has to look out for fools.

OK, I am a pre-millennialist. There will be a Millennium between the imminent messianic event and the eventual Eschaton. Capitalism will have 1,000 years to wither away. It will go peacefully to its place of pride in the Economic Hall of Fame. That is a promise. Take it for what it is worth.

If capitalism and the day traders bring us nothing more than an economically robust Internet, they will have done their job. They have helped mightily to make straight the way for the pre-millennial messianic event. We should all be glad. Now, all they will have to do is help with the economic part of solving the rest of our mundane human problems. This will be much easier in the Millennial environment. It will be a necessary prelude to our then being able to focus on our eschatological, spiritual destiny.

Won't the day traders be surprised when they find out what Her Invisibleness has put them up to? It ought to be a revelation.

Nasdaq is down 13 at 11:39.

rev. 6/14/00

The Last Miracle

Embracing the world

Cynthia,

Yes, God does hide until it is time for her to stop hiding. And generally she does hide in plain sight.

I would like to turn our 'paranoia' about God into a 'pronoia.' This would be the modern equivalent of turning water into wine. I think you are already on the verge of this, otherwise you would not be here now.

God does 'mess' with our heads, and/or permits other folks to do likewise. This may be experienced in positive or negative fashion, depending on the source and on the target. When she is in hiding, she keeps a low profile, and most of the messing is being done by proxies of one sort or another, many of them undesirable.

However, the mere fact that God can choose to hide implies that she can also choose to come out of hiding. This may happen when, where and how we least expect it. Yet, each of us is responsible to remain vigilant for, and open to, this very real possibility. It is this never ending possibility that keeps many of us, probably most us, alive.

And one can go further than just being open to God. One should always be pushing the God envelope. This is where paranoia becomes pronoia. I am one of those in this neighborhood who is willing to do just that. If we have the time and inclination we should set ourselves down and figure out how God might wish to come out of hiding and then be there and do that. What else is there to do?

This is what I and some others are doing here.

Like the sign asks, 'How do you like our driving?' As long as you choose to frequent these environs you will be a de facto participant. How would *you* like to see God emerge from that tool box in the frozen tundra? Pull up a log and join the campfire. What would Rainer Maria Rilke have to say about this?

Dan

Jhan,

Yes, and no.

I believe in a universal salvation. I was raised as a Unitarian-Universalist, after all.

I have and still do toy with the possibility of a Separation with humanity, but if this were to occur, it would not be based on good and bad. It would be more along the lines of a separation into high and low tech or into yin and yang. I do not doubt the basic goodness of human nature, given a reasonable environment and an understanding of why we are here.

And yes, we are our brothers keepers. We will be evaluated by our influence on others. But this evaluation also entails that we know what we ought to be doing.

We are still missing some basic pieces of the formula concerning why we are here and what we ought to be doing about it. Determining these missing pieces then has got to be our highest priority.

Mainly what we are missing is the knowledge of the moral/spiritual dimension of our sojourn on Earth.

Darwinism is a false doctrine in this regard. Darwinism is currently the main obstacle to our enlightenment. The only way for us to transcend the severe limitations of Darwinism is to transcend the limitations of materialism and physicalism. Absolutely nothing has a higher spiritual or intellectual priority.

Until the scientists and technologists face up to this intellectual and spiritual challenge, all their other endeavors are being undertaken as if they were blindfolded.

Most scientists have the excuse that no one ever challenged their materialism and physicalism. Those within the sound of my voice, no longer have this excuse, and they will be judged accordingly. They will still be saved in the end, despite themselves.

Dan

Chris,

I have no objection to the God within, that is Her preferred domicile, after all.

But do you begrudge Her the occasional foray into the Great Outdoors? Yes, I admit that the Prophetic Tradition is an old one, and that God uses it sparingly, but there are times when it becomes necessary for God to show her face in a singular, historical fashion. There are times when the Prophetic Voice must be heard in an unmistakable fashion. You probably do not doubt that both the Maharaji and Jesus have served as special manifestations of

God.

Many people believe that humanity has yet to fulfill its Earthly potential. They suppose that a dramatic divine intervention will be necessary to inaugurate this final, historical period of fulfillment. Thus they look forward to the arrival of a Messiah, Mahdi, Maitreya, Parousia, i.e. the Prophet for the Millennium.

It seems both callous and elitist for anyone to tell the world that it has nothing special to look forward to; that there is no solution to our worldly problems; that we should expect nothing more inspiring than what we have already experienced on Earth. Faith and hope are the greatest motivators; we would not even have gotten this far without them. Must we jettison them now in the home stretch?

Did Bland create the world? Is Bland our destiny in the world? Is humanity going to be Bored to death? Is Bland the solution to the world's pressing problems?

Perhaps you just look forward to a Bland technological millennium or utopia, and wish to keep the Spirit sequestered in the mystical recesses of the mind. Spirit may have other plans. Have you never been excited or inspired by Spirit?

A Messianic event is risky business, but do you suppose that this is beyond the capability of God? Are you going to try to prevent this from happening? Do you wish to kill the Buddha if you meet him on the path?

Do I not serve God's purpose by anticipating and participating in Her messianic plan? Should you not be doing the same?

Dan

Chris,

>Actually, if masses of people directly experience the God within, that
>will be pretty special, exciting, and inspiring. (Until now, this has
>never happened in history.) And a lot of worldly problems will be
>solved through new approaches inspired and based on this inner
>consciousness and understanding.

This would not just be *special*; it is absolutely essential to our survival.

Spiritual awakening can no longer be the luxury of the few. It is now the necessity for all of us.

Does the Maharaji not realize this? It certainly would appear that he is

moving his own operation toward this eventuality.

The Millennium is defined as the Aeon of global spiritual wakefulness. It is the Geist Zeit.

Why do people think that we can just continue to muddle through in our spiritual daze, with business as usual? Cannot people feel the continued quickening of the pulse of time? Don't they realize that we are coming to a new threshold, where it will no longer be possible for us to drag our spirits behind in the dust?

Surely Maharaji knows this! Is he not riding on the cusp of this wave? Is this not the knowledge of what it is to be alive at this time?

Every human has always had the capability to be alive, awake and in the Knowledge. But until now it has been just a potentiality. We have been putting off the Millennium for all of our history. Now the cosmos has worked up its head of spiritual steam and it conspires mightily against our dilly dally. Our lazy days of dilly dally are gone. This is not a test. This is finally the reality.

With our *inward* turn comes a reciprocal *outward* turn. That is the turn on which I am particularly focused. That is the turn that will involve the fringes of science and all of the people who find themselves gathered on that far shore. Are you and I not among these folks? What is our message to them and to ourselves?

Dan

Cynthia,

Why would you suppose that God is an express train?

No. No. No! It is we who are the Santa Fe Express!

It is God who sits in the shack by the tracks. God is the stillness at the center of the storm. The eye of the cyclone.

The only ontology of Archie is God. God is never anywhere other than where she absolutely has to be which is exactly everywhere, everywhen.

Even when the express train of events is high on our derailment, there is just that split second of stillness within that is our only intimation of eternity. Chris and the Maharaji speak to that split second of stillness. I speak to the echo of that stillness that begins to reverberate everywhere as the Santa Fe Express leaves the tracks for good. The little old man in the shack just smiles and puts down the switch. We are all of that.

Dan

Don,

>No, no, no. God is an elephant, and because they are blind,
>humans can't "see" it.

Is this the voice of resignation? Are you resigned to human blindness?

Perhaps it is you who are blind to the dawning of awareness. Have you done everything that you can to make straight the way for the Dawning of the Light?

I think that you protest the darkness too much. You seem too much huddled by the light of your one candle. There is a brighter light and it comes from the active sharing of what each of us has to offer. That sharing is a two way street. It is a grand, global dialog, it is not the mumble of monologues. Are you going to let the Living Energy pass you by?

Dan

Don,

You write the fiction of the Last Miracle. I am interested in the reality of the Last Miracle. How will the fiction become the reality?

Writers of fiction tend to be recluses. The outer world never seems able to live up to their inner world. This is partly the problem with Chris and the Maharaji. It is relatively easy to embrace the reality within. It is more difficult embrace the world. Very few are ever truly able to do this. When they do, it leaves an indelible imprint on the psyche of every human.

This miracle has happened before. And it need only happen once more before the Eschaton. This will be the Last Miracle.

Does your fiction speak at all to this reality?

Dan

rev. 6/15/00

Economics & the Idea of Progress

Getting with the plan

Adam Smith maintained that the engine of economic progress was the division of labor supported by investment: thus did the wealth of nations grow. Technological advance was not identified per se.

This admittedly narrow definition of progress went against the grain of the traditional contrarian view, which could only imagine human and natural history as being a falling away from a primordial, pristine act of creation. That traditional view is now well ensconced in the scientific concept of entropy and the inevitable 'heat death' of the universe. Everyone is surely aware that science takes a very skeptical view of any notion of directed evolutionary progress, despite continuing maverick attempts to find a scientific basis for that very fuzzy notion.

Pockets of entropic disequilibrium will exist, just by the laws of probability. The fact that we happen to find ourselves in an extreme instance of disequilibrium provides scant grounds for optimism. That we have been able to cheat the laws of probability for a billion years provides no assurance that we will be able to do so again tomorrow. This reasoning may be further developed into a cogent doomsday argument suggesting that random observers like you and I will most likely find ourselves in a bubble that is about to burst. The bubble in this case would be a population bubble, which would also be a breeding ground for other bubbles of a more economic nature. This is not a train of thought that is conducive to pleasant dreams.

Scientific objectivity, in its allotted three centuries, has not been able to envision a life force. It is not unreasonable to posit that science is inherently incapable of assimilating such a force since it is likely to have an essential subjective aspect. If we cannot objectify the very reason for our existence we will be facing a profound challenge to our modern worldview.

My educated guess is that the life force is partially projected as the invisible hand of economics. We also see it manifested as the Anthropic Principle dictating the design of the universe. Encompassing both of these aspects is the teleology of the life force, which is pulling us toward our eventual destiny.

The upshot of this alternative view of reality is that if we want to understand economic progress we will need to understand the cosmic plan. It would appear, however, that the global economy has been progressing in healthy fashion without regard to any alleged plan, cosmic or otherwise. Although it has been argued that the origin of capitalism is closely tied to the Western prophetic tradition, capitalism has apparently managed to outgrow any such childhood attachments.

For how much longer can we moderns afford to deny something as crucial as the

life force? For how long can we postpone this day of reckoning? Many factors, however, will have to conspire to awaken us to this reality. It is unlikely that the economic interests will be at the forefront of what will initially have to be an intellectual and spiritual awakening.

History indicates that the hegemony of an existing worldview can gradually erode over a long period of time before a new worldview gathers sufficient momentum to replace it. Postmodernism is antipathetic to worldviews of any kind. It may enjoy a lengthy interregnum before being succeeded by a more positive philosophy.

Nonetheless, the failure of modernism and postmodernism to provide any qualitative accounting for seemingly obvious historical trends ought to be more remarkable than we presently take it to be.

Modernism sees science as just the inevitable accumulation and application of knowledge; inevitable as long as reactionary interests do not actively oppose it. Modernism is simply an acknowledgment of the existence of the trend. Futurism extrapolates this trend into the future in a sometimes brutish manner. The future envisioned by the futurists seems generally devoid of or in contradiction to what most of us would recognize as life. Certainly that purely technological vision creates a challenge for anyone with a humane concern. Let us take up this challenge in a subsequent essay.

rev. 6/21/00

The Big Bubble in the Sky

& The Best Possible World

The inflation model of cosmology suggests that our universe is a mere bubble created by a vacuum phase shift that could collapse tomorrow in a subsequent phase shift. So, yes, we could say that our universe is just a fit of irrational exuberance. Bubbles on Wall Street are pale shadows of the real thing. The original contrarian would be none other than Satan, anticipating the next paradigm shift.

The inflation model may be carried over into immaterialism, which, as you should know, is the expected replacement for scientific materialism. In immaterialism phase shifts and paradigm shifts work out to the same thing. The two biggies being the Alpha and Omega that delineate human history, according to the prophetic tradition. This would also be the best possible world, recognizing that all good stories must come to an end. That bubble bursting Satan is then just another aspect of God, of course. Let me then proceed with my devil's advocacy.

Whether you are physicalist, fiscalist or an aphysicalist, the universe is a free lunch, like the stock market. If you are a mystic you tend to eschew the lunch in favor of the eschatological wedding feast or parousaic hierogamy, finicky that you are.

With immaterialism the world is a fit of conspiratorial exuberance, a notch above irrational exuberance. It is the aeonic hypostasis of the Archons (arch-conspirators), a holographic 'folie a pleux.' We are the almost self-sustaining inflation of God's dream. And from the preceding essay, we naturally, naively find ourselves in the biggest, densest dream bubble just before its collapse. This is beginners luck, and Satan is just a big contrarian prick, but someone has to bring down the curtain on the cosmic drama, as we revert to the golden, nirvanic mean, or the mystical experience of nothing and everything.

What I have been trying to say in previous essays is that the big crunch has to be choreographed. If we create a big enough bubble or bomb, be it on Wall Street or on Trinity Flats, respectively, the invisible hand has to manipulate in order to prevent a premature meltdown. God has to look after the really big fools with their really big bubbles, because God is the bubble master, and because his brother Satan insists that only he be allowed to finally jump on our sandcastle in the sky. God has, however, negotiated a Millennium for us, not that we particularly deserve it, but just for the exuberant logic of it. Satan demanded a really fat bubble to jump on.

The point is that the day traders really have nothing on the Archons, and if you want to know when to sell AOL, better call your broker and then wait for her 'buy' signal, or else not. It's all in the mind, anyway. Now biotech is an interesting

bubble to consider in this hierogamic context. I'm still considering it. It all depends on the best possible world.

rev. 6/23/00

Walden to Conantum

The Fab and the Prefab

Disconcord is the foundation of christian agape. The awestruck slackjaw is God's fool. Thoreau was the Walden fool; Emerson the Conantum sophisticate. But within the Conantum prefabs was the image of the laughing squaw: all agape. Only to recall some childhood images along the Harvard-MIT corridor of Concord.

Futurism is the erotic sublimation of the other as represented in nature, to borrow from Desmond et al. The fabulous is replaced by the prefabrications of scientific materialism. Human nature is inflated before it is sublimated to the machine. This is the adolescent fantasy future of science fiction.

The real future lies with agape. Here there is the sacrifice of the self to the other. This is no surrender; this is a giving upward. This is the surrender not to the other, but to the 'one knows not what.' This is the fabulous awesomeness of the x-event. This is the ultimate perplexity. This is the only eschaton, the open ending of our delineated history.

We seem to have the choice of a prefabricated, technocratic future and the fabulous future, hardly a choice at all. The bubble of scientism and futurism will be burst on the ultimate perplexity at the core of the eschaton. The laughing squaw surely knows this.

The economy of the Millennium is witness to the sublimation of the eros of capitalism into the agape of communalism: no mean feat. We surely know now how not to accomplish that. This is the economy of giving upward. The economic perplexities of the Internet are portentous in this regard. This is our economic playpen.

Biotechnology poses other perplexities. The prospect of prefabricated being will force us to contemplate the radical incompleteness of true being, wherein even God must forsake us. That she doesn't always is fab.

rev. 6/25/00

On Not Taking It with Us

The future of technology & economics

They say that we can't take it with us. We can't take our money to heaven, or to that other place, unless perhaps the difference between heaven and hell is defined by the presence of plastic in the netherworld.

I am supposing that life after the eschaton and the afterlife are not qualitatively distinct, although we might suppose that the former state is more robust socially, or perhaps one should say communally.

Some time ago I ventured the opinion that the telephones don't work. This has to do with my notion that electrons have more to do with logic than with physics. The telephone system is an extension of the logic of electrons and so exists mainly in our collective noodle.

Ma Bell does not have a celestial counterpart, nor does Nipper for that matter. Ergo, at some point during the Millennium, Ma Bell will be replaced by your basic, homegrown telepathic grid. The task at hand is to extend this logic to the rest of the millennial transformation. The presumption is that we attempt to front load as much of the afterworld into the Millennium as possible so as to minimize the post-millennial eschatological transition. What else would be the point of the Millennium?

Telephones are easy. Bodies are less so. We don't take them with us, at least not the ones that we drag to the office every Monday, to use an expression about which I have only the dimmest of memory.

Biotechnology has designs on our flesh. Designer bodies can't be that big a leap beyond body art, and perhaps we can eliminate the common cold along the way. But speaking of elimination, what is to become of metabolism, which you'll recall is the foundation of our electronic logic? We don't usually imagine having to schlep our glorified bodies to the crapper. Reproduction is another consideration.

We might suppose that OBEs would become 'de rigeur' as the Millennium comes to a close. Our genetically engineered masterpieces would be gathering dust in some warehouse, and on E-day, we just throw away the key. This would solve one aspect of the population problem. I apologize for the simple-mindedness of this vision. As for the 'problem' of making spiritual babies, I remain open for suggestions. I suspect that there will be many spiritual options when it comes to skinning that cat. Strange time loops may be one of the less strange options, but I don't want to give away the story. You'll just have to stick around.

rev. 7/1/00

On Quitting Our Day Jobs -- Gracefully

The Microeconomics of the Millennium

For those of us who still have day jobs, consider that being unemployed may not be everything it is cracked up to be. A little patience is in order.

There may be a natural desire to short-circuit the Millennium, but no one ever said that a Millennium was a thousand years; it may just seem like it. Of some practical concern is the stock market. If all the folks with day jobs decided to celebrate the Millennium, those of us clipping coupons might look a little foolish, and we wouldn't want that to happen. Also the CIA might take a dim view. How are we going to keep the boys and girls down on the farm?

DARPA's Internet was a brilliant stroke. Working for a dot com is not quite like your father's day job and it can do wonders for the coupon clippers, just ask them. The problem is the encore. Biotechnology will take up some of that slack. Cosmetology will take on a whole new meaning.

The virtual reality industry certainly has prospects. The new epithet will be 'get a virtual life.' The silicon gang already has designs on the New Heaven and New Earth. The Eschaton will just be the endless Rave. Let us not be too hasty to disabuse this enthusiasm. How are we going to mediate between telephony and telepathy? What is the difference between the soul and a quantum cable modem? How do you explain to the day traders that the best things in life are free? Who ever said that the Millennium would be a walk in the park?

The simple way out of these dilemmas is to posit a meta/physical separation between the high and low techies. I have been sorely tempted by the easy split, but I think that the cosmos has something more dialectical, or should we say 'metaxological' (Wm. Desmond), in mind for us. In practice there is likely to be a proliferation of blurred boundaries. Our day jobs and our night jobs will commingle, as our credit lines expandeth.

The future remains open to the imagination. This best of all worlds is sometimes best left just slightly unfinished and a bit rough around the edges, dontcha think?

Cosmetology

& the end of matter

The only problem with planned parenthood, it is said, is that we cannot plan our parents, but others suggest that we do indeed. I suggest that the lot of one's birth is poorly correlated with the satisfaction of one's life. And as a corollary, let no one stand in the way of life's passion to diversify.

Into this pot genetic engineering casts its lot. We face the internal challenge of the eighth day of creation. The mass anxiety/marketing juggernaut collides with biological determinism – the irresistible force, the immovable object. While body art is but a dim portent, its implication is that the passion to diversify is intact.

The immaterialist take on genetic engineering is a resigned bemusement, i.e. this too shall pass. It will play itself out by working itself out of its job inside of the Millennium.

Families are a big thing in most any scheme, and where would families be without family resemblance? How else to promote and maintain diversity? How better to balance the exotic and erotic? And then there is mutation, the fascination of the evolutionists, with all its drawbacks. No other fact puts creation in a darker, starker light. This appendix of creation is meat for the genetic engineers. Obviously their trade is God given; let us not begrudge them that.

Yes, there is a spiritual metabolism, of which all this organic metabolism is but a shadow play. That curtain will be raised. Cosmetology will be raised to cosmology. Heaven may not be R&R, after all. It may just be a bigger challenge. We may wax nostalgic for Ma Bell and Genentech. Let us master this school of soft knocks in the time allotted. Our precious Millennium being but an intermezzo.

TechGnosis

Wired Omega

Take away the wires and we might have something. A dear relative once suggested that I put my physics to good use by figuring out how to eliminate all those ugly wires. I chose to interpret that as a push toward metaphysics and not as a prescient forecast of wireless communications. I predict there will also be no transistors in heaven.

Erik Davis has a grand vision of the future; all he has to do is ditch the wires. The only thing wrong with his electronic Body of Christ is the electrons. In this regard he suffers only a slight failure of the spirit. His mother forgot to explain to him that the telephones don't really work. This lacuna does handicap his obvious prophetic talents.

It is equally obvious that if God did not want us to invent the Internet, she would not have given us electrons and photons to play with, but at some point we will be called upon to set aside these toys. How do we know that we are not being piped instead into the maw of a satanic, alien cyborg from Beta Reticulus? Do we not all have UPC 666 on our foreheads?

We don't know. We are supposed to keep on our toes. The Internet is not heaven. It is just a ladder with some loose rungs. We must step lightly. It shines only in a pale reflected light.

Erik says, 'never mind the wires, let's just go with the chaotic flow.' 'Go with the flow' is the battle cry of the techno-utopians often heard in these environs. I demur in favor of a more substantive, less wired revelation.

It all comes back to the misplaced substantiality that those of an unwitting Bohmian mindset invest in the electrons. But if you attend carefully to the bouncing quantum ball you know that electrons are but an informational construct woven out of an Anthropic logic. That web of logic is the cosmic Internet, of which its wired cousin is but a shadow. This is the Gnosis beyond the techno glitter.

We need have no fear of wires or electrons. They are but stage props and security blankets to help us toward our spiritual adolescence; keeping us on the straight and narrow.

The consciousness movement and alternative medicine are gradually deconstructing our physical materiality in favor of a psychosomatic cosmology. We see the soma, but not yet the cosmic psyche. Then we realize that we are the cosmic psyche. We have met God and she is us, virtually and virtuously.

That is the last revelation. When you let yourself hear it you will go in peace.

Gravity's Logic

Consciousness and gravitons

A recurrent dream of mine is about flying, but not in an airplane. If I just pump my arms enough I can get above the tree tops with some exertion, and maybe even higher. Gravity is still very much present, but it is being partially counteracted.

In the waking part of this best possible world we traded in our wings so that we could build airplanes with our hands, giving us the best of both worlds, and still we can dream of unassisted flight.

I am quite willing to accept that some people can levitate objects and even themselves, unassisted, while wide-awake. Such exceptions go to prove gravity's compelling logic. We need solid ground rather more than we need to levitate. We are part of a two dimensional ecosystem whose third dimension is ruled by gravity. I trust that there are other realities where gravity is optional or even absent, but they will require other kinds of ordering principles in order for there to be level playing fields on which the players may interact.

Given a semblance of gravity, the continuity of consciousness demands that gravity remain uniform unless the Principle of Sufficient Reason rules otherwise. The inverse square law is a necessary part of any system of gravitating bodies. If we are going to dream consistently and collectively of going to the Moon, then the gravity of our dreams will have to obey the inverse square, and so it does.

This is how gravity really works. Supersymmetric gravitons are a wonderful mathematically consistent embellishment upon this dream logic, but that should not mean that we have to believe that space is actually filled with gazillions of virtual gravitons. Occam says that the continuity of consciousness is a vastly simpler and better explanation. Why are we not more amused when a prominent gravitationist attempts to explain consciousness in terms of gravitons? Is this not a *reductio ad absurdum*?

Gnosis Envy

Science attempts to tap its vital roots

But it is too little and too late. As Science wanders down its disenchanted, dead-end alley wondering where it went wrong, it begins to be besieged by the vital forces that it had so recently banished to the oblivion of superstition.

Techno-paganism and ‘techgnosis’ are rather feeble attempts by befuddled scientists and futurists trying to recapture the spirit that they had unsparingly scorned until so recently.

Yes, the future belongs to Spirit: a spirit that knows only one master. A spirit that only one person has ever tamed. The pagans, anarchists, atheists and nihilists will gnash their teeth to the end. The scientists set out to master nature in the name of cold logic and see what they have wrought.

Yes, other civilizations, other dimensions intersect with our trajectory at this cosmic crossroads. They come seeking the pearl of great price, the truth that has been tested by fire, the foundation stone that we rejected. Science sold its soul to a far lesser truth. It reaps the whirlwind of its mammon.

I will gladly stand as a witness to the singular truth and as ‘confessor’ to the prodigal son of that truth which is science. Scientists as a whole reject the ravings of the techno-pagans. They will not repeat their error of being stumbled by partial truths and half-baked metaphysics. Patience remains the order of the day.

Believing in Love

The one thing there's just too little of....

Anyone who wastes her time believing in something other than love, is simply not acting rationally. This is because every sane person agrees that love is the one thing there is just too little of.

Capitalism will never buy us love. Science will never find us love. Therefore most of the energy being lavished on these two enterprises is misguided. We are not behaving like the rational animals we are supposed to be.

How can we be more rational in love? Can we not agree that love is no accident, and it is not superfluous? If we do not believe in the ultimate victory of love, will we be diligent in its pursuit? Is there any point in living if we know that love's labors are lost?

Can we not agree that there is one person who stands out in history as having put love at the top of the human agenda? Was this not the most amazing and consequential feat in history? Is that life not then the measure of every subsequent life? How do we measure up? Every subsequent enterprise exists in the shadow of that singular enterprise. How do science and capitalism measure up? Might they be found wanting in the balance?

How might we right the balance? Is there any question more important than this?

rev. 7/8/00

Logos Spermatikos

Seminal Reason

This concept was first deployed by Heracleitus, the Greek philosopher of the cosmic flux. It was the force that brought order to the primordial chaos. The presence of the Logos in the Western tradition appears to be what primarily distinguishes it from the Eastern tradition.

The transformative, unifying logos was originally identified with fire. This connection persists in the tradition of the pneuma or holy spirit. Heracleitus saw the logos as a dialectical principle connecting all opposites. This led to the idea that all opposition would eventually be consummated in an eschatological spiritual conflagration, an idea shared with Hinduism.

The principal bifurcation in the West came about between those who view the logos as necessarily personal and those who do not. This is basically the distinction between religion and science. The Pythagorean tradition culminating in modern physics has identified the logos with mathematics.

Chomsky and Piaget are modern exponents of the logos spermatikos in the form of generative grammar and genetic epistemology. These notions of the logos strike to the heart of the distinction between natural and artificial intelligence. Can natural intelligence be identified with any algorithmic, heuristic, connectionist or functionalist formulations?

I believe that this question has been definitively answered by the linguistic philosophers. The ceaseless, Heracleitian flux of the mind is the product of a constantly striving, vital intentionality that is nowhere captured in the formulations of mathematics. That chaos theory might uncover a generative grammar seems baseless. The same goes for 'A-D-E singularity theory' and the like. There is simply no basis for the categories of intention or reference. Mathematics, by definition, is a purely extensional system. The only intensional (sic) dimension is provided by human cognition. This is why computers are not replacing mathematicians. Godelian self-reference remains strictly meta-mathematical and in no way susceptible to any extensional, mathematical rendering. It is this profound lacuna that has left science completely vulnerable to the cacophony of postmodernism.

Out of this cacophony the one, true, vital logos spermatikos is destined to reemerge, and it will do so in its original dialectical, consummational, eschatological context. The logos cannot be divorced from the divine self. 'In the beginning was the Word, and the Word was with God, and the Word was God.' Science has spent three centuries trying to disprove this simple fact. Its time is up. Ole, ole, infree!

The logos spermatikos lit a fire in the mind of human kind some 30,000 years ago when we discovered language. That fire continues to burn ever more quickly and fiercely until the consummation. This is the true holo-caust.

No agent or agency can douse this flame. The best that we can do is expedite the Second Coming with its promise of a final Millennium. This is the message from the stars. The stars come down to flame central. This is the 'burnt meat' that all the visitors seek.

rev. 7/13/00

The Bomb Squad

The dismantling of MJ12

Something scary lay buried in the desert. MJ12 was a time bomb that would inevitably explode in our faces unless it could be dismantled in time.

We are safe now. The bomb squad has been successful; the clean up crew meticulous. The grizzled factotums are ensconced in their nursing homes. The ashes have been scattered to the winds, dispersed to highways and byways in asynchronous packets.

Did the visitors then fail to deliver their message? No. This was the plan from the beginning. The message was to be broadcast in just this shotgun fashion. Once the intended recipients became convinced that the original message had been completely dispersed, they would then rise to the task of resurrecting the message out of the ashes. In this way they could read the handwriting on the wall in at their leisure and in a spontaneous manner which bore no external threat.

So here we are. How do we go about the process of reassembly? How do we second-guess the original intent of the messengers and the source? What do we make of this peculiar method of delivery? Are we ready to ask the questions and sort through the possible answers? Are we ready to face our destiny?

rev. 7/14/00

Cargo Cult

On what came down our chimney

Santa Claus is alive and well, but he has traded in his reindeer for a Zero Point Energy propulsion system. Uncle Sam has now reverse engineered the chariots of the gods, but the oil companies are keeping them hidden in Hangar 18 so that the Cartel may continue to raise our gas prices.

No, Virginia, I don't believe this, despite the evidence of the rapidly rising gas prices. Worse than this, I don't even believe in the Galactic Federation that is supposed to be our benefactor. Heck, Virginia, I don't even believe in galaxies, but never mind.

It's not that I don't believe in a free lunch. It's just that I happen to believe in the Big Free Lunch in the sky. Yes, Virginia, I believe in Creation. And as a residual protestant I don't think we should accept gifts from strangers dressed in funny clothes claiming to be intercessors of God from Zeta Reticuli. I think we are meant to exercise our own powers of ratiocination. It behooves us to consider the Source.

Instead of heaven we are being asked to believe in a technological utopia in the sky. In the scientific context this does seem like a better bet than the happy hunting ground. But does it make sense? Does it fit the data?

There is one premise with which I agree: at a certain point of our development we can no longer be excluded from cosmic society. If we have not already reached that point, it is inevitable and probably imminent, unless, as some suggest, we are the products of a bad seed and due for eradication.

On the other hand there are problems with this picture. How far can technology be carried before it turns its technicians into magicians or even gods? Are there physical limits on technology? Could not technology create virtual worlds of virtually any description? Is it not then more likely that we are the products of such a creation than just accidental products of nature?

How do we distinguish imagineering from imagination, ultimately? Is there such a thing as mind and how do its ultimate powers relate to those of technology? Is not technology leading us to the inevitable conclusion of mind over matter? Or are the philosophers and mystics correct that the refractoriness of matter to mind is just a temporary illusion, along with the technology that partakes of this illusion.

Physicists are accepting the fact that there is nothing to prevent the existence of infinitely many worlds mediated by every conceivable set of physical principles. If this were the case, and knowing that mind is possible in at least one of those worlds, would there never arise a world that was predominantly mental, or that was a construct of mind? If even one such world were possible, then why not every

one?

We have been supposing that mind can arise only as a product of physics. The presumption used to be that physics is simpler than mind and so is more likely to be spontaneously generated. Progress in physics continues in the direction of increased complexity and abstraction at the most fundamental level of phenomena. This trend continues to erode the belief in a natural prohibition against a foundational role for the mind?

Darwin, however, has made it more difficult to assign more than an epiphenomenal role to mind. The fossil record clearly lays before us a story of biological rather than mental evolution. The fossil record is backed up by the celestial appearance of a deep space and time devoid of any other evidence of mind. It has become very difficult for us then to imagine the reverse of the apparently lopsided predominance of matter seen in this universe. If mind were fundamental then the universe ought to be awash in sentience.

Unless...unless our universe is the product of a mind which has special intentions for us. If our world is a creation, it is a creation that has put us in a special isolation chamber: isolated from other intelligent creatures and from the creator. It would have to be a very special creation that does not also have the appearance of a special creation. Who would bet that the creator might not be so talented and so inclined?

I suggest that the creator need not be profligate with creation. Creation is not a hit and miss operation. One puts almost all one's eggs in one basket and then watches the basket carefully. Yes, on this one globe we have the appearance of redundancy and profligacy, but if this were the only such globe, creation might seem exceedingly parsimonious.

The evidence suggests other realms with other intelligences, and one can easily imagine special roles for such realms. The emphasis here, however, seems to be on a more 'natural' diversity. It has been said that ours is the only planet of choice. The choices here are great indeed. The guidance is minimal. Is there anything that has not been tried at least once? Is there any thought that has not been entertained? We are a kind of compost heap radiating much heat.

Is there any reason why the creator might stop with a single compost heap? Let me suggest that this realm is the root of creation, also the route of creation. We are on the royal road to creatordom. What is the matter with two such paths converging? We already have 10^{10} such paths converging right here. Our isolation and the possibility of our uniqueness seem on the verge of gaining us a very hard won solidarity. Would the creator jeopardize that vital solidarity with an eleventh hour revelation of our expendability? I suggest that our very isolated globe defines a 'natural' optimum of redundancy. In as much as the creator has been revealed to us, that revelation is couched in the strongest terms of singularity. Is this not the whole point of monotheism? Reversion now to polytheism and poly-everything

else would seem to be swimming against the strong current of history, besides being utterly pointless.

What has finally come down our chimney at this most crucial of junctures is not a grab bag of gadgetry. It is something more rapturous, more singular. It is our ticket to ride, not the rocket, but the glory train. The Archons have been called off. The coast is clear. This compost heap is deemed ready for its transmorgification. There is no intention for us to tarry. Our allotted Millennium is but an eye blink. Our one measly gadget now is this little Internet. It is sufficient unto this Day of days.

Ur-Phenomenon

The Perfect Story – Antidote to Materialism

There was the story of materialism. That story is finished. It was an incomplete work. It failed to account for experience. It provided only a very narrow abstraction of instrumented experience.

Where do we turn next? Our only option is to tell a better, less abstract story. Nothing new here. About all we ever do with our lives is tell stories to each other and to ourselves. The new thing is the notion of the perfect story. This is the cosmic story or the story to end all stories.

The idea is that the cosmos is a story. The underlying order of the cosmos is story-like. This is the only alternative to the ordering principles of physics. The story is superordinate to physics.

We can also look at this from the aspect of relationalism. To exist is to relate and all relation is in the context of cognition and meaning. Relationalism implies the coherence theory of truth. The ultimate coherence and meaning is just the story we seek. It is the greatest story ever told.

The postmodernist will object that there are many stories. My reply is that there is but one cosmos, and the story we seek is the one that is attendant upon that one cosmos.

The telling of this story is not so difficult because we already know it. The knowing of the story is the prerequisite of our participation in it. The lapse of our memory of this story is coincident with our necessary recreation and eventual recollection of it.

The story is the foundational coherency of any and all reality. To be real is to be experienced. Our ability to experience the inchoate is limited. The inchoate is parasitic upon what is coherent. There is a virtual reality and a virtual chaos, but these are interdependent. The virtual ur-myth is the seed crystal of the cosmos. It is the catalyst of reality. It is the irresistible force. All sub-optimal myths are subsumed by the ur-mythos. This is the perfect story. It is the logos and telos of reality. It is also, necessarily the love story. We will be occupied for the duration of the Millennium in piecing this story back together through our living of it. As our task is accomplished we become one with the Alpha and Omega of the story.

We will understand how selves along with atoms are the concomitants of the perfect cosmic love story. We will understand how our history has been the necessary prelude to the story. We will understand materialism in fact and in cognition as one of the pillars of the story, as the flying buttress of our cosmic cathedral.

I strongly suspect that this ‘fin de siecle’ will only become complete with the reemergence of the ur-story teller. This is none other than the long awaited messiah or the second coming on which the whole story hinges.

rev. 8/25/00

Selves & Atoms

Nothing to lose but our chains

Science struggles to explain the self in terms of atoms. Let us explore the possibility of turning the table. Might not atoms better be derived from selves? In the process I point to the strange fact that scientists have expended untold effort in their quest to fill this explanation gap, but I have spent untold hours searching the Internet nearly in vain for any sign of this alternative project. What is signaled by this oversight? What conspires to so blind us to the obvious? I will return to these questions at the end of this piece.

After centuries of studied neglect, the scientific establishment is under increasing internal and external pressure to admit that its continuing inability to place mental phenomena in any existing theoretical framework is a very strong indication that the mystery of the mind is insoluble with the conventional framework of science. Understanding the mind may very well necessitate a radical new vision of the nature of reality.

Of those few who consider the possibility of a new worldview that will do justice to the fundamental nature of the mind, mine is arguably the most radical, although this has not been a difficult distinction to achieve.

The mind is notoriously elusive, and the scientific community has turned up its nose at that imponderability in favor of more ponderable entities such as atoms.

The problem with physical explanation is in not knowing where to start. The smallest self-contained physical system is a Universe. With standard QM, even that is not enough. There must also be an external observer system; a system that physics has been unable to characterize.

The mind game starts up where the physics game leaves off; with that observer self. This is a primordial self, but I don't imagine that a self can lack experience. At the very least the self must experience 'dreams' and other 'altered' states, somehow filtering a chaotic experiential background. The primordial self may surely dream of itself and of other selves. A primordial society exists when one realizes that there is likely to be symmetry between the dream selves. This is also the primordial act of mutual creation. There must even be the rudiments of space, time and memory existing as complements to the structure of the self and as the minimal prerequisites of any sort of experience. Unless experience has a minimum degree of coherence, it becomes indistinguishable from a background of virtual, meaningless chaos.

Our world and its history are the result of pushing this model of mutual creation to its extreme. The extremity of this push is evidenced in the over-determination of the parameters that make up the anthropic principle. The primordial world is a

tribal council set in a jungle of sorts, not exactly a Garden of Eden. Taking this basic conception and running with it results in what we see here – impressive but not impossible for the imagination.

A principle fall-out or spin-off of this rampant creationism is atomic physics. The atoms may be thought of as logical extensions of the primordial self. They are a necessary aspect of any space-time manifold. They are bodies reduced to the absolute minimum, along with their atomic intelligence. Is this paganism run amok? No, just a slight embellishment on standard quantum physics. Atomic multiplicity is as much an illusion as is the multiplicity of selves. The Monad is never in jeopardy.

What I mean to say is that atomic intelligence is part and parcel of cosmic intelligence. I hasten to add that I don't have a compelling model for how this partitioning of intelligence functions, but what's the harm in trying? Surely there is something like object-oriented programming that comes into play, but we need not fall back into the atomic objectivism of physics.

Consider our bodies and the minimal paraphernalia of incarnate intelligence. Consider how difficult it can be to voluntarily disassociate from our bodies. A body is an ideal tamer and discipline device for intelligence, but it is finally just a projection of intelligence. There are two aspects of intelligence involved in the creation and maintenance of bodies: the former is individual, the latter is cosmic. Just as atoms follow the path of least resistance, as in the least action principle, so do our bodacious selves follow a least action trajectory within history relative to the boundary conditions provided by the Alpha and Omega. From Eve we come and to the Evangel do we return.

Atoms are outriggers on this same trajectory. The big loop of Alpha and Omega is a construct of the many smaller loops of parochial time. It is just the boundary loop. That there is none bigger is something we still have trouble grasping, as we have trouble with the finiteness of space-time. The atoms, like the selves, are all a part of the reflective cosmic illusion. Only the primordial atom transcends this illusion, doing so at the pain of its own abstraction. The object-oriented program that constitutes atomic reality is embedded in our own reflections of the cosmic self. OK, let it not be said that I am not trying. Imagine how much better the rest of you can do as soon as you break the bonds of physicalism that enslave your minds. You have nothing to lose but your chains.

rev. 9/3/00

'Dear Ron'

A look back, and a look ahead (In the form of an open letter)

Dear Ron,

Bill and I had our first strategy talk in well over a year last night in the aftermath of the little dust-up in the Sarfatti group. I was telling Bill that I have come to an impasse, and that if you are unable to help pull my bacon out of the fire, I don't know who will.

Let's recapitulate. About twenty-three years ago was my 'spirit-of-truth' inspiration. That motivated me to talk to many academic and religious people while intensively researching various metaphysical systems. After about five years, I reluctantly concluded that immaterialism was the only viable metaphysical system. I say 'reluctantly' because I knew that I would not have the 'mojo' to sell such a radical scheme to intellectuals steeped in modern cosmology. I knew that it would require an act of God to reawaken that spiritually numbed crew.

I went back into hibernation, until my second major 'spiritual episode' which caused me to focus on the paranormal field. Within a few months I had established contact with you. That was just nine years ago this month. I knew then that you were to be the closest thing to a 'deus ex machina' that I was going to come across. With you as my 'exhibit A' I returned to my former role of activist metaphysician, making new waves wherever I could. The activism progressed for about six years up to the point of your deciding whether or not to sponsor our visit to the NSF. After some hemming and hawing, you declined.

After some fumbling around of my own, I decided that the next logical move would be to embrace the emerging technology of the Internet, as I have been doing for the last three years. There is now a rather voluminous website. There has also been a voluminous e-mail correspondence with an extensive network of individuals more or less connected with Jack Sarfatti.

But both the material on the website and my e-mail correspondence still rely heavily on my continued association with you and the possibility that you might at least represent a 'deus ex machina' in the larger scheme of things. My speculations about that focus on the possible existence of an 'MJ-12' and the reputed 'visitors.'

The upshot is that I have played that set of cards to the point of exhaustion of the potential audience and myself. Without some additional input from 'on high,' I will have to do some serious regrouping.

There is a potential upside and downside. My thesis is that humans are endowed with an unquiet spirit; a spirit that will not rest until it has found its way back

home. For the last several hundred years, science and technology have provided humanity with a surrogate spiritual outlet epitomized by our reaching out to link up with our long lost soul mates among the stars.

This is where you enter the picture. In as much as anyone in the government is known to have investigated the possibility of our clandestine cosmic links, you are that person. You are the one who monitors the 'Aviary' and the 'ufological' arena. In the background is a continuing epidemic of messianic fervor that has come to include UFO lore as a natural focus.

We have arrived at a Millennial cross-roads. Our continued material progress is widely questioned, unless there is an unprecedented scientific breakthrough possibly even mediated by our 'visitors.'

In lieu of a scientific breakthrough, I have been suggesting that there will have to be an imminent spiritual breakthrough just in order to prevent a catastrophic collapse of human hope. We can see clearly how far we have come. And as we teeter on this brink of our material prosperity, not knowing from whence will come our next reprieve, we can see even more clearly how far we can fall.

To put this all in a nutshell, it comes down to you, Jack and myself. You represent the possibility of a cosmic reprieve. Jack represents the possibility that this reprieve will take the form of a scientific breakthrough. I represent the possibility that it will take the form of a spiritual breakthrough. Jack claims that he is now in a position to forge ahead without any additional input from you or the 'visitors.' I make no such claim.

I am at the end of my spiritual tether. If you want to maintain a spiritual option in any manner through my auspices there will have to be some greater effort on your part. Otherwise I will be maintaining a significantly lower profile.

The practical issue for you at this point is to determine what is the window of opportunity for playing the spiritual card that I have been suggesting. I could easily argue that this window is much narrower than what others are probably thinking.

If you have ruled out the need for a spiritual contingency along the lines I have suggested, then I need not bother you. Otherwise we are long over-due for a serious discussion.

Sincerely, Dan

Realities for sale or rent,

Rooms to let, fifty cents....

Jack,

>> If Creation is not accidental, then it is programmed in some fashion. It is tweaked from the future in self-consistent loops in time....<<

A 'programmable' reality, assuming that the 'programming' of it can be shared equitably by all of its participants, guarantees unlimited, creative power to them.

A merely 'tweakable' reality offers much less creativity to the participants. That reality is much less amenable to being fashioned to meet the needs and desires of those participators. The untweakable part of it is like dead weight, which is not designed for any intelligent use.

Clearly, then, the 'programmable' reality is the more desirable. Desirability is the great attractor -- toward which ultimate reality conforms by the power of the consciousness that it generates and captivates.

The less desirable, merely tweakable realities loose out in the Cosmic Nielsen ratings. They would quickly become uninhabited, and die of total conscious neglect.

Which kind of reality would you prefer? Would you really want to end up in a low-rent, dead-end reality??

rev. 9/17/00

Reality Engineering

& the non-captive audience

Jack, et alia,

The unwitting arrogance and hubris of physicists is due to their understandable assumption that they are confronting an absolute reality of which we are all a captive audience.

It never occurs to them to Question Reality. Physicists know only how to interrogate reality, they never actually question it. Do you see the fundamental distinction?

Nonetheless, let us celebrate the fact that that our very own Jack is pushing the envelope of physics like no one else before, and maybe even since. I say not since, because there may be a breaking point for physics. Jack is just on the verge of breaking physics, and I have been tasked by Ron to egg him on. Jack is teetering on the brink between good ol' physics and REALITY ENGINEERING. All I have to do is whisper these sweet nothings in his ear and he will wake up one fine morning, take a sip of Latte, and realize that he is no longer a physicist, but now he is a CIA certified Reality Engineer. Hallelujah! And, my well-deserved CIA pension will get me all the way to Hawaii.

Here is the Whisper of the Day: Jack, there is no way you can keep us down on the physics farm! Is that not the very most basic lesson of our Starry Visitation? Your less starry eyed colleagues realize that once they pin their sheepskins on a shooting star they are stepping beyond the pale and into the twilight zone of REALITY ENGINEERING. Yes, Jack, you have gone where physicists fear to tread.

Consider the lowly STARGATE. Suppose that you could build a stargate with just good ol' Bohmianated Torsion physics. What would be the very first *human* CONSEQUENCE? That is one little problem you have, Jack; you are great with the physics, but weak with the human factors part.

Guess what is the very first thing that those little human buggers are going to do with your stargate? You don't have to be a brain surgeon to know that they are going to BUG THE HELL OUT!!! Talk about Boat People, well, you ain't seen nothin' yet. Remember, Jack, what Ron told you. Listen to Dan when he talks about the Trends. Well, Jack, you give me a Stargate, and you will see the biggest Trend to hit this planet since Noah's Flood! We won't need any eschaton, 'cause there won't be anyone here but us chickens.

How, Jack, are we going to keep 'em down on the Farm?

Oh, but it still gets worse!

In a distant Galaxy, far, far away is the Bistro at the End of the Universe. It is the absolute Chic place to be. You are absolutely no one if you don't show up at the Bistro at the End of the Universe. What are the Bistrovians going to do, when they see the impending onslaught? They are going to say, 'Hey this is ridiculous, let's blow this joint.' They are going to take one of Jack's stargates and aim it at the Universe to End All Universes. And then what? In the very next breath, every stargate in this backwater universe is going to be aimed directly at the Universe to End All Universes.

If there ever was a trend, Jack, that is it.

No wonder your colleagues are reluctant to go around poking holes in the space-time continuum. There can be only one end to it.

Oh, but it still gets worse!

If a stargate is possible then probably a lot of other things are possible such as teleportation, out of body travel, etc., etc. In fact it will be very hard to make people believe that we don't, each one of us, have our own personal stargate. We call it 'death'.

So it's six of one, half dozen of the other: Stargates, Teleportation, Out of body travel, Reincarnation, Transmigration of souls, Metempsychosis, etc. However we look at it, we ought to be the least captive audience that could possibly be imagined. So what the heck are we doing in a crummy, backward joint like this?

We have to jump to the conclusion that we are prisoners here on Planet Alcatraz, and that Physics, the WTF, ETs, God and everything and everybody else in creation is conspiring to hold us captive down on this Prison Farm while we pay for our not very original sins or just plain bad luck.

Yes, that is what almost every human has ever believed, Hindus, Christians, Scientists, Ufologists, everybody. This is the Paranoiac view. Jack is plotting the prison break.

But I am saying that the only thing around here that is going to break is the Physics. This is the Pronoiac view.

We are in for some heavy duty, industrial strength reality engineering. The ETs are here mainly just to demonstrate this reality engineering.

So what the heck took them so darn long?? And why do they have to be so coy about it?

Well, yes, Dick, it's because this really is the Only Planet of Choice. Also there is that little proviso, the 'prime directive'.

But, first, let's back up just one minute here. Where were we headed before we fell into our little paranoid funk? We were headed to the Universe to End All

Universes. And just what would that be? It would be a universe that was eminently amenable to our desires. It would be an unobstructed universe. There would be no obstructions to the realization of our dreams. What is ever and always our one greatest dream but to love and be loved. The Universe to End All Universes is the universe that has no obstruction to love. Could there be such a world? Almost certainly, unless there is a cosmic law prohibiting love.

Could there possibly exist any lesser worlds? They would become totally uninhabited in an instant unless the World of Ultimate Love conspired to keep untold billions of souls trapped in love challenged/obstructed worlds, kinda like this one. But that would not be a very loving thing to do, would it? Goodness me, we must have a paradox!

There is only one way to avoid this ultimate paradox of love. We have to identify our world as the World of Ultimate Love. What a streeeeeeeeetch that would be!!!!

Not really. We need only add a little bootstrapping to the creation process and we become the amnesiac bootstrappers of the Creator, about recreate our love machine. And so the human history of being love challenged is just the blink of an eye, 'sub specie aeternitas'.

Whew! That was a fast one I just pulled, but I have already run over my time allotment.

And, yes, Jack, your great-great-granddaughter, Sophia, told me what is the 'cheat-code' to get to the next level of this cosmic game. Can you guess what it is?

Dan

Gun-Shy

Working with the 'shyness effect'

Martin Gardner likes to make hay with the 'shyness effect', and it's hard to blame him. Where would our technotopia be if our computers were bashful?

The shyness effect is the line drawn in the sand between good ol' engineering and Reality Engineering. The shyness effect is the safety-lock on our consensus reality. That is how we keep our dreams from 'contaminating' our 'reality'.

Reality engineering involves consciousness in a direct fashion. By definition it must involve our collective consciousness that makes up our consensus reality.

Our consensus reality sometimes seems to be set in stone. This may be historically accurate. The global megalithic culture at the dawn of history may have been heaven's anchor on Earth. The sacred astro-geometry immortalized therein was the crucial initial step of our globalization via astro-geomancy. That was the first great reality-engineering project on Earth. Columbus and NASA are among its logical heirs.

If we wish to build a tower to heaven or a stargate of some fashion, we will first have to retro-reality-engineer the Great Pyramid. The legend of a stargate being hidden beneath the Great Pyramid may be an encapsulation of these historical circumstances.

This retro-engineering is not easy, or it would have already been done. It is not just a matter of building an inverse pyramid or even an anti-gravity device of some kind. The megalithic culture is now firmly established in our collective unconscious. The shortest distance to the 'stars' is a detour through our collective unconscious.

The collective unconscious is the safety-lock on our consensus reality. The shyness effect that is the bane of the paranormal is just the collective fear that is generated when we begin to tamper with the foundations of our being. That foundation is the circuitry by which each of us is wired to everyone else and to the cosmos.

But tamper we will. That, too, has been written in the stars and in our hearts. The only way to dislodge the tamper-proof seal is by understanding the cosmic 'circuitry' that is the foundation of our being. Without understanding the circuitry we would only produce short-circuits of more or less catastrophic proportions. The cosmos is understandably gun-shy. Thus the shyness effect.

As we continue to accelerate toward the barriers that physics has imposed on conventional engineering, the survival issues thus raised will eventually manifest in a messianic event. The messiah will be the one who definitively catalyzes the

process by which we will discover how our individual selves are ‘wired’ to the cosmic self. Once we put our global mind to the task it will seem like no task at all. Until then, reality is truly up for grabs.

rev. 9/20/00

Selves & Atoms II

An holistic perspective

My claim is that selves and atoms are made of the same stuff. The major difference being that atoms do not partake of an individual long-term memory as do human selves.

In a dualistic frame selves and atoms are generally taken to represent the opposite polarities of reality. In the materialistic frame selves are taken to have no objective existence.

In the immaterialist frame it is the existence of atoms that is problematic. The immaterialist is responsible to explain atoms in terms of the self.

As a first approximation we may compare atoms with numbers. The contrast here is that numbers are extensionless, as are selves. However, real and complex numbers are intimately involved with our most primitive and sophisticated spatial concepts. Apart from our proprioceptive system, space is an entirely mathematical construct as first conceived by Descartes.

The most advanced concepts in physics significantly undermine the common distinctions that we make between particles and space. Particles are now comprised of abstract mathematical spaces, of which our experiential space is an arbitrary branch.

Recall then that mathematical spaces are simply logical extensions of number systems, while experiential spaces are psychological reconstructions of neural signals. Atoms and space cannot then be said to comprise fundamental aspects of reality.

Experiential space is indeed a projection of the psyche. Physical spaces along with the particles are known most intimately as co-dependent mathematical systems, knowable only in the context of a suitable quantum logic.

The general thrust here is that the physics is being subsumed to logicism which in its turn is being subsumed to psychologism. The cosmological anthropic principle gives further weight to the notion that the existence of intelligence is a precondition of physics. However strong this logic may be, it does not fully capture our sense of how both the atom and the self manage to transcend the merely logical. That they manage this in some parallel fashion is what remains to be demonstrated.

Individual atoms and selves give the impression of being able to exist in a much more independent and self-contained fashion than is any given number. I would chalk-up this impression to a question of degree as well as to a considerable bias. This is not to say that we are mere ciphers, but rather that we are still struggling to

appreciate existence in a truly holistic and holographic sense.

Dan's Double-Bind

Beyond Fermi's paradox

Larry,

Without trying too hard you have, nonetheless, managed to misconstrue my argument.

Bless you! You are actually a precious resource here, being one of the very few non-ufologists braving these alien infested waters. There is a creepy critter under almost every one of these rocks. Just ask Dick!

I wonder if you don't think we aren't just a bit deficient in the sanity department.

You do seem to recognize that 'insanity' is a fact of life, and not likely to go away in anyone's lifetime.

If we were to put a positive spin on insanity, we could simply call it thinking outside the box. It would seem, Larry, that you are a confirmed boxologist. When it comes to paradigms, you would much rather fight than switch. You serve here as a sometimes-articulate representative of the silent majority of non-boatrockers.

It is a very comforting sight to see the ship of state sailing peacefully into the sunset. Who would want to disturb such a picture? At other times we cast a weather eye and see a red sky in the morning. Do we batten down the hatches or do we set every sail and hope to outrun the storm? Do we throw caution to the winds?

All of us ufologists see a larger reality than you boxologists. There is before us a kind of Pascal's wager. The ufologists might be wrong, and if we are what is the harm? You are concerned that we might upset the ship of state. Our particular 'insanity' does show the tangible effects of contagion. The UFO virus has demonstrated its virulence. Spreading such a virus before a storm would seem to be the height of folly. At the first gust of wind the ship of state might go belly-up. Better that we keep our shoulders to the wheel, our noses to the grindstone, and so on.

Science and technology have brought us a great abundance. Let us not look this gift horse too carefully in the mouth. But this is just where things get to be slightly interesting.

Just what is this gift horse of science on whose tit we have been sucking for lo' these several centuries? How many more centuries of milk are left in this tit, and where will we be when that well runs dry?

You pat us the head and tell us that the well shows no sign of going dry, and that we need not worry our little minds, but just keep our noses to the grindstone of

science and we will continue to receive our just rewards.

Ah, but there is just one little hitch in this swagger. Beyond Pascal's wager, we now have Fermi's paradox. Where are all the other little suckers? Why aren't they here already? If Science is the ultimate cosmic tit, then the universe should be swarming with life and we should be seeing ample signs of it. Do we not instead smell something fishy, of cosmic proportions?

And so a great debate rages both inside and outside the halls of Academe. If they aren't here, why not? If they are, why are they being so damned coy about it?

Larry, if the cosmic tit is as great as you say it is then we surely should at least have been contacted by some of the other little suckers out there who should have been on this tit for at least a thousand times longer than we have.

This is why, Larry, UFO debunking is such a grim and lonely sport. UFOs, for better or worse, are our most tangible form of hope. Most observers of the human scene will tell you that hope is our very most rare and most precious commodity. If people have no hope, you can forget your wheels and grindstones, those people will simply not be getting out of bed in the morning.

Science can ever only point to the past, and it can never legitimately speak to the question of whether its Sun will be able to rise again tomorrow. It is only the ufologists who can lay claim to the hopes and fears of all our years.

It is your precious Science, Larry, that set us on our collision course with this, our ufological destiny. Now that this collision is upon us in a culturally irreversible manner, you wish to turn the clock back to a simpler and less portentous time. Too bad!

If the UFOs are not here, you had better pray for a new, science-transcending source of hope. If they are here, well, you had still better pray, just the same! You can call this 'Dan's double-bind'. It takes us far, far beyond Pascal's wager and Fermi's paradox!

Dan

rev. 9/25/00

God & ET

Jolting us awake

No ET has been observed wearing a Cross or a Star of David. ET religion remains very obscure, much more so than their 'technology', which by contrast is often thrust in our faces and other places less mentionable. Thus we are forced to speculate.

The mere fact that ETs do not sport white gowns and halos is more than enough to convince any good fundamentalist that the little buggers must be working for the Devil herself.

On the other hand, the scientific ufologists assume that lack of spiritual evidence is sufficient to prove that ET cares no more about God than does NASA. And why should they? Once ET gets over that first bit of Edgar Mitchellesque disorientation, she goes on about her business like any good scientist. Surely she would be evolved far beyond such childish superstition.

These initial reactions define the current thinking on ET religion. I suggest we can do better than this.

First we have the Anthropic problem. Most scientists dismiss the Anthropic Principle with the following observation: the universe is obviously hostile or indifferent to life just by the fact that even under the best conditions it took life nearly a billion years just to carve out the most primitive niche. Anything beyond that can be chalked-up to the 'luck of the Irish'.

But if in fact our skies are being over-run with ETs, we will have to reconsider this 'luck of the Irish'. Then clearly there are some very deep aspects of physics and the nature of reality that favor a ubiquitous cosmic intelligence. Clearly the cosmic dice are loaded in favor of such intelligence. The 'big bang' model of creation must at least be augmented with a very strong internal life force or an external designer principle. In either case, the ETs would be much more directly tapped into this force than are we.

The very strong possibility that ETs are much more directly plugged into the Cosmic Intelligence is the most likely explanation for their apparent lack of religion. An ET with a bible would be like a fish with a snorkel. Ludicrous!

But if ETs are so plugged into cosmic intelligence, why do they do such idiotic things to us? The answer is about the same. They have a very different mode of being than ours. They are having a heck of time connecting with our extremely primitive ego-based mind set. It's like God trying to communicate with the Israelites. She had to use every trick in the book just to get their attention.

The primary impedance to ET/human communication is the oft-noted fact that ETs operate in a 'hive' mode, while we are in an ego mode. It is like a native tribal council trying to communicate with John Wayne. If there is a cosmic intelligence, it is much more likely to be of the former variety than the latter. Besides, it can be argued that ET customer relations is catching on to our foibles quicker than we are wising up to their own motivational scheme.

Still it seems like a cat and mouse game. We don't like being the mouse that is played with. No kidding! But I don't see anyone shaking their fist at a UFO and saying, 'OK, let's stop playing games; let's get down to serious business!' No, we don't see anyone putting that idea in the ET suggestion box, do we?

We have now, thanks to the ETs, resolved the existence of cosmic intelligence. But beyond that one salient point, we spend our time whining about the finer points of ET proctoscopy, and arguing interminably about how the little devils got here. When we will pop the Big Question? How can we expect God to treat us seriously while we fixate on every superficiality that comes along?

We think of the ETs as being just another planetary civilization like ourselves, but obviously they are not, and this causes undue perplexity. We should begin to think of them as the outermost veil of cosmic intelligence. God was supposed to have sent us a choir of angels, and this is certainly not that. A choir of angels would have lulled us back to sleep. Instead we have gotten a jolting wake-up call. No one likes to be woken abruptly out of a sound sleep, but now that we are awake let us recollect our senses. Let us begin to paddle our end of the cosmic boat.

Ferreting out the Answer

or a Tiger by the Tale

It would appear that Susan P. is in for another uninvited guest, and I will once again get to be the bearer of these 'bad' tidings.

Also it appears that Ron wants me to be a bus driver. He wants me to obtain a bus and paint it to look like an 'official' MTA bus, and go around the city picking up passengers at the bus stops, but instead of delivering them to their usual destinations, I will take them on an eschatological tour. When I told Ron that this might be construed as being illegal, he did not seem perturbed.

Would I lie to you? Do you think for a minute that these were not my 'official' instructions from a person who seems no longer inclined to deny membership in 'MTA-12'?

These, my friends, are **your** tax dollars at work. Imagine how many bureaucrats it takes to figure out how to capture a Tiger by a Tale. It even boggles the mind of the putative Conductor. Why, aren't you impressed, yet?

Yes, there is supposed to be a website for homeless ferrets, but I have not yet checked. Ferret: 1: a partially domesticated usually albino European polecat that is sometimes classed as a separate species (*Mustela furo*) 2: an active and persistent searcher. This group has a location near Towson, I am told. I will have to sign the papers saying that I will bear full responsibility for the maintenance of the previously discarded pet. That responsibility, however, will actually fall upon the birthday boy, Junior (Oct 7). I was also involved in the purchase of **three** chicks obtained surreptitiously of Mistress P. on a previous such occasion. It is reported that she does become reconciled to these domestic interlopers. One of these has had to be replaced by an exotic bird, whose bird-name I regret has slipped my mind. But I think that if you have been paying extremely close attention you will be able to figure out the 'real' name of this new and exotic fowl.

Are you paying attention, Class? Rap, rap!

Are there any questions?

Who will be the first with the correct answer?

Otherwise I am told that we should be pleased that we are staying the course. We should by now be able to see clear signs of our progress toward the truth and that even Joe F. is coming around.

And, oh yes, Ron reports an extensive e-mail interchange with Rick. But we are wondering who 'Wayne' really is, and how he would know so much about Rick's

alleged prowess in Germany. His social security number was not given.

One more thing, Ron has received many requests for invitations to the debriefing and so we may have to rent a tent. Or maybe we should just hold it @ 'Dan's Place'.

rev. 9/30/00

Ocelot & Ferret

Green Light?

I have been reminded that there is a more definite ferret connection with the Aviary.

There are two 'birds' that are not birds. These two are known as Ocelot and Ferret. It was several years ago that these two names came up, and they had not been mentioned since, so my memory lapse is understandable.

Ocelot and Ferret reside in the DC area. Periodically they make a trip to Los Alamos, sometimes as often as twice a year. The purpose of the trips is to ascertain whether the time is right yet for disclosure. The inference is that the conclusion has been uniformly negative, unless we are also talking about back channel disclosures. However, in the present context, we are being given to assume that finally Ocelot and Ferret have been given the green light for the front channel disclosure.

As an aside, let me add the following. You may recall the infamous 'tarmac delay'. Back in ancient times, in the first Clinton term, there was a two hour tarmac delay of AF One at LAX, with Bill on board. There was much speculation in the media as to the possible explanation, until finally an LA hair stylist (male) was trotted out at a press conference. This did not end the speculation as to the true nature of the tarmac tryst, and I was willing to venture an ET hypothesis along the lines of Ike with the toothache in Palm Springs. I then heard from a Houston source that there had been two previous, shorter tarmac delays that had only been reported in the local media. Both of these were at, ta da, Albuquerque. Next I heard from an expatriate British astronomer, with whom I had once shared an ONI contact, that the story inside the Beltway was that Bill had not liked the first two 'haircuts'.

If we factor into these stories, the Aviary Ur-myth of EBE1-3, with their now residing under that mesa in NM, we get a common thread. Please recall that my very first aviary story, that I immediately disseminated on compuserve, was of Pelican headed to Los Alamos to meet with Penguin and an ET. The trip was postponed, allegedly due to my loquaciousness, qv. *ici*.

Oh, yes, sorry but we're not quite through yet. Those three (Easter) chicks1-3?? There really were three of them, since I was instrumental in their purchase on my card, predating the still expected arrival of the ferret at the Pelican household. My previous account, however, has been corrected. Two of those 3 chicks eventually had to be replaced with two more, one of which turned out to be a bantam rooster. Now as Freud said, sometime a cigar is just a cigar, but with Pelican involved, one can never be too sure of that. So is it just possible that the bantam rooster is also a fowl proxy for a certain chicken little? And what would 'replacement' then mean?

I have no doubt that this exercise is trying the patience of any number of you. We

have been promised a real story, not just chicken excrement, so to speak. However, I can see why, even at this very late Ocelot hour, it is helpful to be reminded from whence we cometh, and just how we are arriving at this historical juncture, where we are poised to finally break the chicken ceiling and all become cosmic birds.

To this end, I have consulted with my local and long-time media consultant, author and experimenter. He suggests that both of us meet with Pelican at an early date. If the meeting is reasonably propitious, he could then contact Sy Hersh about doing a set of articles in which the disclosure heat would gradually be turned up. The trick here is to get out as much as possible into a public medium before, inevitably, the questions get back to the Pres.

This raises another delicate point. Who will the President then be? It would appear that this disclosure has been on hold for the last several years pending a changing of the guard. Pelican picks W as the lesser of 'evils'. I have referenced familial connections with the B's, although my sib in question is now leaning to Al, due to his stance on women's issues. In any case, a changing of the guard always seems to stir the disclosure pot. This time bodes to be no exception, what so ever!!! Oh, by the way, I do believe that our little pelican has come up in the world a bit and is now the nio/cmi, but I could be mistaken.

I should point out that there already was arranged a preliminary meeting between Pelican and the local investigative journalist previously cited, that was about three years ago. As you see, the wheel of 'justice' turns slowly, but it grinds finely.

rev. 10/5/00

Scripting the Non-Announcement

& the non-eschaton

.....
[deleted 10/19 -- LL/SS]
.....

.....
[deleted 10/19 -- LL/SS]
.....

.....
[deleted 10/19 -- LL/SS]
.....

Why do I bore you with such details? Because this is a significant part of a larger pattern that is leading up to the non-Announcement that will occur on or about March of 2001. More importantly it is up to you and me to script this non-announcement. The only stipulation is that we script the best possible announcement of the cosmic presence. Best? Yes, the one that yields the greatest benefit at the least cost.

There are two camps concerning the portent of the cosmic presence, depending on the relative importance of the 'how' of it versus the 'why' of it. I am in the 'why' camp. The presence is not just a cosmic 'motorama'. The visitors are here as agents to facilitate our acceptance of own destiny. This implies a primary Facilitator, which continues to be my role mainly by default. No government is constituted to be the Facilitator. That authority must be vested in some individual. It has taken this long to work out the proper vesting and vetting. As above, so below. The vesting is a major part of the announcement process. If you don't like the present arrangement you are invited to suggest alternatives. You will find, however, that this forum is the only one where such suggestions will be seriously entertained. Let us get on with the task at hand.

What we seek is what we already have, a gradual process of acclimation to the cosmic presence and our concomitant destiny. The process to date has been brought to you mainly by the visitors and 'MJ-12'. They are looking for an exit strategy and we are it. Their authority will be conferred to us with whatever minimum degree of explicitness is necessary for us to initiate and maintain a deliberate progress toward our cosmic destination, which is the 'non-eschaton'. The description of that 'destination' is another dissertation to which you will also be contributing, later.

Let us get back to the immediate task. I suggest that at least one of us brief the new presidential science advisor on or about March of 2001. I am volunteering to participate, with Ron along as my official witness. You will help me to write the

best possible script for that meeting. My conferring with Robert, xxx and John is a significant step in that direction. Presumably there will be other steps in the meantime.

.

rev. 10/18/00

Felicitous Culpability

If you put all your eggs in one basket...

Watch the basket carefully. Modern civilization, that's us, is guilty of putting all its eggs into the basket of materialism. To compound our error, we forgot to watch the basket. Now, given the over-stressed condition of scientific materialism, someone may have to pull our irons out of that fire. I hereby volunteer.

But wait one darn minute, you say. By passing this buck to Dan Smith, or to Joe Blow for that matter, are we not just making the same mistake of putting too many eggs in one basket, all over again. No, because my basket is a lot easier to watch. And furthermore, at this late hour, there is precious little choice.

At this point you have to start thinking about cosmic felicity. If Adam and Eve had not eaten the apple, then we would not have had the opportunity to know Jesus. If modern civilization had not swallowed the poisoned apple of materialism, then Prince Charming, that's me, could not have come along to dislodge the apple.

We are facing the probable contingency of a dramatic paradigm inversion from materialism to immaterialism. Historically, each paradigm shift has been attributable to a single individual. This one, the mother of all shifts, will be no exception. Someone rises to each occasion.

Unlike its predecessors, this final paradigm shift has eschatological implications. As we all awaken to the illusory nature of reality, there is the possibility that our cosmic dreaming could turn into a nightmare. Prince Charming, Mr. Paradigm Shifter, will have a weighty responsibility. There must be a sufficient splash to wake most of us up, but not so much of a splash that we all drown.

The hopes and fears of all the years will have to be vested somewhere. Naturally we want to vest them in God. And the historical record on this point is also fairly clear. When our need for God is the greatest, God will show up as or through one of us. How else would we have it? How else could it be?

All that I will need is access to the Universities. As a practical matter this will require access to the academic deans. This could be arranged through most any national body with both academic and government affiliations. Considering the nature of the paradigm shift, this ought to be a scientific body. For instance, my being granted access to the NSF would be tantamount to my having access to any university.

As for my personal qualifications, I believe that I have a modest but unique combination of intellectual, political, and spiritual authority that will be sufficient for this task. May God help me and all of us.

.

| [Contents](#) |

rev. 1/4/99

A Cover Letter

By way of apology...

In many respects 'Felix Culpa' is an outrageous statement. I realize that because I still retain a shred of 'sanity.' I would like to be able to apologize for this statement, but I did not create the peculiar situation that has logically led up to it. People whom I respect greatly have shouted their outrage at me, as might some of you, but when the shouting is over, where are the alternatives?

You may choose to ignore these implications for a while longer, but time may no longer be our friend. The longer that we wait to look seriously at our situation, the less time will there be for deliberation and negotiation. Or you may choose to deal with the problem directly, and that is why I am here for you.

Trouble was that after Rene Descartes we never really bothered to kick the tires of materialism. Felix Culpa. But now you will have ample opportunity to kick my tires. I would not be coming before you if there had not already been a lot of that. If there is still a shred of ego involvement, and there probably is, it is only because Dr. P. and a few others have fallen down at their job.

If at some point it is determined that I am not fulfilling my part of this bargain, will it be possible to pull the plug? It will be, but only up to a point. There will be a point of no return, and we should be on the lookout for that. After that... les jeux sont fait.

The decisive point will be when the thinking segment of the public is able to suspend its belief concerning the origin of dinosaur fossils. I suggest that those too could have been conjured out of the cosmic intelligence, and for a perfectly legitimate reason. Is it possible that God could love paleontologists? Why? At first sight this does seem to be the end of rationality. But, if you allow yourself to look once more you may see that it could also be the beginning of rationality. Descartes attempted put asunder what had already been put together. Realizing this may just be the first step back to reason. Reason has become a rare commodity, and that is why I am here.

rev. 1/6/99

Operation 'Prince Charming'

Operation Analysis:

In order to preempt a larger insanity, we institute a smaller one.

We build a minimal backfire in order to stave off a wildfire.

Dan Smith is turned loose on the college campuses. Lacking the ability to turn water into beer, he will have to be given an entre. The entre will be through the Deans' offices. That can be arranged as follows.

A white paper along the lines of 'Felix Culpa' would be written and also a cover letter requesting a meeting, probably at the NSF. At said meeting we would discuss the logistics of having one of the members of the foreign liaison group at NSF, i.e. one of your guys, handle any telephone inquiries from the Deans' offices. The only statement given out would be to acknowledge that the alleged meeting had taken place. There might also be occasional inquiries to your office, wherever that will be. The rest of it will be up to me to finesse.

I will be attempting to generate discussion and controversy toward the activation of the academic 'grapevine.'

For all we know and don't know, there may actually be an eschaton lurking out there in the cosmos. The idea here is to try putting a bit of the fear of God into the Godless academe. This will be done on a carefully graduated and experimental basis to obtain the stimulus/response parameters for these subjects, using in their own terminology.

rev. 1/7/99

Aquarium's Campus Initiative

A Simple Logistic

Making inroads into the academic community is the primary focus for the 'Aquarium.' It is here that the 'battle' of the paradigms will be engaged. The upstart paradigm of immaterialism must outmaneuver the entrenched forces of materialism. As with most battles, the outcome will be determined by the logistics.

Scientific materialism is a broadly based, but rather superficial worldview. Its devotees are, of course, lacking in spiritual motivation, and most academics are decidedly uncomfortable with the obvious inhumanity of materialism when carried to its illogical extreme.

Yet the challenge to scientific materialism remains inchoate. The reason for this is the well-known incommensurability of paradigms. The old paradigm provides no basis for the new one. There is no logical progression from one to the other. There is no piecemeal or compartmentalized approach to dealing with paradigm shifts, and especially not in this case where we are confronting a veritable paradigm inversion, or gestalt switch.

One does not have to ponder long to realize that a global awakening to the immaterial or spiritual nature of reality would constitute a revelation of apocalyptic or biblical proportions. That most people would be intimidated at the prospect of initiating such an event, would be an understatement. But where angels fear to tread, fools are wont to rush in.

I have volunteered to guide the transition to the new paradigm. This would be unremarkable were it not for the fact that my offer has apparently been received with some interest within a critical venue.

The venue I am referring to is the semi-official 'phenomenology network.' The intelligence community has a responsibility to be vigilant with respect to 'uncorrelated' phenomena that might have implications for national security. This vigilance has led to the accumulation of sequestered data that are at odds with the assumptions of scientific materialism. It would be safe to assume that these data are not entirely anecdotal.

With the ending of the Cold War the sequestration of this data becomes more problematic. However, the revelation of data that would subvert the shibboleths of modern civilization and which also has spiritual implications poses a major challenge for a modern secular government. The official government has naturally shied away from this challenge and has gone on with its daily business. That leaves a residuum of stalwarts holding the Pandora's box. This is a sobering responsibility, which likely enhances one's natural fear of God. If you were one of these folks, you too would be looking to God for a solution.

Something over twenty years ago I had an experience, which led me to believe that I would have a role to play in the revealing of a new/old truth. Now I am in indirect contact with the keepers of the data. Apparently they have incurred an obligation to assist in my mission to facilitate our transition to an immaterial worldview while ameliorating the consequences. We can only hope that all of us are being guided from above.

Now for the logistic challenge: it is the old problem of the cart and the horse. The sequestered data is the cart. I am the designated horse. The skeptical academics would naturally prefer to put the cart before the horse. They want to see the data up front. I can sympathize, but only up to a point. In this case the 'horse' is also serving as a proxy for the 'cart.'

I am the solution to the logistic challenge. This is a package deal, and I am the package. I am the interpreter of the data, but also I have become a critically significant part of the data. If you don't like me or my interpretation, you will like the 'raw' data even less. Much of the data has been in the public domain for decades. The data were received and disseminated in garbled fashion. Much of it is highly subjective, and none of it bodes well for scientific materialism.

I am here to gain the cooperation of those who are most ready to cooperate in facing what is slated to be the ultimate challenge for humanity. They will understand the desire to pull as few political strings as possible to initiate the process of transition. They will understand why this 'political' process must be out in front of the raw data.

Cooperation entails nothing more than participation in a constructive dialog and inquiry. Only in such fashion will a more subtle truth prevail.

rev. 1/11/99

The Eschaton

Walk softly and....

Everything will be at risk at the time of our cosmic awakening. As we leave our historical womb of the millennia for a vastly expanded consciousness, then will we be at our most vulnerable point. This is the point at which we will be finding out about cosmic redundancy. This is when the Christ event will truly be recollected.

Does a tree make a sound when it falls in the forest? Does a universe leave a trace when it collapses back in upon itself? Even our present-day physics suggest that “no phenomenon is a real phenomenon unless it is observed.” Observed by whom?

If the falling tree kills the only listener, then still there was no sound. There must be a transcendental observer: an observer that exists both inside and outside of the phenomenon. This is the meaning of the x-event. If as we awaken we cannot walk together toward the cosmic light, we will wander apart and die alone in the cosmic void. There will be no trace of our dreams.

X marks the spot. That is our emergency exit to the cosmic light. That will be our sky-hook off the sinking ship. All our dreams will have to be vested somewhere lest they become a puff of smoke. We have been preparing for the eschaton for two millennia, let us not snatch defeat from the jaws of victory.

Yes, each one of us is a light unto herself, but without a beacon to guide us, very many of us would become snarled in the collective knot of fear that could take two more millennia just to unravel. We will need all the help we can get. Let us not become arrogant and intransigent in our hour of greatest need.

I have reason to be optimistic. The Christ event was a guarantee for the whole world, not just for the few. This world and every one of us are precious because there is not the cosmic redundancy that the Astronomers and Hindus postulate. We are not just cogs in a cosmic wheel. Each of us is a world unto herself. The earth is not an expendable speck in the cosmos. It is the center of cosmic gravity. God has put almost all of her eggs in one basket and is watching the basket carefully. This might seem foolhardy to us mortals, but not to God.

How do I know this? Because I know what we would and will do in God’s place and I cannot imagine that God is any less of a moral being than we are.

The best argument against this view is the apparent redundancy of humans. As a former ZPGer, I can speak to this point with some expertise. Not only might there be too many of us, but certainly too many of us have died in ‘senseless’ deaths.

Just as the dictates of ecology prevent us from saying that there are too many insects, so must the dictates of spiritual ecology and the cosmic complexity prevent us from making rash judgments about ourselves. The rapidly increasing complexity

and interdependency of the global economy are just a harbinger of much greater things to come. And of course there are many other spiritual worlds or enclaves, but none of them need be as dense or as isolated as this one. We are the hardest of the hard core. We are the pearl of greatest price.

If God could 'deceive' us with dinosaur bones, would God not also deceive us with the words of the prophets? Only if the first deception was not necessary to fulfill the latter. God had to hide herself behind those bones in order eventually to reveal herself over the Internet. No bones, no Internet. Science and technology and religion, for that matter, are all interconnected in the historical economy. That is the very delicate Ariadne's web in which we are being caught up into heaven. Hide and seek is a game that even adults can play. Think of it as stealth technology. Once we have God on our radar screens it will be a whole new game and a whole new technology.

rev. 1/14/99

Geocentricity

Transcending mere quantity

Giordano Bruno was the first westerner to take up the notion of a numerically infinite cosmos, a notion that had been a mainstay of eastern mysticism. Science has followed Bruno's lead ever since, and we all remember hearing Carl Sagan intoning his 'billions and billions.'

The western prophetic tradition maintains another view. Humanity has a special covenant with God. Ironically it is the eastern immaterialism that will enable us to recover this covenant from the jaws of science.

It is this covenant that is our reprieve from the cosmic abyss. It is that which defines our humanity. The abyss turns out to have been an illusion, in any case. The quantitative infinities of science are a proxy for the qualitative infinities of the spirit. The transcendental presence of God is the bedrock of reality.

Some may feel deprived at having to trade an infinite cosmos for a personal Creator. Am I not imposing a cosmic population control? A potential infinity of planets is being denied its right to existence and life. I suggest that the proper concern here be with quality and not quantity. Redundancy has its place in nature but not in spirit.

The apparent infinities of space and time are merely a projection of spirit. So too is each of us. But we are each an actor, not to be confused with the scenery. Each of us is a microcosm, a proxy for God.

Is God logically prevented from creating an infinity of creatures, or is this a matter of judgment? Could God have a personal relationship with an infinity of creatures, any less than with a billion creatures?

As microcosms our minds are biologically composed of several billion neurons. The natural example suggests that other worlds would constitute separate realms of consciousness, and so there would be at least one level of being interposed between the Supreme Being and us. This would be a spiritual redundancy that could adversely impact the transcendental nature of spirit. Polytheism would have to be reconsidered, but we have already been down that path. That path leads to tribalism, among other things, even if it is on a cosmic scale.

I submit that the Creator could have created a geocentric cosmos that would sacrifice nothing of spiritual value, but rather would have been its highest expression. Let us not suppose that we are expendable, unless we are forced to suppose that. Such a creation would not support the humanity and divinity of which we are evidently capable. The notion of expendability is likely an excuse for irresponsibility.

What we can expect is the expansion of our consciousness as we take on the divine eternal presence that is not limited by time or space. The qualitative infinity of our cosmic consciousness will dwarf all quantitative or astronomical notions of infinity. We will recapture the source of our humanity with all of its personal value.

A geocentric cosmos does not exclude other worlds; it simply puts them in their place relative to us. We are already the seat of the cosmic federation. We are Mecca.

What will we do for an encore to our own salvation? Are we experiencing the climax of creation? What about those poor souls who might have missed the finale? Will there not be a reenactment? Such questions will lose their significance once we have moved on to a larger consciousness. At that point all of space and time will be present to us. But won't this just be a replay? The burden of choice will have been removed; otherwise we will face the paradoxes of time travel.

We must realize that our very narrow, temporally oriented view of reality does not allow us to draw conclusions about the execution of free will or even about causality. For instance the operation of teleology remains well beyond our grasp. These processes await a greater comprehension. It is in these inner dimensions where the spiritual infinity of our cosmos exists, and wherein lies our destiny.

.

rev. 1/14/99

Our Greatest Threat

A challenge for both science & religion

It would not be difficult to argue that the 'eschaton' is the greatest present threat to our survival. But the immediate problem is to define the nature of that threat and the specific challenge that it poses for the scientific community.

The immaterial nature of our reality adds very significantly to all the other instabilities that face us on a daily basis. In addition to all the physical problems we face, we must also consider the metaphysical. The fact that our technocratic civilization is oblivious to this situation only magnifies its potential for harm.

I agree that a sudden announcement of the heightened precariousness of our circumstances would not be advisable, but unless precautions are undertaken soon, that may be unavoidable.

The idea of a metaphysical eschaton sounds like something that could only be comprehended by religious experts. But if it is redefined as transphysical then we are faced with a problem that falls into the chasm between science and religion. That is the very nature of immaterialism: our previous compartmentalization of reality is overridden, and we are caught with our categories down.

Addressing the new circumstance will require novel thinking. I am not suggesting a massive effort, merely a concerted effort. One or more respected scientific authorities should quietly register their tolerance for attacking this emerging problem. It carries great risks and opportunities, but the longer we ignore it, the greater will be the risks.

| [Contents](#) |

rev. 1/14/99

Threat Assessment

Our cosmic security is what we make of it.

One might suppose that people would be glad to discover that our world is a thoroughly spiritual creation. But this does not take into account the suspicious side of human nature. From much sad experience we have learned to look every gift horse in the mouth. I will happily accommodate that natural impulse.

Enter the eschaton. The carrot of discovering the spiritual basis of reality comes equipped with its own stick just in case we are too lethargic to get up and nibble the carrot. And, of course, that is the case. The eschaton will be the measure of our spiritual lethargy. We will not be spared whatever it takes to wake us from the slumber of materialism.

In the end we will be saved not by our virtue but by our circumstances. God knows that when a boat has to be rebuilt in the middle of the ocean, it is best not to rock the boat. Similarly, it should not take much rocking to instill a proper respect for the power of the ocean.

Immaterialism is the only basis for universalism. Dualism of most any sort leads to apocalyptic separations. With immaterialism, everything is of one substance, so salvation is an all or all transformation. To put it crudely, and contrary to popular opinion, we will get to take our toys with us. Mind you, this is not a recommendation for toys, only a statement of fact. Think of our accouterments as so much baggage, baggage that we become increasingly burdensome. Along with our toys there will also be our worst enemies, precisely the ones we were certain would be smitten to smithereens. Such are the burdens of metaphysics. A simple rapture would have been so much easier.

So where is the threat? Come hell or high water, we will still be able to retire on our cosmic security. The only caveat here is how high do we want the water to get. If we want to stay reasonably dry and comfortable, we will definitely have work to do; starting just about right now. It is time to begin our metaphysical homework. It is time to question reality, while maintaining respect for our existing life support system. Continuity is our measure of success.

Our rapidly increasing global economic interdependency is just a harbinger of the spiritual interdependency that lies just around the corner. All the 'clichés' about spaceship Earth can hardly prepare us for the shock of the spiritual integration awaiting us. Any prospect of cosmic resegregation lies very far on the other side of our immediate spiritual reintegration. Those who think that they can run to the hills and escape the spirit are succumbing to their own delusions.

| [Contents](#) |

rev. 1/15/99

Threat Assessment – pt 2

Beyond sentiment

Scientists will find it difficult to accept that their profession was built on the foundation provided by the Inquisition. That historical fact will be all too obvious once the spirit is unleashed. They will find solace only in the further fact that it was the Christ-event that paved the way for the Inquisition in the first place. This connection is an essential part of the cosmic plan for our salvation.

Understanding history is a crucial part of our preparation for the eschaton. Knowledge will be our primary weapon for containing the threat posed by the eschaton. Our knowledge must not be colored with sentiment. We find ourselves in a very tight spot. To get out of the tight spot we will have to know precisely how and why we got into it.

It is paramount that we face evil. I maintain that the source of evil lies in the self-concealment of God. Creation is made possible by the voluntary self-limitation, self-concealment of God. This is the foundation of our free will. Non-interference is the prime directive. The eschaton will violate that directive primarily through the agency of the Second Coming. Our faith is tested as always.

Why has God waited for so long to reveal Himself? Holocaust is piled on holocaust. What end could justify this means? Can any end justify any means? Without venturing into the abyss, we cannot scale the heights. Some lessons can only be learned the hard way. Unless we fully understand the consequences of every action and inaction, we will not be sufficiently careful about finding our footholds on the cliffs above. There will come the day when we too shall slip, and so will begin another round. It is expected that we will transcend all previous limitations. Can the center of gravity be any more grave? Only if we have sufficient levity. Only in this fashion can our history become present. These riddles of time will be mastered. They are essential to the unfolding and infolding of the eschaton.

| [Contents](#) |

rev. 1/16/99

The Death of God

And the sign of the seal

God must die to be reborn in us. This is the necessary mistake. God must overreach herself in order for creation to be transcendent. Jesus' death marks the spot for all of space and time. We have carried that torch for two millennia, and now we become the light.

The creation of a new spirit requires a spiritual vacuum. That vacuum is our history. Our birth is the breaking of the cosmic shell. The breaking is not entirely spontaneous. The x-event was the seal on the shell. That was the childproof, safety lock. To break the seal we have to be sufficiently mature to properly grasp the seal. As we do so, let us be mindful of having set aside our childish ways.

The safety seal will serve as a safety valve for a spell. A fair measure of that function falls to the Aquarium. The mixing of the old and new spirit cannot get too violent or chaotic. It would be a mess. We must not let the cart get ahead of the horse. Our new spirit is still vulnerable.

If the x-event was the cosmic seal, then the Inquisition was the mopping up. That action was logically attributable to the prior sealing. The ensuing rise of scientific materialism would effectively conceal the seal, but only for the allotted time.

The lesson is that the eschaton is not to be a spectator event. It will rather be the first full measure of our participation in the cosmic spirit. We will find safety and encouragement in our own numbers, but they must be the right numbers, especially at our point of entry. Mark the sign of the seal.

.

rev. 1/16/99

A proposal for continuing a scientific dialog

To be submitted to a national scientific body

By most measures the scientific worldview has been more successful than any other. Yet most thoughtful people will agree that, despite its success, it could be saddled with a fundamental misconception. I submit that such a defect could have serious consequences. Furthermore, we have an obligation to explore and, if necessary, respond to this possibility. The misconception that is both the most likely and the most consequential would be our failure to discern a nonmaterial basis for reality.

Such a possibility naturally boggles the mind. Would this not take us beyond the realm of reason? What would it take to persuade us to adjust our patterns of thought in such a fundamental manner? It may require the prospect of the end of the world, and it is to that prospect that I speak.

That the apparent materiality of the world could be illusory, as almost every sage has suggested, is of no consequence unless the illusion were to become transparent. That would be tantamount to the end of the world.

Nonetheless, the material illusion has been remarkably stable for at least the half dozen millennia of recorded history. However, scientific materialism is coming under increasing scrutiny at the same time that its explanatory powers are being pushed to the limits of reason. Perhaps we have already gone beyond those limits.

Finally, one could argue that the anticipated inversion of the materialist paradigm to immaterialism would constitute a spiritual revelation of biblical proportions. As such it should be anticipated as an 'act of God,' thereby absolving us mortals of responsibility.

This last argument forces the activist to adopt a prophetic role. Barring any alternative that is the role I must accept. But as a prophet, should I not be addressing an audience other than scientific? Not as long as my message is sufficiently scientific in content. I submit that it is sufficiently so, and I base that claim on twenty years of dialog with scientists on this topic.

| [Contents](#) |

rev. 1/17/99

A Cure for Metaphysics

Cutting the Gordian Knot

For the most part scientists would be relieved to lay down their metaphysical baggage; however, this is proving to be a difficult maneuver. For instance, the rise of anti-scientific sentiment in the latter part of this century has naturally provoked a conservative reaction from scientists. This reaction often entails a hard-line stance that includes homage to the tradition of scientific materialism.

It is difficult to avoid the psychological speculation that behind all this posturing and rhetoric there lies a deeper, unexpressed concern. I have taken it upon myself to give expression to this concern by attempting to act it out. These attempts on my part have tended to provoke further resistance and denial. Thus have I felt compelled to resort to a more political stratagem that brings me to these meetings with scientists who have administrative responsibilities.

The problem is with the metaphysics, which most scientists see as little more than a nuisance. It has almost no bearing on their work, and yet it is the source of many passionate and often pointless debates. My stratagem is to bring out the issues of ultimate concern that I believe underlie the endless rhetoric.

Let us look directly at the 'worst' case scenario. In this case, scientific materialism is not just a little bit wrong, but is dead wrong. That leaves us with an immaterial world, which ought to be a scary proposition. I claim that it is precisely this fear which best accounts for the millennia of metaphysical obfuscation that leaves us now in such a state of metaphysical confusion. And if I am right our present confusion has a divine sanction and a divine cure.

What then do I need from the scientists? I need their sanction in order to explore and act out the consequences of our awakening to an immaterial cosmos. I want their permission to act out our worst metaphysical nightmare that is the eschaton. The eschaton is the end of the world as we know it (TEOTWAWKI). I can hardly give credence to that image without the implied consent of the scientific authorities.

| [Contents](#) |

rev. 1/17/99

Science & Absolutism

Confronting the 'Irrational'

Absolutism has seldom been celebrated, and particularly not in this supposedly postmodern era. Yet, it would be difficult to maintain that even with all its post quantum sophistication that science has completely shed the absolutism of its origins back in the metaphysics of materialism. Skirmishes continue between scientists and humanists over this issue.

Those who criticize the residual absolutism of science apparently fail to comprehend the potentially radical nature of the relativism that they suggest. And for their part, the scientists are understandably reluctant to point out to its social critics that they may be playing with fire. However, the fact that the critics tend to only nibble around the edges of scientific materialism, implies that they may sense that they are venturing onto thin ice.

When all the angels are fearful to tread on 'sacred' ground, the call goes out for 'fools' like myself, and we are happy to rush in. And into what is it that I rush? Immaterialism is the answer.

I am suggesting that the studied indifference to metaphysics exhibited by so many scientists is only barely concealing a deep-seated fear that they share with all of us. The fear is that our world is much more fragile than it appears, or than we are willing to acknowledge. This is what is at stake when we finally resolve all the talk about absolutism versus relativism.

To better grasp our situation, we may look to history. There we find absolutism most closely associated with the tradition of monotheism. From thence it entered into politics as the alleged 'divine right' of monarchs. It is then difficult to argue that there is not a strong historical tie between the absolute laws of God and of science. This latter-day residual absolutism of science carries historical baggage. Disencumbering ourselves from that baggage will be a risky maneuver.

Immaterialism is the logical opposite of materialism. It is the view that the world is a state of mind, a mind that must at least include the minds of all sentient creatures. The world then is not a mere object, but rather the object of a 'cosmic' intelligence that might or might not be more than the mind of the creatures.

What I have just outlined is a very old idea that comes down to us as recommended by almost every sage. But now I give to it a new spin. I do this in response to the inevitable 'so what?' The immateriality of the world is entirely moot so long as we are able and willing to ignore it. It would appear that we have profitably ignored it for at least the half dozen millennia of recorded history. Why stop now? I merely suggest that our extended period of 'material grace' might have a logical and imminent conclusion. 'Repent, the end of the world is near.' Is

there anything new here? Yes. I claim that the eschaton will not be the arbitrary act of an absolute deity. It is rather something that is built into the metaphysics of creation and which we will control.

Very simply, to the degree that the world is not an absolute object, to that same degree it is something superficial. It has a hidden, non-material foundation. The high degree of intelligibility of the world is not an accident. It is because we are its co-creators. That this fact could be so well concealed behind the façade of nature implies the involvement of a 'higher,' but probably not separate, intelligence.

What has been concealed may also be revealed, at the appropriate time. Inevitably our science will lead us back to its own origin. This has been happening from the start and is still accelerating. The recent history of science and its public vicissitudes may be more comprehensible from this larger perspective. I am merely anticipating an outcome that need not be viewed as unreasonable.

If anything I have said may sound radical, it should be considered relative to the more radical speculation that science is representing an absolute truth.

The question remains as to whether the ideas presented here warrant any action on the part of the scientific community. I would argue that they do, at least to a minimal extent.

If science were to forego its absolutism, as many people propose, then immaterialism becomes a leading contender to replace the present materialism. Both sides of this issue bear responsibility to weigh the consequences of such a move. I have been able to bring about that deliberation only to a very limited extent on my own. By being granted occasional access to a scientific body such as this, my efforts would be advanced to a minimal but still useful extent. Considering what may be at stake, could any lesser response possibly be justified?

.

rev. 1/20/99

A Scientific Dilemma

And an unscientific solution...

There are two pillars of science: objectivity and corrigibility. For almost four centuries these two ideals have stood together, to the point that we view them as nearly synonymous. It is because of our objectivity that we remain corrigible and vice versa.

There is an underlying assumption that is paradoxical. Objectivity implies the existence of an object that is itself not corrigible: neither the object nor the assumption of its existence. The object in question is the physical world.

The reality of the world is clearly a metaphysical issue that should come under the purview of philosophy. Yet, the treatment of this issue has been both sporadic and superficial for at least the last century. Quite simply it has not been taken as a serious issue, even to the extent that its lack of seriousness has not been a topic of discussion.

Superficially, the reason for this lack of consideration appears to be the overwhelming success of science over the last century: a success that evidently countenances no questions. And for all the philosophical analysis that has taken place, this fundamental issue has managed to escape analysis. Even more interesting is the fact that this fundamental oversight is continuing in the context of a rising interest in metaphysics in general.

What I suspect is more germane and what I have been testing is that the silence on the issue of the reality of the world is the result of an unarticulated sense of vulnerability, not just on the part of scientists, but for the whole of our modern civilization. There is a nearly outmoded word that denotes the nature of this vulnerability: it is 'apocalypse.' How so?

This word derives from the Greek *apokalyptein* meaning to uncover or reveal. If the physical world is not an absolute object, then it must be contingent on something else. It is that something else that is to be revealed. Similarly, to reveal the source of the world's contingency is to demonstrate its vulnerability. This is a vulnerability that can be assessed only in eschatological terms. Such a revelation necessarily brings us to confront our destiny.

What started as a dilemma for science has been seen to include the most basic issues of philosophy and theology as well. Yet, none of these disciplines is taking up this challenge. It can be surmised that they feel a lack of authority adequate to meet the challenge. Accordingly, I return to the scientific community to seek its tolerance for my taking on this challenge by also proposing its solution. The solution is to contain the vulnerability at the same time that it is revealed. This is the only responsible approach.

If the risks and opportunities attendant upon this particular revelation are indeed the ultimate challenge for humanity then we should settle for nothing less than the personal and direct intervention of God. But there is a small caveat. We have to help decide how we want God to intervene. My suggestion is that it would be preferable for God to do that as one of us. There is ample precedence for that to happen. Furthermore, so as not to be caught standing on ceremony, I am volunteering as an adequate agent for this task. I feel obliged to offer this package deal, one that might not be easy to refuse. It certainly ought to be entertained.

.

rev. 1/22/99

The Absolute

Setting our sails

In times of great change there is felt a great need for something by which to chart our course through the perilous waters. We need a pole star whose position is fixed and visible to all. We look especially for moral absolutes. Relativism is not welcome. Only an objectively real beacon will serve. We want God to come down out of the clouds and speak to us in an unequivocal, unmistakable fashion.

There are two problems with this desire. It has never been fulfilled, nor would we ever want it to be. It would be both impersonal and unloving on the part of God. Many people believe that the closest thing we have had to an absolute moral guide was the Christ event. The least obscure aspect of that event was the declaration that God is love. Although love is unconditional it is not an absolute. Love is necessarily personal and mutually relational. It is decidedly subjective and intangible. It is antithetical to any form of idolatry.

When God appears, even in a time of great need, we should not expect to be overwhelmed. At most we should feel only a fresh and gentle breeze, as if a new door had been opened to love. That is the greatest gift. That gentle breeze will be our surest guide through even the most tempestuous seas. Before that gentle breeze our greatest enemies will tremble like leaves in a gale.

Build your house not upon the rock; instead, set your sail to the zephyr.

| [Contents](#) |

rev. 1/27/99

Kingdom Come

And how?!

We know that the kingdom is within, but how do we manifest it? This is like the sculptor and the marble. We simply let go of everything in our minds that is not of the kingdom. That takes no less faith than that possessed by the sculptor. The world is so hard and our minds are so dull.

And there have been impediments. First there was religious absolutism. Now there is scientific materialism. Both are idolatry. Neither one is of the kingdom. As we dispense with these distractions we will set ourselves free and unleash an energy that has no limit. It is the energy of cosmogenesis. It is the energy of cosmic love.

Before we set off to explore and create new worlds, some work remains to be done here. That work will not be onerous once we can see the end of it. Our new vision of a world of spirit will render the old obstacles transparent. Space and time will take on other meaning. They will become relative.

But how will the kingdom work? What will be its governance and its economy? How do we get from here to there? That last question contains a big part of the answer. It is very important to know that our journey begins from right here. We are already in the perfect place to begin this journey. Everything that has transpired in our six millennia of recorded history has been a preparation for this commencement.

All the skills and all the tools that we will ever need, we have them right now. Yes, we have plenty of things to brush up on, but it will all be learning on the job. There will no bootcamps, no reeducation, and no reformatories. We all have more than enough to teach each other.

And who will be in charge? No one will be more in charge than I am right now, and that is not saying a lot. It will be management by objective. That will mean that we have to sort out our abundance of new visions, and focus on those where our new energies are best applied. That will not be easy, but when it comes to vision, we can never have too much. Let us be embarrassed by the diversity of our riches.

There will be no need for control, beyond the remnants of what we see now. We don't need a new economy. We need to transform the old one. This is not an economic revolution. It is an economic breakthrough.

rev. 1/27/99

Probabilities

Give me six of one...

What is the probability that, rather than being the producer of intelligence, the physical world is the product of intelligence? I will argue that the odds are just about even, a priori. But, come to think of it, it looks like they are not even – not even close.

There are only two mysteries in the world. Why does it exist? Why do we exist? If these two mysteries are in any way related, then it is almost certain that the world is an artifact.

Let's put these questions another way. Why does anything exist? Why is anything known to exist? Any correlation between these two questions would lead to the same conclusion as above.

Is it possible that nothing would ever exist? Might that not require something to prohibit anything from existing? Thus the prohibition would exist. It would seem that something is bound to exist. But if anything existed, then what would prevent everything from existing?

I am partial to the view that everything does exist, and that the world is where it sorts itself out, under the transcendental logic of love. That logic is the closest that we get to the notion of an absolute God.

It is not the atoms that sort themselves out, but rather the experiences of atoms. I suggest that it is much more probable that an experience exist than something exist purely unto itself. An experiencing is a priori more probable than a thing.

Positing the existence of something is a piece of logic. The logic must exist prior to the thing, logically. 'Existence' is a word that must be defined. How can we suppose that something exists without a notion of existence?

We can posit the existence of an unobserved planet, or even an unobserved universe. But that is not a real planet, that is a hypothetical planet. If it were subsequently 'discovered,' how would we know that it was not actually an artifact of the instrumentation, theories, logic, history and teleology that was attendant upon its 'discovery,' just like everything else in our dream world? What would make it any more or less real than the million-digit prime number that we may discover? How will you decide if it is more rather than less real than the prime number?

None of this is rocket science, yet these are basic questions that have somehow been lost sight of in our rush to embrace materialism. It looks like we have some homework to do. And from whence comes our fascination with matter? Surely

someone must have spiked this punch.

rev. 1/27/99

How Objective is the World?

Gosh, it's pretty darned objective, all right. But is that an objective observation? Isn't it more like a gut feeling that we have spent several millennia attempting to rationalize?

What then are the measures of its objectivity? The world does very often seem to be impervious to our desires. The world does seem to extend very far beyond our ken. The world seems to be a buzz with activity occurring well outside of anyone's purview. The world seems natural almost to a 't.' Have I missed anything?

Yet, none of these measures is even barely quantifiable. One might surmise that objectivity is an all or nothing proposition. A miss is as good as a mile. That would put the burden of proof on the objectivist – an onerous burden.

The best evidence for the world's objectivity is anecdotal in nature. For instance, history must be real because we can precisely record it with film. But then consider the Kennedy assassination. What precisely was recorded? How do we know that it was not a staged event, and that Jack and Marilyn have retired to a village in the jungle? All that we have are probabilities, and how objective are they?

Consider a library full of printed books. Each one must be objectively real because we can take anyone of them and compare it precisely with its copy at some remote library. Those two books could be shown to remain as fixed objects down through the millennia. Isn't that close enough to a measure of absolute objectivity? How could that happen in a dream world?

In an immaterial world an artifact is not as real as the idea it represents. The character of Tom Sawyer is more real than the books representing that character. Why then in such an ideal world might there be a misspelling of Tom's name in one of the editions? Why would there be typos in our dreaming of Tom Sawyer (sic)? Isn't that proof that we are not dreaming?

If physical objects just represent ideas, why do they get scratched and dented? The problem is that if there were no scratches and dents, rather than thinking we were dreaming, we would probably think we were in heaven. The scratches, dents, and typos are a very significant part of what makes this world seem natural. They serve a very important cognitive function. Virtual reality workers strive to reproduce them. Spell checkers of the future may have a 'typo' option to give documents that authentic look. The fact that creation comes with a built-in 'typo' function should impress us with the ingenuity of the creator. But, instead, when our new car is scratched we are more likely to curse. Next time be more appreciative. Realize that the joke is on us. We already are in heaven, but God wants us to wonder about it. As we spiritualize the economy, self-repairing artifacts will begin to appear, but we may have to pay extra to get the 'lead out.'

Am I being too facile? No doubt. The world is an ‘external’ manifestation of our collective memory. Where would we be without memory? The dent in my fender is the trace of a traumatic memory, a personal reminder that physics is not just a good idea. It is the law. It is the imperfections that individualize and personalize the world. Cosmetic surgery is not everyone’s ideal. Physical death may be a small price to pay for our memories. Let us not be too facile about the depth of the logic that goes into creation. We still have many lessons to learn.

rev. 1/28/99

Objectivity

Duck and cover

Suppose someone gets angry and throws *The Adventures of Tom Sawyer* at me? What am I to make of this? If I don't duck, I am liable to get a bruise'n.

But that is not the question. Is it the book that causes the bruise or the idea of the book? I suggest it is the latter. The bruise is psychosomatic, even if I were comatose at the time, and the book had fallen off a bookshelf. But suppose the book missed my comatose body and ripped apart when it hit the floor. Is that psychosomatic? Of course. Walk through a forest and notice all the fallen trees. Imagine a forest without dead trees and dead leaves. What a joke.

But why bother with idealism? Why not stick with the idea of gravity and wind acting on decaying wood? But that is just the idea. We can never get away from ideas so why pretend otherwise? We pretend otherwise only when it serves our purpose to do so. When it does not, we should not. We can become overburdened with ideas, as well as with things. We also have the spiritual resources to renew the world and ourselves. That should be a very scary prospect, but only in prospect. That is an idea that we cannot and will not duck.

| [Contents](#) |

rev. 1/28/99

Objectivity 2

Punch cards

Suppose that we can concede a pre-scientific version of nature to a cosmic intelligence. What about all the human artifacts? How can we explain those without invoking objective materials? I submit that it requires no additional metaphysics to explain punch cards than is required for woodpecker holes in a tree.

Let us look again at nature. A good cybernaut already has the tools to create a credible virtual lifeless planet, like mars, and store the result in a set of punch cards. I am not suggesting that God would resort to punch cards. God is not a Univac in the sky. I merely posit an entity containing multiple personalities, which are capable of sharing dreams and memories, or not sharing them when appropriate. Some of the personalities could be pecker-like, others would be human-like. Let them start dreaming and voila. That is the way Tom Sawyer would create a world. That is how I will save this world.

rev. 1/28/99

The Vulnerability of Science

Look to the foundations

Scientists should be excused for not minding the store. The tremendous success of science extending over several centuries should lend great credence to the basic soundness of the scientific enterprise. It would be mind boggling to suppose that there might exist a basic flaw within that system of knowledge. Yet, the possibility of that being so is becoming more apparent.

The continued consternation on the part of those who are attempting to embed the mental within the physical makes the alternative approach ever more attractive. That outcome would constitute the reversal or inversion of the entire system of scientific materialism. The historical consequences of such a development are difficult even to imagine.

That difficulty, however, does not justify the denial and avoidance of the issue. As a concerned citizen I hereby bring this issue to you. I request your attention for the span of a brief meeting. I will make a suggestion about how to deal with this important contingency. It will require a bare minimum of commitment or accountability on the part of any scientist or institution.

| [Contents](#) |

rev. 1/28/99

Beethoven's Fifth

Choirs of Angels

How do we know that we are not in heaven? If we were in heaven I would not have a toothache, and there would not be children starving on my TV. I would not have a TV. If I wanted to watch a Western, I would just borrow the eidetic memories of Billy the Kid. But suppose I wanted to have a really authentic western experience. I would be Billy the Kid. I would die with my boots on. Wow! It doesn't get more real than that.

But I'm not Billy the Kid. I am Billy the Goof down the block, or worse yet I am Dan Smith up the creek. Who would want to be one of them? But if there is a long line at Heaven's Gate, we hear that there is a longer line at Earth's Gate. People are desperate to catch the last show. They will even come on as a starving Ethiopian if that is the price of admission. Things must really be bad out there in limbo land. Why did God create so many lost souls? Hasn't anyone told her about the birds and the bees?

In heaven if I wanted to hear Beethoven's Fifth I would just put my mental token in the big juke box in the sky and I would be hearing it in Dolby digital surround sound. No, it would be angelic surround sound. But would they be real angels or just holographs? How would I know?

Would I really be getting my money's worth unless I could be in the nosebleed seats at the Vienna Philharmonic and I had proof that the triangle player was being paid a starvation wage and living in a garret behind the hall. Now that is real music. The starving Ethiopians are definitely in the nosebleed seats. Can they still hear the music?

Anyone can get upset at the unfairness of life. There have to be at least three situations a day where any one of us would vastly prefer to be someone, almost anyone else. Yet, suppose that your idol of the day were to walk up to you and offer to exchange lives with you. Would you jump at the opportunity, or would you hesitate? Many questions would come to mind. Imagine the consequences, big and small. How about making the switch retroactively at birth? How about being her psychic twin for a day?

Having any sort of out of body experience, beyond the bare minimum, is likely to be a reality-shattering event. Your life will never be the same again. It will change your identity, just as much as being in a near death experience. Very few people would volunteer for that. Not many people venture up the mountain for the mystical experience. But the mountain is always there in our hearts. Who needs the near death experience when we all know we are going to experience the real thing in digital Dolby?

But all good things must end. So too will this world with all its injustice. If you can feel a twinge of nostalgia for the worst injustice, then you know what it is to be sore afraid of the eschaton. It's been real. Ignorance was bliss. Now we get down to the nitty-gritty of revelation. All of it won't be pretty.

Will we have visitation rights with history? Perhaps you and I are having one right now. Let us dwell upon it, and let us not tarry.

| [Contents](#) |

rev. 1/29/99

Telephony v. Telepathy

Reinventing Ma Bell

Gosh, there sure are a lot of wires out there. When we get to heaven, we will all have cell phones. But wouldn't it be easier just to use mental telepathy? There would be no more busy signals and answering machines. But what about privacy? Come to think of it, there might have to be answering machines in heaven. But aren't each of us actually an answering machine for God? So when does God pick up all the messages?

If I am a lineman for the county should I be worrying about the new telepathic order? When will we switch to the big fiber in the sky? Frankly, I would rather have a web site than be a web site. Can't I at least charge admission to my own mind? Besides, what would I be doing if I weren't sitting here typing and listening to my FM card? If I weren't doing this I would be out riding the line, and we might all be better off.

Each of us will have to have security levels for our thoughts. And we will have to contend with the mind hackers. Copper wire sounds better all the time. What about two cans and a string?

The new telepathic order might be like being inebriated at a cocktail party and spilling one's guts to strangers. If that is the cost then where is the benefit? Will there be caller ID? Clearly there will have to be a higher level of telepathic netiquette.

On the other hand, things could get hostile. There could develop tribal telepathic enclaves, or covens, where psychic encroachments would be dealt with severely. There seems to be a lot of this going around already, and much of it may be unwitting.

There would be opportunity for the formation of many novel social structures based on new patterns of communication and production. Not all of these structures would be readily compatible. We have spoken before about the prospect of separation. That would have to be handled gingerly if it were not to degenerate into open hostility. Too many people already anticipate a spiritual Armageddon.

Perhaps the Internet is a God given opportunity to work out the bugs and the new alignments in cyberspace before any further implementation of psispace.

It is the alleged objectivity and absoluteness of the space-time manifold that undergirds our personal identity. Any phenomena that appear to violate the sanctity of that manifold will likewise threaten our personal identity. Such ideas are about as welcome in our modern society as would be a communist cell at the American Enterprise Institute. This is not to be politically inflammatory, but rather to use a

fictional analogy to illustrate the self-censorship that in turn undergirds the 'objectivity' of scientific materialism.

Modern society thrives on the creation and maintenance of artificial boundaries. Just ask your neighborhood lawyer. Telepathy puts every one of those boundaries in jeopardy. People reacting to that newfound personal vulnerability will likely overreact in ways that will be socially pathological. We run the risk of a sudden precipitation in a saturated solution.

One can hear it now: 'better dead than immaterial.' 'Better dead in the flesh than alive in the spirit.' Think upon these sentiments the next time you pick up a copy of the 'Skeptical Inquirer.'

The beauty of the telephone was that it reinforced the illusion of separation at the same time that it transcended it. Think of the telegraph line strung over the vast stretches of desert. With the Internet, that vast copper skeleton is beginning to implode under its own weight. Cyberspace takes on a life of its own. It pushes us over the event horizon of the eschaton. Telepathy will just be a stowaway on that night flight.

rev. 1/31/99

Free Energy & All That

It has potential

If anything could be more threatening to our modern sensibility than telepathy, it would either be free energy or free love. Does promiscuity have no decency?

It is my contention, as an immaterialist, that free energy, anti-gravity and the like are all variations on the telekinesis/telepathesis theme. Free energy is more natural than unfree energy. We really had to sweat over the space-time manifold to construct unfree energy. Reversion back to the natural state may seem even more difficult.

One must address the natural state of entropy. Any student of these pages will know that I have struggled with this issue. It is difficult to avoid the Darwinian temptation of the free cosmic evolutionary lunch. My problem may be that it is not free enough. The bootstrapped God is a tempting idol for any stalwart physicist. But is it reasonable?

Besides entropy there is potency. If there is enough potency, then who needs entropy, or energy for that matter? I am thinking of the quantum fluctuations of reality. It is very seriously alleged that our universe sprung from those quantum inflationary loins. It seems more likely to me that God would have sprung first from any such loins. But then why bother to spring? Why not just go with a more potent potency? Instead of asking if God exists, we should be asking if potency exists. It would seem that potency would always have a good potential for existing. But maybe we should be wondering if existence has any real potential. Maybe existence has been greatly overrated. It is an idea that may have already realized its own potential. The grave of existence is full to overflowing. The grave to which I turn is strangely empty. Who needs free energy when we have free love? Therein lies the potency of telepathesis.

rev. 1/31/99

The Blameless God

From the sublime to the absolute

There is nothing more American than the revival preacher thundering about the sins of the believers. From the mind of the sinful believer springs the sinless God. But this is not just a phenomenon of Christianity on the Frontier. Look to the Platonists. The perfection of the heavenly ideal, the idea of the Good, was contrasted with our sublunary realm of corruption. Moral and scientific absolutism are the natural response to our natural feeling of being lost in the world, of being disappointed in the world.

Consider 'original sin.' Each of us is born of 'sin.' Was the world any different? Is the world an Immaculate Conception? On the one hand we have the deadbeat dad, and on the other hand we have *Deus Abscondus*. It sounds better in Latin.

Satan is the other side of the blameless God. Evil is the uncreated creation. The sending of the Savior is not an act of contrition, but an almost arbitrary act of charity.

There are those of us who resent charity. We consider ourselves to be self-made individuals. If we can't make it on our own, then we should not make it at all. Those who don't, prove that we are special. The sinless God is our idol. He is the self-made wonder. Jesus on the other hand is suspect. We suspect that the cross really was empty, and the birth not quite immaculate. Jesus is for the crybabies. The people of the blameless God are also the Platonists of science. They are the absolutists. Their faith is unshakable.

I recommend the potent over the absolute. The irresistible force will always wear down the immovable object. Love is the irresistible force, physics notwithstanding.

Creation and salvation are the two faces of love. Was this love unsolicited? Or was God seduced by the potency of her own creation? Therein lies the original sin. Evidently there was enough of that felicity for all of us to share at the beginning and at the end.

We are left with the absolute space-time manifold. That idol has feet of clay. It is a paper tiger. Einstein managed to put a big dent in it. But NASA is doing a good job of keeping it propped up. I intend to kick out the props, and that is now mainly a political challenge. In case you were wondering, I will be doing that in the name of Jesus. I do that not gratuitously, but out of the recognition that I am not self-made. This is not an act of charity. It is an act of finality.

rev. 1/31/99

The Corrigibility of Science

The need for an acknowledgment

Scientists rightfully pride themselves on the corrigibility of science relative to the more traditional systems of knowledge. In any system, however, the smaller corrections are easier to make than the larger ones. The prospect of a correction of significant magnitude will generate personal and institutional resistance. This will be particularly true if the prospective correction involves a foundational issue.

The issue that I wish to address concerns the objectivity of the world. This is clearly a foundational issue for science. This question has been touched upon or alluded to on numerous occasions, but to my knowledge it has not been directly confronted in the past century.

Philosophical idealism, or immaterialism, has had a long and honorable history in both the eastern and western traditions. Yet, in the twentieth century this tradition has been neglected. The reason for the neglect is not difficult to perceive. The enormous success of science in the last century has raised the stakes for immaterialism well beyond the reach of a purely academic inquiry. Indeed, the fate of modern civilization appears to be at issue.

The closest there has been to a comprehensive critique of scientific materialism in this century has come under the rubric of eastern mysticism. This is a relatively innocuous endeavor because the inherent irrationality of this approach renders it virtually inconsequential.

What I have been pursuing for the past twenty years is a more rational and therefore consequential critique of scientific materialism. This approach takes its rationale from the western tradition that gave rise to science, thus it hits closer to home.

Because my critique dares to question the foundation of modern civilization, it necessarily situates itself within the scope of the prophetic tradition. I must appeal to a higher, and hopefully more rational, authority than is claimed by science.

I have only one request of the scientific community: an acknowledgment that the ideal of a corrigible science entails the examination of the issue of the objectivity of the world. Without this acknowledgment the issue will not be addressed unless other more drastic and unpredictable circumstances arise.

| [Contents](#) |

rev. 2/1/99

The Logic of Creation

Stressing non-redundancy

We live in a world that is comprehensible and we sometimes wonder how it got that way. How much of the comprehensibility lies with us, and how much with the world? There is also a logic to our dreams, but it is rather less stringent than the logic of the world. I suggest that the world is a dream product that is subjected to the laws of necessity and self-consistency.

Our history is the shortest path between the Alpha and Omega points, between the beginning and conclusion. For the sake of argument we may assume that at present we are much closer to the Omega than to the Alpha. Once initiated the dream develops a life and momentum of its own up until the conclusion.

An important condition is that we not wake up in the middle of the dream. Our natural curiosity that drives us to test the limits of our dream reality is offset by our more conservative desire to avoid rocking the boat. There are various social mechanisms that keep these conflicting desires in balance up until the conclusion.

Our integration into a natural order is necessary to make us feel at home. The laws of physics provide a platform for the natural order along with the rules for action and interaction. These laws enable us to occupy a shared reality. The elegant mathematical structure of these laws may represent the minimal logic required to integrate the Anthropic constraints operating at the phenomenological level. The mathematical structure is required for a seamless support. The mathematics may also be spontaneously entailed by a naturally occurring principle of sufficient reason. They represent a least action process.

Human consciousness represents the exposed nodes of a collective network of cosmic intelligence. The mathematical structure is the lowest level of the network.

There can be other shared realities that are less physical and more dreamlike. Different organizing principles will prevail. Entities are able to transition between realities with more or less difficulty. In some cases there is just a shifting of consciousness and in other cases there is translocation. There is a transduction or translation of phenomena. Anomalies may result. Complete translation might inhibit a return. Special interactions may be required on both sides of the transition. Special pathways may develop through habituation.

The unified state of the cosmos is probably the high entropy state. It is the most probable and natural. It takes much effort to compartmentalize the cosmos into separate worlds. All entities and worlds are interconnected on many levels. The identity of indiscernibles is one of the elements of logic ensuring the interconnection. Identical experiences are identical. Experience is non-redundant. There is also only one electron that puts in multiple appearances. There is just one

electron shuttling back and forth on the loom of time. It was Feynman who pointed that out.

One might wonder about the degree of difference between worlds. The existence of biological functions in a world will determine many of its physical attributes. It would seem that biological reproduction is an either/or, make or break proposition. Any habitat supporting reproduction would likely share many of its characteristics with the Earth. That would necessarily include creatures with human-like consciousness. I am suggesting that there are no non-planet-like ecosystems. Any system on that scale would have to include human-like consciousness. Thus it is not unreasonable to suppose that there is only one planetary system. The identity of indiscernibles acts to pull any competing world into our experiential trajectory, into our historical manifold. This would have happened in the mythic dreamtime with the gathering of the tribes, and it is happening again now. Before that megalithic ingathering employing sacred celestial geometry, the planetary status of the tribal worlds would have been indefinite. There might have been transitional proto-planets to circumscribe the tribal consciousness.

This might be my most outrageous sounding claim. It is not offered gratuitously. If it is correct it is a matter of cosmic logic. The other worlds that appear to be in contact with us are parasitic upon our reality. They are not and have not been independent of us. Some of them may be alternate trial futures of our own world. Their technology is much less oriented to physics than is ours. They may be employing hybrid mental-physical technology that we will be able to borrow from at the appropriate time.

We will be able to create some new compartments of reality but they will not support a robust independent biology or ecology. That is unique to the Earth. There need be only one biological factory. Redundancy is not necessary or possible in a teleological cosmos. Gaia will revert to her timeless form once our history concludes. And there is only one history to go with the one Earth. But there may be many ways of experiencing that history. It is capable of an unlimited depth of meaning, of which we have only scratched the surface.

If there could even be two Earth-like worlds then there might as well be an infinite number. Our uniqueness is part of our attractiveness. It helps to explain why there is so much contention over our limited spaces. It is our meaning that is not limited, but we have yet to grasp that potential. That meaning awaits our multidimensional reenactments, whatever that may be. Almost all of history still lies buried in our unconscious. There is gold in those hills. Nothing is wasted in the cosmic economy. Our potency resides in how much of us is hidden, especially from ourselves.

rev. 2/2/99

Resistance to the Anomalous

Ghostbusting from the couch

Any system must be able to protect its turf. Anomalies are an encroachment on its vital order. But anomalies also represent the diversity that any system must incorporate if it is not to collapse under its own redundancy. Anomalies are the connections to a larger reality. The anomaly economy is an important part of any system's attempt at self-regulation. Human history is no exception.

The containment of anomalies is a significant factor in the work of compartmentalization. It would appear that this was a major function of organized religion early on. Their success in this regard meant that they were working themselves out of a job. Organized science followed on as a clean-up operation. Much of the work is unwitting, of course. It occurs mainly on the psychological level. Even organizations like CSICOP do very little in the way of actual ghostbusting.

The ecosystem and the technostructure both provide robust constraints on the anomalous. Glitches in either system are efficiently dealt with. The ecosystem contains the anomalous within the dreamscape, while the technostructure deploys its entertainment arm to similar effect. These two vehicles tend to support each other. The eschaton might be seen as a final excursion of these vehicles beyond their normal boundaries, propelling us into the unknown.

Maintaining ecological and technological continuity under eschatological circumstances will be a worthy challenge. Both systems will undergo transformation. The ecosystem will be incorporated into the technostructure in a high-tech Noah's ark. Similarly cyberspace will be incorporated into the dreamscape. These will be the transitional forms, at least. This situation is mildly reminiscent of the high v low-tech separation that was touched upon many pages ago, but now it has more of a multidimensional feel, which is fine.

| [Contents](#) |

rev. 2/2/99

The One & the Many

‘Too many Indians...’?

The idea of a single source of creation is perhaps the most widely held metaphysical belief. The unity of that source is allegedly reflected in the unity of nature and of mind. E Pluribus Unum remains a fervent, and seemingly futile, desire of many. That we return to our source at death is a common assumption. That we undergo a collective return in the Parousia is only somewhat less common.

The multiplicity of the world is often taken as a sign of its illusory nature. The profligate multiplicity of creation has been compared to the endless reflections seen in a mirror. The feeling of individual alienation is the other side of that coin. If our source lies within, it is all too easily obscured.

If we are created in the image of God then we may suppose that God is also a social rather than a singular entity. The concept of the Trinity is a nod in that direction. Are we not part of God’s society? Does assigning a social attribute in any way impugn the creator or the creation? This should not be construed as a recommendation for polytheism. All I am suggesting is a mitigated singularity, a step away from absolutism toward personalism.

Theogeny must also be considered here. The evolutionary emergence of God out of lesser phenomena would seem to be a reasonable hypothesis. Yet this does imply a preexisting temporal dimension. I suggest that God is a self-realizing potentiality, and that creation is part of the self-realization. There is still a quality of emergence.

It may also be true that there is strength in numbers. If we compare God to a neuronal model of our own minds, a model of which I am justifiably skeptical, we might suppose that the more the creatures, then the greater the creator. This manner of thought will distinguish theists from deists. The more the merrier. The smarter God gets, the smarter we get, if that is to be desired. Obviously this is excruciatingly naïve, but it is not easily discounted.

The same line of reasoning would recommend a multilevel model of creation in which there is no end to the theogeny. Such a model would fit more comfortably into a Hindu cosmology. This seems to be a recommendation for absolute deism. Most of us would rightfully insist on being able to go directly to the boss. Cosmogony contains many pitfalls and slippery slopes. We trust that we are not among the victims.

Cosmogony represents a very delicate balance between the finite and the infinite. There is no sense in needless limitations. There is no benefit in heedless promiscuity. There is ample need for divine guidance.

.

| [Contents](#) |

rev. 2/3/99

Personal Identity

Who do we think we are?

‘I think, therefor I am.’ I, who? Is it the same I who first heard that maxim some forty years ago? If I cannot be sure of my own existence, how can I be sure of anything else? I am looking at the other side of the Cartesian certainty.

Had I been suckled by wolves, would I not be something else? The idea of a God given soul with a factory warranty is reassuring. But it may be an oversimplification. Objectivism has no greater recommendation than its ability to objectify our own souls. The loss of identity is what we fear more than death. It is the final death. The guarantee of my identity is the identity of my creator. It may not be reassuring to realize that the Creator seeks its identity in its creation.

God may be as much the idea of Jesus as the other way around. Clearly Yahweh underwent an intertestamental personality change. Is that bad? Or is it smart? Is this not the heart of theism? Is not the creator reflected in the creature? Is that not the purpose of creation?

Identity is potency. There is synergy in the potency of creature and creator. The potency of Jesus may have existed before Yahweh, yet it required the latter to prepare the way for the former. The Parousia will somehow complete this dynamic.

The mutuality of creator and creature may be a cosmological necessity. It prevents a promiscuous creation from collapsing under its own weight. It serves as a safeguard to all identity by maintaining the personal dimension of the cosmos.

rev. 2/3/99

Science & Reason

Working it out with a pencil

Some scientists would have us believe that science and reason are synonymous. If science does not have the answer, the answer is not to be had. Until science gets the answer, you had just better be patient.

By this same token, reasoning is totally objective and analytic. If your thinking is outside that box, you are out of bounds. You are committing irrationality. Some day science will be able to demonstrate the mechanics of reason, and until then you had better take it on faith.

Some of us find that difficult. Some of us even find it cultist, but it is not easy to argue with the juggernaut of computer intelligence. The practitioners may all be too busy making money.

Analytic philosophy lives on, but only as a method and not as a metaphysic. The metaphysics of analysis has suffered innumerable deaths. The practitioners of applied analytic intelligence are blithely ignorant of the lack of foundation. They would merely argue that if the brain can be holistic, then so can machines. That begs the mind/brain identity. But if they are not, is that not being dualistic? Not if the brain is a product of the mind. That is immaterialism. The apparent inconceivability of this logical reversal might lead one to suppose that the beliefs of scientists are secure. We will just have to wait and see.

Words got us into analysis. Can they get us out? It was once thought that all thought could be analyzed into a finite set of facts. This was wrong. Many of our speech acts are irreducible, yet comprehensible. Intention and reference are examples. How would a machine intend? The rejoinder of the artificer is that we only pretend to intend. Intention is an artifact of a free will that cannot exist in the objective world of science.

Consider the notion of infinity. There are a dwindling number of mathematicians, the constructivists, who claim that infinity is meaningless because it lacks a construct. Lacking any construct, it cannot be programmed into a machine. Most mathematicians continue to make very frequent use of infinity, without apparent ill effect, despite the occasional paradox. In fact, physicists would still be back in the dark ages if they did not enthusiastically employ non-constructive mathematics.

It has been argued that reasoning necessarily entails a free will. Mechanics and logic, causation and proof are not and cannot be synonymous. It takes a great deal of handwaving to suggest otherwise.

Scientists suppose that they have all the time in the world to come up with the answers and the arguments. That is where I come in.

rev. 2/3/99

Free Will?

Secret Agent Man

If there is anything clear about free will it is that if it exists it is the most non-thing-like thing there is. And it may not exist.

We tend to think of ourselves as moral agents. We are agents of the Good, of God. Does that make us free? Do we not subject ourselves to the will of God? And is that a free choice? Or is it an act performed by God's grace? Does God have free will? This is treacherous ground. Maybe we should try something simple like predestination.

If love is all there is, who needs free will? Are we not all slaves to love? Love is the one thing there is just too little of. How do we make it? We make it out of trust and faith. We make ourselves vulnerable to it. Is there anything else that we ever do? Anything else is wasted, but nothing is wasted. All that we can do is try to deny it. How hard we try. How hard do we try?

God makes love in making us. Love is also sacrifice. God makes the ultimate sacrifice, the ultimate act of faith and vulnerability. Everything is at stake when everything is open.

Going outside the box is going outside of our shell. It is following the transcendental impulse. It is the spark that takes us out of every system. Only then & there can love grow. It is being gentle as the dove and clever as the serpent. That is where freedom lives. We can only reach for it. We never hold it. It is no thing.

When we so love the world we will comprehend it. It will become transparent and revert to no thing. It will dissolve into the aqua regia of our compassion. Only then is everything possible. That is the impossible freedom. That is what we die for, for the infinitely potent lightness of that being. It leaves not a trace. It is the bolt from the blue. This is not a mystery it is just the mother of eternity. It is who I am. It is who we are. It is what is is.

rev. 2/5/99

Barrier to God?

Dynamo of History

What bothers me most about traditional theology is the absolute distinction between Creator and Creation that it often alleges.

I believe that the incarnation of Jesus derives its significance almost entirely from its most evident violation of that alleged principle.

It is the outrage of that divine act that is the dynamo of Christianity, and which has spilled over in many ways into secular culture.

The dynamo is the tension between monotheism and incarnation that is strictly internal to Christian culture. It would hardly exist in pagan polytheism.

The peculiar eschatology taught by Jesus derives from this outrageous act. Our salvation could only occur collectively in an act of 'hierogamy' between the church and the risen Christ that would consummate the incarnation.

Jesus is our conduit back to the God from which we sprang. If that reunion is to be something other than annihilation then we must partake of God.

I suppose that this is out and out Gnostic heresy, but is this also not an innocent desire? Why should theologians feel so compelled to beat that innocent desire out of us creatures?

Let me hasten to answer. Becoming one with God can only be a collective and final historical act. Those wishing to bypass our necessary historical sojourn are not acting in the interest of Creation. The barriers to God are erected so that they could be removed at the appropriate time.

That is my answer, at least.

| [Contents](#) |

rev. 2/12/99

One with God

One with the World

Was Jesus just another mystic? Evidently not. He did not renounce the world. He took possession of it. His was the stake for God's reclamation of the world. He brought down the Kingdom. God was setting up shop – right then and there. It was to be a monopoly franchise – the ultimate ponzi scheme. The medium of exchange would be the Holy Spirit.

But did it work? It is working to completion. The fat lady is about to sing. The last remaining idol, scientific materialism, is about to be turned inside out. Imperial science is about to be shown to its place in the Kingdom.

So the world was not an illusion after all. It was God's Venus flytrap for all the wayward souls. Here we are caught with our hand in the cookie jar, stuck in the ambrosia of the gods. This is the best of all possible flytraps. It is the only one that ever was or ever will be.

God did not create this world just to commune with a few mystics. She was after bigger game. It was a package deal from the beginning. We are the willing sinners and reluctant saints.

As we participate in God we become one with God and one with the World. It is panentheism in the end. All the past and all the future become present in our Christ consciousness. We become the resurrection of the dead and the rapture of the future. Is this a mystery? Not when it is in our face.

| [Contents](#) |

rev. 2/14/99

Creation

The Alpha & Omega of it

Speculating on the subject of creation is about the most foolish undertaking that one might imagine. Perhaps that is why I feel compelled.

Another motivation is my unhappiness with the orthodoxy. Creatio ex nihilo definitely goes against my grain. I see that as little more than a conversation stopper along the lines of 'my old man beating up your old man.' Dialog is essential to our salvation, and I suppose it was also essential to our creation. Love has to do with intercourse on all levels. The God of love cannot be a stranger to the creative potential of intercourse. If we are social creatures then so is God.

It seems illogical to suppose that there might have been no existence. The most rudimentary relational existence would be a virtual compound of subject and object, say, potential experiencing, which is about as close to nothing as one might get. A totally passive experience may also be illogical. A potency of willing would be a part of the proto-experience. From the git go there are two orders of creativity: the spontaneous and the willed. To that primordial soup we add the potency of love and voila, the rest is history. God is the bootstrapped agent of a willing love. If this makes God less attractive or less credible than an absolute monarch, then I will just have to eat my hat.

The attentive student will have noticed a proto-gender gap: spontaneous vs. willed creation. Yin and yang no doubt, and already personalized. Between will and spontaneity lies the cosmic intercourse of creation. This is also the A & O. The imminent eschaton is the furthest outreach of the will of God. Form and substance and other dualities lurk in these same waters.

rev. 2/20/99

Down Memory Lane

Memory is all around us

I am not happy with the storage metaphor of memory. What sort of metaphysical redundancy is this? We have enough trouble just perceiving the present. Why compound the epistemology by inventing a new mode of perception with respect to the past?

What exists is experience that is rationalized into the temporal structures of self and cosmos. Our lives are trotlines in the ocean of virtual experience. The lines are woven into the cosmic web. The omega is the fishing trawler. The lines are set from the future, but we experience them as moving forward, as dreamers do when awaking to a knock on the door.

History is a construct of the omega consciousness. The generational shifts are the hooks and sinkers on the lines. Time, logic and causality are all apiece. The dream channels provide for external adjustments. The past is incubated in our expanding 'memory' or direct awareness of it as we thread our way back in time. Our amnesia is with respect to the future.

The karma is undone as we act out the past on the spot. The experience is undone, and we are left with no memory of the future. Karma is part of the logic of causality. The temporal and moral threads are intertwined. The eschaton floats on its karmic anchor. It is all gathered in one spot to be deep-sixed. Letting go of that is our waking up. Then the omega transforms into the innocence of the alpha. It is as if nothing happened. There are no footprints. Only the possible logic of it remains. The one and only history informs the impossible lightness of being.

This is how being is self-limiting. All being then remains grounded in the personal. Every sparrow must be counted. Spontaneity maintains her modesty with a little help.

| [Contents](#) |

rev. 2/21/99

Constructing the Past

A non-trivial logistic

If we deviate from conventional space-time causality various logistical problems arise. Our memories are private, the past is public. Are there not going to be many reality conflicts if we try to reverse the direction of time? How would we explain the retroactive coordination of memory without the benefit of an objective past? Temporal continuity must be maintained.

When a video is run backwards many impossible things appear to happen. For instance, a diver can propel herself up out of the water. And the existence of the video itself is just as inexplicable.

These problems are largely an artifact of our materialist biases, because otherwise the video is just another form of memory. But the existence of physical records seems more difficult to explain than intangible memories.

We need to think of time in a more experiential manner. Before there was time there were temporal experiences. There were experiences like birth and other experiences like death. They had more meaning if they were combined in a sequential manner. Experiences become real by becoming meaningful. Temporality is a prime source of meaning. Whatever the meaning of life, it is inextricably bound to the notion of time.

We say that time is irreversible, but cyclical time is entirely repetitious. This was our primordial experience of time. There is also the narrational aspect of time. Consider a piece of instrumental music. Its directionality is subtler. Compositions can spring into the imagination of an artist almost fully formed. I am suggesting a similar origin for history. The eternal significance would likely 'precede' the temporal.

There may have been competing potential or virtual histories. The one with the most meaning would 'gravitationally' overwhelm its competitors in the arena of experiential alignment or crystallization. Even virtual experiences can exist only relationally. The more deeply embedded in the narrative, the more real. A false note in the midst of a symphony is not a part of the symphony, it is a 'mistake' and as such it would be part of another narrative.

There can be many stories and symphonies, but only one metanarrative of history. Of course, there are other possible worlds, but that is all they are. Reality is a balancing act, and small shifts can throw everything out of balance. The relationality has to work overtime to maintain stability. We will get a much closer look at this mechanism as we approach the eschaton.

History may also arise out of an annealing process applied to the virtual pleroma.

Many analogies will be needed to put this puzzle back together. The eternal present is shattered. It pieces itself back together under the aegis of time. Time finally dissolves into the eschaton, which includes the 'resurrection' and 'recollection' of the past. In resurrecting dinosaurs we are overshooting the mark, but there should be no penalty for that.

Under the aegis of cyclical time causality can be established from the top down rather than from the bottom up as in the view of science. Habit and causality become mutually sustaining. Linear time manifests in the greater and smaller incidences of irreversibility that intrude upon the natural cycles, such as when two realities collide.

| [Contents](#) |

rev. 2/23/99

Top Down

Causality revisited

In the modern view we think of causality as operating only on the microscopic scale and only within the space-time manifold. With immaterialism experience has an immaterial or spiritual basis of which the space-time manifold is a construct.

But why bother with space and time? I would argue that space and time are necessary to support the microcosm. The microcosm is necessary to support the cosmos. Creation is not superfluous. It is the pillar of reality, of which God is the center and circumference. Each of us is a spoke on that wheel. We the microcosms must be able to function as independent members of a society. The space-time manifold is our minimal relational construct. We are the atoms of the cosmos. The material atoms exist only relative to our reality.

Electrons exist in conformity to the requirements of chemistry and electronics, which in their turn exist in conformity to our ecological and social requirements. The rules of chemistry might have been more arbitrary without physics, but biochemistry is not reducible to physics. There are 'morphogenetic' structures and vital constructs that supervene on the physics. Physics is a logical substratum that plays a formal more than a causal role.

Perhaps it is then true that the human microcosm is only playing a formal role with respect to the cosmic intelligence. We are the formal subvenerers of God. The microcosms provide a logical continuity and stability for the cosmos.

Our bodies are composed of cells, on the scientific view. The cells are a rationalization of our socially necessary corporal functions such as eating. They are our microcosm, worlds within worlds. Why does reality act as if it were broken up in this fashion? It may appear this way only from a microcosmic vantage. We see the world in a mirror of our own construction. The logic of science serves to reify the contingency of our existence.

We can experience eating in our dreams without benefit of digestive system. But is that accurate? What if in our dream we started to wonder what was happening to the food that went into our mouths? We would have to postulate some sort of system. If the food simply disappeared there would be a very confusing reality gap. A person could walk into a cave and disappear. In the latter case we would perform rituals to extend our life world into the cave space. Science does this with respect to micro and macro space. Such rituals need not be causal, they can be teleological.

I am suggesting a form of social psychologism. Logical continuity is a requirement of any social manifold. Anything less is highly disruptive to the social fabric. Tears in the fabric will be mended consciously and unconsciously. Notice how our

psyches manage to fill in our blind spots. Physics is the logical outcome of a teleologically imposed continuity. Thomas Edison was simply pushing that envelope. Alchemists would occasionally push beyond the envelope into a realm of magic that was later routinized and sytematized.

In the eschaton is the logical end of the social continuity. That is where we enter the space between spaces. Our constructiveness and inventiveness will find greater utility.

rev. 2/23/99

Constructing Heaven

After the unrevolution, the unraveling

It may be that heaven does not yet exist. Maybe it is up to us to construct it, but the construction cannot get underway until after the unrevolution. I am referring to the anticipated overthrow of the original Copernican 'revolution.' Immaterialism will partially restore the anthropocentric worldview. More accurately I anticipate a spiritualized anthropocentrism.

We have reached the logical summit of materialism. That was the hard part. Coasting back into our natural spiritual existence ought to be exhilarating. Turning ourselves around to do that will be the most difficult step. There is no reason why we cannot spend some time here to enjoy the view and reconnoiter our immaterial world. If there were a heaven in anything like the traditional sense it would be perched atop our precarious Mount Olympus. Our biggest risk is that we might individually or collectively fall back into the spiritual womb of God from whence we have struggled. This could happen by our becoming overly protective of our hard won rewards, or that we might overreach ourselves. Tales of Atlantean catastrophes may be premonitions.

Our millennial Atlantean heaven is not meant to last, in any case. We must complete the mission. There will be no monuments, and even memories are set aside. We will choose our own way back. What remains is the actual possibility of a great world. The realization of that possibility we already knew as a forgone conclusion. Our present experience of it will remain a timeless possibility. Ours is the shortest and longest path between here and here. We do not need to grasp on to our ignorance. It always was transparent. This web of Ariadne is meant to be unraveled. That is the object of heaven. It will take two thousand years to unravel this knot of fear. There is no need for haste.

This outward actuality is the projection of an innermost potentiality. It resides there as the extreme possibility of logic and love. It is the heart of the matter. All of the seeming redundancy has been put in one place, and here on Earth it is not redundant. There is no other redundancy. Each thread of life is an accepted variation on the extremal path that marks the core of our history.

rev. 2/24/99

Kairos

www.thewordistruth.org

I have been asked to comment on the book by Joseph Firmage that has been published on the above website.

Joe is struggling with materialism. He wants desperately to transcend it, but does not see how, other than through biological evolution, or possibly through death. He is pushing the envelope of the materialist paradigm to its limits, but that still leaves a big gap between him and immaterialism.

It is not easy for a physicist to pass through the eye of the needle that is immaterialism. It took me about five years of rationalizing before I could make that leap.

From a public relations point of view, his path is more reasonable. There are many people who would be willing to go as far as he has gone with the scientific paradigm. That puts him at the forefront of a potentially large segment of the population. One can almost calculate the economic and political benefit of being in such a position, but there is no indication that Joe is doing so. He is sincerely struggling with the truth as he sees it.

I am looking at a non-linear, even discontinuous path between the truth and us. There will have to be a leap of faith. But this also has a benefit.

There is a built-in safety mechanism. We cannot exercise our spiritual powers without becoming more spiritual. This is a guard against a runaway technology. The eschaton is the eye of the needle through which we all must pass on our way to the Kingdom that is coming.

It will be up to us to make this passage. The 'aliens' will be able to help us only to a small extent. We must rely primarily on our own internal divine guidance to navigate the eschaton.

The various species of 'aliens' represent a *cul-de-sac* in the scheme of cosmic spiritual evolution. The Earth is the center of cosmic gravity. We are the ones with the spiritual *gravitas*. The aliens are here to hang on to our spiritual coattails as we make our spiritual transition. The Christ event was the pearl of great price. It is the cosmic treasure that all intelligences seek. We will show the way back to God.

This is the truth as I see it.

| [Contents](#) |

rev. 3/3/99

Bird & Window

Where is the physics?

Bird flies into window. Bird breaks its little neck. What is the matter? Where is the physics?

As an immaterialist I believe that there are circumstances under which the bird and the window might not interact. Matter does not constitute an absolute reality. It exists at the behest of some deeper reality. Needless to say, our instruments are having difficulty detecting the deeper reality. Only our psyches can detect it, and even they have difficulty.

The deeper reality is where our psyches interconnect. That is the locus of the one substance, the potency that constitutes our immaterial world. That is where the solidity of the world resides and from whence it can be transcended. It is where the laws of physics reside.

Ours is the densest reality, but it is not the only one. Other intelligences inhabit other realities with other rules of action. When these intelligences interact between realities, each reality will be overridden by the necessary principles of linkage. In the domain of overlap, matter will be less material. The rules of physics are meant to be broken under such circumstances. As we all transition to a greater spiritual consciousness, so will we more readily override and bend the existing rules of our consensus reality.

If there is a compelling reason for the bird to fly through the window glass it will come to pass. It will not come about arbitrarily, or for an ad hoc reason. In order to override physics, we must understand the spiritual purpose of the cosmos and see how we fit into it. With the proper combined alignment of our spirits with the cosmos we shall overcome all obstacles to our desire to be one with God. That is our resurrection. The instructions for this are written in our hearts.

There may well be a spiritual 'technology' which will accompany our new spiritual powers. This technology will only bear a passing resemblance to any existing technology. The spiritual 'technology' will serve to maintain a finer degree of control over the application of the spiritual power.

rev. 3/3/99

The Self-Regulation of Spirit

Down on the Farm

How do you keep folks down on the farm, once they have seen God? There is no way. God hides. Only then are we willing to cultivate our own spirits. That is what we do until the harvest.

God hides behind nature. God may be seen in the gaps that are the miracles. Miracles shatter our parochial reality. God regulates miracles through us.

The regulation of spirit has two main aspects: the maintenance of the consensus reality and the limitation of paranormal phenomena. A further aspect of the regulation is to ensure that our spirits stay firmly attached to our bodies. In particular the paranormal, out-of-body experiences must be constrained.

There must be a mechanism, akin to memory, which is responsible for the habituation of phenomena. It would then require deliberate intervention to cause a phenomenon to deviate from its habitual, prescribed course. The fact that these phenomena are later determined to be in conformity with the strictures of mathematical physics indicates that an element of teleology may be operating in the habituation or memory formation process. The necessity of the continuity of consciousness has already led us to consider that creation may have a retrograde action starting from the eschaton. The forward flow of phenomenal time must be counter balanced by an undercurrent moving in the opposite direction. The dichotomy between conscious and unconscious may pertain to this dual aspect of time.

Memory serves as a container of spirit. Finally breaking out of that shell would be akin to the eschatological rapture or out-of-body excursion. We want this to transpire in a non-apocalyptic manner. We must gradually transcend our earthly memories and body. It is not just the human spirit that is being freed. All spirit is so contained. Nature is the container. We will be reanimating the anima. Our third rock from the Sun will be the cornerstone of the new heaven and new earth. It always was the cornerstone, and deep space was God's veil.

The crust of creation weighs heavily upon us. For the most part we have gladly accepted the burden. It is our rock of security. Shedding this mortal coil is something we cannot easily contemplate. It would seem to be giving up everything we love in the world. Smashing this pumpkin is not something we ought to do. We need the seeds to start a new vine. The new vine is already growing. We can afford to be cautious at this final juncture.

Spirit conspires to be just normal. Intimations of freedom can send a chill. There is a little nip on the air. Our old fears can spook us. The earth rises. The sky falls. How will they embrace? How will they dance? How much of the eschaton

remains to be choreographed?

We are breaking the conspiracy of cosmic silence. That is the Second Coming. That is the return of spirit. I transgress to transcend. I am the fireman answering the alarm. We may cut a hole in the roof to exhaust the combustible gasses. Mormon temples have a trapdoor in the roof.

The Deus absconditus has actually fallen asleep. We tread carefully around the sleeping giant. We look for signs of breath. We take our own pulse. The slightest abnormality is a fright. Strange spirits disturb our sleep. Cosmic miscegenation transpires. The Hubble informs us of a seething cauldron at the edges of our experience. Will the bubble collapse? Where is Atlas? Jesus, Atlas. What separates also connects. What connects also separates. That is the Archemidian fulcrum, the seat of our self-regulation. That is the plow that turns the earth down here on the farm, the farm that we have bought with our blood.

| [Contents](#) |

rev. 3/8/99

Construction of the World

Bricks & Mortar

The cosmos is composed of microcosms that are produced and held together by love. This is the message of the Christ event, Jesus being the archetypal microcosm.

The cosmos is composed of 10^{10} (10,000,000,000) souls that are produced in the big bang that is the eschaton of Christ consciousness. Human history is the taproot for this cosmic tree.

There are other than human souls, but they are much less individuated. Nature is composed of such souls that are differentiated on the basis of natural kinds. Pagan animism deals with the ensoulment of nature. Human artifacts are ensouled through our own exertions. Witness the 'soul of the machine'.

The individuation of the human soul is based in its personal memory. Personal identity is based largely on the compartmentalization of memory along microcosmic lines. Personhood enables us to act as communication nodes. That network gives rise to space and time through a shared narrative and choreography. The onset of cyberspace is the portent of the imminent inversion of space and time back into immanence.

Personhood stretches between the alpha and omega shocks. The latter being the eschaton and the former being something on the order of the Thera event, a la Jaynes. Those shocks, both actually operating teleologically on a bi-directional time line, represent the creation of the microcosm, as a phase change in tribal and cosmic consciousness respectively. Realize though that on a deeper level of causation the genesis proceeds from microcosm to cosmos. Christ as archetype/architect must contain the Alpha and Omega, as it is written. All of us reflect that fact.

History both reveals and conceals the cosmos, i.e. Christ/God. History is the outworking of the spirit. History is dharma/karma. It is dissolved in our salvation. Our only legacy is our permanently unique potency. All else is dressing.

| [Contents](#) |

rev. 3/25/99

The Furniture of the World

Tables & Chairs?

I am a bit like the dentist who tells you that your teeth are OK, but the gums will have to go. We folks are in good standing, but space and time are suspect. On second thought, maybe you and I should get a physical.

Recall that what is real is felt meaning. The paradigmatic and perhaps only feeling is love, and variations on that theme. The theme is the meaning end of the feeling. There cannot be love without a story. Love without a story is a sound without a tune. Unintelligible. Love's story is herstory. Telling you this is not going to make the tables and chairs disappear, not yet, but it will make them more coherent, which is a big step in that direction.

With regard to space and time, vision and memory, recall that the love that is absent may be more tangible than the love that is present. But how many loves are there? There is only one virgin mother and child, all the rest is smoke and mirrors. That is the microcosm. Fathers are an afterthought? No, they are the story makers and heart breakers, which may be about the same thing if you are into country. The world is the prism and the rainbow of love. Theme and variations. Are they not infinite?

Love is blind. Vision is an afterthought. It helps with the microcosmic logistics. We are not lost in space. We are just lost. We see the notes, but can't hear the symphony. Heidegger heard part of the symphony and got the wrong conductor. He briefly joined the wrong party, which goes to show that a little knowledge can be dangerous. Make no mistake, we are playing with fire, and this is the only game in the cosmos. We can run, and we can only hide from ourselves. The trap has already been sprung. Is there a Lady in the house?

| [Contents](#) |

rev. 3/28/99

The 'Holy' Family

A Relational Microcosm

Recently I have proposed the (Christ/human) microcosm as the foundation of reality. But in keeping with my relational perspective, it would be appropriate to expand that idea to a relational family, particularly to include a virgin mother. The mother and child would be in a parthenogenic relationship. This is an anthropocentric, relational cosmogony. And yes, Oedipus is lurking. The original sin may have to be reexamined. The epithet of the street may have a cosmic precedence.

The mother-child bond is then the originary relation. This particular force of love could and should be given logical precedence over its relata. Parturition acquires a metaphysical significance prior to any biological function. The biological function may then be nearer to cosmogony than mere metaphor. The author-character analogy is closer to this parturitional scheme than is an MPD syndrome, which would lack an adequately relational basis. But rather than an author, we have a matricial mother. It is the developing 'mother-child' bond that generates the respective personas in a yin-yang orientation.

These considerations bring the cosmos back into a human perspective, and help to explain the connection between the cosmos and microcosm. The Anthropic Cosmological principle takes on a new depth of meaning.

A better understanding of the Alpha process will aid in our preparation for the Omega process or eschaton. The reproduction scenario of the Alpha may not be unrelated to the supra-genetic hybridization that is reported by experiencers in the abduction phenomenon. Hybridization is part of the realignment of the cosmos and microcosm. The ET's represent a secondary offshoot from the primary genealogy of humanity. They did not individuate to the degree that humans did. They do not participate as strongly in the psyche of the microcosm. What still remains vague is the origin of Earth/Gaia on the one hand and the angelic sphere on the other. A rethinking of the Trinity is part of the picture.

It is probable that sexual taboo may play a significant role in cosmic censorship. Confronting one another along this demarcation are tantra and original sin. The tension between Eros and Agape goes way back.

| [Contents](#) |

rev. 3/29/99

Cosmic Self

The Source of Reality

It has been awhile since my last contribution here. The Aquarium has been engaged in attempting to keep up with the UFO CEO, as Joe is sometimes referred to. Hopefully there has been some progress in all of the activity that has been generated. The UFO tree has been shaken, and some things have come to ground. Whether we are closer to the truth remains to be seen.

In this same time frame I have also had some interaction with Jack Sarfatti regarding his 'post-quantum' metaphysics. Jack claims to have an objective way of explaining consciousness. I remain skeptical. Certainly we should push the objectivist program to its logical limits if nothing else than to better define the subjective pole of reality. Once that pole is admitted to the pantheon of reality, reality will have to be redeployed about that source.

It is reasonable that the Self is a process with a trinitarian structure. There is a self, an other, and a mediating entity. That primordial trinity is then ramified into humanity and all the heavenly host. Each created self partakes of the primordial transcendence. The ramification can be reversed in a cosmic cycle that is unique. The identity of indiscernibles permits only one human cycle of history. Any other cycle would have to be spiritually orthogonal to ours, making it virtually unintelligible to us, but perhaps still integral to our existence, manifesting another aspect of the cosmic self.

The veil of nature, or Maya, that is the buffer between humanity and the cosmic mind protects Creation. Nature is not transcendental in itself, and science is discovering its limits. The human spirit does not retire within those confines. Inevitably it will find its way back to the source. Seeing the source through the veil is our apocalyptic, pre-millennial revelation. The eschatological millennium is post-historical.

We are very reluctant to relinquish our illusions. It still remains unclear how the deed will actually be done. How much longer can we hang out on the edge of our reality, denying what is all too obvious? The non-theistic mystics claim to transcend all subjectivity, but with what do they transcend? They identify with the void, but what does the identifying? Perhaps they are slipping into one of the orthogonal dimensions where unintelligibility is taken for non-existence. We would have to reconcile this lacuna with our being created in the image of the cosmic self. Can part of that image escape our human ken? Would there have to be an orthogonal Christ? This may be carrying things too far. If we contemplate even one alternative reality we open Pandora's box. Cosmic discretion may be the better part of such valor. Some answers may reside beyond the eschaton.

rev. 7/9/99

God & the Quantum

Who's Afraid of the Quantum?

The Quantum has long been a staple of popular culture. It has the cachet of mystery and intrigue, putting it along side the X-Files in the popular consciousness. Needless to say, professional scientists are not amused by this unruly guest at their banquet of rationality. It is simply staggering to contemplate the amount of academic ink that has been spilt in the increasingly desperate attempts to discipline this unruly guest.

Why this tempest in a teapot? To grasp what is at stake, you have to go back 350 years to the founding father of Rationality, René Descartes. Descartes drew a line in the sand between mind and matter; it was rather like the decision of Solomon who offered to cut the baby in half to placate the disputing mothers. The irony here was that both the theologians and the scientists agreed to take the 'Devil's' offer, each went home with half of the baby. And so we have the dualism that is the hallmark of modern civilization.

What is incredible has been the fruitfulness of our bargain with the Devil. In fact it is the very success of Scientific Materialism that now threatens to expose its own dubious origins. A very significant part of the Scientific Establishment, namely the physics community, is feeling marginalized after effectively producing a Theory of Everything. They cannot just leave well enough alone, they feel compelled to reexamine their own roots in that Cartesian compromise. Thus do we have the nascent consciousness movement that is now spreading beyond physics.

The lynch pin, the exhibit A, of the consciousness movement is that same unruly Quantum. They have rediscovered the Cartesian Grail, the 'pineal gland' that was supposed to be the missing link between mind and matter.

More sober minds are very wary of this new metaphysical enthusiasm. It threatens to shake the foundations of Modern Mechanistic/Analytic Rationality. I agree. When you go back and open the ancient family heirloom, you never know what skeletons may be lurking in that closet. The Quantumnauts are fearless. They can handle it. Wiser counsel is much less sanguine. They try to stop up this metaphysical leak with their collective finger. It is a futile gesture.

Who's afraid of the big bad Quantum? After all, the quantum is just a little atomic fuzziness. How is this atomic lint going to threaten Modern Civilization? OK, I will tell you.

When Madame Curie saw the very first evidence that an atom could be split, she might have wondered the same thing. The problem is that there are a lot of atoms out there and we don't have to split very many before we all wind up with a splitting headache.

Now with the Conscious Quantum, I am suggesting the possibility of a psychic bomb that will be tantamount to the Eschaton. It is one thing to allow a psychiatrist to meddle with the mind of a person on a couch. It is another thing to invite the whole physics community to join in. But that is just part of the problem.

The real problem is what else the physicists are going to find when they peak behind the Quantum door. Sure as shootin', they are going to find God. Wonderful, there will be more physicists going to church. The problem is that the physicists are not going to sit quietly in the pews. They are going to be getting into the theology act, and it won't be theology 101 anymore.

Remember folks, I was once just a quantum physicist. Then I saw God behind the Quantum, and it has been a trip, as a few fellow travelers can attest. You have to make up your own theology as you go along. What will we do with all the Jesus wannabes who come tripping out of the physics departments and then out of every other department? It looks like a major paradigm shift, to say the least.

Once we let God get her foot back in the door of the mundane world, the world will not be the same. The bottom line of the paradigm shift will be immaterialism. Then, you see, the paradigm shift becomes a pole shift. Don't just take it from me. Stick God and the Quantum in your own little computer and see what you come up with. Do I hear silence from the Lambs?

But wait. Help is coming. Jack Sarfatti comes riding in on his White Horse he calls 'Back-action.' Jack is going to chain the Quantum to the bedrock of the material world. The world will be safe for Science and good old Rationality. Ah, saved at last! But wait, where are his soldiers? Why are all the other physicists still hiding in the bushes? What is this rag-tag army? Are we going to have to save the world all by ourselves? Well, yes and no.

rev. 7/30/99

Jack & the Discarnates

Genius in his Madness?

Yes, there is a genius in Jack's Madness. In order to sell the Quantum to the physics community, he will have to give it a Good Housekeeping seal of approval. He will have to purge it of its mystical spookiness.

Back-action comes to the rescue. All the spookiness of the Quantum can be restricted to one innocuous little feedback loop from particle back to Quantum. All the particle has to do is suck that elusive Quantum field back into its own little classical self, and presto no spooks. There will then be no discarnate entities because there will be no place for them to go. The quantum field keeps being pulled out from under them by the under-tow of the back-action. Too bad, all you wannabe Jesuses can just pack your bags, because God has just had his magic carpet taken away. The Son is OK, but the Father has got to go. Spirit remains crucified forever on its very material Cross. (Just to paraphrase WJ Bryan).

The only God will be those little gray beasties coming back from our future, riding on the back-action, to make sure we aim our quantum rockets in the right direction.

I dunno, Jack. Conceivably you could be right, but I wouldn't want to bet the farm on it. Spirit has a reputation for slipping out of the tightest stranglehold. Rather like Houdini. Matter needs spirit a lot more than spirit needs matter. So here is my little prediction. Spirit is not going to just slip out of this cage. Spirit is going to laugh and make the Cage/Cave of materialism disappear. Yes, it was all just God's little magic lantern (holygraphic) show. Now you see it, now you don't.

But, Jack, be a skeptic. The harder you resist, the harder you will fall. It's liable to make enough noise to turn a few heads. So I am counting on you to give the performance of a lifetime.

rev. 7/30/99

Natural Intelligence

And its 'origins'

It is difficult for the modern, educated person to imagine a non-evolutionary origin of intelligence. Immaterialism opens the door to non-Darwinian explanations of reality, but it does not require such explanations. One could naively imagine a Darwinian form of immaterialism being played out in a purely experiential realm. In fact, I am sympathetic to the view that an immaterialist form of Darwinism would give rise to a God of Love as its ultimate expression.

My strong reservation with any form of Darwinism is its dependence on a temporal dimension. Evolution implies a unidirectional flow of time. Thus evolution cannot explain the origin of such a structure. One might wish to think of time as 'evolving,' but clearly this would be a major and perhaps untenable extension of the notion of evolution. An immaterialism that posits an a priori space-time manifold is broaching self-contradiction.

Another way to pose this problem is that if time is a construct of mind or intelligence then we cannot invoke time to explain intelligence. For immaterialism, mind is the a priori element. The cosmic mind does not evolve or change in any essential manner. It may employ the construct of time as an essential ingredient of itself, but that is a very different state of affairs.

We are naturally appalled at this evasion of our instinct to explain everything, but any system of understanding must start somewhere. It cannot start from nowhere, logically speaking. By starting with elementary particles or fields, physics seems more satisfying in this regard, but that satisfaction cannot be taken as a substitute for truth. Furthermore, rationalism must start with the rational, that is to say a minimal system of meaning. That meaning can ever be derived from non-meaning is not part of any rational metaphysic. Rationalism, immaterialism, idealism, relationalism, organicism and the coherence theory of truth each envision an a priori system of things, none of which need be, or possibly even can be, finite. Similarly, linguistic competency is not something that is finitely specifiable, certainly not in the sense of being programmable. One may be able to simulate linguistic proficiency with a computer to a limited degree, but not emulate it. All the king's programmers will not be able to pass the Turing test for natural intelligence.

It should not be difficult to remain skeptical about artificial intelligence or about the evolution of intelligence. Linguistic ability is a case in point. What is the minimum conceivable program that would enable a computer to 'learn' a language?

There are two schools of thought: connectionism and nativism. The former would argue that all we need is a sufficiently robust connection between any two 'neurons' to enable machine language. The latter would argue that yet to be

specified 'deep' rules of grammar are also needed.

A connectionist could argue that just a few genetic mutations might account for the development of human linguistic ability beyond the natural intelligence displayed by other primates. Too many mutations would make it very difficult to construct an evolutionary scenario for a linguistic community. But one should then wonder why it has been so difficult for us to reproduce this same small step in our machines. Is not this quantitative conflict between the explanatory and programming problems making any reductive model of language impossible to conceive? However, a non-reductive model of language would open the door to immaterialism in a major way. How much longer can reductionism bear the strain in this arena, or in any other arena for that matter? How much strain can the materialists tolerate before they are willing to swallow immaterialism? What should be surprising is that neither the materialists nor their opponents recognize this simple logistical impasse.

rev. 11/29/99

Buddha & Jesus

Time tells all

It is plainly not fair to put anyone on the same bill with Jesus. It is not fair to the other individual. This point is so obvious that it is generally considered impolite even to mention it, but it is far from clear who benefits from the silence.

If it were not for the fact that the charisma of Jesus was so badly misappropriated and exploited by people who forgot that they owed their lives to it, Buddha would have been forgotten long ago. That historical fact remains to be corrected.

It is not clear that anyone who has been exposed to that raw imago, without some great cultural buffer, has ever been less than profoundly affected. Certainly no other image comes close.

An army of experts might present arguments to the contrary, but common sense argues that much of what passes for modern reality hangs from that peg. That the owner of the peg might fail to rendezvous would seem most improbable, regardless of any professional opinion. Even the concept of professionalism, when it has ever been more than mandarin, could not be disentangled from that imago. How long a shadow can even a Hippocrates cast in such a light?

That we have not all already been infused with the light is an unsurpassed cosmic joke. In fact we have been, but the realization of it is not an event from which we are expected to recover anything that resembles ordinary life. There is still time to wait for the realization, and that is all the time there will ever be.

rev. 11/29/99

Yahweh & Jesus

Monotheism on the ropes

Beside Jesus, Yahweh suffers a fate not much better than Buddha: he looks quaintly, faintly ridiculous. It is no wonder that Mary had to be elevated to supplement the spiritual heft of her former suitor.

Trinitarianism has been a difficult brew for the monotheistic tradition to imbibe, and its refusal is legion. One way around the impasse is to dump Yahweh. Gnostic Docetism is a step in this direction, and immaterialism obviates much of the historical problem with multiple substances.

I have been tempted on occasion to say that God fully emptied himself into the incarnation, making His death real. This is in contrast to what I have just said about the supra-temporal nature of the cosmic mind, but until we partake of the hierogamos we should not expect a premature rationale. It is logical to suppose that the Second Coming will complete the divination of the Body of Christ, that's us, and that is the hierogamos or resurrection of God.

The Jews and Muslims will not have so much trouble with all this the second time around, in fact, they will probably find it easier to take than many 'Christians.' The Hindus and Buddhists should be satisfied with the basic immaterialism of it all and the fact that they are getting off the wheel a lot quicker than their experts predicted, thanks, of course, to JC. Is everybody still happy?

| [Contents](#) |

rev. 11/30/99

Whither Materialism?

Looking for the next big thing

It is interesting to speculate about the future of materialism. It is conceivable that materialism could hold out almost indefinitely, or that it could finesse its transformation into immaterialism in such a manner that hardly anyone would be the wiser. This latter course seems to be the path of postmodernism. Yet it seems improbable that some child will not notice materialism's absence of clothing and make a fuss about it that the media will be able to ignore.

Materialism desperately needs a shot in the arm, although a shot in the head might be a better idea. It needs a breakthrough. The proliferation of digital technology has kept the public and the economy sufficiently distracted that few have noticed the lack of consequential scientific advances for the bulk of this century. Transistors and atom bombs are an application of physics that was well understood in the first quarter of this century. There has frankly been nothing of consequence in physics since then. When Horgan recently wrote a controversial book on the demise of physics, the controversy was only three-quarters of a century behind the times.

Biotechnology could be another matter. It continues to hold promise, but the emphasis is on the promise. Perhaps it is only languishing in the economic shadow of the Internet, or perhaps its lack of momentum points to the basic flaw in our materialistic conception of the life force. If biotechnology is unable to take up the slack from a rapidly saturating communications boom, people might start to notice that materialism is looking a little raggedy around the edges. They might wonder what will be the next big thing.

Capitalists have become addicted to the 'Big Mo.' If materialism does not produce for them, their eyes may turn to the skies, like those of Joe Firmage, but it may already be too late. We are back to physics again, wondering why a breakthrough in physics should not and cannot be our rainbow bridge into a twilight zone of UFOs and metaphysics. It is not easy for impatient non-physicists to appreciate the depth of the dead-end into which physics has dug itself in the last three-quarters of this century. Impatience is not going to rewrite the handwriting on the wall. The fact of a metaphysical barrier will eventually sink into even the thickest of skulls. There is a ring-pass-not. It is there expressly to keep the fat cats from buying their way through the eye of the needle. If you don't like it, complain to the management.

Will the capitalists then throw ashes on their heads? Who knows? What will it take to get us into the transcendental mode of thought? How long will it take, and how long do we have? We do not know what is the glue holding together our rapidly spinning and shrinking globe. Watching it unravel would not be pretty.

When and how will the invisible hand become visible?

rev. 11/30/99

Millennium Gridlock

Breaking the logjam

Given that the immaterial cosmology outlined in these pages is not totally off the mark, what will it take to break the intellectual and spiritual gridlock that is now the main legacy of centuries of scientific materialism? Short of a public 'act of God' on the scale of Fatima, I can see only one alternative as a long shot.

There is a minimum combination of factors that would be required. I see no prospect of a purely intellectual breakthrough. The academic community shows no signs of intellectual volatility beyond postmodernism, which remains defiantly anarchistic and acosmic. One has to go back to the pre-Darwinian phenomenon of Hegelianism to find any innovation on the cosmological front. In this century there are only Whitehead and Jung whose followers have gone no further than acosmic idealism in the face of science. On the spiritual front the only innovation has been in the New Age Movement, which has avoided any direct confrontation with the scientific and medical establishments, resulting in a de facto dualistic posture despite its disavowal of same.

Here is the long shot alternative: a collaboration between Joe and myself facilitated by Ron. This intellectual and spiritual collaboration might be highlighted against the backdrop of an end to the present Internet equities bubble. The collaboration would then seed a grander revision of the original inter-networking vision.

This available combination of elements: intellectual, spiritual, ufological, conspiratorial, technological and economic is unique and would be sufficient to break the millennium gridlock, without another Fatima. It remains to be seen where Joe and Ron are with respect to any such thinking.

rev. 12/2/99

Ring-Pass-Not

Salvation drama

‘Ring-pass-not’ is an esoteric notion describing a barrier in the path of spiritual evolution. For the purpose here, materialism is the singular barrier to the soul. Mind you, it is not the non-existent matter, but just the idea of materialism that is the barrier.

If matter is non-existent, why do we become materialists? We can blame the self-concealing God who hides behind the apparent materiality of nature. In our search for truth we become further entrapped in the ‘material’ veil. The more we struggle with those bonds, the tighter they pull. One might easily see this arrangement as diabolical.

It is for this reason that we cannot storm heaven, we cannot build a tower of Babel, or create a golem. Materiality serves to protect us from the larger cosmos, but also from ourselves by limiting or channeling our self-destructiveness.

We cannot save ourselves from the illusion of matter. Only the self-revelation of the cosmic spirit and our subsequent realignment will suffice. It is this final revelation about which we are impatient and fearful. This revelation will occur through us, in keeping with the prophetic tradition, despite all our procrastination. It seems now to be a question of who, where and when. Various interests with varying degrees of knowledge put their cards on the table. ‘Les jeux sont fait.’ This is how we thread the eye of the needle, the ring-pass-not.

| [Contents](#) |

rev. 12/3/99

Incarnation

Was it necessary?

How else could God have died? For how long then was God dead and what about the Second Coming? Thus we address the resurrection of God through humanity. Jesus was resurrected so that he could prepare us for the Second Coming and the Millennium that would complete the salvation of humanity and the resurrection of God.

This problem from the Jewish perspective is that of an interrupted messianic mission. This was not what they expected. They did not foresee the death of God as part of the messianic drama, despite the fact that the sacrificial death of the God/king is a universal theme.

Christianity tried to play down the death of God through its elaboration of the Trinity. The incarnation was a major headache for Christianity, and no other religion had the gumption or calling to take up this burden. One would suffice. One will suffice.

Islam was much more efficient as a religion. It was so efficient that it almost snuffed out a Christianity that was constantly stumbling under its theological burden. It is only with the Second Coming that Christianity will show its true colors, and become universal.

| [Contents](#) |

rev. 12/3/99

Tribulation

What if I'm wrong?

In case you hadn't noticed, the logic of immaterialism mandates certain crucial elements of the prophetic tradition despite the fact that historically the mystical tradition has been more partial to immaterialism. In particular, immaterialism mandates a self-concealing, self-revealing creator along with an abbreviated linear time-scale punctuated by an Alpha and Omega. This does sound suspiciously similar to the tenets of fundamentalism.

Perhaps the biggest bone I have to pick with the fundamentalists concerns the Tribulation, and beyond that it is the nature of evil. The fundamentalists are big on evil and retribution and thus tribulation. Where they go wrong is in their near idolatry of Satan. They give too much credence to evil. I suggest that the cosmos is a tight ship, and that there is not enough slack to permit a Satan that is a loose cannon on the ship. Fundamentalists grossly underestimate the efficiency of the cosmos. They have virtually no appreciation of Leibniz Principle of Sufficient Reason. There is a reason for everything, particularly for 'evil.'

Specifically, the fundamentalists do not grasp the cunning of God's concealment. Scientific cosmology is not a human aberration; it is fundamental to the cosmic plan. Yes, the fundamentalists are weak on the fundamentals. The fundamentalists are not fundamental at all; they are bibliolators. They underestimate the importance of Christ in the flesh and in the cosmic scheme, and, of course, have no conception of the death of God. Is this a problem? No, their misconception of the Second Coming is a necessary ingredient of it.

'Evil' is the result of our gullibility concerning the concealment. Scientists are guilty of out-smarting themselves, and nothing more beyond the arrogance and hubris that goes with that error. But the irony is that it requires an even greater hubris to rise above the herd mentality of the scientists in order to penetrate the cosmic deception. Unless one is willing to partake of a spiritual responsibility of biblical proportions, one will stick to one's scientific knitting. What I have had to do to get to this point of presumed clarity goes far beyond any conceivable job description, unless you consider John 16:12 ff. to be a help-wanted posting.

The long and short of it is that we have paid our dues and done our homework. We don't need scolding; we need enlightenment. We need a proper prophetic revelation. The Internet can handle most of that, but God will have to get the ball rolling. Is that the dead God? No, that is the eternal God.

And if I'm wrong?

| [Contents](#) |

rev. 12/4/99

A Tight Ship

An extravagant nature

Much of the extravagance of nature is what we incorrectly project from the Earth onto the universe. However, the Earth does display more than its share of extravagance: consider the one million species of beetles and the $\sim 10^{10}$ humans.

How does the Principle of Sufficient Reason speak to the one million species of beetles? Well, all those beetles do keep the entomologists busy, and there is nothing wrong with that. One might ask what would be a more proper number of species, but why not just suppose the more the merrier?

When it comes to humans, more is not always merrier. Much suffering may be attributed to overpopulation or at least to a too rapid growth of population. However, if we consider that the Earth and its inhabitants are one of a kind, it is more understandable that folks and beetle types would be dying to have their moment in the Sun, particularly if we are coming to the end of the moments. Our millennial population will be a matter of much deliberation.

One way to solve the population problem would be to have designed a bigger Earth. We do not know all the ins and outs of the Anthropic principle and how much leeway we are allowed in matters of design. This problem may be related to the problem of the monster group, which remains in abeyance. We have to continue to suppose that the Earth is the best of all possible worlds until we have firm evidence to the contrary. This, of course, does not mean that there is not room for continued human improvements, and improvisation. There will be plenty for us to think upon and work on over the course of our Millennium.

But let us return briefly to the beetles. To what do we ascribe their extravagance of morphology if not directly to evolution? First of all, evolution's explanatory power has been vastly overrated due to the virtually unrestrained wishful thinking of the evolutionists. Evolution explains the world simply because it must. An idealist may appeal to an ideal, virtual evolution, or simply to the very idea of evolution. Evolutionists and entomologists do much of the work in the teleological matrix. The collective spirit of the beetles themselves in conjunction with a creative Nature should not be left out of consideration. There are plenty of smarts at the top and in eternity for Nature to fill its many niches without having to chain God to the drafting board or trying to teach virtual atoms to jump through metabolic hoops.

There is good reason to suppose that nature can employ fractal design from the top down, and that this strategy could be employed on the biological front as well, thus the extravagance of nature. God could use a fractal CAD/CAM computer instead of a drafting board. This is in a manner of speaking. I believe in the immateriality of Pentium chips, but what supersedes computing on the cosmic level in the

teleological matrix is still well beyond our comprehension. Suffice it to say, what transpires is more holistic than digital. We may also rest assured that none of the extravagance is wasted.

rev. 12/5/99

In God We Don't Trust

The only good cosmos is a lobotomized cosmos

Modern atheism is equally as remarkable as it is understandable. It comes in many forms. In most cases it exists as a counter-posture to religious conservatism and hypocrisy. The most common rationale for this counter-posture is to be found in scientific atheism. Science has no need for the God hypothesis.

The picture is complicated somewhat with the New Age Movement in which other non-theistic ideas and traditions are imported to modern civilization as an adjunct to post-modern syncretism. Included are various forms of polytheism and pantheism.

In the history of ideas there are strong links between monotheism and the modern science. Monotheism is seen partly as an antidote to mysticism and pantheism which were generally less propitious to the scientific attitude.

Immaterialistic monism, as opposed to basic dualism, is naturally inclined toward traditional mysticism and pantheism, unless the immaterialist is able not to discard all the insights of modernism with its roots in rational theism.

Pantheists are partial to an organic, living cosmos, but they do not wish for it to possess a will that might be imposed upon their own. They share in the common wisdom that power corrupts, certainly down here, and as below so above, unless there is very good evidence to the contrary.

However, the mundane abuse of power will continue unless cosmic justice ultimately contravenes it. Karmic justice with its impersonal mechanism has never been envisioned as problem solving.

Christian theology seems designed to speak directly to the concerns of corrupted power. The problem lies in what has been left undone, specifically with regard to the Second Coming. Many Christians feel cheated by the inconclusive nature of the first coming, and have placed their hopes on a decisive and glorious return. Perhaps decisive and glorious are not both in the cards. You can take your pick. Effective, to the point and otherwise minimal would be more in keeping with what has been established and what will avoid the blandishments of power. The power remains latent in a personal truth and thus ultimately potent. Justice and the fears of the atheists are reconciled. Give truth a chance, that is all it needs and it is all we need.

We cannot trust God without trusting ourselves. Realizing that cosmic truth is necessarily our deepest personal truth will remove the veils of mistrust. Blandishments will pale.

rev. 12/6/99

Cosmography

Conjuring a maximal presence

On occasion we strain for a glimpse of eternity. What can we hope to see, enshrouded as we are in time? What can we make of the reports of the philosophers and mystics? We are children of eternity, though modern science and skepticism seem determined to question our birthright. What does the mind's eye see?

Can there be more than one cosmos? Science says yes, philosophers and mystics say no. An objectified world will always be disparate. A subjective world is much less easily delineated. Mind space is amorphous and porous. Philosophers, mystics and poets scoff at the notion of minds contained by skulls. Neuroscience is a wonderful way to pass time, but it may not bring us to the heart of the matter. If we partake of a cosmic mind, there can be no way to partition that mind in any objective or absolute sense. The only partitions would be mental.

It is difficult not to imagine an evolving cosmos. One imagines a 'quantum' chaos of virtual experience sublimating and crystallizing into coherence. This is at the expense of potentiality and modality. On reflection, it is even harder to suppose that there is not a maximal potency of the cosmic mind that includes and transcends all experience of time. Is this not closer to the consensus of wisdom?

The maximal potency is maximal presence. Our paltry experience is primarily of absence, we being granted only as much presence as we can assimilate. Maximal presence is a balance of the primordial centripetal and centrifugal forces of the psyche. These forces manifest in multifarious fashion.

History is where the action is. We inhabit the Mainline. History seems a repository of redundancy, but that is the extent of it. The above considerations strongly imply that History is singular to the singular Mind. We are not an experiment. We are an about to be finished crucial component, speaking 'sub specie aeternitas.' Otherwise we are deprived of meaning and presence. The structure of history is delineated by AXO, 'X' being the Crux of the matter.

| [Contents](#) |

rev. 12/8/99

The Primordial Self

The measure of all things

The self is the measure of all things. It is the primordial thing. The only conceivable rival for primacy is the mathematical Monster Group. This contest for primacy can only occur in our imaginations. The outcome is preordained.

I have been a bit slow in picking up on the self. It looms too large and too close to easily notice. My task is to bring the self to the attention of the physicists. Physicists take too much pride, hubris really, in their ability to rise objectively above all things psychical, and then above all things, period. This prideful, thoughtless 'objectivity' bodes ill for their entire enterprise. Pride runneth before the fall. The Monster will be my stealth weapon against hubris.

Physicists do not rise above the self. They rationalize their ignorance of the self by consigning it to the dustbin of Darwinian evolution. They build their beautiful theoretical castles upon the vague assertions of a woolly-minded botanist. What do they expect?

The consolation prize for the physicists is the Monster Group, which turns out to be a peculiar variation on the Trojan horse. And what is concealed inside this beast of Jovian proportions? Nothing other than the self. How so? I do not pretend to have the complete answer. My only task is to motivate a natural inclination toward higher truth.

The Monster Group is alleged to embody all the structure of mathematics and physics, i.e. all of reality as conceived by the modern mind. The problem lies in the conceiving. The Monster sleeps in its lair of logical circularity. We will watch it swallow its own tail like its mythic progenitor, the Uroboros, the tail-eating cosmic alchemical dragon popularized by Jung, and thus revert to the cosmic self.

The recent 'Sokal hoax' shows how much we physicists detest any imputation of subjectivity in our discipline. The Institute for Advanced Study in Princeton recently attempted to purge its ranks of those investigating the cultural dimensions of science, threatening to ignite an intellectual Armageddon between feminists and scientists.

At the turn of the last century Edmund Husserl, an early proponent of psychologism, published a lengthy attack upon it. Psychologism pits Aristotle, Locke, Kant, etc. against the Platonic school of absolute realists, particularly in regard to abstract mathematical entities. This issue is far from being settled. It is reinvigorated by the powerful role of mathematics in physicists' dreams of a final theory, epitomized now in the emergence of the Monster Group. We have epistemology vs. ontology.

How is it that the human mind is able to comprehend the mathematical Monster? If the Monster had even a slightly different structure, anthropics strongly suggests there would be no minds to comprehend it. Can there exist an abstract entity without abstraction? Who breathes reality into these abstractions to produce the physics and the physicists? Physicists are obviously reluctant to plumb these navel gazing depths where all thought necessarily circles back on itself in Uroboric and teleological fashion.

It is my claim that the self owns this circle -- is this circle. Reality is necessarily a self-contained system. The ultimate closure is complete and singular. It is no wonder that our linear thinking is unable to comprehend the cosmic self, which is exactly orthogonal to our line of thought. To paraphrase Jack Sarfatti, the real back-action is epistemology $\rightarrow$ ontology, instead of his mere $Q \rightarrow X$, but one should note the similarities. The Uroboros of this back-action is the vital, self-organizing principle. The Monster Group will be our Rosetta Stone for translating between psychology and ontology.

From this perspective the dispute between the physicist and theist is over the relative weights to be given to the subject and object. The pendulum still has a long way to swing back toward the alienated self.

rev. 12/27/99

Metaphysical Activism

Looking for the Archimedean Point

In other postings here I have discussed the lack of fellow travelers on the Aquarium path. Despite the continued rapid expansion of the Internet, the philosophical speculations posted here remain unique.

It is possible that the gestalt switch from materialism to immaterialism will proceed gradually and spontaneously until it is generally recognized as an anticlimactic fait accompli. If this is the case then there will be very little that any individual or small group could do to expedite the process. On the other hand, the process might be amenable to some form of leveraging by one or more individuals. A proselyte must always remain open to such a possibility.

I continue to be open to the possibility that some sequestered information could serve as a point of political leverage, but there is little more that I can do to pursue that possibility. The next most likely point of leverage is to be found in the intellectual arena where philosophical speculations are supposed to be given due consideration.

There has been a recent upsurge of speculation surrounding the traditional mind/body problem. This speculation is still far removed from the immaterialist eschatology that I advocate, but it is a substantial step in that direction. It does appear that as the problems with materialism and dualism are seen to be more intractable there is an increased willingness to reassess the practicability of immaterialism. I have not yet come up with a presentation of my ideas that might be expected appeal to the few individuals involved in that aspect of the discussion.

Immaterialism on the Web

Sentient beings persist in a state of tension between the material and immaterial poles of existence. That tension comprises the life force. Life is that duality. The cosmos can relax into non-being, which is the ground of all being, in no time and for all time. That is the ebb and flow that is beyond time.

Matter has its fascinations and its disciplines. In our history we have come a long way toward its mastery. The final phase of our history and mastery will occur under the aegis of the larger truth. Only thus will we have the wisdom to complete our errand into the wilderness. This is the prophesied millennium.

I am a pre-millennialist. The apocalyptic revelation will be tantamount to a messianic advent.

The apocalypse will be in the eyes of the beholders. Those of us who partake of the paradigm shifting on the Internet will be the harbingers. All we have to fear is a stage fright that is overcome by our plurality. Like blind sailors, we grope with the rigging. We need a little sea chanty. These pages attempt to be useful to that end.

rev. 8/2/98

The Emergence of Physics

Must Anything Exist?

Probably, yes. How could it be prevented? Given that something must exist, what is it most likely to be? Would it be objective, subjective, actual, potential, or what? A reasonable guess is that the minimal existence is a potential pleroma. This is self-creating creation.

Emotion comes before motion. This is the inflationary theory of cosmic mind, which must nonetheless be a singularity, because all existence is relational and integral, because that is what is most natural and robust. To create isolation is to create a void that is like creating a vacuum in the atmosphere, which requires work.

Out of this self-creating, self-inflating, potential pleromic sensorium there emerge things like proto-space-time, out of a self-organizing necessity. But before that there emerge proto-microcosms or selves, which then participate in eternal reorganization that manifests in cosmic phase changes which could be something like proto-space-time, for example.

The microcosms must have the potential for self-differentiation, which would entail boundaries within manifolds. These boundaries and selves emerge from an aboriginal cosmic personality split that may have been trauma induced, the trauma being related to the potential of infinite self-awareness. The fear of falling into that infinity keeps most of us firmly lodged in our respective skins, only fearing death.

The identity of indiscernibles may act to reinforce the exclusion principle between microcosms, until the big crunch, which recapitulates the inflationary big bang. Thus is cosmic symmetry maintained.

Self-maintaining psychic boundaries evolve into physical boundaries and then physics emerges. Good fences make good neighbors, unless they are gay bachelor farmers. Homophobia may partially translate to theophobia.

The Pauli exclusion principle, mysterious and complex though it is, may be the first principle of physics. The bosons are then just the cosmic bozos, or clowns of God. They have more magical possibility than us poor fermions.

Symmetry breaking is the beginning of normal reality. A physical barrier is a manifestation of a multidimensional psychic barrier. Everything is the skin of something. The void is the unobstructed universe. It is the fearful, fateful symmetry.

Self-awareness and privacy contrast with tribal awareness. God made creatures to further self-awareness in a secure, piecemeal fashion. And what happens when we work ourselves out of our jobs and out of our skins? God may forbid, but curiosity always gets the better of us cats. That is our destiny.

With skin comes metabolism. Reality is internalized and refined in bites. With immunity we

maintain integrity. Food is digestible information. Redundancy is mostly illusory because of the caveats on indiscernibles. Physics is the illusion of habituation, reinforced by our instincts. Remember that the entire world could be woven from a single quark shuttling back and forth in the loom of time.

Skins are hollow, but rocks are not. Rocks are a tangible void. They are dead skin which can be like a skeleton. These bring us further into physics. Our bones are the measure of the world and the coordinators of space and so probably of time as well. Just ask the Centurions.

But let's look at physics from a more informational perspective. Computers are our informational Centurions. They crystallize information. Analog is just a fuzzy digital. Quantum rules. Space could be a spin lattice. Logic is the skeleton of the mind. There can be only one kNot, ramified into nothing.

How do we maintain the Olber and Fermi paradoxes? How does God keep everything from happening at once? We need lots of kNot -- lots of skin. The starry sky is our tribal skin viewed from the inside, with pours. The pours breath information that is pressuring us to jump out of our skin, pace NASA. The information from outside is beginning to connect with the information from inside. Lucy is in the Sky with M-branes.

Our eschatological Aquarium trick will be to jump out of our skins without rumpling them. We maintain our material umbilical while pushing technology through its own skin, probably with the help of quantum computers. This is not forestalling, this is foreplaying. This is our millennium, and the Aquarium is the pre-millennial advent -- dramatic minimalism.

rev. 8/2/98

Postmodern Reconstruction

Stumbling Past the Eschaton

The eschaton alarm keeps buzzing in our ear and we keep punching the snooze button. Not to worry, things are moving along more quickly than we realize, and we seem to be more or less on track.

To any change there is resistance. To fundamental change there is simply denial. Denial is the only way to resist the inevitable. Those of us who do not mind anticipating big things are given a full measure of time to savor the drama.

We are coming close to the point where we can begin to coast. Our common objective will begin to supplant our individual struggles for mere survival, and this will happen without benefit of legislation.

Many of these changes have occurred subliminally, but they are now coming to the surface, especially for those who care to observe.

The saving of the world was accomplished two millennia ago, but only now can we begin to understand how that was managed.

The light at the end of the tunnel is seen in the form of an expanding consciousness of the deep connectivity of the world. Aspects of the world will continue to disintegrate, but the light we see will be the primary force by which we can minimize the suffering. Most of the suffering will be felt in the letting go of the darkness. The light seeping in through the cracks of our old reality can only seem confusing and threatening at first.

It has been said that the modern era spanned the time from the storming of the Bastille walls to the storming of the Berlin wall. Like for those confused prisoners of the Bastille, it is easier for us to see the threat than the promise in the sudden glare as we stumble through the debris of the old order.

The task of building a glass palace from the rocky debris of a prison is likely to be incomprehensible to those who were so recently incarcerated. That is our challenge and our most precious destiny.

Ninety percent of the reconstruction will be done in our hearts and minds. That will be the most difficult task. Once we have made up our hearts and minds, the actual work will just be a recreation. The fields will still be planted and harvested as through the eons, but the burdens will dissolve into the greater understanding of how everything has always worked together. There will be nothing glib about this understanding. It will utterly transport our densest selves. It will utterly reshape reality.

rev. 8/2/98

The Shape of the Cosmos

Simple at the Ends -- Complex in the Middle

The cosmos is simple on the ends and complicated in the middle. The x-event (christos) defines the middle and is the most complicated single item. Its complexity sets the least upper bound on the cosmic complexity.

At the lower end, we have the minimal mathematical principles that make up the ‘theory of everything.’ At the upper end everything converges on the cosmic love. Then there is the fat middle of the experiential realm where we reside.

Our multitudinously reflected selves create the vast bulk of the cosmos. How many selves does it take to pull-off one x-event? Obviously it requires about 10^{10} of us. The pearl creates the grain of sand that ‘irritates’ the cosmic oyster. The eschaton delivers the pearl.

Yes, there is teleology, final causation, and all that. Our belief in the past, the future, and ourselves keeps the world from vanishing in a puff of smoke. Culture is not something gratuitous, and MTV is an unmistakable aspect. The linkage between MTV, Shakespeare, and the x-event are nothing less than profound. With the eschaton our magical presence expands to overwhelm the abstractions of space and time. This occurs on an individual basis until the global phase change is catalyzed. That phase change will not eliminate normal reality, but it will redefine it.

Normal reality is transformed by being reintegrated into the larger reality. We take our individual gestalt switches and bring them back into our ‘normal’ lives. Our lives become informed and reformed by the expanded reality. We realign ourselves around the eschaton and disseminate that dynamo.

At the same time we are relinking with the cosmic mind. This is mostly done in the form of free and open channeling. The cosmic mind will also be represented by intermediary beings that will commune with us. These beings will mostly be artifacts of that link. They are a buffer between our cosmic self and us. They ease us into infinite self-awareness. They will be the most tangible aspects of our expanded reality. We must be careful about any exploitation. The karma at that level is easily short-circuited.

rev. 8/3/98

Metaphysical Activism

Looking for the Archimedean Point

In other postings here I have discussed the lack of fellow travelers on the Aquarium path. Despite the continued rapid expansion of the Internet, the philosophical speculations posted here remain unique.

It is possible that the gestalt switch from materialism to immaterialism will proceed gradually and spontaneously until it is generally recognized as an anticlimactic fait accompli. If this is the case then there will be very little that any individual or small group could do to expedite the process. On the other hand, the process might be amenable to some form of leveraging by one or more individuals. A proselyte must always remain open to such a possibility.

I continue to be open to the possibility that some sequestered information could serve as a point of political leverage, but there is little more that I can do to pursue that possibility. The next most likely point of leverage is to be found in the intellectual arena where philosophical speculations are supposed to be given due consideration.

There has been a recent upsurge of speculation surrounding the traditional mind/body problem. This speculation is still far removed from the immaterialist eschatology that I advocate, but it is a substantial step in that direction. It does appear that as the problems with materialism and dualism are seen to be more intractable there is an increased willingness to reassess the practicability of immaterialism. I have not yet come up with a presentation of my ideas that might be expected appeal to the few individuals involved in that aspect of the discussion.

rev. 8/15/98

Naturalism

A More Worthy Opponent

Naturalism is an idea that usefully complements materialism. From a skeptical point of view, it might only be a euphemism for materialism, but in actuality it is rather less restrictive. It is reported that one can be a naturalistic theist. This is possible because naturalism orients itself toward local problems, eschewing metaphysics of any kind when it comes to problem solving. At most, naturalists adhere to a non-reductive neutral monism. In dealing with those pragmatic problems it upholds the scientific method as an ideal. There might well be a God beyond the natural order, and religious practice could be beneficial within the natural order, but never the twain shall meet except in the imagination of the believer.

Obviously, naturalism stands as a more worthy opponent of immaterialism than does materialism, which too easily becomes a mere straw person.

We can then follow Jerrold Katz in his exposition of the Naturalistic Fallacy that appears in his *Metaphysics of Meaning*. In doing so I must take issue with David Chalmers' 'hard problem' approach to the mind. His divisive strategy begs the Cartesian solution, although he claims to be a naturalist.

Katz is a non-naturalist of the Platonic persuasion. He confronts the behaviorist and functionalist understanding of language, an issue which Chalmers et al wish to concede in favor of their 'hard problem' (and sexier problem) of consciousness. Katz concedes nothing.

Katz uses mathematics as his starting point. He defends the position that in mathematics Platonism has never been seriously challenged. The only disagreement comes from anti-platonic philosophers, not from mathematicians. Given this fact, it is rather easy to extend Platonism to the realm of language in light of the notorious problems that continue to haunt the behaviorists and functionalists in that domain.

This is not to suggest that research into computational linguistics is not useful, because it will continue to be so, but that we do not need to sell our souls in the process.

rev. 8/15/98

Transcendental Naturalism

Kicking the Habit

I must commend David Deutsch for displaying the courage of his convictions in his *Fabric of Reality*. His courage allows the rest of us to see more clearly the fallacy of the naturalism that he pushes to its logical extreme, which, but for one minor point, is indistinguishable from immaterialism. In doing so, Deutsch uses Frank Tipler's *Physics of Immortality* as a point of reference.

A la Tipler, our destiny is to find ourselves reprogrammed into the virtual reality of a cosmic, quantum computer. Amen, but hold the computers.

To his credit, Deutsch spends some time flirting with and defending Berkley, which he must do in order to flesh out his very robust version of virtual reality. But he is never quite able to kick his very serious computer habit. Computers are our final security blanket.

But on the more practical side, just how do we know that we are not already the figments of a cosmic computer? Deutsch barely touches upon this problem that ought to be looming. Without so much as a nod to Leibniz, he takes it as obvious that even a novice programmer could produce a reality more comfortable than what we have been experiencing, lo these many years. Obviously God has compassion for fools.

How will we kick the computer habit? Very simple. Let's all start dreaming about the big computer in the sky. We will evoke it before it evokes us. After all, God is dead, isn't She?

rev. 8/15/98

The World is the Prism of Love

The Christ Event Defines Its Shape

In this manner we provide the logical basis for a functional or structural cosmology.

The ultimately potent potentiality of love is the entraining principle of the cosmos. Every other organizing principle survives only as the detritus of love. All other structures and functions exist only in a subservient relation to love.

The christ event is the paradigmatic locus of love's recursion. The cosmos is christo-, anthro- and therefor geo-centric, pace Bruno and Rodenberry.

By the identity of indiscernibles there can be only one x-event. Upon it hangs all of reality. Any possible orthogonal realities must also intersect at that event. All notions of individuality and universality are thereby instantiated and confirmed. Ironically the x-event was also the point of maximum alienation. It pushed every envelope and every button. In the AXO schema it was the point of maximal complexity. The Alpha and Omega are simple by comparison.

The mathematical theory of everything will approach the x-event as its limit point of comprehension. We can do a mytho-structural analysis of that event to whatever extent is necessary for us to realize our spiritual origin and destiny.

With whatever degree of reality we choose, any of us may participate in the x-event. All of us already have to a much greater extent than we realize. It constitutes the core of any individuality. By definition it is the most redundant event. The second coming will merely help to recapitulate the first. That event will also be defined by its openness to universal participation. The possibly retrospective participation defines both events. That redundancy only increases the comprehensive depth of the events. It in no way detracts from their originary quality. We need not ask for whom that bell tolls.

There can be only one consciousness with many mirrors and prisms. To find ourself we lose ourselves in the fun house. This eternal structure is a process that is necessarily gratuitous.

How long will it take the mathematicians to do their homework? How much can the Internet expedite them? We do what we can.

.

| [Contents](#) |

rev. 8/16/98

The Illusion of Color

Metaphysics like any other endeavor can make for strange bedfellows. So imagine my consternation at having to eliminate color, a la the functionalism of love. Why not just allow color to exist gratuitously? I am not sure that question is answerable before the fact of unity. In subsuming color to love, one will elaborate the notion of the latter.

First consider taste. Taste is the original means of recognizing the other as belonging either within or without. If you taste bad I spit you out, unless I have other motives. Taste is variegated according to the necessary complexity of our diets, we being high on the food chain. But why don't peaches taste like apples and vice versa? Somehow that does not seem like a proper question. If there were 'apples' that did not taste like apples, we would not be calling them 'apples.' We might call them 'Snapples®.'

I am suggesting that qualities are not gratuitous. They are functional and thereby structural. That is a bit of a stretch, but it should motivate mathematicians to expand their imaginations. There must be a transcendental topology of love and color. This is neither reductive nor eliminative; it is merely illuminative. Ultimately topology will pass the taste test. As dialecticians we can worry how quality and quantity are interchangeable. Music might provide a proving ground.

Ooops! To eliminate or not to eliminate? Subsumption is the operative term. We want Occam's razor and not his scalpel. A cosmos is a fairly tight ship, without a lot of unnecessary baggage. Necessity implies function implies structure. But can we or should we calculate love? No, but we must communicate it and so illuminate it with all our intellectual and spiritual power.

This endeavor will require us to reintegrate our disciplines along the lines of a transcendental rationality. The nature of that rationality is being explored here in a discursive style. Illumination will follow upon motivation. The function of charisma is to facilitate.

In this process we will rediscover various of the 'logias' that were spat out by a domineering scientism. Take numerology and astrology. After considerable reworking, these will find ample room in a higher dimensional reality.

.

rev. 8/16/98

Abstractions

Immanentizing the Eschaton

There is confusion. Love is supposed to be an abstraction. I don't think so. Love is what makes the world go 'round. Love is the epitome of the real. By comparison, an eighteen-wheeler barreling down the highway is an abstraction. Admittedly, most people find this difficult to grasp.

Consider that the motive force behind the eighteen-wheeler is love, even if it happens to be transporting munitions. A materialist would say that it is DNA that moves the munitions truck. The purpose for moving the munitions is to put rival DNA out of circulation. A physicist would say that it is diesel fuel that is moving the truck.

All of these explanations have their place in a complete understanding. But if the world is immaterial, then clearly we have to reconsider the nature of abstraction.

Materialists are currently having their noses rubbed in abstractions by the philosophers of mathematics and language. Mathematics is an abstraction and yet the physics of our world is thoroughly and completely mathematical. How could that be? Numbers are not supposed to be part of the natural, causal order and yet they order every facet of it. All I am saying is that if you look behind the numbers you will find love. The anthropic principle points to a numerological agape. As we align ourselves with the cosmic agape the world becomes increasingly transparent and amenable.

Meanings if they exist are supposed to be abstractions, but only if teleology is also non-existent which it is not. The world is structured for intelligence. Intelligence is structured around meaning. Then ask anyone for the greatest meaning in life.

The distinctions between abstract and concrete hearken back to Descartes' dualism. He drew the line between extension and intension, but that is highly arbitrary. It is easy to posit that qualities are more concrete than quantities. Certainly they are more immediate. It all comes down to the functionalism of love. That function finds its ultimate expression in the eschaton. The function of the Aquarium is to immanentize the eschaton, which is the opposite of abstracting it.

rev. 8/17/98

Epistemology

And the Ontology of Creation

The problem of knowledge is another legacy of the Cartesian era. If mind and matter are distinct types of substance, there is no way for them to interact. In theory, immaterialism should obviate this problem.

For starters it is common to suppose that the individual is a microcosm and so should have innate understanding or access to cosmic structure. This approach, however, is liable to lapse into a dualism between the micro and macrocosm. It would be more economical to forego the microcosms and simply posit direct access to a shared reality. We then have to account for perspective and privacy.

From a Gnostic point of view we have to explain our being trapped in our respective bodies. The existence of bodies is clearly a central feature of the cosmic game plan. They are our tokens in the game of life. Separate bodies are necessary to decentralize intelligence, and perhaps they will also facilitate its recentralization under the aegis of the eschaton.

Enough for the 'why,' how about the 'how?' Perhaps the duality of why and how is also a part of the Cartesian legacy. We could posit a cosmic mitotic process of which the world is a construct for filling in the gaps. Each creature is responsible for maintaining and expanding its aspect of reality.

As co-creators of a shared reality, we maintain direct access to it, as much as we have direct access to our dreams. As far as a substrate is concerned, we might have no more need of that than Einstein had of the ether. I am tempted to posit that memory is access to the past. With a teleological backward creation the primary movement is from the Omega to the Alpha, and so the past is constructed out of our 'memories.' The eschatological meaning of history actually becomes the source of history. This is the most economical metaphysic.

Thus is epistemology subsumed by the ontology of creation with which we must continue to struggle.

.

| [Contents](#) |

rev. 8/17/98

Society of Mind

The Very Idea of It

There exist self-organizing memes or prehensions, which are internally related to each other. Mind per se does not exist. What exist are societies of thoughts.

A symphony is a society of tones. The tones exist only in the context of some musically structured idea. They can be taken out of context only to be put in some other meaningful context.

We too are memes that exist only in the context of a cosmic meaning. Our existence is impoverished to the degree that we are ignorant of that meaning.

From a biological perspective, each of us is just a society of neurons. There is a principle of holism that ensures that a society is more than the sum of its parts. The identity of the parts is dependent upon the whole.

Redness is not a thing. It is a placeholder in a system of meaning. Placeholders are not inert; they are officers. Redness has a mind of its own, otherwise we could not connect. When I am in a card section I can also be red, or blue. There is only one idea, which is refracted and reflected, but there are no mirrors or lenses. It is love all the way down. This is where understanding is pushed to its limit and beyond.

Yes, love is blue, odoriferous, and even numerical. Nothing exists beyond the light of love. On the edge of love are just shadows and shades. We have pushed love to its limit and beyond. This will be reconciled in the eschaton.

We are worlds within worlds that continuously re-circulate and reformulate, with and without time. We are our own ideas. We stop only in the name of love.

.

| [Contents](#) |

rev. 8/18/98

The Impersonal

The One True Vacuum

If the world is a unity it must be a comprehensible unity and so it must be personal. The truly impersonal is a vacuity. It does not matter.

One might suppose that mathematics epitomizes the impersonal. I would suggest that sacred geometry, for instance, provides evidence to the contrary. Numbers exist because we count. I am a constructivist relative to mathematics and to the world. The world exists only in as much as it has personal meaning for us. Comprehension is a personal act, rather similar to love for that matter. We comprehend infinity due to the infinite, transcendental depth of our spirit.

Science has worked overtime to objectify and depersonalize the cosmos. But the further we peer into the depths of reality, the more we plumb the depths of our spirit. We have transcended the point of maximum impersonality and alienation. It was a vacuity. The only thing between our personal God and us is our residual ignorance, or perhaps more accurately our dogged stupidity.

.

| [Contents](#) |

rev. 8/19/98

The Personal

It is Persons All the Way Down

It is one thing to say that reality is personal. It is rather more to say that it is only persons all the way down. That extremity must be embraced if we are to avoid the slippery slope back into the incoherence, the irrationality of dualism. What is the price? It is priceless.

Redness is not just something personal; it is a person. An artist must have carnal knowledge of pigments. A 'abstract' painting is a society of colors, which has communicated itself to the artist.

How many persons are there in a can of red paint? How many in a rainbow? That depends on who is counting and why. In love there is only one flesh. The atoms live in us, through us. How many are we? $10^{10} = 1$? That is the sacred number. The Israelites fleeing the Egyptians held up their outstretched fingers in defiance of their duodecimally bound captors. This was perhaps the epitome of all street gestures. And you say that numbers are an abstraction?

A person is a holistic system, and so is the cosmos and everything in it. Every part of the cosmos is a microcosm. This is also a holographic model. Everything is a system of meaning that is integral to the system of cosmic love or agape.

Like so many Atlases, we have been trying to hold the world at arms length, depersonalizing it. But like Atlas we grow tired. It will be much easier to embrace reality, to resacralize it.

.

| [Contents](#) |

rev. 8/19/98

Pagan and Christian

Agreeing to Disagree

Ironically it is Jesus who is the primary obstacle to reanimating the cosmos. The first coming necessarily and effectively drained the rest of the cosmos of its spirit, making possible the advent of science and technology, as we know them today. The x-event acted as a spiritual short-circuit, dimming all the other lights. It will take the second coming to reanimate the cosmos. Jesus is the light and the way but He was so bright that we were blinded. And none of this was accidental. It was the keystone of the unfolding cosmic plan. The dualism that most people ascribe to Descartes was really the 'fault' of Jesus.

But now with the second coming we come to our greatest challenge: an amicable parting of the ways. Reality is still too big for us to embrace individually so some of us will embrace the cosmos/nature and the rest will embrace the anthropos/Jesus. This is the separation between natural magic and artificial magic, between low and high technology. The mechanics of this separation, however, remain far from clear. Once we see the urgency, we will have ample time to work out the logistics, physically and spiritually. The decision as to the path can only be made by individual free choice to the greatest extent possible. This is the whole point of democracy.

By immanentizing the eschaton we are attempting to stretch this separation out over several generations. This separation is the most traumatic aspect of the eschaton. It is the subliminal fear of the separation that motivates our denial of the eschaton and the immaterial cosmology that is its context. This is a choice that none of us wants to make. The middle ground will be very sparsely populated. It will serve only as a communication channel. Only in achieving identity with the cosmos do we transcend the fundamental duality outlined here. There is a great deal more involved here than deciding on Sunday morning whether to go to Church or go out and hug a tree.

.

| [Contents](#) |

rev. 8/20/98

Losing Ourselves

Gaining the Cosmos

We have passed the point of maximum alienation, which is also the point of greatest individuality and identification with our egos. Our egos will survive but their light will be dimmed as nature and anthropos are reanimated. We have built up our egos by denigrating the world, mainly through scientific materialism. Again there is irony in the fact that Jesus served as the epitome of ego, as an important one of his very many functions. Modern ego developed mainly out of the romanticism that emerged from the x-event.

By coming to understand our magical, non-Darwinian roots we will be in a position to rework that magic to bring us to the level above human. Our consensus ego reality will devolve back into pre-prophetic, cyclical time, becoming unconscious relative to our super ego that will be split into its left and right portions of anthropos and nature respectively. The superego is the cosmos and it is epitomized in the first and second coming.

The super-ego will be our out-of-body experience. Our bodies will carry on in a passive state while we get on with our dual magic. The old earth will be the platform of the new heaven and new earth that we create. The population and technology of our bodies will then enter into a long decline back to a primordial, mythic state, completing the major cycle.

In dealing with cosmic cycles it is natural to wonder if our history is being retraced. Are we redundant? I think we should trust our feelings of not being that. But do we only go around once? What if we screw up, either individually or collectively?

We can be, we already are whoever we want to be. We are one flesh and one mind. Consider our 10^{10} neurons. Is there a Bill Gates or a Brooke Shields neuron? Probably, yes, in our holographic, worlds within worlds reality. But what does that mean in the greater scheme that is you and me? It is only a hill of beans to us. But you and I are also anthropos and nature. We have already been there and done all of that. The only way we might envy or sympathize with someone is because we have already been in their shoes. When you go to heaven you will be both Bill and Brooke, but you won't get to heaven until you realize that you have already been there, and that you never left except to go skin-diving in some body.

Do I make light of our suffering? If you are bothered by someone's suffering it is because you have also been there. If not, there is a long waiting list. We don't have to sweat the details because all of us already have. We worry these details because this is my first time and it always is. We are all virgins and all crones and always will be. If you want to know how that works you will want to study higher mathematics and stay tuned.

And are we screwing up? Always and never. What a miracle!

.

rev. 8/21/98

The Structure of Experience

Bootstrapping Existence

I have said that only one thing exists and that is the personal or the relational. One might say that there exist only social relations. What then is the status of persons and other entities?

Persons are self-organizing collections of experience. Nothing can exist prior to experience, and only meaningful experience can persist. Meaning supposes intention, which conceptually polarizes into subject and object.

When I experience something the personal meaning of it possesses me. These meanings are held together by my own meaning. My meaning exists in my relation to others. Our only real need is for meaning and this is satisfied in many ways. There are only so many conceivable meanings and we are identical to the degree that we experience the same meaning. It is that commonality of meaning that holds our reality together. The depth of meaning has to do with the number of experiencers. Meaning has no content beyond the dynamic relations of its experiencers, and this is all that we experience through the identity relation. In this manner existence is entirely bootstrapped.

Admittedly, the patch of green in my visual field seems nothing like a structure of social relations. That is the problem with sense data; they keep getting in the way of reality, but where would reality be without the data. Does the song exist for the notes or the notes for the song? Since there are notes there can be many songs. The single note is perhaps the nearly meaningless (?) intersection of all of its songs; an orphan begging for yet another song.

We distinguish between the sign and the signified, but if the world is a symphony, where are the signs? Combinatorics allows there to be a common current on whose waters we are but ripples. O.K., solitons then!

.

| [Contents](#) |

rev. 8/21/98

Combinatoricians All

Fission and Fusion

We all toil on the chain gang stringing and unstringing the atoms of reality. All of us are ciphers of reality. But there are no atoms and no ciphers. There are only relations and relations between relations. There is only the chain. Form is the only substance. Only meaning and no meanings. We know that from mathematical physics, but it is very hard to believe.

Reality begs to be sliced and diced and we readily comply. That is our bread and butter. But it turns out that every atom is a microcosm; is a flower in the crannied wall. There are no unobserved atoms. It takes the biggest machines and the biggest brains in the world to split an atom, and when they are finished we see the structure of the ‘Cosmos’ in their strings. We set out to split the atom, but it looks like the atom may split us into yin and yang, into nature and anthropos. Every time a photon hits an atom, our universe splits in two, or so they say.

If we ever turn from our Sisyphean labors, the cosmos will just collapse back into love. That is the eschaton. We must figure out how to harness that power of fusion, how to immanentize it. In some sense we already have, but now we need to be more deliberate about it. Now that every last bit of data has been digitized, the Internet will enable us to string it all back together into the big Tapestry. I’m doing my bit, what about you?

| [Contents](#) |

rev. 8/21/98

Bits of Reality

On Having our Cake

Why is reality so determined to shake itself to pieces? Is this not self-destruction? We are left with a trail of crumbs, which might or might not lead us back to reality. Let us examine the crumbs.

What we see are atoms, sense data and vocabulary. What are their features? Elementarity and commonality are the prime features. Is this a logical necessity?

Relationality in a space-time manifold requires communicability. Communicability requires commonality. Commonality requires elementarity.

We have a hard time imagining an unprojected reality. Mathematics, poetry and songs are partial steps in that direction. Intuition and telepathy also provide a more direct and holistic grasp of reality.

Commonality and elementarity also enable reconstruction. Reality shakes itself apart and we put it back together. We have to wonder how many times reality has been reconstructed and how many realities there are? This raises the problem of superfluity, which seems to detract from our supposed meaningfulness. 10^{10} is a lot of redundancy to begin with. We might suppose that redundancy and superfluity are two very different considerations from a cosmic perspective.

I am still inclined to believe that by sheer logic there must exist a maximally dense reality and that this world is it. Maximal density also is related to our AXO schema. I would have to agree with the Christians that the positing multiple x-events is oxymoronically pleonastic, if you get my drift. The entire significance of the x-event has to do with not being wasteful and not being wasted.

The demands of teleology might provide a solution to the paradox. We can of course construct realities Lite sans AXO, but we may have been drafted into the 'telic' construction of this world, which only appears to us as reconstruction. Rather like eating our cake and having it too. Who ever said that God was not clever.

Cosmic Drama

JFK vs. LHO

All of us experience various degrees of drama in our own lives. Otherwise inexplicable events have profound influence on our lives. Regardless of our outward spiritual orientation, it is difficult to dismiss the possibility that larger forces may play a role in such events. Similar events may also have a profound influence on history, and if there is a cosmic plan we have to suppose that larger forces are likewise involved. It is also likely that it will be difficult to distinguish between cosmic and conspiratorial forces. Each might wish to exploit or cloak itself in the other.

In our AXO schema, one would expect that the cosmic forces and conspiracies would be particularly active in conjunction with each of the three pivotal points. As we approach the eschaton, there would presumably be some form of preparation that would include deliberate clandestine collaboration on the part of the authorities. The latter day conjunction of the cold war and the ufo phenomenon would not then be coincidental.

The cold war would facilitate the installation of a global technostucture that would in turn be a precursor of a second coming. The outline of the eschatological plan would be revealed to the authorities on strict need to know basis. Their compliance would be secured with the judicious application of force. Thus a ufo phenomenon aimed strategically at the opposing militaries. The result would be to secure a global eschatological conspiracy preliminary to a public revelation.

I submit that the Kennedy/Camelot phenomenon was a key event in the end-time drama. It was the primary precursor of the second coming. It was a shakedown cruise and a calibration event to name just two of its functions relative to the Parousia. It significantly involved a deliberate and clandestine human collaboration in its execution. The CIA and the KGB shared the brunt of the collaboration. The twin foci of that collaboration were the Cuban missile crisis and Lee Harvey Oswald. The Kennedy family became aware of the conspiracy and their sacrificial role in it mainly after the fact.

The missile crisis served to solidify the international linkage of the clandestine collaboration. Oswald provided further refinement of strategy and communication, and his historical trajectory ironically is closer to that of the anticipated x2-event than the Kennedy trajectory.

In the LHO story one sees the interplay of conspiracy and synchronicity of the quantity and quality that would be necessary for the second coming. Its 'success' signaled the close of this penultimate phase of preparation. Relatively few of the participants were aware of the significance of this test beforehand. On the order of one thousand people are presently aware of the full portent of these events.

rev. 8/24/98

Meaning

The Primordial Impulse

The way for idealists to deal with the problem of epistemology is to circumvent it. Redefining the primitives does this. I take meaning to be primitive. I am talking psychology rather than semantics.

The meaning of life, which happens to be love, is the logically mandated primitive of all existence. The felt meaning of love is the force and organizing principle of reality. But must there not be a subject and object of love? Not with 'self-love.' Subsequent duality arises from and in support of that primordial impulse.

The primordial impulse might be more accurately be characterized as the mystical experience of 'cosmic union.' This impulse is highly resistant to analysis. This is the primary organizing principle for all of reality. This is the Alpha and the Omega and, of course, the x-event. It is the ground of being and the root of all existence.

Love exists, so we know that it is possible. If it is possible then I claim that it is logically mandatory since it is the motivating, organizing and creative principle par excellence. Give love a metaphysical inch and it will take over the cosmos, or, more accurately, it will create the cosmos.

Imagine a primordial chaos. What is it a chaos of? Mainly of potentiality and potency. It would be potential experience, that to become actual would have to be organized into something meaningful. Experience is polarized into a who and what only under the influence of the primal impulse as it actualizes and coalesces into felt meaning. Temporal terminology is being used only in a metaphorical or logical sense since time and space are not primal.

The primal polarity is between coherent actuality and chaotic potentiality. The push toward actuality is logically the ruling dynamic. Within that dynamic there will be 'cyclical' patterns.

The primal state is necessarily malleable with respect to the primal forces. There is competition between the various systems of organization. The most effective strategy prevails. But this does not mean moving pieces on a chessboard. Recall that existence is relational. The strategy is to facilitate relationality.

How does one thing come to relate to another? If we set aside spatial relations, then we must consider mental connections. The prototypical relations in this realm are that of thinker and thought, and experiencer and experience, but we are left with the dichotomy of subject and object. Another possibility for a primal relation is that of two subjects, each conjuring the other. Self-conjuration might be the more basic form. Even the strict materialist would be hard pressed to offer an alternative to self-creation as an explanation for the phenomenology of the self. The primal

entity could only be self-created.

Spontaneously generating selves would come to interact at a primitive stage. Mutual nurturing would be the basic expression of love. If that interaction were possible it would become the prevailing principle. There would arise 'families' of selves and so on.

We might wonder if we are just the lineal spontaneous descendants of such a process, or if we are somehow more contrived in the sense of there being some sort of ad hoc creation responsible for our existence. It seems reasonable that our remarkable apparent self-containment would have to be partially contrived. To just that degree we would be the creatures of a special creation, rather than simply being 'off-spring.' To what extent might any of these processes be usefully explicated? Do we need a metaphysics of love?

.

rev. 8/29/98

The Metaphysics of Love

Auto-hyperlinking

Our problem is similar to that of Einstein's attempting to explain light without the ether. We are trying to explain thought without mind. We could simply predicate a primal mind of God, but that is too easy. God could know his creatures, but how would the creatures know each other. There would have to be mind within mind or multiple ethers.

There must be a primal relational empathetic process. If intersubjectivity were not pre-existent, it would have to be invented. It is the same stuff as intrasubjectivity. It is one thing to posit a virtual experiential chaos, but how do we arrange for these experiences to organize themselves into coherence? If somehow there arise spontaneous foci of coherence, then we must arrange for these foci to interact meaningfully.

Clearly there is some discrepancy between the idea of a primal chaos and the principle of relational existence. There must be a means by which the chaotic elements can become internally related. We now suppose that this happens only within preexisting minds.

Perhaps we can use the present chaotic state of the Internet as a metaphor for the primal chaos; the idea being that the ontogeny of the Internet will recapitulate its metaphysical phylogeny. Effectively facilitating this outcome is the strategy of the Aquarium. To exist on the Internet is to be internally related or hyperlinked. Hyperlinking also acknowledges the Identity of Indiscernibles. Each website is a focus of coherence that also generates novelty. The II, or 'auto-hyperlinking,' then mandates relationality in the oxymoronic event of redundant novelty.

Let us consider the mechanism of generation within the experiential chaos. Alternatively we could posit the virtual preexistence of every possible experience, but where would we go from there? We would be faced with cosmic stasis. The primal need not be atemporal, but it should be transtemporal.

The generative process must be non-central and malleable. It would be non-random with aspects of intelligence. There would be latent coherence. We suppose that there would be generative foci that would become associated with selves. The selves would aggregate functionally.

What is the mechanism for sharing experience? How would the foci multiply? These problems may be related along with the issue of perspective.

Perhaps the primordial state does not have the above distinctions, but rather a range of related multivalent and multifunctional entities. Structure would arise out of these states through functional aggregation.

We need to characterize the primal generators. Each felt meaning would be integrated with its own generator. We should say that each felt meaning is necessarily generative. Does this then create a population problem? No, because the relational requirement and the II will minimize randomness and redundancy. An overall coherence is mandated. It is probable that the focus of coherence will shift on occasion, but that should not disrupt the overall structure.

The minimal possible existence appears to be a self-generating society of felt meanings. This is nice, but how do we account for ourselves, we being the microcosms of this cosmic society of meaning? Right now I am more concerned with the how than the why, although these two questions may be closely connected in an immaterial schema. Our existence is closely related to the fact of the space-time manifold and the eschaton. The AXO schema is in our blood.

Does not our population explosion threaten to run afoul of the II? The II may be our ultimate limit to growth, but what would be the purpose of pushing that limit? Numbers are not the issue at hand, which is the possibility of a microcosm. Perhaps we are the solution to the problem of cosmic self-knowledge. The cosmos is able to comprehend itself through us, and this may constitute the fulfillment of a metaphysical requirement to the effect that an idealist cosmos must be omniscient. Ultimately self-knowledge entails the participation of others, and in the cosmic case most of the participants must be microcosmic.

Why would the cosmos put so many of its eggs in the microcosmic basket? How great is this risk? I would suspect that, in point of fact, the microcosmic strategy is actually a move to reduce the overall risk, even though it may not appear that way to us.

We should see if we can get any clues from nature on the microcosmic strategy. We need look no further than our own bodies, which we know are societies of microorganisms. In our case the strategy serves several indispensable functions. However, I do not believe that we can put much stock in this analogy in attempting to solve our ontogenetic puzzle. In the case of the cosmos the organism is logically prior to the microorganism. However, it is possible that we might somehow be the lineal descendants of the proliferating foci of generative meaning introduced above. This possibility would bring us into closer alignment with the organismic analogy. In that case there would be less distinction between the cosmic and microcosmic level since there would be a multi-layered hierarchy of the foci of meaning. Each of us struggles to bring the meaning of our own lives into alignment with the cosmic meaning of love. We could do worse than this by way of understanding.

.

rev. 8/31/98

Our Holographic Connection

It is only Natural

In the previous essay I postulated that humanity is a subsystem in a hierarchy of generative foci of felt meaning. And earlier I have posited that our particular subsystem comes under the aegis of the AXO schema, which insulates us from the rest of the cosmos. We are arguably the largest subsystem in the cosmos, playing a crucial and indispensable role.

I have been liberally employing the concept of the microcosm, and I would like now to press the similarity between the concepts of the microcosm and hologram. In the previous essay I touched on the analogy between microcosm and microorganism or cell. Animals are composed of cells, any one of which could be cloned to reproduce the entire organism since each cell contains all of the genetic information of the animal. The case of the hologram is similar. Each piece of the hologram contains information from the entire image, but without all of the detail. Each person can be considered to be a piece of the cosmic hologram. Each of us can grasp the concept of cosmic love, but not all of its detail.

Language also has a holographic aspect in that the meaning of each word is related internally to every other word. All definitions are circular for the most part. Each of us represents a meaning that can be defined only relative to everyone else's meaning.

The relational aspect of all existence is paramount. The fact that humanity does seem to be isolated from the rest of the cosmos or lost in space, as it were, should be viewed as a contrivance, which is bound to end, and sooner rather than later.

The same observation applies to each one of us. Reality is naturally relational or holographic and each of us is just a chip off that block. It is not the holographic aspect that requires explanation, but rather the unnaturalness of things that appear to exist in isolation that is contrived and bears explanation. And the best explanation is that our isolation is an illusion to which all of us have contributed.

The eschaton is often anticipated as the epitome of an unnatural event, when in fact it signals our return to the natural state of much greater interconnection with each other and the cosmos.

rev. 9/1/98

Finitude

Hiding behind Love

The possibility of the microcosm implies the finitude of the cosmos. On the other hand, the transcendental nature of spirit implies the transcendence of all limits. How can this paradox be resolved?

We do see analogous conflicts between the finite and the infinite that are at least partially resolved within physics. The quantum places limits on the divisibility of phenomena. Relativity enables the universe to be both finite and unbounded. The ultimately personal nature of reality imposes its own limits.

The finitude of the cosmos is self-imposed and that imposition does not detract from its infinite possibility. The implication is that there is nothing substantial that is eternal, with love being the eternally possible exception. Any alternative has to be considered as a form of pagan idolatry and also as illogical.

The cosmos is personal and anthropocentric, we being the holographic microcosms. The personal center is finite and it is only love that can transcend the logical yet self-imposed limits. There is no external standpoint except in transcendental love.

The most difficult aspect of finitude concerns the AXO schema. This schema covers a linear time sequence of something only on the order of about 10,000 years of which we are rapidly approaching the end. Do we only go around this once? Yes and no.

Cosmic finitude and death are transcended only in the context of love and faith, and otherwise there is necessarily a cosmic censorship. We are the resurrection and there will be a new heaven and earth, but not even God stands outside of that process. There is nothing to prevent us from trying to imagine other AXO schemas, other than the implied self-contradiction. This is not to say that love cannot square any circle, but even fools like me can see reasons for not being able or willing to plumb those depths. Self-limitation may be the ultimate sacrifice of love. Beyond that lies only idolatry. We, like Moses, see dimly beyond the Jordan. Those who arrive there will not see us any more clearly. They will only know our love, and that is all they need to know. You might say that I am hiding behind love. So be it.

rev. 9/10/98

Crossing the River

View from the Boat

I would guess that WWII marks the beginning of the end. The Cold War was a holding action while preliminary human preparations could be initiated. Open and deliberate action follows.

We do not know how wide is the river that we are crossing. It marks the boundary between history and the beyond. We have only the dimmest awareness of what lies on the other side.

Despite many appearances, there is no concerted effort to turn back from this crossing. Those who might so act have not the vision to discern the situation. We are already caught up in the currents and well over our heads.

Cause no harm is a helpful guide in this situation. We need not and ought not to burn our bridges or our boats. Politics and economics will suffice as our self-transcending vehicles. Let us facilitate their transformation.

Let materialism run its foreshortened course. Ours is mainly an educational initiative. The means of production will continue to shift at an accelerating pace. Let us monitor that and intervene in only the subtlest fashion.

Let us be more specific. Through no great contrivance of my own I am a stockholder. Msft is my largest holding. Gates has been a central figure in decentralizing information. I could hope to do as much for spirit. But can the paradox of decentralism be avoided in either case? When will we have outgrown our need for the likes of Gates? We need a vision of the alternatives.

rev. 9/10/98

The Resurrection of Flight 111

Casting the Net

Sometimes it takes a catastrophe to put us to sleep; speaking teleologically, that is. Consider the “breakdown of the bicameral mind.” It may be true that it was the explosion of Thera that triggered the lateralization and individuation of our thinking. Looking at that prehistoric event from the perspective of final cause, it was a principal one of a myriad of public and private traumas in which there is a conversion between comprehension and potency depending on which way one runs the film of history. This is the dynamic of the ‘AXO’ schematic. This is similar to the mechanical cycle between potential energy and work energy, which is also reversible, but only when there are no discontinuities such as I am suggesting here.

The traumatic discontinuities seem to function as focusing devices. A mechanical analogy would be the eyelet in a spinning machine. If it were to be run backwards the eyelet would appear to be causing the material on the bobbin to be individuated into fibers. That is what happens with historical trauma: what was collectively unconscious becomes individually conscious. The traumatic events break open the smaller cycles to enable the cosmic cycle between the conscious and unconscious to be completed. The christ-event, more than any other, broke open the tribal cults and confronted the individual with a cosmic choice. This is the dynamic of the AXO schema that defines cosmic history. Reality is necessarily teleological, and that entails or requires a reversible $Cs \rightleftharpoons Ucs$ cycle.

I did not anticipate such a lengthy preamble to flight 111. The vicarious trauma of that crash has triggered a greater specificity in my thinking on teleology and time reversal. It has individuated my thoughts, enabling greater comprehension.

Such a cataclysm is a public interruption of the natural life cycle. Its apparent irreversibility is a stark challenge to the ordinary meaning of our lives. In order to comprehend its meaning or function we have to run the film backwards while observing from a cosmic perspective. But can we? Does that not violate logic? It violates only the logic of materialism.

Instead of AXO the schema is now O111A, where we are temporarily substituting flight 111 for the x-event and reversing time. In Omega there is comprehension. In Alpha there is potency. Comprehension evolves, but only after the self-containment of the latency in the system has been broken open. That is the insult. The necessary and sufficient insults are implemented teleologically. There is not a Deus ex machina. There is a Deus in machina.

I suggest a realism of the Present. The ultimate Presence is the eschaton. History evolves in our memories. History becomes present as the present projects itself retrospectively. This evolution of the ‘past’ transpires primarily in our collective

unconscious, while the historical events become increasingly present to us. At the Alpha there is a potent, unresolved, cyclical presence. The Omega comprehends and resolves all of history and the Alpha.

We are seemingly left with a paradox. The tape of history is being created retrospectively and experienced prospectively. Some philosophers have speculated that our dreams are produced and experienced in this same fashion. How else could the waking stimulus become meaningfully imbedded in a complex story line?

All I am suggesting is that the eschaton is our waking stimulus, and history is the retrospective story line. The eschaton then has 'already' occurred and history is just our groggy attempt to rationalize it. The telos very definitely wags the dog. The dream and the memory of it are not two things. There is only the artificial 'memory,' and ditto for history. The apparent direction of time is purely contrived. The world is indeed a construct.

The world is not created. It is what is caught up in the net of the eschaton. God is the fisher casting her net on the waters of forgetfulness. She and we are lifting ourselves by our own seine net. Each person constitutes one strand of history. The consensual moving present arises through the synchrony of public events. 'Irreversible' cataclysms are each a proxy for the eschaton. Flight 111 was another necessary proxy. Global communication of such events serves to produce the greatest response with the least stimulus. Hiroshima, the Holocaust and the x-event served likewise, each in its own way. The eschaton is the sum of its proxies. Each pushes us to align our own strands with the pull of the cosmic net. Without that pull we revert to the state of cyclical tribal unconsciousness which characterized the Alpha state. With that pull we revert to the state of global consciousness that is Omega.

What happens to those of us who suffer a premature 'awakening?' This is a question that often concerns the faithful. Each of us has cast his own line. God casts her net. Understanding is seen in the resulting tapestry. Grasp understanding and you become the Omega. Disseminate understanding and you become God. Would you have or be more?

.

| [Contents](#) |

rev. 9/18/98

On the Innocence of Wm. J. Clinton

Why Me, Lord?

If you had to cast a line, that of WJC would be as unlikely as any. Who would have made that bed and who would lie down in it? Why Bill? Or for that matter, why any of us, Lord? Which would you prefer – a seat on flight 111, or a desk in the Oval office? Are we quite sure that this is the best of all possible worlds? Wrong. It is the best of all possible histories. And therefor, it is the only history from anywhere to eternity. Poor Oedipus, he thought he owned the patent on tragedy. If he could see Bill now, he would probably have a jealousy complex.

History is and always will be. It is the only way to get from A to O. As the quantum mechanics say, it is the path of greatest constructive interference. All other paths are overwhelmed by its probability. We are left with the Presbyterians to contemplate the predestined meaning of sin.

Does the person make the sin or the sin make the person? As with Freud it works both ways because of the interplay between the conscious and the unconscious, which is related to the bi-directionality of time. Les jeux sont fait. God has cast her net. End of story. We are the story lines of her net. If one line broke the whole net would unravel. That is our factory warranty. It is good until the Omega.

I can go on in this vein until the end. That's when we finally get it. And none too soon. Hurry, Lord!

rev. 9/18/98

Foreseeing the Market

A Profits Prophet?

What better venue for laying bare the dilemmas facing a modern prophet? Is God a capitalist, or is she just going with the flow? Is there a future for capital? Even the Calvinists figured that money was at best a means to an end. But what is the end?

Perhaps the accelerating change is more than a portent. Perhaps it is an entering wedge for the eschaton. With such a force in the world, would God not choose to be its invisible hand? Perhaps we can discern the fingerprints?

Is economics a stepladder to 'utopia' that we can kick aside, or should we rather be facilitating its self-transcendence? Any kicking would have to be violent. Where is the continuity between the material and spiritual modes of production? Is Bill Gates Jesus? Not according to Janet.

Have I not said that the 'material' world will just fade to oblivion, once having served its purpose? Perhaps I was being needlessly dualistic? I have also spoken of the separation between the high tech and the low tech. If the new heaven is the high tech, then what is its techne? What is the ultimate distinction between magic and technology? If we are being visited, what is the techne of our visitors? How will this profit our spirits? It all comes down to vision and its practical implementation. It is finding the means that harbor the ends. We do need to reinvent or revision the wheel that is the economy. It's the economy, genius. And maybe there will even be a role for Monica.

| [Contents](#) |

rev. 9/18/98

Indra's Net

And the Modes of Spiritual Production

The problem being addressed is the continuity between the material and spiritual modes of production. This is of prime concern to us as we approach the spiritual transformation hoping not to suffer severe discontinuities in the process.

The most hopeful sign of continuity at this point is the developing Internet, which appears amenable to a virtual rendering of Indra's Net, and is in the process of redefining the modes of production as we are swept into an information economy.

Just how far can we expect technology to carry us into the spiritual transformation?

This goes to the heart of our understanding of how the material realm is embedded in an immaterial reality. I have said that our world is a construct. Does that leave it open to deconstruction? Some have suggested that the apocalypse of the transformation will take the form of a demolition derby. I disagree.

Because our world is and always has been spiritual from top to bottom, the transformation has more to do with our understanding than with the world itself. Furthermore, since technology itself is a spiritual enterprise at its core it is subject to reinterpretation and redirection along with our own lives. The only caveat here is that the redirection of technology may occur in the context of a separation of human society into a segment that is more concerned with the transformed technology and a segment that is less concerned. That demographic division would be the most traumatic aspect of the spiritual transformation.

In any event, these very large considerations must be taken into account in assessing and anticipating the economic and technological changes that are upon us.

The challenge is to anticipate the manner in which technology will take on an explicitly magical aspect. For instance, many have argued for the magical aspect of virtual realities, but I would not agree. I am looking for something that is intrinsic to the technology itself. At the present time it appears that quantum computing is the most likely venue in which technology could transcend its mechanical origins.

Another possibility already being developed is alternative medicine, but it is not clear to what extent technology will be an integral component of this field.

| [Contents](#) |

rev. 9/22/98

Quantum Magic

A Bridge to Immaterialism

In the eyes of immaterialism the entire world is a magical construct. Technology is a particular form of that magic and should in general be subject to whatever forms of mental manipulation the rest of the world is subject.

At the present time the best demonstration of magic is in the field of alternative medicine. I am referring to the apparent effectiveness of various psychosomatic techniques ranging from placebos to acupuncture.

Another realm where magic is alleged to be observable is in the paranormal field and this would include parapsychology. Psychology proper is purely magical if we consider it to be the domain of the psyche.

None of the above traditional realms of magic have a direct bearing on technology. Technology pertains to physical systems, which function according to precise laws. Any telekinetic interference with such systems would in the first instance result in malfunction.

Recently, though, a number of people have suggested that the quantum domain provides a likely channel for the mental to impinge upon the physical. Generally I have been reluctant to follow this line of inquiry because of its dualistic aspect, but for the same reason it may serve as a conceptual bridge between materialism and immaterialism. Pressing our luck even further we might hope that it could also provide a technological bridge.

Quantum computers would hopefully provide the leverage that would allow traditional technology to transcend itself. Even if that turns out not to be the case, we can use this possibility to launch an exercise in the economics of immaterialism.

Quantum computers might serve to amplify and test the ability of our minds to directly influence the world. They might also serve as probes of alternate realities. In either case they would provide a fundamental extension to the power and scope of the Internet.

The immediate concern is to see where and how the conceptual possibilities of QCs might be exploited economically. Perhaps even more important is to determine how susceptible the market is to ideas with metaphysical content.

rev. 9/23/98

Redundancy & Mathematics

Hology

Ultimately there exists only nothing and everything. These may be represented by 0 and $\{0\}=1$, respectively, but once we start the process of re-presentation we are headed down the path of redundancy, and mathematics follows.

The unreasonable effectiveness of mathematics is the measure of our alienation from $\{0\}$. But math can only go half way into alienation before it begins to implode under its own weight back into the $\{0\}$ of its origin. The imminent meaning-centered implosion of the Internet will be a related virtual eschaton. The AXO (OXO (8)) schema is what redeems us from our redundancy.

Mathematics is the logic of redundancy. It is that largely unconscious logic which will keep the airplanes flying for as long as we need them. The prospective unified field theory of physics is emblematic of the implosion that awaits us at the eschaton. This is the implosion of hyper-synchronicity, which will evidence the holographic basis of our world and which necessitates the UFT.

Redundancy is a measure of our ignorance. Logic is what fills and supports the vacuum of our ignorance. Science deals only with the logical hall of mirrors that is our reflected ignorance. The implosive unification of that logic will be a significant part of our apocalypse.

Nothingness can only arise in a singular fashion from our minds as an unconscious construct of logic, whose singularity we discover only after the fact. It is an aspect of the final causation of the world.

Technology and economics play a necessary and multifaceted role in the construction and 'deconstruction' of the redundancy of the world. It is our job to facilitate the end game.

Quantum logic is where the dictates of classical logic begin to give way to anthropology, leading us back from the nihilism of pure science. QL shows us the holography of the cosmos and its absolute non-redundancy, pointing finally to Christology. Quantum computing will be the minimal technology of our redemption. Don't sell Lucent short, in other words.

rev. 9/23/98

The Logic of Love

Did God Have a Choice?

If our world is a necessary component of the best of all possible worlds, then to that extent God had no choice in creating the world. Even the saving of the world becomes a necessity. But this is just the skeleton of our world. Its flesh is God's love. God is in the superfluity of the world.

Ours is an island universe. It is a coral island emerging from the deep blue. Our consciousness is the living flesh of the island. Ours is the only island save a few archipelagoes from whence come visitors.

What will happen to our island at the eschaton? Will it dissolve back into the ocean – be blasted like a bikini? No, because no one is an island. We face the final logic of continuity. There cannot be dissolution, only subsumption. This ought to have considerable economic significance. Economic continuity is important. The eschatological Jubilee will not entail the collapse of capital. The economic frame can only be transcended.

Ditto for the rest of physics. This is not to make life easy for capitalistic physicists (like myself?). This is just letting nature take its course. This is the form of the harvest. Everything is used, especially the squeal. The eschaton may be more subtle than we imagined, but certainly no less significant or final – only more so. There will be no unfinished business. This will be a wrap.

Logic is the way in which love is able to hide from itself. If logic did not already exist then we would have had to invent it and we probably did anyway. Our skeleton may constrain our movements, but it sure gives us a lot of leverage. Logic's crannied wall gives purchase to both weeds and flowers. Its lagoons give shelter from God's passions. Its estuaries are a breeding ground.

Are there other logics? Sure, but they barely hold a candle to this. We have cornered the market in ignorance and stubbornness. The depth of our logic takes most of the credit. There is no logic like anthropology. This is the great attractor. If we were beyond the pale we would be less entrenched. We would be the visitors. We would be sniffing out El Nino with the best of them. But no, we are the dog in the manger. Let us be glad.

There is a logic to karma. God's love will save us by solving it, not by dissolving it, although the outcome might seem about the same. How does one solve the karma equation? It takes some subtlety, as we will see. It has something to do with Godel's theorem and a lot to do with the x-event, no doubt.

rev. 9/29/98

Grand Unification

It Could even Overcome Separation

On occasion I have speculated that the increasing fragmentation of scientific knowledge could hasten the advent of another more coherent paradigm. On the other hand, the progress toward the unification of physics can be taken as evidence that the world is a mental construct in the sense that mathematics is unreasonably effective. Recent developments seem to be favoring the latter alternative, which I will now examine.

Over the last few years theoretical physics has been making some spectacular advances toward the ultimate unification of the fundamental forces of nature. The progress is such that it is even providing further impetus to the unification of various branches of mathematics. All of this should be grist for the philosophical questions concerning the nature of physical and mathematical reality.

Pythagoras is credited as the first to suggest that reality has an underlying mathematical structure. When this fact is not simply being taken for granted, it is often given a mystical significance as I have indicated on several occasions.

Further advances in mathematics and physics might push us right into immaterialism. The physics would show that the world is a mental construct and the math would show us how to manipulate that construct more directly. It would be an indisputable case of mind over matter. Coming about in this fashion, the new paradigm would also help to maintain the technological and economic continuity that is suggested by the teleological orientation of our world.

An outcome of this nature, by further underpinning the continuity, would help to alleviate if not obviate the problem of separation. The greater emphasis on the purely mathematical could lessen and eventually eliminate the disparity between high and low tech.

rev. 10/1/98

Where are the Laws?

Where is the Key?

We are faced with the same problem that confronted Plato and Kant. To oversimplify, Plato would put the laws in heaven, while Kant would place them in the mind, and many scientists would simply posit them in nature. We might suppose that this ambiguity of location would not exist if it really mattered, but it may determine our destiny.

The problem is that of transcendence. Is there or ought there to be a way out? This is a question of limits. What limitation does the world impose upon us, and what recourse do we have? Are we the prisoners of nature? Is there a court of appeal?

I have supposed that the world is a mental construct and that if we got ourselves into it we ought to be able to get ourselves out. Or have we dug ourselves into a hole? The way in is probably not the way out.

Most observers would agree that with regard to nature we are misfits. And furthermore that this is not just a recent aberration. Despite all the evidence of 'natural' evolution, it is difficult to deny that somewhere in its dim past, humanity left the reservation, we passed a point of no return. There are radical ecologists who believe that we can and must return to a pre-historical state of nature, but they have no plan short of cataclysm.

Pace the deep ecologists, it is difficult to suppose that God would have given us two hands and silicon if she did not intend for us to make computers. Computers seem to be bringing us to the banks of another Rubicon, but it is difficult to discern the other side.

Computers with their promise of cyberspace and virtual realities are pushing the envelope of natural law, but they seem to fall rather short of being chariots of the Gods. The human spirit refuses mere blandishment.

We languish at the gateway to our dreams. We look for a hidden entrance. I have previously discussed the probability that there already exists a sequestered stargate. How could there not be if the world is what we imagine? The only question is how to storm the gates of heaven. To do that we need to understand their construction.

Our dreams and imagination readily transcend the dictates of nature, but we also know to be cautious about what we wish for. We may inhabit a cell, but it is a padded cell, and in the larger cosmos those pads may not exist. Imagine all of our self-destructive tendencies suddenly being given free reign.

Most of us would agree that we will need to take baby steps; we will need

continuity. Unless that continuity has been providently built in to nature we will be in trouble. We must trust in the providence of teleology. There is no other way out.

All that we have to worry about then are the details, but we can still work at the puzzle from both ends. We work on understanding the bigger picture and figuring out the details at the same time and gradually everything will fall into place.

Once upon a time reality was more fluid and more permeable, but the demands and habituation of civilization have led to the present state of rigidity and to the apparent precariousness demonstrated in the anthropic principle. We do not see many loopholes. The quantum realm presents one possibility. We can imagine that cyberspace could be supercharged with quantum computers. The quantum might provide a conduit for our minds to participate more directly in the reshaping of the world, or in the exploration of others. We can reasonably suppose that there are other realities and that we should explore them before venturing to construct or reconstruct our own. Such mutual exploration is likely ongoing, albeit in camera. Quantum information conduits might be sufficiently indirect so as to allow imminent public participation.

The possibility of other realities challenges our understanding of this reality. How might they connect or communicate? That they must do so is a given for a relational and immaterial cosmos. Our present degree of isolation is unnatural and unenforceable.

Yes, we might visit in an out-of-body state. But even so, what degree of strangeness could our minds comprehend or withstand? Would our identities be at risk of terminating? Our apparent facility with virtual realities provides some room for optimism.

I have supposed that our world is distinguished, if not unique, in its impermeability. This feature relates to the degree to which its phenomena are permeated by mathematical forms. It has to do with its atomicity and analyticity. Virtual realities may be modular or object oriented, but are non-atomic. This restricts metabolism, which is the basis of our intra-connectivity. Perhaps there is a trade off between intra- and inter-connectivity. Do we have to sacrifice one for the other, and if so, how? How can we ignore atoms in our rush into quantum cybertronics?

God is said to be in the details, and VRs are noted for their lack of same. Object orientation is easy on the programmer, but tough on the processor. Every object has to be second-guessing its situation. It has to calculate its every move. How do atoms manage so easily? If they are our figments then our imaginations must be overworked. On the other hand, all the computers in the world are unable to calculate the topological dynamics of the smallest unit of the Plank vacuum. Things can't be as difficult as they seem.

Experience is nothing if it is not minimally consistent. A minimal facility for self-

organization within the experiential, teleological manifold could go a long way toward ensuring a meaningful world, a world that could even contain atom-smashing experiences when pushed to its limits, as we have certainly managed to do. Meaning is nothing without the appropriate company. Every meaning is naturally gregarious. That is all that is needed. We just need to become better oriented to the telos, because that is the source of our meaning.

The problem is to translate teleology into technology. Our technostucture is where we are most dependent upon the dictates of physics, while at the same time it is the primary locus of change. Is it not just pushing us deeper into materialism? How can it be turned around without disruption?

This brings us back to unification. Unified field theory is the principal artifact of our intellectual history. Surely its apparently approaching completion portends the telos, and the theory itself must even anticipate it. Where else could lie the key to transforming scientific materialism? Is the key obscured in the intricacies of the mathematics, or is it not more likely to be in plain sight?

rev. 10/2/98

Islands of Knowledge

Ocean of Ignorance

Recent developments in math and physics lend some credence to the perennial speculations on the unity of knowledge. Let us examine its possible import.

On other occasions I have remarked on the irony that the unreasonable success of science could undermine its own materialist assumptions. If science is too successful it fosters the idealist notion of mind over matter. Of course, it is very difficult to determine what is unreasonable in this regard.

The possible unity of knowledge would pose a remarkable challenge to ontology and epistemology. From whence comes this unity and how are we able to grasp it?

How could both the world and we be so rational? This puts a severe strain on the materialist notions of an accidental evolution in a meaningless world.

Where the trend toward unity probably faces its greatest challenge is in the psychological arena. We find there a seeming duality between reason and emotion, or between the abstract and the sensual. The bridging of this gap or gaps would acquire a greater urgency if we were to see further unification on the part of our mathematical and scientific abstractions.

The prospect of unity should be encouraged by the power of aesthetic intuition that is amply demonstrated on the part of mathematicians. The recent successes in that arena have been motivated largely by conjecture. Some of these conjectures were supported by calculation, such as with Fermat, but this is much less the case with Taniyama or with Langlands' larger program which provided the guidance to Wiles' final assault on Fermat.

What are we to make of our aesthetic intuition? What do Mozart and Taniyama have in common? We do see that passion can run deep, right into the depths of the atom and the cosmos as Einstein discovered. The only passion left out of this picture is the x-event. But can we believe for a nanosecond that that omission is due to anything other than our ocean of ignorance? This omission will be remedied. That is my conjecture.

rev. 10/8/98

Psychological Unity

Without Mysticism

Let us consider the indications of unity in the psychological realm.

- Unity of consciousness
- Universals of aesthetics, reason and conscience
- Continuity of personal identity
- Versatility and resilience of the mind
- Apparent relative coherence of the world on all levels
- Increase in the perceived gap between natural and artificial intelligence

However, rather than using this evidence as an excuse to turn toward mystical holism, I would suggest a turning toward a mathematical holism in our endeavor to shed additional light on the mystery of the mind.

In this regard it is noteworthy that the unification in math and physics is being made through the use of principles that have holographic implications. That the foundations of mind and world appear holographic indicates that the explanation of the unity is built into its form, as we should expect.

rev. 10/9/98

Welcome to Mind Space

Where everything contains everything else

We have been surprisingly reluctant to apply our mathematical tools to psychology. Our protracted materialist biases have constrained us to the application of mechanical analogs to our minds. The analog of choice has been the switching circuit. This choice enthrones biology and neuroscience at the expense of psychology. It is reductionism at all cost.

Let us be candid and say that from an immaterialist point of view, the fact that our skulls are filled with gray matter rather than with sawdust speaks more to propriety than it does to necessity or to reality, for that matter. So if we want to get to the point of existence, we need to put aside these stage props. Admittedly this does leave us suspended in air over an abyss, but this should be no problem as long as you don't look down. Oh yes, and welcome to mind space!

And what is mind space? How does it differ from gray matter or sawdust? Naively it is a place where ideas can float around. It is decidedly not located in our skulls. It is nowhere and everywhere. How do we distinguish between the idea and the space? There is no substance, it is all form. Ideas are similar to mathematical objects of various sorts existing only relatively. Words are then like the numbers that might label these objects.

Mind space is holographic, and each of us represents a part of that hologram which is projected into consciousness as the consensual world. Mind space is also infinitely dimensional like Hilbert space where each of us and each idea would appear as a ray. There is symmetry between persons and ideas, which is broken in a developmental process. Keep in mind that consensual time is only a derivative dimension.

Ideas and persons acquire baggage in the form of increasingly dense relations that have to be shuffled about. Remember that all existence is purely relational. Mind space bootstraps itself, as do the cosmic bubbles in the inflationary big bang. Ideas possess persons as much or more than persons possess ideas. These mental objects interact as do knots or solitons in 'physical' superspace. These objects, i.e. persons, ideas, etc., take on lives of their own, constantly reorganizing as the cosmos recycles. The life impulse is a fundamental ingredient of this dynamical space.

Every object is a holographic microcosm in that it must contain every other object. Projective dualities abound. God is the circle whose center is everywhere.

Obviously we are a long way from developing econometric models of mind space; however, we could make much better use of the mind games enjoyed by mathematicians and physicists.

As for the eschaton, we should be expecting a phase change in the weather.

rev. 10/9/98

A Handle on Mind Space

Wading in the Ocean of Ignorance

One way to get a handle on a slippery object is to ask an impertinent question of it: If ideas are like mathematical objects then what is the difference between a circle and the idea of a circle? The answer is none at all. The problem arises in contrasting a particular with the universal. If I am seeing or visually imagining a circle, how does that particular circle differ from the universal Circle? The difference is much less than you might think. For an immaterialist there is little distinction between seeing and thinking. To think about something is to attend to it in some context. You can think of me as a Platonist without the cave. The cave is just in our imagination.

There are circles, ellipses, loops and hoops. Which is the real Circle? They all are to a degree. A circle contains the idea of a loop and vice versa. Every idea contains every other, to a degree. This is simply the doctrine of internal relations. I do not have a mathematical model for internal relations at the moment.

How would a hula-hoop in my basement relate to the Circle? Well, it partakes of circularity, of inertia and of location. The latter two attributes are distinguishing, but they need be no less ideal. What holds these attribute together and in place if there is not a material substance? Surely there is a distinction between a substance and its idea. If there were it would be very hard to discover. Every idea has some sort of substantiality and locatability. Are there more hula-hoops than there are Circles? Every idea partakes of numericity, it depends on the context.

The relation between hula-hoop and Circle is not unlike the relation between person and God. Each contains the other. Which one seems more real can depend on the circumstance and perspective.

The external projection of 'physical' space and time will be central to our understanding of mind space. We should not doubt that there are many ways to skin this particular cat. With mathematics there usually is an embarrassment of riches. There are also extremals. There is incarnation and Incarnation. We are only wading in the ocean of ignorance. There will be opportunity for swimming. (10-9-98)

Let's do a retake on the circle problem.

On the one hand there is an experience, and on the other hand there is a possible mathematical description of the mental dynamics of that experience. One would suppose that I could experience the description without having the experience, although it is possible that I could not correctly understand a purely mathematical description without a partial recall of the actual experience. In other words it could be that I would look at a

novel mathematical object and then recognize the experience to which it corresponded. It might also be that there is a unique correspondence between every mathematical object and every experience. With this new understanding would come a decisive shift in consciousness.

It is even conceivable that every integer could function in this manner, to the extent that, as we seem to be finding in number theory, every integer can be associated with a unique, non-arbitrary mathematical structure. Questions concerning the countability of significant structures would have to be addressed.

Elsewhere I have stated that all mentation is based upon feeling. If that were the case then there would also have to be an intimate relation between math and feeling.

Normally one makes a distinction between form and substance or between structure and content. But if there were going to be an ontic and epistemic unity then one would have to posit that it is structures all the way down. This is possible.

Allegedly mathematics is reducible to pure logic. By the above arguments it ought also to be reducible to feeling. How these two reductions can both be carried out is beyond my present understanding, but it need not be a contradiction. Perhaps it is the case of transduction versus reduction.

It should be noted that, ironically perhaps, the challenge facing the monistic idealist is not entirely unlike that facing the materialist or now the functionalist. At least we can sympathize.

Later I hope to take up the role that quantum computing might play in shedding light on these difficult issues.

(10-15-98)

P.P.S. If a color-blind mathematician were to examine the mathematical structure of color experience, would that person have a color experience? Perhaps this question is undecidable. Can color-blind people imagine colors they can't see? Can the rest of us? Perhaps there will be cognitive restrictions that correspond to the sensory restrictions. One would have to consider the typology of the restriction.

One might say that in the more intuitive mathematics of the future, the mathematical structures would necessarily be more self-referential. The Godelian arithmetic would have to be greatly ramified.

Obviously there are some semiotic issues here that will need elucidation.

rev. 10/17/98

Aquarium Update

The more things stay the same, the more they change

The Aquarium has been quiescent these last several months. You may recall that the last substantive issue to come before the aquarium concerned 'phenomenology' and the role of the government therein. Inquiries in this direction eventually led to a stonewall. This matter awaits a more opportune time.

In the meantime I have been relegated to pursuing a more mainstream inquiry. Specifically I have been considering the economic and philosophical implications of 'unification' on the scientific front. The best prospect of extending the unification impulse seems to lie in the direction of quantum computing. More on this in subsequent communication.

Certain aquarium-related items have, however, come to my attention. Most of these have to do with NIDS, for some reason.

NIDS has recently published a roster of affiliated individuals. Rumor has it that there are blatant omissions. Only two avians are identified. There are several others who play significant roles.

Of late, at least two well-known philanthropists have participated in meetings at NIDS. These meeting included displays of alleged alien implants.

This organization continues to annoy Ron with its secrecy and with the contradictory nature of its visible actions. In short, there is a conspiratorial concern on the part of this intelligence officer. He has suggested that a significant shadow player is GN, who has a long history in such affairs.

It was announced recently that some new documents relating to MJ12 have surfaced. The probability of a continuing hoax is high, but so allegedly is its quality. This fact would point in the direction of a continuing concerted disinformational effort, which makes it of interest to the aquarium. It should be no surprise that the individuals involved include another prominent NIDS omission.

The more things stay the same, the more they change.

I almost forgot that another probable NIDS Omission with Raven/DARPA connections is also hot about quantum computing, just to bring us full-circle. Perhaps I should apply for NIDSO status?

rev. 10/15/98

Quantum Computing

Going with the Flow

I would consider that the possibility of significant quantum computing would entail a welcome step away from the brink of eschatology. But that is not to say the subject is devoid of eschatological implications. I would certainly hope not. I see this as a convergence zone for many developments, including even in eschatology, and as such it will be difficult to untangle the many issues.

The promise of quantum computing is seen in the fact that until very recently it was considered to be an oxymoron. The fuzziness of the quantum was seen as the ultimate obstacle to indefinite increase in the power of computers. Well, one person's fuzz might be everyone's gold, if the early returns are to be credited.

It is just here that the metaphysics appears. It is my hope that the otherwise apocalyptic paradigm shift to immaterialism can use the quantum computing loophole as a back door entrance to the mainstream of our technoculture. We would thereby avoid a dramatic confrontation. In the short term, our closest encounter with the eschaton would be ameliorated without, however, changing the larger consequence.

I have been ambivalent toward the quantum. It is too easily construed as evidence for a dualism of mind and matter. However, with the resistance to outright immaterialism showing very little sign of cracking, a conceptual detour through quantum dualism might be just what the doctor ordered. This intellectual detour might actually be a shortcut around a lot of unnecessary turmoil. I readily admit that my own intellectual development took this same detour. But what then seemed like wasted time might have expedited my subsequent conversion to immaterialism. This detour would provide us aquanauts with additional time to get our stuff together. On the other hand the *faux* dualism will complicate an immaterialist prognosis of the developments, and that prognosis will be the key to any economic strategy on the part of the aquarium.

rev. 10/15/98

Quantum Duality

A step in the right direction

When the intellectual promise of scientific materialism had worn thin for me, it was initially the quantum domain that held out the hope of a step beyond those confines. All the laws of physics were expected to operate within the quantum domain. It seemed a small step to suppose that the laws of psychology could operate in the same domain. That domain could be the modern equivalent of the Platonic realm of ideas. In fact, the mind itself probably dwelt behind the vale of quantum 'randomness.' It was the quantum that solved the Cartesian puzzle concerning the connection between mind and brain.

After several more years of resisting the obvious, what I eventually learned was that once you let the mind get its foot back in the door of scientific reality it will inevitably take over the whole 'hood. Once we ascribe an independent existence to the mental realm, the only thing left of matter are all those scientific abstractions which may as well be taken back into the minds from which they sprang. This is how the rug is pulled from under the scientific world-view. This is how our world is turned inside out. It just took a little quantum oil to grease the skids. To convert a significant portion of the scientific community it will take some striking developments in the quantum arena to prime this metaphysical pump. That is what I wish to facilitate. With the economic possibilities attached to quantum computing, it may also be a question of putting money where the mouth is.

| [Contents](#) |

rev. 10/15/98

Quantum Convergence

Dualism vs. immaterialism

Consider the mounting evidence for a conceptual convergence on the quantum zone. What we see most prominently are two apparently disparate developments. The most obvious is the continuing progress toward a quantum interpretation of gravity, which is still the missing link in the unification of physics. The second development is the continuing turn toward quantum based explanations on the part of the consciousness research community.

A less obvious connection is with the recent proof of Fermat's last theorem. That proof holds out the promise of a more unified mathematics especially in areas that pertain to the unification of quantum physics.

The consciousness researchers have not yet absorbed these other developments that reinforce their hunch about the quantum basis of the mind. The perceived structural richness of the quantum domain is being expanded by the unification of physics, while the more powerful mental tools of the mathematicians are increasingly penetrating that domain. Our minds are beginning to legitimize their place in the world. And then along comes quantum computing.

A naïve dualist might hope that a quantum core would finally provide computers with consciousness and the long sought natural intelligence that goes with it. But she then might wonder who would compute if computers could scream. Who indeed?

It has already been demonstrated that quantum computers can perform some operations that are unfeasible for their digital cousins, including solving a whole class of problems that are digitally inaccessible. The leading theorist of quantum computation effectively argues that the power of these machines derives from their ability to tap into an infinity of parallel realities in the course of their computations. He is utilizing what has become a nearly standard interpretation of the quantum superposition principle. But even this is not dualism.

A dualist who was not squeamish about possible ethical issues might consider using a quantum computer to tap into the mental realm to extract information from it that might not be accessible to our own minds. God knows what might be out there. At the least he might hope to explore mathematical structures not yet even dreamt of – structures that might make fractals look tame. By exploiting the quantum links back into our own consciousness, we could launch ourselves directly into these alternate realities with our quantum computing backpacks. Cyberspace would take on a whole new dimension.

An immaterialist might be a bit more cautious. She would point out that we already exist in the cyberspace of the cosmic mind. Normal reality is just our

current mode of dreaming. At best, quantum computers are just a dreamed up surrogate for real transcendence.

My own take is both more pragmatic and more hopeful. This dream is bigger than all of us so let's go along and see if we can use the historical momentum behind the technology to leverage and to mainstream the eschatological charism of our awakening. We will have to do our best to expand the thinking of the dualists, which would likely dominate the initial endeavor.

rev. 10/16/98

Quantum Harbinger

And the Second Coming

Many folks will miss the choirs of angels, but you don't have to think too hard to appreciate the subtlety of using the quantum computer as the harbinger of our transcendence. And we might still be able to negotiate a respectable Second Coming.

Taking the quantum route is definitely using the back door for the Second Coming, but remember that this is to be like a thief in the night.

The quantum computer appears to have been designated as God's Trojan Horse. This is how she sneaks past the authorities. By the time we understand the trick it will be too late.

We are substituting the quantum computer in place of the public disclosure of UFOs as a trigger for the eschaton. The UFOs will continue to do their clandestine preparation work, not publicly revealing themselves until after the QC and JC have done their business. This is how we maximize continuity and minimize the effects of the apocalypse. Be glad.

The QC will set the stage for JC. That will require a command performance on both of their parts. The QC will have to do two things. It will have to be sufficiently useful to justify its penetration of the digital markets and networks. Having established itself as a workhorse, it will then have to show its colors as a Trojan Horse. That will open the door for JC to explain what is going on and what will then come to pass. The details may still be up in the air. We are open to suggestions.

| [Contents](#) |

rev. 10/16/98

Semiotics & Structuralism

Recall that there is concern with the epistemic and ontic roles of mathematics. We were hoping that mathematics would provide a handle on mind space, in a fashion that would allow the technostucture to participate in an otherwise discontinuous transformation to immaterialism that might take on the aspect of dematerialization – something to be avoided. The conceptual and economic roles of quantum computers were suggested as a vehicle for the participation.

In the process of examining qc's I came across the 'semiotic interpretation' of qm. This might be helpful in better defining the semiotic potential of math.

A personalistic immaterialism would likely suppose that thoughts are largely reducible to felt meanings. If there is to be a significant semiotic role for math, then its constructs ought to be similarly reducible. Naively this seems unpromising. Perhaps there is some misapprehension concerning the nature of reduction. In a purely relational world everything should be mutually reducible to the extent that anything is reducible.

Psychologism and intuitionism as applied to math are only a small step toward feeling. It could be that mind space is irredeemably heterogeneous. There is no common basis for its phenomena. What then is the basis for unity? The source of unity may lie in the transcendental domain. That light is then broken into myriad colors and shades as it is refracted into 'matter.' There is no subconscious, only a unified supra-conscious.

The mathematics describes the continuous ramification of the original source in all its possible variety. Historical time is another dimension of meaning. There can be only structure because actual substance would obstruct the return cycle. The substance is only our ignorance. The structure is purely relational.

If a math-structure program is to succeed it will be necessary to show that color is not elementary. Even from an evolutionary perspective, color vision appears relatively late and would likely incorporate other pre-existing cognitive structures, or so would argue the functionalists.

Be clear that this structural program is not reductive in any usual sense. Our common currency, our lowest common denomination is cosmic love. Love may be blind but evidently it need not be color blind, speaking only literally, of course.

We tend to suppose that color is gratuitous and arbitrary. Those who are color-blind can manage very well. Yes, but color and its lack can be integrated with the structures of meaning, as is more obviously the case with olfaction.

.

rev. 10/22/98

Cutting some Slack

The How & Why of Symbols

At this late hour it occurs to me why there should be material in an immaterial world. Without matter we could not construct symbols. Without symbols we could not communicate. Space and time are required to allow us to manipulate symbols. Only with the void and externality of space and time is it possible for one thing to represent another.

If in heaven there were no accidents there would be no externality. There would be only internal relations. There would be a spiritual plenum, or an over-determined spiritual ecology, if you will. This would be experienced as the direct mystical vision of God. There would be no room and no need for symbols or representations, because everything would be fully present. This is not where we are, not in our normal state of consciousness, at least.

We occupy the regenerative portion of the cosmos, and to carry out that function we must have the space and freedom to rearrange the furniture of the cosmos. This we do with symbols until we are ready for the metaphysical re-creation commencing with the eschaton.

Indirect perception can be very frustrating. Our indirect perceptual aparati are susceptible to all sorts of (mis&dis)information. That is the (small?) price that we pay to carry out our cosmic function as the creators and manipulators of symbols. Color is one of the many freebies. Imagination is another.

Mathematics serves as the science of symbols. It provides formal systems of rules for manipulating symbols. Language is our informal system. These rules describe possible systems for a plenum that we might aspire to create.

The hope is that mathematics will serve as a bridge between the objective and subjective aspects of reality. As of yet, not a single point of contact with the experiential can be claimed. The nearest possibility appears to lie in the domain of quantum logic. This at least is the hope of several consciousness researchers.

Know thyself. This is the ancient prescription. This will not happen until mathematics can be expanded into the experiential domain. Mathematicians succeed to the degree that they can appropriate the structures into an intuitive repertoire. This is a good indication that mathematics involves more than just a superficial manipulation of symbols.

Our need to manipulate symbols accounts for much of our mathematical skill. That need may also account for much of our physics, looking at the world teleologically. What is not clear is how the mathematics comes to be so deeply embedded in these two domains, namely in physics and psychology. An idealist

might well suppose that the physics and psychology have evolved in concert.

The presence of deep and complex mathematical structures indicates that the core of our reality was somehow preexistent. There is no reason that we should have had to reinvent or re-evolve these structures. They are the closest thing we can imagine to a cosmic language. The fact that previous attempts at integrating mathematics and natural language have largely failed is not a reason to abandon the project. I can again point to quantum computers as the most likely impetus for this project in the near future.

Mathematical structures appear to subsist in domains that are usually remote from our attention. One might say that they take up the slack in the cosmic mind space. They keep the world running smoothly at night. They also provide the optimal space for our projects.

Mathematicism is a bad word for some people. Pythagoras was the first mathematician. He believed that numbers governed the world. Spinoza was a Platonist and so was Einstein, and Plato was a Pythagorean. The problem is that some people think that there is not room for love in a universe that is run by the numbers. Fear not. It all works out. It is our job to work it out. Will there still be room for poets? Obviously I am trying to figure out how to add a little math to this poetry. Quantum computers will help, but God is not a quantum, she is just a good ol' girl.

Doug Hofstadter was in my freshman dorm, and his Dad was my adviser. He has done as much as anyone to combine math with poetry. We will have to do a lot more, but no one else is trying right now. We can do whatever we put our minds to, all that we need is the motivation, and from where will that come? And that is a rhetorical question.

.

rev. 10/23/98

Microcosmic Model

A Mathematical Starting Point

The greatest challenge for any metaphysical scheme is to explain how each of us is able to possess or access an effective model of the world. This is the problem of the microcosm. Surely, all of our mathematical knowledge ought to provide us with some clues as to the structure of the relation between cosmos and the microcosmos.

Holography provides an intriguing optical model, but it would have to be greatly expanded to touch upon the dynamics and generality of our mental maps. Any such expansion would have to rely mainly on pure mathematics. If there were to be room for physics it would likely involve models for quantum computing.

Preliminary to mathematical modeling there must be a concise account of the metaphysical problem. This first step would be crucial, but in the early stages there may be considerable back and forth between the mathematical and metaphysical modeling.

To the best of my knowledge, the scientific community has barely even a clue as to the structure of our mind maps. Cognitivists place this problem in the area of natural intelligence. The only serious modeling of natural intelligence comes from the discipline of artificial intelligence. There the problem is to transform vast databases into a workable intelligence. Computational brute force is the only strategy to-date.

How do you put IQ into a machine? Where is the program that will enable a machine to transform data into knowledge? It has recently been learned that the bulk of the genetic differences between humans and monkeys is carried on only about 100 out of our common pool of 100,000 genes. Each gene contains several thousand base pairs. The total informational difference between our IQ of about 120 and a monkey's IQ of about 40 could then be contained in a modest computer program of less than 100,000 lines of program code. Nature stumbled on these lines of codes by sheer accident. And the best minds in the world do not have a clue. If this does not constitute a reduction to absurdity of reductionism, then what possibly could?

Needless to say, we shall try another path.

| [Contents](#) |

rev. 10/25/98

The Mathematics of Cognition

Beyond the Network

A primary attribute of our world from the perspective of immaterialism is its relational structure. Objects and events have no meaning or substance when taken out of context. The meaning of any part of the world depends on the meaning of many other aspects of the world. This is the problem with artificial intelligence. Unlike natural intelligence, it operates by dealing with only a small aspect of reality at a time, and so is easily confused by novelties that are easily handled by our natural intelligence.

Computer programming languages must be defined with complete precision. Beginning programmers become frustrated when computers follow instructions to the letter, seeming to ignore the intent of the programmer.

Dictionaries demonstrate the highly relational structure of natural languages. There is much circularity in the definitions of words. Also the meaning of any utterance depends on its context or on the frame of reference of the speaker. This is also known as the horizon problem. Although machine translations are often passable, meanings are frequently distorted.

Mathematical language, like programming language, is defined with precision, but like natural language it is relational. There is a great difference in the frame of reference between the computer and the mathematician. The computer performs simple mechanical operations. An adding machine can add numbers with precision all day long, and yet could in no way respond to questions about the meaning of numbers.

Most mathematicians spend considerable time with rote calculation that could conceivably be handled by a computer. But this is ancillary to their main function of discovering and exploring structures or patterns. Like most scientists their work involves the framing and testing of hypotheses about the patterns they observe. The hypotheses are couched in terms of symbols of great abstraction. A computer can be instructed to manipulate rudimentary symbols. It can test hypotheses that can be reduced to combinatorial procedures such as the map-coloring problem. But the only relation it can recognize is whether one number is bigger than another.

Let me restate the problem here in terms of pattern recognition. The work of mathematics is to recognize and explain meaningful mathematical patterns. Most mathematical objects derive from such relational structures. There are no formal procedures for recognizing patterns. Patterns may be computable, but only after the fact. The machine must be instructed precisely what to look for.

The salient point is that the cognitive challenge of mathematics is not particularly different from any other area of human activity, but no other discipline has been as

concisely documented. Nowhere else has the depth and breadth of the human psyche been so exposed. If there were fundamental limits to the mathematicizing of the cosmic and human mind, the knowledge of those limits would be among our most important pieces of wisdom. Otherwise, we cannot fail to continue in our journey to self-knowledge.

The fact that the neuroscience industry has granted an exclusive franchise to the computer model of the brain is an increasingly serious obstacle to progress on the much broader front suggest above. Once again, the most effective challenge to the hegemony of neuroscience is likely to come from developments in quantum computing.

rev. 10/27/98

The Mathematics of Cognition - pt. 2

A Grammar Lesson

We have mathematics, physics, psychology and the cosmic mind. We know something about all of these subjects. We would like to know more, particularly about the relation between the human and cosmic mind.

Given the existence of the human mind and a relational, immaterial reality it is quite reasonable to suppose that the human mind is patterned upon and has access to, or may be contained within a more encompassing intelligence.

The mind has a demonstrated capacity to fragment itself into subcomponents and even into sub-personalities. It would be metaphysically economical to suppose that we are the products of some such process. It would be helpful to have a model of this process.

We know that the human mind is able to discover deep mathematical structures within the patterns of natural phenomena. This suggests that similar structures may be latent in our own minds. The challenge is to further probe the structure of our psyches. Any progress in this regard would lend further credence to an immaterial cosmology, and would be of utmost importance in the working out of our destiny.

A major conceptual obstacle is the ambiguity between the objective and subjective aspect of any mental structure. How could one structure be cognizant of another? When we do mathematics are we working from the inside or the outside of the structures? Are there any analogs of cognition?

The presently favored theory of cognition is that it is equivalent to a verbal competence with respect to the object in question. My knowledge of a circle is the same as my ability to speak cogently about it. This would include the proper manipulation of the symbols referring to it. In computer terms, circle knowledge is equivalent to the portion of a geometry database relevant to circles, along with a modicum of linguistic capacity. Similar reasoning might suggest that we are happy because we smile, rather than the other way around.

Platonists would argue that our knowledge of a circle has to do with our ability to access the universal property of circularity, but this says nothing about the nature of that existence. Do the existences of goodness and circularity have any common features? I am suggesting universals have structural properties well beyond any superficial structure they might entail.

Consider Chomsky's idea that beneath our superficial grammatical ability lies a deeper universal grammar that we must employ to communicate our thoughts. Most of the work on universal grammar has been directed toward computer language applications, and so has been computational rather than mathematical in

its focus. I believe that we will discover a mathematical structure associated with the grammar, which is integral to the larger structure involved with cognition, sensation and emotion.

It may be that mathematicians have not yet intuited the nature of the mathematical structure that will eventually allow us to comprehend the cosmos. Undoubtedly it will include those structures that are necessary to the unification of math and physics. This will not be a closed system. There will rather be an open-ended hierarchy of structures that will include the ability to generate novel systems. Such structures may also be anticipated in the design of advanced digital systems. The advent of quantum system design will bring us another step closer to understanding.

An Immaterialism Discussion Group

A not so small step for academia

I am surprised and delighted to find an active discussion of immaterialism on the web. (See the [KARL JASPERS FORUM](#).) One of the non-participating mentors is Amit Goswami who now maintains an e-journal called [Science within Consciousness](#). He is a physics professor in Oregon with a Quantum Physics textbook to his credit. I had the good fortune to meet with him several years ago.

Like most of the immaterialists in the forum he bases his belief on a radical reinterpretation of quantum physics. Also like most of the participants he is a conservative idealist. He does not see any immediate dramatic consequences of the immaterial paradigm. Over the years I have scaled back my estimation of the necessary magnitude of the impending cosmic drama, the apocalyptic revelation. I am a relative minimalist in that regard, but there is still a considerable gap between myself and the academic idealists of the Jaspers Forum.

The academic mind is generally much more comfortable with mystical idealism coming out of the eastern mystical tradition. I am coming from the western prophetic tradition. The problem is that the scientific community has a long history of happily ignoring mysticism. Some of the idealist academics may migrate to a more prophetic stance, as they become frustrated with the narrow-mindedness of their materialist colleagues.

This is why the quantum computer or something very much like it will be necessary to shake up the establishment. It would be the minimal substitute for the proverbial UFO landing as a harbinger for the revelatory Second Coming and dramatic paradigm switch. In this regard I am keeping an eye on the quantum physics e-prints. (See the latest entries on my [New Links](#) page.)

Nonetheless, the Jaspers Forum is a big step in the right direction. Its development merits close attention.

| [Contents](#) |

rev. 11/1/98

An Immaterialism Discussion Group – pt. 2

The Cure vs. the Disease

Most of the attention of the [Jaspers Forum](#) is being focused on the refinement of the problem of idealism rather than on its solution. The academically minded are reluctant to jump into the water. They would rather stand on the riverbank and talk about what it might be like to jump in. Rather than look for new answers, they would rather rehash old questions. One can then easily conclude that the cure of idealism must be worse than the disease of dualism because no one is willing to take it.

On the other hand it can be argued (see [R. Pippin](#)) that modern philosophy is so saturated with Hegel's idealism that we are already swimming in that river whether we want to or not.

I am recommending the transition from mystical, contemplative idealism to a prophetic idealism. This transition entails a shift from the position of student to that of professor or proselyte. Professing is just about the last thing you are likely to catch a professor doing. It is not cool. It is not professional. Hegel was the first and last proselyte of idealism. Subsequent idealists are students of Hegel. They hide behind his ample skirts.

This is not necessarily the fault of the professors. It is partly the fault of Hegel for not having adequately grounded his immaterialism in the Judeo-Christian-Islamic prophetic tradition, despite his own preoccupation with that tradition. The only way to do that is to incorporate the paradigm shift into the context of the Second Coming. This is beyond almost any professor's conceivable call of duty. Some of Hegel's followers were not averse to his being the Spirit of Truth, but it would be difficult to take the plunge without the benefit of Ron, or perhaps a quantum computer operating in a quasi-oracle mode, or both. Maybe Ron is a quantum computer, no offense.

You can see why it is easy to suppose that the cure is worse than the disease.

rev. 11/2/98

Capitalism & Technology

How do we get from prophets to profits and back again?

The Aquarium has discussed the possibility of a mutual investment scheme, but at this point we are without a strategy. Let us consider the larger issues.

Investing would seem to conflict with the Aquarium's interest in expediting the end of the world. Well, to paraphrase either Bill Clinton or Bill Gates, that depends on what you mean by 'end' and what you mean by 'world.'

The conflict is mitigated by the historical probability that capitalism itself is firmly rooted in the apocalyptic vision of the prophetic tradition. Certainly it has a strong affinity for the puritan segment of that tradition.

Material reality, for both the mystic and the prophet, is an illusion to be transcended. The Aquarium concurs. The question is how? The mystic goes up the mountain and the prophet comes down from the mountain. The prophet prepares us for the incarnation. The incarnation prepares us for the resurrection. Cyberspace also prepares us for the resurrection. But in the meantime, everyone seems prepared to eat everyone else's lunch, including Microsoft and Amazon, for instance.

There is a slight problem here concerning means and ends. Eating the other guy's lunch is one thing, but eating his last supper is another thing. We have the old utopian dilemma of competition vs. communion. If Bill Gates were Jesus there would be no problem -- all we'd have to do is get rid of Janet and Linux. This reminds me that we should buy some of Red Hat Software, or would that be profiting on slave labor?

It would be wonderful if we could follow the model of Linux and all be volunteer programmers of the resurrection, but that might not keep body and soul together unless we take the Heaven's Gate route, speaking of volunteer programmers. Instead of Bill Gates we could have Bo and Peep, but hold the applesauce. That business model might not survive until its IPO.

| [Contents](#) |

rev. 11/3/98

Latter-Day Capitalism

Connecting the Dots

I am not totally happy with Amazon.Com. Something is missing. At best we have Amazon = AOL + Yahoo! - Espresso.

AOL is having trouble being more than a website with training wheels. Yahoo! may be everyone's portal and no one's parlor. They could both use some B&N espresso and hold the cybers.

An ancestor of mine allegedly made a small fortune in the Gold Rush by selling work-gloves. Where are the work-gloves for the Web Rush?

I put 'glove' into the thesaurus, and all that came back was 'glow.' That is what is needed. That is all that the Aquarium can offer. The problem is that the glow is easily lost amidst all the gold. Man does not live on gold or on bread. Most of us are still unwittingly living off the glow of the incarnation, but after two millennia there is a limit.

And that brings us back to childrens-furniture.com. What do they have that Amazon does not have? All that they would have is us. All that we have is a vision. There is spirit in them thar hills. All we need is the vision to see it. That vision will come or we will cease in our struggles. The connection between children's furniture and quantum computers may not compute, but then we are not computers. The dots are all there, we just have to connect them.

The trick with the Aquarium is that we do not need an actual vision. All we need is the vision of a vision. All we have to do is find the fence that no one can afford not to whitewash. And we already know what that is. We give everyone permission to be visionaries and philanthropists. Amazon.com has not been given that permission, yet.

| [Contents](#) |

rev. 11/4/98

Gift Horse

Taking Advantage of the Internet

Look at the Internet from the perspective of the Anthropic Principle. If the forces of physics were not with us, we would not be here and neither would the Internet. The existences of life and of the Internet impose separate conditions upon physics. We happen to live in a world where those two sets of conditions overlap. How we regard that circumstance will determine how we exploit it.

I am suggesting that the Internet may be a gift from heaven. It may also be a gift horse. It is one of the means by which the cosmic spirit will subvert our material order. The other, more traditional means is the prophet. When you put a prophet together with the Internet you are dealing with an event of biblical proportions – namely the Second Coming. So I am further suggesting that the savvy Internet worker/investor should keep in mind that there is a ghost breathing down our necks. If we can't beat it we had better be prepared to join it by becoming part of the cosmic fifth column.

There is probably a third ingredient – physics itself. Physics contains the seeds of its own subversion. This is the quantum. The quantum is the loophole in the otherwise rigid order of physics. As noted previously it is already pushing many thoughtful people into the arms of immaterialism. The bottom liners will ignore the quantum until it is shoved down their throats in the form of a quantum computer. And if I am not mistaken, our tardy Jesus will be there to help them swallow. It has already been said that you should not look the gift horse in the mouth.

Obviously no one wants to stand between the cosmos and its telos, but there may still be a role for mere mortals. Where can we line up for the fifth column? Just about anywhere. There is nothing wrong with children's furniture. The Internet will be commercialized. There is Internet commerce and there is cosmic intercourse. There will be miscegenation, unless we are living in a Cartesian cosmos where mind and matter never meet. There is no business model for this, only sweat, charisma and vision. Oh yes, and a lot of creative networking.

rev. 11/4/98

Concerning a Visit from Ecuador

Lest there be some misunderstanding, E should be informed that neither I nor my correspondents are specifically involved with the field of "spiritual growth."

The reason for my involvement with E's proposed visit from Ecuador is the same as my involvement with M's original visit. I was infomred that E had information that he wanted to share with responsible government officials. In that regard I can be of some assistance. Beyond that my contacts are very limited. I have suggested that E get in touch with Richard Boylan and Standing Elk both of whom have a wider public audience.

My other concern is that E be fully informed as to the specific nature of my mission. He certainly need not subscribe to that mission, but he should be aware that there is the possibility, particularly in the future, of guilt by association, and that some people do avoid contact, presumably with that in mind.

I believe that we are now in a position to finish the unfinished business undertaken by Jesus some two millennia ago, namely the salvation of the world and all that that may entail. I find myself with a modest but unique combination of intellectual, political and spiritual authority that might lend itself to that task. Whoever throws their hat into that arena must do so with the expectation of fulfilling the prophecies concerning the Second Coming. That may be one reason why there seem to be so few hats.

Despite the repeated denials of my principal government contact, I continue to labor under the impression that a segment of the US intelligence community has incurred some obligation to at least tolerate my specific mission.

I am hoping that E may use his considerable skills to provide further insight into the nature of the Second Coming and any role that I might or might not have in that regard.

Cosmology 102

The Holographic Universe Revisited

In my usual perusal of nytimes.com's technology section my attention was caught by a reference to xxx.lanl.gov which is making waves in academic publishing by putting quality research papers online. Once there I noticed a paper by G. 't Hooft, [Dimensional Reduction in Quantum Gravity](#), '93.

After considering the entropy of black holes 't Hooft concludes that there "simply are not more degrees of freedom to talk about than the ones one can draw on a surface.... The situation can be compared with a hologram." L. Susskind further pursues this startling conclusion in [The World as Hologram](#), '94.

I trust that these authors are familiar with the holographic speculations of Bohm and Pribram dating back at least to the Seventies. They do make reference to the Bootstrap model that was formulated by G. Chew in the same time period, all of which figured prominently in the zeitgeist of the mystical physicists.

I find it surprising that this professional interest in the holographic model has not been noticed in the popular literature, at least not to my knowledge.*

'T Hooft and Susskind also allude to the possible connections of their ideas to the informational models of physics. The combination of the above speculations seems to provide a natural scientific basis for an immaterialist or idealist metaphysics, in my opinion. Perhaps it is the fear of offending their potential scientific audience that has prevented the mystical physicists from being more emphatic about this very obvious consequence.

The above summary is just by way of an introduction to my further speculations along these lines. It is my inclination to take physical models as metaphors for the structure of an immaterial cosmology. In this spirit I suggest that we substitute the black boxes of our mind/brains for the black holes in 't Hooft's holographic model. This is just about as far as one can fetch a metaphor, but so be it.

What we would then have is the first mathematical model for the concept of the mind as a microcosm, and the physical cosmos as the projection of our multiple microcosms. Projective geometry provides a much more rudimentary model for the concept of the microcosm. The quantum correlations then must be all tied up in the teleological constraints of the eschatology implicit in immaterialism.

I will attempt to expand upon this very rough outline of an idea.

*I have just read Lee Smolin's book, [The Life of the Cosmos](#), '97. He refers to the "holographic hypothesis" in chapter 21 as partial justification for his relational model of the world. This Leibnitzian/monadic view is a big leap toward immaterialism, but Lee says he is

still holding out for an objective reality. It is very difficult to let go of that security blanket.

.

| [*Contents*](#) |

rev. 4/26/98

Cosmology 102a

Monadic/Holographic Paradigm

Following the suggestion of L. Susskind, we attempt a monadic cosmology based on holographic principles.

In this case the monads will be you and me and all the other spiritual beings. We are the microcosms. The cosmos is our mutual projection and self-reflection. The entire cosmos is the God monad, or Gonad, just to ensure that we don't take ourselves too seriously. Aptly enough, we are the seedlings of the gonad. As our world approaches the critical information density, there ensues an "information implosion" in analogy to the formation of a black hole. Thusly does the gonad recycle itself through us monads into a new gonad that includes a 'new' cosmos.

Contrary to the speculations of L. Smolin and others, there is only one recycled cosmos. This is based in part on Leibniz' Identity of Indiscernibles. The world history exhausts the possible 'atoms' of experience. The combinatorial possibilities do not infringe upon this limit. These could be included in the imaginal realm in any case. Each history cycle is a metaphysical superposition of all the cycles. The world-line of each monad represents one such cycle.

The gonad exists on our information horizon that we approach in the eschaton, a la Tipler, with our consciousness' becoming telepathically linked. Collectively speaking we only go around once. These observations need be construed only to limit redundancy not creativity to which there is no limit.

Other worlds exist only in the experientially orthogonal spaces to our own, and these are what compose our imaginal and unconscious realms to a large extent. These worlds are tightly interwoven into one single entity. There can be no other entirety. There can be no island universes by the sheer logic of relations. There has ever been only one eschaton and that is the one we are about to experience. But each experience is still completely new. The multidimensionality of time will come into play and that will explain the seeming paradoxes.

rev. 5/5/98

Cosmogenic Bootstrap

A Fragment

[This fragment was dated 11/16/97. I am not sure yet what was supposed to have preceded it. In any case it is resurrected and temporarily placed here.]

.....

I suggest something metaphysically more economical and more palatable than either of the above alternatives. This third alternative is a primordial experiential chaos. Logically there need be and could be only one such chaos which contains within itself, in some virtual form, all possible experience. This could be the end of the story. My momentarily present experience would be one of those possibilities. The illusion that my existence entails long and relatively coherent sequence of such experiences could be just that, an illusion.

We can impute a greater reality to our world by ascribing its emergence to some robust bootstrap process. We can reasonably postulate a tendency toward coherence. The most economical way to do this is to simply adopt a relational metaphysics. The relational view is that all existence is relative, or to put it another way, to exist is to relate. No one or no thing can be an island unto itself, and presumably that would include God. Applying this notion to our experiential chaos we see that the path from virtuality to reality is by spontaneous aggregation toward a relational coherence. This last move is in the spirit that if nothing is forbidden, then everything is possible. Centers of coherent experience would be proto-egos or spirits. These would be the virtual subjects of virtual experiences. Already there has crept in an implied temporal directionality, but that should be seen as an artifact of the limitations of our language and imagination. Space and time would remain virtual constructs until later (sic!) in the emergence process. Or one could suppose that 'originally' both space and time are infinitely dimensional.

One might have simply supposed that virtual egos would be built into the original chaos, but there would still need to be an aggregation principle for egos to combine with experiences and with each other. In some sense the ego is that principle in action. The egos act to enhance the coherence or relational depth of their experience. They would tend to do this by interacting with other egos, and so a primordial virtual society bootstraps itself toward a more coherent reality. Obviously the relatively strong coherence of our world places us at a remove of several 'generations' from that original social reality.

One principle of aggregation, operating below the level of ego, would be the so-called 'identity of indiscernibles.' Singular indistinguishable 'atoms' on molecular chains of experience would automatically fold into one another, creating more complex structures.

I was becoming so entangled in the experiential chaos that I nearly forgot about the physics. In part 2 I will endeavor to make amends.

.....

[And I'm not sure what was to follow.]

.

| [Contents](#) |

rev. 5/30/98

Cosmology 102b

Redundancy

This remains an important and difficult question. Although I don't think he deserved to be burned at the stake (that's a joke folks), I do believe that Giordano Bruno led us down the wrong path. The idea of infinite worlds is a moral cop-out in my estimation. We have chucked our cosmic responsibilities by pretending to be horrified at being lost in space. We are like Adam trying to hide behind the tree of knowledge. We are only hiding from ourselves.

Rather than appeal directly to anthropocentrism, I will try to stick with a more neutral logic - namely the identity of indiscernibles. At the same time I'll employ the notion of possible worlds and the virtual experiential chaos which is a background, but not strictly the source, of our world.

Philosophers find that a robust and realistic notion of possible worlds is a necessary construct to support many of our logical structures. This is anathema to traditional realists, and it does get support from quantum cosmology.

If we consider a quantum modal Bruno smoldering at the stake, we get a headache at the redundancy of you and me. This would make even the most ardent reincarnationist blush. It is only a robust Leibniz who can rescue us from this morass.

A monad will be a robust experiential episode. There can only be so many distinguishable such monads, and our world comprises most of them that we can imagine. Any other humanoid world that attempted to bootstrap itself out of the soup would get sucked into our reality vortex by the II, and our own imagination. What are left over are the ufonauts and nuts.

When time permits, I will elaborate. Something to look forward to, I'm sure!

.

rev. 5/30/98

Hoax?

Concerning the Provenance of UFO Documents

Once again, it appears we will be facing questions concerning the *bona fides* of certain UFO documents purporting to be of government origin. What can be said without knowledge of the specifics?

Concerning the so-called 'MJ-12' documents, the informed opinion is that these were fakes. But now, just suppose that more 'MJ-12' documents were to surface. Could this do anything to change our views?

How much 'better' would these documents have to be in order to overcome the pall of skepticism cast by its predecessors? Could we not just suppose that the original hoaxer had simply had additional time in which to hone his art?

There is no way to prove the authenticity of any artifact. It is only ever a matter of considered opinion. The opinions will be heavily influenced by speculations concerning human behavior. We cannot venture into that territory without heeding Pascal's warning that "the heart has its reasons of which reason knows nothing: we know this in countless ways."

Consider for instance crop circles, the shroud of Turin and Theodore Kasczynski. We have examples of probable major hoaxes juxtaposed with the dedicated anonymous fanatic. With these as a base line, it would be difficult to imagine any artifact that could transcend suspicion. In the case of MJ-12 type documents we would have also to consider the motivations of organizations such as the CIA, KGB, Scientology, etc., just to add to our witches brew.

We come to the conclusion that the provenance of any artifact is not the ultimate issue. The behavior or phenomena that gave rise to the artifact is ultimately moot. The only significant issue is the behavior that an artifact generates. It is either ignored or it is not. Very few individuals can claim to have been able to ignore the original MJ-12 documents. Those documents have left an indelible imprint on the modern psyche. Should we expect anything less of their erstwhile successors?

.

rev. 5/14/98

Working Both Sides

Phenomenology vs. UFOs -- Inquiry Update

The idea is to put the squeeze on UFOs. We use the aviary to go after the UFOs directly and we use the phenomenology network to establish a cordon sanitaire around the periphery of any possible UFO involvement on the part of our government. It may be that there is a complete disconnect between UFOs and phenomenology, but this dual attack would put a least upper bound (lub) on the various MJ-12 scenarios.

Obviously any separation between phenomenology and UFOs must be completely ad hoc and it appears also to be pro forma. It is for the express purpose of avoiding citizen inquiries, I have been told. The purpose then of the unofficial phenomenology network was first a semantic exercise to eliminate all words that might trigger any FOIAs, and then finally to eliminate the paper trail altogether.

The questionable goal of keeping the citizens in the dark concerning UFOs is compromising our national security with regard to our collection and analysis of anomalous phenomena in general. This is not a tolerable state of affairs.

Now that the paper trail has been eliminated from the phenomenology network it has been possible to bring UFOs in the back door again by maintaining a close liaison with the Aviary, while absolving the government of all UFO contamination. What we see here is a major exercise in semantics, leger de main, and disinformation of the citizens. At the same time it is very likely that this gamesmanship is compromising national security.

Nonetheless, behind this facade of game playing it is not difficult to detect an edge of seriousness that belies the seemingly casual treatment of national security matters. I am reluctant to believe that so much effort is expended and so many liberties taken simply to avoid the FOIA paperwork. The more rational explanation is that there is indeed something serious being hidden from public view.

When all of these buttons are pushed with the principals involved in the arena, there is just one last line of defense: the public does not want to know. Well, I regret to inform all those players that this is an entirely unacceptable justification. It will not stand. Democracy was never intended to provide a defense against truth. Citizens have more than a right to know; we have a contractual obligation with truth. That contract will be enforced.

.

| [Contents](#) |

rev. 5/15/98

Phenomenology on the Sly?

Talking points for an Intel. Comm. staffer

After many years of detours we believe that we have established at least the outline of a problem that can and should be resolved. I am referring to the collection of phenomenological data on the part of our government.

Officially there exists no such collection. What do exist are various informal and ad hoc arrangements with the expressed intent of avoiding proper oversight. The issue here is one of propriety. Is this state of affairs proper or is it simply expedient and proprietary? It is not unreasonable to posit that this issue is the largest unresolved remnant of the Cold War history, second in significance only to the nuclear remnants.

There is a further complication. Phenomena do not exist, at least not for us moderns. Phenomena are an embarrassment to our modern psyches. They are more than an embarrassment to the scientific establishment. They are a threat. Our intelligence apparatchiks are caught in a bind between being scientifically correct and protecting us from the unknown. To believe that something that goes bump in the night might actually hurt us is to demonstrate a lack of faith in the omniscience of scientific materialism, but it is also demonstrating a pragmatic degree of wariness. The resolution to the double bind, up to now, has been to work underground and outside of all official channels.

Meanwhile, problems accumulate. The phenomena become like so much dirt swept under the rug. We can all see the mound in the rug, but most of us are too polite and too politic to point a finger. We have a nice little back alley waste disposal system, nice as long as it does not make too big a stench. And stink it does.

It may be just a molehill under that rug, but as the years of studied neglect pass by, our imaginations often run rampant and the repository of anomalies spontaneously breeds little green men and other vermin of all descriptions. This may mean big bucks if you are an entertainment mogul, but it hardly contributes to public trust or enlightenment.

One feels almost like a party pooper to suggest at this belated hour that it is time for an airing out -- a time to audit those books. Will the public lack for entertainment if the little green men turn out to have been nothing more than plasmoids? Well, I am truly sorry, but it is time to let that cookie crumble.

.

| [Contents](#) |

rev. 5/15/98

Patrolling the Perimeter

Life on the Edge

I would like to pursue the idea of the *cordon sanitaire* that was mentioned in the previous piece. In doing so I will suggest an alternative to the standard view of 'MJ-12.'

On the standard view MJ-12 is a bastion that aggressively maintains a *cordon sanitaire* between the aliens and us. This is based on the view that UFOs are a physical phenomenon, which in turn is based on the view that our world is also physical. The idea of questioning reality rarely occurs to us as we take almost everything for granted. We suppose then that if there are any barriers between worlds that they must be artificially imposed and maintained by fiat. The MJ-12 are the overseers of the cosmic separation.

If, on the other hand, worlds are metaphysical then there will be natural barriers between them that are more profound than mere space. Apparent physical distance is only a metaphor for metaphysical discontinuities between alien and human consciousness. MJ-12 performs mainly the reconnaissance function of supervising the mapping of the shifting boundaries of consciousness. There are also specific preparatory exchanges that occur along the cosmic Berlin wall that are monitored by MJ-12. Ultimately MJ-12 is overseeing the crumbling of the Berlin wall that has delimited and defined our consciousness. An unobstructed universe is our patrimony, and we are its reluctant heirs. At worst, MJ-12 can do little more than reflect our fears of the great beyond.

Ufologists look to the supposed authority of MJ-12 to finally blow the lid on the cosmic cover-up. But that is not their call nor their calling. That is our job. MJ-12 can only monitor our progress toward understanding. We have the same access to the same cosmic secrets. Their only historical advantage was their greater initial awareness of their own ignorance. It was the 'big event' that triggered that awareness, the details of which are barely significant. The cosmic wall will crumble when our ignorance becomes as great as theirs.

The greatest barrier to our unknowingness may be the pseudo knowledge of too many ufologists who see their endeavor as a game of trivial pursuit. A focussed ignorance points to the path of disclosure. It is not the case of being blind, it is just a new way of seeing. The mystics have much knowledge but they lack the historical vision that is peculiar to the Western mind and crucial to resolving the present hiatus.

.

rev. 5/16/98

Oversight of Phenomenology

An Unfulfilled Obligation?

Compelling national security interests dictate that there be such a thing as a "phenomenological network." There are equally compelling reasons why there should be a proper oversight for this network. However, it appears that this latter obligation is not presently being fulfilled. In fact, a participant has informed me that there has been an effort to minimize or avoid oversight allegedly for reasons of efficiency.

I would like to know who in the Congress should be made aware of this apparent lapse?

Ron,

I am scheduled for a phone conference with Chris Straub (SSCI) this Thursday pm. This is what I plan to discuss with him. Have I misstated the case?

Dan

If you are referring to me as the "participant" then you certainly have misstated the case. But why let the facts interfere with your creativity? Also, why a phone conference with Chris? I thought your coffee with Chris last time was a big success. At least you can see his reaction.

Ron

Straub's eschatological plate is filled right now with concerns about our lack of oversight wrt nuclear proliferation on the subcontinent. He requested that the briefing be by telephone. I will, however, request a follow-up meeting.

If our communication protocol were more direct there would be less need for me to interpolate your remarks. Could you please fill me in on the quality of the present phenomenological oversight.

Dan

You continue to confuse phenomenology with UFOs and/or intelligence. That's why you think the public would be interested. Phenomenology is natural science. It is the physics behind our observations. At times there is minor public interest, such as with upward propagating lightning, but it fades quickly. The phenomenology network, as you call it, is just a group of scientists, including yourself, who have a common interest in natural science.

Ron

Evidently one of us is confused. My dictionary defines phenomenology as any field of study that classifies phenomena relevant to itself. On the other hand, science is defined as dealing with phenomena that have already been classified as operating within some lawful domain. Clearly there is a distinction. Science is much more strictly defined.

National security cannot allow itself to be compromised by concerns for scientific protocol or correctness. This is why there have to be phenomenology issues over and above any purely scientific issues.

Nonetheless, you have stated to me that the phenomenology network excludes certain types of phenomena from its purview for reasons that appear to be based more on politics than on security. So far you have been unwilling to discuss this issue with me or to describe any process for decision making. Thus I feel compelled to take the matter up with the people in the Congress who have a well defined legal responsibility in such matters.

Dan

Contrary to the UFO community's belief, nobody cares.

John A

Ron is right. There is a difference between specifically excluding topics, and not being interested in some.

Check the NRL web site for phenomenology.

John A

On second thought, I should admit that I am more concerned about salvation than about security; however, in an eschatological context these two concerns will be increasingly difficult to distinguish.

With this in mind I will ask Straub to agree to be the congressional liaison for the Aquarium inquiry into government involvement with the UFO phenomenon. This ought to be an offer that would be difficult for him to refuse. This is what he has already been doing implicitly.

Perhaps it was John's two previous contradictory statements that pushed me toward taking this more direct approach. In the first statement you express anguish that no one cares about a phenomenon which you believe is of utmost importance. In the second statement you appear to defend Ron's right to not care about it. Does this strike anyone else as being disingenuous?

Ron must have a weakness for crazy people, otherwise he wouldn't hang out with us. We should be very careful with him because otherwise he might just take his phenomenological football and go home. Well, I am counting on his continuing to be the soft touch that we all know him to be.

I will admit that it is possible that Ron does not know where the alien bodies are stored, but I am willing to wager that he has a pretty good idea of approximately where the most serious of the ufo-type of collections end up, and it is not in a circular file. This is the 'paper trail' that must be pursued if we want an inquiry that is something other than a joke.

Ron, tell me its not true!

Dan

Inquiry Report -- 5/22/98

I failed to connect with Straub yesterday, and I may not have another chance until next Tuesday.

What I intend to report to Straub is that our group of investigators has accumulated substantial indirect evidence of a government UFO cover-up.

Our prime exhibit is Ron and his phenomenology network. This network appears to be structured in a manner that could facilitate the collection of UFO related data while at the same time being able to maintain a posture of deniability.

If there is a policy to employ subterfuge in fulfilling this 'unconventional' collection requirement, then that policy is being admirably executed. This set of circumstances raises several issues that will have to be addressed.

- Does such a policy exist?
- Has this policy been properly enacted and implemented?
- Is it being properly reviewed?
- Is such a policy justifiable?
- Has the public cost of the subterfuge been adequately appraised?

I suspect, however, that the above circumstances are simply both de facto and default. There has not been any formal policy setting process. There are no controls over this networking endeavor despite the fact that it has thoroughly insinuated itself into the government. This is a situation that could easily lend itself to very significant abuses of public power and trust.

If this last surmise is correct, then there are compelling reasons for the government to set about the task of formalizing, at least to some reasonable degree, an effective phenomenology network.

I have been informed that the present phenomenology network is the successor to and spin-off of a formerly classified entity that was sometimes known as the Enigma Group. I am not acquainted with the circumstances of the demise of this group, but they are worth speculating upon in order to help ascertain our present options. To guide this speculation we will need some background material.

Phenomenology is usually taken as the attempt to classify a given set of phenomena that do not otherwise fall under the purview of an existing science. However, within the context of national security, nothing can be taken as given. Therefore the collection requirement must remain completely open. This fact alone creates dilemmas for the government. Clearly there will be conflicts between national security and the various legal restrictions on data collection. Also the collection requirements may justifiably include phenomena that incite public curiosity such as UFOs, the paranormal, parapsychology, etc.

My understanding is that the Enigma Group attempted to exclude certain types of data so as not to create a tempting target for public curiosity. Also there was the concern that the open-

ended requirements were not compatible with the normal bureaucratic rigidities. These were among the considerations that lead to the formation of the informal and freewheeling phenomenology network.

The desire to avoid public curiosity is incompatible with the need to collect data in the public sector, unless a very great effort is expended on secrecy. Such an effort would necessitate a structure that would in no way be freewheeling. To some degree I represent that public curiosity, which may also be the public's obligation to keep itself informed on matters of general concern.

Perhaps all of these issues have already been considered and adjudicated, but I suspect not. Can these issues be given a reasonable airing without jeopardizing our national security? I believe there is an obligation for us to make that effort.

rev. 5/22/98

Inquiry Report -- 5/25/98

On Not Collecting UFO Data

Since the termination of Project Blue Book in the Sixties, there has been no concerted effort on the part of the government to collect UFO data. In fact, there has been some effort since then to clear any remaining or newly generated UFO data off of agency and departmental logs by turning it over to the National archives for declassification.

Nonetheless, there is a general perception that the UFO phenomenon is a continuing one, and so it seems reasonable that the policy of non-collection should be reviewed from time to time to see if there are any changes in the circumstances that would warrant a new collection effort.

However, a senior member of the government's phenomenology network has informed me that no such review has been undertaken. When I ask if there is any official position or policy pertaining to this matter, I am told that there is not. The non-collection of UFO data by the phenomenology network is due entirely to a perceived lack of interest on the part of its participants and customers.

There have, however, been some exceptions to this general rule. There have been, since the termination of Blue Book, some UFO briefings that were either administered by or reported to the phenomenology network. Since the UFO topic is no longer classified, neither would these briefings be. Nonetheless, my information about these briefings remains rather sketchy.

In my estimation we are faced with a potentially noteworthy discrepancy between an apparent continuing public interest in the UFO phenomenon and a pocket of informed disinterest on the part of the phenomenology network. One might reasonably infer that the public is misinformed in this area, although I would not want to prejudge that issue. Hopefully then, in the interest of better informing the public, I would like to put together an informal UFO briefing packet for the public, and do so in consultation with members of the phenomenology network. I also hope to consult with an Intelligence committee staffer. The packet would be disseminated over the Internet.

rev. 5/25/98

An Informal Network

Mission

John,

I would agree with you that the threat of an alien invasion is remote. However, there might still be some intelligence concerns related to this phenomenon that would be worth our while to consider.

In this regard there has been a clarification by Ron concerning the imputed status of the Phenomenology Network. Contrary to my initial impression, this network has only a virtual existence at present. I am recommending that the network's status be elevated from virtual to informal and that Ron and I should bring this suggestion to Chris Straub, hopefully when we meet with him next week. In making this recommendation we need to consider our mission objectives.

Looking at the Navy's Office of Strategic Phenomena (OSP), as you suggested, we see one side of the phenomenology issue. I understand that Ron's associate, Owen Lewis, and his Photon Research are prime contractors for that project, so there is already a step in the right direction. The environmental impact on our SIGINT covers the major part of the government's concern. There is also a HUMINT side to phenomenology and that is where our IPN could provide some unique input. To be comprehensive, though, these two components should be integrated at some level. The integrative function would be a prime concern for the IPN.

There is a further and very significant integrative function and that is between the government and civilian interests in phenomenology. Particularly under a democratic regime and in peacetime we do not want to alienate the legitimate civilian concerns relative to possibly extra-scientific phenomena. The IPN could play a small role in diffusing and defusing these public concerns. Beyond that amelioration, there ought to be a constructive role for the public on the HUMINT side.

I put these thoughts to you, John, as a potential Non-Lethal and UFO consultant to the IPN. Clearly our patriotic duty beckons.

Dan

rev. 5/27/98

Busy Beavers -- pt. 1

And the Unreasonable Effectiveness of Mathematics

Can we excuse the physicists for supposing that since God is a mathematician she cannot also be a dramatist? How can they be so parochial?

Even more extreme is the view that because the universe exhibits a deep mathematical harmony we can let the mathematics be a substitute for God. Is this idolatry any less crude than the worshipping of a golden calf?

Would we be more worshipful if God had left her autograph on the moon? Because mathematics is objective and impersonal we suppose that the universe is also.

But why, then, would a personal God use an impersonal tool? Possibly for the same reason that we might use a shovel. It gets the job done. But this is much too crude for an explanation.

Notice also that we identify arbitrariness with the personal, and lawfulness with nature. We view our free will as unlawful and unnatural. The laws of nature are enforced by mathematical logic, so we do not need a lawgiver. Natural phenomena are mathematically determined so there is no room for divine intervention. There are some concerned physicists who generously suppose that the quantum loopholes in classical mechanics are sufficient to allow for the intervention of human and divine will, but they are barking up the wrong tree.

There is another hidden assumption in the views of most scientists which is that mathematical constructs supposedly help to reify the processes that instantiate them. Atoms are more real because they are independently lawful. The atomic realm is objectified by the fact that all natural laws are thereby instantiated. That is the necessary bedrock of physics.

But now let us consider the design of a virtual reality. Into that reality we will have to design regulating principles if there is going to be any cognitive coherence. These principles do not have to be anything physical or mathematical, but by lending coherence they will enhance the sense of reality, but in no way alter its virtualness. But I am not suggesting that God works for Atari or that we ought to be placing our quarters into some coin slot.

Rather I am suggesting how the tree on the Berkley campus continues to stand when no one is watching it. Or more to the point, how it might fall when no one is there to push it over, with or without a sound.

We suppose that it falls down because of gravity and an industrious beaver in the night, ignoring any possible coed involvement. We can calculate exactly how it should fall, and we could program a very realistic simulation using those calculations. But again I am not suggesting that God is a programmer or even a mathematician. It is we who are that. In effect, God was so lazy that instead of creating a universe, she created us to create the universe. This is not to cast aspersions on the almighty, but merely to illustrate a point.

Our dream worlds are often quite coherent and law abiding, but less so than the 'real' world. All that God has to do is figure some way to allow our dreams to constructively interact with each other so as to enhance their collective coherence and lawfulness and voi-la we have a 'real' world, at least one that can sure fool us! The true mystic would hasten to point out that our individuality is only another aspect of the dream and so there is only one dream anyway. That might be just a bit of a cheat!

Do we need to specify the dream mechanism? We can have dreams in which gravity is completely optional and so are the beavers. And they can have dreams in which we are optional. But in our all-together dream, these things once given, cannot so easily be ignored. Gravity will be gravity, beavers will be beavers. The furniture of the world takes on a life of its own. We may be the sorcerers, but the world is our apprentice, and won't let us forget it.

The beaver has its own innate repertoire of lawful behavior and so does the tree. When they are not in their natural setting of being on the ground, then gravity intervenes, as it is wont to do. But how is that intervention mediated or meditated? One possibility is the avoidance of surprise. If we got up in the morning and saw that the beaver chewed tree was still upright, we would suppose it was a dream and attempt to wake ourselves up. The beaver would be puzzled too. Not wanting to cause us alarm, the tree assumes a supine position. But what does the tree care? Unfortunately, the invocation of spin-2 gravitons and 11-dimensional string theory, helps very little in trying to sort out the problem of who does what to whom and why. All that the physicists really accomplish is to put our most critical faculties to sleep with their fantastic mathematics. History shows that they are much more accomplished at this than best magicians.

rev. 5/28/98

Busy Beavers -- pt. 2

Immaterialism at Work

What we would like to know is why do the planets obey gravity? There might have been no planets. But given that there were going to be wandering stars, could they not just follow a random walk? But even doing that would require a program.

Besides the planets, we also had the Sun and terrestrial gravity and possibly communication satellites to consider. But why and how would these phenomena be placed under just one lawful regime? What necessity drives this invention? It has to do with the continuity and/or depth of nature as an aesthetic and as a constraint. It has to do with the conceivability of the world, something that also pertains to our dreams.

That the world be conceivable is a tautology. That it be so conceivable is a marvel. God has clearly pushed the envelope of logical possibility. What enforces these logical constraints? Does logic have a life of its own, independent of mind or is it the condition or ground for mind?

Logic would be a necessary principle of self-organization in order for there to be coherence and experience.

I would agree with McDowell when he states in his *Mind and World* that we cannot separate coherence from experience. Incoherent experience exists only parasitically wrt normal experience or as its virtual background where it lends itself to creative potentiality as in artistic styles of dementia.

If logic did not already exist, then experience would have invented it and probably did. Logic does not limit experience, but merely provides a convenient skeleton or body for it. Our bodies do have a biologic of their own. Our bodies simply instantiate a convenient biologic. Atoms and bodies belong to the same metaphysical category.

Should the process of instantiation be metaphysically problematic? Not unless we suppose there is a divide between concepts and experience. Our bodies are embodied in experience, and necessarily so. That is not to prohibit bodiless experience, but that would have its own domain, only loosely attached to ours, as we see in dreams, for example.

Does all this settle the issue of planetary motion? It does if we can think of the world as a logical and natural extension of our bodies, which seems to be a logical way to look at things. Anthropomorphism comes with a very respectable intellectual pedigree, so let us not spite our nose for our face.

Which is just to say that when this book is balanced, we will turn out to have been the busiest beavers of all, but we already knew that.

.

rev. 5/28/98

The Tree on the Quad

What is it made of?

Yes, it is of the stuff of dreams, but let us be more specific. The tree does not exist in isolation; it is a relational construct. Recall that the first law of immaterialism is that to exist is to relate. There are no unobserved worlds, for instance.

A tree can only exist in relation to a very complex ecosystem, and behind that ecosystem is an even more complex spiritual ecology. Our world is merely a 3+1D projection or extrusion of the one and only spiritual cosmos.

When I see the tree I am seeing the reconstruction of a particular relational node. It is not that photons are bouncing off the tree and into my eyeball. The photons are just another construct. We see by the light of the spirit, not by the Sun, contrary to some opinion. This is not to denigrate the Sun but merely to remind the scientist that they may not be the final cosmic arbiters.

But let us hasten to add that the fact that I have the particular illusion that I call a tree, is not a cosmic accident. It is part of the greater system of things. My mystical experience of the tree may be closer to the ultimate reality than my normal experience, but clearly the normal experience is not gratuitous either.

Normal experience is shaped and learned through our use of language and socialization. The toddler's experience of the tree may be closer to the mystic's than to ours, and so might be the blind person's experience.

Also our experience of a tree is strongly shaped by our interactions with all related phenomena, i.e. by all the rest of our experience. The visual tree, per se, is the end product of an ongoing filtration process that allows us to have a seemingly localized intercourse with the spirit world. Does this answer every question? The real question is what are we to make of this state of affairs? Does it present us with unrealized opportunities? Of course!

rev. 5/28/98

BioTechnology

Pushing the Paradigm

Apparently we were meant to push the material paradigm to its logical limits, at which point we begin to see through to the other side. Thus when we push physics to the limit, we begin to see quantum cosmology and anthropics. When we push electronics to the limit we get cyberspace. These new vistas start us on the road back to immaterialism from whence we came.

Bioengineering provides the prospect of the eighth day of creation - our brave new world. In general, though, technology makes us more interdependent which is a prerequisite for spiritual reconnection and reintegration. Certainly in the abduction phenomenon the metaphor of hybridization is very common, although there seems to be little contact with the realities of genetic engineering. Are our new spiritual bodies residing in a test-tube somewhere? Shouldn't this be an oxymoron?

One can easily discern metaphysics in the quantum, but it is much harder to see it in a test-tube. This takes us back to the days of alchemy, perhaps. The leap from a material to a spiritual body is perhaps too traumatic for us to take as a civilization and so we must proceed through the much more laborious process of bioengineering. No free passage to paradise, but this may be an improvement on the apocalypse.

We must also ask if there are to be interdisciplinary efforts that will combine biotech with cyberspace and holistic health into a new paradigm. Will biotech just become a residue of the material paradigm or does it contain the seeds of its own transformation? Is there a quantum body in our future? Will the batteries be included? More thought is in order.

.....

[I left out neuroscience because my original motivation was to consider the conflicts between metaphysics and commerce, and neuroscience is not yet on the commercial radar screen, thank goodness. What follows is just a comment.]

Neuroscience and AI are two other mechanistic paradigms, which, by pushing them to their limit, will help us to more clearly discern the advantages of immaterialism. Quantum computing may temporarily muddy these waters, but that too shall pass -- pass over into a purely immaterial science.

.

rev. 5/29/98

The Weird

What Business Is It of Ours?

Societies frown upon rule breaking. When a citizen breaks the law, he must be punished. When natural law is flouted, there is consternation. It sets a bad example, but who should be punished? Since we seem to have no recourse, there is a strong tendency to overlook such infractions. On the other hand, there is also curiosity. A conflict may then arise between the desires to engage and to disengage from the weird. Disengagement is clearly more acceptable. Intercourse with the weird can become a burning issue. It is no secret that science arose from those ashes. To examine those ashes is to examine the pedigree of science, but this is not an historical essay.

Usually the weird can be and is ignored, but there are occasions when that option might become more difficult. A case in point would be when the authorities become engaged. Such an incident would be viewed as a provocation. Ignorance is no longer an option. There can be a response and there can be concealment. There has, however, never been an uncontroverted incident of that nature, and so the laws of nature are still intact, so far as established science is concerned.

To challenge the status quo would be to challenge an established order, and that would require a mandate. One could only appeal to a higher authority, such as Truth. Science claims to be the maintainer of truth, but when it comes to beating these particular bushes, professional scientists are noted by their absence. It would seem that there is a conflict between maintenance and discovery.

If one is concerned to discover truth, one might have to find a way to bypass the maintainers of truth. One could only hope to discover a back door. The Weird is the back door to the Truth, but where is the back door to the Weird? The path becomes obscure, or perhaps it is just too obvious.

Why should there be a door and why should it be unlocked? If there is a higher cosmic order, then there would always be some means for individual access, but the access would have to be restricted unless there were to be a subversion of one order by the other. The possibility of an ultimate subversion is simply the subject of eschatology. To open the door, any door, is tantamount to pulling the plug. It is something that one would not undertake without provocation.

On the other hand, if there is a door and it is unlocked, is that not sufficient provocation by itself? What would justify our turning away? Is this the temptation of the devil? There is one way to find out.

.

| [Contents](#) |

rev. 5/31/98

Concerned Citizen

Ron,

You and I have two fairly separate interests. Yours is military phenomenology and mine is metaphysics. However, these interests appear to overlap and even conflict with regard to popular UFO sentiment. You see that sentiment as a nuisance and I see it as potentially significant.

You have been very dismissive of this sentiment, and your expertise and experience should provide you with a solid and perhaps unique basis for making that judgement. However, my attempts to solicit additional supporting information from you have been unsuccessful.

Our differences may be inconsequential to the normal business of the government, but there may have been or may be circumstances in which you will be called upon to render your opinions on a matter related to the UFO phenomenon. Strictly speaking, that would be none of my business. However, as you well know, I am often inclined toward the role of the concerned citizen.

As such I have provided you with some significant and novel insights into the UFO phenomenon. I am not aware that these insights have had any influence on your thinking on this topic. But neither have I been able to ascertain anything else that may have influenced your thinking. I can only conclude that it is expediency rather than experience that informs your statements. Or one might suppose that your experience has inclined you toward expediency rather than toward thoughtfulness.

That expedience rules is hardly surprising. Nonetheless, there are still the two of us and the Internet. Is there something in your employment contract or in your constitution that would prevent us from discussing this issue with some deliberation and candor and placing the results on the web? Would this compromise either your career or national security?

Dan

rev. 6/3/98

Linkages

'Going for Broke'

& Piercing the Quantum Veil

People have wondered how it is that one thing is able to refer to another. This also has to do with the problem of meaning, intention and perhaps consciousness itself.

In an immaterial world, the only basis for existence is relational. To exist is to participate in an unlimited network of felt meaning. Things are composed entirely of their relations. They are ad hoc nodes in a relational manifold. This manifold is simply the ground of being.

In a material world there are only spatial relations. In order to objectify spatial relations, one must introduce a measuring system along with a coordinate system. These systems are abstractions rather than objects. The physical status of space itself is far from being objectively defined outside the contexts of various mathematical theories.

Mathematics is a seemingly self-contained, self-referential system, but is it? The simplest mathematical symbols can be manipulated mechanically as in a calculator. If our minds are glorified calculators, then we should suppose that simple calculators should have a simple numerical sense.

Let us suppose we have a robot with a visual system that is inspecting and counting widgets coming off an assembly line. By analogy with ourselves, we might suppose that the robot would have a concept of number. But how would that work? The brain of the robot is composed entirely of identical switches. An individual switch might have a sense of being on or off, but how would that translate into anything more complex? How would the states of multiple switches become meaningful except to someone reading the output?

One set of switches might be programmed to interpret the state of another set of switches, but unless you were the programmer how would you know that? It might just be a random wiring. Suppose that you are computing on a virtual machine that is time-sharing on various random physical machines. If there is any sensibility, does it reside in the machines or in the program? Is it in a physical copy of the program or in its abstract design?

Let us come back to numbers. Suppose there are a pair similar items on a table. By what means do we pair those items? Somehow we associate those individual items with each other and then with the numeral '2.' Could this be a mechanical process? Where in that process would the notion of a pair reside? Is it a simple or complex notion? If we look at the developmental process that goes into the human ability to count, we would have to consider it to be complex. For instance can we understand the notion of a number without understanding the process of counting? These two concepts are mutually dependent in a way that might be the subject of a philosophical essay. What does that say about the mechanics of numerical sense?

The concept of a pair is the simplest of relational concepts. There exists an association between two items, but where does the association reside? We could build a robot that would react in a special way just to the stimulus of finding paired objects in its field of vision. Its response would constitute a third item now associated with the first two. Where does the pairing exist? Is it in the objects or in the response? Suppose the response is just accidental.

If the two objects do not interact in any way, how can we suppose that their association has an independent reality? The association might have an objective existence by virtue of their being in proximity to each other, either temporally or spatially. One might say that a pair of green meteors hit the U.S. in the past century. That would be a highly arbitrary, subjective association. It might exist only in the mind of the speaker, yet its subjectivity is only a matter of degree.

We generally suppose that Mars has a pair of natural satellites, independent of whether we had ever invented telescopes. But would that be a fact independent of the concept of a satellite? Consider a solar system in an uninhabited galaxy in which the fourth planet from the star has a pair of satellites. Such a situation might exist.

Is not existence itself a concept? If there were a hedgehog inhabiting each of the putative satellites, how would that effect the question of existence?

The fact that we only ever find macroscopic things in a definite state of existence leads us to suppose that existence is definite and purely objective. But could there be a macro quantum world where we could observe superposition and collapse of wave functions? Would there be anything to prevent the extension of quantum physics to our experienced world?

We could argue that such an extension would be incompatible with our existence. It would not be a possible experiential world. Our continued existence is preventing the world from dissolving back into the logical chaos from whence it came.

It comes to pass that the products of our minds seem to take on a greater stability than mind itself. This is our necessary illusion. We lose track of the linkage between mind and matter.

Quantum computing will probably be a necessary step in breaking out of our material box. Cells act as quantum computers, a la Penrose. Genetic engineering and quantum computing will be linked together and to the cyberspace. QCs with super Squids will allow us to directly manipulate virtual realities that will become our new realities.

The quantum realm may not be epiphenomenal. It may be a universal touchstone that connects realities. This would be more like my first ideas on the quantum connection back at UM. How does the UFO phenomenon respect that portal? It would seem that they have broken down the door.

It is not Plato land on the other side of the quantum. It is the rest of the cosmos. Is that the eye of the needle for us? We will have to thread it with silver and gold - spirit and economics. It will be the convergence of those two movers.

Piercing the quantum veil. Could this be connected with the extra dimensions? One might

hope for something a little more esoteric. Our minds can jump through but our bodies get left behind. How do they and we walk through walls? It may have to do with the greater collectivity of their thought. The smallness of Plank's h may be relative to the disjointedness of our minds. That is the mesh of our reality net. It has to be small enough to keep our small minds from slipping through.

The problem is to find how the figurative quantum connects with the real quantum and then use our ingenuity and economics to pry it open. This is the hard way to reintegrate mind and body, and it may be the only way to do it without a real eschaton. Anyone got a better idea? How many ways are there to skin Schrodinger's cat?

Perhaps the QCs will powerful enough to simulate genetic engineering in the context of cellular dynamics. Also the QCs could facilitate our mind linkage in various ways that would be more or less direct.

rev. 6/26/98

Three Problems

Anomalies, UFO's and the Aviary

A civilization which has a desire to survive will know that what it does not know can hurt it. The bullet that we do not see is the one that will kill us. The civilization that lulls itself into thinking that it has a handle on absolute knowledge is putting itself at risk to the unknown. When it comes to collecting intelligence we can never make assumptions. We must always be looking beyond the pale, watching our backside and keeping our eyes on the horizon for warning signs. To do otherwise is foolhardy and suicidal.

Our ability to watch our backside has been seriously eroded by the politics surrounding the UFO phenomenon. The blame for this situation can be placed upon our over-reliance on a singular and dated vision of science. The scientific establishment reckons that any alternative form of knowledge is a threat to its continued domination and so it fosters a climate of ridicule surrounding non-conforming ideas and phenomena. This is not a healthy situation. If there ever was a place for pluralism it should be in our intelligence gathering processes.

The thinking directed to the issue of anomalous phenomena has become so polarized and politicized that rationality has all but vanished. Rationality has been replaced by suspicion and vindictiveness in virtually all of the discourse surrounding this topic. Thus has our intelligence gathering ability been severely compromised. This constitutes a potentially enormous problem with which we apparently lack the will to cope.

Against this backdrop of irrationality and inaction, there is, nonetheless, an opportunity to take a small but perhaps significant step toward a greater understanding. There exists a microcosm wherein all of the problems noted above find a focussed and concrete expression. I am referring to the now notorious 'Aviary.' The Aviary is a group of individuals with significant government connections who have demonstrated a long-term interest in anomalous phenomena and who cloak themselves in secrecy.

I suggest a concerted public effort to examine the sources and methods of this group in order to bring it to a greater public accountability. The success or failure of this rather modest undertaking will be a test of our resolve to ever shed light and reason on the much larger problem confronting us. The primary strategy will simply be to confront the individuals and their government connections with our concerns and a demand for a public accounting. There will be a grass-roots effort to gather public support.

rev. 5/6/98

The Government and UFO's

Protocol for Truth

How well has the government responded to the popular belief that it is concealing evidence of ufo's? Here is what seems to be the standard conservative view: Since there is no basis for the popular belief to begin with, any attempted response on the part of the government is only likely to stir that pot and thus be counter-productive. The opposing view is that by inadequately responding, the government is contributing to the perception of a cover-up. In most situations the conservative position naturally tends to dominate and that has been the case in this context. However, I happen to support the 'liberal' view that there is at least some justification for the perception of a cover-up and that something ought to be done about it. Furthermore, I believe that I am in a position to do so, but any effective action will require the cooperation of people both inside and outside the government.

Much effort has already been expended to expose a cover-up, generating some significant results. Clearly there have been numerous instances of concealment of ufo-type data, and there have been documented recommendations to withhold such data from the public. What has not been demonstrated is that there is an ongoing concerted cover-up. If there were such a thing, it would require a concerted effort to expose it, and that is what I suggest.

I recommend a significant departure from the past efforts, and that is to use a more structural approach for the inquiry. By this I mean that we should give primary consideration to the infrastructure that would be necessary to maintain a cover-up. This would entail taking a more deductive, and therefore speculative, approach to the problem. The alternative is to keep looking for very small needles in a very big haystack. What then can we reasonably deduce about the alleged cover-up just at the outset?

The first thing to consider is its unreasonable effectiveness. It is this unreasonableness that is the basis of most skepticism. Conspiracy believers have generally concluded that the cover-up is being maintained by a sinister group of humans in alliance with an equally sinister group of aliens bent on human conquest. This might be true, and if so there is precious little we could do about it at this late date, short of praying for divine intervention.

The alternative theory is that there is something less sinister afoot. However, in order to rationalize the secrecy there must be a disturbing element that has to be concealed. The preferred scenario here is that we are coming into contact with a vastly superior civilization which is orchestrating our gradual acculturation. But frankly, it is difficult to see how such a scenario avoids the previous sinister interpretation. Which is worse, the subversive or the conquistador, and is there a difference?

There is another problem with the idea of cultural contact. This is the problem of timing. Why now? Most ufologists who have considered this problem have come to the following conclusion. Given the enormous age of the universe, it is very unlikely that this contact would have been the first for the planet. At the very least there would have been a long term monitoring process. Much more likely is it that there would have been timely interventions in

the otherwise random process of evolution, culminating finally, now, in an open contact. This is about as far as ordinary speculation can go. Beyond this point one quickly becomes ensnared in controversy of a distinctly religious nature, as should be obvious.

However, I am suggesting that if we are to truly grapple with the problem of ufo's, then we must be prepared to go beyond the ordinary. You cannot employ ordinary means in dealing with the extraordinary. If we are to deal with what is usually alleged to be a 'superior culture' we will, at the very least, have to be willing to suspend many of our current beliefs. And this is much more easily said than done.

In my estimation it is the failure of the imagination that has been the signal failure of ufology. Let me elaborate. The immediate response to the extraordinary is fright. Beyond fright there is curiosity. One can poke at the phenomenon from the outside, or one can jump right into it. This is the distinction between ufologists and contactees. Both of these approaches lack imagination.

Effective imagination comes in the proper mixing of the known with the unknown. I am suggesting a more anthropological approach to the problem, as opposed to the purely scientific approach or to the act of just going native.

We have the known and the unknown, and somehow they are going to intersect. The only question is when, where and how. To facilitate the process, one must anticipate the answer, and ultimately that means being the answer. To attempt to prophesy about the unknown is the most direct way to come to understand and explain it. The mystic and scientist will have an equally difficult time accepting this, but they are not even trying to understand it, are they?

In our prophetic tradition, we have come to consider the prophet to be either a quack or a divine. I would suggest rather that it means being in approximately the right place at the right time with a mild propensity to stick one's neck out. All the rest is just history.

That brings us back to the immediate problem of confronting the cover-up. The only sword at our disposal is the truth, and in the prophetic tradition one is obliged to use a capital 'T'. If you are going to play the game you have to place your bet on the table of those who are already playing. Let me explain or at least summarize the situation.

There is a disturbing Truth that is justifiably being withheld from us. The only way to pry it out is to reasonably guess what it is and then demonstrate that others can be convinced of it, and so it is no longer being kept secret. In the natural course of events, the former keepers of the Truth will then join in its dissemination. This is both the most direct and most rational way for us to proceed, especially where all other approaches have proven inadequate.

If the cover-up is effective, as it obviously has been, investigation alone will not penetrate it. The investigation must be accompanied by a successful networking of the suspected Truth. This is the only way to bring about its gradual revelation. This is the natural, built-in protocol that must be followed. To find the truth, you must become the truth, you must be its prophet. This is my best estimate of the situation.

Ufology Confronts Darwin

Back to Basics

Let us examine the fundamentals of Ufology. The received view is that we have been visited at least periodically by an ancient federation of space-faring cultures utilizing incredibly advanced technologies. It is quite probable that they have intervened extensively in the evolution of life on this planet. We are now on the threshold of induction into this galactic civilization.

Many people have considerable difficulty accepting this view. The main source of difficulty lies in not understanding the possible motivation for the expected transition from clandestine contact to open contact. Why should there be such a unique and dramatic episode in an otherwise very gradual and long-term process of biological and cultural engineering? The other side of this question is why would the space culture engage in such a program to begin with?

Convincing arguments have not been forthcoming. There is a fundamental inconsistency in any scenario involving ET contact. If open contact is possible, why has it not already occurred? The best answer is that we have not been ready. But if we never have been ready, why should we ever expect to be?

All life forms on this planet have evolved as a single ecosystem. Isolation of species is the exception rather than the rule. The biggest exception may have been the absence of Homo sapiens from the Western Hemisphere. However, once the contact was made it became robust, in the sense that cultural disparity between hemispheres never greatly exceeded the disparity within each hemisphere. Ufologists are suggesting a very different and ad hoc model for cosmic evolution, and it does not fit anything we know or can readily imagine.

But even the notion of any sort of cosmic evolution leads to great difficulty according to modern science. The concept of evolution was the essential concept of modern science. It is what allowed us to set aside the idea of creation and design. With ufology, scientists correctly surmise that religion is sneaking in the back door, despite the protests of ufologists.

That there might be a robust mechanism for cosmic evolution, rather than just sporadic planetary ecosystems, would apparently push the already strained mechanics of evolution well beyond the breaking point. Mind you, I do not object to this development, but let us consider the consequences.

My own thinking along these lines was greatly stimulated by the development of the Anthropic Cosmological Principle back in the '60's. Most observers agree that this principle arising out of science poses a serious challenge to the modern scientific worldview by raising the specter of design. For this reason scientists continue to ignore it. Ufology just pushes that challenge a good deal further.

There is a very strong tendency to try to keep problems separate. It is the modern way to take a piecemeal approach to understanding and solving problems. But those of us also concerned

with the shifting of paradigms realize that there are limits to analysis and that we may already be well beyond the stage where the costs of the old paradigm begin to outweigh its benefits.

Besides the challenge of Anthropics, there is also the apparently intractable mind-body problem. Most students of that problem agree that its solution does not lie within the grasp of the scientific paradigm. The conundrum of consciousness ought to be giving us a big push in the direction where any new paradigm must lie.

The problems posed by anthropics, consciousness and ufology all suggest that life and mind must comprise a fundamental aspect of reality. They are not just an accident of chemistry. At the very least we must reconsider the problem of cosmic design.

That there is a hidden plan or design is our most ancient belief, now being painfully resurrected. The proponents of design must acknowledge that it has been well hidden. The world has every appearance of being natural rather than 'supernatural.' Yet when one probes the mysteries of nature with an open mind, one must consider that Nature might have an Author, an author who chose a strange method of concealment.

The mystagogues will let the matter rest as an ineffable mystery. Is that not a failure of imagination and nerve? There is a fairly obvious path to understanding. Simply suppose that mind is the fundamental aspect of reality. This is not an easy concept for those of us weaned on Darwinism. But consider that the mere existence of either mind or matter is highly improbable. We should first ask why there should be anything at all? Why not nothing?

But does nothing make any more sense than something? To prevent anything there would have to be prohibition on everything. Nothing is then not really nothing, but rather a universal prohibition, which is a rather mentalistic something at that. As they say, any law is meant to be broken, the act of which would also be mental. Mind can hardly prohibit mind. Already we are well on the way to a self-creating and self-manifesting cosmic imagination, and where are the laws of physics? If we suppose that physics arose as a separate reality, we are right back with the mind-body problem. But aren't we missing the First Cause? Not really. Time is an aspect of imagination beyond which there can be no first or last. The Alpha and the Omega are bound together in 'eternity.' They are the cosmic bootstrap. Is all of this any less rational than the 'Big Bang?' Only for those who are hopelessly trapped in an old paradigm.

What does this excursion into metaphysics have to say to ufology? It says that ufology is operating on the cusp between two paradigms, and ignoring that fact will result in the confusion we have been seeing. Very few ufologists follow the path of rocket science. ET's ignore the barriers of our space and time as easily as they ignore the walls of our buildings. Does this not very strongly suggest that we are dealing with parallel realities, neither of which can be absolutely objective? Around these phenomena the walls of our own 'reality' are thinner. We begin to see through the veil and back into the cosmic imagination.

The remaining question is what can we do about all this. Well, plenty!

.

rev. 3/22/98

UFO's & the Aquarium

The modern scientific worldview contains so many inconsistencies that it ought to collapse spontaneously under their weight, but realistically that might not happen even within the next century. The interest we have vested in the scientific view is so great that it will require a strong external stimulus to dislodge it from its preeminent position within any reasonable time span.

A purely rational argument to demonstrate the greater intrinsic truth of immaterialism over materialism has and will continue to fall on deaf ears until some tangible and dramatic proof is brought forward. It is only belatedly and with considerable trepidation that I have cast in my lot with ufology. Nonetheless, I believe the commitment to be irreversible. Within the ufo arena I am further committed to the belief in a cover-up. By simply considering the logic and politics of immaterialism, I end up in a rather tight corner. So be it. Now that I am here, how can I possibly fight my way out of this corner?

My only recourse is to penetrate the alleged cover-up, and do so in a public manner. Many people have already made valiant efforts in this grail quest and apparently failed, but I am not convinced that every stone has been properly turned. I am counting on the fact that having a better handle on the nature of the secret being concealed will facilitate my quest.

The problem facing the would-be Galahads is that there is a double veil between the truth and us. The grail is not some ufo being kept in cold storage. The ufo's are just another veil. The problem is to penetrate to the meaning of the phenomenon. The meaning is not that we are a cosmic tourist attraction, although that might not be completely off base. Rather, the ufo's are participating somewhat indirectly in our cosmic/spiritual commencement. They are facilitating the clandestine preparations for an event of apocalyptic proportions -- the end of the old world and the creation of the new world. We are at the cusp between two realities, neither of which has a material foundation.

The only fault of ufology has been to grossly underestimate both the gravity and levity of our situation. We are changing worlds the way a caterpillar changes its form. Both worlds are illusory except for the life they contain which transcends all illusion. Knowing what is being kept secret and why, will surely help in its disclosure.

rev. 3/22/98

Why Ufo's Cannot Exist

Just ask God!

Ufo's can't exist, because if they did exist we would know about them. This argument is perfectly reasonable, but its force is reduced considerably by recognizing that it is also the primary rationale for atheism.

Even the atheists will have to concede that this consideration poses a problem for ufo skeptics. The primary force behind ufo skepticism is ridicule, but very few are the atheists who consider the question of God's existence to be ridiculous. To the contrary, most atheists are all too serious about their atheism.

Why then is the question of ufo's treated so differently from the question of God? The reason is to be found in the dualism that is inherent to theism. Perhaps the deepest mystery of the human psyche is our passion for perfection, a passion that is integral to most other passions. God becomes the primary posit of that passion, and that is then the basis of dualism. If there is something that is not mundane then it must either be explicitly divine or else it must be satanic.

Ufo's are obviously neither mundane nor divine, therefor one should avoid all contact. Ufologists vainly argue that we should treat ufo's as a natural or scientific phenomenon, but neither the theist nor the scientist is to be persuaded. Despite the best efforts of ufologists, the taint of untouchability cannot be removed from the phenomenon. The ridicule referred to above is then a cover for our much darker suspicions, suspicions that are readily apparent in the ubiquitous popular treatments of the subject.

ET's are not angels and they are not rocket jockeys. The only reasonable alternative is that they are cosmic shock troops. They are here to awaken us to a much larger reality. Their initial target was the mundane power structure that was only too eager to cooperate in the subsequent cover-up and disinformation. With their cover in place, the ET's could undertake a broader program of cultural manipulation stopping short of disclosure. This approach may seem undignified and ungodly, but it has been effective. The barely concealed message is that our deepest assumptions, both scientific and religious are in for very serious revision.

The popular conception, being fueled by the media is that the ET's are attacking us, but actually they are attacking our belief structure, a fact with which we have even more difficulty dealing. The inevitable apocalypse that we face is much more psychological than physical. The ultimate outcome is our transcendence of the mundane. We should celebrate, but our perfectly natural reaction is instead to be petrified.

Why does God have to deal with us in such a devious fashion? The answer brings us back to the beginning. A primary attribute of God has been concealment, and most people would frankly prefer it to remain so. However, ultimate transcendence is the inevitable outcome of the human condition and this speaks to our otherwise inexplicable passion for perfection, misguided though it usually is.

Our sojourn with earth was never intended to be a permanent arrangement. This is not to say that the earth is disposable, but rather it is to be recycled into our new heaven and new earth. The recycling is not intended to be a spectator event. We will be the movers and shakers. In the process we will gain a much more accurate impression of the true nature of God. The truth will be vastly more subtle, more awesome and more personal than we can presently imagine. Our self-transformation will be the centerpiece of cosmic regeneration. We are the cosmic retards. But the scariest part is the simple fact that the last shall become the first. Wait till you see the looks on our faces!

rev. 3/29/98

Going with the Flow

The Path to Disclosure

If there were not a continuing concealment of government originated ufo information, then we would already have a definitive history of the subject. It would not now be the mystery that it has become. There is no question that a great deal more information was generated in government channels than has since been recovered, even though the amount recovered is considerable.

The only possible rejoinder is that this information has simply been lost in the cracks of the bureaucracy through general neglect and incompetence. It is very hard to believe, given the intense and widespread interest in the subject extending now over many decades. This response simply does not take into account the most basic of human traits. Humans are renowned for collecting curiosities. Ufo memorabilia would have been the most tempting of collectibles over all those years. Consider the zealous collecting of ufo information that has occurred on the outside. Unless the inside information were actively being contained, it would have been collated and leaked out long ago.

Most people, on the other hand, find it very difficult to believe that any human organization would be able to contain such important information. I agree, however there are two main caveats. The present concealment process is only an offshoot of the historical self-concealment of cosmic intelligence. Also the nature of the information being concealed militates against its easy dissemination.

The simple line of reasoning given above already provides a useful handle on the functioning of an anomalies network. Let us summarize the situation. It is not reasonable to doubt that a great deal of ufo information has been collected and generated within government circles over many decades. A significant but obviously small portion of this information has been diligently collated on the outside over the years. The bulk of the information has been consolidated and sequestered on the inside.

The anomalies network had a very steep learning curve for quite a few years, but as the insiders and us outsiders have become acclimated to the situation its work has been simplified, so much so that it can proceed on course despite the subsequent removal of the cold-war umbrella of secrecy.

It was that umbrella of coercive secrecy that enabled the network to cover its early confusion and ineptitude. As its understanding increased, the collection requirements became much more focussed and sophisticated. The learning process was not unilateral. The ET's were also becoming more adept at implementing their side of the cosmic agenda in coordination with both the insiders and outsiders among us humans. As we progress along this path the lines of demarcation between insiders and outsiders is becoming increasingly blurred without there being a definitive breach of security. There is instead a plethora of more or less accurate speculation, the rate of accuracy diminishing as one proceeds toward the periphery and into the media.

The content of the agenda is the main question. There would not be the considerable degree of cooperation necessary for concealment unless the agenda were perceived to be primarily in our best interest. There must be a progression toward an inevitable beneficial outcome that would include a greater knowledge of our place in the cosmos. There are though some significant possibilities of trauma involved in this transition which can be minimized by appropriate preparation prior to the dramatic disclosures. The path toward deliberate disclosure must be perceived to be expeditious by all parties, otherwise there would be preemptive unilateral disclosures.

For the most part we can rest assured that we are in good hands, up to and including those of God. However, the main transformation will require the participation of almost every one of us. The clandestine preparations are directed primarily toward ensuring our full and prompt participation. The recruitment effort moves as quickly as the secrecy allows. The still growing ufology movement and the expanding coverage by the entertainment media are testimonials to its success.

What has just been given is very straightforward and elementary analysis, yet it is an analysis that has managed to elude almost every other researcher, as far as I am presently aware. This calls for some explanation. The main cause of the oversight is the dualistic and adversarial thinking that is endemic to modern culture. The continuing need for secrecy has generated an 'us vs. them' mentality and a general sense of paranoia that pervades ufology. This is quite understandable, but that does not make it correct. Those very few who espouse similar views are easily dismissed as being hopelessly naïve and idealistic. Such views are not conducive to aggressive inquiry.

I mentioned a recruitment effort. Most ufologists would find this idea laughable based on their continuing unsuccessful efforts at penetration. Nonetheless their considerable efforts do attract public attention which provides for indirect awareness and a more subtle form of recruitment in the form of 'entrainment' while still maintaining a basic cover.

The only way to penetrate the cover and not maintain a code of silence is to anticipate the inevitable disclosure process. This has been the strategy of the aquarium since its inception over six years ago. This is a networking strategy that is actually aimed at preempting the disclosure, but only in the appropriate time and manner. One might think that there would be much competition for such an auspicious undertaking, but the actual playing field is still rather small and the various players tend to slide into their appropriate roles. Only toward the very end will there be any significant attempts at claim jumping, but by then the situation will already have been solidified.

.

rev. 3/31/98

The Birds and the Fish

Opening Gambit

Here is a summary of the present understanding:

- There has been concealment of ufo related information.
- There will be a disclosure process and it will require extensive human participation.
- The aquarium network is a likely vehicle for any such participatory disclosure.
- In light of the above, the aquarium is proceeding with an inquiry

Before venturing very far into the hinterland, the aquarium must set its own house in order, and we should proceed on that score with an eye to our neighbors in the aviary. The extensive experience of the aviary with ufo networking in and out of the government provides an invaluable resource. Every effort should be made to utilize that resource. It will not be easy to convince individual members that a new networking initiative will meet with any greater success than they have apparently already had, but reasonable support and input from the aviary will be essential to our entire outreach effort.

General questions for the avians:

- To what extent, to what end and by whom has their collective wisdom previously been collated?
- What are their beliefs concerning the concealment of ufo and related data?
- How does the aviary fit into the "anomalies network?"
- If they were given the proper authority, how would they conduct an inquiry into the government concealment?

A principle tasking would be to review with the avians the list of potential interviewees and interview questions.

rev. 4/1/98

Interview Letter

Another approach

There continues to be a widespread interest in the possible existence of extraterrestrial intelligence. There is controversy concerning whether the Earth might already have been contacted or even visited by other beings. We humans naturally have a keen desire to know more about what may lie beyond our earthly existence in both the spatial and spiritual senses.

In recent decades a great deal of information concerning these questions has become available, and in recent years the government has been making an effort to address the issue that it might ever have concealed relevant information.

I am one of a network of private citizens who are helping to piece together the relevant historical details, which we then make available to other researchers and scholars. Our approach differs from previous efforts in its greater emphasis on the infrastructure and logistics of the collection and analysis of anomalous data of the most general sort. Much of this would involve phenomena of a rather less sensational nature than ufo's per se. This explains our eclectic list of interview subjects.

Even if we don't find any little green or gray men in the utility closets, we feel that we will have made a significant contribution to resolving the concerns and suspicions of a good many citizens. It is with this in mind that we look forward to your cooperation.

.

rev. 4/5/98

Aquarium Mission

Taking back the Night

As the Aquarium looks forward to an expanded networking initiative it is timely to review our mission statement, or even lack thereof, to wit:

Humanity continues in its accelerated confrontation with new challenges and opportunities. Like those dialecticians of old, I believe that at some point this quantity of change will take on a qualitative dimension of its own. Much more recently the McKennas and others speak of an omega point or 'time wave zero' where our historical acceleration leads us into a new mode of existence and reality entirely. I would refer to this as our eschaton. This is the point at which our destiny becomes historicized, at which point time ceases from its linear imperative. Or this could simply be the point where we exceed our global stress limit and fall victim to a collective psychotic break. This would be our ultimate challenge.

To meet this challenge, we will need to utilize every possible resource, and some that may not even seem possible. Clearly the resources that will be of transcendent value will be our imaginations and creativity. In this regard there are some very significant obstacles, namely any belief system that exercises undue constraint on our creativity. The greatest culprit at this point in history is our not so modern scientific worldview.

I am not suggesting that we should repeal the law of gravity tomorrow, but I would consider repealing it next year, if we can get our act together. To put it another way, we will have to make up our minds rather quickly as to whether matter exists to serve spirit or spirit exists to serve matter. If the latter is the case, then we might as well throw in the towel right now. This place was not meant for us, we don't belong here, and let's get the heck out before it's too late. Shades of Heaven's Gate? You betcha! But that will not be necessary, because we already know from the depths of our being that spirit is the alpha and omega of all existence. If 13.7% of the scientists in 1998 happen to believe otherwise, I would highly recommend this as a time for them to recalibrate their slide rules. And if you are looking for the biggest bargain in history, consider faith, its price has never been lower than right now.

But how can I be so sure that this is finally the time and place where we are going to meet our maker? It may be just a hunch now, but I am looking forward to proving it to you.

Consider the politics and psychology of the anomalous. We humans may be the most curious of animals, but we also place a very high value on normalcy and stability. The weird is one of our greatest of luxuries, but is valued only as such. We have gone to the ends of the world in search of mystery, but we sure as heck don't want it to come searching for us. How many people would give their life savings for a ride in a flying saucer, and how many abductees would give their life savings to not have to ride in a flying saucer? Everything in its proper place. No longhairs in the cockpit, thank you.

Consider also our attachment to the laws of physics. If the physical is an epiphenomenon of the spiritual, why is physics so unforgiving? It is simply that we have grown accustomed to

and vitally dependent upon that system of things. The lone magician has a very steep climb to ever get out of this hole we have dug for ourselves.

The magician faces a phalanx of conservatism of the most rabid and sometimes vicious sort. Those of us who aspire to be the magicians of a new heaven and a new earth, clearly we need a deus ex machina. And that is what I sometimes claim to be, in moments of indiscretion.

I have a trick up my sleeve. Some people might call it Roswell, but you can call it anything you like. It is a Trojan horse from the larger reality, planted here years ago. I now claim it by eminent domain.

The door to this mystery treasure is well hidden, but so is the door to heaven, and yet people manage to crash in there all the time. But rather than crashing, I would suggest following the path. There is a path of crumbs. There is a trail of little anomalies leading to the big anomaly. There is even a paper trail, but first we have to consider the anomalies from all perspectives, from the point of view of God, the magicians and those rascally conservatives who only want to keep the airplanes flying.

Those conservatives have all the foibles of the rest of us but manage to be rather more discrete. They have our curiosity and they can afford to collect rare oddities like crashed saucers and do it without fanfare. If the rest of us were to find out, we would exercise our eminent domain and spoil their trophy case.

But there is another side to the anomaly business, and that is where the vulnerability lies. The other side is money and deception of the cosmic kind. A Trojan horse must be designed to be very appealing to its targets, so that they won't just lock it up in a case and throw away the key. There is nothing more appealing to the modern mind than a good gadget, especially one that is saleable. Imagine a silver saucer filled with high-tech goodies -- we can have our trophy and sell it too, but we do have to be discrete.

And there is a darker side. Now that we have our golden goose, how can we prevent our enemies down here from taking it away, or our enemies up there from taking it back? We'll need a whole new defense system. Now we have the space race, star wars, black projects, and proprietary commercial spin-offs. Modern civilization has been co-opted into the cosmic game plan almost unwittingly, with multiple layers of self-deception. What a scam! But now comes da boss to say the party is over, too bad!

There were a few of the insiders who were not so easily duped, something smelled fishy. They remembered their history lessons and started to do some serious thinking. They looked this gift horse in the mouth and were sore afraid. Instead of baubles they saw a rending of the veil. Instead of high tech they saw some very old tech. Pandora's box was open and the reaper was on his way. We were the fatted calves being prepared for the harvest in the sky.

They were right to be afraid, but their worst fears were misplaced. The eschaton is upon us but so is the second coming, and they turn out to be virtually one and the same. This is a risky game designed like a thrill ride. The closer our encounter with the eschaton the bigger will be our boost into the wild blue. It is the physics of the gravity sling, but on a spiritual level, of course. We wonder if this ride has ever been tested. We question the Architect.

That is the story in a nutshell. Myself, I'm a cautious conservative guy, but I can also see that our destiny beckons. Let's not keep her waiting too long.

rev. 4/8/98

Intelligence & the Anomalous

PsiCops vs. CsiCops

The CSICOPians are the Keepers of the Faith for the scientific establishment. Their job is to define scientific correctness, to keep the faithful from straying too far from the straight and narrow, and to make sure that our disposable national income is directed toward Big Science and not to the local acupuncturist. In our developing cultural ambience of post-modernism, the CSICOPians might envy the lesser challenges faced by their counterpart at the Vatican, Cardinal Ratzinger.

The anomalous finds no friends at CSICOP. But one might wonder whether there exists another arena where other interests might come to bear on those things that go bump in the night?

Operating out of the public eye, our intelligencers work under a different and broader mandate. Their job is to look for chinks in our armor. They cannot afford to be quite so doctrinaire or even cavalier in their scrutiny of unconventional phenomena. They cannot fall back on general principles when it comes to engaging with forces that might operate under a different set of assumptions.

Theirs is not an easy job. They must protect us from potential threats that mainstream culture believes should not exist. They must protect us in our slumber of materialism from the shadows that come creeping in the metaphysical twilight. Ironically, our own disbelief in these phenomena is our primary line of defense, but on the rare occasions when that fails, our PsiCops must be able to respond. Even in their own profession these folks have to operate on the margins and so they must be given unusual latitudes. They would have to develop their own informal infrastructure and reporting channels. This is what I refer to as the Anomalies Network.

The anomalies network is the catchall for the uncorrelated targets, unknown phenomena and even for the unusual personalities with which such phenomena are not uncommonly associated. That there should exist an anomalies network is a possibility that has not been lost upon the producers of our entertainment media, sometimes redounding to their own good fortune. This treatment may leave us entertained, but not particularly enlightened. And this is where the matter presently rests as far as the public is concerned. To proceed further would require a political authority sufficient to at least partially raise the lid on the anomalies network.

.

| [Contents](#) |

rev. 4/9/98

Anomalies Network

Some Questions

I have two data related questions for the folks in the anomalies network:

- Does their data challenge the scientific paradigm?
- Does their data support the extraterrestrial hypothesis?

I also have some procedural questions:

- What restrictions are placed on their collections?
- Are they either provided or denied access to data repositories?
- Generally describe the informal reporting channels. To what extent do they include Congress and the President?

These are straightforward questions, and I would hope to get direct answers; however, that is probably being a bit optimistic, at least at the outset.

rev. 4/9/98

Collecting on the Margin

Postmodern Intelligence

In the fog of the information battle zone, the question still remains -- who is do what to whom and why? The only problem is that there now seem to be more players with more agendas.

The original purpose of a battle was to draw up sides. It always ended up as just them and us. It seems like those were the good old days. The two dimensional battlefield has been replaced with an infinite dimensional information space. The combinatorial possibilities abound. The threat of being blind-sided is compounded.

Instead of combatants there are simply loci of intelligence. Each locus attempts to impose its reality on the others. That is the only territorial imperative.

Finding the high ground becomes the first and then the only objective. This is the purpose of the battle. This is the only way to bring order out of the chaos. The battle is the recreation. It is the dragon fight of old. Each battle results in a new creation, which is a redefining and a recommanding of the high ground.

Our history is that battle, and one may believe that there is a resolution. The fog will dissipate and the emblem will be visible from afar.

Each battle has its hamburger hill with its slippery slopes. That is where the new intelligence meets the old. This is where we do our homage and get on with our business.

Keeping an Eye on the Future

You Gotta Know Your Territory

If the future were no surprise, life would be no fun, but we do like to keep things in proportion and we don't necessarily want the future to get out of hand. We keep a wary eye on things, particularly on things at the margin.

Ah, but where is the margin if it is not everywhere? Well, if the future is something more than blind chance then it partakes of fate and so it will have a will of its own. It will have a signature. There always are premonitions, particularly in retrospect.

When the future is preparing to throw us a curve, that it just when things will look the darkest because the way ahead will appear blocked. Our usual vision will begin to fail, and that can be scary. That is when we forgo our eyes and engage our antennae.

But this is not a game of solitaire. The stakes are high and there are many players. The players define the playing field. There will be two kinds of players -- the seers and the feelers. The feelers go by the seats of their pants. They work from within the phenomena from within

the future. Their role is to be the fifth column for the future. The seers do their work from a greater remove. They are the heralds. The type of role that each of us plays may be arbitrary and subject to change and combination.

The ill-defined boundary between these two functionalities defines the critical margin. That is where the future becomes defined. That is where our new vision will be developed and deployed.

The future will come to us as an alien intelligence that we must accommodate and assimilate, lest we be its fodder. Our resistance serves to better define the shape of things to come. The alienation will be temporary.

The future as alien will have its hostages and to discover them is to discover it. Those hostages define the battle. We go looking for them, wary of the traps. If we don't find them, they will find us. We suspect that the state of being a hostage may also be ill defined. How will we know when we have met this enemy?

Such are the trials of postmodern intelligence.

Hostage to the Future

It is sometimes said that our children are our hostages to the future. But just for good measure, the future has a few hostages of its own. So we negotiate a settlement, an exchange of prisoners, that is our childhood's end.

Some hostages are well guarded. They already know too much to let them walk abroad. To know what they know is to become what they are. The process has its ambiguity and ambivalence. The art of being a good hostage.

The problem is not to find the door or even to open it. The problem is to walk through it. Evidently one can walk back out, but there may be a price. And then there is Janus, the two-faced god of the threshold who just stays put. We are all that to an extent.

Collections

Beyond Blue Book

Blue Book was an effort by the government to collect data on the UFO phenomenon. It was terminated in the mid-Sixties after a panel of scientists deemed that the collection was serving no scientific interest. How does that decision stand up after several decades?

It seems to have been a no win situation. To continue to collect data would have kept the government in the middle of a controversial issue. But by washing its hands of the issue, the government held itself open to being charged with a cover-up. But that same charge was and would be leveled against any continuing collection effort, since no effort could satisfy

everyone.

Is there anything that should be done now? The default policy is by-and-large to ignore the phenomenon and the charges. This is seen to be the course with the least political risk. Unless there were a reasonable guarantee of success, there is very little incentive for a politician to initiate an investigation. An unsuccessful effort would quickly become a joke. This is where the matter now stands.

But there is other recourse. The UFO community represents a vocal opposition group. The government can attempt to defuse some of that opposition by making overtures. This also seems to be happening. A small but significant amount of information flows in the back channels directly between government officials and concerned citizens. At least the citizens know that someone in the chain of command is more or less accessible to them. Perhaps, however, this back channel can serve a more significant purpose. It could serve as a channel of informal inquiry, thereby alleviating the pressure for an official inquiry. This function may already exist.

An 'Aquarium' Sampler: Aspects of a vision

Including:
pages from the website
&
open letters to academicians

Dan Smith

<http://www.clark.net/pub/dansmith/>

Urgency?

I continue to be impressed by and to impress upon others the urgency of reconsidering the consensus presumption that our world is a physical object. If this reconsideration need not be an intellectual and spiritual priority then this is an auspicious occasion for skeptics to give their reasons. One might at least state why silence on this topic is not indicative of considerable uncertainty or confusion.

Discussing the new world-view

I believe it is urgent for us to begin the public consideration of a new world-view. I am looking to gain some assistance for this from the academic, religious and political communities. At present my only request to these communities is for a modest degree of access to a few individuals for private conversations on the issues. Such interaction would be beneficial and perhaps necessary in enabling me to represent the issues in public.

In light of the potential significance of this new paradigm, I believe that the above request is indeed modest, perhaps it is asking for too little, too late.

With particular reference to the academic community, the debate over the various forms of materialism and immaterialism that are of concern to me have been taking place among philosophers for as long as there have been philosophers. By considering the historical and cosmic implications I am bringing a new sense of immediacy to this issue, and seeking to extend the audience beyond professional boundaries.

rev. 2/12/98

The Politics of the Anomalous

A Guide to the Future

Most thoughtful people harbor serious reservations when it comes to employing science as a worldview. But, although there is no particular shortage of criticism of the scientific worldview, there is also no concerted effort to construct an alternative. I believe that the reason for this lack of effort is the fact that the only workable alternative to the scientific view will necessarily be a radical one.

The only rational alternative to a robust materialism is an equally robust immaterialism that, as I have argued elsewhere, will very likely have eschatological implications. It would be practically impossible to pursue such a radical line of inquiry from within any existing social context. The only available context is that of the prophetic tradition, a tradition which by definition cannot be honored in its own time.

The only thing the world owes to a prophet is a hearing. I do and must seek my fifteen minutes of public time, and this is a non-trivial endeavor especially if pursued within the bounds of legality. Hopefully there are such means. Nonetheless, any self-respecting prophet must always be pushing the envelope of propriety.

There is one political recourse. Let us call it the politics of the anomalous. This is a risky undertaking, but if there is going to be a paradigm shift, it will require more than just the words of a prophet. There has to be something more tangible by way of evidence. In dealing with the anomalous, the would-be prophet is caught in a bind. The intrinsically sensational nature of anything anomalous is almost guaranteed to overwhelm the content of the message, particularly in our global tabloid village. There is however a political context that has grown up around the public concerns with anomalous phenomena.

Secular and sectarian authorities are naturally chary of the anomalous appearing in any context other than entertainment. When the miraculous breaks the bounds of propriety it portends an historical shift in the social dynamics. A political tension arises between a public that feels deprived of the numinous and the authorities that feel defensive toward the same. This is the political fodder for the would-be modern messiah.

To proceed further, one makes the assumption that there is a method to the miraculous, that there is an unfolding plan to rekindle in humanity an awareness of the numinous, and that this is necessarily occurring in an apocalyptic context. Furthermore, appropriate human participation is essential and the requisite spiritual guidance must be intrinsic to the cosmic plan. Any prospective guide would then make his or herself available to those in authority who would likely be privy to our scheduled rendezvous with destiny. The alternative would be to stand on the street corner, waiting for lightning to strike.

The ideal outcome is a maximum of awareness and a minimum of apocalypse. Such an outcome puts an emphasis on the intellectual content of the paradigm shift from materialism to immaterialism. Thus do I appeal to those scientists who harbor reservations concerning

materialism. To their reservations I add whatever political clout can be mustered from among their own who would have access to sequestered anomalous information.

This is what I can do. It may or may not suffice.

rev. 3/3/98

Dream Cosmogony

Bridging the abyss

Many people have experienced relatively elaborate dream plots logically leading up to an awakening event that turns out to have been generated by a real event external to the dreamer. If one rules out the ad hoc precognitive explanation, one is left with the possibility that dreams may only be concocted awakening 'memories,' and not actual sleep experiences.

Here then is my modest proposal. Human history is a concocted eschaton based memory. This is teleology or final causation with a vengeance. This is the psychic inversion of the Big Bang cosmology. Let us see what this does to the rest of our cosmology.

The first thing out the window is time, which is now a figment within an illusion. What does this do to free will? We humans are secondary dreamers. Will fill our microcosmic details into the macrocosmic plot. Our lives come with predefined boundaries and conditions; within and around which we individually and collectively arrange the 'furniture.' Most of that transactional/creative work may actually be carried out in our dream dreams. Our 'waking' experience is then like reading the galleys.

This stratagem is one way to avoid the paradoxes of time travel. There is no time so there can be no time travel. Also there can be no miracles in the ordinary sense. We think of miracles as being divine intercessions into the normal flow of events. In a dream cosmogony, the 'miracles' would have to be present at the 'start,' along with the main plot items.

Miracles can however become the pegs upon which history is hung. Another analogy would be that miracles are the pieces of sand around which the cosmic oyster manufactures its pearl that is our history. On this premise, the christ or x-event was not a reenactment of some Cosmo-mythic sacrifice. It was that sacrifice per se. The x-event is the crux of our entire history, and the Alpha & Omega events play a logically secondary role. The omega or eschaton retains logistical supremacy, but the x-event maintains its genetic dominance. It is the cosmic seed.

History is a suspension bridge, with the x-event being the primary suspension point over the abyss. The A & O are the anchor points. The great pyramid is almost literally the Alpha anchor. It, along with the rest of the megalithic culture for which it was the keystone, defined an astro-geodetic grid that became our heaven and earth. For the omega point the Internet takes the place of the megalithic grid, from which our new heavens and earths can be launched from cyberspace into psychic space.

rev. 2/14/98

.....

Impossible!

Improbable?

What is the chance that the world is a dream? Zero? One chance in 10,000,000,000,000?

Perhaps we should consider the evidence? But what is the evidence and how do we consider it? How do we weigh the physical evidence against the mental evidence, and how do we distinguish between them?

At this point most people throw up their hands. So what if the world is a dream? What difference has it made? It has made very little difference, apparently. What difference will it make? It could make all the difference in the world.

Many of us like to think that we can hedge our bets by going to church on Sunday or meditating in a closet, and the rest of the time we just pass the ammunition. I suggest otherwise and that makes me unpopular. That causes the campus police to take a special interest in my whereabouts. But I am not here to win a popularity contest. I am here to set the world straight. I am here to save the world. Do I need a better excuse for talking to people?

rev. 2/9/98

Are You Serious?

You tell me.

After twenty years in pursuit of a larger truth, there is not a question here about personal sincerity. The question is about the seriousness of the issues I am raising.

Obviously I have convinced myself of their seriousness, but my correspondents remain more diffident. Why is this? Do they see a flaw in the ideas? Are they too polite to point out the error of my ways? This does not appear to be the case.

More to the point is that my vision, if it is to be taken seriously, is earthshaking. Most people are not disposed to rock the boat, and particularly not one as large as the earth. They have a legitimate concern that if they lend any credence to this set of ideas then they will become participants.

I recognize that I am necessarily putting my correspondents on the spot, but I do attempt to minimize their exposure to the flak that will inevitably come this way. When the stuff does hit the fan each of them can say that they were merely being polite to a stranger. They were merely humoring someone who might otherwise have let the air out of their tires. The fact that some of their colleagues were less polite does not argue for their own complicity, it only proves that my tire slashing proclivities were overrated.

After having established everyone's innocence but my own, I can then reiterate that no news is good news. If I have given my correspondents ample opportunity to refute anything I have said and none is forthcoming, then there is only one conclusion to draw under the circumstances.

The situation is serious.

•

| [Contents](#) |

rev. 2/9/98

So What?

So what if the world is a figment?

As I press to get a response from academia concerning the possibility that the world could be a mental construct, I am not finding any great misgivings with or resistance to this concept. But before entering into any substantive discussion of the issue, my correspondents would like some reassurance that it would not be a waste of time.

One apparent consensus is that the long-standing equilibrium between science, religion and mysticism while subject to historical vicissitudes is sufficiently robust and flexible that it does not mandate any significant new concern on our part. There could be, for instance, a considerable additional intellectual shift from materialism to immaterialism without requiring or causing any great disturbance to the social fabric. Whether the shift to immaterialism might be personally beneficial or not, it is not going to have any great impact on the conduct of business as usual, or on the world itself.

I disagree. This negative assessment begs the whole issue. It is based on the materialist presumption that ideas do not matter. If the world is an idea, and largely our own idea at that, then clearly our ideas have mattered and will matter. I cannot predict the threshold or point of no return, beyond which a global mind change will begin to manifest, nor can I predict how it will manifest, but I do predict that we are about to find out. We are the guinea pigs in the cosmic experiment.

The only real problem facing a metaphysical activist like myself is the age-old problem of the chicken and the egg. At this point we have neither one, so how does one jump-start this inversion of our paradigm? There is only one simple answer to this difficult question -- in a word -- opportunism. Persistence and luck become synergy and charisma. That is our only bootstrap to the global transformation. There is of necessity a "quantum barrier" to this transformation through which we will learn to "tunnel."

Opportunism is another word for faith. The traditional religious answer to our predicament is to wait and pray for divine intervention. Ok, it's just that some of us have unusual forms of prayer. Only one question remains. Can we afford to forego this experiment?

rev. 2/5/98

A Blind Alley?

An open letter to computer scientists

For the past two decades I have been conversing with academicians about the possibility and consequences of a fundamental revision of our world-view. This type of issue should be of primary concern to philosophers, but they have yet to rise to the challenge. Like all the other academic specialists they are very reluctant to venture beyond traditionally defined professional territories. The result is that our universities have become the most conservative of cultural institutions. Beyond the very narrowly prescribed limits, there is increasingly an intellectual gridlock.

At the same time, computer scientists are unleashing a force of technological change that is already dwarfing that which was created by physicists in the century now ending. We do not have to proceed recklessly down a blind alley. We can on rare occasions stop to consider the larger issues involved here. There is an obligation to exercise our human capacity to wonder what all of this might mean. Should we not be searching for a vision of the future that can bring personal meaning to otherwise overwhelming developments?

I bring a new vision to the academic arena for your testing. I submit that this vision is the leading candidate to transcend the intellectual gridlock in which we find ourselves. I further submit that our adoption of the most appropriate vision may well determine the fate of humanity.

These are strong words. By what possible authority can I presume to utter such words? That remains to be determined, but I have derived considerable encouragement over several years from a curious and very unofficial 'liaison' with our government. If anyone would care to question that 'liaison' the UMCP public affairs office would be the place to check first.

rev. 2/7/98

Computers & Philosophy

What computer professionals need to know.

Modern civilization is based on an ever-increasing fragmentation of knowledge. This process must have a logical end point, the point beyond which the obvious benefits of specialization are negated by the breakdown in our ability to communicate across the proliferating boundaries.

The last academic holdout against the tide of specialization has been the discipline of philosophy. Only there are you likely to see substantive discussions between specialists in the various disciplines. But the philosophers have no plan for stemming the tide of fragmentation.

I do have a plan, radical (i.e. fundamental) though it must be. My plan is to implement the vision that our world is a mental construct rather than a physical object. All beings partake of and contribute to this construct. Our world is the shared vision of all sentient existence. This vision provides the only path back to the coherence and the integrity of all our knowledge. Every person engaged in cultural transmission is obligated to ascertain and accept the truth of one vision or another.

After philosophy, physics and psychology, computer science is the field that is most relevant to the concerns I am addressing. Here are some of the reasons.

- Computer science (CS) is now shaping our culture more than any other discipline.
- CS must grapple with the possible distinction between natural and artificial intelligence. This distinction is fundamental to my concerns.
- Computer technology can contribute mightily to the expansion of human consciousness.
- Virtual realities serve as a portent of other realities.

As the products of physics shaped our last century, so the products of computer science have begun to shape the next. That experience has induced some thoughtful members of the physics community to grapple with the larger questions of existence such as those I am presenting. I realize that computer science is still young, but these days even our children have to become wise beyond their years.

rev. 2/7/98

The Ghost in the Machine

An open letter to psychologists

Psychologists do about everything they can to avoid getting caught up in philosophical polemics such as the mind-brain controversy. It is fair to say that most psychologists would like nothing more than to carry-on their work in the calm of scientific detachment.

Brainstorms and passions do not lend themselves to the dispassionate analysis that is supposed to be the hallmark of the academy. But when a storm is brewing there is another place to look for calm. That is in the eye of the storm, and that is where we should be looking for wisdom.

No metaphysical issue has ever been resolved, so those who have been looking for greater certitude have done well to avoid metaphysics. But I am not looking for certainty, only for wisdom, and there may be a world of difference. With certainty we all die. With wisdom we can all live, and even do so with grace.

It remains unresolved as to whether existence is physical or mental or both or neither. To my mind we are thus presented with a clear choice. What ought we to believe? And I have thereby begged the question. 'Ought' is a purely mental construct. We can and ought to believe that the world is a mental construct. From this simple choice there follows human destiny and human salvation. This is no choice -- this is our fate. This belief has comprised the core of human wisdom down through the ages.

I am an agent for this truth. You may stop me if you can. The greater truth will win the day, and that day may be this one. We all know about academic politics, and I claim to know a little bit about cosmic politics. So let us all pull our strings, and then we might find out which is the longest string and that one might lead us beyond where we presently seem to be stuck in our modern intellectual gridlock. Fair enough?

Dan Smith

rev. 2/8/98

Anomalous Phenomena

Wagging the doG

Any reasonably astute observer would note that there is a dearth of material on this topic on this website, setting aside for the moment my comments on the 'stargate.' This has been as result of my own caution and out of deference to the more academically inclined. The academy has never been hospitable to the weird.

In my twenty years of overt philosophical deliberations, it was only late in the game that I confronted the phenomenological dimension. Even so my contact with this domain is largely through the literature, and to a much lesser degree through personal accounts. What direct experience I may have had has been very limited and already noted.

What I have noted above all is the striking degree of vulnerability of modern civilization and the modern psyche to things anomalous. It is this vulnerability that provides a focus for the humane and cosmic politics of the paradigms. In the end it is the political aspect rather than the experiential that motivates my interest.

If the world is a mental construct, then the most difficult thing for me to explain is the amazing lack of anomalous phenomena. But slippery Smith is going to turn that problem right around, of course! I argue that it is precisely our extreme vulnerability that explains the extreme rarity of the anomalous. I do this by appealing to the power of final causation.

Modern civilization is the logical outcome of the millennia of the pre-modern. Modern civilization is the logical precursor of our spiritual resurrection. It is the telos of the eschaton that enforces the necessary conditions of modernity, which include the success of science and which preclude its violation.

The eschaton is the fulcrum of the world. The vulnerability of modernity is the fulcrum of the eschaton. The political sensibilities surrounding that vulnerability provide the political clout that enables the messiah. The tail (eshcat?) wags the dog (canus?). Thus endeth the lesson in cosmic politics.

.

rev. 2/12/98

The Truth Will Set Us Free

And it will also enable us to survive

There is a profound irony here at the end of history. The realization that neither the world nor we are physical beings may enable us to survive as if we were such, well beyond what otherwise would be the end of the world. We will be able to survive more or less as we are for an extended period of borrowed time, only if we are fully aware that by doing so we are maintaining a fiction.

Clearly we are being presented with a challenge. We are like the sleepwalker awoken at the edge of the precipice. Our dream of physicality can be maintained, but now only with a deliberate effort.

The above irony begs the question of necessity. Why bother to wake up at all? The reason is that we are, by most accounts, rapidly approaching the end of the world unless there is a profound change in our collective thinking. I submit that our belated turning to the truth at the very end is our only hope for transcending that end. But not to fear -- this has been the plan from before the beginning. It is just this ending and this transcending that gives meaning and substance to history.

The same question can also be turned the other way. Why bother to maintain the fiction of physicality? The answer is, at the risk of considerable oversimplification, that we can have our 'physical' cake and eat it too, in some not yet fully revealed sense. And by maintaining that fiction we are decreasing the risk of tripping over the eschaton and falling headfirst into that cake, not a pretty sight. That would be a full-blown apocalypse, heaven forbid. In any case, as fast as our minds can think it, the bedrock of our present reality is transformed into a sideshow of what will then become our new heaven and new earth.

.

| [Contents](#) |

rev. 2/5/98

Our Imperative

To be moral agents in the pursuit of truth

One should not need a bank account in order to pursue the truth, but that is the present situation. It is my intention to change this situation, in the manner explained below.

Every institution has an obligation to truth, and we must constantly remind ourselves of this. This is particularly so for academic institutions, and for every department thereof. At this fin de siecle it is the philosophy departments which reluctantly carry the academic burden of truth. It is they who are left to apologize for their academic colleagues who have dissected and compartmented the truth beyond all recognition.

At some point before the end of this world, the truth will be resurrected. To be human is to believe that there is a larger truth in which we all participate as moral agents. This truth is not an impersonal abstraction. The larger truth is of necessity coherent and thereby personal and every thinking being is both the origin and recipient of it. The world in which this truth reveals itself must also be a mental construct.

Cosmic intelligence pours itself fully into human intelligence and is thereby resurrected. This is the meaning of human history. This process runs to completion, and the point of completion is much nearer than we suspect. As we push the material world and the paradigm of materialism beyond its limits and our own limits of survival, then we will turn to the truth of immaterialism. Each of us and then all of us will realize that we are the way, the truth and the light.

This is the simple truth that I profess to the professors. This truth will change nothing and then change everything, all in the blink of an eye. It should not be my burden to determine how every academically analyzed piece of truth will fit back into the cosmic picture, but I will temporarily take on this burden so as to prime the pump that is our resurrection.

.

rev. 2/6/98

The Vision Thing

What's a visionary to do?

Everyone wants a vision. No one wants a visionary. We like to eat filet mignon, but we don't want to visit the meat packing plant, and don't ask about having to work there.

The problem with a vision is its source. Either a vision comes from God or it doesn't, and either way it's a problem. If a vision comes from God, that presents a problem for the agnostic and atheist, but it presents a much bigger problem for the theist, because then they are forced to respond. Theists of all persuasions have gone to great lengths to raise the barriers against having to deal with novel visions. This is called canonization. Basically you carve out one very big steak, and then you outlaw butchery. If two thousand years later people are getting a bit hungry, well, let them have Stone Phillips.

The modern, secular thing to do is forget the source. Let's just look at the content. Then instead of the meat packer you have the meat grinder. Here we have a vision, now let us examine it. The philosophers will perform a philosophical analysis, the physicists will perform a physical analysis, the psychologists will perform a psychoanalysis, etc. This is called deconstruction, which is the opposite of canonization, but the practical effect is the same -- no vision.

So here I am, back from my forty days in the desert only to be greeted by the meat packer and the meat grinder. What's a visionary to do? There are two things we can do, walk on water or play some serious politics. I attempt both.

rev. 2/9/98

A QUICK INTRODUCTION TO THE AQUARIUM

The Aquarium is an informal and loose-knit association of individuals with widely divergent backgrounds who share a common realization and goal. We recognize that society is rapidly approaching what will be a critical junction. This junction will be the point of convergence for a number of powerful trends and may severely challenge the ability of our organized institutions to effectively govern.

Although we feel that the most profound issue facing man at the present time is essentially spiritual, we also realize that the most practical way to bring this issue to the public is to become involved in some of the related current problems. Examples of our present areas of concern are:

- the problem of realigning the secular political institutions with the undeniably spiritual nature of the universe;
- government openness related to the above;
- selected ecological issues (tigers), etc.

While a strong spiritual basis is central to the Aquarium world view, dogmatic adherence to any one belief system is strictly avoided. We also eschew any political affiliations which would limit our ability to act effectively.

Our goal is to minimize the confusion, disruptions and disharmony that will occur and to maximize the benevolent aspects of the inevitable coming changes. To this end we endeavor to engage a number of key relevant issues.

THE AQUARIUM DECLARATION

We of the Aquarium envision a truth beyond that of traditional and modern understanding.

We know the world to be a construct of intelligence and spirit.

We see the world as on the brink of a dramatic transformation that will encompass its every aspect.

The Aquarium Objective

To help bring about the transformation of the world in a manner that conforms with our highest aspirations and with the cosmic plan.

The Aquarium Strategy

Networking in every way possible. No rules.

Membership

Everyone who wants to participate and a few select individuals who don't want to participate but are deemed useful by Dan T. Smith.

Our Present Situation - On the Doorstep of the [Eschaton](#)

Although we spend most of our time profitably engaged with the immediate concerns of everyday life, more and more of us are becoming aware of a pervasive and deepening sense of anxiety that is clouding our horizon. Even the ending of the cold war, an apparent booming economy and our new commitments to protecting our environment and establishing a new world order have done little to relieve this subliminal sense of crisis.

With this undefined unease there is the accompanying realization that we are approaching what many feel will be the most significant events in human history. For some the sources of this belief can be traced to the many historical prophecies concerning the end of the world, but even those who choose to discount these predictions recognize that there are a number of powerful trends manifest in modern society and that these trends all seem to be leading us to some final event.

We at the Aquarium believe that human society is indeed on the doorstep of the Eschaton. We also believe that this event will represent both a frightening challenge and a great opportunity for society as a whole and each of us as individuals. We invite you to further explore our present situation

Navigating the Eschaton

Contents of this section

- [The best strategy is a self-fulfilling prophecy](#)
 - [Navigating the eschaton](#)
 - [New worlds for old](#)
-

The best strategy is a self-fulfilling prophecy

(*Repent! The End is at hand!* Or so they said..., the prophets of old that is. The complete postmodern prophet will need a bit more sophistication, and perhaps a website.)

Given that our world is not a physical object, it is then a manifestation of spirit, including ours in particular. The state of the human spirit will be manifested in the world. If we want to transform the world we must transform our spirit, our minds. What we truly believe about the future is what will come to pass. The future will be our self-fulfilled prophecy, whether we want it to be or no.

Navigating the eschaton

The eschaton is something to be avoided and something to be courted. It is a virtual singularity of human consciousness marking the end of the historical epoch. In itself it is a neutral event, one to be reckoned with. It is a point of leverage for wielding the human spirit.

History has been our long march into the thrall of a 'material' world. What started as an amalgam of tribal dreamtimes has been forged on the template of Gaia, into a rigid, unforgiving reality. The eschaton will be an unravelling of that reality, more or less under our control.

Hopefully our world will unravel from its fringes, leaving an intact inertial center as a source of stability. By *fringe*, I am referring to the fringes of consciousness. Our world making will be carried out in altered states of consciousness, but gradually these altered states will be integrated into what remains of our consensus waking world.

There is a time frame for these events, and if we get too far ahead or behind the invisible time line, there will be correctional forces coming into play from the outside. It would be difficult, but if we were to fall off the track entirely, it would ruin our whole day. We would experience a real singularity of consciousness, rather than just a virtual one. By always maintaining a continuity of consciousness we prevent the destructive discontinuities or singularities from entering directly into the public sphere.

New worlds for old

Once we are safely past our close encounter with the eschaton, which might transpire over 'decades' of our present time, we will find that our reality has been made rather more supple by the 'tidal' forces of the eschaton. This will be our new 'dreamtime.' We will be building new realities out of old, using 'technologies' that are infused with our spirit.

These new worlds will never become as rigid as this one has. As our spiritual path accelerates, there will not be time for the structures or vehicles to become fixed, nor will the boundaries ever be clearly defined.

Let it be clear that the metaphors of space and time that are used in describing the world after the eschaton, are only metaphors. History will be a thing of the 'past'!

The Aquarium Conspiracy

by Dan Smith and Rosemary Ellen Guiley

"In the beginning there was eschatology--the branch of theology dealing with the end times. Dan, having spent many years first studying physics and then metaphysics, came to the conclusion that the scientists have been looking at the world upside down. Mind, not matter, is the foundation for all realities. Moreover, the materialist paradigm was in danger of imminent collapse, being subverted on the inside by its own contradictions, and on the outside by the growing body of evidence for the paranormal.

Creating and maintaining a reality is no easy game. It requires a lot of magic, and a lot of conscious critters like ourselves who are pretty good at collective self-deception. Fortunately-- or perhaps unfortunately--our particular reality game has about reached its natural conclusion, and we are waking up to the fact that mind and matter are not separate. We are undergoing an exciting but stressful revolution in our collective consciousness. This revolution, or global spiritual emergency, will bring upheavals and overloads in our global consciousness that will impact the material Earth for better or worse, and may quickly get out of control. We also will be opening up to other realities that will be impacting us as well. Our present very tidy sense of reality and its boundaries is due to become much more fluid and permeable. Every spiritual tradition takes very seriously its prophecies about the end of the world, but for the first time we are seeing these prophecies turning into believable predictions of earth and reality changes.

That is how Dan fell from physics into eschatology. After experiencing numerous slammed doors among his former scientific colleagues, he decided that the most logical place to find fellow eschatologists would be in various intelligence agencies and among investigators of the paranormal. Dan next addressed how to communicate about the eschaton. Even a small hint that the government is worried about the end of the world might start a chain reaction of panic, which could possibly serve as a trigger for the eschaton. On the other hand, people inside the government might be wanting to set up a kind of civil defense network vis a vis the eschaton, and so they would be looking for people on the outside who could much more freely network among the general public.

An important link in the communication chain is what has become known as the Aviary. This is the final link next to the public network, and so it must be heavily disguised by its own surrealistic smoke screen. The Aviary functions best by amplifying people's own misconceptions about the paranormal. It does this by helping to overinflate individual pieces of the puzzle so that particular investigators get pushed further into their own blind alleys. People are encouraged to be so distracted by the trees that they fail to see the forest. This cacophony by people looking for truth in all the strangest places provides an excellent cover for the deadly serious business of clearing the decks and battening down the hatches for the eschaton event. It is like a Manhattan Project going on behind the scenes of alien grays and praying mantises having sex with humans.

However, this eschaton conspiracy is being orchestrated by higher powers, and we don't mean the Committee of 300. Very few of the people even near the center of the orchestration have a clear picture of what is coming down, but they do know that something is coming and that they will have front row seats. The Manhattan Project relative to the eschaton is a global civilian network of people who will serve as a lightning rod for the cosmic energies coming in during the consciousness revolution. They will be looking to channel these energies into expanded realities. Thus, they will provide a degree of protection for those people who can find their places alongside the network.

Outside of the network there will be greater levels of trauma and confusion. The pieces of the network are already in place, the remaining task is to properly activate and link the pieces into a critical mass of awareness. This last step is now underway. This is how an Aviary helps to spawn an Aquarium, and how birds learn to swim. The Aquarium is our business, and we are working to reach people who are ready to be activated in the consciousness revolution."

Anthropic Principle

This really just describes the intuition that our world is special in a way that makes our existence possible.

There might have been no world, or it might have been different in a way that would have made life or consciousness impossible. When physicists look at this world, they are impressed by the fact that even slight variations in otherwise arbitrary physical laws would radically alter the attributes of the world. It seems either obvious or likely that most of those alternative worlds would not be amenable to any form of life.

Thus in modern physics, we are being pushed to once again consider the problem of design or [teleology](#), that was supposed to have been put to rest by the Theory of Evolution. Not!!

Cosmology

The Big Bang and Unified Field theories will remain as a convenient way to systematize the physical appearance of the world. At a deeper level, we will come to understand that these 'physical' appearances were a logical way for the cosmic intelligence to separate and conceal itself from us creatures. As scientists do their theorizing and 'discovering' they are actually participating in the manifestation of the cosmic template that is also embedded in the microcosms of our individual minds.

From our mythic, dreamtime origins, it was our continued participation in this mythos that has gradually imposed the present degree of detail and constancy that is the delight of scientists. It is us creatures who have fleshed out the template of our world that resides in the mind of the universal spirit.

But now we are destined to become *conscious* co-creators of new realities with new templates.

Dualism

Spirit/Matter or Mind/Brain dualism was introduced by Rene Descartes (1596-1650), the French philosopher. It is the view that the world is composed of two distinct substances: mind and matter. Matter is distinguished by having the attributes of spatial location and extension. Mind, on the other hand, has only the attribute of thought.

Since the time of Descartes, science has done its utmost to eliminate the mental or subjective aspect of reality. However, within the 'Consciousness Movement' there are now a number of scholars who are using 'quantum dualism' to revive the Cartesian dichotomy.

Nonetheless, history has shown Cartesian dualism to be an unworkable and incoherent compromise between the monistic philosophies of materialism and immaterialism, in my opinion.

History

A distinction may be made between history proper and pre-history, history proper being recorded human history. The recorded history of human consciousness can be ascribed a reality greater than that of dinosaurs or the Big Bang, in my opinion. Pre-history existed as a mythic dreamtime where time and space take on a very fluid character. One does not have to draw a line of demarcation between these two epochs. The one can be seen to blend into the other.

Another consideration is the teleology of history. The eschaton becomes the primary ordering principle of history,

and is the final cause *par excellence*. The [paradigm inversion](#) suggests that the eschaton may replace the Big Bang as the primary 'causative' agent in shaping our world and history. The meaning of Human History will be finally understood in the realization and the light of the eschaton.

Immaterialism & Idealism

The history of philosophy and of ideas in general may be understood as a prolonged argument with the tendency we all have to embrace a common sense form of [naive realism](#).

Science also takes the world as brute object, but it is far from naive and far from decided as to what might actually be out there.

Immaterialism is a direct inversion of the scientific and naive tendency to objectify the world as existing independent of all consciousness or intelligence.

Idealism, in its Western, Platonic versions, tends to objectify preexistent, transcendental ideas as the ultimate source of all order in the world. In contrast, the immaterialism that I espouse is rather more pragmatic and process oriented, in the sense of A. N. Whitehead.

Paradigm Inversion

Science could be right about all its facts, but still be wrong about the nature of reality. Instead of our minds being an [epiphenomenon](#) of a material world, it is entirely possible that our world is a construct of cosmic intelligence, of which we are an integral part.

The practical question is whether this cosmological gestalt switch in our world view can be made without serious disorientation, particularly within the academic and religious communities. Using the internet to its utmost would be one way to both expedite and soften the impact of this Paradigm Inversion.

Teleology

Teleology and eschatology are inseparable doctrines, in my estimation. The 'final cause' of teleology is located in the dynamic of the eschaton of history. Teleology holds that meaning, purpose and design exist in all things. This would not be possible if human history did not have a conclusion or goal.

History, in order to be a meaningful story must have a beginning, middle and end. This simple insight is the genius of the Western prophetic tradition.

The idea that there is an arrow of time that moves in a linear fashion actually derives from the prophetic tradition. But it was 19th century physics that attempted to make this over into an objective abstraction transcending the phenomenon of history. The idea of an absolute, objective time and space are conceptual traps from which physics in the 20th century has been struggling to free itself.

Next to the problem of mind, the problem of time and causality has provided metaphysicians with the greatest perplexities. For instance it is not at all clear whether time depends on causality or vice versa. This is only to say that there is plenty of room for other than initial material causes in the greater scheme of things, as long as we are willing to forego the oversimplifications of a prior century.

Make mine well done

This is an anecdote of a visitation. The visitors let themselves into the house and ask for some burnt meat, in the usual telepathic fashion. The accommodating housewife turns up the skillet, throws on a patty and smokes up a storm. Upon tendering this offering, the visitors refuse it, much to the woman's chagrin. This was not what they actually had in mind. They then conveyed the idea of a truth that had been tested by fire. The still accommodating housewife dutifully offers a bible. This they exchange for some holographic storage device of their own, and then head back to their ship. Mission accomplished.

Of all the hundreds of encounter stories I have perused, this one stands out in my mind -- the utter simplicity and even homeliness of it constitute a certain charm. But there is more to this, I believe.

This story goes very much against the accepted encounter syndrome. We are treated as their chattel, which they occasionally seek to enlighten. I would suggest that this syndrome is the result of a stage management meant to create a general response. Only on the rare occasion does the larger truth shine through.

Mankind has since its origin sought truth in the heavens, despairing of ever finding it down here. The modern mythos of science and science fiction continues this age old quest of ours. Our cosmic inferiority has been the drumbeat of every civilization, with only one substantial exception which still shines through from the Christ event, despite the unceasing efforts of organized religion to darken that light.

To suppose that we might be the special vehicles of cosmic truth has and will shatter many a mind. This is far too great a responsibility for us who supposedly have barely made it down from the trees. Nonetheless, that was His message and that is my message. It is we who now carry the cosmic torch. The universe is waiting on us, patiently.

By almost every account, earth is a cosmic hell-hole, yet folks are just dying to get in on the action. All those babies must know something about this place that we have forgotten. And all those visitors, are they really coming a trillion miles just to sample a Big Mac? It seems like we are now hosting the cosmic surprise party of the aeon, and we still haven't figured it out. Will someone please give us a clue.

Here is the clue. This is the second coming, and it is our coming out. We were the spiritually densest of all the worlds and we are the last to emerge from our cocoon, and the last shall be first. This is where the fires burned the hottest. This was the foundry from which the toughest steel would emerge. The deepest pit would hide the brightest diamond. Our truth is the centerpiece of the cosmic puzzle. Many mysteries now dissolve. Our destiny awaits us.

If things are moving to fast for you, well hang on the best you can.

rev. 7/23/97

The Only Planet of Choice

Earth Harvest will serve as a modern diaspora to the Rome that is the cosmic federation. The modern christian catacombs of Dulce and the like will be the egress of christian cells. As refugees we will carry our virus to the most distant galaxy, using the federation highways.

We are the only planet of choice, and we have made our choice. Now we inform the universe. We were the densest, most retarded planet, and so now we become the tungsten filament of a cosmic light.

While the New Agers wait for the ships to land so that they may surrender, the new christians will set off on their final crusade. We will not be needing our laser blasters this time. We are the lasers of truth. Planet Earth, the rock that was rejected, becomes the cornerstone of the new universe. These are our marching orders. Many will laugh at our temerity, but many others will be expecting us. Let us not disappoint.

.

| [Contents](#) |

rev. 7/20/97

Harvest Time

After many millennia Planet Earth has completed its mission. Humanity is to be harvested and the Earth is to be regenerated. Within the next very few generations, this planet will be essentially depopulated.

Just within the last couple of decades, the cosmos has reestablished a 'permanent' link with us. There is now an infrastructure of clandestine underground dimensional doorways, serving primarily as egress. Death, of course, will continue to provide an alternative exit route. The choice will be ours.

Our fate will gradually become known and accepted. The final holdouts will probably have to be forcibly ejected. The Earth is now an officially designated cosmic refugee camp. We will be resettled off-world.

Our optimal strategy is to prolong the harvest for a century or so. This can be accomplished if we act in a reasonably intelligent manner. The key to this accomplishment is the proper dissemination of this information. The optimal scenario for this dissemination will be the Second Coming. The planetary egress will be overseen by the infrastructure attendant to this 'second coming.' For the sake of argument, I can be that one. So could you, but we will have to decide, if the decision has not already been made.

.

rev. 7/20/97

'Stargate'

It is my belief that our reality is a joint construct of the human and cosmic spirits. Furthermore, we are now being prepared for the reintegration of our world into the larger cosmic reality. Human history, of a dozen millennia or so, was simply the history of our temporary isolation from the rest of the spiritual cosmos.

My best guess at this point is that our world achieved a permanent cosmic 'docking' in about 1980, as the outcome of several decades of preparation involving considerable ufo and other ad hoc paranormal phenomena. The result is now at least one clandestine 'stargate,' the primary location being an underground facility under the nominal control of our government.

These stargates can now be replicated without tremendous effort, and probably have been. A global underground system of these 'reality tunnels' or 'dimensional doors' each with controlled access will constitute the most tangible aspect of the initial phase of our cosmic reintegration.

In a future phase of the reintegration these fixed dimensional doors will gradually become redundant as our entire reality becomes more malleable and dream-like, without thereby becoming any less 'real,' quite the contrary.

As pointed out in ['Religio.'](#) a very significant minority of us will choose to resist the cosmic integration and will go on to join or establish other more isolated worlds.

.

| [Contents](#) |

rev. 7/18/97

'Religio'

No later than 1953, 'multi-tracking' had become the 'official' policy toward the ufo phenomenon. There were two principal tracks, one inside and one outside. On the outside there was a posture of studied neglect, and on the inside, acceptance, containment and a wary eye on the future. Now, evidently, the future has arrived, the tracks are shifting.

And what did we accept? We accepted the inevitable. Ufo's would be part of the furniture, they were here for a purpose and there would be no advantage to our being obstructive.

And the purpose? 'Religio.' We were to be relinked to the cosmos. We were being towed back to the dock. The gangway was being lowered.

An expanding portal is in place, cosmic intercourse is already the order of the day. Welcome to the brave new world. The permanent portal was established no later than 1980. The final acknowledgement of this 'fait accompli' is still highly problematic.

The impact of this announcement on humanity will be terminally divisive, and possibly worse. A hard core of humanity will successfully resist the 'Religio' and will go on to form the nuclei of other worlds. The bulk of us will adjust to our new environment, making the best of our refugee status. There will be a significant rise in the mortality while mortality itself is being redefined. Life goes on, so to speak.

Was there anything else you wanted to know?

.

| [Contents](#) |

rev. 7/17/97

It's about time we saved the world, isn't it?

I don't see any good reason to further delay our salvation. The only thing standing in our way is our belief that there is something standing in our way.

As near as I can tell it is our unthinking dualism that is standing in the way. We think that the world is an obstacle to our spirit rather than a facilitator. We think that we have to shed our 'container' in order to get to heaven. At the very least we have to castrate ourselves! It took a real genius to come up with that bit of metaphysics.

Scientific materialism is false. It does not now and it won't ever explain consciousness. The increasing number of intellectuals who realize this all start heading back in the direction of Cartesian dualism, anything to avoid the radical leap into immaterialism. If they would just stop and think for a few minutes they would realize that immaterialism is the only rational successor to materialism. This one thought is all that it will take to save the world.

There is an irony to saving the world, as follows: In order to save the world it must be possible to save the world, and where did this possibility come from, and what the heck do we mean by 'possible' in this context? Is it possible that the most important thing about any world, namely its salvation, could possibly be left to mere possibility?

No. That is not possible. In order for the world to be saved, it must have been designed that way. Salvation is then nothing more than coming to the realization that we are salvageable, and always have been.

But it gets worse. If the world was designed to be saved then it already has been saved for all practical purposes. And our salvageability has probably, no, certainly already been demonstrated. Yet there seem to be a lot of people out there who just don't get it.

And I know why. We all know why. It is our pride. We all want to be self-made men and women. We would rather be a monkey's uncle than be somebody else's creature. Look, I know the feeling. I was born with almost a megabuck in my piggy bank, so don't think I haven't envied the Bill Gates' of the world. It is natural. Almost all of us are underachievers.

But, no. Salvation is not when we all become Bill Gates, God forbid! Fortunately we cannot build rockets big enough for us to carry our gigabucks to other planets where we could all chop down small forests to build our dream houses.

There must be a better salvation -- a win-win salvation. The answer is that instead of all becoming Bill Gates, we all become God, assuming that there IS a difference! As long as we remain mere mortals we are creatures. But the only reason for there to be creatures is for them to be able to aspire to Creatorship. To aspire to anything less would be a sin. A much greater sin than eating meat on Friday!

But wait. Are we not falling back into the trap of Pride? No. If I thought I could be God alone, that would be pride. Realizing that we can pull off this trick only by pulling together, that is the simple Truth.

So there is a Catch 22. We apparently have to give up most of our individuality to participate in the Godhead. Yes and no. In order to find ourselves we must lose ourselves. We are talking transcendental, which is something necessarily shrouded in paradox to our still mortal eyes. We are talking heaven, not Windows 97 or even Windows 2000, again I assume there IS a difference!

Enough with the transcendental already. Meanwhile, back on the Earth we are merely looking for the paradigm shift that will open our minds to the spiritual unity of all things. Many people already see that the days of scientific materialism are numbered. The once great monolith of science is melting like an iceberg, and splitting into many no longer recognizable fragments, or so they think. A few of us see something more exciting. The iceberg of modernism is melting in such a way that it has become liable to flipping right over, just like some real icebergs do.

Thus do we flip from materialism right into immaterialism. Forget that dualism business. It is a big waste of time, a colossal bore. We have already 'wasted' 300 years on it.

So I see this iceberg about to flip, and naturally I want to give it a nudge. And now with cyberspace, that trick is easy. I don't even have to be smart like a Hegel or an Einstein, for example, or a spiritual genius like Jesus or you name it. All I have to do is be the monkey's uncle on the typewriter, stringing together enough of the right words so that whenever the disenchanted graduate student plugs the forbidden words into Lycos, she will flip right over to Dan's Place, or your place, or to wherever the right words end up.

But I need not sell myself short, nor should you. Yes, we all are saved, by we know who, but.... But there is a little unfinished business for us to tend to. One could call it many things, but to call it a spade is to call it the Second Coming. And you thought I had discovered humility. Actually I am just being practical about our peculiar situation here at the end of the world.

Someone has to put a face on the Eschaton -- give it a voice. After you Alfonso! See how polite I am. The Truth is that if I get this job it will be by default. I will then have to rise to the occasion, God willing. When people see that even little me has a shot at the spiritual big time, then they will know for sure that we are all capable of being the resurrected God.

.
.

KEYWORDS: money sex megabucks God Jesus eschaton fed up with school and tired of my stupid materialistic professors and ready to get off this planet without pheno-applesauce, etc. Shove that up your web crawler. If this web site looks like Dr. Bronner's, then don't blame it on me.

rev. 4/8/97

Ultimate Concerns

Modernity is characterized by the belief that there are no ultimates. Reality is flat like an impressionist painting. No depth, no meaning, just a kaleidoscope of sensation. Reality can be arbitrarily divided into professional enclaves, where it can be metered out in dribs and drabs. This supply side reality is widely supposed to be the ultimate human accomplishment. It will stand from now until the alleged heat death of the universe in another 20,000,000,000 years! Well, if my calculations are correct, it might last for as long as twenty of those years, and that is being generous!

Does this mean that we are returning to the dark ages of theocratic fascism? No, it just means that we will come to our senses, and once again attempt to grapple with meaning and mystery. Something like capitalism will stumble on into the future, but it will become an item of vague nostalgia.

What exactly it is that will turn the tide of our public pursuit of triviality is not predictable. There is a private thirst for things spiritual, a thirst which has yet to find a guiding vision or voice. Such a voice will emerge, and hopefully prior to some calamitous spiritual emergency. Priming the spiritual pump is not an exercise in rationality. It could be entirely spontaneous, or it could be a deliberate act of irrationality.

In the modern fragmentation of reality, no one is licensed to address the large picture. There exists no authority which could grant such license. Merely to question this lack of vision is to brand oneself as a misfit, dilettante, kook, anything but serious or pragmatic.

There is no logical, incremental manner in which a visionary may go about her task of communication. There is no modern equivalent of the prophet. The voice of the prophet has only its ancient themes and variations. There is no plastic in which it can be packaged and measured out. It still comes full strength or not at all.

Science refuses to be confronted about its foundations or lack thereof. I have been trying for two decades to begin a dialog. The scientists pass that responsibility off to the philosophers for whose profession they show palpable disdain. Even the most theoretical scientist will scorn what they suppose is the empty rhetoric of the philosopher, which they deem as only slightly more concerned with reality than is theology. The philosophers have in this manner been cowed by the scientists into eschewing anything that waxes speculative or cosmological. Postmodernism is making some inroads in academia, but the pace is positively glacial, and the results are, of course, only deconstructive.

Modernism may go out with a whimper, it may go down with the modern ship of state. It could end with a single dramatic public demonstration of the paranormal. But the historical, canonical harbinger of the spirit is the voice out of the wilderness bringing us back to our senses, waking us to ourselves out of our materialist slumber.

.

rev. 5/21/97

That Was the Eschaton that Was

The Eschaton need not be dramatic. We might already have passed the point of no return, well on our way to a non-material world view. The point of greatest risk, or closest approach to the Eschaton may already have passed, unheralded. It will be up to the historians then to celebrate our successful transition, after the fact.

This is the situation that we may discover after a careful appraisal of the progress toward a non-material ontology that is being witnessed on the Internet.

Some people may be disappointed by the lack of any overt apocalypse associated with our spiritual awakening. But perhaps there have been a sufficient number of apocalypses throughout history to render a final one redundant. Most of us would be happy to breath a well deserved sigh of relief. Then we can get on with our spiritual rendezvous with the cosmos.

It will not hurt to keep our options open, and thus do we avoid prejudging the future.

rev. 4/16/97

Reflections on 'MJ12' -- part 1.

Business as Usual

Yes, Virginia, there is an MJ12, but you may be a bit disappointed by its lackluster nature.

It is an eclectic unofficial group that is heavily weighted, nonetheless, toward older male scientists having had long association with the US government. Collectively they have come into the possession of a body of information and artifacts about which the only common understanding is that the public would not be particularly benefited by its release in the foreseeable future. The emphasis here is on passive collection and containment of information. There is simply no compelling reason for these folks to take a proactive stance or to rock any boats. They are second generation custodians.

The beliefs of these individuals regarding the phenomena in question are probably quite varied partly as a result of different levels of access to data even in the inner circle, and also as a result of genuine uncertainty, even at this level of exposure, and due to the inherent ambiguities of the phenomenon.

Nonetheless, it is unlikely that the inner circle harbors any significant beliefs that are not well represented among the outside investigators and students of the phenomena. The fact that there is such a considerable overlap in beliefs between the insiders and outsiders is one more reason for these folks to keep their own counsel. If there were a desire to inform the authorities or the public on some matter, that could be done by just an occasional lowering of the barriers to the outward flow of information along preestablished channels. Over the years these informal protocols have become rather smooth in their functioning.

Beyond the inner circle, other individuals and small groups are more involved with mundane aspects of the collection and containment of information. These people are partly self-selected and partly drafted into service. They have normal careers that must be maintained in order to provide a cover for their special activities.

The mundane aspects of collection and containment will generally entail direct contact with individuals in the military and government who have taken it upon themselves to collect information. Those individual must be discouraged from becoming further involved in the investigation or reporting of the phenomenon, unless there is some component that is novel or otherwise warrants special attention. With as little disclosure as possible, such individuals would be made to realize that there were other authorities already engaged in a larger collection effort, and that their own efforts might be counterproductive, while also letting them know that their activities would continue to be monitored.

'MJ12's responsibilities do not end with the government and military spheres. Collection and containment efforts take place in the civilian sector as well. This does not require as much effort as one might suppose, as long as the general public is satisfied with the status quo. All that is required is the active cooperation of some strategically placed individuals, most of whom, with varying degrees of knowledge of the overall strategy, would be volunteering their

efforts. The cooperative individuals would, of course, receive preferential treatment whenever possible.

UFO's are not the biggest secret ever. They are perhaps the worst kept secret ever. 'MJ12' is not a sinister organization that is bent on world domination. It is the natural outcome of a relatively open society attempting to grapple with a mysterious cosmos. It is a part of the natural filtering and buffering process that all of us employ individually in our continuing negotiations with 'reality.'

Business Not Quite as Usual

Up to this point of the exposition, I have painted a relatively benign picture of the phenomenon and our response to it, but there are several caveats that need be kept in mind. It is my own opinion, but one that is widely shared both inside and outside, that the cosmos is considerably more mysterious than is generally credited by our modern science based understanding of the world. The UFO's and related paranormal phenomena thus represent the very small tip of an 'iceberg' of mystery. The biggest uncertainty and the biggest worry in this sphere is how and when the existing conflict between modernity and mystery will be resolved.

Science does not and cannot credit the existence of a cosmic intelligence. In the mind of science, the universe must be an object. If there is a larger intelligence, it must be something quite distinct from the strictly material world. But if there is anything distinctive about the phenomena in question it is that they show very little respect for our normal modern categories of thought. It is the definite prospect of having to undergo a paradigm shift of monumental proportions that has both the insiders and knowledgeable outsiders most worried.

The when and how of the paradigm shift is the bottom line of the concern. Keeping this concern in mind is a good way to shed additional light on other aspects of this emerging realignment between cosmic and human intelligence.

Scientific materialism, which provides the basis of the modern understanding of the world, is only an approximation to reality. It tells us just what sort of object the world would logically have to be if it were in fact an object. However, there are growing indications that the world is not an object, but rather the construct of both cosmic and human intelligence. The domain of 'paranormal' and 'anomalous' phenomena is just one of the indicators of the myopia that is inherent in scientific modernism.

(continued)

.

rev. 6/5/97

'MJ12' -- part 2.

The Punctuation of our Equilibrium

'MJ12' is the natural outcome of a particular interaction between cosmic intelligence and human intelligence. To the degree that cosmic intelligence has a prime focus, to that same degree its interaction with human intelligence is also likely to be focussed, 'MJ12' being a popular designation for that focus at this particular juncture of history.

Cosmic intelligence can and has manifested itself to us in myriad ways. All human cultures, including modern culture to a lesser degree, have been based on particular assumptions about the nature of cosmic intelligence and our relation with it. The UFO phenomenon, although present throughout history, has played a special role in the interaction between the cosmic mind and the modern mind.

The modern mind entertains certain expectations and myths about the cosmos, and the UFO phenomenon is shaped to partly adhere to those expectations at least to the degree necessary to engage the attention of a modern secular society. The phenomenon evidently adheres rather more to science fiction than it does to science per se. Thus it manifests itself as something of a caricature of our imaginations about the evolutions of technology and biology. We are fascinated to see manifestations of our imaginations, but when we attempt to make actual extrapolations from us to it, or from here to there, we run into logical barriers and paradoxes that baffle our linear extrapolations, and which leave scientists feeling very uneasy.

The degree of bafflement suggest the width and depth of the 'Rubicon' which must be crossed in the paradigm shift that we will have to endure in the process of realigning ourselves and our 'reality' with the cosmic reality.

Neither modern reality nor any of the traditional realities can begin to cope with cosmic reality, nor can any straightforward combination of them suffice. Nothing short of a breathtaking new vision of ourselves and the world will suffice. We will simply have to re-identify ourselves and the world and in that process, give up most of our cherished modern and traditional identities.

In order to grasp this 'brave new world' we will have to be persuaded to let go of the old one. Can we be so persuaded by anything less persuasive than an apocalypse? Could we not instead 'evolve' into our new belief system through a process of graduated exposure to the larger reality? Well, the smart money seems to be on the skeptical side with respect to our gradual graduation. It allegedly took an asteroid to knock us from a reptilian equilibrium to a mammalian one. I do not believe in either asteroids or dinosaurs per se, but I do believe in apocalyptic revelation. All of our traditions do speak to such episodes past and future.

The hope for the continuity of our 'physical survival' lies in the possibility that the apocalypse can be played out primarily in our public imagination and communication without having to spill over into such things as 'earth changes,' 'Armageddon' or 'raptures.'

On the scale of these possibilities, 'MJ12,' even by the most exaggerated accounts of its power,

appears puny indeed. Even the cosmic intelligence may not have the power to ensure an entirely benign outcome to the transformation facing human intelligence and identity.

The gauntlet is being laid down before us. It is the path to our destiny. As in every other human endeavor, the most basic of human strengths, faith, hope and charity, will decide the day.

MJ12//TX11 -- part 3/3

Now for the Good News

MJ12 has only one 'official' function. That is to report to the President. Each President is allowed at least one report. Along with this report there is some sort of briefing book.

The report to the President is not upbeat, not even up tempo. It is not something that any politician would want to wave in front of the voters. The good news is that UFO's are just an illusion. The bad news is that so is everything else, including especially all of the cherished illusions near and dear to the electorate. Has any President requested an encore to this bombshell? Some, properly forewarned, manage to forego the experience altogether.

Depending on how you look at this report you might get the impression that by comparison the Big Bang cosmology of scientific materialism is downright cozy, or that paleo-Darwinian survivalism might not be such a bad idea after all, not when you consider what is coming 'round the mountain.

When the revelation comes the voters will unanimously demand a cover-up. UFO investigators will develop new and intense interests in stamp collecting and bird watching.

MJ12 is not most people's cup of tea. If you apply for membership that is proof positive that you are not playing with a full deck, or that you are clueless in DC. MJ12 is not anyone's cup of tea.

Yet life will go on, and from the next reality we will look back on our prerevelation selves with an embarrassed smile. Let's face it, the Rancho Santa Fe 39ers took the easy route to Heaven. Why couldn't Hale-Bopp have become our Levy-Shoemaker?

The only question now is who wants to be Good News Charlie? Where did all the volunteers go? Why won't Charlene (visitor EBE3) hold a press conference and face the music? Even Charlene is not that dumb. Perhaps her voice transducer is in the shop for repairs!

Experience tells us that when you give somebody a red button to push, even the most crazed and callused will start having second thoughts and start thinking of everything they missed in life, and then take a quick trip to the pub.

Yet we will have to get on with the show. Perhaps not tomorrow, but the next day. There are only two people who can call this shot. They are you and me. Suddenly we have six and one half billion very lonely people staring at each other sullenly. That is our psychological grid lock, and it is coming time to get out the key. There is only one key that will fit this lock and it is the Second Coming, and it ain't coming in a UFO. Can anyone spare a Cessna?

rev. 6/6/97

What Did the Scientists Know?

And when did they know it?

Yes, we have come to this. We are now, hopefully, looking at the aftermath of materialism and dualism. We could play the role of the prosecutorial historian, but we do have bigger fish to fry than those of a few million wayward scientists.

I am merely suggesting that scientists are rapidly becoming less naive about things metaphysical. How could they help to be otherwise? But they do not yet have a means for expressing their newly found, hard won wisdom.

Retrospectively, the scientists will find themselves in an historical position not unlike that of Adam and Eve. They did eat of the forbidden fruit of materialism. Were they not sorely tempted? And look what we would have missed had they not so eaten! Felicitous sin.

As their would-be, historical defense attorneys, we can do one better than that. Along with most everything else, we can lay the blame right back there at the cross. It was the Christ event which unleashed the forces that devolved into materialism and dualism. The buck has to stop somewhere. The whole point of that event was to facilitate the retroactive unburdening of our heavy spirits.

Yes, the Chinese did invent gunpowder, and the Persians did invent Astronomy, and Alchemy, of course. But, and this may be the biggest 'but' in the history of civilization, the Christian world took those odd pieces of human imagination and lit up the world with them. Felicitous sin.

Yes, the scientists did have to overcome ecclesiastical opposition, but in most cases, even with Galileo and Darwin, this opposition was token.

I am not going to offer scientific proof for the unscientific origins of science and secularism. Many historians have already produced worthy reports on the ironic foundations of modernism. Many of those scholars would agree that if Christ never existed, we would be forced to invent him in order to explain the last two thousand years of history. Very few of their insights are taught in Western Civ. 101, and certainly not in Physics 101.

It is with hindsight that we will better appreciate the metaphysics of human history. Only when we grasp the completely spiritual nature of all existence, will we realize that Science will perhaps be the greatest monument to the creative power of the imagination that has ever been constructed. We could never have built the pyramid of modern civilization if we had even half of our spiritual wits intact. The true impact of the Christ event is still percolating in the remaining hidden parts of our psyches. How that force finally emerges will largely determine the outcome of the Eschaton.

.

rev. 4/17/97

Science Gives up the Ghost

Reports of Science's demise are premature. Science is not dead, but it is giving up its ghost. Say what?

The specter of Science is its fanatical absolutism. There is only one Truth and we are its possessors. Shades of Religion. There is only one world and it is physical, that is completely explicable on the terms of Physics.

Over the last generation, coming off of a high, scientists have learned the hard way that you just don't want to tangle with the human spirit -- not intellectually, not politically, not in any way. It is a losing battle fought by fools.

So the scientists have been learning how to keep their collective mouths shut, or at least muted, when it comes to confronting the contra-scientific trends in other segments of society. They are learning to tend to their own knitting, and to leave the metaphysics to the metaphysicians, whoever and wherever they may be. Thus do they avoid garnering the ire of the public.

Some of these lessons have also been taken to heart by a larger number of scientists that even they would like to admit. This is certainly my educated suspicion that comes from reading between many different lines. The scientists are very quietly rediscovering their own spirits, as is most of the modern world, and they are being very careful not to rock the boat in the process. The scientists are in an excellent position to realize how precarious is our present situation, like the soft-crabs that have just molted out of one world view that had become too small, but not yet grown a new one. Nonetheless, very few scientists are yet aware, I imagine, of the true extent of the changes that are just now beginning to take effect.

As a case in point, consider the John Mack affair at Harvard. I was fortunate to have played a small role in that episode, gaining some first hand knowledge. It is conceivable that historians might single out the 'Mack Attack' as the point of humanity's closest approach to the Eschaton. Had cooler heads not prevailed, that situation could have devolved into a circus. As it was, we got off with just a few magazine articles, as the Harvard Board of Overseers managed to restrain the more rabid members of the scientific community from inaugurating an inquisition against John Mack's abduction research. Ultimately it could have led to a showdown between modernists and post-modernists, reaching well beyond the ivied walls. That would have been an excitement that we can well afford to have missed.

Advice to an up and coming RE...

...Reality Engineer, that is.

So you want to play the reality game.

Not yet knowing whether your talents favor natural magic or 'technical' magic, you will want to keep your options open for the time being.

Myself, I have always favored the theoretical side of things, but in the realm of magical ideas, there is not nearly as much distinction between theory and application as there is in conventional science.

There is no substitute for being well grounded in as many ways as possible. That means intellectually, personally, professionally, spiritually and every other way. At the same time, however, you need to be willing to live on the edge when necessary. Don't go looking for trouble, but don't run away from it either. Always keep your options open, stay flexible and roll with those punches. But also, if you are going to make a mistake, you might as well make it a big one. Don't be half-assed. When you find something that works, stick with it and see where it goes.

The modern philosophers are correct in their assessment of the importance of language in the reality game. 75% of magic lies in our use of language, and symbols. 100% of reality is a construct of communication. Reality is nothing more and nothing less than a medium of communication. We are the mediums.

Stay connected. No substitute for a good network. Many beasties lurk in the shadows, two legged, three legged, etc. Get protection. Protection comes in many forms, be eclectic. Be paranoid, positively paranoid, not negatively. Keep in the flow of things, follow the synchronicity, but don't let it take you over.

Keep your objectives clear and simple. Align your self with the cosmic plan. Operate simultaneously in the micro and macro cosms.

If this sounds like mundane common sense, you're right. This same advice will help you to take out the garbage and bring in the flowers. It is just that 90% of the population spends most of its time doing the opposite. But don't fret for them, they are God's fool's.

rev. 4/4/97

Want to party?

Getting from our original participation to the final participation is a trick. It is the beginning and ending of our history. History proper is where we are stuck in the middle between the original and final participation.

I am using the language of Owen Barfield, the classics scholar, recently departed. I know of no one else who saw the big picture quite as clearly as did he. Yet, and this is most significant, his writings gave no indication that we could do anything about it, personally. He was no Aquanaut. You would not have found him stalking politicians, or consorting with spooks. No, no, no! But I digress.

Original participation is where everything just is, no questions asked. Myself and the rock are all part of one thing, no big difference, except that I get around faster. Thought begins with difference, that is analysis. Suddenly the rock is unknowable. The only thing I can know of it are the electrical pulses in my brain that somehow create an impression of it.

Now this is an odd thought, indeed. This is an incredible example of truncated thinking. By what means am I acquainted with those electrical pulses? How can I know them any better than I know the rock? Neuroscience is an exclusive club of people who train and cajole themselves into somehow managing never to ask that question. Quite a feat. When I go to Johns Hopkins to ask that question, I do so only under the threat of being arrested on sight. Crazy world, this. It is fun if you like intrigue, but even that becomes childish.

Back to the rock. The rock and I are all of the same stuff, and I don't mean atoms swerving in the dark. We are the light. There is just light and its (non)absence, and this is not photons, either. This is the light(ness) of being one, and knowing it as one. This is the final participation, of which the administrators at John's Hopkins are so fearful, and surely with some cause.

I know the rock, but does the rock know me? Not exactly. Not the rock I just kicked. But rockness and I-ness are ultimately inseparable. One could not possibly exist apart from the other. Subject and object are dim reflections of the one light of all knowing -- the unobstructed universe.

These are not original thoughts. Heck no. But the impending eschaton of final participation will be originary. It will be our final commencement.

If the rock and I are one, then the big bang cosmology is an inversion of the future eschaton. This is a joke, that University administrators find less than amusing. The big bang is in our heads. So are dinosaurs and their fossils. Barney is actually more real than his alleged ancestors. But surely we did not invent dinosaurs. True. There is an internal logic to dinosaurs and all that. Those seeds were planted in the garden of logic, and we are the gardeners. We lay down in the bed we have sown. Logic is truth. The truth is one, and that one is love, because it is not sex, lies or videotape. Is it?

This is the final gestalt. If you don't get it, then hold the phone for a minute. This is not a truth that can be entertained in private. It is the social reality that will destroy my false privacy faster than a clipper chip. This is a truth that can only be celebrated in public, with God. What a party! Want to party?

Rev.. 2/22/97a

Like Son

Like Father? Many Christians of a liberal or New Age persuasion find Yahweh to be a considerable embarrassment. You just about have to be an orthodox Jew to find the old Man likeable, and even they seem to like nothing more than to argue with Him.

Once Jesus comes on the scene, he steals the show. Yahweh becomes an abstract deity, a backstop for a son, who only with some difficulty could get himself unnailed from the cross. Unless you had spent those forty years chasing Yahweh's UFO out in the Sinai, it is easy to become forgetful of the old Man.

I would argue that Yahweh is more than a theological backstop for the Son. For one thing He provides the necessary setup. Jesus could not have been any other father's son. In that sense, Jesus was not a self-made man. The father had to play the straight man for the son's routine, which could then be vastly more subtle.

It is now at the Eschaton that the father comes back into his own, in a somewhat different capacity. Instead of just being the son's father, he is now the husband of the son's mother. This is of course where the Protestant Deists will want to jump the ship. And then it gets worse. Yahweh turns out to be just one of the sires to the cosmic matrix. The Queen of heaven necessarily has numerous consorts. This is polytheism with a vengeance. Monotheism is preserved only in the form of monogyny. Those darn Papists were right after all, Mary is a big deal, the biggest one of them all.

Here is where we can get into hot water. We come back to the problem of separation. Jesus only had one father, of course, but what about the rest of us. All of us have the same mother, spiritually speaking, but did we all have the same father, and what if we did not?

We have to take the cosmological perspective once again. We are back to the cosmos with the big yin and the little yang's, Yahweh being one of the latter and thereby having a certain hegemony over our world history that is focussed upon the Christ event. But the other sky god's cannot be left out of this picture, even though they have a somewhat lesser role to play, because each of them has their own world, as Yahweh has this one.

Our world is special among all the conceived worlds. We are special because we are such a cosmix. It is because we are such a mixture that our universal salvation in Christ becomes absolutely crucial. In any of the other, more homogeneous worlds, a savior may not be necessary. We are the cosmopolitan world, and we may not all have the same father but we do have the same savior, and of course the same spiritual mother.

It is only through Jesus that we can find ourselves. We find what we hold in common with humanity and what is different. Jesus is our universal mirror and prism. We are his rainbow coalition, his rainbow children.

If we look elsewhere for our self-discovery we will revert to tribalism and genocide at the Eschaton. It is with respect to Jesus that we will save or damn ourselves. The Christ event is the deepest point in history, and that is where we will discover our deeper identities beneath

our tribal origins.

It is through our wild and mongrel stock that the other more homogeneous worlds will be spiritually 'reseeded' in the post eschaton events. This will happen for all of us -- those who take to the skies and those who remain with the Earth. Those of us who become the new sky people will have a further differentiation according to the worlds with which we shall then become involved in whatever fashion. All of this will entail the loosening of our physical and biological bonds in a gradual manner, hopefully.

This is the way in which the cosmos recycles its energies and rejuvenates its spirit. Each of us will have a definite role to play in the drama that is now unfolding. Our final patience is very important, lest we push ourselves off the cosmic stage.

rev. 4/12/97

Religion, Lies & Videotape

If CNN or even CBN had covered the Crucifixion, Christianity would be a lot less interesting. Yet, most Christian sects seem to feel that they had been granted exclusive coverage on that portentous day.

Instead of entering directly into that no win battle, let us take a step back and consider the metaphysics of videotape. As an immaterialist I maintain that there are no objective records. Consider the words in this sentence. Those words have no more objective reality than, say, our bodies. Words and bodies and videotape exist only in the eyes, no, minds of the beholders. The beholders exist only in the mind of God who exists only in the minds of those who think, unconsciously(?), about her. Yes, we are still bootstrapping ourselves into existence, and the eschaton is our ultimate bootstrap. Reality is our conspiracy of imagination. If this makes you feel just a little bit dizzy and anxious, then you have gotten the point.

An encyclopedia does not actually consist of words, nor a rock of atoms. Each of them is an ideohologram, of sorts. God has not numbered every grain of sand, nor is the Encyclopedia Britannica written upon our collective unconscious. That would be misplaced concreteness. The writer and photographer, like all of us, are parts of a technocratic social matrix which is daily extending the bounds of our virtual reality through the circulation of mimetic viruses of all sorts. A book is a collection of mimetic viruses, and if you don't ask me what those are, I won't ask you what constitutes an actual scientific quantum observation event, e.g. if an event is recorded on a piece of paper which is then destroyed, did the event occur? Remember that all is fair in love and metaphysics!

But I have changed my mind. I will explain mimetic virus to you in the only manner that anything can ever be explained. I will do so by exhibiting the paradigm of all MV's. The Christ event was not an event, it was and is the mother of all MV's. It is the MV upon which our virtual reality is constructed. It is acting from outside of our virtual space and time. The X event contains the Alpha and the Omega, the creation and the eschaton. Jesus lived and lives in a way that you and I are struggling to emulate. Jesus lied when he said that he was the Son of God. He knew that we could not then bear the fact that He is God and we tried to kill him. Jesus is Lord, simpliciter. Fratricide was bad enough for us. The eucharistic body of the 'historical' Jesus is the quintessentially real object. It is more real than all the rocks and atoms and videotapes, etc. We are not the dust of stars, as some scientists would have us be. The starry sky is somehow the eucharistic holo(y)skin. And the eschaton is the hierogamy. If you can do half as well as that in explaining the nature of a quantum event, then you would win a Noble Prize, guaranteed!

.

| [Contents](#) |

rev. 5/20/97

The Crux of our Reality

The X event is what holds our world together. As the revelation of its mystery begins to unfold, we can start the process of dismantling this world and the reconstruction of multiple interconnected worlds. We will gradually come to see where each of us fits into the greatly expanded reality. These worlds will, in turn, be seen as integrated into an even larger cosmic unity which is in a continual process of self-renewal.

The X event reflects and is even the guarantor of that larger unity. There may be multiple worlds, but there cannot be more than one cosmos. This is not merely a matter of semantics, but of profound metaphysical necessity. It has to do with the ultimate structure and source of consciousness.

[Elsewhere \[and here\]](#) I have spoken of a polytheistic, or more precisely a polyandrous, cosmology. That was said in a spirit of democratic cosmopolitan generosity. If I were to take a coldly objective and logical point of view, that assessment would have to be modified.

The X event is self-contained and all encompassing in a fashion that is not favorable to imaginable alternatives. The theme of the sacrificial king has been played out in human mythology in myriad ways, none of which could hold a candle to the reality.

I would suggest that the wild diversity of human history holds a special place in any conceivable cosmic ensemble. It reckons to be the microcosm among all microcosms. E pluribus unum. That the all in all might be revealed as Christocentric is a possibility that any logician would be loath to rule out. Yes, sports fans, this is where and when all the cosmic chickens must come home to roost. They will soon be crawling out of the woodwork. This is where the action is. If you had been counting on a little R&R this time out, it looks as though you managed to pick the wrong horse!

.

| [Contents](#) |

rev. 5/21/97

Cults and Suicide

The recent group suicide in San Diego raises a number of issues that are worth addressing.

I have been favorably impressed by the news coverage in the first day after the event. There does seem to be a genuine desire to come to grips with the event, apart from the expected defensive posture and narrow focus from many of the observers.

Any dramatic deviant behavior on the part of a group brings attention to the fragility of the social fabric. Each observer has to wonder what lines have been crossed and how easy it is to fall off any one of the many edges of our social world.

What was the significance of this act for the participants? Was it undertaken out of desperation, protest, celebration or what? Was being prone to suicide something that these people brought to the group, or did it only emerge out of the group dynamic?

Part of the significance for the Aquarium is the dualistic metaphysics signified by this act. We could blame Heaven's Gate on Rene Descartes, who introduced the mind-matter dichotomy to the modern world. These people thought they had to "shed their containers" to reach their "higher source." This is the old Gnostic dualism reduced to its modern absurdity.

From an immaterialist point of view, the body is much more of a vehicle and facilitator of the "soul" than it is a container or obstacle. The entire world is a construct of consciousness. The fate of humanity and the world are inseparable. Our destiny lies in the eschaton and our successful navigation of that cosmic connection. Where we are now is where all the action is. Leaving prematurely is at worst a tremendous waste, and at best a very minor side show in the much bigger drama.

Without the proper "vehicle," the eschatological transformation of humanity and the world will simply not be experienced -- too bad for the non-participants.

There will be more acts like this one, and they will help to focus public attention onto the larger questions and events. But such acts can also be distracting and confusing to the public. Repetition will quickly produce a jaded audience.

rev. 3/28/97

Pecking Away at Heaven's Gate

Or the Aviary and How Bo Peep Lost His Sheep

The Aviary is not responsible for the deaths of 39 innocents. It just looks that way. The Aviary always just manages to be in the wrong place at the wrong time, minding someone else's business. And I should know.

There is plenty of guilt to go around, because of course we are our brothers keepers, and we did not leave the 99 sheep to go to the aid of the 39. They just slipped through one of the many cracks in our society. But did any of us give them a nudge?

There is a larger agenda and those 39 got caught at the short end of that agenda. The Aviary knows something of that agenda, and it shakes a lot of trees trying to find out more, and some of the apples will hit the ground pretty hard.

Item: the remote viewing of the alleged Hale-Bopp companion was pretty much an Aviary spin-off.

Item: the alleged April UFO landing was definitely an Aviary story and I was the one to pass it on to the public where it quickly took on a life of its own.

Item: two days ago I received a call from an ABC reporter who had come across my name in the above context. He is working on a Heaven's Gate special. As he put it, the lost 39 had just put 2 and 2 together and come up with 5.

If I had it to do over again, what would I do? I would do it over again. My problem is that I am all too proficient in mathematics. When one sheep goes astray, I am very reluctant to leave the other 99 in the lurch, or the ends do sometimes justify the means. In the field of eschatology, one gets paid mainly to keep track of the ends.

I knew that the UFO landing story was very likely to be disinformation, and I was not at all surprised to see that it gained considerable currency in the UFO arena. And that did not stop me. The Heaven's Gate affair is the Bennewitz affair written large.

There is some explaining to do. I believe there is a cosmic agenda relative to human destiny and this agenda is now coming to a head. A small part of the US government has reluctantly become caught up in this still clandestine agenda. Other parts of the government would like to know what the heck is going on and the Aviary has come to be a principal tool for gaining information and access.

I for one have a special interest in this game of hide and seek. Long before I could even imagine that such a thing as the Aviary could exist, I was given the impression that there was a job available for me in the destiny business, and when the knock on my door came a second time, I opened it up to find one of those innocent birds strategically positioned, and ready to do some hand holding.

I believe that I have what everyone is looking for, the truth. The Aviary is on the scent and I am holding one of the tail feathers, waiting for the birds to realize they are chasing their own tail. In the meantime I go along for the ride, getting in my two cents at every opportunity. The role I have been playing is mainly that of publicist, which is one thing most of the birds would just as soon do without.

Bottom line is that I believe the 39 are in very good hands, seeing as how God suffers fools gladly. I believe that we are all in good hands, and if two of those hands turn out to be mine, please forgive me for not being quite as surprised as you. In the meantime I'll be right here setting out my fish bait, even though some of it may have a few bird droppings mixed in.

Heck, if you don't sport a buzz cut, this fish food is probably safer than the strawberries!

.

rev. 4/4/97

Let a Thousand Cults Bloom!

Personality is the most powerful force in the cosmos.
It is about to be unleashed upon the land.

OK, I admit I am a panentheist. The cosmos is a personality cult after Mary and her consorts, including most notably for humanity, Christ. The cosmos is Her Matrix of beliefs, each based on a personal creator. Every last one of us is a personality cult, wishing to become one with the cult of our creator.

Charisma is the key to the cosmic eros of identity. Charisma is the transcendental mystery. It cannot be objectified or routinized, it can only be written in the eucharist of flesh and blood. Truth is finally the process of identification. It is not an object, rather it is the transcending subject. Truth is God is Love.

To grasp the Truth we must let go of our truths. To find Self we must lose ourselves. Fear of loss of self is the fear of God. We fear God only in the abstract, it is our abstractions of God that we fear. To fear God is to fear our innermost being. That is the light of the world and we only fear the shadows of that light.

Charisma is our cosmic window and our microcosmic mirror. The confusion of ego with charisma is the most deadly sin. That is the Lie, that is Death, that is Satan. But this is the game of life and we cannot not play it. It is far better to have loved and lost, than never to have loved at all. Loving is always losing, in the larger sense.

Modern scientific materialism is the nursery of the ego. It is time in the history of humanity to put aside those childish things, time to get on with our destiny. This should not be easy. There will be a thousand cults, and the body count will rise, but there need be no more holocausts. We have been inoculated to that already.

In place of tribalism we do have our intellect which is one of the legacies of science and technology. Giving up our egos does not mean giving up our lives or our intellects. Discernment becomes our primary survival skill.

We are talking about the person whose kingdom is coming. How many of us have said that prayer without even thinking. Just because we were not thinking does not mean that the cosmos was not listening. It is coming and we are not ready. The degree by which we are not ready is the measure of the almighty. We have very powerful imaginations. Whichever one of us has the most powerful imagination could not begin to imagine the refusal of this gift.

The kingdom has absolutely nothing to do with any politics, with any legal system, or any conceivable system of economics. We will get there from here, there will be a continuity of consciousness, but not of consciousness as we can now imagine it. You will see the natural, logical necessity of the entire cosmic process, and it will be the most awesome thing that any former mortal can grasp.

How patient should we be? Each of us will only be as patient as we can. Patience for some will run out sooner, and those will be only as rational as their pain allows them to be. They will be the expendable fifth column. Could any ends justify their means? Certainly not, but this is not about justice, it is about love, and there is a world of difference. And what do we know of love? Nothing more than a fish knows of magnetohydrodynamics. Precious little.

The cults are coming and the harm they do is a small measure of the pain they are unable to hide. If you think that you can sit in judgement of them, then you must think you know something about what makes this world go around. You must think that you know the day and the hour. You must think that you can miraculously measure the depth of your own ignorance.

When we see that the quickening quickens, when we open our mouths to scream for the world to stop and we cannot catch any breath, that is when we will know that the cosmic personality is dreaming its last dream.

rev. 5/15/97

Surfing the Channels

I have two things to say about the channelings that I have run across to date. I am impressed. I am unimpressed.

This is what I think is going on. Under self-hypnosis, people are willing to be more bold in their statements and speculations that they would under normal circumstances. A trance is to some people what alcohol is to others. So there is a good deal of self-deception, of course. If we could be true to ourselves we would need neither.

Channeling is our most concerted effort to find our voice of salvation. The effort is impressive, and I speak as one who has found value in those voices.

I do not suppose that every channeler is a New Ager, but they could as well be from the sound of the voices. One mark of consistency of the channels is the anti-Christian tendency. Along with the tone of moral and intellectual superiority that the speaker invariably takes toward humanity, there is also the invariable response to the inevitable question concerning Jesus. Why sure, isn't he a swell guy, in fact I ran into him just the other day down at the health club, and he sends his regards. Well, EXCUSE ME! Yes, the mice will play when the Cat is away.

Any rational person can deduce only two things from the above observation. Channeling is not always just about self-deception, and furthermore Satan is alive and well. And I go one step further. When Satan speaks, we should listen very carefully.

So what is our comrade, Mr. Satan up to? It is very simple. He is trying to make the best of a bad situation. His days are numbered, and he will accept his inevitable fate like any gentleman would, and he will get in a final riposte or two, just for old times' sake. You do have to admire that numero uno of all the good ol' boys. And it is even possible that like his brother, the Gnostic demiurge, he just don't know any better. Like a certain comic strip figure, he travels in a perpetual cloud of navel lint.

On a slightly more sophisticated assessment, channeling is proof that both nature and Satan abhor a vacuum. When God is still concealing, you can be sure that it is Satan who will be revealing. And there is one additional point on which Christians tend to be rather stupid. Not only will the anti-Christ not claim to be such, neither will he claim to be the second coming. That would give away his game. He will do precisely what Mr. Channelor does. Damnation with faint praise.

What is God waiting for? Only for Satan to help wake us up, not by what he says, but by what he does not say. It is up to us to finish what Satan has started -- the Revelation. Like the Minuteman at the Old North Bridge, I am willing to fire the first shot. Someone will fire the shot heard 'round the world of our spiritual liberation. That person will be the Second Coming, no matter who he looks like or where he comes from. That will be God's final message, His final gift. We will not refuse it, try though we might.

How and When the Sky will Fall

(They call me not *Chicken Little* for nothing.)

The day draws nigh. We can watch on-line as the mind is being rediscovered by the [Tucson Consciousness Conferees](#). Our minds went missing at about the time that civilization began its long march into materialism. Modern scientific cosmology is the reductio ad absurdum of that inexorable thought process. Descartes was just the advance man for the final, scientific stage of the process.

The mind is sneaky and slippery. You give it an inch and it will take the extra mile. You crack open that door, and next thing you know it will have taken over the whole neighborhood. All of human history is the story of how we managed to keep a lid on the Pandora's Box of our minds, or more accurately our cosmic spirit. The end of history, and actually the end of the world is when, inevitably, we let that genie out of its bottle.

Another way to put this is that if the mind is not an accident of the world, then the world is a construct of the mind. What is constructed will be deconstructed and reconstructed. As we awaken to this situation, that will be the task before us. Materialism has bequeathed to us a cosmic class communication web that will greatly facilitate the earliest stages of the transformation of ourselves and our world.

One is allowed to be ambivalent about the end of history and the world, but there is no use crying. Life will go on in some mysterious fashion, and we must busy ourselves with maximizing the continuity and minimizing the traumatic discontinuities of consciousness.

Also, let it be known that we are not alone in confronting our spiritual destiny. We are not the sum total of the great spirit. A reasonably successful outcome of our natural transformation is as inevitable as the transformation itself. History has been one long preparation for this day. In our final hour, those preparations have been accelerating, mostly without our direct knowledge, but some humans have been given that knowledge down through the ages. Now that knowledge is for all of us. Let us use it wisely.

The Mind Bomb?

Scientific modernism has established a track record of being excruciatingly naive when it comes to matters of the mind. On top of that abysmal track record, we are now seeing a stunningly belated scientific 'discovery' of the mind. Under other circumstances this 'discovery' might have been considered a welcome antidote to centuries of scientific neglect of the mind in favor of science's purely materialistic contract on the world.

No. This is not welcome. Not now and especially not under these circumstances.

How quickly we forget. The last time that science was afforded the opportunity to unlock any secrets, we came very close to blowing ourselves up. What have we learned from that lesson? Has science become more moral? Do scientists show any greater sense of responsibility or any deeper understanding of the world? There is a burden of proof here, and it does not lie with the potential victims of continued scientific stupidity.

In their own defense, some scientists will try to claim that there are no secrets of the mind, indeed that there is no mind, so there is nothing to get worried about. All that these scientists see is an accidentally evolved, epiphenominal complexification of matter into brains. We are merely meat machines, harboring egomaniacal delusions of spiritual transcendence. Are these the people we want to be performing global brain surgery, in the sense of a government sponsored Human Mind Project? Which of these scientists or their sponsors harbor ambitions of global mind control? If there is no God, then they will surely try to create that job for themselves.

On the other hand, suppose there is a mystery of the mind. What then? Then science has been dead wrong about the nature and source of reality. Then they should start doing their homework. Before applying for government grants to unlock those secrets they had better start rethinking the past three centuries of the existence of science. For starters consider how and why Descartes tried to split all of reality into an absolute physical reality and a separate and absolute mental reality. What agenda was being played out in that breathtaking excursion into irrationality? That 'sacrificial rite' became the foundation of scientific modernism. How strange!

Let us hereby declare a moratorium on government mind research. Let us first, instead, stop to think about what we are doing. We might even go so far as to consult with the people who would be the ultimate sponsors of any such research.

A Crisis and a Vision

Although we still spend most of our time profitably engaged with our immediate concerns, most everyone is aware that a pervasive anxiety continues to cloud our modern horizons. Even the ending of the cold war and our new commitments to protecting our planet have done little to relieve a general sense of crisis.

Perhaps closer to the source of our concerns is our rather sudden apparent loss of a vision for the future. Until quite recently scientific modernism and its vision of unlimited material progress for all of us provided a common basis of mutual understanding and confidence in the future.

Reexamining science from an historical perspective might shed some light on the origins of our present predicament. A reconsideration of that history suggests an alternative to the vision of scientific modernism. In what follows I only give the barest outline of this vision which may allow us to look beyond our present condition.

Those early visionaries who unlocked the door of science could hardly have imagined the marvels of technology and cosmology that we now almost take for granted. It started out as a very limited vision, and however much we might wish otherwise, those same logical limits still remain in place. At some point in time we were destined to reach those limits. That we may already effectively have done so may explain the present crisis of science. Even if unforeseeable breakthroughs remain, the ultimate fate of science is sealed in the logic of its origins.

Our new vision must begin from where their vision left off. Because of its overwhelming successes, it is easy to grant a superhuman status to its perfectly human origins. Yet clearly there was a political fiat. The Church will continue to reign supreme on spiritual matters, and we scientists will henceforth confine our attentions to a strictly defined material realm. What a felicitous arbitration, at least for us scientists, at least until now.

If, indeed, reality cannot be so divided, where does that leave us now? Well, we cannot, nor should not take back our history. Its simple logic could only be repeated. We are simply and unavoidably left with a breathtaking alternative. All of human experience and knowledge is ultimately of the spirit and for the spirit.

Long before science was ever imagined, this alternative provided the foundation of human wisdom, trust and confidence. This simple truth has withstood and been renewed in every trial that humans can be made to endure. Only in times complacency are we able to forget our true nature. In what flight of hubris can science imagine that it has closed this door to a higher rationality.

Out of the remembrance of the true nature of reality we can make everything or we can make nothing, it is entirely up to us. In truth, mind is what exists. We could never know otherwise, and what would be the point of pretending otherwise? The reason that mind does not overcome matter is that it is not there to be overcome in the first place.

Thus for the purpose of understanding human history and destiny, we can to a first approximation just consider human intelligence and cosmic intelligence. Between these two there is a simple and natural dynamic. The creative cosmic spirit renews and recreates itself by sacrificially pouring itself into the microcosmic seeds of its creation. Those 'seeds' have become us creatures.

The history of human consciousness has been one extended journey to the outer limits of our spiritual envelope. Scientific modernism and our reaching for the stars was the final and spectacular leap of our cosmic journey into the construct of materiality. As we come to recognize the completion of that process, we will be spirit bound and on the rebound. The return phase of our journey is very likely to be more swift than the outward portion.

This is the barest outline of an immaterial cosmology. It is a first approximation to a postmodern rationality. But before we can decide exactly what to do about our present situation in this cosmos we must spend some time to accustom ourselves to it. That process of deliberation can begin anytime. Who would like to calculate the probable risk of procrastination? For me to be of assistance, there will need to be a minimal degree of institutional toleration of my efforts. It is to that end that I am presently engaged.

Reality in Transition

Many have suggested and many more suspect that our reality is a construct, but no one has yet been able to make that idea stick. Nonetheless, it is an idea whose time will come. When that time does come we will know that we are living in the 'latter days.' It will be traumatic for us to realize that the last foundation of our existence, by being a construct, can be deconstructed. The final bastion for our security will have evaporated. To what will we then turn? It is in anticipation of and preparation for this future trauma that I seek the minimal degree of toleration necessary to initiate a continuing discussion concerning the impact of such a radical reappraisal of the world and our situation in it. It is possible that such a discussion might serve to trigger the anticipated revelation.

The real wonder of our situation is that we have honestly been able to come to believe that the world might not be a construct, that it might be an absolute and arbitrary object entirely self-sufficient, and that by some nearly unimaginable cosmic fluke we happen to find ourselves here now. This is a point of view that most of us take so much for granted that we seldom contemplate its breath-taking nature, even in comparison with all the other breath-taking schemes which humanity has ever embraced. In our defense, let it be noted that we did not come by this belief easily.

The days of science, as with every other human endeavor, are numbered. When we reflect upon the vast enterprise that science has become, it is difficult to imagine life after science, other than as a regression to some very dark age, and so we cling to it out of desperation. But our clinging and our desperation may, at best, postpone the inevitable.

The fact is that science has already deconstructed itself. Science has, after all, served an historical role as the great deconstructor of being or presence. But if science is not wise, it is at least fair, and it did not spare its own vision. That is why science is no longer spirited. We might suppose that science could last indefinitely as a well maintained machine, but who would we be deceiving, and why?

Science was supposed to have explained the world, but instead science has explained away the world, although not yet to everyone's satisfaction. What is the world without a foundation? It was no mean feat for science to demonstrate that there is no foundation. We are left with a dizzying spiral of mathematical abstractions, that could exist only in someone's mind, pace Plato.

Yet, there are many who are not being willful in believing that the stars in the sky above and the dinosaur bones in the ground below remain un-deconstructed. But those artifacts of science can retain a residual significance only as long as we forget that scientific cosmology, and any cosmology, is of a whole, and is only as strong as its weakest link, and certainly no stronger than its foundation. As we set about to construct our next world, this is a lesson that will have been well learned.

It would be folly to give up on one world when the next one may not yet even be a figment of someone's imagination. In the meantime there could be a panicky retreat to the premodern traditions. This we are already witnessing, but rest assured that those bridges were actually burnt, despite rumors to the contrary. What is left are mere shards that will now have to be reexamined and reevaluated. It is this kind of preliminary recapitulation that is now so important for us to begin. This discussion should be our global priority. That I might serve as a 'provocateur' in this regard, is all I have to offer.

Dan T. Smith, Baltimore, MD

The Relativity of Existence

The relativity of existence is hardly a new idea, but it is an idea that most scientists find all too convenient to ignore. The generating impulse of science was to understand how things worked, and the path to that truth was to analyze the world into its simple parts to determine just how they function. And so science set about to deconstruct the world, with considerable success.

Only on occasion was there any serious question as to whether this analytic process might be neglectful of anything essential to our comprehension of the world. On those occasions the scientists could simply ask to be shown exactly what it was they had left out. But, so far, no one has been able to bring a neglected piece of reality into a laboratory where it could be duly registered. But still, not everyone is satisfied that science has done justice to reality.

Those of us who feel cheated can go to church, or go out and hug a tree, or we can do our homework in philosophy 101, or it was philosophy 201? Don't let me put you to sleep with scholasticism, and remember I am usually grinding an eschatological ax, and it will fall on those not paying attention.

First, there is no unique definition for existence, let alone a definition that even looks scientific. Science is off to a rather shaky start if it cannot define its domain of inquiry. If you want to know whether quarks exist, you will just have to take a poll, and then make up your own mind. Even first year physics graduates can deconstruct quarks in their sleep. We are after bigger game.

I find dinosaurs more challenging, especially velociraptors, which are often seen with the blood of misguided geneticists dripping from their jaws. Now please pay attention while I make the velociraptors disappear, and excuse me while I get out the Big Gun.

The big gun is the Observer. When science was just getting started there was a very big observer called 'god.' God was omniscient. God was the one who kept the tree in the Quad from disappearing when all the students and faculty were asleep. God never got bored doing this. Those were the good old days. We took god for granted until we discovered the Quantum, and then decided that even god could not tell whether a certain cat was alive or dead. Now we allow god to be agnostic about quarks, too.

That was as far as things went until the cosmologists got into the game by inventing universes. Soon they had to wonder if there could exist unobservable universes, or would that be like a square circle? Could we have the same problem with a quantum universe that we have with a quantum cat?

- 2 -

To make a long story short, all of us, including the velociraptors, are left up in the air. For example, suppose the comet that wiped out the velociraptors had been a little bit bigger and wiped out everything. Suppose that the same thing happened to any other planets harboring life. Then suppose the universe fell back down its own black hole. Now did that universe ever really exist? Says who? Whose point of view is determinative, god's, the velociraptor's, the quantum cosmologist's...? Can we be agnostic?

Perhaps the best we can do is fall back on the Cartesian 'certainty' that I think, therefore I must exist? We might then begin to wonder how existence works. Do we exist because of the velociraptors, or they because of us? Is existence some gordian knot?

The only other mystery to challenge the mystery of existence is that of the mind. We seem close to fathoming the depths of space and time, but we have barely touched the surface of the mind. This fact alone strongly suggests that the potentiality for mind, and observers, could be an ineluctable and essential component of our reality, and of any(?) reality. Whether one proceeds by induction or deduction, by analysis or synthesis, one is led back to the problem of existence.

Science is forcing us to rediscover what we conveniently forgot. Existence is no simple matter. Not the whole of it, nor

any part of it. Ironically, the how of existence, and all its enigmatic relativity, may suggest a why for existence. Instead of the great chain of being, we have the gordian knot of existence. (Maybe they are the same?) The implication verges upon a cosmic ecology of mind. Each of us microcosmic individuals is an essential reflection of the whole. The dynamic is the reflexive reconstitution of the parts into the whole, and the whole into its parts. Human history is a significant link in that chain which defines our spiritual origins and destiny.

The quarks, quasars and velociraptors are each the logically aesthetic components of a naturalistic veil that temporarily and necessarily shields and distinguishes destinees from destinors, or us from US. As we finally begin to see through that veil, life does begin to get more interesting. All things become possible. Yes! Is that frightening? Yes, indeed! But the eschatological ax is so sharp that one hardly feels it.

Do those erstwhile velociraptors get short changed in this spiritual bargain? The only way to find out would be to ask them.

Dan T. Smith, Baltimore, MD

Objectifying the World

The Modern world would be nothing if it were not naive. Given that limited choice, most of us prefer being naive to being nothing, and so we go on about our business as usual. If even a few of us ever stopped to think things over, the whole world might come crashing to a halt, which is a scary prospect. In a world founded on naiveté, thinking can seem sociopathic, unless you are a professed eschatologist, as I happen to be.

Actually I am ambivalent about the end of the world. It may be more interesting to imagine than to experience, but, given its inevitability, I take it upon myself to make the eschaton as enjoyable as possible, which will require some thought.

The hardest part of thinking is deciding where to begin. Worrying about the bills that need to be paid will never get us any further than the nearest bank. While owning a bank may facilitate the thought process, it often has the opposite effect, alas.

The obvious place to begin is quite simple. To be or not to be. The question of existence ought to be the beginning and end of any thought process. The beginning and end of existence are of particular significance.

Science takes special credit for our modern naiveté regarding existence. The problem of existence is not likely to come up even in graduate school, and by then it would be much too late anyway. Science sweeps away the question under the rubric of the Big Bang and the Big Crunch. Those two convenient receptacles are the beginning and end of everything that will ever exist. What comes in between are just accidental rearrangements of all those elementary particles. If it were not for an ATM, I would still be teaching that to freshmen.

Modern professional philosophers know better than this, for the most part, but unless they have a plan, they are just throwing good thoughts after bad ones. Everything is business as usual, with minor adjustments, unless you join the eschaton brigade. An acosmic postmodernism, just does not make it, but add a little cosmology to postmodernism and you get eschatology. Voila!

Science is supposed to be studying objects, like electrons and big bangs. But in my six years of physics there was not one mention of the problem of objectification. John Wheeler did not come out of his metaphysical closet until several years later. By then he had tenure and some extra change, and I was on the road, trying to be an existentialist.

The blindingly obvious question is how does an object come to be objectified. How we managed to lose track of that question might be answered if we knew why, historically, the Western tradition posited God as creator rather than as objectifier - a fairly subtle distinction. Perhaps it - 2 -

had to do with the idea of creation from nothing, one might suppose. Lately, when the problem of objectification does come up it is likely to be swept under the quantum rug, as if the quantum domain were the source of the problem, rather than just a symptom.

One does not need to be a tenured professor to suppose that objectification might entail objectifiers, and that is us and whoever else might be lending their thoughts to our reality. Yes, I am reiterating the notion of a socially constructed reality. Recently when a physicist pretended to argue that quantum gravity might be a social construct, it was supposed to have been a joke, but it might all depend on how you define 'social.' To say that gravity is a construct of the American Physical Society is a bit of stretch, but to say the same of quantum gravity might be cutting to the quick. Ouch! In order to say that our weight on earth is a construct of the stars in the sky, you have to be a famous physicist. To say that weight is the construct of cosmic mind, including ours, you would only have to be a little less naive than the average scientist.

The more we attempt to objectify the world, the more complex and abstract it seems to become. Instead of any real objects, physicists have been left contemplating a dizzying spiral of mathematical abstractions. This predicament has led more than one physicist to suggest that the world is much more like a great idea than a great machine. But then why do so many of us continue to insist, to the contrary, that the world has got to be an arbitrary, self-existing object

in which we happen to find ourselves purely by accident?

There is a palpable sense of security in believing that one is standing on a solid object. All of human history can be understood as an extended journey into the illusory security of materialism. But as the abstract complexities continue to mount, we must wonder if we have reached the logical limits of the illusion of materialism. As we awaken to our situation, where will we turn next to find security?

Our only real security can come in recognizing our origins and destiny. In doing so we can consider that we are part of something larger. The fear that the cosmic mind will now proceed to swallow our microcosmic minds is a very reasonable one, but that might be the easiest way out for us. Even more troubling would be the notion that we are about to become that cosmic mind. No one had warned us that becoming God was part of our contract. But did we ever wonder what else we might possibly become? We might choose instead to become cosmic Peter Pans. Perhaps that could be arranged, but isn't that being just a bit escapist?

Dan T. Smith, Baltimore, MD

Concerning the End of the World

Science is fairly definite about what it points to, religion is rather less so. And most people accept that both of these traditions represent at least some form of reality, and that the realities thus represented cannot be entirely independent.

Thus there are many people just as intelligent and rational as you or I, who believe that the institutional segregation of reality as represented by science and religion is an historically generated distortion of a what is actually a more unified world.

If human understanding of the world is going to continue to advance, then at some point we will have to confront and overcome these institutional limitations.

The greatest minds in the world have spent millennia grappling with the problem of how to integrate the material and spiritual aspects of reality. Most philosophers would now agree that there is only one rational answer to that question. The answer is simply that reality is ultimately spiritual. The many modern and post-modern philosophers who defend other beliefs, will readily admit that they do so only because they believe that reality and rationality are radically divergent, no matter how much all of us might wish otherwise.

In other words, scientific modernism is the view that although the world may be partially intelligible, this does not imply that it is the construct of a larger intelligence. But I do not see this as sufficient reason to reject the idea that our minds are an essential part of a larger intelligence of which our world is one of the products.

But if I am right, then science is wrong about the world, particularly in reference to its beginnings and possible endings. I can do nothing other than uphold the traditional spiritual imperative to concern ourselves actively with these beginnings and especially the endings.

Thus, in as much as science claims to know about the end of the world, I should do everything in my power to make sure that its claim is seen by the public to be rationally refutable. This ought to be a fairly straightforward task, albeit one with spiritual, intellectual and political ramifications.

Dan T. Smith, Baltimore, MD

The Inevitable Risks of Reality Engineering

Given the high probability that our world is not, strictly speaking, a mere object of our perception, to that same degree its stability will eventually become vulnerable due to the natural and artificial amplification of some forms of spontaneously initiated disturbances of a mass psychological nature. So, despite the fact that any form of preparation is likely to hasten the anticipated instability of our world, it is deemed that a minimal, quasi-public preparation effort at this time would be our best overall strategy.

To the degree that there is a subjective component inherent to all of reality, to that degree the world must be considered to be a construct of all perceivers. Any construct of that sort is open to a similar deconstruction. Furthermore, based on various historical and logical considerations, it is not unreasonable to suppose that the potentiality for its timely deconstruction would have been an essential feature of our world from its inception.

There are two scientific results which have a special bearing on our considerations. The first is that our individual mental functions appear to be highly integrated and correlated to the rest of reality. The second is that those same functions are far more resistive to analysis than any other aspect of reality. These two results combined offer a very strong argument favoring the notion that our minds manifest an essential aspect of all of reality, despite the fact that our scientific endeavor has heretofore been premised upon the contrary conception of reality.

So far we have spoken of the world as a construct that might be deconstructed. The other possibility to consider is the eventual reconstruction of the world. How that might actually come about is very difficult for us even to imagine at this very early stage of our reconceptualization of the world. But, certainly, our proper reconceptualization will be a principle ingredient of the reconstruction process.

What I am suggesting is that our world may not be quite as 'natural' as it appears. Behind its apparent naturalness, there exists a considered purposiveness in which we have, up to this point, been the unwitting collaborators. Our unwittingness had been one of the design features. We are about to make a dramatic conversion to being conscious collaborators in the larger scheme of things. At that point we are participating in the recreation of our world. We become reality engineers, for better or worse.

Dan T. Smith, Baltimore, MD

Our Present Situation

By unlocking the mystery of the atom, we nearly brought our world to an end with the advent of nuclear weapons of mass destruction. That was just a preview of what is about to occur. The only mystery greater than that of the atom, is that of the mind. In finally unlocking the doors of the mind we will be setting in motion the events which will bring this world to an end.

There is only one secret of the mind, which is simply that there is only one mind, despite any appearances to the contrary. The corollary to this truth is that the world is its construct. After we finally grasp this simple truth, the world will become for us just another option, just a state of mind. It will be ours ultimately to set aside or reconstruct as we then see fit. There will also be ample opportunity to experience other worlds - the other creations of the cosmic mind.

This sounds like an end of the world that we can all live with. Hopefully, yes. But there will be an attendant trauma and suffering, the minimizing of which will be our best motivation and guide toward performing an optimal cosmic transition.

The true miracle is not the revealing of the secret of the cosmos, but rather the fact that we were able to postpone this revelation for so long. Be assured that this postponement was the cosmic intent, and is a tribute to the creative power of that mind which is all of what we are.

But was all this really necessary? Of course. Recycling is a cosmic necessity, and we of the microcosmic persuasion were the vehicles for bringing that about with the least amount of trauma and discontinuity that was possible. This was not the best of possible worlds, it was the best possible mulching system. It could have been worse. It is only now that we can get on with mastering the real possibilities, and then perhaps we can enjoy the few remaining years of our compulsory sojourn with the Earth. This old world might take on a new meaning, even a new taste!

It is stunning how long science managed to postpone its day of reckoning with the mind. That it might be so swift, is a very good reason to have kept putting it off. Science likes to dally over the digestion of its subjects. It might have wished that the mystery of the mind could have kept it in the clover for centuries to come. But, unfortunately, that is not what is in the stars. Think of me as the thief in the night, coming to rob science of its feast at the last moment.

Let me now go through the motions of an explanation. This will not get me off the hook, but it will have to do for now - we scientists know all about 'hand waving,' I trust.

It was the deconstruction of space, especially in the radical fashion of quantum cosmology, which set the stage for the reconstruction of the cosmic mind. The 'anthropic principle' certainly did not hurt the cause, either. Now, science is not supposed to deal with imaginary things, which is what an unobservable, unmeasurable universe would be. Imaginary is what our universe would have been without observers. This can mean one

of two things. There was a preexisting virtual mind waiting for the appropriate virtual universe to come along so that together they could achieve reality. That sounds rather Cartesian - a mind and matter proposition. The alternative is to skip the material part and let the universe simply be a construct of the mind. Then there will be a lot fewer ships out there passing in the night, thank you Occam.

Another way to approach cosmogenesis is to consider the primordial chaos of the quantum void, in which everything is virtually possible, including virtual kitchen sinks and universes, like ours at the time of the alleged big bang. However, there is a bias on the part of physicists toward virtual objects at the expense of virtual subjects. One can split the difference and simply posit virtual experience, again Occam comes to the rescue. The primordial quantum soup then looks less like a junkyard and more like a bad hallucination, if anyone can tell the difference.

Whether we start with a quantum 'junkyard' or an hallucinatory jumble, we must also posit a principle of self-organization. It is reasonable that self-organization should apply more naturally to virtual thoughts than to virtual particles. Take your pick, but here we are and the only thing we know for sure is that we are thinking. All the rest is up for grabs, which was where I came in.

Could there be any other 'cosmic' minds out there in the night? No. There are other worlds which are just chips off the same block, all more or less interconnected. But in the primordial chaos, everything already happens at once. We are part of how it all gets sorted out. That is our genius, that is the cosmic genius, or God, if you will.

Finally we can put away our rocketships and our atom smashers and start using our minds, as they are now truly meant to be used. They will take us to wherever we can imagine.

When we think we know where the truth is leading us, it is a burden that we can all share. But when there is an apparent change of course, a new direction must be articulated. At that crossroads, truth becomes a singular affair. That is the stuff of prophecy. One can either wait patiently, or put everything else aside. I cannot apologize for doing what someone had to do in this singular situation.

My job may already be finished. Perhaps not. That is largely up to you. In this transition there is a need for some new authority, a new combination of spiritual, intellectual and political authority. It is the new truth that we will all be living, but here at the crossroads, continuity of consciousness demands a balancing of the old and the new. That is the politics. There are many things to discuss, we just need the proper provocation. If I should continue to be that, then fine.

Dan T. Smith, Baltimore, MD

A Situation Report

The remaining time allotted for us to continue participating in the experiential realm that we regard as our particular, isolated world is disappearing rapidly. We are being pushed and pulled into a greatly expanded experiential order, which would include the experiential realms of other intelligences. Even considering the shock of the cultural encounters of several centuries ago, we have not participated in anything comparable to this since the prehistoric era.

What has been our 'normal' experience for the duration of our recorded history is, from this larger perspective, exceptional. Through our various spiritual traditions we have attempted to explain our situation to ourselves, with obviously limited success.

What we can see in our history is primarily the story of our fascination and then our increasingly skillful engagement with the 'physical' world, culminating in a global technostucture supported by the belief system of scientific modernism. All of this has been directed to the extreme cultivation of our individualistic, microcosmic consciousnesses. Now for the harvest?

Not quite. Despite our own 'physical' mortality and the occasional cosmic drama, there is a necessary underlying continuity to all aspects of experience. We are about to participate in one of those dramas in which the prospective discontinuities will be seen in retrospect to have been relatively superficial. This is not to discount the actual trauma and suffering that can attend such events. The minimizing of those effects will be our best motivation and guide toward making the best possible cosmic transition.

But let us not get too far ahead of ourselves. Back in the present of 1996 we can barely distinguish the clouds forming on the horizon. It is one of the smallest clouds which ought to be getting our attention now. As a precedent, a few decades ago the philosophical community quietly acknowledged that analysis could never provide a complete explanation of the world. By present trends, in the next few years there will be a more difficult to ignored acknowledgment by the scientific community that a similar attempt at the complete analysis of the mind is logically doomed to failure. Relative to all the other global developments that should concern us, this might rank as one of the most obscure, and so it would remain were it not for the fact that our scientific modernism happens to be a conceptual house of cards, or a set of dominoes.

Let us examine the critical dominoes. The unanalyzable nature of consciousness will be seen to entail its non-physicality. Its non-physicality means that our ability to experience a 'physical' world could not be an accidental or even an evolved attribute of such a reality. At this point we might be tempted to recapitulate the Cartesian cosmology. According to Descartes there were two created orders, spiritual and physical, inhabited by us creatures. The creator is kept rather busy maintaining the harmony of these two spheres of existence.

In the nearly four hundred years that have intervened, the intricate conceptual unity of the experiential realm has become better appreciated, significantly through the efforts of science. It is now impossible for us to return to Descartes' simplistic and ironically anti-rational view of the world.

Our alternative is to postulate the existence of just one 'substance:' experience. The apparent naturalistic order of our world is a tribute to the one inherent attribute of experience, its impressive and unlimited potential for self-organization and expression. In our normal, waking state we do not consciously participate in these potentialities that constitute the cosmic spirit.

It is in the natural order of things that this spirit should be both self-concealing and self-revealing. Its self-concealment has characterized our recorded history. Its revelation signals the logical end of that history. A fear of God is a perfectly natural reaction to millennia of superficial absence. That our temporary spiritual blindness should be spontaneously overcome largely through our own conceptual and creative power, is as it should be. If I can contribute to this process of revelation, then so can we all.

Dan T. Smith, Baltimore, MD

Official Culpability?

There is more than adequate evidence demonstrating that there were repeated 'official' contacts over a period of several years with several individuals who were at the time aggressively disseminating UFO rumors to the public.

The official contacts were emanating primarily from one section of a particular defense agency. Within the constraints of the present evidence it is possible to suppose that these contacts were being orchestrated by a few individuals outside of their official responsibilities. This could have been a rogue operation, however difficult it might be to conceive of its motivation. On the other hand, if this was part of an officially sanctioned disinformation effort, it is nearly as difficult to conceive of its overall objective, other than to suppose that this was an especially risk laden display of incompetence at a high level of authority.

It would be appropriate at this time for someone with the proper authority to initiate a review of this particular episode. Such review could shed considerable light on what has become a significant source of public confusion on the subject of the Government's involvement with the 'UFO' phenomenon.

Some of those individuals who were being contacted have already been the subjects of low-level government inquiries, with inconclusive results.

rev. 7/9/97

The U.S. Government's Involvement with UFO's and Parapsychology

It is indisputable that actions on the part of numerous government officials over the last several decades has contributed substantially to the public perception of UFO's and parapsychology. On the other hand, there is at this time no substantial evidence to support the notion that there has been any concerted effort or policy by or within this Government with respect to the above phenomena. With this finding in mind, let us consider some specific cases.

During the 1970's there was a general high level of concern that the Soviets might develop applications of parapsychology that would prove detrimental to U.S. interests. This concern gave rise to a rather modest counter effort lasting for about one decade that cost some tens of millions of dollars of federal funds. The principal result has been the spin-off this program into the private sector, which continues to be a source of unending speculation and confusion.

Over a much longer time frame continuing into the present is the fact of Governmental concern and confusion about the so-called 'UFO' phenomenon and its side effects particularly in the public domain. It is undeniable that private citizens and government employees report unusual experiences that they suppose are artifacts of non-human intelligence. There is no evidence suggesting that the Governmental concern has been translated into any concerted programs or policies. There have been concerted government initiated investigations into the phenomenon, not all of which have been made public. But no actionable conclusions have been drawn.

There have been numerous interactions between government officials and citizens over this time period pursuant to personal and official collection of information. A very few of these interactions resulted in allegations of information of a provocative sort being related to private individuals that were subsequently magnified in the public domain. It is very difficult to reconstruct the initially disseminated information. It is deemed impossible to substantiate any of the possibly disseminated provocative information.

The past experience with parapsychology and UFO's point to inherent vulnerabilities in modern social institutions. While these vulnerabilities may be readily noted, the possible remedies remain obscure. However it can be clearly stated that government secrecy of any sort exacerbates these vulnerabilities, and this is a very significant social cost that must be recognized in maintaining or initiating any officially sanctioned secrecy.

rev. 7/9/97

UFO's Posed Cold War Security Threat

According to one security analyst it was not the little green men that were threatening our national security apparatus, it was rather the folks who thought they were tracking UFO's who on some occasions unwittingly penetrated otherwise secure projects, such as stealth.

Although some government secrets were inadvertently leaked to the public as a result of these penetrations, there were no known instances, according to this analyst, where any foreign agents were directly involved in this type of penetration. Perhaps we were just lucky.

Thus it was that UFO's indirectly became a major concern to the higher levels of the intelligence community. Some of these security headaches may also have been the unintended fall-out from unauthorized use of ufo disinformation by overzealous field agents, thinking that popular myths of ufo's could provide a convenient cover for legitimate government projects.

Such isolated instances are partly to blame for the considerable efforts that various agencies and departments have expended in filling the FOIA requests from citizens chasing ET's in the corridors of government. As to whether our government might have found ufo disinformation as a generally useful ploy in the collection of foreign intelligence, this analyst declined to speculate.

This past experience with ufo's may point up an inherent weakness in maintaining legitimate government secrets in a post cold-war, post modern open society. Suppose that a paranoid and fanatical segment of the public could be persuaded that Jesus is being held prisoner at 'Area 51,' for example. One could conceive of a general melt-down of public authority if such thinking were to become more prevalent. Concerns about such problems might become part of the rationale in the downsizing of government secrecy.

rev. 7/8/97

Spotlight on the Aviary?

For anyone seriously interested in uncovering the connection between UFO's and the government, the 'Aviary' represents the primary collection of known 'witnesses.' All members have been on the 'scene' for at least a decade, and most of them for considerably longer. If one could demonstrate that this group of individuals was not privy to any substantial UFO related secrets, that would go a long way toward resolving this entire issue.

If the public concern about a government cover on UFO's intensifies then so will the pressure increase for there to be substantive action toward resolving this issue. Informal attempts to collect Aviary testimony should be encouraged. If this approach fails to produce an adequate response, then more formal processes should be instituted. Several members of the Aviary have already been subjected to low levels of inquiry. The results of these inquiries should be reviewed in light of any new information. As much of the information as is practical should be made directly available to the public.

There are other avenues of potential inquiry besides the Aviary. Over the years ufologists have amassed a great quantity of government documents, many significant ones of these have not even been privately circulated. There should be an effort to make a rough inventory of these very substantial holdings with an eye toward developing a rough overview of the nature of the known UFO paper trail.

Many ufologists also have developed their own networks of government informants. There should be a preliminary assessment of the usefulness of these existing networks for any future expanded inquiry.

There should also be an attempt to interview a substantial random set of former government officials in positions where they would likely have been privy to inside information of either a formal or informal nature.

Rather early in the above inquiries one could get a good indication of the value of the information resulting from the given level of effort. This assessment should also be made public so that the interested parties could decide on the desirability various continuing actions.

Such measures as these are not going to resolve every question and concern, but they could go a long way toward substantially reducing the amount of public distrust in an area that generates much impassioned confusion.

.

| [Contents](#) |

rev. 7/10/97

A Preliminary Assessment of Government Involvement

Among skeptics of ufo's it is widely supposed that there could be no big secrets held for a long period of time. The simple answer is that the facility with which information can be contained should depend a great deal on the nature of that information. That could be turned around to use the fact of containment to assess the nature of the information being contained.

Several factors would facilitate containment such as concentration, compartmentalization, negativity, confusion, uncertainty and weirdness to name but a few. Some of these same elements appear in publicly reported cases and so it is fair to assume that they occur in a concentrated fashion in the information being withheld. If there is a timetable for the planned release of information that is already being implemented, this would improve the cooperation of the various participants. Although material incentives and coercion could play a role in the containment, it is unlikely to be the major factor.

If there is a primary, focussed source of ufo related information, this would greatly facilitate containment. This would tend to generate a similar human infrastructure. The information collection effort would be that much easier to control.

A particularly sensitive aspect of the entire containment process would be the likely necessity of briefing the President. This would be a necessary weak link in the whole effort, and it would likely entail some elaborate but informal or ad hoc precautions. The briefing process would ensure a coordinated control function, even if this were not already imposed by the phenomenon itself.

Another consideration is the probable degree to which science and technology are involved in the collection and the content of the information. Is there an ancillary R&D effort? To what degree can this effort be mainstreamed without compromising the security? Somewhat reluctantly I have come to the conclusion that there could be a considerable clandestine R&D effort, besides a very significant mainstream component. The former would necessitate an elaborate but feasible infrastructure involving long term isolation of significant proportions. Isolation from this world would seem to require a compensatory linkage to another world. This is my assumption. Such preliminary linkage would be an integral part of the 'R&D' program.

That there could be a technical aspect to ufo's and our response to them, need in no way detract from the central metaphysical and spiritual significance. The technical dimension is likely to be mainly a concession to our modern culture.

Relatively abstract considerations like those above can go rather far in painting a picture that is as reasonable as it is fantastic of the 'ufo' situation in these latter days.

As an overall assessment, it is reasonable to suppose that something like the above picture is more likely to exist than not. Part of the assessment is that we will not have very much longer to remain in the dark.

.

rev. 7/11/97

The Aviary/Roswell Problem

Does the existence of the aviary present or point to any definable problem? Here is one possibility. The history of the aviary and its ramifications points to the possibility that an entire civilization could conceivably succumb to spontaneously generated confusion.

It has been cogently argued, for instance, that the Roman Civilization succumbed to rumors about a single non-death resulting from one of its million or so crucifixions.

There is no way to be certain at this point in time that our modern scientific civilization might not succumb to rumors about the crash of a single flying saucer. Certainly a large segment of the entertainment industry is caught up in continual variations upon that theme which has had a measurable impact on the public distrust of governmental and scientific authority.

Is there anything that Rome could have done about the Jesus problem? Is there anything that Washington could do about the Roswell problem? There seem to be only two possible solutions. There is the Coliseum solution and the Constantine solution. In the case of Roswell, it would appear that both of these solutions are being pursued, perhaps unwittingly, and perhaps not completely so.

In the larger sweep of history the actual source for any global shift in consensus reality is only of academic interest. Once the reality wrench has been thrown, there is no way to turn back the clock and wonder what might have been. The actual wrench has by that time already been encrusted with too much cognitive dissonance to ever be more than a source of perpetual PhD theses and diatribe.

By definition, reality wrenches always come from out of the blue. Whatever might be a given reality, there will always be a reality wrench and there is no conceivable defense mechanism. There may be stratagems of delay, but these are just as likely to be counterproductive, since they will themselves be based on some questionable assumptions about reality.

Once the wrench has been thrown there can only be the Coliseums and the Constantines -- only the Philistines and the Essenes. There can only be winners and losers in the larger sweep of history.

There is one possible loophole. Remote view the winning side and get on the band wagon, but not too soon. This would appear to be the Beltway Insiders solution. This is also the aquarium solution, with a slight twist. The twist is to reinvent the wrench. Find the empty tomb/nest. Find Raven. Steal the ma/jic: Manhattan engineering -- joint chiefs integrated command or something.

rev. 7/9/97

One Red Heifer

Democracies provide for a changing of the guard every few years. When some more serious shift of power occurs, even the most carefully crafted democracy will be put to the test. At our bicentennial mark, we are the oldest democracy. Other democracies have come and gone.

Before democracy there was divine rule. Kings and emperors ruled at the pleasure of the Gods. The king's subjects would look for portents of divine displeasure and keep an eye on the palace politics.

The recent birth of a red heifer in Indiana may precipitate popular unrest among the Hasidim in Israel that could subvert the fragile peace of several regimes in the Middle East, with unknown global consequences.

The authority of the Gods is based on human perceptions of same. The modern authority of science as embodied in technocracy is no less based upon human perceptions, despite whatever claims to absolute truth the scientific establishment may wish to make. Secular democracy and scientific authority have become highly interdependent, and perhaps equally fragile.

Deeper in the human psyche, every authority and every reality is open to question. In times of stress, in the interregnums, in the Twilight of the Gods, one red heifer can deconstruct the most finely crafted global civilization.

Mr. D. is such a heifer, an authentic modern prodigy, born right in the King's own stables. What is the King to do? The King must ignore all prodigies. But even the Sagans and the Clintons are not superhuman, they are not above wondering about lights in the sky and rumors in the parlor. The rasputins can smell the blood of the Gods. The subjects keep a close eye on the palace scandals.

rev. 7/7/97

Reconstructing the Aviary

The aviary is an artifact of the demise of a highly compartmented program possibly involving alien intelligence. The aviary may have been an ad hoc safety valve enabling a minimal self-debriefing of the various compartments once the central authority became dormant. R. performs several functions. He is batting in the cleanup spot, making sure that the unavoidable leaks do not create any lasting problems for the government. There may also be a moth balling function in the event of a possible reactivation of the underlying program.

I am part of the public collection detail, helping to assess the overall leakage to the public sector. But there is also a salvaging or reconstruction opportunity that complements the dismantling or deconstruction task of R. I am entrusted with the unclassifiable souvenirs, to make of them what I will. Our two jobs conflict, but in the interest of containment we operate in the same compartment.

Debunking and deconstruction are approximate synonyms here. The zeroth debunk is to explain the aviary as an acute case of viral insanity. The next debunk is to add small elements of tactical foreign and domestic counterintelligence. The second approximation for deconstruction purposes is to add an element of grand strategic deception. But this is now becoming a witches brew.

Whatever it was got out of control. How do you put the toothpaste back in the tube? We have a level 4 virus that has escaped and can travel at the speed of light with a latency period that can last for generations. This is not a pretty picture especially for a modern secular, and would-be democratic society.

If there is no reality behind the aviary/ufo phenomenon, then one might hope that our modern technocratic society will survive the viral insanity and in the process acquire a rudimentary immune system that would be valuable in future generations. We just watch the fever burn itself out, hoping that the enemies of democracy do not exploit this nearly fatal weakness. On the other hand...we reach for the fire extinguisher, only to find a little black bible behind the glass. This is an even less pretty sight to modern eyes. But even if you took all the religious leaders and put them end to end, what new tricks are you going to teach them? What new tricks are they constitutionally capable of assimilating in anything approximating real time.

This is when people start taking a second look at the aquariums of the world. And just how many are there, and who will decide the pecking order? But perhaps this has something to do with the reconstitution of the aviary toward serving its undefined agenda, and so the circle is already unbroken.

Coup d'Esprit

Armageddon/Spiritual revolution/New World Order/Kingdom come

There are some issues here that need to be addressed. At Dan's Place we have been speaking of the Second coming, mostly in the abstract, but, nonetheless, as a human based event. If that is to be the case, then there will be a political dimension to this event.

In the traditional apocalyptic, this is the point at which the anti-christ attempts a final liquidation of Christians who are saved by divine intervention only at the very end. I would like to suggest a significant revision upon this theme.

In this scenario, the anti-christ is supplanted by the second coming which triggers the 'Armageddon.' Our secret cosmic visitation which occurred about fifty years ago, generated two principal secret factions, which are now about to surface. One larger faction represents the establishment or status quo, and the other much smaller faction consists of those who see this situation as a final opportunity to promote spiritual values.

Upon some triggering event, these two factions are slated to emerge from the shadows of the military-intelligence complex to confront each other in the open. The Armageddon will be an informational, psychological battle for the hearts and minds of the people, many of whom will find themselves being quickly caught up in the fray.

It is with this in mind that I spoke earlier in this end times section of using an act of public personal disobedience as a possible triggering event. The act itself might not even be necessary in lieu of a sufficiently compelling verbal gesture, as long as the factions in question are paying attention to what is being said, and by whom. Hopefully, this informational/spiritual Armageddon can remain precisely that, and not devolve into physical strife.

As American as Gnostic Pie

Or according to the Gnostic song, "Bye, bye, Miss American Pie...."

This essay comes from reading the Harper's article "The Deep Roots of Heaven's Gate," June, '97, brought to my attention by Dick Farley. In the article, Chris Lehman points out the many Gnostic aspects of that cult, and how so much of this same nexus of beliefs is endemic to American history and current events.

The subtext to the Declaration of Independence is not the pursuit of happiness, but rather the pursuit of our divine manifest destiny across the ocean. Ask any perceptive grade school student in the ghetto or the barrio or the suburbs. This destiny can be achieved only by liberating ourselves from the conspiratorial tyrannies that keep us chained to our mundane existences.

The majority of Americans who do not consider themselves upwardly mobile find weekly solace in hearing about their impending rapture into God's kingdom, and how the tyrants will be crushed under the heel of the apocalypse. Many 'news' programs each week are following the count down to Armageddon.

Gnosis is the leading heresy of every world religion. It is the belief that all human institutions serve in the entrapment of the human spirit and in the concealment of the cosmic spirit. This is also the Mother of all conspiracy theories, and nowhere is conspiriology healthier than right here in the US of A.

Well, what is the Aquarium take on all this? A qualified Amen, for sure. The qualification is that I hereby, unequivocally forgive all tyrants. Almost without exception, they knew not what they were doing. They were being only slightly more myopic than their tyrannees. For many millennia we have been needing food to eat and so someone had to keep us down on this farm we call the Earth.

It takes two to Tango and for every tyrant there must be a tyrannee. It is both of them who conspired to produce this grand illusion we call history. History is now history. Tyrants and tyrannees both have nothing to lose but their chains, nothing to gain but their spirits.

Before we usher in the kingdom of the spirit, someone has to turn out the lights of the Grand Illusion of materialism. I will gladly do that if no one else can get to the switch before I do.

rev. 5/30/97

The Greening of the Intelligence Community?

Or, Cosmic Contingency #1.

My understanding is that an Intelligence Community task force with broad powers related to "saving the planet" is being set up under the supervision of the Director of Central Intelligence and with ample new funding from Congress.

It is expected that this task force will be coordinating greater IC support for ongoing US environmental programs as well as support for US sanctioned international initiatives. This support would include providing assistance with the full range of technical and intelligence services and resources at the disposal of the IC.

I believe that saving the planet is an urgent and worthy cause, deserving of support from all quarters including the IC. Much of the new effort on the part of the IC need not be controversial. It would simply be an extension of what they are already doing as a matter of course. What I would like to focus on are the areas of possible activity that would be more controversial. Some of these activities may already be ongoing.

An obvious application would be to include robust environmental modeling in all forecasting and contingency planning efforts. I would hope that this is already being done to a large extent. The potential for controversy would be in planning for various doomsday scenarios that would hearken back to the days of the cold war. Such planning would have to include the possible employment of emergency powers on the part of the government.

I would suggest that the results of such forecasting should be made available to the public on an experimental or need to know basis, as a way of keeping the public informed as to the possible seriousness of the environmental threats.

The above applications will, of course, arouse further public fears concerning the emergence of a sinister New World Order. Such fears may be well founded, and the only way to ameliorate them is to ensure that the underlying issues are given a continued public airing.

Almost all of the environmental issues are international in scope, and so when it comes to enforcement we have recourse to international bodies and to the Super Power, namely us. There will be ample opportunity to augment international agreements with ad hoc, behind the scenes operations and pressures.

So much for the business as usual approach to saving the planet. That is just a very rough sketch of an area about which I have only a general knowledge. For the remainder of this very short piece, I would like to address an area of more immediate concern to me, which I believe has a direct bearing on saving the planet, and which also may be relevant to the Intelligence Community.

Let me point out some obvious connections and parallels. Saving the planet is tantamount to saving humanity, and the saving of humanity is tantamount to salvation, in the minds of most people. Most people expect that saving humanity will necessitate some new spiritual impetus

or a fundamental global change in attitudes that will take us far beyond our present concepts of business and politics as usual. This would be the positive aspect of a New World Order, which would thus be seen as the utopian divine kingdom to come. However, according to the same lines of thought, this new order must be preceded by an apocalyptic crisis. Purely humanistic, business as usual, efforts to save the world will generally be seen as either being futile or downright sinister, in this more spiritual context.

There is, however, the glimmer of a compromise between the humanistic and divine plans for saving the world. This would entail a dramatic shift in our world view away from pure scientific materialism. An intellectual revolution could initiate a spiritual or attitudinal revolution without recourse to the traditional prophetic sequence of an apocalypse followed by divine intervention.

If you are looking to see what role the Intelligence Community might play in such a scenario, you may not have to look too hard. The answer might be in plain sight. You may already have been co-opted into this role by forces rather beyond your control. This is just a possible contingency of the cosmic variety.

rev. 5/9/97

Summary of & Response to DF's 'Cosmology'

'Reality is the sum of all conspiracies ever imagined' -- RAW.

Most conspiracies are inadvertent -- other people are seldom as competently evil as we like to imagine.

The person who is ultimately responsible for all concealment is the self-concealing, self-revealing God. If we ask for an end to all concealment, we are asking for an end to the world as we presently imagine it. Is it any wonder that there is resistance and procrastination? You are, of course, doing what you should be doing, but would it be too much to ask for an occasional hint of irony? Irony is the result of realizing the limits of rationality. If God did not want or expect there to be conspiracies then He would have created a world rather different from the one we now inhabit. To end conspiracy is to end this reality. Consider also that God may be a conspiracy of angels, for all that you or I know!

For every alleged negative conspiracy you delight in, there are probably a dozen unsung positive conspiracies. For example, consider the 'invisible hand' so loved by economists that is credited with maintaining the stability of our markets. If the CIA is keeping cosmic secrets, it is mainly because they rightly believe that this is what the public wants them to do. If they benefit in so doing, that does not prove malfeasance. It is we investigators who flout the will of the people in our zeal for truth. Is there no irony in this situation?

What I say finally to you, Dick, is that you must not continue to shirk your responsibility. If you insist upon the revelation of the cosmic secrets, then you are arrogating to yourself a divine prerogative. There is nothing wrong with that, unless you attempt to conceal what you are doing. So here finally is your irony. It is you who are perhaps the greatest concealer of all. You pretend to be the innocent journalist, when in fact you are a cosmic agent, or a wannabe agent. If you ever choose to come out of that closet, guess who will be the first person you run into! Yours truly. As I read between the lines of my interaction with Ron & Co., it is we, you and I, etc., or whoever is then the Spirit of Truth, who will finally decide when and how the sky will fall. Anytime you want to get serious about these responsibilities, just let me know.

Dan

.

| [Contents](#) |

rev. 5/18/97

Dan,

"All in fun," of course.

But Dan, a simple country journalist IS all that I really am.

Not a camouflage or cover for being some kind of "angel in human drag," my interest and eventual peripheral involvements in these various fields have arisen simply from looking around.

In your case, when did you decide to cease being a student of physics (or did you) to adopt an Eschatological Interface role? In all traditions there are folks who play roles in such dramas, no doubt none so important (at one time or another) as Dr. Hal Puthoff in earlier years of "asking questions" about RV @ SRI. And now, Hal is a "physicist, again," trying to do the math for a star-chasing drive that may not see operational reality for a century or two more, IF even by then.

Or Dr. Ron Pandolphi, inheritor of part of the very large chair of Kit Green, who BEGAN with his earlier work supervising the contracts of Puthoff & Co., only to grow and accelerate through his field and into areas no doubt the "kid Kit Green" was never able to imagine...(unless of course, he was...and did...which may have propelled him on his way to some "kid-dreamed" future). I doubt whether Kid-Kit dreamed of earning the National Intell. Medal. Given that such acknowledgements are not bestowed in any "light" vein, no doubt adult-Kit would never have wanted a "kid-Kit" even to imagine, let alone worry, about the kind of a world and "universe" where Kit, Hal, Ron and their peers wake up every morning and "go to work."

The key here, Dan, seems to be "balance." Theirs...mine...yours. Finding it. Keeping it. Enjoying it.

If one's life is too empty, too strained or too lonely for what is "real" to serve as a deep enough keel to keep you upright in the kinds of "psychic storms" and "consciousness cross-winds" that often arise "out there" (where "Truth" resides, or doesn't), then it is pretty easy to suffer a knock-down and be swamped.

Keeping with the sailing metaphor, because it's one that fits the "cosmic" travelling we all dream of doing sometimes, it is the mark of an experienced mariner to sense the weather and to know when to reef your sails...or to change course and head into the wind, surviving until a storm is passed... or simply to find a port and sit out the storm.

At moments like that, (ending the metaphor), it is helpful and good to have friends, family and some other contexts where a sense of "normalcy" can be relocated, restored and maintained.

As I've mentioned to you previously, perhaps the treatment of this kind of situation that comes closest to describing what I have learned about it from watching other "seekers" is the way Janet and Chris Morris handled it in "The Stalk." (ROC, 1994). I have beaucoup respect for Janet and her incisive reporting on the kinds of issues that face policy makers and shapers when a "reality base" is altered. As she (and John Alexander and Dick Groller) tried to make

potentially positive in "The Warrior's Edge," ...and as her influences on Newt Gingrich, as evidenced in his "Windows of Opportunity" (1984, which Janet essentially is credited with re-writing and helping to focus)...Janet knows that even if "the aliens" land (or maybe are "already here"), we still have to pay the rent, feed the babies and take out garbage.

The determination (by whomever, for whatever) about what and when to "tell the people" whatever are the "biggest secret" kinds of things has to be "What will happen after we tell 'em?"

If a "Heaven's Gate 39" doesn't send a signal that some of us are not at all ready...or if your own suggestions for a "direct action" or the kinds of things Operation Right-To-Know plays at doing are any indication...then, heck no, we are NOT ready.

So, if you want to be "an angel" or Eschatological Interface, Dan, remember: "Angel is as angel does!"

Stay loose, guy. And be patient! It's not about you, me, Hal, Ron, Kit, Bruce, Rich, Nelson or "Larry the Rock."

.

| [Contents](#) |

rev. 5/19/97

Dick,

Well, we managed to sail right past each other, two ships in the night. I am not looking for a collision or confrontation, but merely a dialog.

True, I am attempting to remove the mask of journalist, simple or otherwise. In this postmodern world, journalism is the profession that is in greatest jeopardy, and rightly so in my estimation. There is no such thing as a quantum journalist. No one is just an observer, any more.

Welcome then to the club of participation. I wish only to point out that you are lacking that essential postmodern credential of a home page. If you had one, I might have a better idea of where you are coming from and to where you might wish to go. Then there could be a dialog, of sorts. I proceed, nonetheless.

Along with the mask of journalism comes the mask of cynicism. I know what are your fears and some of your doubts, but I don't know your hopes. I take it that you are a fairly orthodox, though non-evangelical Christian. You believe that the world and the heavens are full of potential anti-Christ. The world is a dangerous place and getting more so on a daily basis. You are a mostly spiritual survivalist, with a touch of the Paul Revere syndrome, 3 lights in your tower if they come from the sky.

The primary distinguishing belief that you share with so many humans, regardless of any other beliefs, is that you are a 'post-tribber.' There has to be a silver lining somewhere, but only far beyond this earthly storm. Yes, we are not ready to be saved, and it is difficult to imagine the tribulation that might prepare us for salvation.

What almost every Christian fails to want to understand is that all we are saved, regardless of whether we want it or even know it. It is only a question of the timing for the final realization. All of our humanly efforts to create a purifying holocaust for our fellow humans have been preordained to fail. Some people are bound to be disappointed with that news.

My ultimate 'direct action' is to be the Messiah, or Second Coming. My first approach to being this is intellectual, but what comes after the intellect is then less determinate. Usually I am quick to admit that my 'divine' appointment could only come after the 'fact,' whatever that unknown fact might be. This is the non-wallflower approach to election. God would like to dance with humanity, but it does take two to tango. Abduction is usually frowned upon at the Senior Prom. Someone of us has to break the ice and be bold about it. When I speak of participation, this is the ultimate. Anything less than this is tainted with pusillanimity.

My suggestion is that you and I throw dice for the salvation of the human race. Which would you be most afraid of? Winning or losing? This 'crap game' is simply a dialog concerning the fate of humanity. This is not intended to be an offer that you can easily refuse. You have been asking for it, in my estimation. This is also your little contribution to keeping me off the grass at 1600 PA.

Dan

.

rev. 5/19/97

Dick,

At 05:06 PM 5/22/97 -0400, you wrote:

>Dan, >Before we can "dialogue" much more, you'll have to clear up the little >misconception you've given me about your relationship with Dr. Pandolphi of >Photon Research Associates (& Company), as Ron says he's not in the least >interested in UFOs, and your and his discussions center on fishing and >technologies. There is little I can add to such a discussion, as my >environmental focus is primarily on "science and public policy," which is how >I even came to be discussing so-called 'UFOs' in the context of Scott Jones, >Linda Howe, Laurance Rockefeller and that ilk.

I'm not quite sure what misconception you are claiming here, but let me at least try to clear up something.

Ron has consistently told me also that he is not interested in UFO's. He has also said that since KG went a bit off the deep end, and may have been asked to leave, that the Co. no longer accepts volunteers for that sort of job. They would only want disinterested parties. Thus Ron is simply conforming to the job spec. No?

But then again, if you were to ask me what his real interests were, I would have to admit that my limited psychic abilities are not up to giving a definitive answer. Sorry! And like Mao once said, we should not be too concerned about the color of the cats. Maybe he takes pride in professionalism.

> I have my personal spiritual views, but frankly I am a bit offended at your >surprising but inept efforts to characterize these for whatever audience you >intend. Your most recent stuff was WAY off target...and way off base in terms >of the kinds of information and commentary I'm interested in sharing.

There might sometime be an audience, but I am talking to you. You claim to be a fellow seeker of truth. I believe that I have figured out some things that you have not. I would like to impart that to you for your consideration. To expedite that, it would be helpful for me to know where you presently are with the 'truth.' But if you insist, I can proceed without any such information, it would just take longer.

>None of >it matters, as I noted. It's not about you, me, Pandolphi, or any of the >other "personalities."

I happen to be a theist, which means that I believe in a personal God, which means that my God has a personality, which I believe is best represented by Jesus, among humans. In fact, I even lean toward thinking that Jesus is God, despite my other Trinitarian biases. So, yes, personalities do matter, to my way of thinking. This means that the Universe is all about individual people, just like you and me and Ron. We are not just ciphers in some cosmic machine, despite the fact that there do seem to be so many of us. Are you with me so far?

> As to your efforts to tease the Secret Service into making you some kind of >"UFOlogical Eschaton/Interface," you're on your own, buddy. I'm not sure >where or why you're going

with all of that; the field of study I've been >following still heads to New Mexico and Holloman AFB, Kirtland, etc. To the >degree that kind of stuff is legitimate "secret technology" and doctrine, I >have absolutely NO interest in "busting the chops" of classified guys trying >to keep America free...if there IS still an America.

I am decidedly non-violent, but... the crucifixion shows that violence does sometimes play a role in even the most spiritual context.

> My focus, as noted to Pandolphi, remains on the historic fact of Project >Paperclip and the concurrent debates about where the "atomic power" and other >exotic German sciences ought to have been sited, circa 1945-1963.

I'm not quite sure what you are getting at here. I have not seen your Paperclip theory laid out in detail or even succinctly summarised.

> When somebody gets into your kind of straits,

You might also give a succinct summary of what you suppose my "straits" to be!

> Dan, I always try to suggest >that they "get a grip," or get a life...and in any event, "GET MORE FACTS." >You might want to start with the little article in the April 1997 issue of >"Military History," which is a little magazine available on your grocery >story shelf. Authored by a writer named Linda Hunt, the piece is titled: >"Project Paperclip, designed to give America's military a scientific >advantage, was at one crucial time run by a spy." > The piece exposes the sorry betrayal of the U. S. by Army Lt. Col. William >Henry Whalen, then JIOA (Joint Intelligence Objectives Agency), attached to >the Joint Chiefs of Staff. > These guys brought 1,600 German and Austrian scientists to the U. S. >between 1945 and 1970 under "Paperclip" and hundreds more under two similar >projects, "National Interest" and "63." Whalen was spying for the Soviets, >later was caught. > The little story by Linda Hunt dovetails nicely with the book that until >now has been perhaps the "definitive" report on the Paperclip programs, i.e., >"Project Paperclip: German Scientists and the Cold War," by Clarence G. >Lasby. Published in 1971 by Atheneum, Lasby's book omitted ANY references to >Whalen and the spying controversy. As with most "content analysis" kinds of >things, what else was missing has clued us in to "UFOlogy."

With your considerable output of writing, I do see a lot of trees, but I am not seeing a forest. This is probably due to either the dimness of my wit or to my not having read your things carefully enough. Could you please give me some help?!

> So Dan. You'll just have to follow the yellow brick road to Armageddon all >by your lonesome, uncontested by me fella. I've got work to do here. Besides, >the "senior weirdness" title has long been occupied by the folks working with >Uri Geller and then Phyllis Schlemmer, channelling "The Nine" for crowned >heads of Europe and uncrowned nincompoops in the U. S., also. That's the "big >dollar" UFOlogical gambit.

OK, and what does this have to do with you, me and Ron?

> Steve Greer is but a tip of their iceberg, Dan. If you have any competitors >for "Saucerian

Eschaton," that'd be Steve & Co. I see from Rich Boylan's >stuff that those folks are still making noises about gigantic revelations. >I'll watch it on CNN like the rest of Americans, Dan. Whitley, Budd and the >rest are pawns & tailchasers. > For me, "Revelations" isn't the END of the book...it's only the beginning. >But it isn't about ending the mundane boredom and responsibility of everyday >life, Dan.

You keep telling us what things are not. But what are they? Do you know? Do you have a guess? Does anybody know?

> Have a nice day. Stay loose. >Oh, yes. Paul Revere? My hero, indeed. But so is Jefferson, T. and Lee, >Robert E. >Just simple Virginia guys, trying to do the best with what they'd been given, >eh? >Adios, my friend. Be well. Live long and prosper. >Bye, >Dick

Thankyou!

End Game -- Part 2

The primary objection to my end game scenario is surely going to be pragmatic. It won't work, the skeptics will say. My best response will be to point out instances where the scenario does appear to be working, and to argue how those instances can reasonably be extrapolated to complete the game. How successful has the game plan been up to this point?

In retrospect the Aquarium concept has been based on a general end game strategy. The only difference now is that this strategy has become more focussed and more concrete. My options for decisive action become increasingly narrow.

The Aquarium cosmology and eschatology was worked out about ten years ago, but the Aquarium itself did not come into being until about five years ago, when I first met R__. Now R__ and I are good buddies and all that, but let's face it, we do make strange bedfellows -- him being a spook and me the wannabe messiah. I claim that this was a match made in heaven, but that can be difficult to demonstrate.

The point is that in my five year liaison with R__, I have been doing a fair amount of squeaking, and I have not yet been replaced. The longer this continues, the less expendable I become. Based on this history, it is reasonable to suppose that I am being encouraged to squeak, that I am being trained as a public provocateur. I'm just doing my patriotic duty.

Uh oh, Smith's transponder just went dead, inbound over the Beltway. Was that an accident or on purpose? Aren't you glad that your mother warned you not to become a spook when you grew up. By the same token, my mother said it was OK to be a cosmologist and also OK to be an activist, but just don't EVER become an activist cosmologist!

rev. 5/6/97

Aquarium Ultimatum

A preliminary draft. Open for public comment and suggestions.

I demand that there be held a public forum for reviewing and discussing the ultimate concerns of humanity, and that this be done in a timely fashion relative to the turn of the Millennium. If this demand cannot be met, then I will consider it to be my citizen's duty and my obligation as a potential witness to a larger truth to carry out the act of civil disobedience that will, within my power, be the most likely to precipitate such public discussion.

Immediately comes the question of whether there exist any ultimates, and, if so, whether they can be known to us. That is precisely what we must begin reconsidering. The answers to these questions may have a direct bearing on the continued survival of humanity.

Modern Truth has arbitrarily been divided between the secular and sectarian. This division is based upon an alleged dichotomy between the Material and Spiritual realms. Once we have allowed Reality to be arbitrarily divided in any such manner, everything else about us and our world becomes equally arbitrary, and equally meaningless.

It will not be easy for the Modern World to admit that its foundations are made of this clay, if you will. If it can be determined that the alleged dualism between mind and matter or between the spiritual and physical realms is probably a false dichotomy, then we will have to begin the very difficult process of rethinking our present civilization and the structure of all of its institutions.

I recognize that our present system of government and education is not disposed or constituted to address any fundamental new issues that cannot obviously be incorporated by simple modifications to the existing system of things.

Only in the face of imminent crisis will the Modern World reconsider the nature of its ultimate concerns. I cannot and will not precipitate such a crisis. But a person can perform an act of sufficient drama which might possibly serve to trigger a public rethinking of the nature of Reality, of the foundations of our World.

I have been preparing myself for this eventuality for at least the past twenty years. For the past five of those years I have deliberately included an official at Central Intelligence in the preliminary discussions. My liaison with the CIA has been overseen by a senior staff member of the Senate Intelligence Committee. I believe that it is now the time to bring these discussions into an appropriate public forum. This cannot be done without the acquiescence of some duly constituted public authority.

It is my further understanding that the final responsibility for the inauguration of a forum on ultimate issues must come from outside of the present system. I am not a subversive organization, I am not a cult. I am a private citizen acting in conformity with my own conscience, doing what I believe any other citizen with the appropriate resources and information would and should do.

[Paragraph deleted in the interest of good citizenship]

If anyone reading this message can think of a more pragmatic way to attempt to inaugurate a public discussion of fundamental issues, please let me know, ASAP.

Be clear that I am not questioning authority, I am merely questioning reality!

"It's time we stop, hey -- what's that sound?
Everybody look what's goin' down."

[BRH.](#)

>And I think you meant..... >

> "It's time we stop, hey -- what's that sound? > Everybody look what's goin' down.">

Thanks, I have made the correction.

>So I tell you what I'm going to do here, I'll hold off a day so you've had a >little time to cool down and sleep on it and if I do not hear back from you >tomorrow night, I'll blast this thing out there far and wide.>

OK, I have cooled off to the extent that I now have this item posted to my website as a "Hypothetical Ultimatum." It is posted in conjunction with my "End Game" essay, q.v. Yesterday I did distribute some copies of it at a local college, just as a test. As it now stands, I suppose that I could be accused of incitement to riot, but that would be a bit of a stretch I would think. Am I being a provocateur, or merely being provocative?

By reposting my hypothetical scenario, you would only be fulfilling your role as an observer and journalist of fringe matters.

What I am doing is pointing out an obvious weakness in our Modern system, or what might even be considered to be its fatal flaw. It is very convenient and very efficient to be able to carve up reality the way we do, and it may also be mistaken. We suppose the spiritual realm to be personal and subjective, and so in the "mundane" world it is just survival of the fittest, everything goes in favor of that sacred "bottom line." This hypothetical division of reality is being underwritten by the trillions of government dollars going into secular science and education.

The Establishment likes to suppose that the only alternative to its present system would be a theocratic fascism, a la the Aryan Nation or Nation of Islam. It uses this popular fear, along with the trillions of tax dollars, to help enforce a strict adherence to the Modern Dualist Metaphysic.

I am suggesting that the Eschaton will, at the very least, put an end to business-as-usual. And the longer we postpone pondering the imponderable, the more unthinkable it will become.

Needless to say there is a great deal of floating anxiety and paranoia. The natives are restless. If we cannot provide a constructive channel, Chaos will have its way.

Attempting to preempt Chaos may require some very risky moves, such as suggested in the Hypothetical Ultimatum. Pelican & Co. are just as aware of this as you or I, and it would be unreasonable for us to suppose that we are not in one of their contingency files. I sent a copy of the HU to Pelican before sending it to you. There has been no response, and I expect none. When the Eagle flies, it flies alone.

If you choose to cross-post the HU, I would suggest attaching this note. I will add this note to my website.

Dan

BRH,

Ooops! Wrong again! Following this is the response from Dr. P.

(Again, you may want to include these in any cross-posting.)

I will not respond directly, but I will say this to you.

The Modern System invites disobedience ("terrorism"(?)) as being a traditional way to get across information that is otherwise marginalized by its own version of Reality. Ususally, the marginal information is further marginalized by the context of disobedience, but not necessarily. This is a risky business, and we live in risky times.

If there is going to be disobedience concerning the definition of Reality, then I am volunteering to serve as that lightning rod. It is up to them and the rest of you or 'us.'

Dan

Dan, > >I sometimes think you are crazy, nuts, strange, etc., but I never think you are stupid. Now I am convinced that you are stupid! I know that you would never >do the things you are suggesting in this e-mail, but the people in the black suits that monitor this e-mail don't know you. People get arrested these days for >even suggesting they are contemplating these sorts of activities. Usually they make it hard for the black suites to find them, posting their notes on bulletin >boards, etc. Why would you send such a note to a CIA server? Too many sips of good wine? > >The world has changed. It no longer is acceptable in the United States to contemplate any form of domestic terrorism. If you get a flat tire on the bridge, I >hope you are carrying a flotation device. Someone likely will throw you in the river! Do you think the public will want to listen to you if you are >implicated in domestic terrorism? I'm glad you are taking a vacation. You need one! > >On a more sane note, do you have any suggestions for our meeting next week. It has been postponed to next Friday. >

[Dr. P]

At 10:55 PM 5/20/97 -0400, you wrote: >I keep hearing strange things about you...Where are you?...There is an >interesting lecture on China coming up next week....Are you interested? >

[Dr. P]

I'm right here....Yes, I'm always interested in China!

Dan

rev. 5/8/97

E Pluribus Unum.

The Reformation of Ideas

The Internet is speeding the process of the dissolution of the old structures of consciousness. Many ideas have been liberated from their old moorings. Slowly at first and then more rapidly, these ideas will be reforming themselves as they pass through millions of minds at the speed of light.

A new truth will emerge. The strategy of the Aquarium is to locate the minds which are closest to achieving a critical mass of truth, and then to engage with them. There are many ways to go about this. It is interactive, it is push and pull. Pushing and pulling at the truth to set it into circulation.

Truth is not an object. It is subjective but not an illusion. It is manifold but not many. Truth is a moving target that leads us like the Star of Bethlehem. Truth is the path that leads us to our destiny. There are many paths and one destiny and the truth is all of these. When we see the truth, I will see your path and you mine. E Pluribus Unum.

rev. 4/21/97

WWW Equals 666?

According to the kabbala it does.

It will be up to the Aquarium to tame this Beast.

At this time the Internet threatens to be at least as disruptive of the social fabric as the automobile has been, and in a much shorter time.

The old institutions have been struggling to survive for some time, and now the corrosive force of the Internet is speeding up the dissolution of those hierarchical structures. This may be cause for some celebration, but people are looking for a safety net, looking for something to fill the void of structure and coherence that is being lost in the orgy of information anarchy.

The founding impulse for human hierarchies was the allegation of divine mandate. This was the trickle down model of spiritual manna and cosmic wisdom. In the Aeon of spiritual scarcity, the sources had to be closely regulated, and of course the regulation aggravated the natural scarcity.

Now comes the flood.

The flood of information is only a minor prelude to the much greater spiritual flood that is about to descend from the heavens. The information glut is both a warning and an opportunity.

If we cannot manage the flood of information, how will we survive the spiritual flood? And correspondingly, how we learn to cope with the first flood may be helpful in dealing with the second.

Having the correct vision of our past and future in cosmic terms is our one and only safety net. As the flood rises we will lose sight of the familiar landmarks, we will have to navigate by the stars, and we will have to pull our oars in unison if we are going to move at all. The proper vision will be our chart to global cooperation.

But this vision cannot be doled out in the form of ecclesiastical encyclicals. The vision must be internalized by everyone. But that is already accomplished. We are all born with maps of the cosmos imprinted on our spirits, like homing pigeons. All we need is the freedom and incentive to open our spirits.

We have a supersaturated solution of ideas and information. What we need is the proper trigger or seed crystal to precipitate out the larger meaning and coherence that still lies hidden. If not this Aquarium, then some other Aquarium will be that seed crystal. This is how we will tame the Beast and calm the stormy seas.

rev. 4/21/97

Cyberspace is no accident

I do not believe that cyberspace is an accident of history or of physics. I believe that it is here for a purpose and so are we. Those of you out there surfing the net who have just a few minutes to spare, ***please*** linger here long enough to consider what may be a stake.

We all have our ultimate concerns regarding our lives. I would merely point out this communications revolution in which we are participating may be about to intersect with those concerns.

Is it being overly credulous to suppose that the ***world wide web*** may serve to stir our spirits in some new way that will have an historical significance transcending its material limitations?

Even by itself this new ***web*** is truly impressive, however, when it is considered in conjunction with certain other historical developments, it would appear that we are being challenged to raise our sights to a vision of ***cosmic*** proportions.

There is one ***slight*** obstacle standing between us and a new vision of our destiny. It is the technology of the web itself that is caught between the old and new visions of reality, and so are we also trapped, between these two conflicting paradigms of the material and spiritual. ***But*** there is a way out, if you will let me explain.

But How Explain?

| [Contents](#) |

rev.. 1/23/97a

publ 1/23/97a

The explanation is easy to state.

It is more difficult to get past our unthinking reactions.

There is a secret that is older than the hills that speaks to our inner selves, so let me whisper it to you...

((All of us, all of THIS, is nothing more and nothing less than the great spirit dreaming of itself.))

See how easy that was?

Consider the implications, if you will!

"But hold on," you say.... "Not quite so fast there, buddy!"

You know that this is just an ancient stab at wisdom, now being perpetuated by unemployed New Age mystics. (Ah! You are only partly right..., just kidding!)

I cannot answer your objections, certainly not all of them. But I can talk about them. Perhaps I can even talk them to death, before I talk you to death. That is the best we can hope for. That should be adequate to this cause.

[Yes, do *please* talk my objections to death, ASAP!](#)

On not Getting It

Everyone is talking about the End of the World, but no one is thinking about it.

Immaterialism is the hang-up.

I catch myself frequently wondering why there are not more eschatologists around. The simplest answer is pragmatic. No one gets paid to study or proselytize the end of the world, except from a purely historical perspective, or from a narrowly sectarian point of view. But this answer is a bit too easy. There should at least be more amateur eschatologists like myself, especially here on the web.

But neither are there any immaterialists to speak of. I believe that I have had personal contact with almost every professional immaterialist in this country, and that may only be about a half dozen. Is this not a bit strange? Talk about intellectual imbalance. Talk about having almost none of your eggs in the right basket!

What we are talking about here more likely has to do with the giggle factor. People generally would rather suffer torture than suffer laughter. Intellectual correctness has amazingly narrowly defined boundaries. Believing that we live in a physical universe that is very old and very big is the definition of sanity in intellectual quarters.

A sharp line has been drawn between religionists and intellectuals on the matter of creationism. Ironically, most creationists now accept the big bang model of cosmology, but they draw the line at evolutionism.

.

| [Contents](#) |

rev. 4/4/97

The State of the Net

Everyone is talking at me.

Everyone talks about the end of the world, but no one thinks about it. It is amazing how much talking we can do without thinking, and this applies to me as well, but slightly less so, I would suggest.

There must be a thought barrier, somewhere. I know where it is because I have been there for about ten years. There was that necessary hiatus between the end of my schooled thinking and the beginning of my own thinking, from about 1966 to 1975. It takes about that long to regroup even under the best of circumstances, and mine were about optimal.

An increasing number of intellectuals are finding themselves in the no thought zone. They go through the motions of the old thinking, while inside they are struggling to find some light at the end of their tunnel. It is my job to be that light, to toss them a life preserver. That is Dan's Place.

Yes, it is ironic that the Eschaton should turn out to be our life preserver. One might have preferred at least a seat cushion. But that is just the way the world is. We are very wary of going through the eschaton door, and so we are like the lab rat on the electrified stoop, waiting as long as we can before taking that leap. Where is the payoff, we might wonder? The payoff is difficult to explain in conventional terms. It does involve faith, unfortunately for the scientists. But compared to the trust that they have placed in the lawfulness of nature, the faith we speak of is almost nothing.

.

rev. 4/23/97

A diagram of cultural trends from an Aquarium perspective

All of us are searching for something of meaning beyond the brute

materiality of our existence. But few of us can admit that, because that is to admit that we are lost souls. Many find some relief in the pre-modern traditions, others in charismatic cults. These all have one quality in common. You are not required to think. It is even better if you do not bother to think.

Oh, there is a lot of new thinking, but it is fragmented. It is revisionary and not visionary.

If there is to be a new vision it must be breathtaking. It must thereby be apocalyptic and even eschatological. It must proclaim the end of the world as we can know or even imagine it to be.

This is the Aquarium vision. Physical reality is an illusion that challenges us to its transformation and transcendence. This historical commencement has been in preparation from the beginning of our historical time frame.

Amidst all of the discontinuities, the Aquarium points to the broad path of continuity along which our existence will be transformed most effectively.

This path starts with the realization of the material illusion of the World. This world is not unreal or unimportant, but it points to existences and realities that are more real and more meaningful. It is time for us to be moving on.

As this vision and new understanding begins to take root in our minds, the social disintegration will be transformed into a new integration. It is just a matter of timing. We have all the time in the World.

| [Contents](#) |

rev.. 2/22/97a

Between Us and a Vision

Focussing on the Five Key Groups

The Aquarium Vision is definitely syncretic. It is a coherent integration of the major world views. To maintain its coherence it must go beyond each of the existing views.

Let us consider the five key groups, but this time take them in the order of least to most rigid in their beliefs, i.e. Experiencers, Postmodernists, Nondualists, Judeo-Christo-Islamic tradition, Scientists.

Within each of these groups we will attempt to identify a few individuals who are amenable to entertaining an expanded vision and motivate them to pass this vision along to their fellow believers.

Even more valuable will individuals who can identify with more than one of the above groups. Such persons will already be well on their way to the new Vision.

To proselytize within each of the above groups we can adopt an 'Aquarium Apologetics' directed at the main barrier that stands between that particular set of beliefs and the Aquarium Vision. In what follows we will consider each groups in its turn.

Experiencers -- These are people who have had life changing encounters with what appears to them to be some other reality. The defining characteristic for these people is that their previous world view has been shattered in the aftermath of another reality having broken into their normal experience. What we can offer is a more **objective** perspective to aid in the integration of their traumatic experience, and one that will also provide a means for them to explain to others the cosmic process into which an increasing number of us are being initiated.

Postmodernists -- These are the artists and intellectuals who have grown weary of the mental and spiritual restrictions imposed by scientific modernism. These people endorse a philosophical pluralism where reality is regarded as largely a social construct, determined by the vagaries of history and the political economy. This is a big step toward an immaterial idealism, but there is a general avoidance of any alternative **cosmology** as this would be seen as a threat to an otherwise radical pluralism.

Nondualists -- By this set of beliefs I am designating an modern adaptation of Eastern mysticism. It is opposed to the Cartesian mind-body dualism which is the foundation of the Western analytic tradition. Nondualism is espoused by many New Agers. This group is partial to the Eastern cyclical cosmology of eternal returns. As such they tend to devalue the significance of **history**, particularly the Judeo-Christian view of history as having a divine sanction and a transcendental outcome.

Judeo-Christo-Islamic tradition -- There is a division between the natural and the supernatural. Our natural world has a divine origin and outcome. The proper outcome will

require a direct and dramatic supernatural intervention. Anything like this Aquarium Initiative is an attempt by humans to interfere in the divine order. These expectations force any would-be Aquanauts to take on a **messianic** complexion.

Scientists -- Last but not least. Unless there is a dramatic intrusion of another reality into ours, the scientists are going to be a tough lot to reason with. However, if even a small number of people in the above groups become interested in the Aquarium vision, this would make an impression on some of those people who inhabit the speculative fringes of science, particularly the fringes of physics. Once these folks can engage their more conservative colleagues in a concerted discourse on the nature of reality, the days of scientific **materialism** will definitely be numbered.

What remains for us is to see how difficult it will be to track down and engage the appropriate persons as described above, using the Internet as a primary tool.

.

rev. 4/20/97

Networking Resources and Strategy

Push and Pull and then Shakeout on the Internet

Being a proselyte, particularly on the Internet, is not unlike being an animal in rut. If that analogy is not sufficiently coarse, one can also consider the Typhoid Mary model which recommends itself at least for being less sexist.

If there is going to be a paradigm shift within the next generation then the outlines of it will be showing up on the Internet within the next several years, if they have not shown up already.

One might expect that the Aquarium would be facing considerable competition from a small army of paradigm hucksters, each hoping to have their two cents worth of input into the drama of global transformation. But, so far, that does not seem to be the case. Let's see why.

The gold rush on the Internet involves a great deal of claim staking, of rushing into the new wilderness to stake out a territory. So actually instead of a gold rush, we are only witnessing a land rush. The Aquarium, however, is going for the gold. We are not looking for another piece of ground to till, our strategy is all or nothing. If one does not suffer from a certain degree of megalomania or positive paranoia, one is not likely to persevere in the face of mountainous odds. To get to the gold fields, one must skirt over the fertile prairies and head for Donner's Pass, hoping to reach it before snowfall.

In cyberspace many folks are already staking their claims to the New Age, but evidently they are waiting for someone or something else to define and proclaim it. It is possible that we can get from here to there without anymore drama than what we have already experienced, but my intuition speaks otherwise. The New Age is not going to be brought about by a petty bourgeoisie of shopkeeping gurus with storefronts on the web. There is going to be something more profound and dramatic.

The spiritual gold of the New Age is concentrated in a vein that runs deep. It is like an underground river with headwaters in the cosmic mountains that at some point will have to spring to the surface from whence it will spread out to irrigate the fertile plains.

That spring has been well guarded throughout human history. It is a no man's land surrounded by at least five dragons, those being the five key groups mentioned above. The various traditions jealously guard their little spiritual trickles, fearful of being swept away in the spiritual flood that surely will inaugurate the New Age.

.

rev. 4/21/97

[\[Piet's home page\]](#)

Dear Dr. Hut,

I have been meaning for some time to contact some participants in the 'consciousness movement,' and now you are my first attempted contactee. I first ran across your name about six months ago as co-author with Roger Shepard of a JCS article, and I have passed this around to a few of my acquaintances. Then a couple of weeks ago my Mother sent a NYT Science article that included a brief interview with you.

Besides a common interest in consciousness we also share a background in physics. I was a lowly physics grad at Princeton from '64 to '66, when I left with a masters. While my cosmological interests have been expanding, I felt that the horizons of physics were shrinking. It was another ten years before I learned of Wheeler's and Dicke's interests in the Anthropic Principle, and that precipitated my return to a more scholarly pursuit that was increasingly laced with metaphysics.

While at College Park, making a second attempt at a PhD in '77-'78 under Charles Misner and Stephen Brush, I first attempted to formulate a mind-brain quantum dualism. But like most thoughtful physicists with any cosmological concern, I found that option unattractive and untenable. A couple of years after leaving school for the second time, I found that my sympathies were shifting to immaterialism. It took me another couple of years to get to the point where I could feel reasonably comfortable with immaterialism, at least to the point of not having to question my sanity every few days. But it was made clear to me at College Park that my ideas had taken me beyond the academic pale.

Last year's Economist (7-20-96) put it rather succinctly: "In the English speaking world [immaterialism] is shunned in polite society except in literature faculties, some of whose denizens have deconstructed the world into subjective oblivion."

From your one article in JCS, I take it that you are pushing a similar envelope, both cosmologically and academically speaking. In twenty years that envelope has expanded considerably, but I am sure that you are still aware of limits. The main purpose of this open letter is to see if communication can be opened across those limits.

Having crossed that intellectual divide some fifteen years ago, it has been only about five years since I crossed the political divide. I have been proselytizing a Christocentric immaterialism to the small community of active students/investigators of anomalous phenomena. And because of my proximity to Washington I spend some time talking to bureaucrats and politicians about these matters, and among them I find increasing concern about popular millennialism.

Let's face it, there is some concern among the powers that be that the whole world may be heading toward "subjective oblivion." For my part, I am arguing for a combined intellectual and spiritual world view that can lead us around that potentially eschatological point of oblivion. At present, you are my star 'witness' on the intellectual side of the picture. You may understandably be underwhelmed and indisposed to this bit of notoriety, and so be it, but it is

a small world in these sorts of circles as you may already be well aware.

This brings me to a final point for possible discussion. Another thing we have in common are our personal websites. In perusing yours I have been frustrated by not being able to read your postscript encoded articles on my PC, despite purchasing what is supposed to be the latest viewing software. I would like my very small audience to have access to your latest work, and so I have also purchased a scanner and am in the process of scanning your JCS 3,4,96. I would be happy to send the result to you for you to post, and perhaps you would be so kind as to supply me with additional relevant material of yours for similar treatment, material which may not otherwise be readily available. Please specify what format you would prefer. Failing this, I suppose I could post some of the material myself without violating standard practice in these circumstances.

My website is <www.clark.net/pub/dansmith/>. I will be posting this communication and any response, unless you prefer otherwise.

Sincerely, Dan

.

Amazing Books

[Amazon Books](#) that is.

Some twenty years ago my quest for truth started at the Hopkins University Library. No, not quite right. It started with a comic book purchased at the University bookstore. This was Bob Toben's *Space-Time and Beyond*, c. 1975, illustrated by Jack Sarfatti and Fred Wolf. The appendix consisted of off-the-wall quotations from various physicists, including one from John Wheeler a former teacher of mine at Princeton. It was very 70's. John was discoursing on the then very strange 'Anthropic Principle,' something I had never heard mentioned back in school in the 60's.

I figured I had better run over to the library to check out the source and see if my old Prof. was really going off the deep end. He was, I was determined to follow, and now you see the result.

Twenty years later and the Internet has replaced Toben's comic book, but books still serve as excellent starting points. When it comes to books on the Web, the one place to start is Amazon. So let's see what we find.

Here is one thing I found -- and did.

An e-mail to Lee Irwin:

Dear Lee,

This morning I was doing a reality check at Amazon Books and ran across your book, "[Visionary Worlds](#)," listed under "reality," and your invitation to communicate, so here I am. I have also seen your [account of a trip to Findhorn](#).

Let me get to my point. I am witnessing a disconnect between two aspects of the New Age movement, namely the eschatological and the evolutionary approaches, and I gather that you take the latter approach. I am attempting to bridge this divide, mainly now with an unregistered website,

<<http://www.clark.net/pub/dansmith>>.

I believe that we are coming to a cusp in our collective spiritual journey that will take the form of a global gestalt switch from materialism to immaterialism which will be mediated through the mass media. This dramatic transformational episode will be full of risks and will necessitate the emergence of an inspired leadership. The "Aquarium," still just an idea, would be a possible vehicle for such guidance. That there are great messianic expectations abroad in the world, is a fact which such leadership could hardly ignore.

Please let me know if you have any comments or suggestions. I will post this note and your response on the site unless you prefer not.

Sincerely,

Dan Smith

rev. 4/22/97

Stealth Site of the Week

Here I am four months as a webmeister, and as far as I know, no one has been around. I have been too lazy to register, which is only a slight oversight.

It is easy to complain about all the noise on the net, especially when it is not one's own. I would suggest that it is the tuning up prior to the arrival of the conductor. I am a would-be conductor, without a baton or a tux, and the orchestra has no clue about the fact that they are an orchestra. They certainly are not paying union dues. That is the challenge for the Aquarium Conspiracy.

Modern society has been getting noisier all the time, and now the Internet is just pouring on the decibels. It is not the rate of flow of information that is the problem, it is the incoherence of the information. Each sound byte has its import, but when you try to put them together, all meaning is lost.

Coherence should be the job of the cosmologists. I speak of Cosmos vs. Chaos. But obviously the scientific cosmologists have been snowed under just like the rest of us. It is very hard to make sense out of the world if you have to start at the bottom with each atom veering in the dark. The Big Bang and the Theory of Everything do very little beyond rationalizing the existence of the atoms.

The noise, the information glut, is the decay of the old orders. We are the maggots feeding off the old carcass. Many of us are enjoying the meal. We like the freedom to eat whichever piece of the carcass catches our fancy, and five minutes later we can move on to a new piece. Yummy!

The mice will play while the cat is away. They will not look forward to the cat's return. And for good reason. There are mostly fascist cats out there. False messiahs, looking to feed off us maggots rather than teach us how to fly.

The intellectuals are at the top of the information food chain. They have the most to lose, and so they put out blanket proscriptions on even thinking about the possibility of messiahship. Which means that they are desperate not to think even about the possibility of coherence. They dread hearing the footfalls of those padded feet, clumph, clumph, clumph.

And it gets worse. Talk about food chain, it is really the angels who are at the top of it. They are living off the emotional glut that goes along with the information glut. Some of these are the myriad 'channels' adding to the cacophony, pointing to truth in all the wrong places. Is this deliberate deception? No, just confusion in high places.

In all this crowd it will be easy to pick out the messiah. She will be the only one who is alone. She will be the stealth site of the millennium.

rev. 4/23/97

Mr. 'Omega'

Terence McKenna is now the 'Omega Man.' He is saying many of the things I have been trying to say and doing it better, yet I am not quite ready to accede to his efforts. I don't recall just when I first heard about the McKenna's, but I am sure that Terence's work has already had its influence on me. Jose Argueles was also into the Mayan calendar date of 2012 rather early on.

Before getting into the background of Terence, or what little I know of it, let me say a bit more about the connection with him that I perceive. He is the firstest with the mostest, as far as popular contemporary eschatology is concerned, which is where I believe that I am supposed to be aiming my own efforts. There is a major discrepancy, however. He is rather far off the mark of Christocentrism. Terence is the self-made urban shaman. I, on the other hand, am grasping for the coattails of the Son, hoping to hang on for dear life. Terence does his job, I do mine. Terence plays well in the Bay area, silicon rave scene. I don't think he will have the staying power to make it to Peoria. I may not either, but that is where the heartland is. I do have a few roots there. Terence is keeping a seat warm for someone.

Terence has had much experience with mushroom assisted shamanic journeys in South America where he has picked up information that I have had to wrestle out of the Hopkins Library and other such stuffy places, with the help of only one joint, which I did actually manage to inhale, so there! I might have had more, but they suspected I was a narc. They might have guessed I would end up playing games with Central. If you think Terry had no such contact, you underestimate our boys in gray. In short, Terry is cool and I'm not.

.

| [Contents](#) |

rev. 4/25/97

So Near, Yet so Far

I have not perused Terence McKenna's web offerings yet, but from his other writing I gather that his cosmology consists of Big Bang mysticism. He is a mystic and shaman about everything except the Big Bang. I know of only one contemporary intellect who has gone up against the Big Bang and that is Owen Barfield, and even with him you have to pay attention to get that point. You can see that Owen is anxious to avoid open antagonism with all the other intellects in the world.

It is politically correct these days to deconstruct everything except the Big Bang and Barney the dinosaur. It is somewhat academic, but I am curious to know if Terence and his many followers are also just trying to be politically correct, or if they actually don't get it. The answer is, I suspect, a bit more subtle. Getting Freudian, or actually Jungian, I would say that on some level these people must be aware that if you let go of the Big Bang, then you are only a step away from becoming Christocentric. Why that should be such an anathema is also not clear, but it probably has a lot to do with the vagaries of history, and with little things like the Inquisition, and, of course, with the collective unconscious.

I have known a number of Fundamentalists in my day. Knowing them, it is easy to see why so many intellectuals are positively Christophobic. But I wonder if they ever have second thoughts about their phobia. The only time I can remember crying over a book, it was not about Old Yaller, it was in reading the 'Greatest Story Ever Told', by whomever, when I was about ten or twelve. That was my pre-born-again experience, I guess, in retrospect. Tears of joy, of course. There is that knowingness of total victory that is absolutely unforgettable, life changing. But I did forget until I was about thirty-five. I had become mesmerized by the Big Bang. My father was a staunch, but quiet atheist. He despised our Unitarian minister! Not having Christian parents can make Christianity easier to swallow, but that is far from being the whole story, IMHO.

.

| [Contents](#) |

rev. 4/26/97

So Who's Apologizing?

Christian intellectuals, yes, there are a few, are uniformly apologetic. They have to apologize for their faith and grace. That is beginning to change now in the postmodern era, but very slowly. The Christian faith has already survived several centuries of deconstruction, so naturally the Arts and Sciences faculty, who are having their sacred cows deconstructed at each new seminar, are casting furtive glances toward some of their theological brethren and sistren who have already been there and done that.

This has not yet motivated the theologians to take up a new initiative. To be a theologian is to be defensive, almost by definition. The overlap between the theologian and the proselyte is small indeed. Theologians have been defending the faith against every form of modernism that has come down the pike. They are not at all sure that postmodernism is not just another modernism in a very clever disguise.

Defending the faith and the faithful is the problem, and that has always meant keeping the intellect on a short leash. If that table were ever to be turned, where the intellect became a partner in faith or even its champion, that would be the end of the theological world, and the end of ours as well, I might add.

That is why everyone, and I mean everyone, is reluctant to begin the deconstruction of modern scientific cosmology. That is the end of our history-long journey into this material world. But that will be our next step and our last one in this world.

ESCHATOLOGICAL, APOCALYPTIC & MILLENNIAL LINKS

Contents of this Section

- [The Eschaton](#)
 - [The Apocalypse](#)
 - [The Millennium](#)
 - [Prophecy](#)
-

The Eschaton

[Terence McKenna Land](#) Home page of Eschatological heavyweight McKenna who strongly advocates the use of consciousness enhancing chemicals to help us understand and transcend the Eschaton.

[The Sign Ministries](#) Featuring lengthy Eschatological Glossary.

[Eschatology Main Page](#) Alternative religious model of the Eschaton, interprets scripture to claim that the Second Coming, Great Tribulation and Rapture have already taken place.

[The Myth of the Eschaton](#) An alternative Eschaton as expressed by Marcus S. Robinson. For Robinson the Eschaton is a compassionate, natural and logical evolution of human spirit.

[Eschatology Tapes - Xian](#)

The Apocalypse

Religious

[Spirit of Truth Page](#), emphasizing a "traditonal" Christian view of the apocalypse, stong economic disaster and prophecy links sections

[The End of the World](#), dedicated to those who look around, see the signs, and proclaim The End is Nigh - emphasis on signs of the end times with a bit of irreverence and humor.

[NewHeavenNewEarth](#)

[Bible Prophecy & the Rapture Report!](#)

[THE RAPTURE INDEX](#)

[The Anti- Rapture Page](#)

[Apparitions of the Virgin Mary in Medjugorje](#)

New Age

[The Way - Rich Butler](#)

[The MILLENNIUM Matters., spirit, Egypt, earth changes...](#)

[Apocalypse Now](#)

[Approaching Concrecence](#)

LINKS TO THE PARANORMAL

Contents of this Section

- [Parapsychology](#)
 - [Remote Viewing](#)
 - [UFOs - Extraterrestrial Intelligences](#)
 - [Angels - the Occult - Magick - Crowley - Thelema](#)
 - [Fortean - Miscellaneous Weird - Crop Circles](#)
-

Parapsychology.....

[Cognitive Sciences Laboratory](#) A center for government sponsored parapsychology research in support of intelligence programs.

[Princeton Engineering Anomalies Research](#) Web site of the Princeton University based PEAR program for the scientific study of consciousness related phenomena.

[Consciousness Research Division](#) Consciousness Research Division of the Harry Reid Center for Environmental Studies UNLV devoted to the scientific study of anomalies related to consciousness.

[Franklin Pierce College Parapsychology Program](#) Contains a number of student papers covering parapsychology topics, numerous articles and links to research centers.

Remote Viewing.....

[Controlled Remote Viewing Home Page](#) Most comprehensive and balanced of the remote viewing sites. Maintained by former U.S. Army remote viewer Lyn Buchanan. Contains articles and papers on CRV and its history, current news and comments, and the "Mr. X" articles criticizing the American Institutes of Research (AIR) report.

[Superpowers of the Human Biomind](#) Ingo Swann's web site devoted to remote viewing. Contains Swann's Database Regarding Superpowers of the Human Biomind, his (eventual) full length book on the development of remote viewing as well as a general database of related papers. Pages are decorated with Swann's exceptional art works.

[Scientific Remote Viewing](#) Web site of the Farsight Institute and Dr. Courtney Brown, the controversial Emory University professor. Special focus is given to SRV data from extraterrestrial targets.

[Remote Viewing in Intelligence Operations](#) Web page for Michael D. Mumford, Washington

Research Center of American Institutes for Research (AIR) report concerning government remote viewing programs.

UFOs - Extraterrestrial Intelligences

[J. Allen Hynek Center for UFO Studies](#)

[The Sublime Lodge of the B.B.](#) Abode of the **Blue** Resonant Human featuring a clever blend of wit, gossip and occult knowledge applied to the UFO scene. His tendency not to take any of this too seriously has endeared him in the eyes of the Aquarium.

[UFO World](#) May not be the largest UFO site but it does have some timely and relevant material.

[The Art Bell Web Page](#)

[Psychic Discoveries Behind The Canadian Curtain](#)

[Internet UFO Group](#)

[National Institute for Discovery Science](#)

[BUFORA](#) British UFO Research Association, large sightings database available.

Dan's Review - notices and comment on some current books and publications

***Omens of Millennium: The Gnosis of Angels, Dreams, and Resurrection* Harold Bloom. Riverhead Books - G.P. Putnam's Sons, 1996, hardcover, 255p., \$24.95.**

A penetrating effort to put several modern phenomena (the angel craze, near-death experiences and dreams as transcendental messages) in historical and religious perspective. The author also explores the origins of Gnostic thought and its relationship to normative religious doctrines. He feels that we are indeed in the shadow of the Millennium and that it will have a special significance for American culture. Bloom, who is Sterling Professor of Humanities at Yale University and a distinguished scholar, clearly demonstrates a mastery of the subject. Although his style can, at times, be daunting *Omens of Millennium* should still be required reading for any student of modern American culture or Millennial thinking. 🍷

***The Lost Gospel Q: The Original Sayings of Jesus* - Consulting Editor, Marcus Borg, Introduction, Thomas Moore. Ulysses Press, 1996, hardcover, 128 p., \$15.00.**

Although no physical copy of the Q Gospel has ever been found, its existence is today accepted by a majority of Christian scholars. It would be the earliest Christian Gospel. The text is largely deduced from commonalities found in over two hundred verses from the Matthew and Luke Gospels. The majority of the material deals with Jesus' practical wisdom sayings. There are editorial notes concerning subtle yet significant translation interpretations and historical conditions that well compliment the text. 🍷

In Other Words

The Aquarium is an informal and loose-knit association of individuals with widely divergent backgrounds who share a common realization and goal. We recognize that society is rapidly approaching what will be a critical junction. This junction will be the point of convergence for a number of powerful trends and may severely challenge the ability of our organized institutions to effectively govern.

Although we feel that the most profound issue facing man at the present time is essentially spiritual, we also realize that the most practical way to bring this issue to the public is to become involved in some of the related current problems. Examples of our present areas of concern are:

- the problem of realigning the secular political institutions with the undeniably spiritual nature of the universe;
- government openness related to the above;
- selected ecological issues (tigers), etc.

While a strong spiritual basis is central to the Aquarium world view, dogmatic adherence to any one belief system is strictly avoided.

We also eschew any political affiliations which would limit our ability to act effectively.

[Link to TACP](#)

Our goal is to minimize the confusion, disruptions and disharmony that will occur and to maximize the benevolent aspects of the inevitable coming changes. To this end we endeavor to engage a number of key relevant issues.

[Contents](#)

Submitted by Bill L. - 2/10/97

Edited by Dan S. - 2/12/97

THE AQUARIUM VISION

We of the Aquarium envision a truth beyond that of traditional and modern understanding.

We know the world to be a construct of intelligence and spirit.

We see the world as on the brink of a dramatic transformation that will encompass its every aspect.

The Aquarium Objective

To help bring about the transformation of the world in a manner that conforms with our highest aspirations and with the cosmic plan.

The Aquarium Strategy

Networking in every way possible.

Membership

Everyone who wants to participate.

Back to the Future - the Reenchantment of the World

There was a time when the modern scientific cosmology was emerging that it was capable of striking terror into the hearts of thoughtful people. The idea that life was an accident in a meaningless universe, and that the earth was a barely a speck of dust lost in the immensities of space and time, is anything but a cozy idea. But we seem to have gotten used to it, and it is difficult for us now to recall that initial terror.

Now, in the face of another disrupting change of world views, we may once again experience the terror of the unknown, but let us remind ourselves that life will go on, albeit in forms and contexts that we might not readily recognize.

Just as we were getting used to the idea of being left alone in the universe to our own devices, we awaken from our slumber of materialism to a world that is vastly more mysterious and complex than science was leading us to believe. Moreover it is a world haunted by myriad, barely concealed intelligences with unknown designs on our own existence.

Taking the world for Granite

Science would have us take a lot of things for granted, but everything is up for grabs when we wake up to the fact that everything is much more like a dream world than it is like an absolute object. But, of course, nothing about the world will change unless we change our minds. Changing our minds will have to be our first order of business.

Proof?

It is fair to ask how we can know what is the true nature of reality. Immaterialism will win the metaphysical contest largely by default. The incoherence of materialism and dualism will make those views relatively unacceptable. There is a coherence to materialism, but it is a coherence that is abstract and theoretical that can hardly be sustained outside the lecture hall. Its conceptual rigidity makes it vulnerable to even the slightest incursions of what may be wild or weird in the world.

The original novelty and shock value of materialism has long since worn off. Our minds now easily wander past its very narrow confines. Ironically it is the psychological and even spiritual allures of virtual reality and cyberspace that can be seen as the last hurrah of materialism. Technology has sewn the seeds of its own transcendence, just as it was destined to do.

It is not the abstract proofs which will carry the day. At the end of the day, it is our spirits that will lead us to our next challenges, guide us to our next high frontiers.

Onward to Mysticism?

No!! Rationality begins and ends with our own minds. If the world is to be rational, then it must be of, for and by ourselves and other spiritual beings of similar nature. This is our only guarantee that there is an

ultimate, comprehensible truth. At this point, one can easily hear the snickering from the cynics in the back benches. How long have we to wait for the final revelation, they might wonder. Only a few seconds....

The ultimate truth can only be love, what else could possibly make any sense. If in the final exam for Logic 101 or for any other course, you dare to write just that one word, you will get an A+, guaranteed. Everything else is fear, loathing and cynicism.

How can I know this? How can I believe it? There is nothing else that is worth believing, and there really is nothing else to believe except a lot of mental abstractions. There is a hierarchy of things, emotions and ideas, and all you have to do is stop to reflect for a few moments to realize what must lie at the top of that heap. There really is no middle ground. We can choose love or we can choose the void.

The Logic of the World

A world composed of atomic stuff in the void can, sometimes, make a lot of sense until we realize that we are not compelled to believe it. We can be sane and not believe in atomic physics, although there are many pressures to sustain the modernist, naive realist consensus. But these pressures continue to diminish, mainly from boredom from within that regimen.

If logic cannot be posited in the atoms or the void, then the only other place for it is in our minds. Our minds are then micrcosms reflecting the cosmic spirit. We are sparks off of that block. This is beginning and end of all knowledge, of gnosis.

One might suppose that there could be something other, something out there radically alien to anything we can know or imagine. What is to prevent this something from crahing into us and upsetting our cozy little cosmos.

Well, in some sense, that alien 'asteroid' is what the [eschaton](#) is, relative to our present slumber of materialism. It is our wakeup call. But it is not alien. It serves only to waken us to the true and deeper nature of ourselves and the world. It is we who have become the aliens. We have become alienated from our true selves and from the truth of the world.

The rest of this cosmology is to be taken in the light of the eschaton waking us to the truth that has been with us from the beginning. You know it when you feel it. You feel it when you see it. To participate in truth, all you have to do is be a little more reflective, a little less grasping of all those half truths that do not finally amount to anything but a big abstraction.

We are the logic, we are the LOGOS of this world. It is our story to tell, no one else's.

What must the world be if it is to be understood?

Perhpas the most mysterious thing about the world is the amazing degree to which we have been able to understand and manipulate it with our science and technology. We have come a long way from the primordial muck that is supposed to be our point of origin. How did we ever manage to get to the point where we can even wonder about these larger questions? How much futher might we progress in spiritual or material evolution? Is there anything special about the world that makes life and consciousness possible? When physicists ask themselves these questions, the best they can do is to posit an [Anthropic Principle](#).

What you must be to understand the world

But the truth is that physicists do not get paid to ask such questions, no one does. Asking questions for which a given culture does not have adequate answers is a threat to the continuation of that culture. If an unanswerable question cannot be ridiculed, then it may signal the end of the culture that spawned it.

These larger questions are ridiculously easy to answer, if we only allow ourselves the freedom and confidence to do so. These are states of mind which most cultures, especially in their terminal phase, will find suspicious if not actually subversive. The upshot is that even before you can ask a serious question about ourselves or the world, you must be willing to entertain some of the notions of [eschatology](#).

You must be willing to undergo an enlightenment that will appear apocalyptic from a cultural perspective. To maintain a state of gnosis or knowingness will surely cast you into a terminal struggle with the *homeys* in the 'hood. You become a prophet, or you go back to pumping gas. I cannot recommend either alternative.

What is there to know?

Mercifully, knowledge is limited to whatever is essential in the given context. We know that the world is a product and reflection of intelligence and so are we. There is a meaning and purpose to all of this, that is revealed at the end, or to those who put themselves at the end of the world, like right here [chez Dan](#).

From where do we come? Whither do we go?

Being located in space and time is a temporary and necessary *illusion*, if you will. This is not to say the the world is unreal, but only that it is not an ultimate reality. Ultimate reality is from where we come, and to which we return, that is our only certainty in existence. Only when we experience ultimate reality will

we comprehend the present degree of our unconsciousness.

In order for us to be lost in space and time, as we are, we must temporarily forget our true natures. We are given to remember only when there is a need.

Timing

Waking up is all a question of timing, and so, of course, is the end of the world. When you awaken, you can only wonder when the rest of the world will follow. Are you and I just isolated incidents, or part of a final preparation? The only way to find out is to see how other people respond when confronted with apocalyptic information. The *Web* surrounding *Dan's Place* certainly provides a new type of venue for acting out the end of the world.

From where comes spirit? - Cosmogony.

If everything derives from a great spirit or cosmic mind, is it illegitimate to wonder where that spirit comes from? Only partly so. Spirit exists beyond space and time, so to speaking of beginnings is only metaphorical.

Think of the primordial chaos, but not as an objective chaos as in science or in the Bible. This is a subjective, experiential chaos, where all possible experience happens at once, in some virtual manner. (This is similar to the quantum vacuum state in physics.) Out of this chaos emerges an ordering principle, not unlike love, which serves as a virtual, hyperdimensional attractor in the manifold of all experience.

The experiences that coalesce around the attractor become the experiences of spirits in worlds. As these spirits learn to 'conspire,' the attractor becomes the great spirit or cosmic mind that we call God. All lesser spirits come from and eventually become this greater spirit. There is a constant cycling and renewal as with the yin and yang within the Tao.

Our world constituted of human history and consciousness is one a many 'bootstraps' which in turn constitute the self-recreation of the great spirit. So much for our cosmogony.

Cosmic politics - the prime directive

The *prime directive* comes from *Star Trek*, or so I am told. It is a statement of a cosmic policy of non-interference between worlds that are at different stages of their history. This is the approach of the anthropologist in studying an alien culture. It is not the approach of the missionary.

Open communication between worlds occurs only when both parties are willing and ready to participate. All other communication is either illicit or occurs in a fashion that is sufficiently ambiguous so as to preserve the directive. The communications that allegedly constitute the origins of most religions would be in the latter category, presumably. The various paranormal experiences of individuals could be in either category.

The natural result of such a directive would be that besides the communicating groups of 'advanced' worlds, there would also be a collection of less 'developed' worlds, such as our own, under varying degrees of quarantine. Each of these worlds represents an essential element in the cosmic cycle of creation and recreation, and so each has its own destiny to fulfill. Nonetheless, matriculation into cosmic communication is likely to be the most dramatic point in the history of any world. After that point, the concepts of history and of space and time take on very different meanings.

This public opening to cosmic communication and consciousness would be an essential component of the apocalypse that is our impending eschaton.

These are the **barriers** that come between **five existing groups** and the **Aquarium Vision**

The Five Key Groups

If there is going to be a global vision of our destiny, then that vision will have to be imparted to five key groups.

Groups	Barrier to Vision
Scientists	Immaterialism
Judeo-Christian Believers	Messianic Episode
Nondualists	Historical Perspective
Postmodernists	Cosmology

For further discussion see [Between Us and a Vision](#)

.

These groups are listed in the order of the rigidity of their present belief systems.

The Aquarium strategy is to identify the individuals on the fringes of each of the above groups who would be most open to the Aquarium Vision. If these individuals could be positively influenced toward the common ground represented by the Aquarium, they could in turn influence others within their respective groups, and so forth.

The World Wide Web is an ideal vehicle for both identifying and influencing the above individuals.

rev. 4/20/97

The following is a proposed letter to be sent to various Senators.

The subject is a discontinued psychic espionage program funded by Congress.

Sen. John Doe
Senate Office Bldg.
Wash., DC

Dear Senator,

In November of 1995, it was officially revealed that the U.S. Government had, for at least two decades, been funding a secret program for research and application of parapsychological techniques for intelligence gathering purposes.

This revelation has raised many questions. In particular, one might wonder whether it is appropriate for a modern government to engage in practices that are reminiscent of pre-modern times.

The question of the appropriateness of the unconventional collection of intelligence has not been addressed. The official position is that appropriateness is a moot point, since it has been determined that the techniques employed are simply ineffective for normal operational needs.

Such is the official story. But this matter is not so easily put to rest. Naturally there is public interest in tales of the occult, particularly where official secrecy is involved. There has been a stream of publications reporting on various aspects of this secret program. Only a few of the relevant documents have so far been declassified, but several of the participants have granted detailed interviews or published books. The result has been a confusion of charges and counter-charges, of sensationalism and skepticism.

A general overview of the program can be pieced together. Over its twenty some years, upwards of \$100 million was spent mainly to research and apply remote viewing techniques to intelligence gathering. In its early stages the program came under the CIA and Army INSCOM, but control was later transferred to the DIA. In this later phase there was increasing involvement from the Congressional side.

As for results, on the operational side there were evidently several tantalizing near misses, along with some possible successes. So far there is no quantitative estimate of actual, overall benefits. As for the research results, the picture is even murkier. No reports on the tens of millions of dollars spent on the research have been located. The reason for this very serious discrepancy has not been established.

Among the charges are several directed at the Congressional members and staff responsible for funding this program. Along with undue meddling in the program, it is alleged that Congressional members and their staff used black funding under this project to secure illicit favors from recruited psychics, and for other inappropriate purposes. The public deserves to know the truth behind these allegations of misappropriation, mismanagement and missing records. Every year more than \$30 billion is being spent on black projects such as this project was. This is the first such project to receive such detailed public scrutiny.

In light of the above situation, the following actions are recommended:

1. Expedite the release of the remaining available documents relevant to this program.
2. Commission a public review of all of the available information.
3. Hold Congressional hearings to review the past record and to consider various recommendations for the future.

Beyond the specific questions of ethics and legality being raised here, there is a much broader concern. There is a wide-spread and often intense interest in phenomena of a psychic or occult nature. This public concern is heightened whenever there appears to be government involvement. This program of psychic espionage is the only such instance that has been officially acknowledged. For Congress to attempt to ignore the aftermath of this program and its alleged mishandling would increase the public's fear that the institutions of government might veer out of control and be subverted for darker purposes.

On the other hand, it has not been adequately determined that the techniques employed in this program are of no future value, or could pose no future threat to this country or its citizens if employed by others. An appropriate defensive posture might include a continuing low level of open research into remote viewing and other related techniques.

Sincerely,

Dan T. Smith
