

Best Possible World: Gateway to the Millennium and Eschaton

This might also be called the Apology Page. Not many people have ever taken seriously Leibniz' suggestion that this is the best of all possible worlds, but that is the intent here. One could say that this is an exercise in metaphysical apologetics.

When it comes to cosmogony, there are just two choices: naturalism and supernaturalism. According to naturalism ours is just one of an infinite and more or less random ensemble of worlds or universes. There may, however, be at least some self-selection involved in our being here. If this universe were incompatible with 'intelligent' observers, we would not be here, we would be somewhere else. Also, just by probability, the average observer is most likely to find herself in a densely populated universe, rather than a sparse one. It would seem that elementary logic and probability are already loading the dice in favor of our having a reasonably hospitable home.

Is this the best that naturalism can do? If we want to do any better are we going to have to call on the gods? Not quite yet!

There are those, calling themselves naturalists, who would rather at this point appeal to the Quantum. By doing so they controversially carry the notion of self-selection a few steps further. You may have heard about the 'measurement problem' in quantum mechanics. It seems that electrons and other wee things have a hard time deciding whether to be particles or waves or be in any definite state at all, unless they are being observed. This ambiguity in itself has left physics notoriously vulnerable to metaphysical speculation, almost *ad nauseum*. The problem can be extended by noting that 'measurement' remains virtually undefined.

The basic question pertaining to measurement is the issue of deliberation. Or, to come full circle, is there such a thing as a natural measurement? Can there be observations without observers, and just what constitutes an observer? Most physicists suppose that a universe could exist without any observers, and that it would exist in a more or less definite physical state, but this is only a rather vague belief which is recalcitrant to justification, and absolutely recalcitrant to verification, unless...unless we posit a cosmic observer. Obviously we are seriously pushing the envelope of nature.

To make a long story short, if we push the Quantum hard enough we can drastically reduce the ensemble of possible worlds by appealing to a quantum bootstrap principle. In order to graduate from mere possibility to actuality, any deserving universe must include a final phase that is sufficiently populated with observers to satisfy the quantum measurement problem on a cosmic scale. Just applying a moderate push to the bounds of physics is enough to drive one perilously close to the pale of eschatological theology. It may not be quite so easy to draw a line between naturalism and supernaturalism.

Moving on from the problem of the Quantum, we next encounter the problem of the Mind, and once again confront the issue of natural vs. supernatural.

The Nature of Mind

There was a time when we distinguished ourselves from the other animals because of our powers of reason. The icon of the Enlightenment was Rousseau's 'Smile of Reason'.

Well, it seems, at least since the time of Machiavelli, Marx and Freud, that we have devolved from rationalists to rationalizers. The primary target of postmodern deconstruction is precisely the notion that there exists any such archetype as Reason. Reason has been dethroned by the Selfish Gene. What was once a singular and progressive history of ideas has been reduced to an endless interplay of mere memes.

There is a problem, however, that the deconstructors of the mind are not facing up to. The whole notion of deconstruction is based on the possibility of analysis. Behind deconstruction lies analysis and the analytical movement in philosophy. Behind the analytical movement in philosophy lies the atomistic impulse of science. Everything must have a foundation, and the foundation of deconstruction is to be found in the ancient concept of the Atom. To deconstruct the mind is, in some very non-trivial sense, to atomize the mind.

Many scientists and philosophers have for most of the last century been searching diligently for the mental atoms. But if you ask them they will tell you that they have come up empty handed. This does not mean that they have abandoned the search, but there is an unmistakable skepticism amongst the would-be analyzers of the mind.

Nonetheless, there remains the quite prevalent view that the mystery of the mind has been virtually reduced to the firings of individual nerve cells and the combinatorics of binary bits. After all, what else could it be? Won't we, before long, be able to build a thinking machine? Once we have such a device we can analyze its software and hardware to our heart's content, and therein will lie the answer to our question about the nature of the mind.

I will not stand here and swear to you that this will not happen. But I can offer to you a reasonable alternative.

Topical Index

(see the [Commentary](#) below)

[An annotated contents](#) (old)

[Index](#) (old)

0. [Introduction](#), [& \(part 2\)](#), [Recap](#), ([brief list of explanatory links](#))

0.01 New! [Here](#) are the contents of this website as of 12/3/05, including the text of the pdf files. It is a 3 meg file. Lacking a search tool onsite, it could be used to search off-line. This was concatenation performed by an anonymous volunteer. WYSIWYG. Note that Google's site-search function may now be used here.

Even Newer....

9-12-10. I'm using Notepad++ and FileZilla. I have never used an HTML editor. I may need to install an old copy of MS ExpressionWeb that I've never used. Testing...123...testing! Well, it worked, sort of, but I do need a WYSIWYG editor!

Ok, now I'm using ms/ew..... Hey, this is working, too. Not too shabby, and not so difficult if I use ms/ew on individual local files, and don't have to set up a duplicate website.

What I mainly wanted to do is point to where I have been for the past few years.....

[Open Minds Forum](#). [Reality Uncovered](#). [Facebook](#). [Physics Forum](#).

Another site to search is Starpod. See my instructions, 9/15, on the following page.

And here is the [new page](#), definitely under construction.....

The [Topical Index](#) proper comes after the following chronological section. Notice also that there are summary pdf files in section [0.2](#). These also may serve as introductory material.

[10/8/07] Work is beginning on a [New Topical Index](#) and [Syllabus](#). There is also a new [Recap](#) page.

What follows here are the more recent pages listed chronologically. These pages take the form of a weblog.

0.1 On the Web (a continuing weblog) (in chron. order: 7/10 - 8/8/2002):

[Immaterialism](#), [Mind](#), [Postmodernism](#), [Eschatology](#), [A Hard Core of Truth Seekers?](#), [Funda-Mental](#), & (part 2), [Quine's Holism](#), [Jerry Fodor & Co.](#), ['Naturalism in Question'](#), [A de facto Dualism](#), [Mind-Body & God](#), [Theistic Idealism](#), [Charles S. Peirce](#), [C. S. Lewis](#), [Bomb + Internet >= better than a Saucer?!](#), [Idealist Cosmology](#), [Holographic Universe](#), [Teilhard's Omega](#), [Tipler's Omega](#), [Blood in the Water?](#), [From Intangibles to Memes](#),

(9/7/02 to 12/21/02):

[The Observation Factor](#), & (part 2), [Materialism](#), [Coherence II](#), [Dan Hutto](#), [Mind-Body Debate](#), [Huw Price](#), [Atomism & Transhumanism](#), [Representation](#), etc., [Who's Keeping Score?](#), [Coherence Theory](#), [Aristotle Gets Real](#), [Representation](#), [Reduction](#), etc., [Nature & Plato](#), etc., [Rationalism vs. Naturalism and other Orthodoxies](#), [What *Is* There?](#), [Coherence](#), [How to See](#), [Alice Through the Looking Glass](#), [Direct Realism](#), [Do Ideas Count?](#), [A Semiotic Answer?](#), [El Camino Real](#), [Gospel of the Real](#), [East is East & West is West](#), [Creation & Maya](#), [The Epistemic-Ontic Divide](#).

(1/8/03 to 2008):

- Messianism: [Saving the World](#), [The 'Competition'](#), [Christocentric?](#), [Pre-Millennialism](#), [Only One Show?](#), [Messianism](#), [Dummies](#),
- Messianic Initiative (in chron. order: 8/25/02 - 8/29): [Messianic Gambit?](#), [Breaking the Barrier of Materialism](#), [On the Verge of God](#), [Creation](#), [Glass Ceiling](#), [Trickster](#), & [\(part 2\)](#), [The Messiah Contingency](#), [How to Save the World](#), & [\(part 2\)](#),

Commentary (7/12/02)

[Note that the most **recent** additions, in the form of a weblog, appear grouped in chronological order [near the top](#) of this page.]

Here you have it in a nutshell. If you have a familiarity with these four topics as treated herein, you may claim to have an overview of my philosophy, for better or worse. Please note the three separate introductory pages under each major topic as well as the [Introduction](#). As of just now I would point to [Introduction to God \(part 2\)](#) as nearest to the crux of the issues being treated here. [4/21/05 - Now also consider [this](#).]

The idea of the BPW is the logical start and finish. We like to complain about things, and with much cause, but that hardly proves that this is not the best possible world.

If any part of this world turns out not to be explained by just atoms swerving in the dark, then, hallelujah, none of it need be so explained. Then we are permitted to turn our metaphysical attention from Newton to Leibniz, the originator of the BPW concept. End of story, almost.

Taking the leap from materialism to immaterialism opens the door to the gestalt of a world stood on its head, and to almost every other possibility including, of course, the BPW possibility.

In questioning the authority of atoms, we consider reductionism vs. relationalism. It is hard to see how reductionism still retains as much influence as it does. We press ahead to the relational view associated with immaterialism and idealism. Coherence wins the day. Is anyone rooting for incoherence?

If the atoms are not in charge, and naturalism is on shaky ground, to what do we turn? How about to the Self and thence to the supernatural? It may not be your father's God, but she will

do in a pinch. It will justify our consideration of the BPW. We take up the all revealing issue of concealment.

And finally the Big Story. I don't want to give away too much, but it does have a beginning, middle and end. It is a participatory drama in three acts and no intermissions. It might behoove us to have a strategy regarding our participation. Just a thought.

Best Possible World: Gateway to the Millennium and Eschaton

This might also be called the Apology Page. Not many people have ever taken seriously Leibniz' suggestion that this is the best of all possible worlds, but that is the intent here. One could say that this is an exercise in metaphysical apologetics.

When it comes to cosmogony, there are just two choices: naturalism and supernaturalism. According to naturalism ours is just one of an infinite and more or less random ensemble of worlds or universes. There may, however, be at least some self-selection involved in our being here. If this universe were incompatible with 'intelligent' observers, we would not be here, we would be somewhere else. Also, just by probability, the average observer is most likely to find herself in a densely populated universe, rather than a sparse one. It would seem that elementary logic and probability are already loading the dice in favor of our having a reasonably hospitable home.

Is this the best that naturalism can do? If we want to do any better are we going to have to call on the gods? Not quite yet!

There are those, calling themselves naturalists, who would rather at this point appeal to the Quantum. By doing so they controversially carry the notion of self-selection a few steps further. You may have heard about the 'measurement problem' in quantum mechanics. It seems that electrons and other wee things have a hard time deciding whether to be particles or waves or be in any definite state at all, unless they are being observed. This ambiguity in itself has left physics notoriously vulnerable to metaphysical speculation, almost *ad nauseum*. The problem can be extended by noting that 'measurement' remains virtually undefined.

The basic question pertaining to measurement is the issue of deliberation. Or, to come full circle, is there such a thing as a natural measurement? Can there be observations without observers, and just what constitutes an observer? Most physicists suppose that a universe could exist without any observers, and that it would exist in a more or less definite physical state, but this is only a rather vague belief which is recalcitrant to justification, and absolutely recalcitrant to verification, unless...unless we posit a cosmic observer. Obviously we are seriously pushing the envelope of nature.

To make a long story short, if we push the Quantum hard enough we can drastically reduce the ensemble of possible worlds by appealing to a quantum bootstrap principle. In order to graduate from mere possibility to actuality, any deserving universe must include a final phase that is sufficiently populated with observers to satisfy the quantum measurement problem on a cosmic scale. Just applying a moderate push to the bounds of physics is enough to drive one perilously close to the pale of eschatological theology. It may not be quite so easy to draw a line between naturalism and supernaturalism.

Moving on from the problem of the Quantum, we next encounter the problem of the Mind, and once again confront the issue of natural vs. supernatural.

Taking Stock

More than a few people have been waiting rather patiently for a new worldview. Indeed, the concept of the paradigm shift had become such a cliché that it fell out of use. There are, of course, obstacles to any such advent.

Worldviews don't just grow on trees, waiting to be plucked down. Someone has to think one up and then facilitate its promulgation. And even if someone does come up with a new, improved 'mouse trap', there is sure to be resistance from the owners and maintainers of the previous models. With this in mind let us take stock.

By my own rather crude estimation there have only ever existed two-and-a-half worldviews: 'eastern', 'western' and scientific. Am I having trouble counting? Who is being short-changed? Without exercising diplomatic caution, it is the mystics that I am hereby short-changing. After all, the mystics make a point of being mystical and so it would not behoove them to have any very definite view of the world. Among the Buddhists, Hindus, Taoists, etc. one finds many flavors of pantheism, pluralism, nihilism and what-have-you. And in order not to leave our new acquaintances, the postmodernists, out in the cold, they might not object too strenuously to being provisionally included in this mixed company.

That pretty much leaves us with just the scientific and theistic views. It is the scientific view that has ruled the roost of modern intellectualism. The scientific cosmology must necessarily be the primary target for any new world view. But what do we do with those tired old theologians and other assorted mullahs of the world? Without giving away too many secrets, let's just say that we are going to have to make a preemptive move. I refer you to the first paragraph above.

For the last two or three thousand years there has been a ready made constituency for a new worldview, or, perhaps more accurately, for a new world. And is this not what the prophetic tradition is about? Let us proceed with this consideration.

5/16/02

BPW -- Contents

(chronological up to 7/3/02)

[Index](#)

[Topical Index](#)

0. [The Best Possible World Page](#)

- naturalism vs. supernaturalism
- possible worlds and their selection processes

1. [The Nature of Mind](#)

- the deconstruction of mind and reason
- the search for mental atoms

2. [Taking Stock](#)

- only two-and-a-half worldviews

3. [A Turning Point?](#)

- intellectual and spiritual void
- *deus ex machina*?

4. [Post-Reductionism](#)

- emergent entities
- the only claim to existence of these immaterial forms lies in their perceptibility

5. [Naturalism](#)

- atomism vs. holism
- an immaterial realm that is of material consequence?

6. [Beyond Naturalism?](#)

- why not imagine an emergent intelligence beyond our own individual emergent selves?
- why the secular philosophers have already jumped through virtually every hoop in order to avoid even one actually emerging entity....

7. [Post-Theology and-or Pre-Millennium](#)

- if the intercosmic Genii is so smart why are we so stupid?
- But all is well that ends well.

8. [Creation?](#)

- the power of creation is almost certain to emerge somewhere
- when it does there is a powerful bootstrap mechanism in place
- creation is likely to be the predominant source of all life

9. [Something Wrong with this Picture?](#)

- If the creative impulse is not to run amok there will be sources of restraint.
- [page to be omitted?]

10. [So Bring on Chicken Little!](#)

- the fragility of materialism
- about popping the balloon that is materialism
- and bringing down the Newtonian sky

11. [Behind the Void](#)

- A Newtonian reality still undergirds the entire apparatus of modernism.
- relationalism
- turning the world inside out and standing it on its head

12. [How Many Buddhas?](#)

- According to Leibniz, there can be but one void and one absolute.

13. [How Many Worlds?](#)

- Who needs a sub-optimal world?

14. [Recap -- Metanarrative](#)

- striving for plausibility, not proof at this point
- The Metanarrative is the only coherent alternative to materialism

15. [Best World for Whom?](#)

- best for everyone
- This world is the center of spiritual gravity.

16. [Our Dramatic Cosmos](#)

- a dramatic finale
- the teleology thereof

17. [Only One Show?](#)

- History goes around once.
- But it can reexperienced if necessary.
- We are all artifacts of the one, absolute experience.

18. [Explaining Science](#)

- The microcosmic alignment of the Metanarrative replaces Darwinism.

19. [Explaining Science \(part 2\)](#)

- distributed intelligence
- metabolic atomism

20. [Dream Atom](#)

- The 'atom' is merely a stand-in for a mathematical superstructure...
- e.g. the Monster group
- the teleology of atoms

21. [Concealment](#)

- Nature is the veil of God.
- We would have to be weaned from the parental God.
- this alpha/omega bootstrap process

22. [Concealment \(part 2\)](#)

- We were so busy tracking dinosaurs and planets...
- the image of God planting dinosaur bones, like so many Easter eggs...
- The material Alpha of paleontology, and astronomy, embodied in the almost tangible Atom, will be amply reflected in the spiritual Omega that is our Eschaton.

23. [Eschaton](#)

- In the popular mind, eschatological doomsaying is the favored cliché for depicting fundamentalist irrationality and radicalism.
- Its allotted time is determined by the parameters of its teleological creation.
- 'Let's get this show on the road!'

24. [Pre-Millennialism](#)

- Is there anyone out there who would not agree that there has never been a more auspicious time for the Millennium?
- The fact that the primary result of all our technology has been the wiring of our global brain may not be incidental in the larger scheme.
- In the best possible world our demand for truth will subvert the materialist Juggernaut well before it pushes us further into tribulation.
- I would suggest that it could all come down to Google.
- Does anyone have a better plan?

25. [Revelation](#)

- From an epistemic point of view, separation entails ignorance and concealment.
- This is the primary source of 'evil' in creation.
- It is the function of the pre-millennial messianic event to overcome these historical accidents and biases.
- I am looking to the Internet.

26. [Millennium & Eschaton](#)

- The concept of the Millennium has been integral to the prophetic tradition since its inception nearly thirty-five hundred years ago with Zoroaster.
- The notion of supernatural armies clashing in the heavens is replaced by the clash of paradigms.
- The potency of the Internet implies that the final messianic trigger could be the merest of 'butterfly' effects.
- Our sojourn into the limited dimensions of matter will be completed.

27. [Genesis](#)

Every engineer knows that a bridge needs two anchor points, and in our case they are the Alpha and the Omega.

- The Alpha Anchor is to be found in Angkor and in Giza.
- The actual time span of creation is framed in the stars.

28. [Christocentric?](#)

- If we take teleology quite seriously, Jesus has not existed yet.
- The X-event was the death of God. This was the necessary self-sacrifice.
- The X-event is to the geodesics of the Spirit, rather as Angkor, Giza, etc., are to the geodesics of the Earth.

29. [Hanging by a Thread](#)

- The idea of a coherent cosmos has simply fallen through the political and logistic cracks of academia.
- A dozen people knowing the truth and using the Internet can easily take this world away from the materialists.

30. [Mere Words](#)

- We do seem to possess an innate grammatical ability that is not reflected in any of the brute force procedures used to instruct machines in the use of language.
- What seems intrinsic to words is their ability to refer to other things.
- The fact is that there is nothing physical about referring.
- Any act of reference must transcend a purely causal nexus.

31. [Straw Man](#)

- The previously mentioned deconstructors of the mind will be our straw man until the warm bodies appear.

32. [Strategy](#)

- Divine minimalism in history is exemplified in the prophetic tradition.
- In our case the Internet should minimize the problem of disseminating the message, and thus we have the concept of the mini-messiah.
- ... nothing other than the dictionary definition of salvation.

33. [Saving the World](#)

- You will notice that I am taking a recognizably Tom Sawyerish approach to this salvational fence painting.
- Publish or perish....

34. [Hot Topic?](#)

- If materialism is going to implode, this would be ground zero for that event.

35. [The 'Competition'](#)

- They are letting the materialists choose the battlefield, and set the terms of the engagement.
- Meanwhile, the theists are implicitly letting the pantheists continue their hegemony over immaterialism.

36. [Never Mind?](#)

- A very important lacuna among theists is the mind.
- Rationalism has almost never found fertile soil in either the east or the west.

37. [Rational Theism](#)

- Imagine the bloke who first figured that out.
- Would it not be much more difficult to prove that it is impossible for God to exist?
- What is to suppose that accessibility to universal mathematics is not a condition of existence?

38. [The Ecology of Existence](#)

- We cannot understand the meaning of one word without, potentially at least, understanding the meaning of every other word.
- The history of science is a steady progression in our appreciation of the complexity and interdependence of all existence.
- Given the apparent holographic, relational, bootstrapped nature of all existence, it would be incomprehensible that any part of creation or existence could be isolated from the creator....

39. [The Level Playing Field](#)

- Knowing God and having a buck seventy-five will get you a cup of coffee in Times Square.
- Any physicist will tell you that space is something awfully contrived.

40. [An Idle Question?](#)

- Why is there something rather than nothing?
- There must be a lower limit of some kind on what it means to be a world.
- If the principle of sufficient reason is possible, non-optimal worlds are impossible.

41. [Is Mind Possible?](#)

- All relations are ultimately subjective.
- Not only is mind possible, but it is the generator of all possibility.
- Is a kitten excluded from all contact with the Monster group?
- God can never be further from us than our own reason and feeling.

42. [Coherence](#)

- The most mysterious thing about the world is its comprehensibility.
- The basis for existence is the process of relating.
- Where's the substance, if it is not in the matter? The substance is in the coherence.
- Coherence exists only in relation to a subjective pole.
- The atoms, while they are current, provide a centrifugal balance to the centripetal subject.
- In the eschaton, the centrifugal force is overcome.

43. [Distinction](#)

- Spencer-Brown's *Laws of Form*
- The Kabbalah speaks of the Zim-zum
- 'seven thunders' that also play a central role in Joyce's *Finnegan's Wake*
- witnessed within history as the syzygy
- the stem cell of language
- this historical process is reversed and accelerated

44. [The Relational Self](#)

- Somehow the pantheists miss the nodal structure of the world.
- There is the even more fundamental dialectical dynamic
- As in the monadology, every node is a microcosmic hologram.
- The preordained harmony is the agape betwixt the Alpha and Omega

45. [Pantheism](#)

- Pantheism has served as a bit of a strawperson in these pages
- those pantheists are not real strong on rationalism, nor on the Metanarrative
- And remember there is no substance.
- The megalithic Angkor sailed right by them.

46. [Islam](#)

- If the modern materialist establishment needed a thorn in its side...
- [They] seem a bit impatient with my Metanarrative, bless their hearts.
- Without McLuhan how could they have known that the message was in the medium?

47. [Emergence](#)

- If physics is unable to reduce itself...
- no one can point to any vital force
- but all the correlations in the world will not explain the existence of what is at least a very fortuitous dual aspect of matter.
- It is not for nothing that people are reluctant to rock the intellectual boat that is modernism.

48. [Relations](#)

- If numbers can exist then certainly relations can.
- Is the past real? If it is, it is only in relation to some actual present.
- If science is teaching us anything about the world it is the almost unlimited functional intricacy
- The isolated object, fact or word mean virtually nothing without regard to its relations.

49. [Relatedness](#)

- The degree of existence, however, is not something that can be directly observed.
- Physics works because it is so totally insinuated into our lives.
- And it is so insinuated just because it does its work. Is this circular?
- As long as astronomers are able to keep pushing the telescopic limits, they will not run into any cosmic or logical brick walls.
- In like manner, the PSR implies the BPW hypothesis as Gottfried was able to deduce several centuries ago.

50. [Recap](#)

- The poor reader may be getting a bit dizzy from going around in these circles.
- I am not writing a thesis.
- I am casting a loopy net into this vast ocean.
- Like those fair maidens of yore, I just keep on spinning.

51. [Immaterialism](#)

- Down thru the ages, immaterialism and idealism have always been prevalent in philosophy and

religion.

- The successes of science have managed to keep a heavy lid on idealist speculation
- We should wonder why the theists cannot find their way to the high road of idealism.

52. [Immaterialism \(pt. 2\)](#)

- For almost five years I struggled to find wholeness within a quantum dualism of mind and matter.
- Once one has opened the door to the possibility of mind on a cosmic scale, all the qualities are drained out of matter
- I realized that my leap from science to immaterialism was a luxury that my fellow scientists could ill-afford.

53. [Rationalism](#)

- Part of the rationale for irrationality is the scientific view that mind is an accident of nature
- Deep ecology, fundamentalism and postmodernism are the disparate responses.
- Historically, rationalism has been based in theism.
- In practice, however, the religious establishments have never been comfortable with the political possibility of free thought.
- along came science to provide a tremendous outlet for a sustained but restricted intellectual endeavor
- Now with the advent of the Internet, will the authorities find another stratagem to keep human reason in check?

Introduction

We have come perilously close to losing our ability to view our world as other than an accident. In this vein we have gone so far as to postulate the existence of an infinity of universes conforming to all possible physical laws and boundary conditions in order to account for the otherwise inexplicable suitability of our universe to the production of complex life forms. This fact of suitability is sometimes referred to as the Anthropic Principle.

An obvious statistical argument would place us among the relatively few universes **best** suited to abundant, and even to self-conscious life. This sounds like a good deal for us -- a free banquet, it would seem. Perhaps we should leave well enough alone. It is the function of this web site, however, to inquire further into the basis for our existence.

What particularly motivates this inquiry is the peculiar nature of the mind -- especially peculiar from the point of view of scientific materialism. By almost every account, the mystery of the mind is the one abiding mystery of the world, possibly apart from the question of why anything exists at all.

Might there not have been every conceivable physical existence without necessitating the seemingly non-physical existence of the mind or of consciousness? The oddity of mind in an otherwise completely physical universe suggests the definite possibility of at least a quasi-independent, non-physical basis for its existence. This is just the possibility that is pursued in this inquiry.

To make a long story short, give mind an inch and it is liable to take a mile. How so?

Peculiar to the mind is its concentrated productive power. Mind is much more than a mirror of nature. It is the great embellisher of nature. If science is correct, reality is a purely quantitative affair. Our experience of the world is almost entirely qualitative. From whence come these qualities? Even more remarkable is the mind's unquenchable proclivity to create and simply spin out worlds of its own, often with little or no regard to the existing one. This production is ongoing in virtually every state of our variegated consciousness.

The most tangible product of the mind is our technology. But what is the function of technology other than the production and dissemination of virtual or altered realities?

If there were any reason to posit an independent basis for the mind, whatever balance might have originated between mind and matter would remain under constant revision on the part of mind. Whenever and wherever mind is given the opportunity to tilt that scale, it surely will. Matter is passive, just be definition, and mind is not.

Among other things, such considerations provide ample motivation to question the arbitrary Cartesian dichotomy posited between mind and matter that has been the basis of our modern worldview. The seeming artificiality of any rigid distinction between mind and matter should cause us to question under what aegis such a distinction might have been originated or be maintained. Without this additional posit of an external aegis, the original posit by Descartes is suspect.

Greatly abetting this suspicion is the increasingly elaborate mathematical superstructure being discovered by physicists investigating the nature of matter. The involution of matter with math, and of math with the mind, removes a logical barrier between matter and mind. The same suspicion is raised by the quantum, of course. Neutral monism and even panpsychism are increasingly being entertained by serious minded, cautious professionals in response to these and other considerations.

It is not my intent here to throw caution to the wind. It is my intent to anticipate the outcome of such

intellectual inquiries. That I should foresee radical consequences stemming from such radical inquiries ought not be particularly surprising. Neutral monism smacks of artificiality almost as much as the Cartesianism it is supposed to replace. I agree with the materialists in acknowledging the reality of a Solomon's choice between materialism and immaterialism. We can't have it both ways. Coherence can and will be given its due. It is simply that the materialists have picked the short straw.

We immaterialists are then faced with the burden of re-explaining the world. Not since Darwin has there been a serious attempt at a coherent alternative. All I can do here is attempt to motivate such effort. The successful motivation of a successful re-visioning of the world will have consequences of 'biblical' proportions, I will claim hereinafter. The 'scare' quotes may be removed when appropriate.

[Introduction \(part 2\)](#) -->

7/8/02

Introduction (part 2)

Since the 1950's there has been a fairly steady decline in the intellectual hegemony of scientific materialism. The rise of postmodernism is a deliberate response to this decline of our modern worldview. I have not been able to find anyone who foresees as radical an outcome of this trend as I do. How come?

There are several differing interpretations of the decline of scientific materialism. The most common view is that we headed into an indefinite period of pluralism. There exists no overarching truth about the world to capture our allegiance, or if such existed it is not accessible to our powers of reason.

The other common view is that postmodernism is simply a symptom of cultural decline. Scientists and religionists alike see this trend as a further falling away from either the intellectual or spiritual rigor of the past. The apocalyptic minded sectarians are content to include postmodernism among the signs of the end times.

What do I see that the other observers do not? Coming from a background in physics, I am aware that there remains a hard core of scientists who are still in pursuit of Truth, with a capital 'T'. The recent progress in theoretical physics leaves some of them tantalizingly close the 'Grand Unified Theory of Everything'. And in general there is a silent minority which has not given up the strong desire for intellectual coherence. If and when a few of these stalwarts are presented with a viable, coherent alternative to scientific materialism, some of them will take it seriously. It would only take a determined and articulate handful of such individuals to constitute a publicly noticeable presence. The ensuing discussions would presumably lead to more 'converts', and would constitute an intellectual and eventually a spiritual trend, given that there does indeed exist a personally accessible coherent Truth as is being outlined here.

I can only hope that in this Best Possible World we do not have to be prodded with a 'stick' in order to become interested in the intellectual and spiritual 'carrot' being offered.

Recap

I am, for the first time, about to attempt a major, but still informal, (year end?) recap. I am not sure yet how to handle this, i.e. whether to make it part of the continuing web log, or to have it stand alone. I will continue chronologically for now.

The last major theme has been my sporadic struggle with the Monster Group, commencing on [2/26/03](#) and continuing up until [12/21/03](#). I claim partial victory by incorporating the MG and all of mathematics under the aegis of [functionality](#). I am not thereby claiming that mathematics is merely conventional, certainly no more than a biological cell is conventional. I am saying that mathematics is a very significant part of the teleological infrastructure of the cosmos.

A second theme in the same time frame was the Archetypes commencing about [4/29](#). I am also claiming success with this endeavor. In their [latest](#) incarnation, they feel reasonably solid.

[12/28]

Despite these recent efforts, the BPW remains optional. But I would also claim that in the BPW, the BPW hypothesis remains optional as long as possible. No?

However, the human psyche is such that paradigm shifting, gestalt switching, tends to be dramatically unpredictable, especially now that we are living mainly on Internet time. A uniquely attractive and rational alternative to both religious and scientific fundamentalism, which the BPW claims to be. If it cannot be dismissed out of hand, it will necessarily take on an insidious, insinuating presence. That is the next and crucial phase. To reach that point there will have to be some strategically located links back to here. I doubt that Google alone could be a substitute for such links. Once those links are established, the Millennium clock will start ticking. The Tar Baby effect will kick in: kick these tires more than once, and your foot may not be disengageable. T'will be a pity.

Just how optional are we at this point? Admittedly, the Big Bang materialist cosmology will be a tough nut to crack. Even the Creationists have almost uniformly given up on their 'young Earth' scenario. They have fallen into line with a post-Copernican sense of deep space and deep time. Even my fellow idealists are strangely silent on the problem of cosmology. I could complain about this lack of competition in the domain of immaterialist cosmology, but I think it is due actually to the logical uniqueness of the BPW. It is either us or mysticism.

Cosmic coherence is in extremely short supply in these postmodern times. If I have indeed cornered the coherence market, if there is only this one corner to cover, the choice will be the BPW or cacophony. It would take very few articulate spokespersons to make a very big dent in the otherwise incoherence of the present Internet. In retrospect, will it not be obvious that the Internet existed as a gigantic means, moving us inevitably toward a coherent end, if there be such? Someone was bound to run the flag of coherence up the Internet pole. Even Google seems designed and destined to this singular end.

Over the juggernaut of scientific materialism I cast the fine net of normativity. Can its thin strands possibly be a match for that clanking mechanism? From our slumber of materialism will we awaken in the place of Gulliver captivated by the fine thread of the Lilliputians? That is the plan, anyway.

Yes, another continuing theme has been norms vs. nature, beginning effectively on 10/10/02: [Nature & Plato, etc.](#) There may be nothing more insidious in the entire materialist cosmos. Norms, rather like consciousness, seem entirely gratuitous in the larger scheme, that is until you attempt to exclude them or

explain them. At first they may seem merely resistant, but they can quickly turn corrosive of even the most solid materialist fortress.

A case in point is the functionalism of Putnam, Dennett, & Co. ([1](#), [2](#), [3](#), [4](#), etc.). Functionalism arose from the ashes of behaviorism, but now, in the hands of the biosemioticians, [function](#) threatens to break the back of materialism. Once teleology gets its functional foot in the scientific door, it will not only be impossible to extirpate, it will, in the shape of normativity, simply take over the neighborhood. As with consciousness, there is nothing that can escape its reach. [Kant](#) clearly saw this inevitability long ago. At this final juncture, his revived cautions and precautions are much too little and too late.

Cannot the materialists simply nuke the norms? What chance does a little norm stand against their deconstructive WMDs? Can we truly 'normalize' the Big Bang? The anthropic principle goes only part way. By itself, it is too susceptible to a dualistic interpretation. Here is where my struggle with the Monster Group will have to begin to pay off. My Monster vs. their Big Bang. Ownership of the Monster, however, may still be in some dispute. Nonetheless, normalizing the MG is not inconceivable even by the most jaded materialist.

The normalized MG plus anthropics puts a very short leash on the Big Bang. Teleology is now raised to cosmic proportions. Quantum cosmology and a universal observer principle can no longer be set aside, as has generally been the case before. The anti-Occamist notion of (infinitely?) many worlds is now even less necessary and less attractive. The normalizing of the MG also undermines the dualist proclivities of the Anthropists and the Intelligent Designers. The net result is that everyone is emphatically being nudged toward immaterialism and the BPW corner therein. All we need is a very few in this crowd to jump ship. It would quickly set off a general alarm. Normativity when diligently pursued is one more straw that turns into a hefty stone that could, along with all the older baggage, just about break this camel's back. I wouldn't want to have to bet the farm on this beast's imperviousness.

It is the Telos that finally confronts the Big Bang. It has been my contention that teleology is an all or nothing proposition. There is no such thing as half a Telos. All politics may be local, but all teleology is global. Teleology is all about coherence. It verges on the oxymoronic to posit a partially telic or partially coherent world.

Of course, the atomists, reductionists, naturalists, etc. would much prefer that we accept a diluted or palliative version of teleology, if we have to accept any at all. Struggle as they might, you do not and will not see them making sense of any such palliatives. It is simply a desperate, rear guard distraction on their part.

Given the Telos, we can hardly avoid the notion of a BPW. They verge on the synonymous. We then must ask ourselves if the Big Bang cosmology is the best one possible. Search as you might, you will not find a materialist touting the intrinsic merits of any of his or her hypothesized worlds. If you don't like any given rendition, that is entirely beside the point. We teleologists, however, take the opposite tack. Everything answers to the principle of sufficient reason. Presence is what counts. The Big Bang universe of deep space and quasi-endless time is anyone's trophy for absence. However, and this is a big 'however', the appearance of absence may serve many esthetic functions. We'll take that 'natural' esthetic, thank you, but eschew its illusory substance. Is that not a possible world? Tell us why it's not possible, please. So much for saving the appearance of the Big Bang. Anything else you wish saved?

[12/29]

The Archetypes emerged here as a counter to evolution: [Creation vs. Evolution](#). Also they are intended to counter Samuel Johnson's alleged refutation of George Berkeley's immaterialism. 'I refute it thus,' says Sam with a well placed kick at an errant stone.

The first choices were [cycles](#) (and [here](#)) and atoms. The [Dream Atom](#) is no laughing matter. We might also call it the quantum or normative atom, thereby challenging, along with [Biosemiotics](#), the [The Epistemic-Ontic Divide](#).

The archetypes are simply the organizing centers of Creation. A minimalist Creation posits a self-organizing cosmos. But unlike our Santa Fe colleagues, we do not eschew the self. The primal Self becomes 'X' in our AZO/X/QRP system of archetypes. It occupies center stage.

Now, better pay attention. Here comes almost the whole show. This may either be the weakest or the strongest link in the BPW system. X marks the spot. A cosmic self spontaneously emerges from the totipotency of the Matrix. Teleologically this is the creator, hero and, yes, savior. It is the Adam/Christos. It is the Alpha and Omega. It is the first and last of the Archetypes. It is the beginning and end of coherence.

We could do worse than follow St. Anselm's [ontological argument](#). The only addition here is the Matrix as the ground of that Ontos. The primal mark of distinction is also the **dialectic** of the I & Thou. This schism sets up the main psychic oscillation, the primal cycle. This duality plus their dynamic relation is the trinity. This is the necessary buckle of the cosmic bootstrap. This is both head and tail of the ouroboros.

Relationalism and idealism are nearly synonymous. To be is to relate. We know of nothing more relationally promiscuous than the self. It is the necessary nexus of all knowable relations.

[12/30]

The materialists bet the farm on the illusory nature of the self. I bet the farm on its substantial nature. The materialists must have us believe that the self is epiphenomenal, accidental in the larger scheme.

If there is to be anything at all, there must be an ordering principle. *Cosmos* derives from the Greek word for order, as opposed to their *Apeiron*. Chaos can exist only relative to something more orderly. To exist is to relate, there can be no relation without order. For the materialists, space & time are the primary principles, but don't bother to ask from whence they derive.

There exist many potential ordering principles. The most potent among them will logically dominate any sort of bootstrapping process. Everything else will then either go along or be gone. Something on the order of self-love fits the bill. Creation is self-realization writ large. We are each an aspect or reflection of the cosmic Self on its inevitable way to self-realization. We see this process under the aegis of temporal flux, but that is just our worm's eye view of the matter. The only end of self-realization is eternal presence.

So far, so good. Where many people demur is with the anthropological problem, i.e. when we touch upon the Anthropos. I see no way to avoid this. No one does. The only escape from the Anthropos is abject mysticism. The only escape from the theos is the pantheos. The only escape from coherence is incoherence.

I can sympathize to a degree. Each of us contains a piece of the cosmos and a piece of the apeiron. The potential for rebellion and anarchy lies in every heart. We would not be here without it. Self-realization is a recreation of the potency of the self. With every construct there is a de-construct, with every light a shadow. With every affirmation there is a hesitation. This is the natural dialectic of being, [q.v.](#)

In hesitating, we are holding out for something better. No? That is why we have the BPW. But there is a caveat. Within the BPW, there is theistic minimalism. Atheism is pandered to, up to a point. I also believe in universal salvation. I am a Universalist. But there are limits, nonetheless. We cannot hesitate

forever. If you have to ask how long that is, you may already be on thin ice.

Nihilism is nothing natural. It is pure posture. It can be a dramatic show, just don't make it your last show. Yes, Virginia, there is self-responsibility.

Finally, if we cannot believe in the self, in ourselves, in what else can we possibly believe? How can you possibly believe in an electron or the Monster Group if you do not believe in yourself. The self is the logical and phenomenological beginning and end of all substance, all being. Could there be any other source? We can try, but we will never be able to totally deconstruct the Cartesian *cogito*.

There will be those who wish to side-step the self in order to more fully embrace the Matrix. That could possibly be our final act, but do not attempt this at home. This is not a sport for amateurs. When you attempt that, you are truly alone. There will be no recourse. The self is just designed to point the way back to the Matrix. Don't leave home without it. I point to the *Mahayana*. For the *Hinayana*, you are on your own. Come to think of it, though, is not the notion of a self-salvation from the self oxymoronic? Don't get hoist on your own petard.

Let us not forget the ecological objections to the anthropic bias of any ontology of the self. Just who do we think we are? Is not the self to blame for all selfishness? The distinctions between selfishness and Selfishness are many and subtle. My only caveat is that we not throw out the baby with the bathwater. The deep ecologists seem bent to that untoward end. See the previous paragraph.

[12/31]

If there are going to be any archetypes at all, the psyche is the only place to start. This is particularly true with immaterialism where we must challenge the ontic-epistemic divide. We start with psyche/episteme. This is just our version of the *cogito*.

We have ample reason to assume a substantial universality for the psyche. It must be the basis of any possible coherence. The microcosm of the psyche is our only portal to the cosmos. There is indeed a bias toward the anthropos, a bias which we should be ready to amend according to the evidence. At present there is no evidence for any substantial alternative. Humans presently own the epistemic franchise. Unless and until some contender appears, we make do with what we have. To attempt philosophy without an anthropic bias is simply foolish, if not patently impossible. Indeed, if there is anyway to overcome human parochialism or anthropocentrism, it would have to be through some form of philosophy.

But I go further than this. There is a more specific identity of the psyche with the christos. I do this out of logical/historical necessity. The mythos surrounding the X-event is simply an historically unavoidable nexus of archetypes. No other event in history comes close to matching the semiotic density that has been ascribed to this one. There are many other teachings and scriptures, but none claim or even pretend to be so personally grounded. Christianity is indisputably a personality cult. Its claims on the psyche are unequalled. If there is a mythic coherence, if there is a metanarrative involving human history, there are no other contenders. Unless one is prepared to reinvent the mythic wheel, we must be prepared to go along with what is so evidently a given.

This, in a nutshell, is an argument for the X/christos/anthropos. If you have a more coherent scheme, it is time to place your bet. History rides on the outcome.

X is the nexus of [AZO/X/QRP](#). We see here the macro/meso/microcosm. The zodiacal Z is certainly a strong nod back to the Zoocosm, but there is no historicity comparable to the incarnation. The Z is the primal circuit of the psyche. I can hardly avoid the apt rendition of 'Lucy in the sky with diamonds'. That 'Lucy' may also be the name of our mitochondrial, hominoidal Eve may be the closest we get to a scientific incarnation.

Originally I took Z for Sol, but this was too limited in its scope. Its brute nature does not conform with the minimalist creation scheme of the BPW. One could do worse than envision a creation sequence of Zodiac, Luna, then Sol. [Heliotropism](#) kicks in only in the latter phase. The common connection made between deep space and the psyche is probably no accident.

Taking Alpha and Omega as the extremes of the primal psyche-circuit of the Zoocosm, is nothing very radical. Alpha and Omega are the seeds of the metanarrative when history is viewed from a progressive, covenantal perspective. Can the BPW offer any less than a salvation economy? That X is also identified with the A&O, but mainly with the Omega, can hardly be a surprise. This short shrift may do for now, as I wish to turn to the microcosm.

Where we first had Sun & Atom, we now have Z & QRP. Much of our Logos is riding on Q, R & P. This is our contact with science, mainly via mathematical physics. But right now it looks more like *manana*.

[1/1/04]

Let's take it from the top again. I postulate the spontaneous **symmetry breaking** of the totipotency of the Matrix into a zoomorphic collection of psyches. These recombine into a semi-stable zodiacal/ouroboric circuit with the symmetry break now focused on the head/tail, Alpha/Omega gap. This polarity is the primal duality. The 'air gap' in the nearly complete 'magnetic' circuit becomes the basis of a temporal direction. The logos of this gap is also the christos. The christos is both the efficient and final cause of the gap. Thusly is implanted our salvific economy, from the very beginning. The salvific dialectic is virtually the precondition of history. Thus do we have Z, A, O & X, right off the mark. Q, R & P are more of a stretch.

What are the common traits and relations between Q, R & P? They occupy the borderland between subject and object. They are essentially normative, each in its own fashion. The biologic/metabolic cycle, R, is a prototype for the Quantum measurement. Under proper conditions it is a primitive recording device. Thus there is a mutual dependence between Q & R. R is the microcosmic analog of Z.

Q, R & P exhibit crucial symmetries. Quantum logic is the basis for most of the many symmetries and conservation laws of physics, viz. the [theorem](#) of Emmy Noether. Thereby enters substantiality into physics. Stable atoms are a direct consequence. The (molecular) measuring cycles of R complete the quantum measurement bootstrap. Many 'quantum' philosophers suppose that this bootstrap is the basis of global teleology. I demur. Pi is my counterweight. It is my logos, even christos, in its own context. Through it the anthropos crucially enters the telic bootstrap.

[1/2/04] [\[a\]](#)

All roads lead back to Pi and its singular relation to the christos. If I could bequeath anything to the world, it would be a renewed appreciation for this fact. First, glance back at 12/20 & [21](#). Yes, I am saying that Pi is the number of Jesus. You cannot understand one without understanding the other. This is a radical statement. Perhaps better than any other, it sums up the philosophy of the BPW. This is all about the reenchantment of the world. Others talk about doing this, but here you can see it being done in real time with all the vengeance of immaterialism finally overcoming matter.

Pi is the Achilles heel of materialism: its jugular, to be more specific. It was Archimedes who said, 'Give me a fulcrum and I will move the world.' Well, Archie, here it is at last. It was right under our noses all this time. Do I detect skepticism? From the frying pan of zodiacal astrology, I jump into the fire of

numerology. But if we are ever to reenchant the world, what else can a body do? Yes, Pi is no more or less teleological than a biological cell. (See [10/30](#) &ff, [10/13](#), [9/27](#) &ff, and other related entries, i.e. [Pi anxiety](#))

It is the Platonic absolutists who have done the most to disenchant Pi. The same absolutism notoriously subverted Christianity. Luther, Hegel, Adam Smith and Mohammed are just a few of its victims. Scientific materialism is just the (very) last chapter in that sorry legacy. But, with a nod to the BPW, we would not be here now were it not for this legacy. There may be many dialectics, but there is ever only one legacy.

The crux of the matter lies in the [anecdote](#) of the freely drawn perfect circle, and also in our attempts to compute away our Pi anxiety. Yes, we are afraid of ghosts, and especially of any Koestlerian '[ghost in the machine](#)' (69,000 hits).

Pi is the anchor of materialism. Nothing in the world has been or can be more precisely fixed. We've got this one nailed down, Baby! I demur. It's all in our mind. Yes, let's watch as the ground begins to shift beneath our feet.

There are no absolutes in the BPW. The closest to such would be cosmic love. Pi's pretense to absolutism stands to be revealed.

Knowledge of anything lies only in its proper usage. To be is to relate, is to be useful. This is pragmatism and utilitarianism where the ends are eschatological and transcendental. The final knowledge and being of Pi vastly outstrips any recitation of its digits, a mere exercise in syntax, with little or no semantic value. Pi is substantial only to the degree that it contributes finally to cosmic love, and I suggest that degree may be far from inconsequential.

Despite much opinion to the contrary, Pi is has much more to do with quality than quantity; although, in the end, it will hardly be possible to distinguish the two. Much of its ultimate quality remains hidden. That it may turn out to be the organic nexus of all math, could stand to revolutionize our conception of Pi. Anything that is useful will be pliable in the hands of the user.

The numerical value of any quantity exists only in relation to other known quantities. The first billion digits of Pi are a pure abstraction, without any intrinsic meaning beyond that to which they might be assigned by some convention or another. An atom at the center of the earth exists to the degree that it influences the gravitational field at the surface. The billionth digit of Pi has not even that much influence, and certainly not as an individual.

A principal influence of Pi is to be found in the syzygy: $e^{i\pi} = -1$, a configuration that was not even a gleam in the eyes of Pi's 'discoverers'. Note that its influence here arises only in conjunction with the other quantities that participate in the context. There is no such thing as an intrinsic or essential quantity. That the same goes for qualities is hardly controversial, but we have lately fallen into the habit of thinking of quantity as quite distinct from quality.

We cannot learn one new fact without modifying every other fact we have ever learned. Some epistemologists suppose that this constitutes an insuperable paradox for holism. The fixity of the billionth digit of Pi would be their exhibit A. Holism is a problem only for the non-vitalist, not for the vitalist or panpsychist.

Knowledge, like everything else, is alive. It moves, it 'evolves': all of it together, not just particular parts. Are there no eternal truths. None, other than cosmic love, and that exists eternally only to the degree that it is lived eternally. By the same token, nothing of value need ever be lost. Yes, each one of us has only a tenuous grip on parts of the eternal truth. Riding that beast is the task of a lifetime.

Cosmic intelligence is like the software of an object oriented parallel processing system. Its infinitely

distributed intelligent agents are constantly reconfiguring and reconstructing themselves. Pi is no exception. Pi is another, albeit transcendently important, chip off the cosmic spirit. It all comes from the same place, and it all ends up there, in perfectly seamless fashion. That is the one eternal verity. That is the beginning and end of all coherence. When we can see the world as Beethoven once saw his Fifth symphony, in one eternal flash, then our job will be done. The Pi we know today is just a pale shadow of its true Self.

Permit me to append a personal communication:

The Matrix as the 'uncreated heaven' and 'cosmic womb' sounds right to me. This is also not unlike the Hindu concept of Nirvana. I see it as the source and ground of all being: pure potentiality, fecundity. It has a feminine connotation, naturally.

Out of the Matrix emerges a primal psychical circuit. This is the original pantheon including zoomorphic psyches, not unlike the zodiacal powers and principalities. These spontaneously organize under the aegis or sign of cosmic love, and this is where the Christos emerges as the preeminent entity. Assume a mixture of genders herein.

Thus we have something like: Matrix -> zodiacal/Logos -> Christos -> Creation proper.

We seem to be missing both Sophia and the Holy Ghost. Also there seems not to be a 'godhead', per se, but I would think that the Christos/Creator entity might be closest to a 'godhead'. I do not see truly distinct forms at these stages. It is still very much a spectrum. With my AZO/X/QRP scheme, I struggle to maintain as much fluidity as possible, even with respect to the entity I arbitrarily designate as 'P' or 'Pi'. What we think of as '3.14...' is a very pale shadow of the living Archetype that is 'Pi'. A, X & P are the core of the Logos, while O, Q & R relate back more to the Matrix. Z is a mixed bag and even less formal than the others. It is almost pure(ly) dialectic.

'Pi' may come closest to pure intellect and wisdom. If there were a Bible 'code', this would be it. The other archetypes are more functionally identified.

My tentative suggestion is that Sophia $\sim$ P. The HG might be subsumed as the dialectic of Z. In the mathematical context it is the $\sqrt{-1} = i$. But recall that the HG is also the Spirit of Truth which, in its turn, reflects Sophia.

A principal point here is that the main archetypes are moving targets. Trying too hard to pin them down is to commit idolatry, Platonism, absolutism. All that you and I can offer is the occasional snap-shot, meant for purely pedagogical purposes. The above dialectic is true of any meaningful relationship in which there is constant give and take, role playing and the like.

All I am aiming for is a minimal identification, and only then as it promotes an understanding of the cosmic dynamic. No eternal verity can or need restrict any living power. Nor need any pedagogical scheme impinge upon anyone's personal relation with the higher powers. The love engendered thereby demonstrates what the most thoughtful words can only dimly echo.

[1/3]

The least discussed of the archetypes is Q. Following yesterday's communication I am inclined to associate it with the **dialectic**, picking up this topic from [above](#) and on the [previous](#) page.

Hegel's great bequest may well be his (transcendental?) [dialectic](#) (246,000 hits), though he might not recognize all of its progeny. What is it? What is it to become?

The great dialectician was Socrates: argumentative questioning in the ferreting out of truth. The Socratic

tradition appears unique in the world, inclined mainly to the West. It stands in opposition to the monologic of rhetoric. The dialectic finds itself refurbished in Kant's hands where his transcendental [version](#) of it is used to defeat the speculative pretensions and excesses of theology. Hegel, not to be deterred, makes his transcendental dialectic the basis of his cosmology. Here I take my cue from Hegel.

Hegel used the dialectic to support his absolute idealism. I use it to defeat absolutism, following Martin Buber and existential theology.

Dialectical dynamics avoids Platonic stasis. I posit but one eternal verity. Lesser existence is not lost, it is merely subsumed, as the musical notes are subsumed by a symphony. The notes are transparent to the final effect. The final effect is the dynamical gestalt.

Existence is relational and psychical. Psychical existence is dynamical and dialectical. The 'internal monolog' is always a dialog. Gestalts are meant to be switched until the transcendental limit of coherence is grasped. The switch from materialism to immaterialism portends to be singular in its scope.

The closest that the dialectic comes to personification is as the third person of the trinity. The Matrix achieves a similar personification as the Mother of God. I oppose my **personalism** to the impersonalism of Hegel.

The nearest that the dialectic comes to specification is as the 'imaginary' i in $e^{i\pi} = -1$. It enters physics as the quantum of uncertainty, placing it in a role that remains ontologically obscure.

In biology the dialectic takes the form of the metabolic cycle, 'R'. It is also the basis of the ouroboric A, Z & O archetypes.

Have I gone overboard with the dialectic?

[1/4] [\[a\]](#)

Let me please follow up with Sophia. The above mentioned correspondent and I have discussed her in the past. My most significant spiritual encounter was with an entity of a similar quality. What are we to do with her? Is she being left out?

My tentative suggestion was to have her be subsumed by M & P, i.e. by the Matrix and Pi. Is this not doing her justice? I picked up the Christmas issue of the *Economist*. Mary was on the cover. Her special connection to Islam was being touted. It seems that there may be a message here. Why not just add Mary/Sophia to the pantheon along side of X, christos? Easier said than done.

The X event is essentially singular. This has to do with the singularity of the BPW. There have been many well-meaning attempts to provide the christ with heavenly and earthly consorts. Do we not jeopardize the Tao by failing to balance the yin and yang? Where is the dialectic?

My best answer at this point is that, in the BPW, balance only serves function. Balance is not an end in itself. The dialectic is an unstable equilibrium. Balance and stability would be tantamount to death. The Matrix is not the Tao. The Matrix is unstable with respect to emergence. X is the primary and singular emergence. X is the cosmic hinge/fulcrum. X & M can never be in balance. The battle of the sexes is essential to history. The resolution can only be eschatological and transcendental.

With regard to the BPW, the trinity has been modified: M, X & HG/SoT. The son has replaced the father. Yes, Christ's conception was even metaphysically immaculate. I have suggested that the holy ghost be considered as a personalized dialectic. For that persona I would suggest Mary/Sophia. How does this square with the archetypes: AZO/X/QRP? Are not the **Matrix and the Dialectic** both missing? The

simple answer is that M & D, being pure potentiality and pure function, respectively, are neither one archetypal. They are the primal pair from and by which the archetypes logically emerge. Ontological priority is thereby being given to the feminine, it would seem. The BPW is her emergent consort. Sophia is the midwife. The only qualm here might be that the feminine is made less personal than the Christ. I would say that it does seem to be a bit more diffuse, but then that was part of the quality that I experienced of Sophia.

As with every other topic here, there can only be provisional resolution.

Yesterday I started out with Q, but then got sidetracked onto the dialectic. Among the archetypes, the Quantum, along with Z, perhaps, comes closest to expressing the pure functionality of the dialectic. What emerges out of Q's dialectic is metabolism as here represented by R, the self-reproducing, self-recording biological cycle.

Q is also responsible for the microscopic emergence of mathematical physics. The mathematical aspect of Q is represented by the 'trinitarian' syzygy of $e^{i\pi} = -1$. Using the previous symbols, this could be expressed as $m^d \cdot x$. The instability appears in the negative unit.

Pi is the stalking/Trojan horse that smuggles every mathematical/physical symmetry into the dialectic of Q. This is not unlike the redemptive role of X within history.

Agoraphilia

Now where were we, before our fish tank got rattled? Here we go, back to the metaphysical salt mine, on the lookout for the occasional flakes of gold.

The premise was that our pantheonic denizens of Mt. Olympus have an essential need for an Olympic venue. Agoraphilia is obviously a natural state of mind that is unlikely to remain eternally unfulfilled. Our world is quite probably an example of its fulfillment. The Big Bang would certainly be one means of producing an awesome agora, but it is also a rather cumbersome, even awkward form of Creation.

If the idea is just to generate a plaza, a *Cafe de la Paix*, then the Big bang would be using a sledge hammer to swat a fly. There are just two logical courses to follow, relative to Creation: monist or dualist. No, sorry, I can see nothing logical in dualism. How we in the prophetic tradition ever got suckered into this incoherent mode of thinking is quite beyond me. Only God could have so successfully engineered this red herring. Clearly Descartes did not manage it all by himself.

If you're going to have a Cafe, you've got to have some coffee. Unbeknownst to us, this coffee was decaffeinated. It was just intended to put us to sleep. Asleep that is to our own creation. If the gods go to all the trouble of putting on an Olympiad, they are going to want us to keep focused on the Games. They don't want us to keep being distracted by ulterior questions. There is only room for so many mystics on so many mountains. The rest of us keep our nose to the nearest grindstone.

But if the gods aren't crazy, can't they be lazy? Trying to save all the appearances of a natural, uncreated world ought to keep them all a lot busier than a bunch of one-armed paper hangers. Instead, all they would need to do is listen to Steven Weinberg for the [First Three Minutes](#), then sit back for next 12,000,000,000 years and enjoy the show. It sounds like a good deal to me.

It may sound good on paper, but I'm suggesting that God is much more of a hands-on type of Gal. The only caveat is that we are her hands,...and eyes, ears, etc. More importantly, we are her Imagineers. Yes, God takes more than one page out of *Tom Sawyer*, but not because she is lazy. It's because we and she are all just chips off the same Matrix.

[5/6]

The struggle continues. Clearly we're not quite ready for prime time, but I maintain that I am ready for the sort of limited engagement that could be greatly facilitated by Ron. I am operating in a vacuum here. Part of that vacuum has been created by my public association with Dr. P. In those pre-Internet days, Ron's phenomenology network represented the only possible outlet for my radical cosmology. And, yes, I was strung along with that possibility dangling in front of me for several years, before reaching the glass ceiling by about 1998. I can understand the historical necessity of 9/11, especially in the context of Y2K and [Y2C](#) (and ref. [X2](#)). It is a psychological bench mark. And I can understand the hiatus in the Aquarium initiative before and after. The dust has to be allowed to settle. But there is window of opportunity here, which cannot be neglected. There must be a sunset provision for the R & D show, and I surely would not envy the person who had to reinvent it. Redundancy is not built into the BPW hypothesis. I recognize that breaking the glass ceiling of the Aquarium by Ron would likely be irreversible and be fraught with uncertainty, but it is not clear that continued inaction is a reasonable alternative. So be it, and now back to the agora.

What I am struggling with are the psychological origins of space and time. This is the critical piece of any immaterialist cosmogony. Somehow we transform semantic into spatial relations. The Matrix is the

singular, indivisible cosmic potentiality. It is the ground of being. To be is to relate. The most related thing we know is the self. The self is the primordial being. The only selves we know are essentially social in nature. There could not exist a singular self. The primordial being is a pantheon. The Matrix has undergone a spontaneous multiple personality breaking of its symmetry. The Matrix has become a Mt. Olympus, or a Zodiacal pantheon. This is the logical and inevitable pretext of any and all relational being. However, any Creational progress beyond this bare beginning is going to require a quasi-conspiratorial, deliberate transformation of Mt. Olympus into an Olympiad, or, more precisely, a spin-off of the former. The Olympiad is a Zodiacal [folie a douze](#) (12), if you will. It is a *Cafe de la Paix*, a la Star Wars.

Without the benefit of the symmetries and translational invariances of space and time, the number of beings that might be accommodated by the Matrix will be severely limited. Upwards of hundreds of fragmentary personalities have been reported in extreme [MPD/DID](#) cases, but you can see the logistical problem of attempting to socialize such a menagerie without taking advantage of spatial relations and combinatorics.

If space is a social illusion, the main problem will be its sustenance. The simple solution is the ritualization of the sacred space. This would involve astrology, sacred geometry and choreography, and these elements would optimally occur in a megalithic type of context. All we have to do is fit these pieces into a mythic or cosmogonic narrative. There ought to be considerable flexibility at this point.

The choreography would likely involve sacred processions and team games particularly using a ball court, as is evidenced in the Mayan culture ([Pokatok](#)). In some such manner do we manage to routinize the illusional charism of the sacred primordial space. The next biggest conceptual hurdle is from a sacred space to a metabolic space, or from 'mythology' to zoology and ecology. Biological reproduction would be the major sticking point. The phenomenology of seeds would be crucial. How might this be routinized? Might fertility rituals provide any clues?

Or perhaps we reconsider the MPD. In this case it is usually a trauma that produces the cloning of the persona. Then consider the myth of the sacrificial god or king often associated with fertility rituals. There is the associated complex of sadomasochism. The dialectic process of cloning, the mark of distinction, the [Zim-zum](#), etc., may all be relevant.

Numbers are relevant to all of the above. Pi, phi and 'e' seem particularly so, along with $e^{i\pi}$. Sequences and functions all have seeds or generators. Pi & phi and syzygys of them are involved in the delimitation of sacred spaces. Fractal geometries inhabit the interface between algebra and geometry, and they usually involve the seemingly androgynous iota. The imaginary iota is a seed, *par excellence*. Symmetry groups are intimately involved in space, cloning and combinatorics. Most of mathematics and physics is directly related to the structure of symmetry groups. The Anthropic Principle of physics and the organicity of mathematics both manifest the vital force that animates all being.

It may be fair to say that spatial and metabolic inflation are both just the logically inevitable outgrowths of the vital or dialectical principle that is inherent to the Matrix. The Matrix is that potency. The only countervailing force to this promiscuous inflation is the relational restriction inherent in coherence and narrational semantics. The cosmic mind cannot expand beyond the relational limit of self-coherence. Creation will surely push that envelope, but it cannot be broken without abrogating the relational essence of all being. That would be tantamount to the logically impossible cloning of the Matrix itself.

The deliberative process of Creation is the subtle interplay between pure potency and teleological coherence. It is this process that necessarily results in the BPW. Rogue forces can only be self-defeating in the teleological context.

Atoms are the coin of any metabolic realm. They, along with their cipher cousins, are the necessary limit of all combinatorial and recombinatorial processes. Atoms are the spatial analogs of the dimensionless ciphers. Coins, atoms and ciphers are all materialized in the rituals of the green eye-shaded, pocket-

protecting technocratic cult. Our passage through this analytico-reductive fire is how our souls are ritually purified for the rapture of the hierogamos. These are the scales of Ma-at, the Egyptian god of measures. This is the singular cosmic regeneration.

The relational robustness of atoms is sufficient for their substance to spill over into the substantiality of our technological enterprise, which is the cosmic pivot of our sojourn into 'matter'. It is the esoteric logic of the quantum that also enables the same substantiality. It is the perpetual interplay of the projective Q and shape-shifting iota which plays out this analytic limit of the vital dialectic.

We seem to be approaching a mnemonic of sorts:

vital potency (M) + relational coherency (Dia-logos) -> [AZO/X/QRP](#) = BPW.

This is the BPW **cosmology** in one sentence. M + D -> AZO/X/QRP = BPW.

All of this has been fleshed out to a degree. Each time around this horn, I stop to reflect on what seem to be the largest remaining logical and narrational gaps, and then proceed to fill them in, connecting the various dots. Our skeleton remains reasonably robust, and reasonably accessible given some personal assistance on my part. At some point I will need to recompile a topical index to afford an unassisted accessibility to the stout of heart. All said and done, the BPW is reasonably prepared for its first round of criticism, IMHO.

From still another perspective, the irresistible force meets the immovable object, yielding, after due diligence, the BPW. Each interested reader should feel encouraged to produce their own paraphrase.

In the meantime: the immediate opacity and seeming intransigence of the world is just one aspect or condition of its teleological transparency and amenability. All is well that ends well.

[5/8]

I have been living with these radical, speculative ideas for more than a quarter century. I am constructing from scratch an alternative worldview. The last known person to make such an attempt was G.W.F. Hegel (1770-1831). I do not wish to compare these efforts with his. He was a ponderous scholar with that peculiarly German style of philosophical exposition. In contrast I am just a gadfly. I am the Yankee Doodle taking pot shots at the 'German mercenaries', i.e. professional scholars, from behind the trees.

I aim ultimately for coherence. Not, in the first instance, for a coherence of exposition, but rather for a coherence of the subject matter. My cosmology is organic. The phenomenological cosmos is a living organism, albeit an immaterial one, which I attempt to understand, not from an analytical or biological perspective, but from a biographical perspective. The coherence toward which I aim is that of the 'metanarrative'. But we live in the postmodern era. It is the sworn duty of every postmodernist to disallow and deconstruct any such construct. The BPW hypothesis, if it were ever to come to their attention, would be regarded as just an atavistic piece of intellectual hegemony -- something quite distasteful or even boorish. Political correctness is to be found only in an absolute pluralism, oxymoronic though that may be.

This is a powerful current to be swimming against. It is a lonely struggle, even as measured on the scale of Google's global purview. How can such an off-the-charts effort not be dismissed as that of a crank? A good question, that one.

My only defense against the putative label of 'crank' is my purported coherence. Purported, I say, because, quite admittedly, the existing website is nothing short of disjointed. The BPW hypothesis is and will remain for the indefinite future a work, hopefully, in progress. I can hardly imagine that there will not

be written more than one book on this topic, but don't be looking for my name on any of them. I have my little thing going here with Sophia, and the last thing I need are the distractions of publication. Every morning I can wake up to a clean slate in my blog, and that is how it must be.

[5/10]

Dear Diary, I have submitted an informal request for a review of the BPWH. I await a response. Without prejudging the outcome of the immediate request, it might be beneficial, nonetheless, for me to use this space to draft some follow-up material.

My request addresses the problem of 'phenomenology'. The putative reviewer is likely to have some background in that area of collection. This approach does raise anew the issue of Aquarium protocol. The subject of uncorrelated phenomena is controversial. More than half of our citizens believe that the government has been less than forthcoming concerning this type of information. My correspondent is the only official who has admitted responsibility for its collection.

My understanding is that you have responsibility for tracking 'uncorrelated' phenomena. I gather that you do this on a very ad hoc basis. For the last quarter century I have been struggling with the theoretical side of this coin. The Aquarium has functioned as a kind of think-tank. I attempt to correlate the previously uncorrelated aspects of the world.

Before the Aquarium there was science, and before science there was religion. Each has in its own manner attempted to correlate human experience. Each of the previous attempts has failed in more or less obvious ways. Those failures, however, should not excuse us from continuing our effort to grasp what is the widest possible context for human experience.

The Aquarium effort is obviously on a very modest scale, and certainly on a modest budget. Yet, the very widespread post-modern mind-set has strongly favored philosophical pluralism and deconstruction. This 'zeitgeist' transforms even this modest constructive effort into something practically world-class, just by default.

Even this modest effort then deserves to be reviewed by someone cognizant of the phenomenology 'problem', if that is how it may be labeled. There is an issue here of global security. If the nature of reality is something significantly other than what is being assumed within science and/or religion, we are leaving ourselves vulnerable to being blind-sided by possible cosmic developments. The problem of eschatology certainly ought to fall into this category of possibilities. Eschatology has become something of a specialty of the Aquarium, and it is an essential feature of the BPW hypothesis.

If I had any direct responsibility for phenomenology, I would want to keep myself apprised of the state-of-the-art for any correlational effort. In the public realm there can be little argument that the Aquarium's BPW hypothesis is on the cutting edge of all such efforts. So, at the very least, perusing the BPWH would be a useful exercise in mind-stretching for anyone burdened with second guessing the phenomenology scene.

So, just what is the BPWH?

Besides science, there have only ever been two truly distinct flavors of cosmology: theism and pantheism. The BPWH purports to be the one possible coherent **synthesis** of these two predecessors, which also takes full account of the scientific enterprise.

Metaphysical monism is the key to the BPWH. This has also been the basis of pantheism. Theism, on the other hand, has too easily fallen into the logical dead-end of dualism. This dualism, as later developed by Descartes into a mind-body dualism, turned out to be very convenient and probably even necessary for the development of the scientific, materialist worldview. Convenience, however, is not a concomitant of truth. Nor can the convenience of science ultimately deter us from our age-old quest for truth and gnosis.

Creation then was never meant to be a spectator sport for us creatures. We are the full participants in this 'participatory universe'. We are its co-creators. The pantheists have known this all along. But, and this is a very big BUT, they disavowed assigning any rationale or intrinsic value to the world. The world could have intrinsic value only if it were the result of a moral act. That Moral Actor can only be the theistic Creator. We can participate in that act only if we may ultimately be identified with that Actor.

This excruciatingly obvious synthesis of theism and pantheism is the single most neglected truth in the world. The Aquarium has staked its existence on the exploration and promulgation of this singular, coherent truth.

The BPW website is a daily chronicle of my struggle to understand and explain the literally earthshaking ramifications of this one simple truth. This is a burden that I am all too willing to share. I hope that you will facilitate my sharing of this crucial task. It is not at all clear to me that your facilitation will not be necessary to reach this goal.

Unless there is some blatant inaccuracy in the preceding, this ought to be a sufficient justification for you and me to take the next step: agree on a designated individual to undertake a preliminary critique of the BPWH.

Up to this point the Aquarium, with respect to the glass ceiling, has been functioning more as a terrarium. Any positive action upon my request could be construed as abrogating that ceiling. I would interpret it in that fashion, and I would probably not hesitate to inform others. Without such action, however, it appears that the BPWH will continue to languish in obscurity. Google alone is not able to stir up interest.

The BPWH is radical to the point of being earthshaking. It deals with issues that could impinge upon global security. This fact would tend to overwhelm any individual interest or action in the absence of external sanction. The Aquarium is stuck between a rock and a hard place. The effort required to dislodge it would be like a swift kick to the sleeping dog that is phenomenology. This rudely awakened critter might bite almost anything in sight.

It is mainly a matter of timing, given any substance to the BPWH. The timing of all this is outside of my bailiwick. I'm just here to tell what I know. When and if anyone else takes notice is another matter, but I will render an opinion, given the opportunity. My opinion is always likely to be 'sooner rather than later'. Can you blame me?

Can any putative review of the BPWH not be strongly prejudiced by all of the above? I doubt it. This does vastly complicate the process. Any content of the review is going to be overshadowed by the mere fact of it. The provenance of the review has to be more significant than its outcome. Should I be surprised that my request seems to have gotten lost in the mail? Unfortunately, no. Will I be able to damn the putative torpedo?

[5/11]

Yes, it does look as though the Aquarium will be remaining in this terrarium mode. We'll have to continue to generate our own oxygen, with just about enough for one fish. On the cover is the little sign, 'Break glass in case of emergency.' Any day now, folks. That leaves us outstanding in our new found agora.

Permit me to elaborate on a previous thought. My being given access to a limited number of people down stream in the phenomenology network would be unlikely to change outside opinion. To achieve that end the review process would have to be networked into mainstream academia. That could happen only with continuing input on the part of my correspondent. It would then be a continuing struggle to keep attention focused on the BPWH, and not be distracted by the phenomenological questions implied by the apparent

outside interest and influence. Such practical considerations do complicate any possible compliance with the request that I have put forward.

Whether the Aquarium pump could ever be primed without this kind of external input is problematic. On the other hand, if the Aquarium cannot pull this off, who could, and under what circumstances that would not turn this whole affair into a circus? Is there some larger scenario that is already in the works, or are we really expected to be flying by the seat of our pants? These questions remain unanswered at my pay grade.

But hold on a minute. Previously I had spoken about networking away from my source. Could that not be done effectively through an outfit like the 'Jasons'? There could be provided access to a person with sufficient public authority to adequately buffer the link back to phenomenology. Does this put us back on track? It is still a long shot. My specific request would be for a practice session preceding access to a Jason-type interlocutor. This, in turn, would precede access to someone who could network to a more public venue.

There is still the problem of handling the X-file aficionados. Early on, they will want to get in on the act, and will be crying foul if they are rebuffed. Who can read them the riot act? Perhaps it has been the intention all along that they would be the canaries in this scenario. Someone would have to do some hand-holding. I'm not sure that my services in that department would be adequate. Presumably there would be a concomitant increase in dissemination, spontaneous and otherwise.

The agora remains a problem here. However, it does appear to be the best encapsulation of the whole BPWH problem that I have come across to-date. That is no small feat. The emergence of the primordial agora is a set-piece puzzle. Progress on this 'toy' problem could give us a handle on many of the larger issues. Yet, it may turn out that further progress will have to be made on some of the more peripheral issues before this central one may be effectively addressed.

The agora is our beachhead into the 'physical' realm. Once secured, we can make further inroads. All relevant tools will be brought to bear in establishing and maintaining the beachhead. From what quarry will we obtain the megaliths? My kingdom for a stone. Where is Ben Johnson when we need him? Sacred geometry must play a role. How will it bootstrap itself? At some point the zodiac is projected outward. Rotational symmetry is established and broken in the same time frame. Obviously this is a crucial step. One might then wonder where the planetary wanderers fit into this scheme. Mach's principle and the centripetal force warrant consideration. The vertical dimension will have to be distinguished by gravity. It is notable that several of these features could be tied together with a gravity pendulum; however, none such survives from antiquity, besides the bipedal figure itself.

[5/12]

Let me not forget that a primary tool of creation will be the telos. In retrodicting the time-line for Creation, we need mainly to determine the path of least resistance between the already given Alpha and Omega. NASA might have as much to do with the creation of space as do the players of Pokatok. Materialism is a path of particularly low resistance. That is why we have such difficulty extricating ourselves from this path. There will come a turning point. Coherence will not be denied indefinitely.

It could have been that Mesoamerica was the cradle of civilization. The strict timeline of modern archeology may only be a retrospective projection based on materialist presuppositions. That timeline is superimposed upon the mythic dreamtime. None of this precludes the possibility that origins of the different cultures were geographically separate at first. Mesoamerica may simply have been the prototype. Arising in a more compact region, the remnants may represent something more pristine. Also I

find the flat jungle setting to be more primitive and perhaps more conducive to a zodiacal interpretation. The materialist interpretation can hardly do justice to the logical commonalities of the allegedly disparate origins.

The megaliths were not just involved in the delineation of the local space, but more crucially were involved with a primordial geodesy. The curious [coincidence](#) of the British and French measures is possibly a residue of an earlier global construct. And keep in mind the [light speed](#). It will not be easy, and perhaps not even necessary to disentangle all these competing influences. We may just appreciate the apparent overdetermination of both the Alpha and Omega. The archeological attention to detail, the counting of every potsherd, impressive though it is, may be distracting us from a much more significant larger picture. In a teleological world it may not behoove us to too readily succumb to a tyranny of the past.

A jungle bound Pokatok court seems almost like a message in a bottle, indeed, a starry messenger washed up on these timeless shores. Is it not something semantically irreducible? The ball in question could only have been the Sun, being entertained and entrained in its nocturnal retreat. Naturally there would be issues of death and resurrection, not to mention recreation.

Next to consider is the origin of the megaliths. I don't contest the existence of quarries. Resorting to quarries will still require a non-materialist explanation of geology. In the BPW scheme it remains an open question as to which came first, mega-Earth or megaliths. Recall that the megaliths figured in the geodesy, i.e. geo-geny. I'm just suggesting that the ceremonial rocks and the Pokatok players may have had a related and more teleological origin. Every primordial ceremony is a cosmogonic reenactment. And on this telic view, each enactment is a vital piece of the cosmic process. Ritual failure has always been taken seriously, and often over someone's dead body.

Speaking of which, body that is, there is a prevalent thesis, e.g. [Schwaller de Lubicz](#), that body and temple are interrelated on various levels. That their origins might be logically distinct would be contrary to the spirit of the Matrix. Recall also that cosmogonic myths frequently involve dismemberment. Is this a naive anthropocentrism, or is science a naive atomo-centrism? Yes, we do have atomic bombs rather than mythic bombs, or is that how we need to redesignate the eschaton? The peculiar choreography of Pokatok does seem to emphasize the individual body parts. How better to embody and sanctify the temple than with a ritual, sacrificial ballgame? What a sacrilege that would seem today. Like everything else, our rituals have been compartmentalized. The triune relation of temple, body and celestial zodiac ought to be instructive. The maintenance of these ritual resonances is crucial to our ontogeny. The ritual continuity between Alpha and Omega is maintained throughout history in a very eclectic, even promiscuous manner. The network of being has its spatial and temporal projections. In this connection recall also the concept of the 'chakras' and the sensory-motor body-map of the cortex. Thus the primordial temple and constellations might be viewed as an exercise in phrenology. Furthermore, the comparable schema for atom and solar system need not be coincidental, and may pertain to these other relations. We are just attempting to locate the nexus for the network of being.

The Pokatok ball-court was our cosmic beachhead. This was our participatory, cosmogonic scheme. Beyond the court was beyond the pale. It was a jungle out there, psychological and otherwise. Inside the court was a mythopoeic order, transpiring under the constellated heavens. Hunting, gathering and planting emerged in due course.

On second thought, we have established no metabolic course. One can only imagine the relevant Corona beer commercial. We'll have to do better than that. At what point do our erstwhile ball-players break out into a sweat? Where will be the nearest taproom? Perhaps we'll first have to find out what is going on in that jungle out there. At what point do we revert to [Jurassic Parc](#)? Have we simply added a ball-court to the JPC scheme? This might not be such a bad idea. It's beginning to look more like [Xcaret](#). We may have to charge admission. Somewhere the metabolic and spatial forms will have to meet. That's what physics is about. The Garden of Eden was pretty sketchy on metabolics and reproduction. Our *Cafe de la*

Paix is turning into a Rainforest Restaurant. We are definitely on the slippery slope between upward and downward causation.

[5/13]

It looks like we're not quite finished with Pokatok. Here's why. Up to this point I have managed to avoid the topic of sex, but now may be the time to talk about the birds and the bees. But I won't. Sex is too important to leave to the birds. I'm also thinking about the slippery slope. More than that, I'm thinking about the dialectic. If the dia-logos does not have a gender specific dimension, we are missing a good bet. I am suggesting that sex has a lot more going for it than mere biology. It has a cosmic dimension. What else is new, you might ask. The Matrix is too clearly gender specific to ignore that aspect of it. Everything else must define itself relative to that.

Biological sex is very useful when it comes to populating the BPW. Genetic diversity would be impossible to rationalize without the double helix and the idea of assortment and recessivity. The extended family is the basis of social structure.

What do these considerations tell us about JPC/Xcaret? They tell us that our Garden of Eden will necessarily be co-ed. Our problem now is to make the necessary arrangements, while carefully balancing on the slippery slope. For instance, does teleology give precedence to viviparity over oviparity, or do they represent parallel ontogenies?

Meanwhile, back at the Pokatok court, we were looking for a way to jump-start **metabolism**. Rather than invoke the 19th hole, I would invoke [Rene](#). The losers get checkmated and the winners get mated. Nothing complicated here, and no one has to pay taxes. It's death and resurrection right there on the center ball-court, by dawn's early light. Of course, *de rigueur*, there will be a fifteen second spot for viagra. Would this not also be a case of instant reincarnation? After all, the show must go on.

Would this be difficult to stage manage? It might be easier than the ball-game. The gestation process does not require the constant attention that must be devoted to Pokatok. Its programming could be mostly object-oriented. While the men-folk are watching reruns on sports central, their sisters, no doubt, are out planting the maize and malt, using the appropriate planting sticks: that oviparity logically paralleling their viviparity.

Where does this leave us with JPC? I trust we have made a little progress, but much work remains. We may not be ready for prime time, but we are ready for the 6am Aquarium show. Recall that Jurassic Parc was originally invoked just to deal with the dinosaur problem. The rest of Creation was placed under the aegis of the archetypes, AZO/X/QRP along with M & D. Now I am attempting to penetrate the fog surrounding Alpha, as a major part of constructing the metanarrative. We are effectively adding an anthropic component to JPC. This would now become the BPW's rendition of the Garden of Eden. We might refer to it as Mayan Parc or MPC. JPC would then be a logical derivative of MPC, as we gradually expand the envelope of floral and faunal diversity. At this point, time is still purely cyclical. Once the MPC phenomenology is firmly established, it would be comparatively straight forward to clone it into other climes and cultures, perhaps on an 'experimental' basis at first. All of this is just the prelude to history proper.

Given Alpha, we may wonder whether history proper starts with a bang or a whimper. Clearly there is a major break in the cyclical symmetry of time. Giorgio De Santillana, in [Hamlet's Mill](#), points to an episode that is, at least, psychologically traumatic. Prior to this episode there is a geodesic alignment of the various versions of MPC. This is an archeoastronomical feat of the first magnitude. The result was a prototype of our present terrestrial globe. This much is fixed in stone. Now forgive me my speculation. There may have been a jockeying for 'pole position' among the candidate cultures. If this competition got out of hand, there could have been a resulting '**pole shift**', of popular vintage. The losers would have been

checkmated, e.g. Atlantis, etc. The further result, nevertheless, is the ideal 23 deg. shift of the ecliptic, and a similar shift in the galactic plane. The precession of the equinoxes is thereby set up to mark the historical Aeons. I am merely demonstrating a good-faith openness to some populist dramaturgy. Creation should not have to be boring. There you have it, from Pokatok to Pole Shift. The rest, as they say, is mere history. It will require but a few more [barleycorn](#) syzygys to move us beyond history and into our Millennial alignment, hopefully without trauma this time.

[5/14]

Is a dream world possible? It is if we can arrange for there to be dreams. Dreams may or may not require a dreamer. A dream world implies coherence which entails a cognitive subject. A world also implies an intersubjective objectivity. This then raises the issue of whether there must be a primary dreamer. Is the cosmos a figment of the cosmic mind primarily, or is God just the foremost of the dreamers? I somewhat dodge this question by positing a fundamental identity between dreamer and dreamee.

[5/15]

Hold that thought. Here is something else.

What is the most important question in the world? It is the God question. What is the second most important question? I have no idea, nor, I submit, does anyone else. In other words, there is no contest about which is number one.

If there exists evidence that might have a bearing on our question, what would be the most likely repository for it? Let me rephrase that. If there were to exist evidence that favored the God hypothesis, where would it be? The Vatican? Well, if they had it, why would they not make it public? What would be the next most likely place? The CIA? Yes, correct. What would the third most likely place? Again, I doubt that there could be any other consensus.

If you were God and you wanted to arrange for limited gnosis, which venue would you prefer? The answer should be pretty obvious. What have we just demonstrated? Not that a certain agency has any such evidence, but, rather, that it would be the most likely known venue. We have reasonably established two significant facts. First, what is the most important question; and, second, if there were an answer, where would it most likely be found? But this is not the end of it. Who then is the one known person who would be most likely to be able to corroborate any of the above. I submit that there can be little doubt that it is Catfish, i.e. Mr. P. Again, I am not saying he does know, but, rather, of all the known people in the world he would be the mostly likely to be able to shed any light on the subject. Period.

But this is still not the end. What is the one venue in which Mr. P. has allowed himself to be openly questioned? Right here in the Aquarium. This is it folks. What may we then conclude? We may conclude only one thing: relative to the most important question, there is an incredible lack of demonstrable curiosity. Is not 'incredible' the correct word here? I can think of no more accurate adjective. If you are reading these words, you are the second most curious individual known in the world. Given a rational individual with access to the Internet, and some command of English, and a modicum of curiosity about the meaning of life, this would be the furthest that she could go on the Internet toward satisfying that curiosity. The next step would be to email me about the continued pursuit of this issue. That has not happened. Not yet.

If you were in this spot, would one test of your rationality not be to be feeling a touch of paranoia, or even more than a touch? Would not the most rational response be to feel that the whole situation was a set up of some strange kind? How else might this be explained? To whom might I now turn to obtain a

reality check? The only one in the world seems to be Mr. P. If this is a game, it is completely rigged. It is curiously self-contained. There is a notable lack of recourse. One time I did attempt to consult a psychiatrist about this situation. I think you could well imagine the response, or lack thereof. This right here is the closest thing I have to a couch, or to a reality or sanity check.

Why me, Lord? Where is everyone else? How do they manage to be so incurious? Are they just pretending not to care? Am I here on this spot just because of a ten minute encounter with Sophia some twenty-five years ago? Why me, Sophia? Enough about me.

Back to dreamer vs. dreeamee. If the self is something essentially social, then there can be precious little distinction. If we are created in the image of God, then God must be an essentially social being. Does this contradict an essential aspect of monotheism? Yes and no. It defeats any absolutist rendition of monotheism. The God of the BPW is the relationalist version of monotheism. Within the pantheon, the Creator is readily distinguished: a very distinct personality. This is just the X factor. She is our Dreamer, we are her dreeamees. In a relational world, there can be no ultimate distinction. Could there exist a non-relational world. Sure. Just ask the scientists. They call it atomism.

There you have it. Dreamer, dreeamee, it's six of one and a half-dozen of the other. The only question is whether an immaterial self is possible. The next question is whether a material self is possible.

Frankly, I think you could shuffle atoms around for all eternity and never come up with a self. In fact, if quantum theory demonstrates anything it is just that there can be no such thing as an unobservable or unobserved atom. It is not at all clear that observation can entail anything less than a self. Any evidence to the contrary is based entirely on the presuppositions of scientific materialism.

Even if a material self were possible, that would not speak directly to the nature of our own selves or to the possibility an immaterial self. It is only the functionalists who claim that science is presently in a position to explain the self, and functionalism overlaps with materialism only at that margin. Functions are a far cry from atoms. There exists no reductionist scheme for functions.

Relationalism implies the existence of a singular Matrix, i.e. a source or ground of being. Any resultant being then implies the existence of a non-contingent relational nexus. That nexus can hardly be anything other than the socially creative self. That is what I refer to as the Creator/Dreamer. If we are anything more than atoms swerving in the dark, we must be chips off of that Block. The BPWH flows directly from this excruciatingly obvious preamble. What more could I or anyone else say about this whole matter?

The Zodiac arises out of the cosmic potentiality as a nexus of quasi-real relational nexi or quasi-selves. To take their reality to the next level, these beings conspire to play games. For that to transpire there must be an agreed upon set of rules with an appropriate venue. An obvious suggestion is a minimalist physics in a limited space. If we wish to make contact with our own reality, the Mayan ball-game of Pokatok presents itself as a suitable candidate. Each of the zodiacal psyches would present itself in this game as one in a set of reasonably similar avatars. The game would progress as a shared lucid dream. It would be an excellent exercise in synchronized concentration. I would further opine that the Pokatok game brings us nearly half way to the BPW. Heck, it is even further than half way if you allow to include that gestational reincarnation addendum. And this latter item ought not to be a big deal within the given context.

Would not this simple scenario sound rather more believable to the ingénue as the basis of reality than would a quantum atom? It is a presumption here that we may have outsmarted ourselves when we take the quantum atom to be an absolute basis of reality, rather than as one of many useful models. I am just suggesting the most coherent alternative to the atomic model of reality. And if you can grant me this

much, the we are half way home already. There should hardly be a contest between these two models. What compels the former is the technocratic turn of our history. If history is to take another turn, the BPW will be the leading, or perhaps the only coherent candidate. Where is the competition?

[5/16]

Before trying to figure out the next step of Creation, let us recapitulate and check for missing links. One area that may need more work concerns the ball playing avatars.

[5/17]

It appears that we may have touched on a sensitive issue here, and we're not even talking about the avatars. Just consider the ball. To what degree is there a reality that corresponds to the appearance? Is there actually anything out there behind all those appearances? It certainly does seem like it. We can see a tree in the distance and then walk over to it and feel its bark, smell its blossoms and hear its leaves rustle in the breeze. We may even climb up in its branches. How much more real can it get?

This self-presentation of the tree has to do with our spatial perceptions. It is not that these perceptions are deceptive, but they may not be fundamental. These perceptions are neither relational nor functional. We generally suppose that our relational and functional understanding is derived from our spatial perception. I suggest otherwise.

The brain is supposed to act as a behavioral transducer. It transforms the external picture into a functional map that our body is able to act upon in the appropriate proprioceptive manner. As a mentalist, I contend that the 'internal' functional map is closer to reality than is the planar map allegedly projected upon our retinas. Perhaps the projection actually works in the reverse direction. The Pokatok ball exists functionally in the minds of the avatars. The resulting 'synchronization' problem is not a problem when we recall that there is ever only a single source of all relational being, which can therefore never become asynchronous. There is no asynchronous protocol for the cosmic web. There is ever only one cosmic mind, which now has the illusion of being a multiple personality.

Will this work? We'll just have to see if and where we can poke holes in it. After a hard days work, reality can often end up looking and feeling more like Swiss cheese, but by the morning it has usually managed to pull itself back together. Which is the real world: inner functional or outer spatial?

There has only ever been one Pokatok game: the first and the last. Our world is just many variations on that one theme. All the physical and biological cycles are derivative therefrom. It can be our singular microcosm. We have pushed that Pokatok envelope to its logical limits. It is about time for us to start wrapping things up and getting our lives back in order for the finale.

We'll have to work out the cloning process that allows us to do so much with so little. We seem to be getting a lot of bang for our buck. The dia-logos is our vital cloning process. It appears most starkly in the planting scene outside the ball court, as mentioned above. How big a problem will agriculture be for us immaterialists? To what degree might farm and sport overlap in their metaphysical basis? I have already suggested that floral and faunal reproduction should be closely related problems. Human reproduction might even be given a logical priority in the ontogenetic scheme of the BPW.

Can we institute a basic **floral cycle** without first having to implement every last metabolic detail? How do we apportion this cycle as between final and efficient causes? The more that we may appeal to teleology, the less work do we make for ourselves.

Recall the high school chemistry experiment of growing those blue crystals out of a solution of copper sulfate? For the immaterialist, it is a problem that is similar to growing a plant. Must we invoke quantum physics to get these crystals started? We take a crystal, dissolve it in water, let some of the water evaporate and then watch the crystal reform. Then repeat. How about that? The phenomenology of dissolving is usually reversible. Every substance will undergo some such process in the appropriate circumstance. Glass melts, diamonds burn. What is the teleology? It has to do with entropy. What is entropy for the immaterialist? What is it for the BPW? Do we chalk it up to planned obsolescence? Is that not what mortality is about? Here also is the logical basis of metabolism. Here is the conservation of matter and energy. Mathematical structures don't have this problem. Or do they? What if one is a constructivist? Can construction exist without deconstruction? Not according to the postmoderns.

Finally, it may be simply a matter of time. I don't mean abstract 'physical' directionless time, but phenomenal, directed time. Without time, there is no history, no dramaturgy, no metanarrative. Such time is not possible without entropy and atoms. The mere fact of a narrational semantics requires the existence of atoms subject to quasi-reversible processes. And, yes, the rest is history. Or is it now just physics? Physics does not come close to explaining phenomenal time, and I would argue that phenomenal time is inconceivable outside of a teleo-logic.

Am I promoting semantics over physics? Yes, indeed. A semantic system relative to a physical system is like a monetary system relative to the cash system. The latter is mainly for show. It is the invisible hand that finally counts in the monetary system; it is the telos that counts in the semantic system. Green eyeshades and pocket protectors are not strictly necessary in either case.

The invisible hand in the semantic system is just you and me as the eyes and ears of God. Yes, we are the normalizers. Even the paranormal has its time and place. Much more than that, however, threatens to upset the system, and before that it threatens our sensibilities. We do keep the trains running on time. The eschaton, after all, is just the caboose on our glory train. Well, if you want to be technical about it, it is the engine!

Is Pokatok irreversible? Imagine trying to play it with a reversible memory. Without entropy, how could the players ever decelerate? At the least, they would need flywheels in order to do that. Instead of using flywheels, they eat the breakfast of champions, which, conveniently, is being grown right outside the stadium.

An important fact about the BPW is that it is a package deal, and not the kind that is put together with string and sealing wax. The Matrix is the seal. But the Matrix is not the point of maximum entropy. It is the point of maximum potency. The BPW is its permanent appendage. The world is just the Matrix as refracted through the diffraction grating of our individual minds. That requires work, our work. The analytic tradition results in an increase in information and a decrease in entropy. The molecular biologists are its latest, and probably its last installment. We metanarrators are semantically repackaging the existing information, which technically does not effect the entropy.

Strictly there was not a first planting or a first ballgame. Their **cyclical potentiality** was gradually brought forth by the potency of the Telos. But then at some point there was a psychological pole shift which managed to permanently break the cyclical time symmetry. My only scenario at present is just the one given [above](#).

[5/18]

Atoms still need some work. They have to do mainly with biological cycles. These cycles require the replenishment of information and energy. They are not reversible.

The chain of being, i.e. creator -> humans -> cells -> atoms, has to do with the distribution of

intelligence. The intelligence is found in the **functional cycles** logically entailing these forms. Cycles are the phenomenal substance of the world.

There is also the issue of multiplicity. Could there be a participatory creation without multiplicative cycles? The creational diversity inherent in the combinatorial possibilities is just the attraction of atomic matter. This is just the logic of our sojourn into matter. This is the central support for our bridge from Alpha to Omega. We and the atoms are chips off the Matrix. We are the droplets that make up the rainbow coalition of creation. The cosmic holography could hardly function without the logic of atoms. That is the logical envelope against which we may push the matricial potency to its limit.

We have not yet minded our P & Q archetypes. They must entail the input of the telos. They balance the first and final causes. They ensure and facilitate the anthropocentrism of the entire holographic process. This is the p-IQ of the atoms. Otherwise they would be inert. The dynamic substantiality of atomic matter resides finally in the singularity of the Monster Group, which, in its turn, resides in the manifold symmetry of Pi. This is how our rainbow coalition becomes the unbroken circle of the Omega. This is the finality of Pi. Every possible color of the Matrix is diffracted through it. The MG is the invisible hand made visible. Pi is the link between mind and the agora, i.e. between logic and space.

Another aspect to be noted of the ballgame is its tendency to transform ritual or cyclical time into a functional or linear time. This is a microcosmic symmetry breaking. Temporal presence is thereby focused. This microcosmic synchrony is followed up by the cosmic synchrony arising out of the symmetry breaking in the pole position contest. There is probably a logical similarity between these primal 'contests' that is not yet visible.

The revolutionary shift from materialism to immaterialism is the transformation in our understanding of the world from mechanical to functional. The mechanical aspect of the world is then seen as merely one aspect of its functionality. Atoms no longer constitute an absolute reality. Quantum physics forced us, very reluctantly, to make a small step in this direction. The BPWH requires that we leap across the remaining conceptual divide. The phenomenology, fortunately, will be transformed in a much more gradual manner, as we better grasp the meaning of the various functions, instead of merely reacting to them. We begin to comprehend the relativity of being.

The problem we face right here is the inauguration. On what formality do we stand, before we are willing to undertake this revolution? Can it be a purely deliberative process, or must there be a coercive element?

Must there be a big stick? Perhaps holistic health will provide an impetus sufficient to transform our metaphysical assumptions. If this were to be the case, we would probably have to wait until molecular biology proves to be less of a distraction than it has been recently. It distracts all of us from the larger, more functional picture. The catch is that the balance between conventional and alternative medicine will be strongly influenced by our own perceptions and expectations. The placebo effect speaks strongly to this point.

It is apparently very difficult for even a few people to undertake such a large adjustment in their thinking merely on a contingency basis. Immaterialism will still appear to most folks as a trackless wilderness. It may require further years of concentrated effort here, before the next most motivated and properly positioned person may find these environs sufficiently surveyed so as to avoid a discomfiting disorientation. A related problem will be to also get a better resolution on the messianic dimension of any such undertaking, but it is hard to see how this contingency might be resolved short of an actual transformation.

My beef here is that although theism and pantheism have been with us since the beginning of recorded history, we have not previously attempted a coherent synthesis of the two worldviews. Having noted this historical fact, what is it that now prevents us from pursuing this path? Is this an opportunity that we can well afford to overlook? On the scale of all intellectual endeavors, why should this one not be given a

high priority? Just on the face of it, should that not be the case?

[5/19]

We might wonder at this point if what we are confronting is a positive avoidance of coherence. Coherence is simply taboo: 'forbidden to profane use or contact because of what are held to be dangerous supernatural powers.' [M-W Dict.] This is, of course, true for paranormal phenomena. Science, however, in regard to the paranormal has taken a different tack. It denies the existence of all anomalous phenomena. There is the presumption of normativity applied to nature. Furthermore, there is a disallowance of any forces not sanctioned by physics. Cases in point are vital forces and mental powers.

Denial, however, is just an ontological form of taboo. In practice the denial takes the form of a collective censorship of scientific speech and activity. As with any human activity, there are implicit and explicit boundaries. The theistic scientist crosses one such boundary frequently, which is acceptable as long as there does not occur a blurring of the boundary in the process. Scientists advocating Intelligent Design must expect to find themselves under constant attack by the more established authorities. This is all part of the fence building and maintenance effort. Good fences make good neighbors.

Postmodernism celebrates these fences. The BPWH sees them as an obstacle to the larger truth. This view consigns the BPWH to being subversive to the established order. It is not a subject that may be taken up lightly. There is an explicit threat to the historical order. This is the eschaton. The irony is that any order is either arbitrary or essential. The BPWH points to a larger essential order that supervenes on all historical contingency. With a stroke of the pen it legitimizes every historical fact, while at the same time it invalidates virtually every existing rationale or explanation for those facts by simply posing a rational Telos.

I arbitrarily search on [telos & cosmos](#) (5,000 hits). Near the top I find [Narrative Telos- The Ordering Tendencies of Chance](#), a dissertation for English by Victoria Alexander, CUNY 2002. There are some other good selections as well, which I shall peruse: [Against Philosophical Appeasement](#), Anthony and Mary M. (Maggie) Mansueto. The others among the first hundred are less provocative. The general effort is to append a telos to a material world, following mainly Teilhard. One might as well pin a tail on a donkey.

The Mansuetos make a provocative case against the nihilism of materialism and atheism. Their Marxist oriented liberation theology also falls into the dualism of the Teilhardian cosmology. Immaterialism would be pushing their Marxist envelope to the max. I am looking at the back issues of Anthony's journal, '[Dialectic, Cosmos, and Society](#)', for any idealist articles. There is no indication of any such articles in the more recent issues despite the lack of any editorial prohibition of same.

Victoria's thesis is billed as the most thorough explication of teleology to-date. I don't doubt it. It is written in a clear and provocative style. She was mentored by a physicist at the Santa Fe Institute, [James Crutchfield](#). That this exposition of the largely scientific uses of teleology had to be written by a non-scientist is indicative of the scientific taboo surrounding this general idea. I am about half way through this dissertation and am finding that it is world class. I have learned more about teleology in the last two hours than I have in my whole life. Our intellectual logjam relative to metaphysics is beginning to break loose. If you are living down stream from the Aquarium, you might consider moving to higher ground.

Permit me please to add yet another sidebar. I refer frequently to the chain of being. One version of this is God -> human -> cell -> atom. From this sequence one might infer a possible analogy: cell is to

human as human is to God. These ratios do happen to involve one of my favorite numbers: 10^{10} . I have long supposed that we might be thought of as the brain cells of God. This has some strongly pantheist overtones. I feel motivated right now to carry this analogy a bit further, with your patient indulgence. Yes, there is a spatial relation between our **neurons**, but more importantly they are embedded in a neural network, which can easily be represented as a matrix. My simple point is that you and I, relative to the cosmic mind are embedded in a very similar sort of subconscious telepathic network. That is how we are embedded in the Matrix, a partial projection of which is God's mind. Now hold on. Amidst all of the electrical activity in our brains, and with only a modicum of very transient external input, we are magically able to reconstruct a remarkably stable worm's eye view of the 'world', which is phenomenally impressive. Now I am saying that in God's mind there is an even more impressive and more stable functional 'representation'. But the caveat is that it may not actually be merely a representation of the world. It may just be the *real* world. Yes, this is a vicious circle. No, it is a sublime circle. It is the reality behind what we naively refer to as the 'world'. This metaphysical cycle circulates in both directions simultaneously. This is the 'mechanism' of our participation in Creation. Perhaps I should set this idea aside before I have second thoughts. What is real and what is appearance? This need not be an easy question.

And here is your homework assignment: how do atoms fit in, what role do they play in this reality circuit? If you come up with the correct answer before I do, you will go to the head of the class.

[5/20]

The atoms find themselves entangled in a non-spatial quantum matrix. It is, however, controversial as to whether quantum phenomena play a significant role at the level of the electrical connectivity between neurons.

There is another analogical ratio here. Creatures are to cosmos as atoms are to cell. Creatures and atoms participate in a similar peripatetic, interchangeable fashion in the information and energy economies of their respective spheres. There is a functional, microcosmic similarity to their respective 'ballgames'. There are two complementary microcosms: self and cell. This cannot be a gratuitous fact about the world. Likely it points to a yet to be discerned level of connectivity. It is also likely that the archetypes of QR&P play a role here. The MG may also be viewed as a kind of microcosm that could enter into this same context. In this case there is yet another analogical ratio: group elements are to the Monster Group as cells are to the body. This second analogy is structural rather than functional. And let us not forget the planetary model of the atom. In the sky it is the milky way that takes an ouroboric appearance. The nodes of intersection between the lunar, planetary and galactic planes were often considered to be waypoints in the transmigration of the souls. Pi inhabits the node of intersection between the logical and geometrical realms. Q&Pi combine to constitute the node between the mathematical and physical realms. X is the narrational node between cosmos and microcosm. Let's see now, have I left anything out of this witches brew? Dig deep, doggie in the bottom. What we may have here is a recipe for the Adam Kadmon or Cosmic Anthropos that somehow constitutes our reality circuit, or else it is a Rube Goldberg contraption. The previous question concerning atoms has now been blown out of all proportion.

[5/21]

The Creator is fascinated with her creatures. We, scientifically speaking, are fascinated with our cells and atoms. That fascination has temporarily blinded us to the presence of God, that is until we begin to stand back and ask the larger questions. At the height of our infatuation with matter, we were unable to see the forest for the trees. Now we have a carrot and a stick. The carrot is the anthropic principle, the stick is the mind-body problem. The universe is incredibly suited to life. The brain is credibly unsuited to mind. Then give these two facts a slight twist. Matter is deployed in the extrinsic support of intelligence, and yet

matter by itself is intrinsically unsuited to that task.

Here we have a major conundrum. We get a small break with the quantum. It turns out that the process of observation is an essential feature of atomic reality. Combining this fact with the previous facts, we then have confront the following fateful question which speaks directly to the meaning of life. Is it the atoms that bring forth mind, or is it the mind that has brought forth the atoms?

This seems like a difficult question so let me make it easier for you. We have spent billions of dollars over the last half century building the most impressive machines on Earth, just to smash atoms. Talk about fascination! And what is so fascinating? Behind the atom we find another reality. This reality is composed of the improbably intricate symmetries of Pi, and the incredible complexity of the mathematical Monster Group. And then according to the prescriptions of 'Monstrous Moonshine', these two features of the sub-atomic reality are intimately related. To get a firm grip on these facts you would have to absorb many thousands of pages of mathematical proofs. It seems that virtually all of mathematics may be brought to bear upon the makeup of a single atom.

Am I making it easy for you? What is nature trying to tell us here? She is telling us in excruciating detail that atoms are nothing fundamental. What is fundamental to the existence of every atom are the most abstruse and complex structures that the human mind has been able to produce. There is just one remaining question. Which came first, God or the Monster? This is a question with which I have struggled. Here is my best answer, as of today. Neither one. The Matrix came first.

Then came the [ouroboric bootstrap](#) consisting mainly of creator and creation intermixed in zodiacal, MPD/DID fashion. The problem we then have is to be fruitful and multiply. We will need to be able to do combinatorics, and in the process we will maximize the diversity of creation by pushing our symmetry breaking of the Matrix to its logical, coherent limit. We deploy the chain or network of being to its fullest extent. At the far end of that chain, at the fourth level of being, is our fascinatingly abstruse atom. That atom is the phenomenological stand-in for the Monster. This bootstrap is indeed looking ouroboric. Creator and Monster are two aspects of the head of the serpent. The MG allows the ouroboros to swallow its atomic tail. It is how the cosmic circuit is completed by minding the P&Q. If X is the Creator, then the MG is the anti-X, almost eschatological. This is how the Anthropic Principle works. Mathematics is naturally anthropic. It is necessarily a bio-logic, and the only logic is the dia-Logos. Mathematics can exist only as a formalization of language. It does not arise *ex nihilo*. It is a social game *par excellence*. The MG is the fulcrum by which the world is able to turn itself inside out. As in Communion, we end up swallowing God.

The mathematical syzygys help to give away this game. They are where chance meets necessity, and where subjectivity meets objectivity. This is a role that was formerly reserved to the quantum and the work of art. Those syzygys are our own footprints on that distant shore. They are our monogram. The combinatorics of our life game is played to the max. Therein resides 10^{10} . The BPW rests in the balance. 10^{10} is an aesthetic limit, and the MG enforces that limit anthropically. The vital essence of the MG is visible mainly on this scale. Its relational existence is a crucial part of the larger picture. Mathematics is as essentially holographic and coherent as is the world in general.

[5/23]

Pelican remains upbeat about the Aquarium, but insists that it acquire a new name. We're open to suggestions. How about 'Fusion' in honor of our oriental restaurant venue near I & 17th where the Pelican's Geo broke down on the way to the Zoo? That would make us the fuses, trying to prevent short circuits, or something. Is this good enough for government work?

[6/14]

I have been hanging out on the Sarfatti list. There was a useful exchange with KG, but that cannot go further without input from RP.

Jack's fringe physics folks are in a logical trap. They are forced to use UFOs to justify their questionable physics. But then they have to explain why the visitors are not cooperating with us in a technology transfer. They end up supposing that the visitors are largely of hostile intent. But then where are the good guys? Why aren't they protecting us?

The best way to explain the standoffishness of the visitors is by supposing that they are preparing us for some public event. This event would focus on the dissemination of non-technical information, presumably concerning our future. It's content would be perceived by many as disturbing, and it could be socially disruptive if not transmitted cautiously. This is where a 'fusion' group would come in handy.

Any further advance of physics into the paranormal domain raises the issue of mind over matter. There is the question of whether the laws of physics are unreasonably conducive to technical advancement. At what point must we consider a cosmic teleology? At some point we must consider a mentally bootstrapped cosmos. This is where the weak goes over to the strong anthropic principle. This transition is the point of my impasse with Jack & Co. This is what stands between here and eternity. Why don't I go back on the list and pursue this issue?

[('misanthropic') **WAP** -> **SAP**]

It is not clear to me why Jack and the others here are so hesitant to embrace the Strong Anthropic Principle, in contrast to its weak sister. Jack seems to hold Tipler and Wheeler in high regard, and they certainly embraced the idea.

The visitor phenomenon would be much easier to understand on the basis of the SAP rather than the WAP.

Everyone here subscribes to teleology and time warps. Why then can we not allow there to be teleology and a time warp on the cosmic scale? Would this not be the logical venue for such constructs, in the first place? Would not a teleological bootstrap be more scientific than having to posit an infinity of worlds? Would it not force us to look for explanations, rather than hide our ignorance behind an Infinity of Worlds Hypothesis?

Come on guys and gals, let's show some intestinal fortitude. The IWH is the end of thought. A dynamical bootstrap is a launch pad for further inquiry. Why not the dynamical model instead of a statistical model? Is not dynamics the whole point of physics?

Who's afraid of the SAP?

The SAP does not preclude the possibility of parallel universes. Not at all. It just means that we don't lean upon that unobservable infinity as an explanation for every last resort. Think of poor Occam!

And finally think of your fellow humans. Does not the SAP lend meaning to our lives, by the same token that the WAP robs us of significance? This should be a no-brainer for us!

Yes, this is a critical issue, alright.

Of course, the SAP is my stalking horse for immaterialism. Do these physics types subliminally sense that? It is for a similar reason that Jack abandons his Bohmian determinism on the cosmic scale.

Clearly the good guys, the Federation, the cosmic intelligence is going to participate in the bootstrap. They are it.

If I can get my foot in the SAP door, I'll be off and running with the 'Fusion' vision. Just wait.

[Berkant:] Sufi tales say there are seven earths and seven heaven..

I don't know what they exactly mean with seven earths.. maybe you have an idea to share with us..

IMHO some of the unfriendly "ETs" are from the "underworld".. so they are "earthly" not heavenly beings.

I would definitely prefer this sort of 'interdimensional' model for the ETs. Even if they lived in this dimension, they would need to travel via the others.

I have no problem with multiple worlds, as long as they are not redundant, i.e. as long as their existence functionally supports and enhances the organic whole. Our Earth would almost certainly be the main one. This would be the focus of the cosmic action. The ETs could be from heaven and hell, or the under-earth and over-earth. They are the supporting actors, are they not?

Also this interdimensional cosmology is much more in accord with an SAP-bootstrapped reality. Are there others here who share this POV??

[Jack:] There is no contradiction between SAP and WAP. You can have SAP in SOME of the WAP Universes - no problem! WAP does not preclude SAP. Some WAP Universes are God-Universes others are not.

God means IJ Good's "GOD(D)" or Stapledon's "Star Maker". God need not be a Moral God, but can be.

There may be War of The Gods across different Universes in Hyperspace.

The Devil is also there if God is. It's Milton's Paradise Lost!

Hold on, Jack. Let's think about this. Being a Creator is a major responsibility. No Creator worthy of the name is going to start picking fights with other Creators out there in Hyperspace, thereby jeopardizing her own Creation, would she?

It would be the height of folly for there not to a Federation of Creators, would it not? Why must we always anthropomorphize our Gods by projecting the worst of our follies onto them??

Furthermore, I see no reason to suppose that being a creature would be involuntary. If you and I were going to be creatures, would we not want as our Creator a moral, loving God who would be a good citizen of the Federation of Creators??

Sure, there might be amoral Gods out there, but imagine how much trouble they would have recruiting their creatures. Don't you believe in the all volunteer Creation?

John,

I understand the entertainment value of science fiction, but need we make it into a philosophy and a religion? I hope not.

What most amazes me about the sampling of Sci-Fi that comes my way, is the incredible lack of

metaphysical imagination that is generally manifested, present company excepted, of course. Instead of a horse opera, we have a space opera.

The WAP is the Mis-Anthropic Principle. This is the metaphysics of the space opera. What you never see in any space opera is the Strong Anthropic Principle. Frank Tipler, however, felt compelled to limit his SAP model universe to pure materialism, a limitation that should be obviously oxymoronic in this context.

Any self-consistent, coherent application of the SAP will have to include a mind-field as its essential element. Jack makes a stab at this with his psi-field, but then he retreats from the full challenge it presents.

Some of us will take up this challenge. It is the only way we will ever be able to explain the mystery of our phenomenal world. I grapple with this challenge on my website, and in this forum.

Rather than plunge into the daunting metaphysics of the 'spontaneous' symmetry breaking of the cosmic mind field, which I shamelessly call the Matrix, let me revert to the more familiar ground of cosmic politics, just one level removed from our beloved Space Opera::

When I last had Jack on the line, we were discussing Jack's notion of Creator Wars in Hyperspace. I have a problem with this notion. Why should we model the Cosmos on Dodge City? Aren't there any better models? Need a better model be less exciting? I think not, but let's see.

The Gods, after spending a few Aeons of bashing each other's creations, get tired of all the cosmic mayhem, and decide to cooperate, even if only for once in their lives. This new found cooperation was not just their own idea. The creatures were getting tired of being hockey pucks on the cosmic ice rink. A Creator has a major problem when she decides to have a Creation and no creatures show up. The show gets cancelled for lack of participation.

The SAP, unlike the WAP, demands participation. Its implied bootstrap is made up of its co-creator creatures, they are just chips off the pantheonic block, after all. The Creator now become orchestra conductor, cum motivational consultant.

OK, so the Creators and Creatures finally get smart and put their collective heads together and decide to outdo themselves. They will make the best darned creation that can possibly be made.

To make a long story short, and not to give away the plot of my website, that's where we are.

But wait, you say, there must be some mistake. This can't possibly be the best possible world! A short answer to that is, you ain't seen nuthin' yet. A more thoughtful answer is: the best possible world will be chock full of diversity and surmountable adversity, a diversity that we are challenged to transform thru adversity into an organic unity: pantheon -> theon. The co-creator bit is no joke!

And then the visitors appear from stage-left. There is a rolling of the drums.....

Dan

[6/15]

[What price innocence?]

Yes, Jack, this evidently is a political and not a physical question, so I guess I'll have to handle it.

I see in these environs many protestations of innocence in regard to many aspects of Creation. I see a great reluctance to accept the designation of co-Creator. Who, in their right mind, would wish to take responsibility for this mess? Politicians always get to blame the previous administration for the mess, up until the next election. As co-Creators we would not even be afforded that luxury.

I'm the bad guy, I'm here to dole out the responsibility. Shoot me, I'm a co-Creator!

Clearly you all cherish your precious innocence. How precious is it, and will we ever be willing to give it

up?

Innocence must be precious indeed, because we have been willing to pay a very great price for it.

Now do you understand why the Visitors remain in hiding? Now do you see why they were so desperate to find another messenger to deliver this bit of bad news? Was I the biggest sucker to walk in the door, or what?

Yes, Jack, you have met the Aliens, you have met Satan. Look in the mirror, He is yours and ours, soon to be lost, innocence.

Surely you all have heard of that famous river, the River Lethe. Did you never wonder why it existed, and why all of us mortals must cross it to get to these shores?

This has to be something that is worth contemplating.

Mortality in the mantle we don to participate in Creation. It is also our innocence. Beneath that innocence is our immortality.

Every time we cross that great river, that great divide, we are granted the priceless privilege of being allowed and being able to reinvent ourselves. In fact, my friends, we have just hit upon the core purpose of Creation. We are just the means for God's self-reinvention.

For every Gandhi there is a Hitler? It seems that God has been willing to try everything once. The envelope of possibility has been pushed to its limits. Here in this garden of eden, in this vale of tears, God has played hide and seek with herself. But like all good games, even this one, the greatest game that will ever be played, must come to an end. Ole, ole, infree!

Sorry 'bout that, guys and gals. It's time for us to move on.

From: Jack Sarfatti [mailto:sarfatti@pacbell.net]

Sent: Tuesday, June 15, 2004 11:35 AM

To: Dan Smith

Subject: Re: What Price Innocence?

Dan is mainly concerned with theology and morality. Fine. I am focused on the "how", the physics, not the "why." The planet is warming. Bush is ignoring that fact. The rank amateurism and incompetent post-invasion management of Afghanistan and Iraq of the Neo Con Cabal inside The Pentagon has not helped. I do note, however, that the rate of suicide bombing in Israel has gone down dramatically at a cost of almost 1000 American lives and at least 5000 American wounded out of a force of ~ 130,000. Eco-catastrophe is almost inevitable. I am Noah. It seem obvious that billions of people now living on this planet will die in a virtual Apocalypse. We have too many people on too small a planet. Only if we can make star gates for massive population transport to virgin Earths in the Universes Next Door in hyperspace do any of these people, including your children and their children have a chance of surviving.

Jack,

Well, are we making any progress in integrating the how and the why, the science and the spirit?

If there is an essential moral component to the UFO phenomenon, then, at the very least you may have to install a plastic Buddha on the dashboard. It may be mandatory, and there may be more.

What I do notice is that you and most of your colleagues have rushed to a negative judgment of Alien morals, and then you use this judgment to justify your own disregard of all things moral and spiritual concerning you own proposed conquest of the Cosmos. It's might makes right, and to hell with the

Golden Rule!

[If you will refer to my first message: we labor on these shores in the privileged state of cosmic amnesia, thanks to the waters of Lethe. I suspect that the visitors have no such privilege. They do, however, have a solemn duty to monitor our well-being. Furthermore, they are under a moral obligation not to disturb our amnesiac slumber. Thus must they refrain from the usual mundane formalities of informed consent, which otherwise I am sure we would not hesitate to grant. Perhaps, in their stead, it is I who has been granted the sublime honor of serving as your cosmic alarm clock. But do I detect just a tad of the 'Mondays', viz. 'Office Space' w/ Jennifer Aniston?]

I am not terribly concerned about this [disregard] because I have reasons to have faith in the moral character of the Cosmos. I am confident that the Federation will not tolerate your 'shoot first and ask questions later' methodology. Nor will they stand by while you or anyone else sets out to pillage and plunder. If there were not such safeguards, we would have been eliminated long ago.

What concerns me is that your one-dimensional, physicalist mind-set may be hindering a broader based approach to understanding what is almost certainly a multi-dimensional phenomenon. It may be that the visitors have a much less dualistic view about the world than you do. Your own formulas, you claim, demonstrate the unity of mind, body and spirit. But when it comes to implementing them, you act as if these dimensions have no connection. It's full speed ahead and damn the spirits.

But rather than sit here and argue about this, why don't we do an experiment? Why don't we see if a more unified approach to the UFO phenomenon will yield more information about it?

I'm thinking that we might be able to perform this experiment without leaving our chairs.

Dan

P.S. I have been hesitating to xmit this missive. What I imply at the end here is what Scott seems now to be insisting upon, i.e. dredging up old business. I am not the only ufologist or avian to have mixed feelings about any such dredging. But, if this has not been attempted in the last few years, perhaps we owe this much to posterity. Evidently there remain many loose ends.

Unfortunately, this puts the ball back in my court. I will have to take my own incautious suggestion under further advisement.

To go further than this with Jack & Co., I'll need some additional input of the avian variety to better resolve either the Rick Doty or the 'phenomenology' problem. I'm waiting now to get word back on this request.

Persistent Transient Failure: Delivery time expired - Delivery last attempted at 16 Jun 2004 14:33:20 +0000

And so it goes.....

[6/18]

I've been reviewing my recent pages, preparing to get back to the blog.

Previous **examples** of how the BPW is supposed to work:::

- We, operating as psychically connected units, stabilize the phenomenal world in a manner analogous to how our interconnected [neurons](#) are able to stabilize our individual perceptual worlds.
- [Jurassic Parc](#) + [Pokatok](#) Court = Garden of Eden (Mayan Parc) (and see [Heliotropism](#))
- The vital, archetypal [equation](#) for the BPW
- Atoms compared with currency, numbers, letters.

- Ouroboric [bootstrap](#) [[siteSearch](#)] model for our self-organizing, self-creating cosmos
- Teleology and [Telos](#) [[siteSearch](#)] and [dream causality](#)
- [Upward](#) vs. [downward](#) causation [[siteSearch](#)]
- [Cycles](#), [memes](#), [normativity](#) [s/S], [functionalism](#) [s/S]
- Network of being (see [Relationalism](#) and [[siteSearch](#)])
- Spontaneous [symmetry breaking](#) of the Matrix ([MPD/DID](#)) ([Zodiacal](#) circuit [s/S])
- [WAP](#) -> [SAP](#) (Anthropic Principles)
- [Direct realism](#) (anti-[representationalism](#) [s/S]) and telephones, [photos](#), etc.
- [Organicity](#) [s/S] of mathematics, [Mandelbrot](#)
- [Leibniz](#)' PSR, II & BPW [s/S]
- Filling in the [blind-spot](#)
- [Synthesis](#) of theism, pantheism and telic science
- (note the last [recap](#))

It might be a useful exercise to try combining these items into a single exposition.

[6/19]

Sometime soon I should attempt another recapitulation of the BPW and how it works. Before that, I need to assess the plausibility of the BPW hypothesis. What are its weakest links? Where is the explanatory coverage the thinnest? What are the most difficult areas to justify?

Stars, atoms, fossils and computers remain especially problematic. Each of these concerns the problem of upward causation in its particular context. My strategy for incorporating upward causation into immaterialism is to employ distributed intelligence in the form of archetypes and cycles. This is a latter-day version of animism or panpsychism, and it fits in with the notions of relationalism, organicity and functionalism. Mathematics, games and language provide examples of such schemes. In each of these examples it is normativity which provides the stabilizing factor. It is in this light that I compare the operation of normativity with physics. The cycles and archetypes are rooted in the emergence of the primal Zodiacal circuit along with the Mayan/Jurassic Parc. Linear time may result from a sudden, purely phenomenal 'pole shifting' or celestial symmetry breaking, but only very gradually does it disrupt the cyclical time frame and begin to accelerate us toward the eschaton.

Naturalism is the primary rival of theism. Naturalism may be accounted for in the following manner. There are two epochs of processes that take us past the aboriginal confines of the M/JPC platform. First there is an animist version of Lamarckism, which is attenuated through history. Much later the scientific enterprise fills in the remaining phenomenological gaps with the projected normativity of its techno-logic. This latter occurs mainly in the microscopic, astronomical and geological domains. Finally a teleologically mediated metabolic and alchemical bridge spans both epochs. Scientific instruments greatly extend the range of our phenomenal world. That there is a coherent infilling of the resulting phenomenal gaps is a further outworking of anthropic coherence and Leibniz' PSR.

Note that there is no explicit invocation of deity. God must be invoked mainly to ensure the proper closure of the ouroboric bootstrap, and that is no mean feat. The Matrix may supply the necessary condition for closure, but it is God who finally suffices, or, should we say, 'satisfices'. There is a great deal riding on coherence, but that is just the manifestation of our monistic idealism. God is the ultimate arbiter of meaning and being, but the emphasis is on arbitration. Leibniz is wont to keep God on a short leash. It is the X archetype that is the cosmic pivot. That is a very short leash. That is also the root of Pi, the cipher of closure.

The preceding is a three paragraph synopsis of the BPWH, a bit shorter than I had in mind. Elaboration

may be the main remaining task. Elaboration and system are not my strong suit in this arena, but there is not much choice for now.

[6/22]

In my ken, postmodernism dates to 1966. That was the year of the Free Speech movement at Berkley, and the year I dropped out of physics. That may also have been the high water mark for materialism. The turning away from scientific materialism was marked by a turning inwards. The emblem of the latter was Edgar Mitchell's Apollo 14 flight in 1971. The irony of his sudden conversion from astronautics to noetics was not lost on my generation.

The turning from outer space to inner space was marked by an upsurge in meditative practice, almost entirely of the Eastern variety. The only theistic support for an open ended spiritual quest was to found in Sufism. Although there was a parallel upsurge in Christian evangelical denominations, with many featuring 'charismatic' services, there was virtually no contact between these developments. Nonetheless, the communalism of the early Christians and the communalism of Haight-Ashbury both had a distinctly millenarian outlook. The inward quest is necessarily a solitary one. It may have been the logistics of drug use among the 'hippies' that was a principle, if temporary, source of social cohesion. It was their version of communion. Sustained communal practice almost invariably involves a devotional dimension, viz. the Hare Krishna and many other such cults. Even tribes must have at least totemic or ancestor worship.

If there is ever to be a global village, there will have to be a common devotional basis. The problem with refined monotheism is that it invariably becomes legalistic. The sacred text becomes the primary cohesive element. The sacred text cannot survive modernity, let alone postmodernity. That leaves us with only Gautama and Jesus, or some future messianic figure. I'm not aware that Gautama can hold a candle to Jesus in modern practice. Where is the passion? Will we ever outgrow our need for passion? Could there be a Millennial 'kingdom' without it? In terms of millennialism, there can hardly be a contest. Social pragmatism, even in this utopian context, is the foundation of rational theism.

Nevertheless, there will still have to be a messianic episode to initiate the epoch of the Millennium. It is hard to imagine that the label of 'second coming' would not be prominently attached to this advent. Could civilization survive without a millennial coda? If we had the choice, would we really want to find out? I don't expect there to be a real choice in the matter.

I have produced this scenario just out of historical considerations. There has been no allusion to the BPW. That the coherence of the BPW's metanarrative demands a very similar finale to history is, however, no accident. All paths of coherence must lead to the same Telos. The Matrix can only sustain one ultimate point of convergence. That we might be approaching a false summit, would not augur well for any relational metaphysic or coherent cosmology. It's 'Pikes Peak or bust', is it not? There won't be any rain checks or retakes. This is where theism and pantheism must part company. Could coherence get us that far and then fail? The divine closure, noted yesterday, is our cosmic seal. If the world were going to fall apart, it would have had ample opportunity prior to this.

A very practical question, needing a virtually immediate answer, is whether we could now revert to a sustainable human presence on the Earth without recourse either to a chaotic reversal, or to cosmic intervention. In other words, from the clearly unsustainable growth curve on which we now find ourselves, could we muddle through to a long term equilibrium state and still be able to think of ourselves as civilized? In more practical terms, this question might be rephrased as to whether we can confine the trauma of our inevitable growth slowdown to isolated or quarantined regions of the world? That seems to be what we are in the process of doing now. On the one hand there is continued globalization for the haves, and on the other hand is increasing isolation for the rest. I suspect that these two trends cannot be

sustained. At some point, globalization would start to be reversed. Without that liberalizing force and outlet for the developed world, there would be an escalating inward turning and protectionism. Once these reactionary forces are set in motion, where do they lead? Will it be to something we can call 'civilization'?

[6/23]

A principle ingredient of postmodernism is its denial of progress, whereas the notion of a universal progress has been essential to liberalism. Globalization has been just one facet of the idea of progress. This is to underscore that postmodernism is likely to be the harbinger of reaction. A global deflation of economic and political expectations is a real possibility that we are now facing. Reaction and depression are concomitants.

Modern society is a complex and fragile construct. Its psychological dimension is just as real as its material dimension. When we lost our positive psychological edge in the last global depression, we were quickly delivered into a World War. Once the fabric of modern society starts to unravel, we will be reminded of how far we have come and how far we have to fall back. If the shock of that rude awakening is not sufficient keep us on the straight and narrow, then we will be in serious trouble.

The last world war did unleash a technological advance that has sustained our economic growth through the last half of the century. It is true that we have not completely used up our our technological potential, but the problem is that there is nothing equivalent to the earlier rise of atomic physics that is presently on our scientific horizon. Nanotechnology and bioengineering are still exploiting the same physics that was discovered a century ago. Instead, physics is treating us to the Theory of Everything, which is to say that it is no longer going to be a source of new discoveries. Atomic physics was a one-time event. That scientific envelope has been pushed to its logical limits.

If we find a new source of energy, such as ZPE, and if nanotechnology begins to deliver on its promises, then, indeed, we could return to another few centuries of material progress, and a revival of modern liberalism. But it is not clear that we should bet the farm on these two contingencies. The way forward may not be such a straight line. We may need to make an historically sharp turn. That is where the BPWH comes into the picture. It will deliver us a Millennium, but it won't come for free. We have our work cut out for us.

What I am thinking of just now is a Millennium Initiative, MI(1.0). This would be a citizens' effort to publicize and/or privatize what has been the Government's 'phenomenology problem'. A significant part of the problem is how to handle the potential overturning of the scientific materialist worldview. The Aviary, Aquarium, Fusion -> MI(1.0), is looking to take up this challenge. The first order of business would be to arrange for a meeting of the principals, which, hopefully, would be later this summer. I have sent the first email in this regard.

There is a ray of hope now that our little initiative may getting back on the track, but at a more modest pace than I might have wanted. Before there is any breaking of any glass ceilings, there are quite a few loose ends to deal with. More secure and dependable communication between me and my contact person are needed. I am hoping to enlist a third party in this effort, someone known to both of us, who can help with continuity and background info. Then there have to start being regular meetings. None of this will be easy to coordinate.

The Sarfatti group may still be a primary outlet, but I will need help to bring Jack into better compliance with some adequate protocol. That there often seems to be a rivalry between the two of us has not helped matters.

Perhaps it's time to reopen a discussion with Jack. The topic I have in mind is downward causation. Is this not the weakest point in the physicalist fortress? I can also discuss with Jack any developments on the MI front.

[6/24]

The ray of hope is flickering. Now, even my interlocutor is MIA, and Jack remains intransigent in his physicalism. With the help of the former, I could probably deal with the latter, but let's reexamine physicalism now, anyway.

On the practical side, I would argue with Jack, that if there were a purely technical solution to our problems, it would be easy for the good guys to supply that answer to us. Shall I go back on the net to say this?

Jack, et al.,

Yes, this is how Jack and his fellow traveling physicalists see the Universe. It is their private Tit. Getting between Jack and his Tit will invariably and understandably incur his boundless wrath.

Jack, by the age of 65, even most men have been weaned. You, however, are still hanging on to the Tit, for dear life. Like Peter Pan, you remain forever the Weenie.

Let's see if we can help you with your problem of arrested development.

Like most Weenies, Jack thinks all his problems will be solved if someone just gives him the right Formula. But even the Nestle Co. will not be able to help Jack in his predicament.

Yes, ZPE is the Great Tit in the Sky. It is being widely touted as just this. Shades of 1849, the great Gold Rush is upon us once again. Mammon is always just around the next bend in the river.

Why can a few of us afford to be skeptical? How can we bide our time?

Yes, if God had wanted us to be Weenies, She would have provided us with a Cosmic Tit. She would have provided us with ZPE. Like the Gnostical Knights of yore, the latter-day Physicalists search desperately for the Magic Key that will unlock Pandora's Box. Cornucopia is ours if we just recite the correct formula.

Like the crazed 'Miner, 49ers' before them, our ZPErs can exercise only tunnel vision in their headlong, headstrong dash to Eldorado. They are so anxious to reach their destination, they do not stop to think what they will find when they get there.

The Mammon will either be limited or unlimited. If it is limited, it will have already been used up by whoever got there first.

If the Mammon is unlimited whoever found it first will already have found a way to distribute it throughout Hyperspace. Unless we are the first to find the Mammon, it will already have found us. The game would already be over.

Subliminally, the Physicalist/ZPErs realize that in either case, their jig is up. If there is a Cosmic solution to the problem of existence, then we would already be existing under its Aegis/Aeon.

On the other hand, if there were not already a solution to the problem of existence, then it is extremely improbable that any life as advanced as ours would ever have been produced in the first place. We would simply be a miracle out of the blue.

Those of us who are not wearing cosmic blinders, those of us who can think outside the Gold Rush mentality, those of us who are not spiritual Weenies, who are older and wiser, can afford to bide our

time. We can even enjoy the spectacle of grown men slobbering for the Big Tit.

Because we don't believe in miracles, we know that we are not here by accident. There is a plan and we can see it gradually unfolding in a remarkably orderly and rational fashion. In fact, in this spectacle of Latter-Day-Physicalism we see a clear omen of much bigger things in the offing. Yes, even eschatological things. It is not about Mammon, it is about the Matrix. There are similarities between the two, but there are also profound differences, differences which our Physicalist/ZPErs would find completely mind boggling.

Well, my little friends, prepare to be Boggled.....

Dan

Not too bad.

[7/1]

Lately I have been ruminating on the interface between biology and physics. It is not clear how to handle this boundary from an ontogenetic or phenomenological standpoint. This goes back to the game of Pokatok where the ball and the players seem to be of distinct provenance in this respect. What to do? What is the phenomenological origin of physics?

One possibility is to use a discrete space-time as in the game of chess. The rules of chess are an elementary form of physics, but then there is no connection with biology, which depends on a continuous space-time. Are we going to have to animate the pokatok ball, as in object oriented distributed intelligence?

As it stands, our ontogenesis has been oriented toward biological cycles. I was hoping the physics could take care of itself, somewhat along the lines of metabolism, thus avoiding a heterogeneous ontogeny. No such luck?

Historically, and thus phenomenologically, the discipline of physics originated with our study of celestial phenomena, viz. Copernicus and Newton, etc. However, I have suggested that ontogenetically, a cyclical heliotropism would be the more logical path to those phenomena. It is even the case in the game of pokatok, with the ball representing the nocturnal sun, that this non-cyclical version of heliotropism could still be brought under that rubric. But at some point, one will have to give classical physics or mechanics an independent standing. The use of stones as weapons is a classical example. I see very little biological precedence for such a phenomenon, but could the bodily mechanics of perambulation be extended to locomotion in general? The phenomenon of gravity comes to the fore. Jumping becomes complexly physical. The bio-mechanics of gravity is also complex for both flora and fauna. Perhaps gravity is our best bridge from biology to mechanics. Besides heliotropism we also have gravitropism. Perhaps these can be logically combined. These two forces combine to determine much of the structure of the biosphere. We might wonder, however, whether it would be possible to produce heliotropism without its being driven by photosynthesis. But this would tend to push our ontogenetic sequence back in a Darwinian direction. A minimalist, idealist version of Darwinism will be necessary to maintain genetic continuity. This is part of the Jurassic Parc scenario.

In attempting to solve the physics problem, the photosynthetic problem comes to the fore, where earlier it had been held in abeyance. What's a body to do? But this is a problem that should have been attended to earlier. We have ourselves a classic chicken & egg problem. Can we arrange for heliotropism without invoking every detail of photosynthesis? Is there no room for teleology here?

[7/2]

It may be that I will, at the same time, have to confront the larger JPC problem, which also remains in abeyance. Can we do JPC as a mind game? By how much will the intelligence have to be distributed? And how so? All we need for now is a handle for this problem.

[7/3]

The only handle we have so far is $Z \rightarrow JPC$. The other handle is the fact that JPC can exist outside of historical time. It need not be situated within history. There may be some confusion here because MPC was to serve as our Eden. This means that Xcaret would mix the metaphors, i.e. $Xcaret \neq JPC + MPC$. One way to sidestep this problem might be to employ an expanding A/O loop. There would be a core ring of coherence that would be expandable, and be multiplied, but the core remains outside of the ordinary phenomenal domain. It is a reference loop. Then we have $Z \rightarrow R_f$, where R_f is the reference version of our archetypal R, the bio-cycle. A two step version of this would be $Z \rightarrow R_f \rightarrow R$. This fudge might temporarily pull our irons out of the fire.

When we equated X with [Freya](#), we might have been touching upon this stratagem. We have the lunar weekly cycle and the zodiacal monthly cycle. We need to understand how the various [cycles](#) ([1](#), [2](#), [3](#)) interact. Also, which ones are primal or referential and which are derivative or phenomenal. For now, it remains a puzzle.

[7/4]

We need to rationalize the transition from $Z \rightarrow R$, from psycho-cycle to bio-cycle. We somehow transition from a psychic chain to the food chain. The former may be reconstructed in light of the latter. This could be the crucial link of the BPWH. It could become the buckle of the bootstrap.

We think of the psychic world as running on ZPE or zero point energy. The potency of the Matrix is our ZPE. Is there anything like conservation of energy in the immaterial world? With total symmetry breaking, there can be nothing conserved. Coherence, however, is a form of symmetry, and so it relationalism. Might thinking not require energy, beyond its associated metabolics? Symmetry breaking might require energy. Would it come from the Matrix?

In the past I have alluded to the idea that the cosmic self might be in the business of growing and consuming its created selves. Is that why we sometimes feel paranoid? This is cosmic agribusiness, it is the harvest of souls. It is often reported that discarnates seem to be living off our psychic effluvia. Can thoughts not radiate? Does this render God to be a vampire? Is the material food chain just a shadow of the immaterial one?

Does the immaterial chain have the equivalent of a photosynthetic base, or are the selves the simplest actors? What is the simplest self? At the lowest biological level, the colony or species might constitute a collective self. On the other hand, there might not exist robust long-term individual eidetic memories much below the level of human. It is reported, nevertheless, that some fish can remember the social status of their peers over a lifetime. Every entity must be minimally microcosmic.

Does every material process have an immaterial analog or association?

It may be that the material world serves mainly the purpose of minimizing psychic predation or parasitism, deliberate or otherwise. Good fences make good neighbors. Creation without a material 'substance' would

perforce be a much more limited affair. It is ignorance of the psychic world that is the main barrier to our abuse of it. Once materialism starts to unravel, there will have to be cosmic intervention to minimize the resulting abuse. We spend all our time exploiting matter. Psyches between lives must be contained by deactivation and compartmentalization.

We might wonder if computer viruses provide a model for psychic intrusions. We need to know the nature of firewalls that could function in various contexts. Biological viruses might also be instructive in this regard.

[7/5]

If you are playing pokatok, you will not have time to attend to psychic affairs, and the discarnates will find it harder to intrude upon the more structured and independent egos. Nowadays, we have pokatok as well as atoms and electrons to play with. If metabolism does not keep us busy there will be plenty of other distractions. Beyond mere distractions, our attention will begin to turn more toward coherence. The discarnates are advised to do likewise if they do not want to get left out of the hierogamos, or I should be saying [hieros gamos](#) (33,000 hits) ([1](#), [2](#)) or rapture. God will be having us for the wedding feast. It is important that our switch from analysis to synthesis be made cleanly so that there is not the effluvia, or the crumbs off the table, to attract the spirits. Drug addiction provides a happy hunting ground for the shades. They don't want to kill the hosts, but just keep us incapacitated. Failed states are another happy hunting ground.

The question does arise as to whether the Millennium is essential to the eschatology. It may not be. If it were not part of the story, that would go along way toward explaining the high resistance to an X2 event. That event would no longer be pre-Millennial. It would rather signal the eschaton. Our rapture would then occur in real-time. This rapid 'hatching-out' is a common strategy that a prey species uses to overwhelm its predators. Witness last month's 17-year cicada event here in Maryland. 1970, 1987 and 2004 happen to mark significant dates for my sojourn in Maryland. I first mentioned this possibility at Al's house on 6/26. It had occurred to me just before then. This amillennial eschatology was my first take on immaterialism, but then I gradually moved toward the less radical view. That move may have been motivated more out of a sense of political correctness than concern for coherence. However, superficially at least, the amillennialism does seem more in the spirit of the BPW. Yet, concern for the table manners of the discarnates and several other considerations, including even the confrontation with my sister, played a role in this very recent shift in my thinking. The previous MI(0.5) came just before 9/11. The apparent failure of this last MI(1.0) got me rethinking the metanarrational possibilities.

As I phrased the issue at Al's, are we going out with a bang or a whimper?

I'll have to try out this amillennialism for a bit and see how it goes. We'll have to see how the shoe fits.

If the Millennium were possible, it would be hard to argue against its desirability. It may just not be in the cards. If we are meant to go out with a bang, the orchestration of the eschaton will be rather more demanding. Will it not place greater demands on the putative X2 event, if that event is still in the revised narrative?

It is a bit odd how we have managed to get from pokatok to the eschaton in one not very linear line of argument. It is hard to see how anyone could argue effectively for an imminent eschaton without having a fairly detailed picture to offer. This would also make it more difficult to minimize cosmic interference in the X2 event. The problem of authentication becomes acute.

[7/6]

There must be a whole bunch of ducks to get lined up prior to any public awareness, besides the usual background of fundamentalist expectations. May we expect to see a continuing run up in those expectations.

The issue of universalism comes to the fore with this new, more dramatic scenario. We would now have to contend with the likes of Hal Lindsey. Rapture would be very low on the list of paranormal phenomena that one might expect on the run up to the eschaton. The earlier than expected X2 event would serve the purpose of minimizing any such phenomenology, that is until we get a better collective or, hopefully, a universal handle on our situation.

A governmental intelligence organization would then have to be involved in facilitating X2. Their arm would have to be twisted by ET/UT. There would be no hope of generating an Internet initiative without a triggering event or announcement. There would at least have to be a handful of credible, independent witnesses to specific UT intentions and actions. This would be enough to provoke global speculation of a public sort. There might not have to be any further pump priming with regard to the concomitant phenomena. Once the phenomena get into the media pipeline, they would quickly become self-generating, according to the immaterialist metaphysic. The Internet would play a crucial but ancillary role. The orchestration of these phenomena would also be crucial, and that problem would fall initially upon X2. The Internet might be necessary for this full orchestration, and the rapid decentralization thereof. There would likely be a natural sequence that would need some cybernetic adjustment. What then has to play out would occur in just a few years before the calendar time would no longer be uniformly applicable. There might be some temporary new types of symmetry breaking prior to the cosmic realignment.

Our individual psyches are wound up tightly into our egos. Once these start to unwind, the process is likely to produce a chain reaction, with much phenomenal fall out. We will quickly have to get our bearings in this expanded reality of presence. We should expect the flora and fauna to participate as we make a partial return to the primal dream-time.

If the powers-that-be were to have their druthers, the *Hieros Gamos* would be postponed well beyond the global optimum. Thus do we need some external intervention to maintain the BPW. The idea of the Millennium is a good idea mainly in the abstract. There is nothing wrong with the idea of God's kingdom on Earth; however, it might imply that we would have to be superhuman humans. The new heaven and new earth might have similar implications. No sense in dilly-dallying. People will mainly want to get on with the show, once we have been apprized of it.

With respect to the Garden of Eden, we have been there and done that. Let's not wax overly nostalgic. The HG is something else entirely. That is where all the action will be. No one will want to miss that show. Let's not short-change the HG. The Millennium seems too much like Limbo.

The only real question is who, when and where. Does there need to be a run up to the X2? What are we waiting for? Upon what ceremony do we stand?

[7/7]

The question arises as to whether my knowledge of an imminent eschaton will make any difference in the run up. Could I not have been informed at the last minute, prior to the final networking? Is there something I am supposed to do with this new understanding? Am I supposed to do a preliminary networking just on this basis? Or am I just supposed to rework things here on the website? Probably both.

I need to figure out the best possible scenario for an imminent eschaton, and then be prepared to help explain and implement it. I'll have to go back and tell folks that I was being too cautious about the timing

of the big E. It's going to be more like, 'Let her rip.'

I have mixed feelings about this development. I will need plenty of assurance that we will not miss the Millennium. It is an awfully big item just to toss aside at the last minute. I'll have to spend at least a month, if not a year on the rework. Longer than this might put me out of commission. I would go back into mothballs, a place that I have not actually been.

How great will be our opportunity to put our house in order? How serious will it be? Can the Middle East be resolved without an eschatological context or pretext? Certainly the Fundies think not. How much flexibility do we get in the timing and the content?

Will there not be greater resistance now without a Millennial buffer? Will we not all be getting cold feet? Will this not reduce our degree of participation? Is this to be a spectator event? The greater burden on X2 ought to be putting it well out of my league. Is it? When should I expect any feedback? What's the hurry for now?

[7/8]

There are two related items to be concerned about relative to our now putatively imminent eschaton. First there is the question of the proverbial apocalypse and/or tribulation, and secondly there is the issue of the judgment. As an ameliorative universalist, neither of these items sits well with me. I have had endless, unproductive arguments with my other sister about these. With this new and more dramatic end game, I will have to be paying more attention to these unwanted details. There are a lot of fundamentalists out there who will be very disappointed if there is not going to be blood in the streets, and if that spilled blood is not constituted by that of a very substantial majority of their conspecifics. It will be an uphill battle to get these items tabled for the duration. Do we need yet another scapegoat? Don't look at me.

My hope is that an eschatological shot across the bow will be sufficient to awaken the vast majority from their present and various somnambulations. That is hoping for a lot. What is the need for punishment? A lot of that is redirected guilt, and who doesn't feel guilty about something? And besides, will we not all have an eternity to reassess our sojourn in time? I suggest that we have already done this and have already forgiven ourselves, because we know that this can only be the Best Possible World. It can logically be no other. Have not one third of the Jews already forgiven Hitler, and this is without benefit of a BPW hindsight?

We wish to punish our conspecifics, mainly because we think that God is not doing her job properly. It is our only recourse for sanctioning God for her apparent failures.

Those who are metaphysically incapable of overcoming their grudges against the world will find themselves clinging to it as it descends to oblivion. This is the adequate object lesson. Move toward the light. That is all we ever need to know.

[<-- Prev](#) [Next -->](#)

[Topical Index](#)

5/5/04

New Page

I will attempt to recommence the BPW from this page.

It has been almost three years since I have updated the BPW site.

At the top of the topical index are the links to the three forums, where I am presently active, plus, of course, my new facebook page. Is it still possible to exist without a facebook page? I wouldn't bet on it.

Can I just pick up [from where I left off](#), three years ago? Well, the last entry was actually on 9/10/08.

But, there has been a fair amount of water under this little BPW bridge.

9/15

Another site to look at is Gary Bekkum's [Starpod](#) site. It does not have an internal search function, which is the case with most websites. What you can do is use Google's advanced search function. At the bottom of the advanced search page, you will see a box to insert the specific site that you wish to search. Google used to have a toolbar button for this very important function. It took me awhile to find this new location. Search Starpod on Ron's last name, for instance. I see 50+ hits.

9/16

Well, I am watching the situation at the Hopkins hospital, where there was a shooting incident, 3 hours ago. The situation has been contained, and the doctor/victim is expected to recover. This update, @1:48, the situation has been resolved. The alleged perpetrator has been shot, and was killed. The 'hostage'/patient in the room, probably the perpetrator's mother, was not injured. The mother is alleged to have not fully recovered from a spinal surgery.

2:07: Correction: the fatal wound to the perpetrator is now said to have been self-inflicted.

2:22: Oh, dear, there is now a murder, concerning the 'hostage'. In addition to the wounding of the physician, it is now called a murder-suicide. The murder victim is now stated to be a relative of the gunman. It may have been his mother. 2:55, yes, it has been confirmed that the suspect did kill his mother. The spinal fusion surgery, on his mother, is said to have been performed, earlier, this morning.

3:04: Mayor Stephanie Rawlins Blake: 'Johns Hopkins hospital, arguably the best medical institution on the planet; it must and will be protected.'

Subject: Follow-up to phone conversation
To: Dan Smith

Dan,

I wanted to follow-up from our phone conversation to emphasize that I think it really is time that you took on a serious endeavor. The audience you have on Open Minds and other lunatic blog sites is composed of, well, lunatics. Your blogging serves no higher purpose than entertaining lunatics. You are bright, resourceful, and educated from some of the best universities, yet you spend your time entertaining lunatics. Your metric of success, the degree to which lunatics pay attention to your blogging, is causing you to divert your attention ever more from reality.

I think it would do you well to cut back on lunatic blogging and drinking. You should take on a real problem; and do so through interacting with sane, well educated people. Your metric of success should be the degree to which the problem is resolved.

You are fortunate in having a few good friends. Work with your friends in identifying a serious endeavor, and develop an approach that is both sane and potentially productive. No doubt it will require hard work. With your intelligence, it is easy to pull the cork on a bottle of wine, then sit back and type out some nonsense that entertains lunatics. It is much harder to work with other intelligent and sane people to solve real problems.

Sam, Aliyah, and I will help. If you demonstrate progress, I suspect others will be willing to help as well.

Ron

Ok, I'll need to provide some background for this.....

There was a fifteen minute conversation @6:30 pm on Tuesday, 9/14, apparently while he was driving home. He asked me what was going on. This is a bit unusual. He usually does not ask open-ended questions.

I said that the C2C appearance seemed to be back on track. I had, of course, been touting this fact on the forums. He asked what the topic would be, and I said that he would be a principal topic. He laughed, nervously(?).

I also mentioned that Sam was working on a bio-economics conference with Charlie Hall. He said he would be glad to consult with Sam on that conference. These were the two substantive topics. The conversation ended when he said that he had arrived at the 'gate'. In previous such cases he has just said that he had arrived home. A small point, but still significant for me.

One point is that there has been some discussion between us, since his engagement with Aliyah, that they would be moving into a secure location. The moving process was going on for several months, and I have not seen the new place. The old house has been used for entertainment purposes.

I've expressed interest in the need for the security, he being my 'handler', and all. There have been two answers.....

- 1.) There was concern about his safety, relative to his brother, during a messy divorce procedure.
- 2.) There was concern for the safety of Aliyah, the 'exiled princess of Kashmir', EPK, during the political upheaval in that region.

(Now, just as an side, I reported on the incident at the Hopkins Hospital, yesterday. I often refer to my Disclosure/C2C role, as being akin to that of a doctor at the patient's bedside. Well, sometimes that role can go horribly wrong, as it notably did yesterday!)

I talked to Sam (Hopkins) this morning about the nasty-gram, Ron having pointed to him as having intellectually 'serious' interests. Well, the irony is that just recently Sam has been coming more to my view of the need for 'external' intervention relative to the various crises that humanity is facing. So, it's looking rather like I may just be a bit ahead of the intellectual curve.

Perhaps the most emphatic advice I have received from Ron was, come hell or high-water, to never change my protocol. Now, at the 11th hour, he wants me to change my protocol!

On RU, Murnut says, "Re: the nasty-gram....didn't his brother tell you the same thing? Odd you seem to be the one subject they agree on." Yes, this also occurred to me. They are both pressing me to change my protocol. Surely this couldn't be a collusion!

And this from Ryan, also on RU: "Speaking of Ron - I heard through the grapevine that he no longer has an office and is primarily only working on the Afghanistan food project (no clearances required). Do you know if that's true? I actually feel really bad for the guy - something went wrong around 1992 or so, it was all downhill from there."

This is an interesting variation on what Ryan and Louis have been saying for several months, now, about Ron being 'fired'. The divorce is alleged by Louis to have precipitated at least two investigations of his brother, in which FBI and CIA agents came to his house to interrogate him about Ron. He opined to me that this spelled the end of his brother's career. Ryan seemed to be agreeing.

But, now, stating the date of 1992, as the time when something went wrong, casts a very different light on the matter. I have reported on several occasions that he was also investigated in 1992, by the Inspector General of the CIA, allegedly concerning his involvement with US citizens, such as myself, precipitated by formal complaints from other ufologists. He has stated that it was a 6-month, \$100K investigation.

Ron and another source have stated that, not long after that date, he was on a fast-track to the top, non-political, pay-grade. In 1992, Ron was still a very junior officer. Maybe Ryan and Louis should get their story straight.

The question I'm facing is whether this (self-inflicted?) sidelining of Ron is not in anticipation of the heat being turned up. Over the years, his job has been to batten down the hatches on government involvement in phenomenology. What is being reported now about his 'firing' is simply the logical last step of his career as the bad-cop on the Phenomenology-beat. Yes? He blows the whistle on himself, after having made himself the logical target, should there be a public investigation of government involvement in phenomenology. He dodges that bullet, just before it is slated to be fired.

That leaves me twisting in the wind, and the primary witness to the, now, self-compromised witness. This following very closely on the heels of a very similar denouement on the part of ONI, the place that Ron has pointed to as the core of phenomenological concern.

So has Ron deliberately, all these years, been setting me up to be the last of the Bird-tribe?

Where is my safe-house, Ron?

I guess, if I were God, that's approximately how I would have arranged it. Not bad.... for gummint' work.

Or, more immediately, is this in anticipation of my appearance on C2C, an appearance that has been discussed with Ron several times, over the past year? Will that be going ahead, as Gary suggested, just last Monday, or will there now be further delays? What is the window of opportunity? What is the point of no return? Is the lid on Pandolfi's Box, about to be lifted?

Yes, I like the systems/process approach being advocated by Ray @RU.

Systems theory affords a major link between the BPWH and a significant portion of Modern thinking. On this view, Creation is a system, a kind of Bootstrap system.

Systems theory may help us to explain the many puzzling features of our interactions with the Visitors.

We inhabit quasi-independent systems. And now we are in the process of working out a more 'substantial' connection with the Visitors. Up to now, this has mainly been a mind-link, with some spill-over into partial 'physicality'.

There is a strong process of habituation in our interactions with the Visitors. There is also a strong teleological component, as their main mission is to help us connect with the Cosmic Telos. This connection is variously referred to as Apocatastasis or Redemption.

9/18

There is one thing that is harder than anything else to grok about a true systems-theory. It's so difficult that I have to struggle with it on a daily basis.....

'Real' systems do not exist in time and space. Rather, Time&Space exist inside of Systems.

This is a bit easier to understand when we realize that the prototypical system is the natural [cycle](#). But, trust me, it's still not easy!

I think of cycles as mainly being Archetypal. The same could said of atoms, which are better understood as concatenations of mathematical formulae, probably more so than they are like little balls, swerving in the dark! Yes?

To get a better handle on this problem, let us consider Windows 7.....

Where is it? When is it? What is it?

Does it not consist of the of the machine code that is presently stored on my HP laptop? Perhaps. But, then, smarty-pants, where does Beethoven's 7th Symphony reside? Does it reside in that CD sitting on your shelf?

These questions remind me of arguments that I've had with Gary and Jack about Informationalism. Where is the

information? One might as well ask, where's the Beef?

Didn't Claude Shannon define information, once and for all? Well, if you look up 'information' in Wiki, Claude gets only a minor footnote: something about channel-capacity.

According to Richard Feynman, there really only exists one electron, it's just that it bounces back-and-forth in time, so it just appears, locally, in many copies. In some sense, that might be a more accurate way to think about Windows 7 and Beethoven's 7th, especially when we think of our Cosmic Circuit, containing all of space and time, and the fact that every little cycle can only be understood in the context of this best possible cosmic Circuit.

I would hasten to say that the same consideration applies to the human soul. There is, actually only one, cosmic Soul. Our personal souls are just reflections of that One. Apocatastasis is the cure for this cosmic multiple-personality-disorder! No?

So, I'm saying that the system/process/cycle that we think of as Dan Smith, is not unlike Windows 7 or Beethoven's 7th. You won't have the slightest clue about who, where or what I am, if you rip me out of my Crannied Wall! Only God can do that, and only in the End. Only by understanding the End, will we have a clue about why we're here, and what we should be doing about it. This is what Disclosure and Revelation are all about. Simply providing us with a Cosmic Context. Nothing more..... nothing less!

So, how does this explain ufo's?

Let's suppose that the ufo-jockeys are UT's. UT's are mainly supposed to visit us in our dreams. They don't need magic carpets to arrange for that. They can use telepathy, for instance. But isn't telepathy a physical phenomenon? It certainly seems to have physical effects. How can there be physical effects, without physical causes?

Can we not, a-la Gary&Jack, invoke quantum entanglement, spooky action-at-a-distance, etc.?

Ok, but what about God? How does she get into this act, pray tell?

My profession is that of the meta-Physician/comforter. I'm supposed to be the guy with the cosmic bedside manner, hopefully with more skill or more luck than Dr. David C., @JHU, on Thursday.

But, what do they say about metaphysics? It's News from Nowhere.....

Whoa! Where's the physics in that?

How can I claim to have news from nowhere? Well, I have this to say about that.....

What I have to say is not news. It may be news to some of you, but that is only because you have not been attending to that still, small voice.

Nowhere is also 'now here'. God is the circle whose center is everywhere.

See, God is a system, very much like you, me, Windows 7 and Beethoven's 7th.

Beethoven, and every artist/genius, are attuned to their muses. They can hear that still, small voice, even especially when stone-deaf.

Ex-spurts, like myself, have to be pushed to extremis, before we can attend.....

Little flower—but *if* I could understand
What you are, root and all, and all in all,
I should know what God and man is.

The living truth is the pearl of great price. It is the holy grail. It is terribly hard to find, but once we find it, we realize that it is everywhere and nowhere. Kinda like love.

If this isn't systems theory, then I sure don't now what is.

Cc: "Gary S. Bekkum", Christopher Kit Green, Aliyah

Ron,

It would help if you could present before&after examples, so that we could contrast and compare.

I have made forays into the two most relevant professional forums: Physics and Philosophy.

In the Philosophy forum I was summarily shut-down, by Postmodern Beatnik, complete with clown-mask.

In the Physics forum, I have variously been shut down and shunned.

Any further suggestions?

On Sat, Sep 18, 2010 at 2:35 PM, Ronald wrote:

Dan,

My suggestion was that you work with sane, educated people on a serious endeavor. I did not intend to suggest that you work only with scientists. One of your strengths is your ability to integrate science, engineering, philosophy, and theology. The people you entertain on OMF and the like have little understanding or interest in any of these fields, and through drinking and lethargy the quality of your writing has diminished. Put the cork back in the bottle and focus on something real. Pursue quality, not quantity in your writing. Ask others to review your work before you post or publish.

Ron

IMHO, Ron is arguing himself into a hole, here. Is that his intent?

Actually, as Jake already noted, he's throwing a bunch of back-handed compliments.

Is that his intent, also? If he keeps on like this, he'll soon be referring to me as 'Jesus'. Ooops, he's already done that, twice, with a half-dozen witnesses.

So, yes, Ron, just keep it up. Make my day.

But, gosh, I've been reading more about the [Cycles](#). I'd forgotten how smart I was, back in the good ol' days, before I had a stroke, and started drinking. What a shame! But, look, if you have a terminal illness, maybe you wouldn't want your comforter to be some smarty pants from Princeton. Yes? I don't recall having had a drinking problem, before I met Ron. I wonder why?

OMG, it appears, on first blush, that it was on this Cycle-page, 37, where I first started talking about the archetypes, see 4/29. The archetypes are the major (sub-) cycles/processes/systems of the Cosmic Ouroboric Circuit (AZO).

9/20

Have we solved the creation problem? Indications are that we are headed in the right direction, and that is what counts. Once we take off our materialist blinders, new vistas open up. In short order we will have moved to take up intellectual and spiritual residence in these wide open spaces. Breaking down the artificial mental barriers is all that is required. All we have to do is break the ice of materialism, then we discover the ocean of the spirit, which is our rightful home, our promised land.

This quote is from 5/4/03 on nexu37. Not terribly shabby, IMHO. Will I ever rise to this level again?

There has been a lengthy dialog with Laura, 49 emails in 8 days. Gary has been included in this exchange. We are mainly discussing the origin of evil, and the singularity of Creation. Yes, there is a necessary, logical connection between these two issues.

If we can get together on the Singularity page, then, IMHO, there will be no stopping us.

I have made [reference](#) to 4/5 @OM, which contains this [link](#). Need I say more?

I may not be as smart as I once was, but I'm not as dumb, either!

Well, I'm just continuing to read nexu37. I've made it to 5/9. Now I'm down to 5/14. Critics who have not understood nexu37, have no clue.

Dang me. @5/14, I only start getting smarter. There ought to be a law against those whipper-snappers.

At least with EPK, she is cute as a button. LME? She is no button, but she could take me down, with one hand.

Remind me @9pm that I'm supposed to be watching The Event. No?

I'm down to 5/28. Gosh, do I pity the poor grad-student who is going to have to write a thesis on the BPWH. She may sympathize with Tennyson's flower, so prematurely plucked from the crannied wall.

10/11

Hey, sports fans, things are heating up again, back on the forums.

We are mainly discussing the Invisible College, and it's relation to MJ-12.

You might want to stay tuned. This is just a warm-up for my first ever UFO talk at Pat Marcattilio's international ufo conference next month in Bordentown. My only previous public appearance, besides with Paul Price, was with the Guangdong Branch of the Society for the Study of Dialectical Materialism in 1980, when I did a simultaneously translated presentation on Rational Theism. Therein hangs another tale.

And, golly, I almost forgot that we are also discussing Jaron Lanier's deconstruction of Strong AI, with his new book, You Are Not a Gadget. This book destroys the hare-brained notion of Perpetual Progress, which is the corollary of the ETH.

10-25-10

I'm [preparing for a talk](#) at Pat Marcattilio's NJ UFO Conference, on Nov 13.

Be there, or be square!

And then there is this.....

http://beforeitsnews.com/story/234/043/Fermilab_is_Building_a_Holometer_to_Determine_if_Reality_Is_Just_an_Illusion.html

BPWH Outline

(New Topical Index)

This new outline/index is a work in progress. The links herein are to a [Syllabus](#) containing explanatory content with additional internal and external links.

- Introduction
- Survival problem
 - Can we survive without a plan?
 - Can there be a plan without a vision?
 - Can any such vision fail to address the Sectarian obstacle?
 - Is there any alternative but to fight fire with fire?
 - To bite the prophetic bullet?
- Having said this, who then is the target audience?
 - This would redirect us to the secularists.
 - This will entail the stratagem of Apologetics
 - This stratagem is purely of xian provenance.
-
- Here we need a segue to immaterialism
 - I would suggest moving from vital force to design to final cause
 - But we need to include the notion of space & time as a construct.
 - Vital force originates beyond S&T. Because it must include a Telos.
 - Then we consider the notion of possible worlds
-
-
- Creation/creator/co-creators
 - Why is there something rather than nothing?
 - Why not everything?
 - Filtering existence
 - Singular existence of the world/creation
 - Final Cause
 - Mind over matter
 - Circularity -- dialectical idealism
 - The Great Symmetry Break
 - Metaphors -- Pokatok, etc.
 - Unobstructed universe
 - Least action/optimization
 - BPW
 - Teleology – causal loops
 - Relationalism/coherence
 - Holographic world
 - Archetypes -- AZO/X/QRP
 - Mandelbrot
- Gestalt switch
 - Paranormal
 - Science vs. Religion
 - Twilight of Scientific Materialism

- Mind-body
 - Holism
 - Reduction & emergence
- Apocalypse/Rapture
 - Deconstruction of space and time
 - Portals
 - Metanarrative
 - Eschatology

Syllabus

(from [New Topical Index](#) and Outline)

(But where's the indexing? Use google/wiki and the OTI for now!)

Old [Topical Index](#) (OTI)

Introduction

(There exists much introductory and summary material on the website, which can best be accessed, at present, from the old topical index.)

(Gradually this Syllabus will be updated to the point where it can replace the old topical index.)

This syllabus is presented in a narrative fashion, starting out in a naive manner, almost as a Just-So story. Gradually the more technical or philosophical material will be introduced. Feel free to jump around in the outline, but if you fall into unfamiliar terminology, you may wish to refer back to the earlier sections.

(Well, already I am introducing technicalities from the git-go. Please bear with us as we sort out the pedagogy!)

Unless otherwise indicated, most technical words and phrases are to be found in Wikipedia.

Perhaps this should be seen as an aphoristic poem that may serve as a key to the BPWH.

Survival problem

Is it not increasingly clear that human survival will be predicated upon some form of cosmic intervention?

Who can claim to demonstrate that our chances of survival as an advanced civilization for even another century are anything better than even?

Is it not the case that our biggest obstacle to survival is our total lack of a common vision or sense of a common interest?

Any such vision would require a visionary. It cannot be hammered out in a smoke-filled room. Any such revelation would necessarily be of biblical proportions. Virtually every religion and sect has provisions for, if they are not even actively touting, such an imminent advent and revelation.

Any serious visionary, at this historical juncture, in these latter days, will have to couch her vision within some such prophetic time-line. And while you are addressing one such tradition, you might as well address them all. Nay, any vision that fails to address them all will fail to accomplish the task at hand. It would be a non-starter.

Can we survive without a plan?

Do we not need to see beyond tomorrow's headlines if we want to avoid the many potential catastrophes that can already be discerned?

Can there be a plan without a vision?

Any plan of survival must contain a clear and positive goal to motivate our survival. This is simply management by Objective.

If the world does not have a consensual plan for the future, then the conflict will be unending. This calls for a shared vision.

Can any such vision fail to address the Sectarian obstacle?

Each Sect would rather fight than Think. I am here to show how, by merely thinking, we can transcend our sectarian divisions, with scientific materialism being included among the sects. That is what the BPWH accomplishes.

Is there any alternative but to fight fire with fire?

Virtually every sect is expecting a final revelation concerning truth. If the new vision does not portend such a revelation, then it has no business cluttering the airwaves. The BPWH makes the case that it opens the door to a final truth that will lead us beyond linear time and space, i.e. beyond history.

To bite the prophetic bullet?

So, yes, of course, the BPWH cannot aspire to less than being a final revelation. It is up to the individual sects to attach whatever scriptural significance they wish to the promulgator of the vision.

Having said this, who then is the target audience?

This would redirect us to the secularists.

Yes, I cannot directly proselytize the xians, but if I can show them how to deconstruct scientific materialism, they will have garnered a new tool to proselytize the atheists, particularly those of a scientific background and with xian roots.

This will entail the stratagem of Apologetics

Yes. This is nothing new in the business of proselytizing, extending back to Paul.

This stratagem is purely of xian provenance.

The xians invented apologetics, as they were the only theists with universal Gospel. The others just sallied forth to lay down the law.

Here we need a segue to immaterialism

And here we bite the metaphysical bullet. The cosmos is not an object; it is an ornament. It is not a machine; it is a thought. The fractal and mathematical structure of the natural world is the key to its immaterial essence.

I would suggest moving from vital force to design and then to final cause

Can we truly believe that mind is an accident? Can there even exist an unobserved universe. No one could demonstrate that.

The role of the Observer is essential to Quantum Physics. Thus it is essential to the Universe.

Is the world not pregnant with mind? What if there were no one to appreciate the wonder of it all? What a shame!

Thus is the Anthropic Principle essential to understanding physics. No teleology, no physics.

We would not be here if we were not part of the Final Cause.

In what follows, the BPWH will spell out the Final Cause.

Any final cause is necessarily intensional/intentional, i.e. subjective.

But we need to include the notion of space & time as a construct.

The seeming abstractions of space and time lend themselves very poorly to objectification. The sterile space-time manifold of physics is very far removed from the shining present that we experience. We are not lost in space, we are lost to the Fullness of the Presence?

Vital force originates beyond S&T. Because it must include a Telos.

Surely the Force is with us. We have come a very long way, Baby, from the primordial goo. Science reckons not the Force. Science is filled with pessimism for our future. The only hope from science is in the Transhuman, i.e. in a cold and bloodless silicon future, until the stars burn out.

The Force is not something Out There. It is closer to us than our own selves. It is more personal than any person. This is the stuff of theos.

So did God give us U235, as a thoughtless parent might leave a loaded pistol in a toy closet?

Or, does God have ultimate faith in the Telos. How could God have that much faith, were she not most intimately familiar with our Destiny? Is God gambling with our Destiny? Or is she using every trick in the book to reel us in?

If evolution were only pushing us from the past, we would have run off the road long ago.

There must be something pulling us from the future.

The crucial question is: how far in the future?

I submit that it must be a heck of a lot closer in the future than the Big Bang is alleged to have been in our past.

I submit that it cannot possibly be further in our future, than the Apes were in our past.

If it is that close, then it can have nothing to do with evolution or science per se. We must look elsewhere. We must look beyond space and time. We must look for some news from

Nowhere. We don't have to look deeply into the oracular mythos to find many potential answers vying for our attention. The Telos is written on those proverbial subway walls.

Then we consider the notion of possible worlds

Doomsday hypothesis & Simulation hypothesis

These two hypotheses need to be connected. Both neglect the Telos.

Creation

Why is there something rather than nothing?

Most any word and phrase herein may be entered directly into Google, which I just did with the above question and came up with a brand new book: *Why is there Something rather than Nothing?* by Bede Rundle (2006). All I have done is peruse the table of contents as given on the google book site. It is right up the BPWH alley.....a good sign that we are moving toward a paradigm/gestalt switch, quite independent of any official disclosure. Well, Bede takes a dualistic, rather than a dialectic, view of Creation.

Given that there is more likely to be something than nothing(!), what sort of something is there most likely to be? (Here is where we begin to get off the beaten philosophical path.)

A basic point of the BPWH is that it is much more reasonable and natural to grant an ontological priority to mental rather than to material objects. This is counter to most everyone's (modern) 'naive' intuition. This is where the BPWH stands the world on its head!

Naively, and especially from a Darwinian perspective, it should be a heck of a lot easier to make a rock than a mind. Rocks evolve into minds, somehow, or so we are told.

But, when you stop to think about it, and when you come to appreciate modern physics, you realize this is more like the chicken and egg problem.

The nub of the problem is that the Western mind is much too comfortable with mind-rock dualism, and then with just cutting mind and God out of the loop. Eastern mysticism, and most pantheist and polytheist societies find this dualism to be very unnatural.

Why not everything?

(We take up with the Strong, rather than the Weak, Anthropic Principle.)

According to String Theory cum Inflationary Cosmogony, there exist a virtual infinity of actual and/or possible universes. And this says nothing of the uncountable infinity of Possible Worlds emerging out of the strict interpretation of Quantum Mechanics.

Filtering existence

The more we understand the intricacies of matter, the more we come to appreciate the

incredible improbability of (accidentally) producing a universe that could even just produce a rock, let alone, walking and talking, rock derived(?) beings.

Is there no middle ground between having every imaginable thing exist, and having nothing exist?

There is one obvious answer: positing a Vital Force. With that one step, we go from nothing making any sense, to everything beginning to make perfect sense. One small step for the BPWH is a giant leap for human understanding.

But, wait. Hasn't the whole point of science to been to eliminate vital forces and the like?

True. The modest BPW hypothesis is that Science has been barking up the wrong tree, lo these very many years. Science has worked itself into an untenable conceptual dead-end. This should come as no surprise, considering its 'abortive' inception, but who wants to remember that?

Vital Force sounds mysterious. But how about Causal Loop? Or Final Cause? Look them up in your Funk & Wagnall's!

Singular existence of the world/creation

Theocentrism & Finitism

Teleology implies finitism.

Theism requires that God is both the Initial and Final cause of Creation.

There cannot be a Final cause unless Creation is bounded in Space and Time.

Monotheism and infinite existence are incompatible. If the monotheists could have gotten this simple notion through their skulls, the BPWH would have succeeded long ago.

The relativizing and deconstructing of Newton's absolute, containerized space is the biggest stumbling block for the modern minded.

Yes, Einstein and QM have taken big steps in this direction, but finally it's like the poor chap who went to the dentist, only to be told that his teeth were in great shape, but the gums would have to go! Its going to be really tough to swallow the fact that the etymology of Cosmos is Cosmetic!

Either the cosmos is pantheist or it is theocentric. It cannot be theocentric and quantitatively infinite at the same time. By that token it would be incoherent to the personal Creator, let alone to every creature. All indications are that the Earth is not only the only planet of choice/'sin', but it is also the center of Spiritual gravity. They all come here. We don't have to go there.

Final Cause [\[a\]](#)

The matter at hand is the purpose of Creation. What is the end of Creation? Will

the temporal end of the world have any bearing on its purpose. Does it matter whether or not the world ends with a whimper?

This question is directly related to the idea of progress. Is human progress, or even just history, essential to the Salvation Economy? The prophetic tradition surely makes that connection. That is the premise of God acting within history.

Certainly messianism points in this direction. Messianism presupposes global Salvation. Will there not be a Cosmic Salvation?

Will the cosmic savior be someone besides the Son of God?

Mind over matter

The Western mind struggles to transcend the ethos of the Machine Age. We cannot imagine that God is not a Mechanic.

I would suggest that God is a much more a politician than a mechanic. God is a people person! Is that too difficult to imagine??

Yes, God is charitable, and where does charity begin, if not right at home in the Pantheon?

Technically, the idea that God is a 'politician' is captured in the philosophy of Personalism, which is the essence of theism.

To put this another way, the mind is nothing if not Selfish. But the Self is not an absolute. The Self is ultimately a social construct. Thus do we easily conclude that God is love. God is also hate, but only when she gets out of the wrong side of bed. Love creates, hate destroys. One is logically parasitical upon the other.

If there is a cosmic mind, then there must be a Cosmic Self. That is the vital Source. That is the Alpha and the Omega.

Before there was a Cosmic Consciousness, there was a cosmic unconsciousness or pure Potency. It was a restless sleep, often like a bad trip on acid. The amoebic proto-mind spontaneously/psychotically broke into into a multiple personality disorder. Thus the pantheonic zodiac.

Atoms would not emerge until the white coat, pocket protector and slide rule were invented! It was a long way down!

Circularity -- dialectical idealism

This is where the narrative finally begins.....sorry for the delay. This is where the zodiacal mythos comes into play.

The Dialectic necessarily encompasses a Pantheon. The primordial circular symmetry is broken in a definitive fashion.

.

The Great Symmetry Break

Here is where the narrative gets into high-gear. This is where Reality becomes the sum of every conspiracy ever imagined (RAW).

The Garden of Eden was Valhalla. It was an all too comfortable Old Boy Network, that is until Sophia/Freya seduced Thor into impregnating her with Creation. Well, you see how greatly the old Rabbis managed to twist Genesis. And don't think they did not have ulterior motives. It contains a 'seed' of truth in a tissue of half truths and much worse.

It was as simple as Pi, one of the Big Seven archetypes, AZO/X/QRP. Pi is the most magical of numbers, and don't ever let anyone tell you that numbers are not magical. That is the beginning and end of the Big Lie that is scientific materialism. The metaphor of this Creation with Pi is to be found in the symmetry break that becomes the Mandelbrot: $z' = z^2 + C$. Much more about the magic of numbers may be accessed from the old topical index, OTI.

Metaphors -- Pokatok, etc.

Here is another metaphor for Creation. The Pantheon is getting bored, so they dream up a game of Pokatok, using their collective imagination. Gradually they become addicted to the sport. The rest is history.

Or, consider Pirandello's *Six Characters in Search of an Author*.

Whoever can collect and connect these metaphors into a single metanarrative wins the gold ring.

Archetypes -- AZO/X/QRP

These are the Big Seven: alpha, zodiac, omega, x/adam, quantum, repro/cyc, pi. See the OTI. These obtain their magic only synergistically.

These are the pillars/wheels of an irreducible Reality. These are the gears of the Cosmic Machine, in as much as there is such a Machine.

These are the touchstones/keystones of Creation. These are the lingua franca, the gold standard of Existence. If you were God, you would not want to leave Mt Olympus without them!

.

Gestalt switch

The basic theme here is that if we push any logical scheme far enough, it either comes to a dead-end, or it comes to the BPWH.

There is no continuous way to stand materialism on its head, or turn it inside-out. The whole point of ego consciousness is to enable the Apocalypse to be internalized in the conceptual thinking of seven billion individuals, just so it does not have to be played out in the streets, with 'blood up to the saddles'.

This is where things begin to get more technical. It is where my pedagogic skills are tested to the limit. The pedagogues who come after, will easily exceed my meager limits. Much of this is directed first to the so-called 'intelligentsia'. If only 0.1% of them see the light, that will be sufficient unto the Day.

This is not rocket science, it is merely common sense, unchained by its not being analyzed to its literal death.

N.B. The BPWH is not Anti-Science. It is post- Absolutist-, Fundamentalist-, Reductionist-, Materialist-, Arrogating-Science. Scientific Materialism was the necessary antidote to Absolutist-, Fundamentalist-,.....Religion. These two parodies of wisdom just manage to cancel each other out, leaving the logical vacuum that just happens to fit the BPWH. What a coinkydink!

Science vs. Religion

Mind-body

Holism

Reduction & emergence

Transhumanism

Informationalism/Simulism

Paranormal

The paranormal may or may not play a central role in the gestalt switch. It may be more like the rough sea that rocks the boat of Science, until they are willing to jettison their absolutist pretension.

What is holding everything back are the Nuts & Bolts Ufologists. Their Mr. Science is Jack Sarfatti. I have tried to reason with him, but it is like trying to reason with a slide-rule. He is totally fixated on his Formulas.

Apocalypse/Rapture

Yes, the issue here is Apocalypse vs. apocalypse. In common usage, there is no distinction. This fact is the fault of the *Apocalypse*. It should not have been included in the New Testament. It is a rehash of the OT, particularly of the pseudoepigraphic Book of Daniel.

Ok, the above statement is a bit harsh, but there is a point that must be made, and I will make it. I will then proceed to temper it.

I will then say this, while the Cat's away, the Mice will play. The Cat is coming back and She is p*ssed! But She is not bent on vengeance. We are all her children. What would you think of a parent who committed an act of vengeance against her own child?

Is that not simply preposterous? Could there possibly be a greater Blasphemy??

And it is just about here that we get into what Jack Sarfatti lovingly refers to as the Messy Antics (R)!

To the greatest degree possible the Apocalypse is immanentized and internalized. With one exception. Me, the messy antic. Think of me as the PtB's poison-pill defense against (premature?) disclosure.

In the Rapture, we don't get lifted up to heaven. Rather, heaven falls on our heads. It is the Advent of the Eternal Shining Present, beyond space and time, here now. The sequestered Stargates expand until we find ourselves ensconced in Earth Portal, the Cosmic Grand Central Station.

We become the conscious neurons of God's Noosphere. The Internet is just our stepladder to the Noosphere.

Apocalypse = Rapture = the rending of the veil of Nature. First it is internal, then external.

Deconstruction of space and time

Portals

[Topical Index](#)

10/12/07

Recap

I have spent the last four months engaging mostly with critics on the Open Minds Forum and, to a lesser degree, on Reality Uncovered. This has been a useful exercise, but tiring for all concerned. It was my contention that we were headed to a new level in the acclimation effort via the R&D protocol. But when I put Ron on the spot wrt to a meeting with a known skeptical academic, he opted to cut me out of that meeting. I have not heard from him since. For the time being, I have removed myself from contention on the disclosure front. I will resume my blogging activities here, UFN.

Allow me to resume a more philosophical and pedagogical routine, but I will let you know if anything transpires on the political front, in the meantime.

In the last few days I have found it useful to review the basic topics of the BPWH on Wikipedia. These topics include: paranormal, immaterialism, materialism, physicalism. Also, not to be missed: philosophy of mind, emergence, reductionism, rationalism, self-organization, neutral monism, dialectical monism, philosophy of space and time.

Without a passing acquaintance with the above topics, one would have a very hard time grappling with the BPWH.

Just from the above entries, one may be able to obtain a rough idea of the current status of scientific materialism. I am particularly on the lookout for intellectual trends away from SM. This, by itself, however, is not likely to portend a paradigm shift.

Another way to survey the status of SM is to survey the publications and critiques of its main defenders. What should be surprising is the general paucity of that defense. There are actually only a handful or two of hard-core defenders of SM who are on the public record as such. This is an astonishingly slender thread from which the entire culture or worldview of modern secularism is hanging.

What is going on here? What we are witnessing is the philosophical side of political correctness. There exists a powerful, almost reflexive, political accommodation dating back to the Enlightenment.

Here is from [Wiki](#):

Europe had been ravaged by religious wars; when peace in the political situation had been restored, after the [Peace of Westphalia](#) and the [English Civil War](#), an intellectual upheaval overturned the accepted belief that mysticism and revelation are the primary sources of knowledge and wisdom—which was blamed for fomenting political instability. Instead (according to those that split the two periods), the Age of Reason sought to establish axiomatic philosophy and [absolutism](#) as foundations for knowledge and stability.

SM was a reaction against the turmoil of sectarianism. In effect, it was the lowest common denominator upon which the various sects could agree, as the basis of a civil discourse. The US Constitution remains the signal achievement of the Enlightenment. Thereby, is SM considered to be the foundation of modern civil society. Remove that, and we descend back into the chaos of religious wars.

But, wait, is that not where we have descended in the present clash between East and West? The clash of cultures is putting a renewed strain on the secular accommodation. Islam seems less amenable to the individualism of modernity than was Christianity. Thus is there a dangerous prolongation of the cultural polarity between the two. The resistance to the perceived ills of modernity feeds into the eschatological expectations of the fundamentalists of all stripes.

10/7

Scientific Materialism (SM) is irrational at its core. It pretends that the world is an object without subjects. It can maintain this ruse only by constantly acting to subvert and alienate us subjects from what SM defines as the 'real', i.e. purely objective world. Thus has SM created the mind-body problem, which, by definition, is insoluble.

The bitter, historical irony is that Religion aids and abets Science in this process of alienation. Thus do we have the Great Conspiracy that defines modernity. Just as Science alienates us from Reality, so does Religion alienate us from God.

According to Science we are merely accidental tourists, lost in space and time. According to Religion we are Sinners, unworthy of Creation. In each case we are living on borrowed time. Nay, we are living on stolen time. We don't belong here. We don't deserve to be here.

The ancient wisdom and the great mystics of all time, have argued otherwise, but to no avail.

How could the great Lie of sin and alienation have been perpetrated with such success? How else could the masses be controlled? How else could we have been kept down on the farm?

Freud recognized our historical predicament and articulated it in an unprecedented fashion: *Civilization and its Discontents* (1929). Famously, and characteristically, he blamed all our social ills on the 'original sin' of Oedipus and its concomitant sexual repression. Margret Mead, in her *Coming of Age in Samoa* (1928), one of the great scientific frauds, claimed to have found the antidote. It was Paradise regained.

These two works may well mark the beginning of post-modernism. Sartre's *Nausea* (1938) completed the triumvirate of PM. Oops, did I forget to mention Marx's *Das Kapital* (1867), a bit ahead of its time!

What is going on here?

I'll take a stab at it.....

SM disowns the Subject, which thereby becomes an unfettered Ego, up for grabs. Original Sin, a concept already perverted by Religion, loses its traction. It then becomes an open season or Blame Game. Materialism can give us everything but.....but What?

Satisfaction??

Can't get no.....sa-tis-faction!!

What is the Solution? What else but 'back to the womb'? Where did that expression come from? There are 25K google hits.

Here we go....from the Catholic Educator's Resource Center, the [Pillars of Unbelief - Freud](#):

Toward the end of his life, Freud's thought became even darker and more mysterious as he discovered thanatos, the death wish. The pleasure principle leads us in two opposite directions: eros and thanatos. Eros leads us forward, into life, love, the future and hope. Thanatos leads us back to the womb, where alone we had no pain.

At the end of his life Sigmund had rediscovered Original Sin: the indissoluble link between sex and death!

Now we're talking.....Nirvana, Hierogamos, Apokatastasis, Rapture.....! Our ticket back to the Cosmic Womb, but only if we behave ourselves, like good little boys and girls. Otherwise you'll lie moldering in the grave, or a hell of a lot worse!

In PM, there is only one Taboo: don't step on Science's Space&Time, 'billions and billions'! You are

encouraged to deconstruct everything except Absolute space-time. But, wait, didn't Einstein and QM already deconstruct space and time?

Only on the atomic and cosmic scales.

Only in this cosmic context can one grasp the full import of the Phenomenology Problem.

Science is nothing if not Ghost-Busting. But, with phenomenology, the ghost-busters get Busted!

Obviously, someone has got their thumb in the phenomenological dike, but it is hard to spot the culprit. The likely answer is that we are all co-conspiring to keep the sky from falling. And if we ever became witting of our metaphysical conspiracy, that would be the end of it. Denial is the name of the game.

What ultimately prevents the UFO from landing on the White House lawn? Is it the Prime Directive or the Prime Mover? Is it not the case of the Irresistible Force meeting the Immovable Object? Let us not trivialize the problem of Eschatology.

The BPWH seeks to minimize the pain of our rebirth into the New Heaven and New Earth.....the Kingdom Come. Can we not achieve that end without blowing ourselves to kingdom-come?

Can there not be Apocalypse without an apocalypse? Can there not be Rapture/eros without Thanatos? Certainly not by the conventional wisdom. What is the chance for the unconventional wisdom? Can it have a prayer?

The paradigm shift, when it comes, will be a paradigm inversion or a Gestalt Switch. There is no continuous or rational path from the irrationality of materialism to the rationality of immaterialism. When the sky falls, it won't have no parachute. It cannot be a soft landing. However, if we conceptualize the phenomenological problem, we can arrange for the sky to fall in our minds, and not on our heads....hard headed though we may be!

By individually processing the Gestalt Switch, we can avoid or minimize the collective apocalypse. This is just the rationale of the VLAA/SDP.

But, hey, if Ron cannot ride shotgun for us, do we have a snowball's chance??

On OMF, I brought up the possibility of a syllabus. No one volunteered. Is such a thing even possible in this context? The rationale of the BPWH is nothing if not circular. It is necessarily self-contained. Syllabi are usually constructed as linear or sequential.

But then recall Britannica's Circle of Knowledge (R). In fact, that is just the transliteration of Encyclopedia. I still have a copy on our bookshelf. It is in the Propedia of the 15th edition. Knowledge comes in ten parts that can be arranged in a circle. Unfortunately, the two ends never meet. Too bad! Hegel, notoriously, attempted his own [dialectical outline](#) of Reality: logic, spirit and nature. One could probably do worse.

The BPWH has its archetypes, [AZO/X/QRP](#), each of which has a circular aspect.

There is also a Food Chain and a Chain of Being, which are not entirely dissimilar, for better or worse! BUT, by keeping both of them circular, we can keep everyone honest, more or less. We keep God honest, and vice-versa. Ecosystems are replete with cycles, of course. N.B., while the BPW is circular it is decidedly not cyclical, which would destroy its basic premise of Singularity. It must be finite in every quantitative sense, while infinite in a qualitative sense.

10/8

I have spent a few hours struggling with an [outline](#) for the BPWH. I'm not happy with it at this point. We'll have to see if there is motivation to improve it. It is only one step beyond the [topical index](#). It contains no links, and I'm not sure how those might be handled in this context.

I'm not sure how this outline might be converted to a syllabus having both internal and external links. Notice that there are only two main entries at this point: Creation and Gestalt Switch. The former is retrospective, and the latter is prospective. Pedagogically, the order might be reversed, because Creation assumes an understanding of the new Gestalt. On the other hand, I would like to start the narrative from a naive perspective, and not bring up all the technical issues until the basic ideas have been laid out in a natural fashion. We start the narrative with the mythic quality of a Just-So story.

Each entry in the outline should have its own link to a page or sub-page of explanation and links. This would reduce flexibility, but it would make the process more platform independent and, thus, more accessible.

10/9

Well, I've made a stab at the [syllabus](#), but it's not turning out like I expected. It threatens to become another blog.

10/11 [\[a\]](#)

On the OMF, it has been very difficult for me to persuade anyone of immaterialism. My strategy in the last couple of days has been to engage the Xians in the problem of salvation when taken in an ET/UT context. As with most ufologists, they take seriously the notion of ETs. They tend to dismiss the theological problem of other worlds or creations, the same problem that sent Giordano to the stake several centuries ago.

However, if I couch the many-worlds problem in a soteriological context, then they begin to grasp it, and see why it was considered blasphemy. If I can make progress with honing that argument, then it may turn out that the xian ufologists will be the prime target for the BPWH. This despite my own messy-antic problem.

It appears to me that the many-worlds soteriological problem (MWSP) hits the xians particularly hard, amongst all theists. This is simply because of Jesus' allegedly singular cosmic connection. How is Jesus going to be incorporated into the Federation? The idea that JC might just be a FedX messenger boy will hardly compute for the xians.

Leaving that problem aside, there is still a horrendous soteriological logistics problem from the many-worlds perspective. Is Judgment Day simply our Federation Exam day? It is strictly a pass/fail grading system.

Ok, but then what? Do we then sit around waiting for the Cosmic Heat Death in a few hundred billion years? Talk about Waiting for Godot! Talk about going out with a Whimper. It could get downright tedious. The Vital force would have long since shot its wad. We are left twisting in the cosmic breezes.

If there is a God in Heaven, then surely she could have dreamt up a more graceful exit, presumably with

our boots still on....still in our prime.

But then we have a sequencing problem. First come, first serve: a FIFO inventory system for planetary civilizations. No?

But a simple FIFO system would be greatly complicated by the cosmic intercourse. Folks would be jumping ship at the drop of a hat. The rats would all be heading down the gang-plank at the first sign of the Big O.

In short, it would very quickly turn into every rat for himself. A real rat-race with no end in sight: always just one step ahead of the Grim Reaper. Sound familiar? Nothing graceful in the slightest. It sounds hellish to me, lasting for a virtual eternity. A big diversion is the occasional foray to sodomize the pledges, apparently a favorite hazing ritual on the Cosmic Frat scene. Talk about cosmic intercourse.

There is, of course, a very simple solution to the whole MWSP logistics problem. How do you spell B-P-W-H?

10/12

There is a rumor, with at least two sources, to the effect that CK may be in political difficulty. This raises several issues. There is the timing issue. If this is a new development, then there is an obvious synchronicity with my open letter about a meeting with an academic skeptic. In that letter I took a pot-shot at one of the avians. This precipitated a very loud protest from CR. This might have triggered a heating up of the long simmering conflict between the Aviary and R&D. On the other hand, the letter and the internal controversy engendered by it, might have spilt-over into a larger conflict inside the Beltway, somehow related to disclosure. CK has long demonstrated an imperviousness to the opprobrium of his feathered friends. To cause him any serious upset would have required their going much higher in the DC food chain.

If the rumor is valid, and if it is related to R&D, then it likely connects with the Repositioning. Since it was broached to me last January, I have contended that the Repositioning would likely signal the final phase of any disclosure preparation. It would impose an automatic deadline of early next year. I have long stated that CK is the lightning rod for any such initiative. His being put on the spot would indicate a last ditch effort to derail disclosure, coming from wherever.

Is this opposition, if real, too little and too late? We will be finding out sooner, rather than later.

It would only take the combined testimony of two insiders to trigger a disclosure. The non-disclosers would have to resort to extreme measures to silence everyone. The sudden death of any one of them would trigger the others to go public, and very quickly. The deaths or disappearances of several, especially if it included CK, would launch a public investigation.

In short, anything now would be too little and too late.

Nonetheless, suppose that R&D were scuttled indefinitely. Wither disclosure?

Unless there were an unprecedented and public ufo event, it will go nowhere, based on the long and sorry history of ufology as we know it.

More likely is the political, internal collapse of Scientific Materialism. But no, such a collapse has never happened.

No paradigm has ever collapsed, without being pushed by another. Is there anything now in the wings that can rival the BPWH in that potential role? I would sure like to see it.

Is it not increasingly clear that human survival will be predicated upon some form of cosmic intervention?

Who can claim to demonstrate that our chances of survival as an advanced civilization for even another century are anything better than even?

Is it not the case that our biggest obstacle to survival is our total lack of a common vision or sense of a common interest?

Any such vision would require a visionary. It cannot be hammered out in a smoke-filled room. Any such revelation would necessarily be of biblical proportions. Virtually every religion and sect has provisions for, if they are not even actively touting, such an imminent advent and revelation.

Any serious visionary, at this historical juncture, in these latter days, will have to couch her vision within some such prophetic time-line. And while you are addressing one such tradition, you might as well address them all. Nay, any vision that fails to address them all will fail to accomplish the task at hand. It would be a non-starter.

In light of what I have just said, I will need to redo the outline and syllabus in order to better reflect the practicality and urgency of the issues being addressed. To wit:

Wrt to the VLAA/SDP on OMF, after 200 pages I think we have gotten past the preliminary introductions. It is high-time to get on with the show.

The logical step is to start a new thread with new rules: The discussion must only be directed at issues raised in the BPWH. That will be the title of the new thread. The BPWH proper, as a continuing work in progress, will remain here. The new thread at OM will only be for Q&A and 'constructive' criticism. I will, of course, continue to post there at the pleasure of the admins.

It may well be that the present level of residual interest in the BPWH will not warrant a continuing active presence at OM. In that case, the residual discussion could migrate to another, *ad hoc*, site.

Perhaps the VLAA could continue as a place to discuss the politics and mechanics of disclosure, and to deal with general ufo issues that are not directly covered in the BPWH. The protocol for that is less clear at this point.

Those who wish to pursue other agendas are welcome to do so in the appropriate spaces.

10/13 [\[a\]](#)

Fore @ OMF remains my stalwart interrogator and Devil's Advocate wrt the BPWH and the R,D&S show. Allow me to reiterate in the recent context:

If there is a phenomenology problem, PP, that concerns the global intel community, then CK is the public lightning-rod relative to that problem and its possible disclosure. His contact with the public, for the last sixteen years, has been mediated mainly through me.

I suggest that this connection does lend credence to the BPWH and to its corollary that I have been designated to be the long anticipated cosmic visionary and savior for these latter days.

This suggestion is subject to ongoing verification. As we approach D-day, there will be an increasing public examination of the BPWH and of R&D. Each new day provides another set of tests. Fore is one of the public testers. If the PP is real, then most of the testing is going on behind the scenes.

A couple of weeks ago I was presented with an opportunity to turn up the heat on disclosure, and I took advantage of it by simply revealing my role in arranging a meeting between CK and a well-know academic skeptic. Since that time, my communication with CK has been mediated by a 3rd party. That person tells me that he has heard from another insider that, indeed, CK is feeling increased political heat, triggered mainly by my unilateral action.

My action was, in no small measure, triggered by Mahmoud's speech to the UN that, in this context, could best be understood to say that he was using his nuclear option to push for the disclosure of the Second Coming.

Is it possible that Iranian intelligence is ignorant of the R&D show? If the PP is real, then there in no intelligence organization on the planet that has not been apprised of R&D. It is the only show in that whole venue that has even a modicum of official sanction.

In that venue is Mahmoud an outsider trying to force his way to a place at the table, or is he an insider following a script? I would suggest some of both. He is not merely a puppet in this game. He has been dealt an interesting hand, and he is no dummy in the game of disclosure poker. It is well known that many of his followers see him as a contender for the title of Mahdi. Islamists suppose that Jesus will be holding the hem of the Mahdi's robe at the appointed Hour.

Should we suppose that the top billing spot might not be a serious bone of international contention in these latter days? In terms of followers the score is obvious: Mahmoud 700,000,000; Dan 0. But wait, which one of us is an FoR, Fore?

Of course, if God does not approve of these immanent arrangements, she is invited to show her own hand. But even she must know that the Hour is drawing nigh!

And then I notice this today from Victor's list:

LONDON (Reuters) - More than 130 Muslim scholars from around the globe called on Thursday for peace and understanding between Islam and Christianity, saying "the very survival of the world itself is perhaps at stake."

Would Mahmoud like to cut a deal with R&D?

10/14 [\[a\]](#)

Fore @ OM seems to have calmed down a bit by last night. He is now talking semi-rationally. His concerns are a bit more focused.

He is dubious about CK being the pivot of disclosure. Should the effort not be more international, he wonders.

I have been at pains to point out the international participation with, and overview of, R&D, at least since the Jack Anderson column in 1991.

Nonetheless, the ufo issue has been the special provenance of the US since day one. If nothing else, Hollywood's focus on that issue, from day one, gives us a virtual proprietorship. And have we heard any

objections to this cozy arrangement?

CK is not the pivot. I only suggest he is the lightning rod. I would be the pivot, if I'm anything at all. However, on the day that he fingers me in public, I then become the lightning rod, as well. The fact that he refuses to do so, even under extreme provocation, is my one temporary reprieve.

CK is one of a kind on the world scene. That is not contentious. The BPWH is one of a kind on the Internet....also not contested.

Both of these facts taken separately are moderately interesting. But put them together, as they have been for the past sixteen years, and you had better be watching out. Indeed, the global IC has been doing so, at least since '91.

Is there any contention that whoever becomes the pivotal lightning rod for disclosure will be playing an historically unprecedented revelatory role? This fact might be partially circumvented by having a disclosure committee. But that won't work if there is any linkage between disclosure and a particular vision. In that case, the visionary will be the *de facto* pivot.

If the vision happens to include an imminent eschaton, then it must contend with the various end of the world scenarios that have been the focus of the prophetic tradition. The primary revelatory event prior to the eschaton in that tradition is invariably an advent of the personal kind. No tradition specifies that this person would merely be a visionary. It is supposed to be reserved for the advent of a glorified Savior/Messiah figure. How else could a global triumph have been envisioned in the old days?

I suggest that the no one could then have envisioned the Internet or the global IC being co-opted by cosmic intelligence. This unforeseeable combination would enable the earthshaking advent of a mere visionary, and that this would be a vastly preferable way to proceed from the vantage of both the cosmic intelligence and humanity, compared to that of the glorified messiah. The further unforeseeable fact is the existence of Scientific Materialism. The simple fact of disclosure would trigger the collapse of that worldview. This denouement then paves the way for the new vision.

That the new vision would be a rationally coherent vision was the final unforeseeable fact.

By combining all of these new possibilities, we have a global Soteriology that would have been utterly incomprehensible to humanity prior to the last few decades. Revelations of the past would have meant nothing if they had not been comprehensible to their target audience.

I maintain that the divine prophecies given in the past were the best possible renditions of the BPWH eschatology that would have been comprehensible to the people at the time they were given.

10/15 [a]

I just thought of a great way to begin my apologia. I will apologize for Scriptures. Scriptural/Scientific Literalists (S/SLs) have possibly done more evil in the world than any other identifiable group of individuals. If this were the BPW, would not God have figured out a way to avoid Scripture? I'm skeptical that Literalism could have been avoided. If someone could figure out how, that would be *prima facie* evidence against the BPWH.

The only way I know how to overcome S/SL, within one generation, say, is for me to be able to pass myself off as an avatar of some kind. If I am unable to accomplish that within a generation of my timely or untimely demise, then that would constitute definitive evidence against the BPWH.

Yes, the S/SLs, bless their little hearts, have fire in their bellies. Nothing wrong with that, it's better than

being lukewarm, but it does mean that we cognoscenti/gnostics will have to fight fire with fire. To wit: avatar land, here we come!

Yes, literalism of both the scriptural and scientific kind was a necessary stage in the development of the human soul. The only way to get beyond tribalism is by way of literalism. Thus do we advance from the verbal mythos to the written logos. In order for there to be a supra-tribal social order, the laws must first be codified. The first known instance of such codification was the Code of Hammurabi (1760 BC). In order for the laws to be seen as absolute, they would have to be attributed to an absolute supreme being. Thus we have the Ten Commandments (c. 1000 BC).

The absolute literalism applied to the scriptures, then segued very easily into the absolute literalism of the scientific laws, as first observed in the planetary motions in the sky. Thus was modern science born when Newton codified those motions into an absolute mathematical law, *Principia*, 1687.

Now, in one fell swoop with Disclosure/Revelation, we are about to witness the demise of literalism of all kinds from the Cosmos, good riddance! In that moment we graduate from management by (literal) directive, to management by a shared, internal objective. That is, we will then only be subject to the Law written in our hearts. Hallelujah!

Can't this transition be accomplished without an Avatar? Yes, with the inevitable demise of scientific literalism, i.e. materialism, there would be a natural evolution of our thinking toward something rather like the BPWH. If God were truly a minimalist, wouldn't she just let nature and the vagaries of human reason take their inevitable course to the larger Truth, unaided by any cosmic intervention? This would just be the final extension of the Prime Directive, i.e. the Intergalactic Hands-Off Policy, IHOP. Why mess with Smith and his 'messy antics' (R)?

Besides, aren't we liable to fall into the literalism of Smithianity? The poor toddlers of the future will be saddled with having to memorize the OMF Catechism, all 215 pages of it!

Well, I look at it this way. Why should we begrudge God this final cameo role? The poor gal has had a tough time, getting crucified and generally castigated. But, wait. Being Smith, is that any cake walk? Sure, it is! I think it's mostly fun, without any serious challenges. I'm having a pretty good time, all things considered. Can you imagine wanting to be anyone else, other than in this time and this place? If you were God, would you rather come back as Dan Smith or as a Circus Freak in a white robe landing on the White House lawn? I did take up flying lessons to do that, but when Ron discovered the flight manuals in the trunk of my car, I got cold feet. I mean, really! I'm older and much wiser now. I wonder if he remembered to notify the FBI? Am I on the No Fly (your own plane) List?? And besides, who needs an airplane, now that we have the Internet? Well, I guess Osama does. Of course he does! He's just another one of those poor benighted literalists who don't have an ounce of their own brain power. No heart, either. Oh, but I forgot. He's probably in the loop, stage acting, and not as dumb as he seems. Those cave shots are actually taken in the penthouse at the Mirage. He's dumb like a fox!

And why is Y2X so easy? Because all the heavy lifting was accomplished in the X1-event. This is just like rolling of a log, or should I say, Internet?

Yes, the world had already been saved. And I do mean every last critter in it! Not just the holier-than-thou bible pounders. It's all over now, but the shouting. The contract has been signed, sealed and delivered.

And as long as I keep making enough gaffs, the toddlers of the world will be spared the memorization! Shurley, God wouldn't make tipos!

The discussion at OM seems to have bogged down with the fundies continuing to throw the book at each other. Such scriptural argumentation has gone nowhere in decades, centuries and even millennia. It makes virtually no reference to anything that has happened in the last two thousand years, outside of the recreation of Israel. It has virtually nothing to do with science or phenomenology.

Thus is the God of history ignored. Thus is history rendered meaningless. Thus is life rendered meaningless, other than to produce cannon fodder for a vengeful God. There is no mention of, or regard for, history from the X-events until the final days.

On these terms, it is not even clear that the X-event had any meaning, other than possibly as a pretext to spread the Ten Commandments. This renders Jesus equivalent to Mohammed. None of Jesus dictums carry the weight of the Law. Being born again has nothing to do with the Law, and is quite outside the purview of the believer. It renders humans as sock-puppets in God's war with Satan. And, by any reading of the prospective body counts, Satan comes way out on top.

The Xian fundamentalists must be envious of the orthodox of the other faiths. Those ones are able to maintain greater strictness to God's laws. The practices of those others is much more central to their lives and livelihoods. X'ianity is but a poor relation to those others. Upon whom may we place the blame that poverty of practice, if not on JC? Needless to say, with all the emphasis on externality, the inner life of the spirit is correspondingly neglected amongst all such. It might be noted in this regard that there are no equivalents of the Sufi tradition outside of Islam.

In any such accounting as this, one must also take into account the general European apostasy, and the fact that Communism was almost entirely excluded from Islamic nations. And so was Nazism. Islamic 'totalitarianism' is only a distant cousin to the virulence of nation based fascism, with the Saudi and Iraqi experiences notwithstanding.

What is lacking in the other cultures is the historical dynamism. That a significant part of that dynamism was founded in its religious history is not generally disputed.

10/25

There still appear to be no openings at OM nor with CK. There is no call at present to push further. In general, the fundies will be able to make enough noise to drown out any attempts to reform the prophetic traditions, prior to some major event and the ensuing chaos. They consider it their sacred duty to defend their own scriptures. Is this intransigence the primary obstacle to disclosure? Or is it being used as an excuse for the PtB to further procrastinate?

10/26 [\[a\]](#)

I continue to peruse the VLAA thread at OM. I continue to find many of the posts disturbing. It is disturbing that otherwise articulate folk, who exhibit openness to phenomena that are generally shunned and denied, are so close minded when it comes to the obvious theological implications of those phenomena.

This raises two immediate concerns:

1. There is certain to be a very large impact of Disclosure on Religion. If our religious beliefs are rigidly defined, that impact is much more likely to shatter those beliefs, thus contributing to the ensuing chaos. It is concern about this chaos that is alleged to be the main reason for the delay in

disclosure.

2. All of the scriptural based religions foresee an imminent Revelation that is expected to transcend all previous revelations. Thus are we maximally vulnerable to having our beliefs manipulated by entities with alien agendas that would be the subjects of the Disclosure.

In point of fact, it is the Xian based theology that should have the greatest resilience to such alien agendas. This salient fact is hardly an accident of history. To the contrary, it seems designed for just this eventuality.

It is, however, the xian fundamentalists who strive to remake the xian religion into the image of those others that will be more vulnerable to disclosure.

These folk who who beat the drum of orthodoxy are very likely just the ones who wish to see our civilization destroyed by making it all the more fragile in its foundation. In doing so they are subverting the essential and strengthening message of Jesus.

Literalism is the hobgoblin of those who are of weak spirit. The literalists struggle everywhere to impose their shackles upon the rest of us. They do this in every human endeavor, not just religion. But it is in religion that their influence is the most baneful.

Literalism has no other purpose than to subdue the spirit. Religion is literally just the binding of the spirit.

My mission is to free the spirit. My principal mentor in that regard is Jesus. He did more in that regard than anyone in history. I am here only to explain how his mission will now be fulfilled.

Freedom is not an end in itself. As Jesus demonstrated, the only end of freedom is love. Free love is, of course, the only love that is worthy. That is the only thing of which there can never be too much.

The driving force behind literalism of all kinds is just the fear of love.

Before literalism there was ritualism, which literalism has now largely replaced. Both of these are just about the routinization of charisma. The mechanization of the spirit is just a measure of the failure of the spirit.

Biblical infallibility came into vogue in x'ianity only in the last century. It may best be viewed as a conservative reaction against the literalisms of Science and Islam. It has done more to deaden the spirit of Jesus than anything else. It is just through literalism that the power of evil has most nearly penetrated the sacred living heart of Jesus. Thus do those of impoverished spirit hope to subdue and bind the risen Christ. Fat chance.

In its alignment with the Neo-conservative wing of the Republican Party in the US, Biblical literalism brings us perilously close to fascism. There is no greater force for evil in the world today than this bargain with Satan.

10/28 [\[a\]](#)

Here is my current explanation for the stalling of r&d:

Since we only go around once in Creation, there is pressure to extend the circuit into a sub-optimal domain, allowing things to degenerate prior to the Disclosure. This fact of singularity is, in general, the basis of my theodicy. The value of diversity places a much greater value on evil in a singular Creation,

than if we were contemplating the best out of an ensemble of independent creations.

Science and technology have improved the lives of many. Some might argue, as I have, that we should go out at the top of our material game. But there also exists a cogent argument that we should go well beyond the optimal point. We should experience a few generations of muddling, before Revelation.

Depending on how the clash of cultures and the population problem are handled, there could be an aggregate improvement in the quality of life. We might be able to work ourselves into a sustainable mode of living with some substantial fraction of the present population. But, at some point, not more than a generation from now, with scientific materialism still in decline relative to a metaphysical worldview, there would be a spontaneous transition to immaterialism. This transition would initiate an eschatological sequence spontaneously.

Thus is there a narrow window for extending the status quo, of probably not more than a generation. The PtB may well want to hold out to the bitter end. The CI may be willing to hold off on revelation for some period of time, not wanting to upset the global applecart in the process. So, yes, the PtB could likely hold us all hostage for another generation, but not for significantly longer. This will be their very last stand. They will be on their relatively good behavior, because they will know that they are operating under the 'gun'.

In the meantime, the CI/hidden-hand will continue to keep the lid on the forces of evil and degeneration: war, plague and economic collapse.

If MJ-12 is less sanguine about such a delay, they still have my phone number.

Theoretically, we have enough goods on CK to effectively demand a Congressional investigation of the allegations, but, in practice, there would be difficulty negotiating my cooperation with whatever group might be able willing to take on the considerable lobbying effort.

In effect, the R&D strategy has been quite effective. CK is able to conceal his shenanigans behind the cloak of my 'insanity'. When, years from now, the can of worms is finally forced open, MJ-12 can claim to have made a good-faith effort to go public. They can say that even the small segment of the public that was actively pro-disclosure simply could not face the disturbing message.

And in the larger scheme of things, what difference will a couple of decades make? The longer we are willing to wait while Scientific Materialism continues to fade into oblivion, the less will be the social consequences of the inevitable paradigm shift.

In the meantime, I can live out my remaining years in peace and quiet. And, should we later need a BP 'saint', I will be well departed, as is kosher in such matters.

Technological **no-fly zone**: [\[a\]](#)

- UFOs are intimately connected with a wide range of paranormal phenomena, none of which have viable physical explanations.
- Shape-shifting is the prime contradictor of any physical basis.
- Jack Sarfatti has done more with UFO physics than anyone, and his efforts are tantamount to a proof of the negative.
- We are very close to a TOE, which, *sua generis*, excludes such phenomena.
- Given the Strong Anthropic Principle, the world is more mind-like than rock-like.
- Mind over matter provides the only conceivable explanation for all of these uncorrelated phenomena.
- This is panpsychism.

- The technological explanation assumes the existence of a Federation.
- The existence of a Federation is contradicted on many fronts.
- On the other hand, these phenomena provide a very strong argument for the existence of a CI.
- This is theism.
- The existence of any such CI would also argue for the ontological priority of mind over matter in the larger scheme.

[above table last edited 10/29]

10/29

I am told that tomorrow we are due a batch of Serpo related material. It is supposed to contain a goodly portion of disclosure politics. I will be interested to peruse that portion, and comment on it. It will be something like reading the tea leaves, to see if some smidgen of truth might have survived the disinformation brigade.

Jake @ OM lays out his interpretation of the BoRev. [\[a\]](#)

I have this to say about that:

I will not respect any entity that treats me like a child.

I will only respect Reasons, not power or authority. If you want me to do something, then tell me why, and allow me to weigh the costs and benefits.

Love comes about only through mutual respect. Anything short of that is coercion, and will be self-defeating.

Love is the only conceivable basis of Creation. The Fundamentalists have wandered very far from this understanding that was the foundation of Jesus' mission. The so-called Fundamentalists have no conception of what is fundamental to Creation. All they have left are laundry lists of offenses to justify what they conceive of as God's hatred for the vast majority of their fellow, misguided humans. They wait with baited breath to see those punishments meted out.

Those ones worship a false God. One after their own image. One guided by vengeance. They are like this because of their collective self-loathing and feelings of unworthiness that they preach to each other. This fear prevents them from reasoning about their ultimate concerns.

Why did God allow this to happen? That is the only sensible issue herein.

The literalists/reductionists, in both their Scriptural and Scientific guises, have become the primary concealers of God in these latter days.

10/30

Here are my first impressions of Serpo 27a, as released by Victor M this morning:

I found nothing even slightly surprising. That is the main problem here. It fits seamlessly with the earlier Serpo material. The same level of skill (high) was involved in concocting this material. I know that Ronnie was not the brightest bulb in the pack, but please. The leader of the free world? And this

compounded with Victor's fawning.

The only hint of a possible truth here was the notion of the Disturbing Message that I have harped on over the years:

The CARETAKER: It was felt that public awareness of these projects would have jeopardized the future space program of the United States. Releasing our secrets about UFOs and alien visitation would also cause a PANIC AMONG RELIGIOUS LEADERS around the world. Therefore, MJ-12 decided that an independent scientific study of the UFO phenomena would be needed to satisfy the public curiosity.

The problem of the impact on Religion has always been at the top of the list of concerns. Reagan was known to be a deeply religious individual. Yet this whole topic was otherwise never once broached in this lengthy transcript. The alleged questions from the President, considering this framing context, were entirely an exercise in trivial pursuit.

So then read between the lines: MJ-12 therefore decided to couch this cover story of the phenomenon entirely in a scientific framework, avoiding all religious, metaphysical and eschatological concerns. Thus do these disinforming disclosers adhere to the separation of Church and State, up until the last possible moment (January?). The exact timing will depend on the degree of public response to these latest disseminations.

The next most obvious fudge concerns the abduction phenomenon. Again, this very large, paranormal phenomenon is shoe-horned into just 80 (sic!) allegedly completely physical incidents.

Just these two prominent red flags should alert any but the most nuts&bolts-crazed audience to take ALL of this with a very large grain of salt.

The only issue that matters at this point is how big a disturbance will this material create in the public arena.

Will it rise to the level of a media event? The previous Serpo stuff approached that level, then fizzled.

The political context of this stuff should make it harder for the news blogs and media to ignore.

It seems to be carefully calibrated to move the game up a couple of notches to see what will happen.

From that perspective alone, I see continued progress here, and on a reasonably short time frame. We could still meet a January deadline for something definitive.

I will be interested to see if there is any renewed aviary or r&d activity resulting from this.

Let's run a scenario:

One of the larger news blogs decides to make a federal case of #27ff. Who can they go after? The first ones to go after are the still living advisors. They can make reasonably honest denials about any specific content, if they even deign to respond. Dead end? Yes, unless they realize that there is a serious CI issue. (CI = counter or cosmic intel, depending on the context.) There is only one place for them to go, in that case.

CK will try to laugh it off, but then they will hit upon the greater problem of r&d. By threatening to get me to go public, they may be able to wring some concessions from CK. Once that ball starts rolling, I doubt that it can be stopped until it gets to the bottom of this hill. Can anyone truly claim to see the bottom?

Suppose I had not decided to push the r&d envelope wrt the BP meeting. What would r&d be talking about now? I would be pushing his envelope relative to #27. Same net result. Not much wiggle room left at this point. The CI/false-flag problem here is decidedly non-trivial. Shall we rehash all the water under the r&d bridge. Would I hesitate to do so in whatever venue comes available? Talk about false-flags! Doesn't the messy antics beat all?

The number of viewers at OM remains at less than 1/3rd of their maximum with the original Serpo release. This does not augur well for a spontaneous media event.

However, with the amount of work that is going into #27ff, we might or should suppose that there will be a staged media event to coincide with the next few releases. The perpetrators would likely have arranged for coverage by one of the news blogs. In this manner could they further push the envelope of public apathy.

Has anyone else noticed the following:

VICTOR: The home world of the HAV, the TRANTALOIDs, is the THIRD PLANET out from the star Epsilon Eridani in the constellation Eridanus at 10.5 light-years away. Although somewhat cooler and fainter than our sun, it is very similar. Hal's friend, ADVISER #4, was mistaken on the distance; an easy error to make given the voluminous amount of information on this subject matter alone. - ANONYMOUS.

This is, perhaps, the biggest giveaway herein. Anyone care to follow-up? Just be darn sure not to reference me!

Well, never try to underestimate the cleverness of ufologists.

So where were we? Why did God ever sanction literalism, the bane of human intelligence?

The main reason is that God loves fools and small children, both of whom comprise the vast bulk of the literalists. So what are all us smarty-pants supposed to do about this?

We can bide our time. We have been doing this for about 2000 years. That accounts for a whole lot of foolishness.

Or we can anticipate the imminent self-destruction of the literalists. This is my favorite pastime!

Where I see this most imminently is in the field of AI, if we bracket the paranormal domain.

AI is not making the grade. When was the last breakthrough in AI? I suggest that it was neural networks, which failed to live up to their expectation and which remain a marginal technology. If there have been no other such 'breakthroughs' then AI is in a whole bunch of trouble.

Their only way out of this impasse is to move toward quantum computing/intelligence. That field remains highly constricted. Does anyone foresee a breakthrough in QI? It has been dormant since Penrose raised that flag almost two decades ago.

All you have to do is look at the Wiki entry on QC to realize that this field is going nowhere fast. The AI folks have been talking about a 'technological singularity', q.v., since 1965. But where is it? I don't sense that AI is going anywhere at this point. Is it not fair to say that AI is directionless now? If it cannot harness the Quantum, what can it harness??

I defy anyone who has a bachelor's degree in physics or above to a debate about whether there can be a

physical explanation for the most basic of paranormal or ufo phenomena. Any takers? The very best in this field is Jack Sarfatti, and he is reduced to screaming when I confront him with the mind-brain problem or with the paranormal. I would be glad to demonstrate Jack's screaming mode if anyone is interested.

As I say, it is extremely difficult to underestimate the cleverness of ufologists.

Without a breakthrough in AI we have nowhere to go other than into the metaphysical dimension. It just so happens that I know as much about that problem as anyone on the Internet.

Is that my fault? Or is there a message in that fact?

Consider the fact that my mentor knows more about #27 even than Hal. What does that tell us? He told me a year ago that Serpo was a DIA project. Good for them. If it were otherwise, he would be responsible to find out who was behind it. All he would have to do is telephone CR. How difficult would that be? Would anyone like Kit's phone number? You could thereby assist CK in the performance of his CI duties. After all, he is underpaid.

As I say, it is extremely difficult to underestimate the cleverness of ufologists. There are hundreds of live targets out there who have nary a clue.

Given the century-old constraints on physics, technology has nowhere else to go. Whereas metaphysics is a wide-open domain. Where else can mind go but gravitate to the cosmic mind? The ufological nuts&bolts folk are the biggest obstacle, along with the literalists whom they mimic, to any revelation.

10/31

Additional points that have been made at OM:

1. The hammering on the matter of the levels of secrecy is aimed at a low-brow Hollywood audience, well below the level of even a dim-witted President. (Reagan was dim like a fox, I don't doubt, well beyond GWB.)
2. That Reagan would be naive about Intel concerns with Hollywood.
3. All of this hews much too closely to just the Core Script. Not a single surprise.

More generally, the response has been underwhelming. It remains well below that of Serpo and the Drones, and is drying up quickly. The only recourse would be that suggested above. Even those few small steps would require more focus and patience than is demonstrated thus far.

Can we expect the subsequent 'transcriptions' to rise above this level of mediocrity? There is no hint herein that they might.

I don't believe, however, that we are seeing the product of a commercial venture or a private hoax. There is the feel of a heavy hidden-hand. Yes, a bureaucratic flavor, as in 'good enough for government work'. I would suggest, as above, that we are seeing the continued playing-out of a committee's rendition of deniable disclosure, aimed mainly at the small and captive audience right here. SDP remains the protocol. We continue to mark time and mark a place. Hurry up and wait, is the feel of this. This just keeps a January date on the back-burner, but probably not the first option at this point.

One might hope that the expressed level of frustration with this latest release would help to foster some new ideas and action, on the inside and outside.

There is no sense of history being made here or even of any genuine excitement. The dialog is replete with clichés and platitudes. Surely there would have been a photographer present for the historic record. Take a look at the recordings of the Cuban Missile Crisis. Without better dialog here, the names would be useless. Folks will just laugh at the amateurishness.

On the other hand, if there was truly something sensitive, there would have been no formal meeting, no record at all. No more than four people present. The given scenario is neither here nor there. Thus the feel of its being a construct, purely for public consumption.

The only possible sliver of reality in this episode is the comment inserted by Victor, as noted above. Still no one has noticed this. And once again we see the cleverness of CK being able to hide behind the 'insanity' of r&d. Hide the gold down an apparent rat hole, complete with live rat!

Given the poor reception of #27, any shot would be a long-shot. The best shot would be to play the aviary politics to the hilt. Get onto each of the birds about their knowledge of Bobby-R. Hound Victor about his comment on Hal. Bobby-R is the only Ray of light in this little fiasco.

It is more clear than ever, that Hal is the main conduit from the insiders to Victor. I had not quite come to the obvious conclusion earlier due to Hal's normal reticence, but this specific function makes good sense. Kit would be the most knowledgeable about this connection. If you are going after one person, Kit would be the one, IMO. He is more vulnerable than CK. Notice how viscerally he reacted a month ago to my cheap-shot at Hal. These folks have played us for fools once too often. Is it not time for some turn-about?

Immaterialism on the Web

On several occasions here I have stated that the Internet could be decisive in facilitating public interest in a coherent world view, i.e. the one being presented here. It is high time to attempt an assessment of this possibility. I'll be doing this in the form of a continuing, informal guided tour of the Internet.

As the most likely starting point on this tour, I would suggest the topic of immaterialism. The intellectual leap from materialism to immaterialism represents the single biggest obstacle on the path to coherence.

Let's see what we have. Google provides 1,500 hits for '[immaterialism](#)'. Not too bad for a start! But now we have to cull through them.

The very first [hit](#) is a diatribe against immaterialism posted on a Mormon website and written by an LDS official. Curious, but not sufficient to warrant further notice now. The second [hit](#) is a brief summary of Bishop Berkley's account of this topic, he being the originator of the doctrine in its 'modern' guise. Next there is a 'Neoist' (?) text on 'Dialectical Immaterialism' which goes right over my head, and which should not be confused with a former rock band of the same name.

Further on down is a [book](#) listed on Amazon concerning the 'Physical Basis for Immaterialism.' This is the only book listed on this topic on Amazon, other than those on the good Bishop, or out of print, or both. It receives favorable mention from a Vedic scholar, and the charge of 'incoherence' from a reader. Clearly the publishing industry is not presently bent on overturning materialism.

Following are numerous items focused mainly on the history of immaterialism and idealism. Coinciding with our *fin de siecle* resurgence of interest in the mind is an increased interest in non-materialist philosophies. The new metaphysical material confines itself cautiously to the mind-body problem, per se, and the more expansive historical worldviews serve only as proxies at best. This speculative caution is well advised in professional circles whose secularism is being jealously guarded against any possible sectarian encroachment or subversion.

Mind -- on the Web

In contrast to the 15 hundred hits on 'immaterialism', 'mind' yields 26 million. Not surprising, really. But consider the uphill battle for those philosophers and scientists who wish to eliminate all reference to the mind as being scientifically illegitimate. They face a gargantuan job of censorship! Take the very first item: [CIA Analyzes Mind of Iraqi Leader](#). What would be the scientifically correct rendition of this news item, I wonder? How about 'CIA Analyzes Cognitive Content of Saddam's Brain'? But does that not directly imply that Saddam's brain is in a vat in Langley? OK, so one could 'speculate about' the cognitive content of his brain, but there is still the implication that an analysis of the physical brain might, at some point, be relevant. How would we then make a distinction between Saddam as biological specimen and Saddam as political agent? Would that not be a necessary distinction for our government to make? If the brain scientists expect us to forego all thought (sic!) of agency, the ramifications multiply endlessly.

Conveniently there are on-line repositories for scholarly discussions of the nature of mind. [Online papers on consciousness](#) maintained by David Chalmers is the principle one of these. Numerous other relevant web resources have been compiled on the same site.

It is not difficult to get the impression that this topic has been picked over rather thoroughly in the last decade or so, and that after some initial progress the discussion has bogged down. One is hard put to find significant changes in the positions of the participants. If one side or the other were to win the debate at this point it would be the result of sudden professional attrition. There is no neutral party that is keeping score. Each side is adept at spinning the results in its own favor.

What seems to be the case is that the 'mentalists' have all the mental evidence while the materialists have all the material evidence. Each side imagines that its own evidence is conclusive. I do not see a prospect for the breaking of this intellectual logjam, other than by an external influence.

Postmodernism on the Web

Postmodernism is well represented on the Internet. Yahoo and Google provide excellent starting points: [Postmodernism](#) and [Postmodernism](#), resp.

'Pomo' mainly bills itself as a deconstructive method of criticizing art and literature. I have yet to see its deconstructive tools applied to modern cosmology. There have been occasions where it has critiqued individual scientific disciplines from the perspective of their alleged cultural relativism. The notorious Sokal hoax (q.v.) was supposed to have been a cultural critique of quantum gravity theory.

To put it succinctly, postmodernism provides only a retail method of cultural criticism. To mount a wholesale critique it would need to venture its own worldview, something which is constitutionally proscribed to it. The last such was mounted by Karl Marx.

Of some relevance to our purposes is the sectarian response to postmodernism. A Google search on '[christian & postmodern](#)' yields a mixed bag. On the superficial side are various responses to the latest in pop culture. On the more serious side is a nostalgia for the simple bipolarity of religion and science that marked modernity. The fear is that the postmodern anti-foundational fragmentation of truth is already facilitating the further fragmentation of the Christian evangel. There is the awareness that postmodernism is a game being played by a staunchly secular intelligentsia, whose take on religion vs. science is a curse on both establishments.

A thoughtful assessment of the sectarian dilemma may be found in [Beyond Foundationalism...](#). In this article Grenz claims that the history of philosophy and theology rationally entails an eschatological coherentism, a view with which I can hardly argue. I notice that his writing is featured by the mainstream evangelical InterVarsity Press. The immaterialist metaphysic behind such a view remains implicit. He simply does not foresee the earth shaking paradigm shift that I do.

But on the note of this positive finding, let us move along to the next web topic, leaving a more detailed examination of postmodernism for later.

Eschatology on the Web

There is no shortage of material here. Google and Yahoo have directory pages devoted to [eschatology](#) and [end times](#), respectively. The sites covered are all in regard to Christian fundamentalist interpretations of biblical end time prophecies.

It is fair to say that its eschatology is the feature that most clearly distinguishes fundamentalism from the rest of Christianity. It is a belief that fundamentalists happen to share with the earliest Christian communities, according to the historical record, but there remains some controversy as to whether Jesus was a direct source of that concern. Eschatological beliefs permeate the entire prophetic tradition, almost by definition, but it does appear that Christians are not to be outdone in the degree to which they have elaborated upon this one theme.

Otherwise the subject of eschatology is virtually taboo. My criticism of the traditional prophetic eschatology is for its unnaturalness. Armageddon, apocalypse and Judgment feature prominently in the teachings. The eschaton is the mark of a wrathful God. Only a faithful remnant may be spared the full brunt of this wrath.

Such views hardly conform to the philosophy of the Best Possible World . What is at work here are the remnants of dualistic thought going back at least to the good and evil ones, Ahura and Ahriman, of Zoroastrianism. The Gnostics attributed evil to matter and even to nature, setting aside any rationale for creation. It was God's duty to destroy evil in the end, which He would do with relish.

On the immaterialist view, the coherence of the temporal world implies the finitude of its temporality. Obsolescence is a natural and logical part of our world. The realm of eternity is another matter, of course. The only question for theodicy is the optimal duration. We will be partly responsible for this determination as part of our Millennial preparations for the Omega, in close consultation with God.

A Hard Core of Truth Seekers?

I would like to think of myself as one of these. I was a Sputnik 'baby' to the world of physics. My father had been impressed by [Donald Menzel's](#) involvement in the Manhattan Project, and his astronomy books were read to me at an early age. Sputnik and Manhattan Project sound more like power than truth, but power and truth are more than tangentially related. Recall the coda of the Lord's prayer, for instance. Truth may be more a matter of what you know, and power of who you know, but these lines are often conflated. A nuclear weapon may convey the notion of 'fear of God' even to a materialist. And what of God do we fear more, the power or the truth?

I would naturally look to my former colleagues in physics, and particularly among those who have evinced an interest in the mind, as potential comrades in the seeking of truth. An interest in the mind has come late to the physics community, and it remains muted. It has never been able to get a handle on the mind, slippery beast that it is. The closest thing to a handle is the quantum, yet the possible quantum-mind connection shows no sign of fruition.

In David Chalmers' list of online papers I recognize the names of several physicists in the [Consciousness and physics](#) and [Metaphysics of consciousness](#) sections. I have had just a few communications with Henry Stapp over the years, and that is about it. These are professionals interested in a decidedly fringe and speculative area. Frankly they have to be careful to maintain their professional status. The sorts of speculations in which I engage would be several orders beyond what might be tolerated by their colleagues. Public association with the likes of me or my ideas would be problematic at the least.

About the only way I can envision engaging such folks would be by the creation of a sufficiently public discussion that they could comment upon it from a professional distance, rather than appearing to be personally involved.

A point to be taken here is that professionalism is, at best, conducive only to those truths that might fall within its historically defined purview. Thomas Kuhn recognized this as a potential inhibition on truth seeking some time ago. In science, as in most endeavors, revolutions come from out of the blue. They are never the result of 'normal' scientific research.

Kuhn's followers viewing this history from a postmodern perspective suggest that any number of intellectual revolutions need not add up to the truth. It could be an endless circling, or there could be no objective reality to begin with.

As I have stated before, the scholarly mind-matter debate has made waves and rocked a few boats, but seems now to be bogged down. The physicists are in a better position than most to recognize the cosmic implications of a foundational approach to the mind. But even the most astute of them have difficulty seeing it as being much more than an intellectual puzzle. They don't see any need to dial 911. That's our job. I hope I have dialed correctly.

[later the same day...]

From a search on ["intellectual revolution"](#) let me recommend the following [Bonus chapter on nutty quantum theories](#) by John McCrone. Quoting from Christof Koch, "...the physicists expect to find the secret of consciousness in some grand, fundamental twist on the laws of nature. In keeping with the great breakthroughs in the basic sciences, they believe the answer should have a deep and beautiful simplicity." But this could be permitted only to come from within the mathematical framework of theoretical physics. Anything that might transcend that framework has no purchase with the physics profession. It would be allowing the tail, mind, to wag the dog, physics. The physicists have been doing the wagging for a long time, and they don't wish to get wagged, thank you very much!

7/13/02

Funda-Mental

The physicists in the consciousness movement have been trying very hard to find a link between the mystery of the mind and the mystery of the quantum. The most suggestive link is in the measurement process. For instance, the focus of attention on a particular process in the brain might in a bootstrap fashion influence the selection of the states being recorded in our minds. Obviously there is a mismatch in scale between the higher order thought processes involving intentionality and the sub-molecular quantum processes. The problem of maintaining quantum coherence on any reasonable scale is a severe constraint on such speculation.

The mere presence of the quantum does not account for any of the qualities of subjective experience. At best the quantum could serve as a link between the qualitative realm of mind and the quantitative domain of physics. We would still be left with a '**quantum dualism**', where the quantum replaces the pineal gland in the Cartesian version of the mind-brain duality.

Despite the absence of any solid results, the speculations of the quantum physicists provide a very important scientific cachet for a resurgence of popular interest in vitalism. We should pause to try to appreciate the extra-scientific motivation for this interest.

It would appear that what molecular biology has taken away from us, the quantum is giving back: that is our ability to believe in a life force. Is our desire for a life force greater even than our need for God? Or is it serving as a politically correct substitute?

I believe that the definitive characterization of this needed force comes from Yoda of Star Wars: 'May the Force be with you.' Notice the personalization of it. What Darwin took away, a quantum savvy Yoda gives back. The 'Force' represents the bottom end of the Great Chain of Being. God is the top end. Each can do double duty. In either case we are not the accidental tourists in an uncaring universe. We are not an epiphenomenon of atoms swerving in the dark. There is something Fundamental about our Being. We are rooted in the very nature of reality. We are not a superfluous flash in the cosmic pan. So reads our deepest longing.

On the Web:

<-- [Prev](#) [Next](#) -->

[Topical Index](#)

7/14/02

Funda-Mental (part 2)

Let us explore our 'deepest longing' on the Internet, allowing Google to strut her stuff: [vitalism](#) (7400), [panpsychism](#) (1700), [pantheism](#) (35000), [animism](#) (30000), [holism](#) (28000), ['conscious universe'](#) (2300), etc. These figures, or course, only show that certain terms are being bandied about on the web.

But consider this data from the point of view of our apocryphal atomistic, mechanistic reductionist. That poor gal might feel besieged. She might feel like road kill on the highway to postmodernism and beyond.

Consider holism: [Holism in Artificial Intelligence?](#), for example. This doesn't sound very touchy-feely, now does it? Is this icon of the New Age being appropriated by the mechanists?

"In the discussion on semantic holism it has been claimed that A.I. is almost entirely holistic. In this paper I show that some of the main lines of research in symbolic artificial intelligence are not holistic...."

Hmmm... What?

As best as I can make it out, this holism is the positing of a relationalism in regard to the meaning of words and sentences. Context dependency is a part of it. At first blush it is a promotion of structure or form over content or substance. If this is a retreat from semantics to syntax, it is a reductionism. Or is it?

We still have those relations to account for. Are they internal or external? There's the rub. Obviously I'm going to have to brush up on my syntax, maybe on the next page, or so. Relations are generally taken to be in the eye of the beholder, or are they in the mind's I of the computer? If the orange is ten inches from the apple, someone has to be able to verify that. There have to exist measurement standards, etc. And are the identities of the relata not thereby irreducibly entwined? The deepest metaphysical proclivities of at least some of the meaning holists, such as Willard v. O. Quine, remain notoriously opaque, if I'm not mistaken [but see [Quine's Holism](#)]. May the Force be with you, Willard? Later....

Even if it is not with Willard, there are, as you may see, a plethora of other willing subjects out there in Web land.

We are then left to wonder whether this hypothetical, vital, Funda-Mental Force (or glue?), could be blind, given all that it must accomplish by way of evolution and watching out for Luke Skywalker. As at least implied earlier, I have much difficulty conceiving of a non-transcendental panpsychism. Does there not have to be a coherent source or potency beyond space and time? Some great minds have propounded an atheistic pantheism, but are they thereby coherent? And if the pan-Psyche is incoherent, how could we come to comprehend that of It, without at least personalizing Her? Is the babbling brook incoherent? Am I in a questioning mood today?

7/14/02

Quine's Holism

You know the drill: [Quine & Holism](#).

It is fair to say that Quine was a pivotal figure in 20th Century philosophy. A single slim volume of his at mid century managed to wreak havoc with the Anglo-American analytic tradition. Its repercussions provoke lively debate into this next millennium, even on the Continent.

Yet, Quine was no subversive, anarchist or visionary. He was a Harvard don. He just wanted to set the record straight. He and Niels Bohr were nevertheless the progenitors of what is the single most characteristic concept of our postmodern world.

And what is this concept? Does this have something to do with the \$40 billion holistic health industry? What does context dependency have to do with ginseng tea?

It has to do with non-localized, distributed meaning. There may be a private mental language, but words are not thoughts. It is all representation and context. The meaning is not in the sound, it is in the silence between the sounds, to give it a Zen twist. The only real meaning is in what we can live and feel. Fear is in the pit of the stomach, as they say. It is in the shadows.

[7/16/02]

I have been reading Ernest Lapore's [Conditions on Understanding Language](#) (c.1995) [listed on [Philosophy of Language Links](#)], an attack on the behaviorist, functionalist reduction of semantics to linguistics and syntax. On his view, Quine is one of the reductionists. He cites agreement with Fodor and Dummett in his own metalinguistic, metaphysical approach to a purely mental semantics.

It appears that I will need to review Fodor. According to Christopher Green, [Review of Jerry Fodor's 'In Critical Condition'](#), Fodor is a reluctant defender of innate ideas. The fact that Fodor is also a proponent of strong 'computational functionalism' in no way inhibits his thorough going criticism of his 'colleagues'. Innate ideas are not good news for materialists.

Using Fodor as the icon, we may be able to locate a coterie of conscientious objectors to the program of the materialists and reductionists, who nonetheless can speak directly to them. There remains the hope that an argument will emerge that is sufficiently cogent to cause a public rethinking by the intellectual community. If rational theism is to emerge in some rational fashion, this would be its best opportunity.

I'm starting with Fodor's [Doing Without What's Within](#).

I'll have to return to holism a bit later....

On the Web:

[<-- Prev](#) [Next -->](#)

[Topical Index](#)

7/16/02

Jerry Fodor & Co.

In his [Doing Without What's Within...](#), Fodor's topic is 'nature vs. nurture.' Generally speaking, rationalism and nativism are pitted against empiricism, naturalism and associationism.

Fodor is quite amenable to having his nativism be explained by a genetically inherited computational functionalism, much as Chomsky has been with his innate grammar. I am not aware that either of them has ever spoken favorably of idealism. But both of them are realists concerning ideas, and that is a big step beyond mere materialism.

Once Fodor calls himself a reductionist [but only at heart, too many other things going on] which might square with his computational functionalism, but more frequently he speaks of his rationalism, something not normally considered mechanical or naturalistic. He does repudiate naturalism. It would seem that Jerry is trying to hang out on a slender, multidimensional pinnacle, requiring considerable philosophical dexterity. There is no solid high ground here. His sympathetic colleagues watch mostly from a safe distance as he performs his aerial jousting.

One alternative to computational functionalism is connectionism. It seems to be generally accepted, however, that connectionism is much too mushy in its general construct to be even slightly amenable to the compositionality that is a fundamental characteristic of our thought processes. There is no physical basis for the sequentiality of thought. Another alternative is associationism, going back to the origins of empiricism. It is a recurring glimmer of an idea that has never been able to acquire substance.

One problem facing the computationalists is to explain how their mental tokens can be both representational and causally efficacious at the same time. It seems rather like a preordained harmony. Is this not also the problem of intentionality in general?

Fodor is a long time defender of mentalese or the language of thought hypothesis (LOTH).

[Later: see [The Language of Thought Hypothesis](#) -- Murat Aydede. Excerpts:

(A2) Representational Theory of Thinking: Mental processes, thinking in particular, consists of causal sequences of tokenings of mental representations."

(B1) representations of the system have a combinatorial syntax and semantics: structurally complex (molecular) representations are systematically built up out of structurally simple (atomic) constituents, and the semantic content of a molecular representation is a function of the semantic content of its atomic constituents together with its syntactic/formal structure, *and*

(B2) the operations on representations (constituting, as per (A2), the domain of mental processes, thinking) are causally sensitive to the syntactic/formal structure of representations defined by this combinatorial syntax.]

When we think to ourselves we tend to do so in our native tongue, but at a deeper level there is often thought to be a private system of symbols, physically realized in the brain. Many others find the very idea of a private language to be oxymoronic. However, the more widely accepted notion of a universal grammar might also provide a foundation for subliminal symbol processing, if the symbols could be given a more universal aspect. Some aspects of sign language are now being touted as a possible precursor to spoken language.

[Later: It was said that Fodor has been moving toward the functionalism of Dennett. I'm not sure how this should be taken.]

[8/26: but see [From Intangibles to Memes](#)]

As you can see, the field of cognitive science remains in a nearly complete disarray, even after much initial promise. It is a scattered collection of half-baked ideas in need of a foundation, and I don't mean the charitable kind. If idealism could make any substantial offer, the cognitivists would hardly be in a position to refuse, and the AI crowd would be likely to take up arms at a moments notice. It would be exciting.

Aren't we in need of a top-down, teleological process? How might that be demonstrated? How could ideas not be associational and teleological at the same time? A monadology of ideas? A mathematical analogy? Ideas vs. numbers. Perhaps all we need is a better search term for Google. Invariably my best ideas are scooped by the web. That's the scoop, throops.

It appears that cognitivism is in a late Ptolemaic phase, and does not know where or how to look for a new sun. Epicycles of the mind.

'Naturalism in Question'

Please excuse my plagiarizing the title of an alleged to be forthcoming publication of the Harvard University Press. HUP does not publicly acknowledge that this book is in gestation, so I'll take the word of [Huw Price](#) and keep my 30+ bucks in my pocket. [And now it is almost [here](#).]

It is my fervent hope that naturalism will be questioned. According to Quentin Smith, in his '[Metaphilosophy of Naturalism](#)', it was Alvin Plantinga's [God and Other Minds](#) (1967) which laid the groundwork for the resurgence of of an intellectually respectable theism. Quentin claims that as of the new millennium fully one-quarter to one third of the philosophy professors are avowed theists, and that philosophy of religion is the largest category among the philosophy titles of the Oxford Press.

Gosh, maybe I missed something. Perhaps the Millennium has already arrived. I'm not quite convinced. The last time I checked, religion and science were still keeping each other at arms length, and Quentin acknowledges that:

"... the great majority of naturalist philosophers react by publicly ignoring the increasing desecularizing of philosophy (while privately disparaging theism, without really knowing anything about contemporary analytic philosophy of religion) and proceeding to work in their own area of specialization as if theism, the view of approximately one-quarter or one-third of their field, did not exist."

As it stands, the return of theism to the academy is, so far, just another symptom of our postmodern pluralism. Yes, naturalism has been and is being questioned by some of the best minds available, but evidently not in a manner that has forced a direct response from the naturalists in question.

From my, perhaps limited, vantage on the web, what I see is, for example, '[Deconstructing the Mind](#)' by Stephen Stich (c.1995). In a section called 'Deconstructing a Deconstruction' he forthrightly confesses to the error of his former eliminativist position regarding the mind. Naturally it is only a very subtle error to which he is willing to admit, but sufficient for this significant turnaround, and Stephen was a senior statesman among the eliminativists. I have not been able to assess the impact of his defection on the rank and file, no one is keeping score in public. I am not even aware of a single other instance at this point.

Nonetheless, the hand is writing is on the wall: 'Naturalism is under the gun.' But which gun is it?

On the Web:

[Topical Index](#)

7/19/02

A de facto Dualism

Plantinga and his followers, e.g. the [Plantigapage](#), put their main emphasis on our personal knowledge and experience of God. This follows in the Protestant, existential, I - Thou tradition. There is plenty of analysis, in the modern genre, but little in the way of systematics and virtually no cosmology beyond fairly cursory examinations of the Anthropic Principle.

Our theistic philosophers are focusing on rebutting the backlog of analytical arguments against our putative knowledge of God. Once again, it's possible, to believe in God and still be considered rational.

Is it thereby irrational not to believe in God? No. I know of no instance where these theistic philosophers attack the tenets of materialism, beyond alluding to what is already being debated on the mind-body problem. There is no active theistic angle in that debate. They are sticking to the epistemology, and questions of metaphysics and ontology are avoided.

As long as the traditional Religion vs. Science duality is respected there will be no real confrontations. Earlier I have alluded to the '[Intelligent Designers](#)'. They remain an intellectually isolated, minuscule faction of evangelical scientists who, I believe, are barking (loudly!) up the wrong tree.

My belief is that this duality is unstable. It was unstable before Darwin, and is more so now. However, there will be no new movement until the metaphysical dualism behind the Religion vs. Science duality is questioned. The mind-body debate should provide the opportunity to raise this question, but it will not happen from a global or cosmological perspective until the God question is brought into that debate.

It would then not take much to rock this boat. From my outsider perspective, I can't tell yet what is the source of this remarkable restraint against boat rocking.

[Later:]

One job now would be to go through the Plantinga related sites looking for anyone who might be contemplating any of the of the boat rocking stratagem being outlined here: Google: Plantinga & ??.

It should be noted that , in his '[Metaphilosophy of Naturalism](#)', Quentin Smith, a naturalist, does claim that modern naturalism has been defeated:

Due to the typical attitude of the contemporary naturalist, which is similar to the attitude expressed by Searle in the previous quote, the vast majority of naturalist philosophers have come to hold (since the late 1960s) an unjustified belief in naturalism. Their justifications have been defeated by arguments developed by theistic philosophers, and now naturalist philosophers, for the most part, live in darkness about the justification for naturalism. They may have a true belief in naturalism, but they have no knowledge that naturalism is true since they do not have an undefeated justification for their belief. If naturalism is true, then their belief in naturalism is *accidentally true*. This philosophical failure (ignoring theism and thereby allowing themselves to become unjustified naturalists) has led to a cultural failure since theists, witnessing this failure, have increasingly become motivated to assume or argue for supernaturalism in their academic work, to an extent that academia has now lost its mainstream secularization.

He, too, is wondering why this news does not get around.

On the other hand, please note that Quentin is the editor of the [Philo](#) journal, now in its fifth year:

Philo is the only professional philosophy journal devoted exclusively to criticisms of theism and defenses or developments of naturalism. To facilitate discussion and debate, Philo also publishes defenses of theism and criticisms of naturalism. The interest in naturalism extends to the relevant branches of

naturalist philosophy, such as naturalist metaphysics, and especially naturalist ethics.

Obviously we do not have a total blackout. Along these same lines I would also note [THE SKEPTICAL THEISM WEBSITE](#). This site is rather less pessimistic about the state of naturalism.

And also, just from [Google: Plantinga & Quentin](#), there is [Scientific Materialism, Intelligent Design, and the Cosmological Argument](#).

Let's see if the boat is at least heeling just a bit.

Mind-Body & God

What is most noticeable on these pro & con theism sites is the reluctance to take up the mind-body problem:

[Google: Plantinga & Quentin & mind-body](#): 18 hits, including:

[Darwin, Mind and Meaning](#) -- Alvin Plantinga

Furthermore, the probability that our cognitive faculties are reliable (i.e., furnish us with a preponderance of true beliefs) on Darwin's dangerous idea is either low or inscrutable (i.e., impossible to estimate). But either gives the devotee of evolutionary naturalism a *defeater* for the proposition that his cognitive faculties are reliable, a reason for doubting, giving up, rejecting that natural belief. If so, then it also gives him a reason for doubting any beliefs *produced* by those faculties.

[The Argument from Consciousness Refuted](#) -- Conifer

Many Christian philosophers (e.g., Richard Swinburne) advocate a theistic argument which has begun of late to garner considerable popularity in the literature. The argument is one from human consciousness, i.e., it appeals to the phenomenon of human consciousness as its main premise. That phenomenon, so the argument goes, is somehow unlikely or perhaps even impossible on the assumption of atheism (or naturalism).

This latter quote sounds promising:

[The Evolution of the Soul](#) by Richard Swinburne (1997 rev.)

Oxford Professor of Religion Richard Swinburne defends substance dualism, a philosophically unpopular account of the mind as far as contemporary academic philosophy is concerned. The so-called "mind-body problem" provides the groundwork for this old philosophical argument, once shared by most of humanity before the secular age emerged. Simply put, substance dualism holds that the brain and the mind are separate entities regularly and causally interacting with each other.

OK, but it is a throwback to a very traditional form of dualism. I'm looking for something more open to new possibilities.

Theistic Idealism

I am deservedly embarrassed to say that I have just, finally, focused on a significant blind spot of my own. How many others do I have? The [founder](#) of the church I attended as a child was the leading light in this defunct movement that I am straining now to see revived. Our sister parish in Pasadena was founded by an ancestor who also founded a well known scientific university that used to bear the family (both sides!) name. The juxtaposition of science and transcendentalism was endemic at that time. Somehow, until I just confirmed it in the Britannica, I was not clear that transcendentalism was just a species of idealism. Another American denomination founded in Boston, Christian Science, was, I used to think, the only ever existing sect of theistic idealism.

The sinister cabal, at least a significant part of it, that conspired to eliminate immaterialism from our collective psyche lies buried in the family plot in Mount Pleasant. Small world! Is not the truth usually hidden in plain sight? It is also to be found in Boston's '[Metaphysical Club](#)', a misnomer if ever there was. What gives? How and why did we drop this ball? Was there too much California Dreamin', or, thinking of Cal Tech and Cambridge, was there not enough? The lion sleeps tonight.

Google: [Theistic Idealism](#) (40 (+ 1?) hits). Our work is cut out for us.

[Pragmatism](#) (132,000+) is the name of the conspiracy. Something funny happened on the way to our manifest destiny. We became the 'gold mountain,' beacon to the aspiring. Are we surprised? Disappointed? Not really. Have faith. It's just another part of the plan. A sometimes tender trap.

[Charles S. Peirce](#) (6,040), whose grandson [well, nephew maybe?] was a grade school classmate of mine in Concord, or so I still like to think, was the brains behind the conspiracy, or so we are told. Perhaps we should pick his [brain](#).

But I already know the story behind the story. It was a very short walk across the Charles River Bridge from the college to the 'B' School, that my Dad soon took, awestruck by the Bomb, and the soon to be [Best and Brightest](#), some of whom he would be mentoring there. And while we're into small worlds, you may recall my Dad's 'Manhattan' colleague, Donald. Both he and Charles' Dad specialized in lunar occultations at the nearby Observatory. If that sounds occult, well, you ain't heard nuthin' yet.

On the Web:

Charles S. Peirce

After working with his Dad on the occultations, Charles became an expert in the logic of relations. How could he possibly have missed relationalism? Or did he? I think we're about to find out.

Moving right along, allow me to use an extended quote: [Charles Sanders Peirce | Philosophy- The Integrating Science](#):

Since, action in the world is so crucial to human life, Peirce was concerned to find the best way to move us from a state of doubt to a state of belief. He outlines three methods that have been used for this purpose: tenacity, authority, a priori rationalism.

The method of tenacity (e.g. faith) is the method of clinging to a belief in the face of contrary evidence, of putting one's head in the sand. The method of authority (e.g. state censorship) is the method of using the power of the state to force people to stay committed to the "correct" belief. The method of *a priori* rationalism (the legacy of Descartes) is the method of simply deducing from idea to idea, through single threads of inference, without reference to evidence.

These methods, Peirce notes, have problems. Tenacity gives way to the re-evaluation of one's beliefs when confronted with the conflicting opinions of others. Authority, though practically superior to tenacity (because if everyone's beliefs are identical, one is less likely to encounter differences of opinion), cannot rule out that people will compare their beliefs to those of other cultures and eras, and form new doubts. Rationalism, while more respectable and intellectual than the other two methods, makes beliefs a matter of philosophical "fashion". Peirce notes that the history of philosophy is characterized by a ***pendulum-like swing back and forth between idealism and materialism*** [italics mine]. People will notice this fact, and -- since their ideas seem to be determined by the "taste" of the era, and not by what is really true -- they will begin to doubt their beliefs.

The main problem with these three methods, Peirce diagnoses, is that the beliefs they lead to are unstable, i.e. they quickly lead to the reappearance of doubts.

"[I]t is necessary," Peirce writes, "that a method should be found by which our beliefs may be determined by nothing human, but by some external permanency -- by something upon which our thinking has no effect." This method is the scientific method, the best method of eliminating doubt. It leads in the long run to the most stable beliefs. One forms hypotheses based on the objective facts and performs experiments to test these hypotheses. One's conclusions are made known to the community of thinkers who can then judge them and, if necessary, offer revisions of them. This process, if fully carried out, is fated ultimately to bring out the absolute truth on all questions.

Ah, yes. Another casualty on the Cartesian road to Certainty. Far more have been killed on this road than any other in history. How could the Best and Brightest be so dense!!

Next topic? As to that 'pendulum', well, whoever swings last, swings longest. Spoken as a true eschatologist.

Did Charlie not notice the oxymoronic flavor of his pragmatic absolutism? What was in that transcendental water in New England? The Bomb and the dinosaur bones do make immaterialism a little hard to swallow, even with full glass of transcendentalism. Absolutism is an occupational hazard for any transcendentalist. The only safeguard in history (just ask our Islamic friends, etc.) has been the incarnation, that very untranscendental (almost obscenely so) irruption into history. With Y2C we have

just a necessary reminder of that X-event, and don't you forget it.

The, oh so, modern materialist may honestly plead total ignorance of her transcendental roots.

C. S. Lewis ('Jack' to his friends, I'm told)

Following a little further down our 'conspiracy' path, we must cross another river from Cambridge, not the Charles to the 'B' School, but over the Cam and through the woods to [Jack's idealist Christian cabal](#) at Oxford on Thames.

I guess we're about to find out how in one generation we got from a hot bed of [idealist Christians](#) to the trash science of Richard Dawkin's [selfish genes and memes](#). For the love of Christ! Some heads will roll.

Jack is the exception that proves the rule. But what is the rule here?

My guess is that it mostly hinges on the Bomb, and those funny bones. But where was the fear of God? All I've heard from that direction was a fear of Shiva and of Joe, Stalin that is. Was U235 part of the plan? If it were, then we must be some real ornery customers.

Why not just use a *deus ex (saucer) machina*? Wouldn't that be a lot friendlier, more in keeping with the BPW scenario -- fewer heads rolling? If anyone knew the answer to that it would have been 'Manhattan & MJ12 (Saucer)' Don the Harvard don, and my Dad's erstwhile buddy on the Steering Committee. It's fair to say that I spent the last ten years pursuing that lead, and here I am, still wondering. It was the Bomb that expedited the Internet, in how many different ways? Perhaps we were running a few years late for Y2C, and still are, for that matter. Bomb + Internet >= better than Saucer?! Why, you ask?

On the Web:

[<-- Prev](#) [Next -->](#)

[Topical Index](#)

Bomb + Internet >= better than a Saucer?!

If this is correct, then C S Lewis would have been a threat to the plan. If his Christian cabal had infiltrated across the river and across the pond, our Cambridge Pragmatists, the 'B' schoolers, ARPA, and even the Internet bubble, would have been a very different story. The Bomb kept a lot of things under a lid. The Bomb, *sans* Lewis, planted a very firm wedge this last century between two increasingly influential groups in this country -- the secular, technocratic intelligentsia vs. the **fundamentalists**. With a Lewis clone on this shore and no Bomb, the Y2C (i.e. second coming) would have had to have been mediated by a Saucer, rather than by this minimalist, 'prime directive' respecting Internet method. Sure, this is a big stretch, but a little cosmic 'pronoia' can go a long way in this game.

[Later: I think I'm trying to say that another Lewis, over here, back then, *sans* Bomb, might have led to a much less dramatic, more evolutionary paradigm shift toward theistic idealism. The dramatically punctuated shift possible right now is more in harmony with the eschatological drama of the prophetic tradition and with the original X-event. Otherwise we might have needed a *deus ex machina* to pump up the drama.]

Wouldn't the Saucer have been more fun? You know, the one that the Guy in the white robes gets out of, on the White House lawn, under the TV lights. Blinding! (Like the Greeks used to do in their dramas.) But, no, not more fun, think about it.

We're adults now, not little kids at a cosmic circus. This is the Best Possible World. We are about to be treated to participatory eschatology. Internet spells 'participation'.

The pendulum does swing between materialism and idealism. It has already swung back from materialism almost now to the middle, but it has considerably further to go. We can just pick up with theistic idealism, where we left off about a century ago. We just have to keep nudging that pendulum. The bursting of the economic bubble, the clash of civilizations, there will be plenty of drama. But the real drama will be right here, even on this site, or on one not terribly different. There will be the default immaterialist eschatology 'blog'. Opportunity is knocking. May the best bloke win. Someone will be able to talk to the Fundies and the Eggheads at the same time. No mean feat. A Connecticut Yankee in King Arthur's Court?

Idealist Cosmology

Over the years I have come to accept that mine was a lonely struggle against enormous odds, but when a few minutes ago I entered "[immaterialist cosmology](#)" into Google and obtained the portentous result of zero hits, even I was taken aback. Google covers, I believe, at least two billion pages. Even a monkey on a typewriter would have done better than that, as a simple calculation ought to show. As of now I am the first person to type that phrase on the web.

If this is not a cause for 'pronoia' I don't know what else could be. This seems reminiscent of an 'ovoid' model of revelation. The truth, like an ovum, has a membrane barrier, and only one sperm is destined to penetrate. That is how the cosmic communication channel is kept optimally noiseless. This also had something to do with the Aquarium's peculiar interaction with the CIA. There is a minimal cosmic conspiracy behind this mini-messianic, second coming, and our friendly spooks at that acronymous agency had to be minimally involved so that history would not repeat that sordid business with Herod and Pilate & Co. Otherwise lightning would strike from the NSA as soon as I hit the Front Page publish icon. I'll try it right now just for the heck of it. Don't switch the dial....

There, see, what'd I tell you. No lightning. Obviously Catfish has done his job. Good work, Ron!

But back to business. Let's try "[idealist cosmology](#)" -- four big hits, and I know one of them personally, [Amit Goswami](#), that is, nice fellow. He is or was a physics professor at Oregon (U?) at Eugene, and was visiting family back in DC a few years ago.

There is just a slight problem. Like almost all of our immaterialist colleagues, he suffers from the Blavatsky syndrome. I was a virtual member of theosophy for a few years, but I realized that out of at least subliminal opportunism, Helena P. had compromised the central tenet of coherence, in capitulating to the materialist cosmology. She would have had to have been a saint not to have done that, and, as they say, she weren't no saint! If you don't have coherence, what the heck have you got?? Does this make me a saint? No, just one plucky spermatozoa, looking over his shoulder at the 800 pound gorillas in the wings, and the rest of us six billion beautiful swimmers.

Then what? Do I just sit here on this lonely cloud waiting for the Internet to gestate, gastrulate and what ever else it's supposed to do? Probably not.

There are a few other folk in here, I think. The only almost contemporary, just off the top, was [Owen Barfield](#) (1898-1997) (a must see site!). I should do some pages just on him. And don't they also say, at least in Rome, and probably also at McClean, the only good saint is a dead saint! There should be ample opportunity to ponder that little question. Just for now, please note, that before he came over here, Owen was a close friend of [Lewis](#) at Oxford. There was a CS Lewis 'clone' over here, a stealth one compared to his friend Jack. The only weak link may have been the eschatology, but do see his '[final participation](#).' Also, I guess, he just didn't have that physics chutzpa. There is something about becoming overly familiar with nuclear physics and cosmology that can cause one to grow impatient with the literati. That's my excuse, anyway, for the 'buck has to stop somewhere' mentality.

Holographic Universe

I almost forgot another recently departed 'saint', Michael Talbot and his '[Holographic Universe](#)' (1991). On the Internet "[holographic universe](#)" yields 4,100 hits.

The bottom line for Michael and me is the "return to dreamtime," the final chapter of his book. This phrase comes from the Australian Aborigines, but it is a concept prevalent in shamanism, and in the pantheist or eastern tradition. He points out that the idea that creation is an illusion or Maya is even present in the Jewish tradition. If the world is God's dream then we can't return to the dreamtime because we are already there. What the shaman are referring to is the time when even our waking world was more dream-like. The world is a '*coagulum spiritus*', from the alchemical tradition. This would also be an aspect of Barfield's '**final participation**'. We take pains to point out that this is not a return to primitive or tribal existence. This is part of the global mind or 'noosphere' leading up to the [Omega Point](#) of Teilhard.

According to Michael, the return to dreamtime could be as minimal as a punctuation in the continuing evolution of human consciousness.

Unfortunately, when I search on "[return to dreamtime](#)" there are only 18 hits, and none of particular substance. The message from Michael has not penetrated our waking consciousness.

On the Web:

<-- [Prev](#) [Next](#) -->

7/23/02

Teilhard's Omega

"[Teilhard & Omega](#)" yields 2300 hits. I have to take issue with Teilhard de Chardin's (1888-1955) mind-matter dualism. At the Omega Point the transcending human spirit leaves the earth behind, rather like a used-up cinder. His spiritual Omega was simply appended to the scientific cosmology without regard for coherence, and so we are left with this unfortunate disposal or perhaps recycling problem. Nonetheless, half an eschaton is probably better than no eschaton at all. Let us see how well the word has gotten out.

All too well, it might seem! It appears that Teilhard's Omega has been hijacked by the technophiles, not a very difficult feat considering Teilhard's infatuation (or was it just a flirtation?) with matter and cosmic evolution. Dualism always threatens to revert to materialism.

The theme of accelerating biological and technological evolution converging on a singularity of some kind is widely entertained: [Frank Tipler](#), [Ray Kurzweil](#), [Terrance McKenna](#), [transhumanism](#), etc.

Just to give you a flavor of our coming attractions I quote from [one](#) of my favorite singularity sites:

"We are at far more of a "turning point" than even the one Capra envisions; in possession of far more of a "web of reinforcement" than Baines could hope for; the morphogenetic-field potential is far higher than Sheldrake predicts; the groundswell documented by Ferguson is about to become a tsunami, with a capability to take the planet off hold and close the "vision gap" in a way that is perhaps more comprehensive than conceived by Barbara Marx Hubbard."

It is Terrance's [view](#) that the singularity involves the spawning of the psychedelic mushrooms who just use our brains to help them build intergalactic transportation for their own fungal genes, a decidedly comic twist of fate from Dawkin's selfish gene. No doubt the fungi have a more generous complement of DNA than do our own, recently discovered to be, impoverished chromosomes.

Our technotopians have less sense of humor. These cosmic Spinmeisters have taken our worst dystopian nightmare of a mechanized future and given it a sugar, or is that a silicon, coating. Our computers steal our souls and take off for the big Omega in the sky. Quite frankly I would prefer to have my DNA hijacked by a toadstool, than to have my soul stolen by an adding machine on steroids. The former is much more romantic, not to say, psychedelic. The mushrooms are more likely to keep us around for company, and at least we share a carboniferous ancestry.

7/24/02

Tipler's Omega

If you care to see the best possible secular future, you can piece it together out of [these](#), and take a look at the sponsor too, curious.

But, of all the secular futurists, [Frank Tipler](#) stands out, and, incidentally, he and I had the same advisor in graduate school. His vision is the most radical, and, yet, it is only a logical extension of that of his futurist colleagues. He is also the leading expert on Anthropics.

If you follow the anthropic argument to its logical conclusion, you will actually end up in the Aquarium. Frank did not quite manage to take the last couple of steps, or he just did not put 2 and 2 together.

The strong Anthropic principle, as he defines it, states that observers are a necessary aspect of any actual universe. Consider this rationale, which is my own adaptation:

It comes down to the quantum measurement problem. No event is a real event, unless it is observed. Observed by what? There must at least be a record of it. But can this record be temporary? If it is merely temporary, who is to say that it ever existed, when it no longer exists? All physical records are necessarily temporary, because they will eventually be destroyed by entropy. There has to be an external, eternal observer, which is non-physical by definition. In as much as we are aspects or reflections of the cosmic mind, we are that. A major bit of evidence is the lack of any physical explanation for the endurance and accessibility of our seemingly limitless, long-term memories, but we needn't dwell on that just now.

All existence has the teleological imperative to be observed. This should be viewed as a corollary of relationalism. At the Alpha beginning of the universe we have the fine-tuning of the physics. At the Omega end we have the universe being uniformly populated by technologically enhanced observers. Everything of significance is recorded in the cosmic computer which experiences an infinite subjective existence. In fact all of us are 'resurrected' [sic] in the guts of that machine. That is the silicon version of the eschatology of the prophetic tradition, as Frank is anxious to point out.

[7/26 -- Note that just now we have switched back to Frank's merely physical, computer simulated observers.]

In fact, we have no way of knowing whether this now is a real existence, or merely one of those simulated existences. And with only a modicum of reprogramming we could ensure ourselves of the Best Possible (simulated) World.

But then why do we have to bother with all that silicon? Once we realize that the mind-matter balance can tip either way, there is very little need for Frank's materialist story line. In a relational, idealist world, and what other kind can there be, cosmic coherence comes for free. The necessary eternal Self has only to manage to pour its subjective essence into its creaturely reflections. It is no mean feat, but it needs to happen only once in eternity.

Blood in the Water?

In this age of the Internet, the saving of the world may come down to just pushing the right buttons. A case in point is my catching the scent of blood in the water. I had been using [Chalmers](#) and Google to follow the debate on naturalism, but I wasn't entering the right search terms in Google until the day before yesterday. This is when I entered '[naturalism & physicalism](#)'. I began to notice a new tone in the recent postings. I also noticed the absence of response.

I had been relying too much on David Chalmers' listing of online papers on consciousness, and, as I have said before, it was appearing that the debate was getting nowhere. His so-called 'hard problem' was turning out to be a red herring, or perhaps it is just too hard. The real problem was the concomitant dismissal of the 'easy problem', his characterization of which had been too readily accepted by his partisan followers. I too was not paying sufficient attention to the real debate over naturalism.

The real problem with focusing too much on consciousness, from the present perspective, is that it deals only with qualities or 'qualia', and these qualia do not lend themselves to analysis, and thus they do not foment debate as readily as does the linguistic side of our mental capacities.

I am only now beginning to re-scan the first 200 items in the Google search given above. The general tenor of the arguments is that 'folk psychology' is turning out to be a tougher nut to crack than the naturalists had been assuming. The coherence of natural language depends crucially on the presuppositions of folk psychology. To undermine those presuppositions is to undermine the logical foundations of language. The naturalists have been caught trying to saw off the limb upon which they, and we are sitting. The more they try to argue these points, the deeper they dig themselves into this logical hole.

As Quentin Smith has indirectly [pointed out](#), the naturalists are realizing that they are playing a losing hand in this poker game, and so they try to leave the table. They endeavor to return to their more traditional, piecemeal analyses. What seems to be new in just the last few years is that their theistic colleagues, about whom Quentin warns, are picking up the scent of a possible major intellectual victory. For the first time in literally centuries, the intellectual shoe is on the theistic foot.

Is this not a tempest in a teapot? Yes, it is, so far. But it does threaten to spill out into the public arena. Right now it is as if the theistic philosophers, those newly hired, junior faculty members, are not quite able to believe the enormity of the victory that seems to be about to fall into their laps.

This situation goes far beyond the issue of the intellectual liberalism and tolerance of the post-modern ethos. It is now looking as though that liberal stance may have just been a deliberate ploy on the part of the rear guard of the secular intellectual establishment in anticipation of their impending downfall. The crude scientism that still undergirds the superficial posturing of the postmodern 'liberals' has never had an ounce of tolerance in its blood.

I am predicting that academic heads will roll. There will be a bloody intellectual battle. The reverberations of which will shake the global psyche in a manner that will recall of prophecies of old. Obviously, the proof can only be in the pudding.

[Later in the day:]

Not until the theists return to the philosophical idealism of the transcendentalists will there be any motive to question the scientific cosmology *in toto*. Merely sliding back into traditional western dualism will not signal a dramatic shift.

The conservative Christians are far from considering immaterialism, but if their Intelligent Design gambit continues to falter, then a few of them might consider something more radical and comprehensive than metaphysical dualism. That would be a start. Perhaps the sterling credentials of C. S. Lewis will be instrumental in persuading some to take another look at idealism.

[7/31]

I had some success with the 'naturalism & physicalism' search combination, and now I need to find the magical combination that will pick out those on the cutting edge of immaterialism. That would be a major breakthrough for me, and it would seem to be a relatively straightforward task, but the goal eludes me, nonetheless.

From Intangibles to Memes

In a few days I'll be leaving for a couple of weeks, so I will have to cover several topics even more briefly than usual.

Where were we? I last spoke of intangibles and teleology. The connection was that intangibles were most likely to enter into the causal matrix under the guise of final or teleological causes.

The topic of intangibility came up in connection with searching for the cutting edge of immaterialism. If the materialists are unable to eliminate abstractions from reality, then idealism will have its big toe in their door, and the materialists will have to take a much more defensive strategy.

Where abstractions are their most potent is in the phenomenal power of communication and language. One can hardly broach the topic of linguistics without running into Chomsky. His concept of a special human faculty for language that encodes a Universal Grammar is a concept that does not sit well at all with the Darwinists. A major counter offensive against the idea of a language organ has been mounted by the Darwinists, being led by Dennett and Dawkins. Their banner is the 'Constructivist Manifesto'.

As mentioned earlier, [Jerry Fodor](#) is the leader of the 'New Rationalists' with his nearly Platonic view of innate ideas. Dennett, in [Darwin's Dangerous Idea](#), sees Fodor, Chomsky and Gould as traitors to the cause of scientific progress. He sees them as being fellow travelers with the creationists. Fortunately for Darwin, the creationists are being very slow to jump into bed with these luminaries. Until Dennett outed these crypto creationists, their subtlety was effective.

Thinking of Fodor's innate ideas got me onto the topic of Dawkins' 'memes'. Considering the source, I had been reluctant to embrace them. The idea of memes seemed to be the antithesis of innate ideas, and to be a reductionistic answer to idealism. But now I am having second thoughts. Perhaps memetics is taking on a life of its own. I understand that Dawkins is becoming wary of his promiscuous intellectual progeny.

Here's the scoop. On the reductionist side one can look at memes as just glorified computer viruses. But that view holds very little water. In the final analysis memes are not strings of code. The consensus view sees no real distinction between memes and ideas. Does this mean that they descend upon us from a Platonic heaven? Yes and no.

I don't mind seeing memes as the atoms of pantheism. Susan Blackmore, in [The Meme Machine](#) shocked her academic colleagues by declaring that all of us are just collections of memes. Why not let ideas live? Why follow Plato in supposing that the only good idea is an embalmed idea? Let my ideas live free, again! Our brains are a living colony of neurons. I trust it is not a penal colony. Maybe the Creator is trying to tell us something. The religious establishment likes us to think that we are a penal colony, but maybe we are the colony of God, as every mystic insists.

There is some fundamental logistics to work out here. Let me sleep on it.

[8/9]

During my [meme](#) hunting I again landed on [Kheper](#). I particularly recommend [The Divinisation Of Matter](#). It contains some useful eschatology that I would like to return to later.

My being a collection of memes may not be such a bad idea as long as there is an optimal stability and there is a goodly mix of transcendental memes, whatever they might be. Our personas change in significant fashion over a lifetime and over lifetimes if that is applicable. If we allow memes to take on a monadic, microcosmic, holistic, holographic intelligence of their own, that might expedite many things.

This would be like object oriented programming and distributed intelligence on a cosmic scale.

The principal logistics issue would be cloning. Do you and I share the same intelligent memes? And how do memes transform themselves? How much of a meme's identity is carried in its external vs. internal relations? How do our individual mind spaces overlap with the universal space of memes? Our individual minds are supposed to be an illusion, after all. We need a [mereology](#) of memes.

We are mutually shifting vectors in the Hilbert space of memes. We exist in entangled superpositions that are mutually observational. The cosmic love telos of the rapture is a grandmother meme. They don't get much bigger than that.

[Later:]

We need a morphogenetic theory for memes. From a holistic point of view, they cannot be given discrete identities. There is a meme or a mind field. We then also need a perspectival theory for them. Each meme will see its partners differently. These monads will have windows, no? If one changes they all change, but then there also has to be an atemporal perspective. Each meme would have an interactive time-line.

How does relationalism work in memedom? For the memes, its not what they know, or their content that counts. It is how they relate to the rest. But there must be some substantive content or structure, nonetheless.

How does the concept of Maya play out in memedom? Despite the windows, there must be a lot of mirroring that goes on. How does memory work, or how can it be represented here? How can time be represented? Perhaps there are memes for time and space. Perhaps the monadology would be helpful here. I'm presently reviewing the Stanford entry on [Leibniz](#).

[8/10]

Are memes real? Are patterns real? Only in a holistic, relational sense.

Genes contain real information only in a particular biological context. Memes are much more contextual and holistic.

Are relations real? Mechanical relations are real for a mechanist. Functional relations are real for a functionalist.

Is distributed intelligence real, as in 'Six Characters...'? Is it all parasitical, like memes? It would help if we knew how that worked.

[8/11]

It is said that memes are reductionistic. But are they reducible, and if so, to what? Has anyone ever seen half a meme? How many memes are there? Where are the chemical formulas?

Has there ever been a reduction? Even 'bachelor' has not been reduced. Every word is context dependent. That must mean that there is a substantial manifold of meaning. It is a manifold with a partial life of its own. We are all just parts of it. That is our reduction. This manifold also has its holographic and microcosmic aspects.

But can a thought have meaning outside of a thinker? How are thoughts and memories stored? How communicated? Each idea might just be a perspective on the cosmos. But then there is still a percept and perceiver distinction. Even the lowliest thought has some independence of the thinker. Are we not just the shepherds of our thoughts? And God is our shepherd.

How do we overcome the distinction between perception and projection? There would likely be circularity in the form of feedback. Each thought or being is a temporary node in the stretching of the separational matrix of creation. The stretching relaxes in the frame of the eschaton.

The Observation Factor

Part of the motivation for this page comes from Allan Randall's [Computational Metaphysics](#). Allan concludes his metaphysical excursion in a strangely truncated form of idealism based on Strong AI and the Many Worlds interpretation of quantum mechanics. All of this because he has forgotten about Wigner's Friend, I believe.

Wigner's Friend is an extension to Schrodinger's Cat thought experiment. It simply raises the question of who observes the observers. This is a question that has famously been left unanswered. Somewhere else on the Internet it must have been stated that no one short of God can observe the observers. (Actually I find one [example](#) of "observe the observers" & quantum, and there is ample mention of God and everything else. Remind me to peruse it later.)

It remains the standard view that the observer role in QM may be satisfied by virtually any registering mechanism, which need not be artifactual. The moon has very adequately registered the impact of asteroids, or so it is generally surmised.

More technically, a registration process is supposed to be any trace of an event, where 'trace' is a disturbance in a medium, such as the ionization path of a cosmic ray. The wave function of a neutrino from the Sun spreads out uniformly until it interacts with another particle deep in the Earth, for instance. Its wave function has been collapsed by the interaction. This is fairly straight forward. But what about the molecules in the air? How spread out are they? Supposedly this is only until they collide with the next air molecule. But now we have no trace. At best we can observe the gross diffusion of pollutants. Otherwise the measurement process becomes anti-entropic or Maxwell demonic, i.e. physically impossible. So an air molecule can spread out to the moon and beyond, if it so chooses. Who is to stop it? The measurement process has become lost in the interstices of quantum statistics, where there is no trace of the individuality that defines any actual measurement.

Let us now stand this problem on its head. To measure a quantum system there must be an external 'classical' system. Suppose, however, that the quantum system in question is the universe. What would it take to collapse the wave function of the universe? This is a notoriously open question in cosmology, especially relative to the quantum fluctuation origin of the Big Bang. How do we know that our universe is not merely a virtual quantum universe that could at any moment dissolve back into a sea of probability?

Think of those infinitely(?) many other uninhabitable, unobservable quantum universes. Do they or can they be assigned any physical reality? Do they exist only in the imagination of the quantum cosmologists, like a herd of unicorns? Physicists, by professional necessity, are most adept at sweeping the quantum problems under the rug. Or perhaps they are passing the quantum buck. If so, where does the Quantum stop?

Before attempting to answer that, we might well wonder why the Quantum in the first place.

[Next -->](#)

[Topical Index](#)

9/7/02

The Observation Factor (part 2)

Why the Quantum? Classical physics would be impossible without the Quantum. Solid objects could not exist, atoms could not exist without something very much like the quantum laws we have. And certainly life would be impossible without the metabolic process made possible by quantum chemistry.

What about the measurement problem? Metabolic process are enzymatic. An enzyme process is paradigmatically a microscopic measurement process. It is anti-entropic because it is not statistical, because it robustly involves individualized molecules. The principle recordings of all these quantum measurement events are our healthy, negentropic bodies.

In general, quantum physics deals only with ensembles, while our ordinary experience refers only to particulars. There could be no experience without converting the quantum probabilities into experienced actualities. That is exactly what the measurement process is stipulated to accomplish. This is collapse of the wave function.

But what about our minds? Could we not just be content quantum zombies? Why do we go around creating, imagining, communicating and all the other strange things that we do with our minds?

A remarkable aspect of our minds is our memory. That, combined with our natural curiosity and our tool making abilities, has enabled us to cooperatively compile a comprehensive portrait or record of a significant portion of the observable universe, including especially of ourselves. This is far beyond the ken of zombiedom.

Is this just a very peculiar accident of nature, or might it actually be understandable as an extension of the observer principle, i.e. no phenomenon is real, unless observed? Any particular reality is garnered only by collapsing or bootstrapping itself through observation. And when we speak of a universe, we cannot just be referring to microscopic phenomena. One enzyme reaction record hardly constitutes a phenomenal world. To bootstrap a phenomenal world would require world observers. A record without a context is no record at all. It could just be a statistical fluctuation. Context implies coherence and coherence implies rationality. But where will that context be when the dying Sun incinerates the Earth? Where will the bootstrap be then, or where was it before the Earth was born? Is there a less fragile extraterrestrial connection?

To maintain logical consistency, something of an external nature must be posited. Why then do cosmologists, at least in public, generally refuse to entertain the stunningly obvious notion of a cosmic observer? Can they honestly say they have no need of that hypothesis? It certainly appears that the need is all but inscribed on the Quantum slate.

Materialism

What is it and does it make sense? It is a reductionistic or atomistic account of existence, and, no, it doesn't make sense.

At the most basic, logical level there is the problem of modality. Consider the property of mass. Mass is resistance to force. Mass is not strictly a fact. It is a counterfactual concept. It makes sense only in the hypothetical, ideal context of theoretical physics. It is not something superficially given. It is not an atomic fact. It is a highly interpreted conceptual handle.

Am I saying that mass is not material? Is it not physical? No, it is not physical because it is *P*hysical. It is not a *sui generis* thing. It is a theoretical construct taken out of the discipline of Physics that has only very indirect observational effects. And so is everything else that we can refer to scientifically. This is simply the problem of holism. A scientific theory does not depend on or refer to any individual facts. It is an interpretation of a very ill-defined collection of facts.

Could we not resort then to a plain language sort of materialism or naturalism? Well, sorry, but a language has only that much more theoretical and historical baggage. This baggage cannot get us any closer to the noumenal reality that is supposed to be the 'raw' or 'naked' material world.

Why do we even bother to suppose that such a world exists, when it has no support from science or from common sense? My answer is a question. Have you ever known anyone to espouse materialism for other than ulterior motives? This is not to say that metaphysics isn't always so burdened. It is simply to point out that materialism is about as far as anyone can get from being an exception to that rule. The fact that any materialist has ever pretended otherwise is perhaps the biggest strike against them.

So do we just throw metaphysics into the dustbin of history? Don't get me started, but that is a whole other piece of the intellectual blood sport that frolics under the innocuous label of (anti-) 'metaphysics', and don't let anyone tell you otherwise.

There is only one alternative to all the blood-letting, figurative and otherwise, and that is coherence. When was the last time anyone checked to see if the world could possibly be coherent? Was it less than a century ago? Not to my knowledge. What's the matter? Not enough blood, yet, sacrificed to the gods of incoherence? Any time now, boys and girls.

Coherence II

Coherence remains the central idea of our cosmology. Coherence is how the disparate parts of the world relate to each other. Many types of coherence are commonly known to us:

- self, organism, organization, ecosystem, religion, work of art, field of study, game, etc

All of these types of coherence compose our world. I am claiming, however, an overriding, cosmic coherence. This coherence comprises the substance of our immaterial world. Leading up to the eschaton, this cosmic coherence becomes comprehended by us. The temporal boundaries of our history, the Alpha & Omega, figure prominently in its ultimate coherence.

The coherence of the world derives from its status as a creation. We, as co-creators, play a greater part in the creation as we begin to comprehend our role in the eschatological context. We consciously align ourselves with the cosmic plan or the will of God. This is how we become one with God as the ultimate aspect of coherence.

From the eschatological perspective we will begin to see how the A & O combine teleologically into a singular eternal presence. Creation is a work in progress mainly in its details, which is the level on which our own lives play out.

From one perspective all creation is just a glimmer in the eye of God, as might be a symphony in the mind of the composer. After that it is a working out of the details. We are just those details. The logically necessary fact of creative optimization is another aspect of the coherence of creation. There may be grades of symphonic creation, but this is not the case for our world. There is a necessary singularity of coherence and consciousness, and our world is by no means peripheral to that. There is an unmistakable centrality of the spiritual gravity hereabouts which is the consequence of our proximity to that singularity.

Polytheism is fundamentally incoherent. Cosmogony is not the work of a committee, as is no other work of art. The potential potency of a cosmic self is the substance of creation. That absolute potentiality is necessarily self-realizing, unless you happen to be able to demonstrate the logical impossibility of God.

By the logic of immaterial, relational, coherent existence, there can be no secondary substances or creations, unless they are functionally integral to the one absolute potency.

Dan Hutto

I had encountered Dan on the web before, but without having to pause. He obviously warrants some consideration here. Now I am better focused on Donald Davidson's crucial role in the defense of physicalism. Previously I was too much in the thrall of [David Chalmers](#)' approach to the mind-body problem to fully appreciate Davidson's '[anomalous monism](#)' ['Mental Events' (1970)], although that phrase was familiar to me from my second stint in graduate school.

Dan Hutto's essay, [Davidson's Identity Crisis](#) (c.1999), is a standardly dense philosophical piece. He criticizes Davidson's attempt to defend a non-reductive physicalism and then recommends idealism in its stead. To my present knowledge this essay defines the state of the art of current critical (non-speculative) idealism, and as such is a useful yardstick. To follow up on Dan, I recommend you go to his book [forum](#).

Along these lines you should also consider Mark Rowland's [Two Dogmas of Consciousness](#). This piece provides a further example of the convolutions surrounding physicalism. The tracking down of physicalism seems rather like the hunting of the Jabberwocky, or perhaps of the Snipe. At present there appears to be no outstanding defender of physicalism or materialism. Dennett and Dawkins are the best known popularizers of materialism, but neither of them figure in the current academic debates.

While following up these leads I came across [Hugh Mellor](#) and [Tim Crane](#) who jointly authored 'There is No Question of Physicalism' in 1990.

"We examine the various definitions and defences of physicalism that have been offered in recent philosophy of mind, and argue that no nontrivial version of physicalism is true. Physicalists need to define the physical in a way that (a) excludes the mental and (b) shows why physical sciences have an ontological authority that psychology and other non-physical sciences lack. Physicalists have used the following notions in attempting thus to define and defend physicalism: reducibility to physics, causation, laws and supervenience. We show why all these attempts fail."

This article was reputed to be the definitive refutation of physicalism. I have not yet been able to locate the article nor any extended discussion of it on-line.

Then I notice a new book by [David Papineau](#), "[Thinking about Consciousness](#)" (OUP 2002). (Note that a complete [draft](#) of this book is presently available.)

"The relation between subjective consciousness and the physical brain is widely regarded as the last mystery facing science. David Papineau argues that there is no real puzzle here. Consciousness seems mysterious, not because of any hidden essence, but only because we think about it in a special way. Papineau exposes the confusion, and dispels the mystery: we see consciousness in its place in the material world, and we are on the way to a proper understanding of the mind."

The beat goes on. The two sides pay attention to each other only when they are locked in the same room, which happens infrequently.

[9/11]

I continue to focus on the four books and the discussions of them that can be found on the [SWIF](#) page. This is the best single source for the current mind-body debate that I have come across so far. I hope to provide a summary here soon.

[<-- Prev](#) [Next -->](#)

[Topical Index](#)

9/9/02

Mind-Body Debate

I have spent several hours reading over the book discussions on [SWIE](#). I see little progress over previous discussions besides the dubious distinction of their being more convoluted and jargon laden.

There remain two sides to the debate: materialist and non-materialist. Both sides agree that our experiential intuition strongly favors the non-materialists. This fact forces the materialists to take the offensive, but there are only a very limited number of logical moves open to the materialists.

- dwell on the allegation that non-materialism subverts the scientific enterprise
- rationalize or deconstruct the counter-intuitive nature of materialism
- construct a theoretically plausible physical model for the mind

Let's take the last item first. No such model existed until Alan Turing proposed the concept of a universal computing machine in 1936. The possibility of Artificial Intelligence has been with us ever since. The mind-body debate closely parallels the debate on natural vs. artificial intelligence. The hypothesis that there is no fundamental distinction is labeled 'Strong AI'.

Despite occasional reversals of fortune, the lay advocates of Strong AI remain active, many of them under the banner of [Transhumanism](#). There are many gradations of transhumanism, up to and including aspects of theism, eschatology and immortality. Needless to say, the philosophical or academic materialists do not engage in such speculation.

[9/13]

In this current discussion, two models of the mind are considered: representationalist and functionalist.

[9/14]

I have spent some hours lost in the discussions of representationalism, while not able to grasp the relevance to the mind-body debate. However, I have just come across [Naturalism Without Representationalism](#) by Huw Price. By page five he seems on the verge of addressing the larger issues.

[<-- Prev](#) [Next -->](#)

[Topical Index](#)

9/12/02

Huw Price

Apparently I had run across Huw's paper, [Naturalism Without Representationalism](#) (c.2002), back in July, but made no direct [reference](#) to its content. (The HUP still does not acknowledge the existence of the book in question.)

His paper comes closer to direct refutation of naturalism than anything of which I am presently aware. Interestingly it is couched in naturalistic terms, but I would claim that his 'subject naturalism' verges on oxymoronicity, and is tantamount to a *reductio ad absurdum* for naturalism.

What Huw claims to prove is that the only way to save naturalism from its own internal contradictions is to turn it into a language game, *a la* Wittgenstein. These contradictions turn on the problem of [representationalism](#), under which term this paper was listed fourth.

The naturalist is confronted with a problem of self-reflexiveness. If the issue of reference or representation is an empirical one, as it must be to conform to naturalism, then the existence of any represented entities remains open, including the concept of semantic reference itself. Thus there is no unequivocal foundation from which to launch the enterprise of philosophical naturalism. There is no uncontested bootstrap. Naturalists are left with no warrant to leap from language to the world. The only partial recourse is 'subject naturalism', which tries to put the best possible face on the prospect of an endless language game. This can hardly be a desirable outcome for our erstwhile naturalists.

It does appear that naturalism is very much in question, and from the inside. This very recent, unpublished paper is tantamount to a logical self-refutation. What will be the response?

What we seem to be witnessing is that the disputations among materialists are gradually forcing all of them further into the very few remaining logical dead ends, from which they seem unable to extricate themselves. In the logical equivalent of quicksand, the more they struggle, the deeper they sink.

The pluralism of postmodernism is the recognition that there are no unquestionable foundations for any systematic or constructive philosophy. Since they all live in glass houses, the philosophers are reluctant to throw stones, and so we witness the nearly interminable end game of materialism.

[9/15]

I am presented with yet another opportunity to advertise my ignorance, this time of Berkley's [argument](#) against representationalism: (appeared in a *Treatise concerning the Principles of Human Knowledge*, 1710)

- We do not and cannot perceive physical objects directly.
- Objects are perceived only as mediated by our mental representations of them.
- In order for an idea to represent an object, however, it must resemble that object in some manner.
- Yet, that which is perceptible has no properties in common with that which is imperceptible.
- Thus representationalism is self-contradictory.

This simple argument may well explain the prevalence of non-representationalism as is found principally in **functionalism**, which is an outright denial of all mental properties. Functionalism is a hybrid of behaviorism and pragmatism. It has no metaphysical pretensions concerning the nature or existence of an external world. But then how 'bout those putative functions? Is not the functionalist committed to representing allegedly objective functions? How can we coherently discuss that which we cannot perceive? How can we communicate that which cannot be represented?

Perhaps this is why functionalism is not considered to be a fundamental piece of philosophy. It is considered a language game, pure and simple. I am not aware that Dennett has any higher aspirations for his enterprise than as a temporarily remunerative pastime. Should we suppose that he has an impractical bone in his body?

Berkley, on the other hand, evidently had higher aspirations, but then he was just another of those impractical idealists.

(Let me just note here that the running battle between the computationalists and the connectionists among the proponents of AI hinges precisely on the existence or not of mental representations or symbol processing. It may behoove us to take look: [Representation](#))

[<-- Prev](#) [Next -->](#)

[Topical Index](#)

9/14/02

Atomism & Transhumanism

Materialism is tantamount to atomism. Atomism, of one form or another, is the logical foundation for every deconstructive enterprise. The primary target of any such enterprise will, of course, be God. Next in line is the concept of humanity. Naturalism, ironically, is just the view that there is no such thing as human nature, or any other nature for that matter. There are no essences, nor anything essential. There are even no natural kinds. There is no meaning. At most there may be an *ad hoc*, pragmatic functionalism. And who decides what are to be our functions? Whomever, or whatever has the power to do so, of course.

And what is our function? Our function is to remake the world, atom by atom, or to turn the atoms loose to remake the world in their own image. We wipe the slate clean of all the accumulated historical, natural accidents, including ourselves, by the way, and start in from scratch. Atom by atom we reconstruct the human genome and every other genome. Or, better yet, atom by atom we construct nanobots, provide them with artificial intelligence and turn them loose upon the world, that is upon ourselves and the rest of nature. Their task is to reconstruct the world.

This is the vision of Transhumanism. It is the perfectly logical end of any deconstructive world view. If the End is not nihilism, then it is a totalizing, absolute reconstruction. Is this a vision, or is it the ultimate anti-vision? In whose image do we reconstruct the world, and to what End? The Transhumans are perfectly silent on this score. They see no End, only an endless means that is totally self-justifying in its necessary inevitability. Along the way, if these self-organizing atomic beings develop the capacity to create new universes, more power to them.

The only possible limiting factor might be the existing laws of physics. However, given that physics is just another accident of nature, anytime a new universe is created, the laws of physics could be re-initialized, and reset to any desired combination or pattern, one might logically suppose.

Does this train of thought not lead us into a conundrum? This (non-) vision is meant to be a strictly linear one. But isn't there a logical circularity, or a vicious circle hiding in here somewhere? What happened to the inevitable problem of self-reflexivity? If it is possible to create a world, any sort of world, then how unlikely is it that we would be the very first creatures to ever initiate such an inevitable process. Is it not much more probable then that we exist rather far downstream from any such inevitable origin of a (deliberate?) cosmic creation process or chain? This is a view that is strongly muted in the glossy brochures of Transhumanism, but which haunts almost every literary fiction of that genre.

Deconstruction leads either to nihilism or reconstruction. Given reconstruction, is it more likely that we are the reconstructors or the reconstructed? Creators or creatures? How can we begin to find out, if we don't begin to ask?

Would it be fair to say that we might just be afraid to ask? Let us not underestimate the psychic paralysis of this most primal of all fears and its every subsequent denial.

On a perfectly pragmatic note, the Transhumans may say to themselves, 'Well, we'll just go on minding our own business until someone or something demonstrates otherwise.' Fair enough. Stay tuned for the mini-messiah.

Representation, etc.

[continued from [Huw Price](#)]

The best expose of current thinking on the problem of representations that I have come across is this position paper, [Does Representation Need Reality?](#) appearing in [Understanding Representation in the Cognitive Sciences](#) -- A. Riegler, M. Peschl & A. von Stein (eds.), 1999.

After describing the lack of relevance of computational symbol processing or expert systems, i.e. purely representational systems, to real world cognition, the authors go on to describe the other end of the spectrum found in 'connectionist' models:

Not only has symbolic cognitive science come to a dead end (in the context of the effort to explain cognitive processes). The euphoric days of the new possibilities of *connectionist networks*, including the simulation of cognitive activities and learning, have passed, too. It seems that cognitive science has returned back to -- in Kuhn's sense (1970) -- "normal science" or to "puzzle solving". As an implication of this development, connectionist cognitive science has almost lost itself in (technical) details, such as learning factors, minimal adjustments, and optimizations in learning algorithms or activation functions, and so on. In tackling only these technical "micro-problems", it seems to have failed to address the really interesting, pressing, qualitative, and "big" questions about cognition.

My guesstimate here is that cognitive science has fallen victim precisely to the [conundrum](#) that was presented by George Berkley in 1710. Cognitivists cannot live with representations and cannot live without them. What are we to do?

On a purely subjective level our linguistic and visual cognition is highly representational, presumably of an external world. However, when we attempt to computationally simulate symbolic processing, there is no semantic grounding for the symbols other than as mediated by external observer.

On the other hand, when we construct more biologically realistic systems of the neural connectionist variety, we find no stable objective structures corresponding to our subjective representations.

Cognitive science was supposed to be providing a conceptual bridge between the objective and subjective worlds, but after a half century of 'progress' we seem no closer to constructing that bridge. And we are not even talking here about the touchy-feely qualia of the 'hard' problem. We are just talking about the most basic abstract competencies of cognition. In fact there does not even appear to be any conceptual progress in attempting to embed a symbol system in a connectionist system (see below). This seems to be the most likely form that such a bridge might take.

There simply appears to be no piecemeal method for constructing that mainly unconscious background of natural intelligence, which the phenomenologists speak of as being the necessary platform for any particular, conscious cognitive process.

[9/18]

A good summary of the representation problem appears in this article on [connectionism](#) (see also [systematicity](#)). We see there the controversy between the symbolists and the connectionists. The symbolists can manipulate symbols computationally, but they provide no internal semantic grounding for their symbols. The connectionists could conceivably provide a semantic grounding for symbols by embedding them in a closed behavioral network, but then they are unable to systematically or logically manipulate those symbols which are effectively wired into the network. Thus there appears to be a logical

impasse between the manipulating and the embedding of symbolic representations.

(The robust, distributed embedding of a symbol is resistant to its individual accessibility.) (The notion of the brain as a 'syntactic engine' is relevant here.)

To be effective in any mental sense, a symbol has to be abstractable and groundable at the same time. These twin constraints seem physically contradictory. This contradiction then argues against any physical implementation of the mind. Note that this aspect of cognition was once alleged to be the 'easy' problem. One moral is that the global unity or potency of the mind subverts even this crudest attempt at the compartmentalization of its powers.

Connectionism may also be seen as a throwback to the long discredited associationism of the original empiricists.

News flash: it is now purported that [dynamical systems theory](#) supplants both symbolicism and connectionism. But, alas, it seems only to be a subspecies of connectionism.

[Chris Eliasmith](#) provides further critiques and yet another hybrid physical model of his own.

Then, while searching on [neurosemantics](#) I came across [SINBAD Neurosemantics: A theory of mental representation](#). This seems to be the state of the art for neural modeling of cognitive functions. I will peruse it and report back.

[9/19]

Alas, it appears that [SINBAD](#) is just a resurrection of the concept of the 'grandmother cell'. A hierarchy of pattern recognition processes in the brain culminates at its highest level in cognizable constructs and models of the world. The firing of a particular cell represents a detection of 'grandmother' and corresponds to our cognition of said individual.

This presents certain logistical problems. First, how do we come to sense the firing of any particular cell or group of cells? Secondly, how do we recognize the semantic significance of any particular cell or group thereof? It would seem that the cells would have to be labeled in some fashion, and that we would then need a label reader. (Back to homunculum.)

Of course we could program a robot using these pattern recognition processes so that it would say 'grandmother' upon any successful instance of grandmother detection. We could do that now with a simple fingerprint matching device. Would this be an instance of natural cognition? Would this justify the publication of yet another paper in 'neurophilosophy'? I would hope not. But what is the logical or philosophical significance of the quantitative difference in complexity or sophistication between two levels of computational pattern recognition? Claiming that a thermostat is conscious of the temperature does not seem to shed much light on natural cognition. It is useful only as an eliminativist gambit.

The wiring of 'grandmother' into the brain hardly seems conducive to the notion of concept formation and manipulation. Again we face the physical contradiction between symbol grounding and symbol use. There ought to be a convenient designation for this problem. I'm just not aware of it.

[Later] I am finding this paper, [Radical Connectionism: Thinking With \(Not In\) Language](#), to be a good introduction to connectionist concepts of representation.

[9/21]

[Neurophilosophy](#) is currently the label of choice for the popularizers of naturalism and materialism. It is worth glancing at some of their books:

[Neurophilosophy : Toward a Unified Science of the Mind-Brain](#) -- Patricia Churchland

[The Engine of Reason, The Seat of the Soul : A Philosophical Journey into the Brain](#) -- Paul Churchland

[Synaptic Self: How Our Brains Become Who We Are](#)

[The Emotional Brain: The Mysterious Underpinnings of Emotional Life](#)

etc., etc....

The only philosophy visible in the books typical of this genre is eliminativism. Metaphysical innocence is the order of the day, as the writers launch into guided tours of the flora and fauna in the not quite tamed neuronal jungles of our brains. There are occasional rest stops where we are treated to quickie seminars on the wonderful 'illusions' of the mind such as the self and free-will. If this is the last frontier of science, [Colonel Sanders](#) would feel right at home. Speaking of which, has America been entertained by such as the Churchlands since the days of [Roy Rogers and Dale Evans](#)? Am I being catty? I spent 30 minutes spell-bound by a 56kps [video of Patricia](#). Obviously metaphysics is lacking in charisma, so it is just too bad that Patricia is playing for the wrong team. The mini-messiah is going to need all the help she can get.

Where are the metaphysicians when we need them? This is pseudo-science raised to a fine art. Apparently, all that one has to do is throw around bits of scientific jargon to become fully absolved of all metaphysical responsibility. It is a brave new world, this neurophilosophy.

Amazon has a plethora of new books touting materialism, and I don't even see where to look for the rejoinders. It appears that the non-sectarian non-materialists have been brow beaten into silence. This is sad. And considering the state of the world today it is emphatically dangerous for there not to be a single visible intellect proposing a transcendental, ecumenical rationalism. Has God forsaken us?

On Amazon the non-materialist field is dominated by [John Searle](#). No other author comes close. But John is very far from theism or idealism, the last I checked. He is simply a conscientious objector to the vocal horde of eliminativists. Otherwise, the intellectual ground between the secular and sectarian is a no-man's land.

However, there are other contrarians, as can be seen on these lists:

[Listmania! Essential Free Will](#)

[9/22]

[Listmania! The Philosophy of Consciousness](#). This list is thorough and even-handed.

[Listmania! Academic books on consciousness and science](#). This brings in some of the quantum thinking.

[Listmania! Consciousness in Physics](#). And some more contrarian physics.

And the lists go on. I'm going to check these out a bit.

The writers on the side of neurophilosophy have a coherent cosmological story to tell. They are even anticipating the logical end of science as it successfully conquers the mind, its final frontier. It is the masterful wrapping up of the story that began being told with the rise of the secular Enlightenment almost three centuries ago. The only thing missing from this story is a subject, that is the subjective self. Neurophilosophy is the end of the line for objectivity. Beyond this point you have to consider the human

self, and then, almost certainly, a cosmic self.

But that last logical step is a big hurdle for anyone trying to think outside the sectarian box. Materialism has become a crutch and a conditioned reflex for anyone trying to break out of the sectarian mold. For those who wish now to think outside the box of scientific materialism, there is approximately zero guidance. The only lamp post is a trans-objective coherence. It is necessarily eschatological. If you don't believe that, then just try thinking about it for two minutes, although most people would find that extraordinarily onerous. There is a final coherence out there that is trying to find a voice. Where is the fat lady when we so desperately need her?

But I promised to check out the lists.

Everyone agrees that there has been an explosion of interest in the mind, and mostly within the last two decades. I don't see a consensus explanation for this upsurge.

All the coherence is on the side of the materialists. They have a linear story to tell, albeit, one without a subject or a resolution. No? Aren't our feeble, genetically burdened organic brains about to be engulfed by a tsunami of silicon? The neurophilosophers, however, are strangely silent on the future, even though their hind-sight is 20/20. They must all be aware of the transhumanist eschatologies, but we are left to speculate as to how discomfited they might be by these nightmarish apocalypses. Their silence ought to be deafening to anyone with even half of an organic brain. But the typically glowing reviews consistently hear no, see no and speak no apocalypse. Someone ought to formally introduce the neurophilosophers to the transhumanists. They might even have to change their tune.

The conscientious objectors to neurophilosophy and transhumanism are scattered all over the map. Even individually they have no consistent story to tell. At best they can marvel in the multi-disciplinary diversity of the topic. A few make allusions to the mystical tradition or to modern phenomenology. That's about it. There is no sense of urgency or sense of any imminent new worldview. Postmodern pluralism is the consensus ethos of these semi-non-materialists. Vision, anyone? What is that??

The cream of this crop may have been [Fritjof Capra](#) and [Ken Wilber](#), but they have had nothing new to say for decades. It is mysticism all the way down. If we experience as much as a very ill-defined [Turning Point](#) we'll have to consider ourselves lucky bums.

But, stop the press and take a look at [Gilles Fauconnier](#). Is this fellow a non-reductionist or what? How about those [mental spaces](#)? And what's all this [blending](#) business? Has froggy phenomenology been unleashed upon our hallowed shores of analytical atomism? What hath God wrought? Just when we surmised forsakenness. Is this a wolf in sheep's clothing or a sheep in wolf's clothing? I can hardly wait to find out.

There may be a pot load of constructivism *chez* Gilles, but, *modulo* the constructivism, has there not got to be something more than atoms swerving in the dark, or 'neuronal group selection'? Speaking of which, I can't resist quoting an example quotation in ['Blending As A Central Process of Grammar'](#) (1996) that Giles uses to illustrate the blending of mental spaces:

I claim that reason is a self-developing capacity. Kant disagrees with me on this point. He says it's innate, but I answer that that's begging the question, to which he counters, in *Critique of Pure Reason*, that only innate ideas have power. But I say to that, what about neuronal group selection? And he gives no answer.

This is getting right down to the nitty-gritty! I detect more than a tad of continental ridicule in the choice of this pretentiously reductionistic, un-continental exemplar.

I can't help feeling, despite the heavy patina of constructivism and even of mechanism, that Gilles is leaving the neurophilosophers to choke on his astutely framed phenomenological dust. We are revisiting structuralism, an idealism dressed in a mechanic's coveralls.

It seems that cognitive science is bifurcating into micro (neuronal) and macro (conceptual) components, and that there is scant to nil correlation between the components. If this split becomes formalized it will provide powerful evidence for non-reductionism.

I'm reminded of Roger Shepard's [mental rotations](#) (1971) experiment. Not easy for connectionists to explain

[9/23]

If there is going to be a metaphysical fault-line in the life sciences, one place that it might occur is between [biosemiotics](#) and [neurophilosophy](#). The conceptualism inherent in biosemiotics is evidently irreducible, but this stark fact, if correct, is not being advertised. One has to wonder about the political considerations that may lie behind the downplaying of this incipient fault-line. I am now just attempting to document it.

This is reminiscent of the age-old [debate](#) between nominalism and realism. Abelard's conceptualism was supposed to have been the compromise position, but it is not clear that there ever can be a compromise. The ontological issue is unavoidable, and trying to shift it around is just a shell game. The political hegemony of postmodern pluralism largely hinges on its ability to downplay any and all ontological issues. It is a shell game of truly massive proportions. Postmodernists have a deathly fear of Being and Substance. They are all trying to hide behind Abelard, but the biosemioticians are finding this more difficult. Questions concerning Being strike too close to their home. In any case, the uncovering of the ontological fault-line among practicing, politically aware scientists may prove to have all the delights of a snark hunt.

[aside...[THINK ABOUT HONKING IF YOU LIKE CONCEPTUALISM](#)]

As I read about the [debate](#) I am struck by the explicitly materialistic bias of nominalism. Evidently something does exist, but the nominalists would argue that all existence is reducible to accidental, temporary configurations of matter. But then what about those atoms? I would suggest that where nominalism is most starkly at variance with physics is with the concept (sic) of the photon. As a result of spending their lives with such entities as photons the number of nominalist physicists can be counted liberally on one finger. There are many more nominalist mathematicians, even, than there ever will be physicists. I don't think the biosemioticians are in an intellectual position where they can blithely ignore the collective wisdom of such an influential group of scientific colleagues. As the [Sokal](#) affair so amply demonstrated, there is surely a fault line between postmodernism and physics. The biosemioticians are trying to negotiate that line. Lots of luck, fellas!

It is fair to say that in modernity it is the Physicists who are the keepers of the Sacred Ontos. Postmodern iconoclasts resent and fear that office. But what they should really fear are the escaped and wandering ontologists, such as your correspondent. Some of us are not entirely satisfied with mere photons. Our sights are set a bit higher on the Chain of Being.

Quoting now from the good [Dr. Ess](#):

BUT -- thought out more carefully, the Neoplatonic version of realism (the primary "version" of realism available during the so-called "dark ages") in fact lands its defenders squarely in a position which, judged from the standpoint of Christian "orthodoxy," must be considered heretical.

That is, Neoplatonism's insistence on the ultimate reality of "the One" (and thus, on both the

ontological and epistemological primacy of "the One" -- i.e., it is both the most real entity and the entity which makes knowledge of all subordinate entities possible) further issues in pantheism. Simply, there is only "the One" and the rest of reality as an emanation of the one. While the rest of reality (including human beings) are in some sense "less real" than "the One" -- in an equally important sense, they also are identical with "the One." In short, all things are God ("pan/theism" = "all/God-ism").

This belief, as a logical consequence of the Neoplatonic version of realism, runs squarely against the doctrinal insistence in "Orthodoxy" on God's transcendence -- i.e., on the irreducible difference between God and God's creation.

Like I often say, I am definitely a heterodox Christian, but I'll wager that's a lot better than nothing at all. You can see why Christians have a deathly fear of Ideas. You let one in and it takes over the whole neighborhood. The Idea is their Eschaton, and mine. *C'est la vie*, and *hasta la vista*.

When I search on [biosemiotics & neurophilosophy](#) there is but one substantive hit: [Cognitive Sciences In the Perspective of a Unified Theory of Information](#). It gives a credible account of the conceptual divide between the naturalists and the phenomenologists, with the biosemioticians falling toward the latter. I would have to assume that [Fauconnier](#) and his followers should be included in the biosemiotic camp, but they avoid the term.

[Hofkirchner](#) makes reference to [Capurro's Trilemma](#): (from a trialog)

[Capurro]: Your conclusion or "solution" of this trilemma is: we go back to the etymological roots (information as "giving form") and we take an evolutionary perspective where qualities can emerge. I call this solution "dialectical informatism", considering it to be a new version of dialectical materialism.

Yes, dialectical materialism is a doctrine of emergentism, and it certainly comes down on the side of realism and objectivism against nominalism. But, again, biological emergentism has to confront the Platonism of Physics. And what is the ontological nature of those emergent entities? How do they relate to and inform matter? In a fashion similar to the laws of physics?

Is there any possibility of a unified theory of information which includes "Capurro's trilemma" as a constituent element of it, and not as something to be eliminated or "solved"? Well, this is a difficult question. Maybe we should take a look at the metaphysics of Leibniz. Leibniz considers reality to have two aspects, namely "monads" and matter. There are no monads without matter (except God), and vice-versa. Monads and matter are folded into the different levels of reality in an infinitely complicated way. *This means that it is not possible for us to have a "true" view of all the "steps" faced by unfolding (or "evolution")*. This means, roughly speaking, that we are faced with infinite concepts of information, something which cannot be overlooked by any kind of theory.

Now there's a leap from dialectical materialism. Those Continentalists sure are light-footed. How could an Anglo hope to keep up? Or just some intramural gymnastics...[let us not forget Stoppard's 'Jumpers'.]

Dear Rafael [Capurro], in a somewhat pejorative manner you have described the concept of information which Wolfgang and I discussed in "Informatio Revisited" as "dialectical informatism".

...a friendly slap of the text.

I think it constructive to look for information from this perspective, and to work out the differences/similarities between the *causality of information processes* and *that of physical processes*. The advantage of this perspective is the unfolding of larger range of analysis than is permitted by physics. It allows for the inclusion of completely different causal relations which cannot be viewed by the natural sciences.

...and then a left hook into the Scientific spleen. Ouch! Do we catch the scent of [Blood in the Water?](#) Where is Sokal when we need him?

Information, on the other hand, is able to mediate between cause and effect without having to obey the Laws of Conservation as such. There is no need for uniqueness of the effect. More than that, not even the type or quality of the effect needs to be predictable. One of the main differences between physics and information sciences can thus be seen here. While physics is oriented towards forecasting effects based on some explicated premise, information sciences have to deal with the structure of the unpredictable. At first glance this seems to be a very fuzzy enterprise, but it is in fact the complement of the unique predictability of the physical world. The new cannot be grasped theoretically by physics. If everything were uniquely predictable in a physical environment, no development of the world would be possible.

A second difference can be found between physical and informational processes. Physical units (in particular in classical mechanics) are based on the metaphysical principle of some factor (like mass, force, energy) while the substantialism gets lost in the realm of information. Information in its reified aspect is like a symbol, a metaphor. It is more a pointer to some kind of interpretation process than an object per se. It does not always point to any object of so-called reality. If there is some conscious process needed to interpret the pointer, and thus to create a new piece of reality, the substantiality of information is no longer needed. By the same argument, uniqueness of interpretation is no longer assured; on the contrary, in information processes there must be freedom of choice, on some level there must even be unpredictability, there must be the opportunity for creativity, and producing something new. Here Leibniz's monads could come into the picture. They could be interpreted as an early concept to explain the half of the world which was left out by mechanical materialism, such as processes of the human mind, the soul and creativity. In my opinion there is no need to stick to Leibniz's interpretation of the monads as being divinely created. The concept of information processes would allow for a materialistic [sic? naturalistic? or maybe you're smoking something? Leibniz is turning over in his grave!] explanation.

I've been following the informatics scene for some time, but have not heard them speak quite so forthrightly. Is this something new under the Sun? Does it go back to [Johnny von Neumann](#)?

[Capurro] Dear Peter, I am glad that the pejorative undertone of my criticism has become an incentive for, not an obstacle to, our dialogue.

...what a gentleman!

My question is "Where are the limits of such an information science?"

.....

Metaphysics also made a distinction between two forms of immanent causality: a "transitive" immanent causality, where a cause can change or even disappear in the process of (in) formation, and another immanent causality where the cause remains the same although changes may take place. The latter is the case for e.g. human or animal souls. The transcendent cause must be "higher" than immanent causality.

And this trialog progresses from there. It was an email discussion dating back to 1997. Capurro is openly theistic in his comments. This is my first experience of a philosophy of science discussion where the God question is treated matter-of-factly. I need to get a better handle on where **Capurro** is coming from, and where he might be headed? None of his metaphysics sources are contemporary, nor do I see evidence of any comrades in arms. It is difficult for me to imagine a similar discussion taking place on these shores.

R. Capurro, [What is Angeletics?](#) (2000):

Angeletics is different from angelology in that its purpose is to study the phenomenon of messages, independent of their divine origin, or, in other words, it studies this phenomenon within the boundaries of the condition humaine. This does not mean that studies relating to the fields of religion and natural sciences are excluded, but its specific focuses are on messages and human messengers.

...there is another neologism for you.

German philosopher Peter Sloterdijk pointed out that we live in a "time of empty angels" or "mediatic nihilism", in which we forget what message is to be sent while the transmission media multiply: "This is the very 'de-angeling' of current times" (Sloterdijk 1997). The word "*de-angeling*" stands out, in contrast to "*evangeling*", the empty nature of the messages disseminated by the mass media

Information science has come a long way, Cherubim.

Who's Keeping Score?

I have been actively searching the web since July, and I am still having difficulty seeing the forest for all those trees out there.

One surprise among many is the lack of scorekeepers. There are many catalogs of sites, but precious few commentaries that aim below the surface. For all the sound and fury, there must be some discernible trends. If so, they are not being well reported.

What I can say here is a highly speculative personally biased travelogue or web log.

In the 'end' it will come down to the gnostics vs. the agnostics. The gnostics will have all the momentum and will win hands down, but for the foreseeable future, the agnostics dominate. They remain the relatively silent majority, except when they are on a mission of deconstructing some gnostic's sacred cow.

In intellectual circles the dominant gnosticism is still materialism. Materialism has been brought down several pegs by the continued sniping of the postmodern agnostics, but now it is pretty much a standoff. I gather that the postmoderns go easy on the materialists because of their shared concern for a reactive resurgence of intellectual theism. Indeed, it has been noted that the philosophy ranks are being significantly infiltrated by junior faculty theists. If this is the case, these new kids on the block are wisely keeping a low profile. They are tending to their knitting, probably in the peripheral areas of ethics and the like. They are not ready for, and probably cannot even imagine a direct confrontation with the scientific-materialist establishment.

In the meantime, the materialists are being permitted what is likely to be their last hurrah: neurophilosophy. Neurophilosophy is mostly smoke with very little scientific or metaphysical substance, and so presents very little challenge for the skilled deconstructors. In neurophilosophy there is not much neuro- and even less philosophy, but it does make a good read for the armchair materialists. Along these lines, sociobiology presented more of a challenge to the agnostics, and that challenge has largely been met. Neurophilosophy is considered a relatively harmless spin-off.

Just from the last extended page I am picking up the notion that the principle challenge to materialism is now coming from the continent. The continental phenomenologists feel less inhibited by the fire breathing **fundamentalists** that inhabit these fair shores. They can talk about God without setting off a general intellectual alarm. Lines have not been drawn over there nearly to the extent they have been drawn here.

What we are also seeing is a continuation of the centuries old demarcation between British empiricism and French rationalism. There has been a lot back and forth, and strange bedfellows, but still the demarcation is there. The latest resurrection of this rationalism is in phenomenology and more recently in semiotics. These kinds of rationalism are seen as relatively harmless in Anglo-American circles because of their staunchly truncated, decapitated form. Atheistic rationalism is like a carriage without a horse, but this concoction goes back to the rabidly anti-clerical Philosophes of the French Enlightenment. Think Voltaire and Rousseau. Now it is relatively tolerant of only the most muted, existentialist elements of theism. Think Kierkegaard. And don't bother looking for froggy eschatologists.

So, is everything under control? Well, that can be hard to say.

Then there's 9/11. When someone throws a monkey wrench its hard to know the consequences. The allegedly underlying clash of civilizations is being reexamined on many levels, and I am sure that most of it is well below the surface of what one can discern on the Internet.

Certainly, the mutual line drawing among the gnostics has been exacerbated, but the folks to watch are the

agnostics. Surely, postmodern pluralism is feeling more than a bit besieged by these developments and what it may perceive as gathering intellectual, cultural storm clouds. The postmoderns are the hot-house flowers of modern civilization. If the heat gets turned up even more, they are susceptible to wilting.

In times of trouble, messianic expectations rise. People may be less tolerant of intellectual cacophony. Coherence may move upmarket, uptown. Most folks will turn to their mainly prophetic traditions for coherence, but the locally visible global clashings will bring a few thoughtful ones to look beyond the traditions. It will take every ounce of web connection and amplification for the disparate thoughtful ones to find a higher coherence and bring it to the attention of the rest of us. It will be nip and tuck, but surely in the best possible world, the highest possible Gnosis will prevail in the end. Coherence is a mirage if it does not include that necessary reality. Our ultimate concerns will demand nothing less.

Or not. Or naught?

Coherence Theory

Here is another subversion of materialism that I have been overlooking.

It stems from the problem, as partially explicated by [Berkley](#), of representation wherein our perceptions and beliefs are supposed to represent or correspond to facts about an external world. The inherent dualism of representationalism and its attendant correspondence theory of truth, ensure their entanglement in the Cartesian problem of the connection between mind and matter. This problem has been a primary motivation for immaterialists and functionalists.

Although **functionalism** is usually presented as a species of naturalism, its metaphysical foundations are ambiguous to non-existent, and, rather as its name implies, it is seemingly open to a philosophical pragmatism that is far from naturalism. This is why Dennett's functionalism is eschewed by serious philosophers. Serious naturalists are thus left to struggle with increasingly convoluted theories of [representation](#).

The only alternative to representationalism is some form of [coherentism](#). In its crudest form, coherentism could be seen as a form of associationism as found in Anglo-American empiricism. Coherentism is a more direct descendent of Quine's semantic holism. With a therapeutic dose of rationalism and phenomenology, the holism of Quine can be exported to the Continent where, as coherentism, it is the epistemology of choice. The idealist and transcendental [proclivities](#) inherent in coherentism are kept in check by the Continental ambience of deconstruction.

It is the Continental semioticians who pick up the baton for coherentism. A break might come if the Continental semioticians connect with the Anglo-American informationalists. Coherentism would receive an added impetus, and it would be under less deconstructive restraint.

(I should note that epistemologists generally are being forced to turn to coherentism as the replacement for representationalism which remains entangled in its possibly intractable foundational problem, see for example: [Coherence: The Price is Right](#). In fact the [Computational Epistemology Lab](#) at Waterloo has a [series of articles](#) mainly on the analytic side of coherence, but some verge off into a more robust phenomenology. Signs of creeping coherentism.)

In our postmodern milieu, coherentism is seen mainly as a lesser evil with respect to the foundationalism of materialism or the nihilism of deconstruction. In this negative manner, coherentism slips in the back door of postmodernism, but for how long can its natural expansionist tendency be contained? At what point will a robust rationalism return? The very limited coherence of existentialism and Marxism has been pretty well played out on both sides of the Atlantic.

[9/27]

In recent years philosophy has experienced an increased interest in things epistemic. I would suggest that this trend is partially in reaction to an increased scientific presence in other traditionally philosophical fields. Epistemology appears to be less susceptible to a naturalistic deconstruction. This is also true of ethics and aesthetics, of course, which remain active, but epistemology deals more with foundational, metaphysical issues and so it can serve as something of, at least, a defensive outpost against the prospect of a total scientific hegemony over human knowledge.

Perhaps surprisingly, the tone of the epistemological discourse is not particularly defensive. The continued, rather noticeable failure of AI and cognitive science to even get their feet in the epistemological door, after these many decades, is leaving the traditional epistemic community feeling relatively secure against such deconstructive encroachment.

And what is now beginning to appear in, say, the last ten years are signs of a nascent counter-offensive. It is, perhaps deliberately, muted, but still unmistakable to anyone who cares to observe. I suspect that the scientific community is blissfully oblivious. There are more than a few philosophers who are tired of being bullied by an imperial science on the one hand, and subverted by their deconstructive colleagues on the other hand. It is fair to say that these hard-core structuralists or phenomenologists are doing some retrenching and retooling in the shelter of epistemology. With coherentism now serving as a weapon and a rallying banner, they appear to be making forays into the wider intellectual arena.

But, there is a major caveat. Not many of these phenomenologists could be ignorant of the historically recent strong association of coherentism with radical idealism. When the scientific community is finally woken from its dogmatic materialist slumber, it will be screaming bloody murder, to be perfectly candid. I am sure that some of these phenomenologists are being most cautious in their anticipation of this inevitable reaction.

And yet again, this coherentism is inherently, unboundedly expansive and probably already is taking on a life of its own that will override the best discretions of its practitioners. The thing to attend to now are signs of early reaction from the potential opposition. One can imagine the innocence of the counter-response, 'Coherentism made me do it'!

[Later]

It is worth noting that Alvin Plantinga, a heavy-duty theistic philosopher and epistemologist, takes a dim view of coherentism, despite his being a prime contestant of foundationalism. Let's check it out.

I attempt to follow [Scott Oliphint's critique](#) of Plantinga. Plantinga argues that both foundationalism and coherentism are open to skeptical attack, and most everyone agrees. But rather than take on the skeptic, Plantinga attempts to dodge him by proposing a novel and weak argument for theistic belief. He merely wishes to show that theism is no less warranted than certain other common beliefs, such as our belief in other minds. Perhaps by maintaining this lower profile, the theist can be less provocative to the skeptic, and hope to get along more amicably with her atheist colleagues. This is not quite your grandmother's theism. Oliphint suggests instead the much more provocative presuppositional position in which God provides the only sufficient ground for both nature and reason. God is the necessary and sufficient presupposition for any form of foundationalism or coherentism.

OK, Scott, I'll buy that. God serves as corner stone or cosmic glue, depending on the context. In the postmodern context, however, I would argue that glue is more needed than stone.

Aristotle Gets Real

This is the headline I imagined upon seeing [Michael Esfeld's](#) article [ARISTOTLE'S DIRECT REALISM IN DE ANIMA](#). Philosophers have been attempting to act upon this injunction for several millennia with but limited success, as is widely acknowledged. Michael may hereby have uncovered the source of all our difficulties.

It was a simple misunderstanding. We just misread Aristotle. Think of all the hassle we could have saved if only we had realized that Aristotle had already gotten real.

If you recall your school days, you may remember Plato and Socrates. Socrates got whacked, and Plato, his student, got whacked out on Ideas, and so he had trouble consummating his love. . Then along came the level-headed Aristotle to straighten everyone out with his Concepts. Concepts were like mini-Ideas, and more down to earth. They just lived in your head, and not in heaven.

Well, it turns out, according to Mr. Esfeld, that Aristotle wasn't so level-headed after all. A closer reading of Aristotle reveals a closet Platonist. Fortunately I have not read Aristotle nor Michael, so I can render my own, unbiased and spontaneous account, as I am won't to do.

Like you, I'm sure, and like Berkley, too, I was always bothered by concepts. How is a Concept supposed to be different from an Idea? What happens to an unconceived concept? Like the poor bereft and unperceived tree on the Quad, doesn't it or can't it go to heaven? Is St. Peter going to slam the gates? Need heaven be quite so exclusive? Just because a concept is intangible does not mean that it has to be immaculately conceived every time it pops into someone's head. Is a little cosmic telepathy going to kill us? Eat your heart out, Ma Bell.

To sum up, concepts, like ideas are either real or not. When push came to shove, Aristotle got real about concepts.

So, given telepathic concepts, why do we have to go to school, and where does that leave the tree on the Quad? Chomskian innate universal grammar and English grammar are not quite the same, so we end up declining Latin verbs. Go figure.

And about that tree. Next time you hug a tree, be more respectful. Please address it as 'Your Treeness'. Or are you so stupid as to think there are no trees in heaven? How do I know? Because I know that by elementary logic and reason that this has got to be the BPW. So this is almost heaven and we have trees here so go figure. Being only slightly less catty, I could quote Michael to the effect that the direct realism of our perceptions commits us to a conceptual structure of the world. Which is to say that atoms are concepts before we manage to reify them, as we are won't to do. Too much tree hugging and there are bound to be tree bambinos. We are just not quite cognizant of our powers of creation, but then we do have divine assistance.

Any questions?

I hear that John McDowell is outstanding in the direct realism field. Let's go see.

Well, his profile on the net is not real high. Check out [Mind and World](#). He has managed to keep his essays off the net. Do we have to buy the book?

9/29/02

Representation, Reduction, etc.

OK, sports fans, it looks like we are closing in on the quarry, at last: the remaining core of the debate between materialists and the rest of the world. I had started this search in the ontology arena, but the action appears mainly in epistemology.

Representationalism had been the leading epistemic theory at least since Descartes. But now it is about dead in the water.* Although the diehard materialists will continue beating on it indefinitely, there is just no life left in its poor bones, as is obvious to the wearied onlookers. Where does that leave us?

That leaves us with coherentism, direct realism and connectionism as the only paths forward. Connectionism is the last gambit for the materialists, but they appear less than happy with its prospects. Conceptually, connectionism is totally opaque. Even if it were the answer, we would never be able to know it. On the other hand, our own minds are conceptually transparent to a miraculous degree. This gross mismatch in conceptual impedances is what has the connectionists in a funk. Reverting to the concept of the 'grandmother cell' is a non-starter.

It is a given that as long as the AI people get funded, they will continue make insubstantial claims while ducking out of every philosophical discussion, along with their camp followers, the transhumanists. Intellectual conversation about the mind is left with no alternatives besides dualism and idealism.

Direct realism is compatible with both Cartesian dualism and idealism, but as long as the coherentists can keep a glove in the ring, they will exert a strong pull toward the latter. And right now, direct realism is getting the most attention. Its proponents admit that it has a distinctly miraculous tinge, but then whoever said that the cutting of the world-knot would not invoke higher powers. With immaterialism the miraculousness can be more evenly distributed in a panpsychic fashion. It then becomes less add hoc. I doubt that any of the direct realists are unaware of their immaterialist option, they just don't want to raise too many red flags at once. They are content to be the stalking-horse for the anti-materialists generally.

After spending most of the last century being beaten over the head by the materialists, the anti-materialists can be forgiven for just wanting to savor the turning of the tables that direct realism represents. But before long they will have to move on to something more positive, and very likely that will be a version of coherentism, leaving the Cartesians relatively isolated. However, when they get around to reading this web site, or anything remotely like it, they will have an opportunity for more than a few second thoughts, I'm sure.

For us, for now, we consider the prospects for participation, or at least for a more creative lurking, and that entails an examination of the status quo and the dispositions of the players.

Of immediate interest is the presence of a theological dimension to the discussion of epistemology. It is a rather modest presence, highlighted by Plantinga's early attack on coherentism. There have been only minor theological counterthrusts. If Plantinga's authority is allowed to prevail, it will significantly diminish theological participation in this important anti-materialist discussion.

Behind the theological concerns is the intuition that theology must have a foundation. Coherentism looks too much like the shifting sands in the desert, too prone to fashion and other human interests. There are thoughtful theologians who see coherentism and immaterialism as the way to move beyond the fundamentalist mindset, but they do not have the intellectual weight of Plantinga. Susan Haak's '[Foundherentism](#)' (c. 1993) has received little theological notice. We'll remain watchful, but this is not where the action is now.

[10/1]

* My announcement of the death of representationalism may have been a tad premature. It is now doing business as '[intentionalism](#)'. In particular see Alex Byrne's [defense](#) of it. According to Alex, it is still the biggest debate in philosophy. I haven't figured out if the alleged opponents of intentionalism, *qua* representationalism, have a positive position or not.

Now I'm looking at Benj's [response](#) to Alex.

[10/2]

I am not finding anything substantially new with Byrne. Intentionalism is the weakest form of naturalism with respect to the mind. It is the lowest common denominator of representationalism and all the concomitant varieties of naturalism or physicalism, be they functionalist, computationalist, connectionist, etc. On top of that, the only intentionalism being actively defended is a 'weak' intentionalism which does not attempt to explain the phenomenal character of imagination, among other obvious oversights. But even in this most diluted form of naturalism that still has any substance, its counterintuitive quality remains blatant.

The intuitive bottleneck of intentionalism is its claim that the fullness of experience resides entirely in the thoughts that allegedly comprise that experience. Our intuition is that phenomenal experience causes thoughts rather than being comprised by them. This is more than an intuitive bottleneck, it is a logical contradiction, unless one is willing to engage in the lifework of chopping that logic, which appears to be the case with the remaining handful of active intentionalists.

How can one explain this dogged tenacity of these intentionalists? What is the dog that is wagging this intentionalist tail? The dog is plainly the scientific establishment and all those who partake of its worldview. The vast majority of these folk remain blissfully unaware of this intentionalist structure on which their vast enterprise rests so uneasily. If the handful of intentionalists were tomorrow to throw up their hands in defeat, would the dog even notice its missing tail? It could perhaps just be seen as one more postmodern deconstructive encroachment. But the desperate tenacity of intentionalism's defenders argues for something more intellectually dramatic. Intentionalism represents the last claim that science has for presenting a coherent and complete worldview. By default, intentionalism has become the logical corner stone of that world.

This is my opinion. I wonder, though, why this putative fact is seldom remarked by either side of this debate. Am I entirely misconstruing its potential historical significance? Perhaps the participants and small audience no longer see the possibility of, nor harbor a desire for, any substantive resolution. As long as the beer flows, this intellectual wake will persist, even whilst the deceased waxes aromatic.

If there were to be a turning point in this debate, it would come as a combination of internal and external factors.

On the inside would be an arbitrary but significant shift in the conceptual terms of the debate. It would be sufficient to motivate some of the observers to finally get involved. This would include one or more prominent philosophers, and an ample number of concerned laypeople, such as ourselves. The public scrutiny would be sufficient to bring the diehard materialists to their senses, or to bring the opponents to declare victory and move on.

However, this scenario has had opportunities to play out in the past, and I believe there has to be one important additional ingredient. There must be an attractive intellectual alternative, either to the debate or to the naturalism being debated. Desultory though this debate on intentionalism may be, it is the biggest show in philosophy. That alternative would almost surely include elements of immaterialism, rationalism

and theism. The locus of the debate might shift from between materialism and dualism, to one between dualism and immaterialism. Without such an alternative, the debate would eventually fragment and dissolve into the wider postmodern cacophony. This last possibility is what most observers would likely predict.

[10/3]

According to [Frank Jackson](#) the beer is still cold and flowing:

Most contemporary philosophers given a choice between going with science and going with intuitions, go with science. Although I once dissented from the majority, I have capitulated and now see the interesting issue as being where the arguments from the intuitions against physicalism—the arguments that seem so compelling—go wrong.

Here is the problem that these materialist philosophers face, even supposing they might possibly be right. There is a strong correlation between intuition and language. To go against intuition is to go against language. The whole intuition of the incorrigibly subjective nature of experience is more deeply embedded in our language than any other intuition. In order to promote the pure objectivism of science, one must attempt to drive a wedge between language and intuition by redefining a very large portion of that language. Materialists concede that this is an uphill battle of unprecedented magnitude and that they are making very little headway.

Philosophy, perhaps more than any other discipline besides poetry, is a verbal discipline. To attempt to do battle with a radically diminished verbal armamentarium ought to be a debilitating handicap. One gets a sense of almost tragic heroism in the challenge that these philosophers are taking upon themselves. But for what cause? Is this a 'truth' that is worth dying for? Does not materialism leave our formerly transcendental notions of truth almost unrecognizably mutilated? Rather I suspect that what is at stake here is professional identity. This is more like Custer's last stand of 'rationalism' against, well, perhaps primitivism, on their view.

There is a similar sense of besiegement on the part of scientists attempting to combat various popular beliefs in the paranormal. And I don't think we can understand the philosopher's predicament outside the context of modernism vs. traditionalism, setting aside the whole postmodern issue. Ironically we have the spectacle of self-defined 'naturalists' attempting to deconstruct human nature. And they pretend to be surprised by the resistance they encounter.

The materialists might have supposed that their battle had been won at the Scopes trial. Why then is there still this opposition and why is it coming mainly from among their own colleagues, rather than from the hinterland?

But so much for social psychology, now back to Frank's philosophy. Why are our compelling intuitions so wrong?

Here is the crux of Frank's [argument](#) [also see [this paper](#)]: he compares redness with squareness. I can experience squareness without entailing the existence of anything that is square, either internally or externally. (This seems like a throwback to the adverbial critique of the sense data theory. I don't have a red sense datum, I am rather just being appeared to redly.) The squareness is an intensional property of experience, not an extensional nor an instantiated property. It is a conceptual or functional property as well, perhaps. If the materialist can justify this intensionalism, not to be confused with intentionalism, then she is off the ontological hook. Redness is a kind of process, presumably physical, and not some extant being, presumably non-physical.

I am still having difficulty identifying the key non-materialists in the debate on representationalism.

[Much of the anti-representationalism is just coming from the connectionist direction.] [Donald Davidson](#) is a leading opponent of both representationalism and the correspondence theory of truth.

[10/4]

The main philosophical [critique of representationalism](#) is coming from the Continental phenomenologists, and it was [Hubert Dreyfus](#) who imported the criticisms of Heidegger and Merleau-Ponty:

For even if, with Dreyfus, we reject the proposition that all successful action requires deliberately attended-to mental direction (in the form of, e.g., rules recited or a meditation on the specific conditions the agent's behavior must meet), we still need to explain how it is that the capacities associated with G[estalt]-Intentionality are afforded. Such an explanation would seem to require that our action, no matter how absorbed, be underwritten by some kind of mechanism that -- because it deals in highly abstract content -- ultimately is representational.

This sounds rather like the dispute between connectionists and computationalists: not much metaphysics.

But check out [Representationalism and Anti-representationalism - Kant, Davidson and Rorty](#).

On the contrary anti-representationalists like Davidson and Rorty do not need mediation between "minds and the world", between beliefs, sentences and the world. Rorty thinks with Davidson that mind and human being are continuous with the world, we could even say, both philosophers ontologize the interwovenness (the impossible distinction) of scheme and content.

Plenty of fodder for immaterialism here.

There are two characteristic and important figures in the analytic philosophy, who prepare the overcoming of the Cartesian and Kantian epistemology and make possible Rortyan anti-representationalism: Quine and Davidson.

Following the holistic path of Quine, Davidson proposes that analytic philosophers give up the idea, that knowledge should be grounded "on something that counts as an ultimate source of evidence". He says "A major reason ... for accepting a coherence theory is the unintelligibility of the dualism of a conceptual scheme and a 'world' waiting to be coped with." Davidson proposes a coherence theory of truth, where belief systems should not be verified by correspondence-seeking confrontational methodologies.

As I have briefly shown, Quine, Davidson and Rorty give up the Kantian idea of epistemology which was central for analytic philosophy and which in Continental context was given up by Hegel. But as it is mostly the case, philosophical systems not only bear the possibilities and hints of their overcomings, they "bear" also their "overcomers" with the result that philosophical systems which are left behind, leave their traces, their "genetic codes" in the "overcomer" philosophies.

We can complete this argumentative circle by pointing back to the previous pages on [Huw Price](#) and [representationalism](#). These assorted arguments appear to put representationalism in a small box. What is surprising is that no one else out there is keeping track of this larger non-materialist case against representationalism and connectionism. Is this not the last possible stand for materialism? Why aren't more folks paying attention? Where are all those alleged new theistically minded philosophers?

Some sort of phenomenological coherentism seems like the only alternative to this boxed-in materialism. Biosemiotics is moderately active, but its phenomenological vision is limited to cognitive science.

We have pretty well scoped out the current materialist debate. Coherentism is the only comprehensive alternative, and we have a pretty fair grasp of the radical developmental potential of that new opening.

Where are our fellow explorers?

Searching under [coherentism & representationalism](#) I find a useful [survey](#) of the various epistemological options from an foundationalist, direct realist point of view.

Before this is all over, we're gonna have to check out informationalism. This fella, [Floridi](#), is the best I have seen yet. Information theory is an excellent test-bed for the various epistemic theories. It seems to me that there is a consensus among informationalists that information cannot be defined without a semantic agent. As of now, no artificial agency is foreseen. Where does this leave the strong AI folk? With the rug pulled out from under.

Here is an excerpt from [one of Luciano's essays](#):

Because information is a multifaceted and polyvalent concept, the question "what is information?" is misleadingly simple, exactly like "what is being?". As an instance of the Socratic question "ti esti...?", it poses a fundamental and complex problem, intrinsically fascinating and no less challenging than "what is truth?", "what is virtue?" "what is knowledge?" or "what is meaning?". It is not a request for dictionary explorations but an ideal point of intersection of philosophical investigations, whose answers can diverge both because of the conclusions reached and because of the approaches adopted. Approaches to a Socratic question can usually be divided into three broad groups: reductionist, antireductionist and non-reductionist. Theories of information are no exception.

Not too shabby for a computer nerd, huh? Luciano classifies himself as a non-reductionist. (I actually had a job once as a low-grade programmer, well, I was using object-orientation early-on.)

Reductionists support the feasibility of a "unified theory of information" general enough to capture all major kinds information (from Shannon's to Baudrillard's,...).

Now how many US computer jocks have ever heard of Baudrillard? Am I digressing? Have I ever heard of Baudrillard, the famous Czech composer?

[10/5]

There is an important article by [Ellen Ullman](#) in the October issue of Harper's, which unfortunately is not available on the Internet. It is a several page article entitled "PROGRAMMING THE POST-HUMAN". It is easily the hardest hitting indictment of materialism and Strong AI that I have ever run across.

Following computer science's quest to create a sentient machine, Ellen Ullman, a former software engineer and a novelist, is prompted to explore what it means to be human. Considering emotions, consciousness, reproduction, and nutrition, alongside computer science's dismissals and rebuttals, Ullman arrives at "recognition of our own kind" as the quality that defines human life. "We are creatures whose brains are formed by learning; that is, through experience and social interaction. We don't merely send out signals to identify ourselves; we create one another's identity."

This brief summary does not do her justice. She skillfully captures the personal cynicism motivating too many of the AI researchers, a cynicism that is usually kept just below the surface. She accuses them of seeing humans as nothing more than 'bags of tricks'. They are holding nothing over Richard Dawkins besides the express desire to eliminate their own species in favor of the much greater efficiency and rationality of programmed silicon brains.

Why have we had to wait this long for someone to throw down the gauntlet? After reading more than my share of dry as dust philosophical argumentation, this was a fresh breeze, indeed. The AI materialists have been intellectually coddled for much too long in their publicly funded ivory towers.

The question before us now is whether this mainstream publication was an anomaly, or something more deliberate and political. If I were in the scientific materialist establishment I would be feeling more than a bit uneasy just now. Is this a call to battle? Who is pushing this very visible button? This virtual arena has every potential to get interesting quickly. If it progresses too quickly for me to keep up, well, more power to Ellen & Co. At one point she even feels it necessary to deny any theistic agenda. And what will happen when the theists catch the scent of blood? It may not be real pretty. Some 'sacred' cows will be gored.

[10/7]

The reaction to the the 'transhumanist' attack on humanity is slow in coming, but I doubt that Ellen's reaction will be the last.

[Anne Foerst](#) has a rather different approach to the same general topic:

At the AI-Lab, she served as the theological advisor for the [Cog](#) and [Kismet](#) Projects, two attempts to develop embodied, autonomous and social robots in analogy to human infants which might learn and develop more mature intelligences. She also initiated and directs "*God and Computers*," a dialogue project initially between Harvard Divinity School, the Boston Theological Institute and MIT and now to be continued at St. Bonaventure. In this function, she has organized several public lecture series and public conferences on Artificial Intelligence, computer science and concepts on personhood and dignity.

Would I be capitulating to cynicism to wonder if her presence represents an awkward bit of CYA on the part of the AI crowd?

Here is a [hostile reaction](#) to her work:

Anne Foerst's perverse convolution of AI and Christianity is disturbing, to say the least. Mixing one of mankind's greatest goals with the myth of the Fall and concepts of sin and estrangement is more than just an attempt to endow AI with Christian meaning. It is an attempt to sully the grand vision of AI itself and the "hubris" of those who are working to attain that vision. The myth of the Fall (the Edenic myth of Adam and Eve, who fell from God's grace upon eating from the tree of knowledge) is Christianity's declaration of war on science. Nietzsche's analysis of this myth is dead-on: "Science makes [us?] godlike - it is all over with priests and gods when man becomes scientific. The moral is that science is forbidden as such; it alone is forbidden. Science is the first sin, the seed of all sin, the original sin. This alone is morality."

This writer's hyperbole is clear, but he probably captures a popular sentiment, nonetheless. Invoking Nietzsche does nothing to dispel or soft-peddle the transhumanist 'grand vision' of Strong AI.

[10/8]

I had not done a search on [reductionism](#) for awhile and I was pleasantly surprised by the results. There are not many folks publicly advocating reductionism.

Noteworthy is Gregory Chaitin on the subject: [The Decline & Fall of Reductionism in Pure Mathematics](#). I had not previously encountered an anti-reductionist interpretation of the crucial Godel and Turing results. The incompleteness of formal systems implies that important theorems may be improvable and so must be treated as irreducible axioms, much the way new phenomena in physics may be explained with new laws. Mathematical systems are made more powerful by being extended with optimally chosen axioms. There need be no limit to this process of extension. This quasi-empirical process is a version of transfinite constructivism, often motivated by computer experiments. This constructivism highlights the increasingly subjective aspect of pure mathematics, in that the choice of axioms becomes an exercise mathematical aesthetics. The demonstrable facility of the human mind with such irreducible intangibles lends considerable credence to its supra-natural character. Who is volunteering a biological explanation for our ability to hypothesize the transfinite Riemannian distribution of the primes? Its likely

improvability only adds to the mystery.

[10/9]

[Psychoneural Reduction - The New Wave](#). This the quasi-non-reductive wave came ashore without leaving much of a trace: [Eliminativist Undercurrents in the New Wave Model of Psychoneural Reduction](#).

The state-of-the-art of reductionism is surveyed in [Physicalism and Its Discontents](#) (2001, CUP), and here is a [review](#) of it. The upshot is very little progress to report in the last several years: "There is a tone of battling programs here rather than detailed argument and reply." In other words, the physicalists have given up talking even to each other. The burden, of course, falls on the reductionists. If they cannot convince each other, what chance do they have with the skeptics?

Bare reductionism never even got off the ground. What we see are continuing attempts to compromise with reductionism in ways that would bring it into some resemblance of the mental phenomena it is meant to explain. These compromises with physicalism, however, are invariably found either to be unphysical or to fall well short of the target phenomena, and so it's back to a very cluttered drawing-board for the would-be neo-physicalist.

Here we linger until we summon sufficient courage to tackle immaterialism. No one seems able to muster the will or the authority to call an end to this exercise in futility. But then there's Mary:

[Nature's Imagination: The Frontiers of Scientific Vision](#) (1995, OUP) takes the gloves off the reductionism debate, thanks, in part, to its coeditor [Mary, Mary, quite contrary](#):

Mary Midgley, aged 81, may be the most frightening philosopher in the country: the one before whom it is least pleasant to appear a fool. One moment she sits by her fire in Newcastle like a round-cheeked tabby cat; the next she is deploying a savage Oxonian precision of language to dissect some error as a cat dissects a living mouse.

....With two other [books], *Science And Salvation*, and *Evolution As A Religion*, she staked out a territory all of her own, examining how science comes to function as a substitute for religion, and how very badly it does the job.

"It was Lucretius," she writes, "who launched the notion of science as primarily a benign kind of weed killer designed to get rid of religion, and did it in great rolling passionate hexameters which gave it a force it would never have had if it had been expressed in unemotive prose.

She believes that philosophy matters, perhaps especially to the people who think it is merely a garnish on the brute facts of life - "like the bed of tulips in front of a nuclear power station",

Love that Brit wit. Unfortunately, no ensuing vivisections have been reported.

Nature & Plato, etc.

Perhaps the most difficult challenge for the naturalists is the [naturalizing of epistemology](#). It appears that epistemology has an irreducibly normative aspect, and although norms can be naturalized to a degree, normativity *per se* entails an irreducible rationality.

The deeper worry is that even if naturalized epistemology can account for what makes one normative standard better than another, it provides a model of the human agent that cannot make sense of how there can be responsible active users of norms at all. It cannot make sense of *normativity*. This charge underlies Davidson's anomalous monism: our practice of thinking and evaluating through the use of propositional attitudes is subject to a 'constitutive ideal of rationality' which cannot be fully explained in naturalistic terms.

There is also the slight problem of providing a naturalized epistemology of mathematics. [Indeed, see the work of Zalta, et al. at the MRL, noted below.]

Christopher Hookway, the author in question, reports that as of 1990, Quine had converted from his radical epistemic naturalism to Davidson's anomalous monism:

What does Quine say about this 'anomalous monism'? He insists that there are 'irreducibly mental ways of grouping' events: 'grouping a lot of respectably physical perceptions as perceptions that p, and grouping a lot of respectably physical belief instances as the belief that p'. (Quine, 1990, p, 71). Moreover there is 'no dismissing' this way of talking since it 'implements vital communication and harbors indispensable lore about human activity and motivation, past and expected.'

[10/11]

Then we have Laurence Bonjour, [In Defense of Pure Reason: A Rationalist Account of a Priori Justification](#) (1997, CUP).

'Although he has been thinking and writing about these issues for many years, the publication of his book is a part of a widespread resurgence of interest in rationalist ideas, from the foundations of logic, through epistemology to moral philosophy, and anyone interested in either the rationalism or the resurgence will need to read In Defense of Pure Reason.' Times Literary Supplement

Yeah, man, show me s'more a that there resurgence stuff!

In all of this Internet sleuthing, I would like to think that we are closing in on what will turn out to be the decisive argument in the final defeat of materialism, but we may just be going around in circles like everyone else at this *fin de siecle*.

And then we have a reissued anti-empiricist, coherentist tome: [Groundless Belief](#) (1997, 1999 PUP). Naturally there are idealist excursions herein.

On a lighter note, you may wish to consider the following:

[Pew Workshop -- The Metaphysics of Human Persons, September 5th - 8th, 2002, Princeton, New Jersey:](#)

- Galen Strawson, ["What is the Relation Between an Experience, the Subject of the Experience, and the Content of the Experience?"](#) (Related documents: ["I"](#) and ["I-diagram"](#))
- Peter Unger, ["Demystifying the Physical"](#) (Related document: ["A Humanly Realistic Philosophy"](#))
- Howard Robinson, ["Sellars's 'Empiricism and the Philosophy of Mind'"](#)
- Robert Adams, ["A Spiritual Universe"](#)
- Godehard Bruntrup, ["Liberal Naturalism and the Causal Efficacy of Phenomenal Properties"](#)

- Trenton Merricks, ["Split Brains and the Godhead"](#)

It does seem that we are turning a rather sharp corner hereabouts in philosophy. Will the materialists be able to hang on? Are they just eating dust about now?

And although this was sponsored by the IDers, it encompassed an impressive diversity:

[THE NATURE OF NATURE: An Interdisciplinary Conference on the Role of Naturalism in Science: April 12-15, 2000](#)

Back to more serious stuff, consider: [Naturalized Platonism vs. Platonized Naturalism](#) (1995). This is a candidate for the smoking-gun paper. Have the materialists not been able to refute these claims? We'd better check.

[10/12]

Here are Linsky & Zalta:

In this paper, we argue that our knowledge of abstract objects is consistent with naturalism. Naturalism is the realist ontology that recognizes only those objects required by the explanations of the natural sciences. But some abstract objects, such as mathematical objects and properties, are required for the proper philosophical account of scientific theories and scientific laws. This has led some naturalists to locate properties or sets (or both) in the causal order, and to suggest that philosophical claims about properties and sets are empirical, discovered a posteriori, and subject to revision. We call this view Naturalized Platonism, and in what follows, we contrast it with our own view, which we call Platonized Naturalism.

Platonized Naturalism is the view that a more traditional kind of Platonism is consistent with naturalism. Traditional Platonism is the realist ontology that recognizes abstract objects, i.e., objects that are non-spatiotemporal and outside the causal order. The more traditional kind of Platonism that we defend, however, is distinguished by general comprehension principles that assert the existence of abstract objects. We shall argue that such comprehension principles are synthetic and are known a priori. Nevertheless, we claim they are consistent with naturalist standards of ontology, knowledge, and reference.

I just realized that this article is the center piece of the program at the [The Metaphysics Research Lab](#), Center for the Study of Language and Information, Stanford University. [At this point I had already forgotten about the **Computational Epistemology** Lab, [mentioned earlier](#).]

The considerable irony is that this metaphysical smoking gun is being constructed by the computer jocks at Stanford. It must be a cold day in hell when the materialists are getting it in the behind from these guys. I always thought that the 'M' in MRL was a joke. I should have been paying closer attention. 'What the heck does a computer care about metaphysics,' I wondered. Well, it looks like the joke is on me. I'm just the last person in the world to realize that materialism was a joke. I've been taking it much too seriously. But isn't the last guy out supposed to turn off the lights. It's so dark in here I can't even see the light switch. Help, Lord!

I am finding this quite strange. Zalta doesn't seem to get the joke. He just tends to his knitting. And how is this going to affect the programming of computers, pray tell?

This article does get very abstract and analytic. I look at Ed's home page and I see that he may never have laid a hand on a computer. But these formal ontology projects are strictly for AI type stuff, I thought. Maybe these computers are smarter than we think. Should we worry?

I'm trying to find the publication page again. [Here](#) it is. I was struck mainly by the conference title:

"A Common Ground and Some Surprising Connections", Southern Journal of Philosophy, Volume XL,

Supplement, 1-25. (Keynote lecture delivered at the Spindel Conference entitled **Origins: The Common Sources of the Analytic and Phenomenological Traditions**, September 2001, University of Memphis, Philosophy Department)

No wonder I'm perplexed. Am I gonna have to read this? [10/14 -- I have read it without yet determining a relevance. It is nice to have a formal ontology, but I suspect that the world is not so wont to stand on ceremony. Formality does not comprehend rationality, and rationality does not comprehend the aesthetic implied in the BPW. Cosmic love is just bound to be trans-rational. The world is optimally rational.]

[10/13]

It looks as though I may have to render some sort of opinion about the competing theories of abstract objects that these latter-day, techno-ontologists love to fret about. In general I would say that their disagreements may be attributed to an overly analytical approach to ontology. They each assume that existence is an all or nothing proposition. This is a major mistake. They don't want to conceive of existence as relative. There is a good reason for this. It's part of our self-preservation instinct. Each of us wishes to exemplify an absolute existence. But on a relational perspective there can, at most, be only one absolute. My more immediate concern is as between the particular and the universal. I have spoken of cosmic love. Do we envision that as a universal or a particular? Do we embody or exemplify that property? I'll have the answer in one hour, so keep your pants on.

Yes, this is what I think is going wrong here, Ed is trying to construct a computer friendly ontology. And he has fallen into the trap of thinking it's not who you know, it's what you know. Well, this is a trap that is more difficult for an x'ian to fall into, if you catch my drift, not to say that Ed is not such at heart, but that is somewhat beside the point, or is it? Someone that analytic has got to be just a tad insecure, and one's x'ianity is directly correlated with one's existential security. It's just that simple. But I'm no expert, just an *amateur*.

And, here's the real catch: to know me is to love me, or, really, vice-versa, and how many of us could ever say that, even about ourselves. No one said that existence, or really just love, is easy. The only reason we continue to exist is because of God's continuing love. Even God is not absolute. The absolute is the creator-creation love feast, or the hierogamos, to be technical. Is that a universal or a particular? Obviously it is more than the sum. It has got to be the best possible love feast. Does that mean we are going to die? No, that means don't ask stupid questions, if you catch my drift. Does that completely answer your question concerning existence? I hope so, 'cause that's all I can think of right now.

And I almost forgot: what about 'holier than thou'? As a wannabe second comer, am I just looking out for *numero uno*? You got it, sister! Oh yeah, and that's *a priori*, if you catch my drift for the last time. And do I know what I'm talking about? Not really, if you catch..... I'm a lot like you, I just work here, if you.....

And that segues us right back to Ed & Bernie (Linsky):

Indeed, from a naturalist perspective, how can there be synthetic *a priori* truths like the comprehension principle? The answer is that there can be such truths if they are required to make sense of naturalistic theories, that is, if they are required for our very understanding of those naturalistic theories.

....As the final step to our argument, we claim that it follows from this conclusion that the comprehension principle and logic of encoding are required to make sense of any possible scientific theory, i.e., required for our very understanding of any such theory. So our Principled Platonism is consistent with naturalism because it is required by naturalism.

I would also point out that I can think of nothing more universal than gravity. But is the universality of gravity not essentially Platonic? And without this Platonism there would be no nature, nay, there would be no naturalists. Nature is not self-sufficient, not even the Creator is self-sufficient. Did you ever see a Creator without a Creation? You could have an ex-creator with an ex-cre(a)tion, but let's not go there!

The comprehension and identity principles present us with an ordered realm of objects that looks more like a formal garden than a jungle.

Well, guys, there's the mistake. We didn't promise you a rose garden. It's just mean streets out here in the BPW.

A principle asserting the existence of a **plenitude** of abstracta meets this standard, for a plenitude is not arbitrary. There is no need to explain why some abstract objects exist while others don't. A Platonized Naturalist, however, operates in the spirit of this standard by pointing out that for objects outside the causal order, there is no way to discover or explain our connection to them on such a piecemeal basis. There is no good reason to suppose that abstract objects are sparse.

The plenitude can only be of, by and for cosmic love. How many more millennia to get this right? The love is gonna getcha! (The Ravens just lost, but we're still tied for first in our division.)

I gather from Bernie & Ed [and see Hookway, above] that Willard Quine was, in effect, the first and last naturalist philosopher. He was the first self-professed naturalist philosopher, and yet his naturalism was amended with a 'limited Platonism'. No naturalist since has been able to refute this peculiar epistemic appendix to nature. A great deal of effort has gone into the attempt to naturalize Plato, but these authors argue effectively that it is a lost cause, and the only recourse is now to Platonize nature. This is not your grandmother's idea of nature.

Willard's refutation of the analytic-synthetic distinction has been touted up one wall and down the other, but not so for his refutation of the Cartesian dichotomy of idea & matter. This is far more significant historically, in my humble opinion. We have spent about half a century trying to restore nature's conceptual virginity, and now it's time to face this fact of life: 'Do not put asunder that which God hath brought together.' 'Anomalous monism', indeed.

[10/14]

There are several contemporary philosophical discussions that bear upon our putatively imminent gestalt switch to rational theism. I have been surveying them in these last few pages.

Now that we have witnessed the partial rehabilitation of Plato in contemporary philosophy, let us return to the consideration of [rationalism](#).

(Just as a sidelight, here is an account of rationalism vs. empiricism in economics: [In Defense of Extreme Rationalism- Thoughts on Donald McClosky. The Rhetoric of Economics.](#))

Rationalism vs. Naturalism and other Orthodoxies

[10/15]

Rationalism and idealism are not two sides of a coin; they are simply one coin. Of course, the scientific establishment is constantly attempting to recruit rationality to its own cause. The next time a scientist makes an appeal to reason, ask her if anyone has ever observed one of them there reasons.

The Fallacy of Epistemological Idealism:

Modern philosophy seems to be a maze of contradictory theories which have arisen in a relatively short period of time. -----

On the surface, there appears to be nothing but intellectual chaos. Viewed from a broader standpoint, however, by far the majority of these theories and systems will be seen to be more or less alike. They reveal a common parentage and show a common kinship. As such, then, they possess a uniform trait, a fundamental doctrine identical in them all, which underlies all the variants and forms the root-idea from which they derive their origin and then develop into different philosophies. This uniform trait is idealism, and the root-idea is the idealist postulate.

Here, here! Nothing worse than all these half-baked idealists! A dime a dozen.

How, then, can the mind perceive things at a distance, or how can things get into the mind? It does not seem to solve the difficulty by referring to the stimuli (light waves, airwaves, etc.), which are supposed to leave the objects and impinge upon the sense-organs; because then we should perceive these stimuli and not the objects from which they come. That, however, is not the case: we perceive apparently objects and certainly not stimuli.

Yes, I always did wonder about that.

The foregoing criticism shows that idealism arises out of the ego-centric predicament and that its arguments involve a faulty logic. This, of course, does not prove that extra-mental reality actually exists; it merely shows that idealism has not disproved the existence of extra-mental objects. The question of the existence of such objects must be solved, not by any a priori, but by an a posteriori method. Facts alone, together with their proper interpretation, must settle the issue; that is the only scientific and philosophic procedure which can lead us with safety to a definite conclusion.

Yes, Mam, just the facts, please. Our survival depends upon sticking to the facts. But to whose facts do we stick? Where is our authority? Nay, where is our Author?

CATHOLIC ENCYCLOPEDIA- Rationalism: (speaking of authority...)

The term is used: (1) in an exact sense, to designate a particular moment in the development of [Protestant](#) thought in Germany; (2) in a broader, and more usual, sense to cover the view (in relation to which many schools may be classed as rationalistic) that the human reason, or understanding, is the sole source and final test of all truth. It has further: (3) occasionally been applied to the method of treating revealed truth theologically, by casting it into a reasoned form, and employing philosophical Categories in its elaboration.

Not exactly a rousing cheer for rationalism from this authority, and I can readily sympathize with their cautions...

But in his method of proof of the authority of Scripture recourse was had to reason, and thus the human mind became, logically, the ultimate arbiter in the case of both. Supranaturalism in theology, which it was Wolff's intention to uphold, proved incompatible with such a philosophical position, and Rationalism took its place. This, however, is to be distinguished from pure Naturalism, to which it led, but with which

it never became theoretically identified. Revelation was not denied by the Rationalists; though, as a matter of fact, if not of theory, it was quietly suppressed by the claim, with its ever-increasing application, that reason is the competent judge of all truth.

They are not quite denying that our presumably God given, supra-natural power of reason is not the final arbiter. (Am I sounding too Protestant?) What else can be? On what other basis can there be an interfaith dialog, or an apologetics?

I am finding the remainder of this article most helpful, and I urge you to view the source.

As has been noted in the preceding paragraph, German Rationalism had strong affinities with English Deism and French Materialism, two historic forms in which the tendency has manifested itself. But with the vulgarization of the ideas contained in the various systems that composed these movements, Rationalism has degenerated. It has become connected in the popular mind with the shallow and misleading philosophy frequently put forward in the name of science,....

Amen, to that.

[10/16]

Consider this [conceptual triangle](#):

Sometimes a distinction is made, as it has been in different ways by Frege and Popper, between three kinds of real things (three 'realms' or 'worlds'). The first contains material things.... The second contains psychological things.... The third contains abstract things.... Philosophers have tended to treat these three realms ... as lying in a triangle, so that the rejection of one was compatible with accepting either or both of the other two. Materialists strictly speaking say that only matter exists, but in modern times they have tended to direct their fire primarily against believers in the second realm, and some of them (e.g. Armstrong) accept at least a moderate realism in connection with the third realm. But this was not always so. Plato, with whom so much of philosophy began, was primarily concerned to assert the existence of the third realm....

If the rationalists/idealists have established anything it is that realm of numbers cannot be reduced to material entities. Given the reality of this 'third realm' then it follows naturally that the realm of the psyche must also have an immaterial aspect in order to make contact with the realm of numbers.

The existence of consciousness is very hard to deny, as materialists must, but its existence cannot be demonstrated objectively, as they insist. The materialists have the rest of us in a bind, demanding an objectification of non-objects, i.e. abstracta. 'Abstract' may be a poor word because it implies a logical dependency, but, in any case, abstraction, *per se*, is a purely psychic act.

Opposing rationalism is empiricism, which is most narrowly equated with materialism. More broadly conceived, empiricism becomes naturalism, which is more loosely defined, so loosely, in fact, to be possibly lacking in coherence.

Next, we look at [naturalism](#). Is it a coherent set of beliefs?

What it insists on is that the world of nature should form a single sphere without incursions from outside by souls or spirits, divine or human, and without having to accommodate strange entities like non-natural values or substantive abstract [universals](#). But it need not reject the phenomena of consciousness, nor even identify them somehow with material phenomena, as the materialist must, provided they can be studied via the science of psychology, which can itself be integrated into the other sciences.

Off the top, psychology is very, very far from being a science. Every psychologist has a different theory of psychology. In these latter days, even the physicists are getting into the pluralism act. Every

theoretical physicist has a different conception of what the final Theory of Everything is going to look like. This simply means that the frontier of any science will be 'unscientific'. Political, aesthetic, intuitive and subjective considerations become dominant. This is about charisma at its highest level. Only when this charisma has been thoroughly routinized are we back in the realm of science.

From an historical perspective we can think of alchemy as, at one time, being the frontier of chemistry. Alchemy was a thoroughly charismatic affair: it reflected intensely personal and creative participation. As an immaterialist, I would go even further than this. During this charismatic stage of science, reality is being defined. There is a give and take between the subjective and objective realms. It is like a lengthy process of negotiation where the protocols of transaction are being worked out so as to achieve the greatest harmony as part of the Best Possible World. Science is not simply a process of discovery. The human intellect and the cosmic intellect are working out an ultimate accommodation which is mediated by and through nature.

Psychology is still very much at the charismatic stage as represented by alchemy. The transactional and transference protocols of psychology are intensely personal, and the results of which will ultimately define how we become one with the creator. That is the 'science' of eschatology; that is what psychology is gradually working up to. The eschatological psychology will be barely recognizable from what we know today. It may even become more charismatic than it is now, but that will not prevent it from also taking on some significant aspects that represent a continuity with the methods of today's science.

But we were supposed to be discussing naturalism. We have simply explained why the epistemological form of naturalism is sometimes referred to as 'psychologism'. It was Frege's reaction to the 'psychologizing' of mathematics, late in the 19th century, which led to contemporary rationalism.

It appears that the academic debate that is of most practical relevance to rational theism is the debate between rationalists and naturalists. It is also true that this area of discussion is as active as any in philosophy.

[10/17]

One of the foci of this discussion is the ['naturalistic fallacy'](#):

The naturalistic fallacy is a metaethical theory proposed by G. E. Moore (1873-1958) in *Principia Ethica* (1903) that the notion of moral goodness cannot be defined or identified with any property. Moore argues that "goodness" is a foundational and unanalyzable property, similar to the foundational notion of "yellowness," and is not capable of being explained in terms of anything more basic.

This has a slightly different thrust than the more commonly stated version of this fallacy as consisting of the attempt to infer 'ought' from 'is', and going back at least to Hume.

Here is [another take](#) on the fallacy:

Small wonder, then, that faith in Nature is hard to reconcile with the rationalist philosophers' critique of the naturalistic fallacy. Environmental ideas of Nature are often based on a scepticism about the power of reason, and a willingness to put faith in spontaneous order precisely because one knows the limits of one's own knowledge about the working of the system.

This points to the divide between naturalistic philosophers, who align themselves with science, and naturalists *simpliciter*. Is there anything in the world more unnatural than science? Natural science should be an oxymoron. These matters are further complicated by the once prominent religious notion of Natural Law. And finally, the concept of human nature is about as contentious as any in the modern world.

[James Boyle](#) continues with his review:

In 'Contested Natures' Phil Macnaghten and John Urry take up these questions. They argue that we

have not one but many Natures, "constituted through a variety of socio-cultural processes from which such natures cannot be plausibly separated." Their argument, if I understand it correctly, is that three things will happen once we realise that the concept 'Nature' is neither 'natural' nor unitary. First, we will stop believing that we can get objective science about Nature. The reason is almost Heisenbergian; the observers are in the frame, not outside of it. We are part of Nature, part of many Natures, and scientific analysis must always begin by assuming some pretheoretical orientation towards one of those 'Natures.'

These preceding observations bring us back to the question I posed yesterday: can anything posing as 'naturalism' be coherent? I am not the only skeptic on this matter. Naturalism is the *de facto, ad hoc* fall-back position for the rag-tag remnants of the once ascendant materialists. As we speak, they are discovering that this encampment is not rationally [sic] defensible, and they encounter a lack of sympathy among the natives.

Now I could be proven wrong in this prognosis, and certainly I am not specifying a date by which the 'naturalists' will have folded their tent. I am not holding my breath, but I am, right here before your eyes, maintaining a vigil. I am supposing that a properly conceived vigil will expedite the folding of that tent.

And, of course, I am doing rather more than that. I am attempting to give shape to the tent that will come. As the naturalists get a better handle on what exactly they are holding out against, it may well increase their resolve. So be it. What could be the more logical contender to naturalism than a rational theism, with its attendant BPW supposition? They may well realize that their best strategy is to fight every strawperson and ignore every real person. When they are no longer able to ignore rational theism, the game is over.

Now I search on [rationalism & naturalism](#). There are over 5,000 hits.

It is disappointing to see how many people using rationalism in its particular historical and non-philosophical sense that is now covered by naturalism. The scientifically inspired attack on religious authority came way back in what was naively billed as the Age of Reason by self-styled Rationalists. This confusion means that a lot of people are missing what is now the principle argument against naturalism. Of course, naturalism is also a misleading term, chosen perhaps deliberately by those defensive materialists.

Here is the first [substantive hit](#). (Note that 'empiricism' is used in place of 'naturalism'):

...the Rationalist holds that some or all of what is true knowledge is in-nate to us, it is literally inborn with us; the Empiricist believes the opposite: all of our knowledge arises from our perceptual experiences in the world after we are born. The name of the school of Rationalism obviously derives from the word 'rational' which itself goes back to the Latin, 'ratio' meaning 'calculation'. This in turn goes back to another Latin word, 'ratus', which is the past participle of 'reor', meaning "think", 'deem', 'judge'. What runs through all of these is the emphasis on mind, an emphasis retained in most of the modern associations connected with the word 'rational' as well: rationalise, rationality, and so on. 'Empiricism' derives from another English word, 'empiric', meaning, 'derived from experience' (this itself going back to Latin and Greek words for experience also). So in the plainest language possible, the Rationalist places the origin of our knowledge of reality in the powers of the mind, whereas the Empiricist places it in our powers of perception.

As John Mullarkey points out later in this article, it is also the distinction between deduction and induction. But in a contemporary cultural sense it is the distinction between the Analytical and Continental schools of philosophy. So if I'm so big on rationalism, why don't I just move to France? Well, the French still see rationalism as opposed to both religion and nature. They are still back in the Age of 'Enlightenment'. Hegel's stab at a rational theism was stopped dead in the water by many converging historical forces. Those deconstructive catholic atheists show not the slightest inclination to revive it.

[10/18]

By the way, I hit on the following article that is apropos of the interface of faith and reason: [The Opening of the Evangelical Mind](#):

If there is a threat to academic freedom, it comes from what he calls "dogmatic rationalism." Naturalism, the belief that everything that exists in the world has a natural origin and can be explained by laws of nature, "becomes dangerous when, like the dogmatists of old, it declares its way of knowing to be the only legitimate one and then seeks to disenfranchise other voices."

Notice that even the editors of the Atlantic Monthly are disposed to equate rationalism with naturalism. The whole religion-science debate may hinge upon the distinction.

Continuing on with the [rationalism & naturalism](#) listing, I find the most complete statement of the anti-naturalist view of the mind: [Mind and the World of Nature](#) by [Steven Horst](#). He is still drafting some of the chapters. I have not run across any defense of naturalism that is nearly as comprehensive. The 'neuro-philosophy' tomes we looked at earlier simply do not address many of these basic philosophical issues. The papers that do address these issues do so in a piecemeal fashion.

Now here is a revealing article by a secular humanist: [Evolutionary Naturalism: the Philosophical Foundations of Humanism](#). Pat Hutcheon reads the Darwinian riot act to his fellow humanists:

Do you assume that human beings cannot know anything beyond nature, nor can they know anything by any means beyond the use of the senses and the application of reason to experience? Do you consider that any sound understanding of reality must begin with a bottom-up, empirical search for cause and effect relationships -- rather than with a priori axioms and a top-down process of deductive rationalism?....

Do you assume that language is merely a tool evolved within our species of primate and that the terms we apply to categories of experience do not carry within them any "essence" of the reality they serve to symbolize? Are you skeptical of holistic approaches to knowing, or to healing, with their grand designs for social change -- or total harmony of being -- that can be neither analyzed nor tested? Do you refuse to devote time and effort to a search for the underlying meaning and purpose of life, and for your own role in some universal cosmic plan?....

All of which was prompted by the following observation:

Many European humanists -- because of deeply embedded cultural tendencies toward romanticism and Kantian transcendentalism [and Rationalism?] -- have never really adopted the evolutionary world view implied by modern science. For them postmodernism is an all-too-easy out. It allows them to have their cake and eat it too. They can avoid facing up to the implications of evolution for human behavior. They can say that, yes, science is one way of comprehending reality; but there are other, equally legitimate modes of knowing. "Most of us here are not in the least interested in Darwinian evolutionary ideology", I have been told a number of times by humanists in Europe. Indeed, I am beginning to suspect that the "postmodern" point of view, which sees all approaches to knowing -- including the scientific one -- as equally ideological in nature, is rapidly becoming the prevailing philosophy among humanists in many parts of the world.

Yes, those Continentals are a subversive bunch. And Pat is right about having to draw a line in the sand. One, well aimed, immaterial stone could bring down the whole glass house that is materialism. The Continental mysticism is a pragmatic defense against the immanent, logical collapse of scientific materialism. They don't want to be taken down with that edifice. They don't want to have to ride shotgun for Science as do their Analytical colleagues over here. The Continentals hope that only one end of the secular boat will sink.

This rather obvious point about Freud vs. rationalism had not occurred to me:

One of the strongest blows to classical rationalism did not come from the crisis of its bulwarks at the

turn of the century (applied non-Euclidean geometry, logical conventionalism, etc.), but rather from Freud's attack on the crystalline transparency of self-consciousness. In effect, Chomsky's neo-rationalism in linguistics adopted from the start the 'opaque' character of language universals.

No wonder that neo-rationalism is an uphill battle. This is from a footnote of Alberto Peruzzi in '[From Kant to Entwined Naturalism](#)'. I'm attempting to discern a possible Continental flavor to naturalism, hopefully it will be spiced up a bit. I am reminded of Linsky & Zalta's [Naturalized Platonism vs. Platonized Naturalism](#) discussed on the [previous](#) page. In the present case, Peruzzi is using the mathematical theory of categories to Kantianize Nature. Again, this is not grandmother's idea of Nature, but scientists have been mathematizing Nature from the beginning. Also Peruzzi reminds us that logic and math are normative sciences rather than descriptive. Is this how we can smuggle intentionality into Nature? Are the Continentals going to help the naturalists get off the materialist hook by making irreducibility more scientifically palatable? Let us see. I suspect, however, that this is another foot in the door for rationalism, and that by giving it these few inches, it will not be difficult for rationalism to take the whole nine yards. But am I the only one who respects the potency of the rational? Has Freud reduced the ratio to the libido? Obviously the cosmic libido respected the rationale of the Monster Group or we would not have Physics. Creation is about the entwining of the Life force and the Logos to produce the BPW. A real neat trick!

But then why am I calling this 'rational theism' and not 'libidinous theism'. I may have just been taking the libidinous part as a given, as in, 'give us a break!' On the Trinitarian scheme does the Force reside more with the Son or the Spirit? It will be on your next quiz.

Science, in its transactions with Nature, recognizes neither the vital force nor the logos. The logos of mathematical physics is a significant exception.

[10/19]

While reading Peruzzi, I notice the next [essay](#) on the Google list, [rationalism & naturalism](#), is 'THE STRUGGLE BETWEEN CHRISTIAN THEISM, METAPHYSICAL NATURALISM AND RELATIVISM: HOW TO PROCEED IN SCIENCE?' by Jitse van der Meer (1995). It has been posted on the [ASA](#) website. The American Scientific Affiliation espouses a more academically respectable version of creationism with God working through nature, more or less, but it is more demanding of scientific openness than anything you would find at the AAAS, for instance, although I am sure that many scientists who are also evangelical belong to both out of professional necessity. Van der Meer is emphasizing the intellectual tension that must exist between naturalism and theism. This is a tension that I have found to be notably lacking among the more nominally, or non-evangelical theistic scientists, who see science as another job. They just work there, so to speak. It is not part of their job description to wax metaphysical, and they'll be damned if anyone tries to make an issue of it, as Jitse does here.

[Incidentally, the Intelligent Design/Irreducible Complexity advocates do not appear to have a presence in the ASA. I'm not sure how closely affiliated the IDers are with the reactionary creationists.]

I then suggest that science needs to expand its methodology beyond the current confines. This expansion consists of accepting non-material causes in scientific explanations, and using broader criteria for theory choice. Instead of explanations that use material causes only, science needs multi-dimensional explanations that admit the causal efficacy of purpose and intent. Not only is the pursuit of several different explanations more adequate for a multi-dimensional reality, but it also provides a way of limiting one-dimensional explanations including those developed in terms of matter alone. This is an hermeneutical approach to explanation in the natural sciences which emphasizes "understanding" and sees explanation in material terms as one form of it.

This is not an unreasonable suggestion, but it will not be taken up without a 'struggle', our without a major shift in public sentiment and understanding. It will not be taken up until rational theism is more widely appreciated.

Methodological materialism is important because it acknowledges the materiality of creation.

Well, there just went the whole ballgame. There's a throwaway line for you. Can anyone out there tell me why the prophetic traditionalists are knee-jerk dualists? I keep trying to understand this dogmatic dichotomy of Creator and Creation, but cannot quite fathom it. Are not human souls part of creation? Are they not immaterial? *Ergo*, Jitse is in a blatant self-contradiction. His obliviousness to this blinding inconsistency is endemic among theologians. Will someone please clue me in? What is going on here?

[10/22]

I've spent the last couple of days perusing [reductionism & mathematics](#). I am finding no defenders of reductionism. Dawkins remains the primary advocate of materialism; however, his 'memes' are decidedly immaterial entities, rendering him anomalous. After him comes Dennett, but his 'functions' are neither physical nor reducible.

There are quite a few philosophers who are 'non-reductive materialists', but I am not the only one who sees their position as self-contradictory. And these latter-day materialists seem motivated primarily by the desire to avoid Cartesian dualism. Their monistic predilection may put them in the forefront of idealism when its turn comes again. Their colleagues have too readily surrendered to the blandishments of pluralism.

Materialists lately refer to themselves as 'physicalists'. However, if you ask a physicist what physics reduces to, they will likely respond with 'mathematics'. If you ask a mathematician what mathematics reduces to, my perusal of the above list tells me that you will not get a definite answer. A century ago, the answer might have been 'logic', but that aspiration has long vanished. Are there any irreducible mathematical objects to which one may point? There are many objects that seem quasi-reducible at best. My favorite remains the **Monster Group**, which many believe has physical ramifications, along with its more diminutive siblings. It does contain many of the smaller sporadic groups as subgroups, but as the largest of that class, it is technically irreducible to them. It is not just the sum of its parts, because its group structure specifies a unique set of relations amongst all its elements. One might claim that the Monster is reducible to the coding of its existence theorem. However, the fact that this putative theorem has never been assembled in one place, is not fully understood by any one person, and is estimated that it would fill some 1,500 pages [3/10/03: [wrong](#), it was 15,000 pages compiled by some 50 mathematicians between 1961 and 1980 (additional [reference](#))], renders this form of reduction less than compelling. Surely, the existence proof of the Monster is already contained cryptically somewhere in the decimal expansion of Pi, along with Shakespeare's sonnets, but specifying its location therein might require many more than 1,500 [15,000] pages. But the Monster group is not physical, *per se*. It can exist only as an idea, and not as an isolated idea, but only as part of a seemingly unspecifiable, holistic set of ideas embedded in an intelligence having considerable overlap with human intelligence. Reductionism seems only able to lead us into irreducible logical circles. Its would-be defenders have been left in disarray.

Where does that leave the rest of us? That leaves us as if suspended on the edge of reality. Suddenly our world is populated by many new and mysterious objects. What are we to make of this new landscape?

Whatever else might be said of this landscape, intelligence is not an epiphenomenal aspect of it. Can concepts exist without conceivers, or experiences without experiencers? By definition, intelligence is structured to render the world minimally intelligible. Given the existence of immaterial, irreducible intelligences, it would seem unnatural to confine higher intelligence to a purely dependent existence. Especially so if we come to suspect, as many have, that the peculiar abstractions of space and time are dependent constructs of mind. In that case, our own immersion in space and time is an integral aspect of a cosmic construct to whose intelligibility we are prime witnesses.

[10/23]

It is revealing to read Steve Weinberg's comments, [REDUCTIONISM REDUX](#), on the reductionism

symposium at Jesus College in 1992. His arrogance is equaled only by the shallowness of his discussion. I have not read the proceedings, but there does appear to have been a dearth of philosophical reflection in a discussion dominated by scientists throwing barbs at each other, a technique easily mastered by Steve. Steve's now 'Standard Theory' combining weak, electric and strong forces may well have been the last hurrah of reductionism, or as he calls it 'grand reductionism'. Steve's 'grand' project was already being 'sneered' at even before the ink on his awards had dried. What role is left for him but curmudgeonhood?

There is another reason for some of the opposition to reductionism, and specifically to the perspective provided by grand reductionism. It is that this perspective removes much of the traditional motivation for belief in God.

Now there's a bit of candor. One almost has to wonder if Steve is concerned about his historical spot in the cosmic pecking order. By the same token, any significant shortfall in the grand project is evidence for cosmic purpose. Check out his [defense](#) of the 'meaningless universe'. With both Dawkins' and Dennett's reductionism suspect, Weinberg might have to be given the top spot on reductionism's hit parade. His motivation seems to lack personal conviction; what I see instead is a literal *reductio ad absurdum* of his professional role playing.

Steve's equation of modernism with 'grand reductionism' is correct, and so is its adversity to theism. The postmodern refusal to grapple with either rationalism or theism is its defining characteristic. It is a deliberate lacuna that is consigning its practitioners to instant irrelevance. The cottage industry of theological apologetics for science should be a scandal. Steve and the **fundamentalists** have the correct assessment. Pluralism is a desperate ploy to curtail thought and discussion of anything foundational. Anti-foundationalism has nowhere to stand.

Meanwhile the evidence against reductionism is mounting. It is strongest in the areas of epistemology and linguistics, areas that traditional reductive science abjures. The subtle arguments of its practitioners are lost beneath the furious controversy concerning human nature. Piaget's and Chomsky's structuralism was much too easily subsumed under biological genetics. Their 'genetic epistemology' was never intended to be about DNA, and the public ignorance of their subdued protestations to that effect only underscores the pervasiveness of the modern reductive hegemony.

The starkly theistic implications of any anti-reductionism, as touted by Steve, pose a great intellectual and political barrier to its academic proponents. They must toil amidst the unobtrusive details, leaving the obvious speculations to us outsiders. Even the growing cadre of theistically committed philosophers is slotted into areas of ethics. It is true, however, that there is a major overlap between ethics and epistemology. It is in that obscure venue that we might keep an eye out for an anti-reductive theistic initiative. Epistemology represents the soft underbelly of scientific materialism.

Plantinga's [Reformed Epistemology](#) is certainly a move in a parallel direction, but it does not focus specifically on reductionism. Alvin is just looking to construct a new branch of epistemology, a safe harbor for theism, rather than provoke a general confrontation. The neo-theists are following his lead, to the relief of their secularist colleagues. That the reformed and evolutionary accounts of epistemology can much longer avoid a confrontation is doubtful, however.

Let us look at ["reformed epistemology" & reductionism](#). An interesting article, ["The Relationship between Philosophy and Theology in the Postmodern Age"](#) (1999), is on the [al-Islam](#) website. This is an important essay. It provides a comprehensive introduction to contemporary philosophy of religion; actually, it is the best I have seen on the Internet to-date.

While philosophy in the U.S. has been dominated by analytic thought throughout, most of the twentieth century, over the last ten or fifteen years, continental thought has come to play a prominent role in American philosophy. What is emerging is a "world philosophy," but one from which the Islamic world is

largely excluded. The reason for this exclusion is not because of some conspiracy to suppress Islamic thought, but because we Muslims have not seriously attempted to enter the discussion. If we are to enter the discussion, we must beware that it takes place in what is often hostile territory, in the context of expectations, presuppositions and standards of reasoning many of which are quite foreign to those found in the Islamic sciences.

What a breath of fresh air from Dr. Muhammad Legenhausen.

Consider, for example, the role of the principle that an actual infinity of causes is impossible. A number of Western philosophers, physicists and mathematicians have come to doubt this principle. In defense of the principle, an important book has been written in which some of the ideas of Muslim philosophers are given attention: William Lane Craig's *The Kalam Cosmological Argument* (New York: Harper & Row, 1979). This is one of the rare cases in which ideas from the Islamic tradition (particularly those of Abu Humid Ghazali) have been the subject of discussion in the contemporary philosophy of religion.

I'll bet you didn't know that.

Other defenders of the Christian faith have argued that the doubts raised by Hume (1711-1776) and Kant (1724-1804) about the rationality of religious belief can be answered through an examination of the standards of reasoning employed in the natural sciences today, which are far from what Hume and Kant imagined.

Amen, Brother. Is it peculiar or not that the ***best*** summary of Christian philosophy comes from Islam?

The theologian provides the philosopher with the doctrinal setting in terms of which reports of mystical experiences are understood, and the philosopher provides a critical analysis of both doctrine and report in order to place mystical experiences within the framework of a broader epistemological theory.

Dr. Muhammad is getting me in trouble. I may be violating Federal Law with more than 'fair use' of his article.

[10/24]

Here is another helpful summary: '[An Evangelical Theological Response to Postmodernity](#)'. (This essay, as noted, was cached by Google from an inactive site. Unfortunately, no other information is available.) I agree with the notion of a global ethic:

Many of the issues which have fostered the development of postmodern thinking are primarily ethical, causing Grenz to comment on the growing concern for a community-based ethic of being.¹⁶⁴

In the postmodern world we are becoming increasingly aware that every ethical proposal - even ethics itself - is embedded in an interpretive framework which in the end comprises the shared belief structure - the theology - of a community. In short, every understanding of the ethical life is ultimately derived from a community-based vision, which links the personal life with something beyond.¹⁶⁵

Grenz believes that the hope for a global ethic, which originally arose out of the modern pluralist ethos, is even more workable in a postmodern communitarian climate.¹⁶⁶

I am most sympathetic with the teleology:

Through the cultivation of a proleptic [i.e. anticipatory] consciousness of the yet-to-be consummated whole of reality, we can gain an awareness and anticipation ahead of time of the future whole, ¹¹¹ based on Gods promise and faith in Gods faithfulness. The gospel of Jesus Christ promises a destiny - the new creation, which means reality is future-oriented. Only with the fulfillment of this promise does reality become a whole and the true nature of all the parts, including ourselves, is revealed. In the life death and resurrection of Jesus, we see ahead of time what this nature is.

He examines the notion of Gods creating as a continuous act, drawing implications for modern

cosmological ideas, and introducing the concept of proleptic creation. God creating from the future, not the past, means that it is the continuing divine work of future-giving that is the source of life and being. For Peters, Gods creative activity within nature and history derives from Gods redemptive work of drawing free and contingent beings into a harmonious whole. 114

[10/25]

In this last, anonymous essay, mention is made of Wolfhart Pannenberg (1928 -). This is a name that I have not run into in years. My bad. He is an advocate of 'systematic theology'. I am wondering if he may exhibit coherentist and idealist tendencies. Stanley J. Grenz, an American follower, provides a [review](#):

In contrast to the classical tradition, he declares that truth is not found in the unchanging essences lying behind the flow of time, but is essentially historical and ultimately eschatological. Until the eschaton, truth will remain provisional and truth claims contestable. Therefore, theology, like all human knowledge, is provisional. It simply cannot pack into formulas the truth of God. The future alone is the focal point of ultimate truth. As a result, all dogmatic statements are hypotheses to be tested for coherence with other knowledge. This, he claims, is in accordance with the Scriptures, which declare that only at the end of history is the deity of God unquestionably open to all-an event. however, that is anticipated in the present.

OK for coherentism, and we get the eschaton as a bonus. I am embarrassed not to have remembered Wolfhart much sooner. This indicates a lacuna in my Internet search strategy. .

[10/26]

While missing Pannenberg, I also have missed the lasting Hegelian and German idealist influence on modern theology. In previously picking up on Anglo-American theistic idealism, I was mainly seeing an offshoot of the former. However, after WWII, French existentialism and scepticism became dominant on the Continent, and theistic idealism toiled in relative obscurity.

Pannenberg's influence may be expanding in the US, of late, despite a pervasive anti-idealist undercurrent which remains characteristically inchoate. It seems to be an opposition mainly directed against **subjective** idealism.

I need to focus on this trend, and particularly in its eschatological form. For all I know right now, Pannenberg is the only exponent of this form. My speculation is that Wolfhart is an amillennialist: all the drama is focused on the eschaton. In contrast, I am a pre-millennialist: there is a dramatic overturn of materialism that ushers in the Millennium. If this is true of Wolfhart, I don't know his rationale, but, again, let me speculate. For Wolfhart, the eschaton lies in the distant and otherwise unforeseeable future, thus the concept of an historical Millennium would be a relatively minor addendum at best.

Carl Henry is perhaps the premier orthodox Christian theologian. Here is a review: [Carl Henry's Reasoned Apologetic](#):

Henry launches his metaphysical inquiry in these works by asserting the supernatural reality and objectivity of God against a tradition of dialectical and existentialist [and idealist] theology whose roots are traced to Kant and Kierkegaard, current manifestations he believes are the subjectivizing tendencies of Barth, Brunner, and Aulén, as well as Tillich and Bultmann. Thus the author returns to the emphasis in earlier volumes on Scripture's univocal propositional knowledge as juxtaposed to the non-cognitive [sic] personal encounters attributed to neo-orthodox theology, or to the ambiguities of the analogical language as defended in the tradition that runs from Aquinas to Mascal. The future-oriented theologies of Moltmann and Pannenberg also come under criticism for casting doubt on the present reality of deity and the lack of adherence to scriptural testimony about the incarnation.

These doctrinal errors are all finally traced to a reliance on philosophical conceptuality rather than biblical revelation.

The last sentence sums up the perennial objection to reason. One might wonder if human rationality were the work of Satan. Carl is our articulate, literate bibliolater. He can't see Jesus for all the Christianity. Rationalism and coherentism struggle to obtain a foothold in the no man's land between science and religion.

I would argue that Henry's incoherent, legalistic literalism is the same one that informs scientism as well as analytic philosophy. [and see [below](#)]

[10/27]

How 'bout that eschaton! Let's listen to Bob Russell, Founder and Director, The Center for Theology and the Natural Sciences, Berkeley, 1981-present, speaking from his important [meta-library](#):

According to Wolfhart Pannenberg, all Christian theology depends on the future coming of God. Eschatology thus involves "one of the most obvious conflicts between a worldview based on modern science and the Christian faith." John Macquarrie, too, wrote that "...if it were shown that the universe is indeed headed for an all-enveloping death, then this might seem to constitute a state of affairs so negative that it might be held to falsify Christian faith and abolish Christian hope." Are these conclusions avoidable?

Good question, Bob.

The only alternative is truly radical: to pursue the possibility that a commitment to eschatology will lead to an alternative scientific [sic] cosmology.

Tipler and Pannenberg have engaged in an interesting and constructive interaction to which Drees, myself and others have replied. Meanwhile, Tipler's scientific claims have been attacked aggressively by other scientists while both Dyson's and Tipler's theological proposals and their reductionist assumptions have been widely criticized by scholars including Polkinghorne, Barbour, Peacocke, Clayton and Worthing.

If this alternative is not to be taken, what options are left? [Immaterialism, anyone?] Polkinghorne is representative of most theological views when reminding us that "an ultimate hope will have to rest in an ultimate reality, that is to say, in the eternal God himself, and not in his creation." Such hope is not in the survival of death of a purported soul, since we are a psychosomatic unity. Instead it is in our resurrection: God remembering us and recreating us in a radically new environment. God will create the world to come through a transformation of the universe.

Maybe, Bob, just maybe, we get to participate in this recreational transformation of our already immaterial universe. A radical recreation implies a radically sub-optimal creation. It wasn't a Big Bang, it was a Big Boner! I don't think so, Bob.

Worthing has proposed that we take up Pannenberg's distinction between theological and scientific apocalyptic visions. Rather than equate the parousia with the remote future end of the universe, Worthing suggests we understand it as a renewal or transformation of the universe as a whole. The Biblical 'end' is not a cosmic end, since it "allows for a bodily resurrection and creation of a new heaven and new earth. "This, in turn, shifts the discussion from the end of the world to the concept of eternity as the real issue in relating science and theology. We are led to consider "the future of the universe...(as) taken up into the eternality of the Creator --- an eternality of a decisively different order from that which the physical universe could potentially possess..."

Exactly what does this mean, Bob? Why do you insist on this incoherent dualism?

Ted Peters writes from just such a perspective, developing the Trinitarian theology of the 20th century with particular attention to the implications of Big Bang and quantum cosmology. What we need is "temporal holism" in which the cosmos as a unity of time and space is both created proleptically from the future and redeemed eschatologically by God's future initiative which we know proleptically in Jesus Christ. Prolepsis ties together futurum, the ordinary sense of future resulting from present causes, and adventus, the appearance of something absolutely new, namely the kingdom of God, the renewal of creation. The creation, from alpha to omega, will be consummated and transformed into the eschatological future which lies beyond, but which will include, this creation as a whole. "The eschatological future is the key that opens the gate to eternity." Peters, too, is ruthlessly honest about the challenge from science. "Should the final future as forecasted by (scientific cosmology) come to pass...then we would have proof that our faith has been in vain. It would turn out to be that there is no God, at least not the God in whom follows of Jesus have put their faith."

Amen!

I believe the approaches suggested by Pannenberg, Polkinghorne, and Peters are particularly promising, but I also want to underscore the challenge of making them intelligible in detail in light of scientific cosmology as it currently stands. If we are to engage in a genuinely mutual interaction, a more complex methodology is called for. I will make preliminary suggestions about such a methodology in Part III: F.

Don't hold your breath, folks: Part III: F, seems no longer to exist. Should we be grateful to be spared the 'more complex methodology'? Only by God's grace do some of us refrain from 'methodology'! I did meet Bob once: a theological *apparatchik*. But what else could he be if he chooses not to rise to the messianic occasion? All the more for the rest of us. Thanks, Bob.

There you have the bleeding edge of academic eschatology.

Now we need to check out that German idealistic theism, tracing its genealogy to the present.

Starting with [idealistic theism](#), the first entry is [On the Rationality of Theism](#), right up our alley. It starts out as a critique of Ayn Rand. Scott Ryan surmises that her incoherence stems from her emotion laden atheism. He then matriculates to his own cosmology.

I hope it is clear that classical theism is "idealistic" in this sense, i.e., it maintains that reality consists fundamentally of a single absolute mind and, less fundamentally, of the objects created by that mind's activity.

This is not rocket science. How then are so many theologians still hung up on Cartesian dualism, three centuries after the fact? What a waste of mind.

Unfortunately, Scott does not manage to put Ms. Rand behind him for long. I have yet to comprehend either the positive or negative fascination with this person. Shades of Blavatsky? Charlatan?

But hear his concise defense of idealism:

Now, beyond the claim (made earlier) that there simply are no fully "external" relations, I can suggest at least two further powerful reasons for thinking that the relation between thought and object is not external in the other direction either. One is that the object of thought must be such as to be "thinkable." Thus, if (as we have suggested) everything which exists can, in principle, be present to and instantiated in thought, then to say that something is "real" is to make essential (though not necessarily explicit) reference to thought.

The other is that even on the most strongly "materialist" or "physicalist" view (I emphasize with Grayling that these are not the same), it still seems to be the case that the "material" or "physical" universe gives

rise, in a causal manner, to the existence of mind. If the cause-and-effect relation is also a logical relation, so that causes logically entail their effects and (arguably) vice versa, then the material or physical universe does logically entail the existence of thoughts "about" it.

So it appears that we cannot strictly conceive of any "external" reality that is so completely independent of thought as to be related to it externally even in one direction. Thought is not "external" to its object if (a) that object is such as to be "thinkable" and therefore composed of the sort of stuff that can be instantiated in our thoughts, or if (b) the cause-and-effect relation between "matter" and "mind" involves logical entailment, so that "mind" was a causal potentiality always logically, and thus eternally, present within "matter." Either of these points suffices to establish that "external" reality is not logically independent of mind in any meaningful sense.

I appreciate Scott's fresh restatement of classical arguments.

[10/28]

From [theistic idealism](#), I find an excellent [source](#) (Britannica? What else?) on its modern provenance.

And here is a lengthy, vitriolic [rebuttal](#) to Scott Ryan by Greg S. Nyquist. Greg does capture much of the current popular sentiment against idealism. I'm not aware that Scott has responded. Greg frequently alludes to the 'absurdity' of idealism. I gather that he is generally and implicitly referring to what Ralph Barton Perry called the 'ego-centric predicament', but I don't think this alleged 'predicament' has had a lasting impact. Rand had her own kind of ego-centric predicament. What is shared in Johnson's, Nietzsche's, Rand's and popular critiques is a rather crude, unthinking, anti-idealist ***machismo***.

This visceral reaction likely shares something with the orthodox reaction represented by [Carl Henry](#). One illuminates the other. Henry is in partial denial of his own [idealist influences](#):

The most influential figures on Henry's thought are Gordon Haddon Clark and Edgar Sheffield Brightman. Ronald Nash summarized Clark's thought as following: (1) the epistemological bankruptcy of any form of philosophical or religious empiricism; (2) the indispensability of Divine revelation to human knowledge as a whole; (3) the shortcomings of any attempt to remove the cognitive and propositional element from the content of God's revelation; (4) the importance of refusing to separate faith from reason whether this separation be a humanistic attack on faith, an existentialist critique of reason, or a Thomistic segregation of the two into different realms of human knowledge;....

Also Edgar S. Brightman who was Henry's professor in the studying period at Boston University is one of significant figures of Boston Personalist tradition. Brightman's personal and theistic idealism influenced to Henry. He argues that whatever exists must be an element in the experience of a conscious mind. Hence, everything will exist as an element either in some finite mine or in God's mind. Also for him, personality is the highest kind of conscious life.

We need to follow-up on Carl's conflicted thought.

Something to note about the orthodox is their ***taboo*** on God. God may reach out and touch us, but we are not meant to return the favor, on pain of being struck by a divine thunderbolt. This is true. Once we act upon the divine mutuality implied by rationalism and idealism, we are setting in motion the eschaton and whatever apocalypses may attend upon it. The popular anti-idealist ***machismo*** thinly disguises a deep, collective fear of our Maker. Only such a reversal could explain its visceral vehemence. This same fear motivates the attraction of materialism and Cartesianism. Don't touch God!!

All such tribal taboos are meant to reinforce perceived cosmic dichotomies. Any violation is ***dire***.

One might, however, be instructed by Mr. Nyquist's interest in Santayana, 'last century's greatest

philosopher.'

Santayana may be the original naturalist. From the Britannica:

Scepticism and Animal Faith (1923) conveys better than any other volume the essential import of his philosophy. It formulates his theory of immediately apprehended essences and describes the role played by "animal faith" in various forms of knowledge.

"The realm of essence," in Santayana's system, is that of the mind's certain and indubitable knowledge. Essences are universals that have being or reality but do not exist. They include colours, tastes, and odours as well as the ideal objects of thought and imagination. "The realm of matter" is the world of natural objects; belief in it rests--as does all belief concerning existence--on animal faith. Naturalism, the dominant theme of his entire philosophy, appears in his insistence that matter is prior to the other realms.

This quibble about essences is at the bottom of the incoherence of all attempts at a non-reductive materialism: mind is epiphenomenal relative to matter, and essences are epiphenomenal relative to mind, so they don't exist, but they're real. The notion of real non-existence smacks of purest sophistry. If one could penetrate the rationale for this sophistry, one might be further instructed. I'm of the impression, though, that Santayana has little residual clout among professional philosophers.

Then there was Bertrand: [Russell's The Problems of Philosophy](#):

Russell was a realist on two key issues, universals and material objects. In both cases he was opposed to much of nineteenth century idealism.

Bertrand was a 'neutral monist'. That would be a more accurate appellation for 'naturalism'.

Once again we are back to the question of reductionism. I am not aware that there has been a global or thorough-going reductionist. Who will be the last materialist? I cannot name a contemporary philosophical materialist. Such a person would have a technically argued global thesis of physical reductionism. I don't know that there has been an extreme and reasoned materialism presented in modern history. Holbach's *Système de la Nature* (1770) may have been the first and last such thesis.

We then have to explain the existence of knowable irreducible entities, even if there were only one. Partial reductionisms abound: there is no consensus as to the primary candidates for irreducibility, yet no one is claiming there are no such entities.

At the very least, there must be material atoms, along with some form of informational or perceptual atoms, whether the latter might comprise numbers, logical atoms or sense data of some kind. A perceptual atom might exist only in individual experience. Even if consciousness were an illusion, there would still be the fact of information transfer, and so there would have to be informational atoms or bits. The bits may be physically instantiated, but they must also be abstractable by the communicating agents. Bit patterns have a computational or functional significance that supervenes on the physical pattern. By definition, there can be miscommunication, but miscommunication has no purely physical analog. There are no mistakes in physics. Physics always just keeps on happening, regardless of anyone's protocol. Informational 'noise' is not a physical construct. I am not aware that anyone has ever claimed that information does not exist. Even if one eliminated mind and consciousness, materialism would be strictly incoherent if there existed no information about matter.

Informational bits, although physically instantiated are not physically reducible. Indeed, instantiation is not a physical construct. It is nowhere represented in the extensive terminology of physical science.

With the advent of quantum physics, many physicists are espousing various forms of metaphysical 'informationalism', and there are, of course, informational/physical dualists, but none who deny information, per se, to my knowledge.

Where do genetic DNA sequences fit into this picture? Are they physical or informational? I would have to say they are an indeterminate hybrid, or proto-informational. I'm sorry not to be more informative. Be informed, however, that the idealist's notion of genetics strays very far from that of the materialist. Be grateful that I have been sparing you all the 'scare quotes' on 'atoms', 'DNA', etc. Your computer may run on bits, but mine runs on 'bits'. If 'you' do not believe 'me', just wait until 'we' are all 'using' 'quantum' "bits"!

Could not one be a strict nominalist about information? Names carry information. There is no way to duck that bullet. But if anyone does know how to duck it, please communicate that information to us.

If these last few paragraphs do not constitute the ***reductio*** of reductionism, nothing will. We cannot shed any more tears over its demise. Our next stop is the Eschaton. There is no other end for non-reductionism. If I can't prove that, the messiah will.

What *Is* There?

My claim is that any systematic attempt to answer this question will land us on the doorstep of God and the Eschaton. Let me provide you with a rough outline of how this comes about. We will then have all the time in the world to refine our answer.

Our main guide will be William of Occam and his infamous 'razor'. That is, we seek ontological parsimony. How is the parsimony to be measured? Let me just say that quality will count for quantity. In other words, coherence will be a necessary component of any strategy of parsimony. Am I thereby giving away the game? That is debatable.

The reductionistic answer used to be 'arbitrary configurations of atoms.' Well, I know of no one who still takes that answer seriously. There are no longer any materialists, *per se*. There are physicalists and naturalists. If you ask a physicist about physicalism, she will most likely speak in terms of information and probabilities or potentialities. No phenomenon is real until measured, and the results of measurement are strictly informational. Even physicalism is being outmoded, by informationalism, among those who are supposed to know.

Another place to look for reductionists is among the AI professionals. There used to be two camps: the connectionists and the computationalists. For a brief time, connectionism was in ascendancy. All information could be contained in dynamically weighted feedback networks variously elaborated. To make a long story short, there was a slight problem. It was the communication problem. Information is not of any use if it cannot be exchanged. Information is rather like money: its only value is its exchange value.

To exchange information, it has to be chunked. On the lowest level, it is often digitized, but then there also have to be higher level patterns or chunks. The specification of those higher levels becomes very elaborate, very quickly. Protocols abound. Then comes transcription, translation and interpretation. The high end of the AI spectrum consists of competing ontological strategies. There we are, right back on Occam's doorstep. We have seen an [example](#) (smoking gun?) of these neo-ontologists speaking of the 'naturalizing of Platonism' at the Stanford Metaphysical Research Lab.

We then have to wonder what opinion the naturalists have of Plato these days. Platonism and naturalism are the opposite ends of the metaphysical spectrum. It would seem that Plato is coming back to haunt them. It must be scary, and this just two days before Halloween. Are there ghosts out there in the ecosystem? The serious naturalists speak of deep ecology and Gaia, and that is just for starters. Our targets though are the armchair, philosophical naturalists. At the minimum they have signed on to the ontology of the sciences. Most physicists that I know are, at least, mathematical realists, i.e. Platonists or Pythagoreans, and that's before you get them started on informationalism.

In short, this is not the high water mark for reductionism. There has been a lot of water over that dam, to amend the metaphor. There is now a veritable spillway.

Where does that leave the rest of us? Struggling to stay afloat on the rising ontological tide. Where is Occam when we need 'im? Unfortunately, Occam is no longer with us. Where are the ontology police? It looks like we will just have to deputize ourselves. All we need is a post-reductionist strategy.

Our postmodern sistren and brethren have thrown up their hands in ontological surrender. For them, any ontological strategy is simply a power-trip. It could also be a truth-trip, but, for the life of them, they can discern no difference. Someone will have to try.

We are left to appeal to emotion and reason. I appeal to both. A rational strategy will start with reason

and acknowledge emotion when it is unavoidable.

The first big question concerns monism. Pluralism is, by definition, incoherent. Pluralism is tantamount to a surrender to emotion. We will end up there, that is more or less what the Eschaton is about: ecstatic rapture. But before then we will attempt to exhaust the natural(?) human capacity for reason. Coherence, with Occam's blessing, dictates monism. Materialism has been retired, we are left with immaterialism. Immaterialism is tantamount to idealism, taking into account the pragmatic dictum that what is unknowable or unperceivable won't hurt us.

OK, take a deep breath. The only coherent idealism has ever only been theistic. By the same token, the only coherent theism has ever only been idealistic.

That's all folks. There you have my rough outline of ontology, *sans* Eschaton. The appeal to the Eschaton is simply the acknowledgment that any unbounded history is incoherent, again virtually by definition. The same goes for the concept of the Best Possible World, of which the Eschaton is a very significant component.

As I keep saying, this is not rocket science. Why are so many of us so reluctant to engage in this most basic of thought processes? If it's not rational, it must be emotional. The Eschaton, et al. are emotion laden. We must deal with that.

Now for the refinements. What is the weakest link in my argument? I submit it is the appeal to coherence. That is the next topic.

[<-- Prev](#) [Next -->](#)

Coherence

(At some point in the following, you may wish to refer back to [Coherence Theory](#).)

It is remarkable that there are knowers in the world. It is only slightly less remarkable that there is so much for us to know.

We speak of the knowledge explosion. We speak of the mysterious comprehensibility of the world and even of a Theory of Everything.

Did the world have to be so knowable and with so much to be known? We are finding this coherence despite our lack of expectation that there should be any. Is it just an illusion? Appeal is made to the controversial Anthropic Principle and to the appearance of a cosmic design, by way of explanation. Did the world have to be thus? Is all this just the luck of the draw?

Appeal has also been made to the Principle of Sufficient Reason. Nothing happens without a reason, or at least without a knowable cause. When there is an 'accident' we try to ascertain the cause, and seek to avoid it in the future. When there is sickness, we expect to find a toxic agent or some malfunction.

In biology there is an almost overwhelmingly pervasive appearance of teleology. We refer to it as teleonomy, and chalk it up to natural selection, but there would be no biological science without it.

The still very young science of ecology finds, wherever it looks, an almost unimaginable relational intricacy in the entire system of nature. The web of life is a living coherence.

We find similar situations in the human sciences. Linguistic semantics is a case in point. There was once the expectation that the meanings of words could be analyzed or reduced to logical atoms and sense data. After almost fifty years of failure, we realized that meaning is holistic. This realization spelt the effective end of analytical philosophy. The repercussions are still being felt. The end of analysis marks the beginning of postmodernism.

Meaning holism is part of what lies behind the expanding gap between what we know of natural and artificial intelligence.

It would seem that the very remarkable external coherence is mirrored in the mysterious coherence and irreducibility of natural intelligence. This could all just be an accident. But ought we not wonder about the cause? Some see a cause in natural selection. That may be a necessary part of it, but is it sufficient? Can it be considered a natural, scientific cause if there are no known or knowable limits on what its ultimate power might be. Such indefinable power and potency seems much closer to what would reasonably be ascribed to a deity. Ascribing it to nature is only to deify nature. Where then might one draw the line between natural and supernatural? If there is no longer a logical distinction, then what is the sense of calling oneself a naturalist?

Under the aegis of naturalism, coherence is a gratuitous mystery. With immaterialism it is a logical necessity. With materialism, everything is alleged to be contained within a space-time receptacle. With idealism there is no such container. Instead of a container, we need a glue. Coherence is nothing more nor less than the cosmic glue.

With materialism, existence is absolute, all or nothing, atoms in the void. With immaterialism, existence can only be relative or relational. To exist is to relate. This is just cosmic holism. We have excellent models for this kind of existence in the holistic domains of mathematics and language.

Is it any great surprise that the potency of nature is bursting the arbitrary, artificial seams of materialism

and naturalism? Why should not coherence be considered perfectly natural? It is, just as soon as we bring God into the picture. With idealism, God is the natural and logically necessary centerpiece of its attendant coherence. Is God anti-nature? Does not human nature reflect divine nature? Are we not each just a microcosm? Are we unnatural?

Idealist coherence certainly violates every Fundamentalist taboo against our relational intercourse with God. This intercourse culminates in the ecstatic rapture of the Eschaton. One might think that this would be right up the Fundamentalists' alley, but any expectations pertaining to Fundamentalist rationality are wishful indeed.

This segues us to the not insubstantial matter of the Eschaton.

I'll have to admit that the Eschaton seems to violate every intuition of what is natural, but I'm going to argue that this is actually the fault of Nature. Am I not digging myself into a logical hole here?

Is the Eschaton not the rupture of Nature? No, it is the rapture of Nature.

Please recall that creation implies an act of separation between the Creator and her Creation. The dualists are right about that. In a relational cosmos, that separation is very unnatural. What we glibly call 'Nature' is actually just covering the void of that most unnatural separation. (Oh good, now I can dig myself even deeper into this hole.) 'Evil' and ignorance are also the manifestations of the unnatural separation of Creator and Creature. Our fallen state is the result of, not the cause of, that separation. That was just a minor theological misconception. The Eschaton pierces the veil of Nature, and returns us and the cosmos to its more natural, fully relational state. The Puritans thought of the wilderness as Godlessness, not as the Ansel Adams Sierra Club poster, which represents mainly a postindustrial, almost postmodern, attitude.

Does this mean that the NRA Bambi Bashers are on the side of God? I hardly think so. But hunting is a rather primitive form of relationalism, after all.

Are the deep ecologists going to miss the Glory Train? Hardly. The clouds of glory that we will be rapturously streaming will significantly comprise their spiritual regeneration of Nature in the new Heaven and new Earth. Admittedly this is not a role that they presently envision for themselves, but we will all have a thing or two to learn over the next thousand years. There will be no bit parts in that final drama.

Is everybody happy? Am I making this too easy? Would you like this exposition to seem more like brain surgery? Have a little faith. We will each be presented with the appropriate challenge, right up to our full capacity. If things seem too pedantic now, there will be days when it will be anything but. And then again, we can always hurry up and wait.

OK, what is our next loosest end?

[10/30]

What remains most pertinent are the loose ends of reductionism. Has the failure of reductionism been universally accepted? I see no evidence to the contrary; however, people are not standing on line to give their testimonials to this failure. There has been no anti-reductionist initiative, except in the form of pluralism. With pluralism, it is just pre-reductionist business as usual, as if nothing had really happened. For starters, I am advocating an overdue 'postreductionism' which is something rather different from postmodernism.

First we must highlight the irreducibles. From whence do they come? A minimalist irreductionist would be a conceptualist. This would be like the alleged view of Aristotle versus Platonism. However, as we have seen: [Aristotle Gets Real](#), when push came to shove, even Aristotle had to confess to a Platonic realism. What gives?

Is there a difference between a concept and a Platonic Idea? If a concept is irreducible then every time it comes to mind is it being created anew, *ex nihilo*? This does not make sense. Certainly Occam would not approve.

Conceptualism presupposes mind and an intercourse between minds. Can we then revert to a nominalist explanation of this intercourse? Is the concept disassembled in the first mind and reassembled in the next? This is reversion to reductionism. It is hard to kick the reductionist reflex.

The only real difference between conceptualism and Platonism is the unwarranted positing of multiple minds. Occam disapproves. There is scant evidence and no rationale supporting the atomic mind theory, once we surrender the brain-mind identity thesis.

Well, there is the slight problem of personal identity with its attendant Newtonian mechanics of the soul. I'm sympathetic with identity, but I don't think that we must thereby revert to the atomic thesis of minds swerving in the void. This was Leibniz' only real sin: monadology. We have Freud to thank for the overthrow of the 'mind in the void' view. That void became his Unconscious, and then Jung saw the logical impossibility of attempting to quantify or enumerate the unperceivable. We are islands of consciousness in this cosmic ocean, with partially partitioned memories.

Only thus does even the minimalist irreductionism of conceptualism make sense.

Show me one irreducible concept, say 'banana', and I will show you the Cosmic Mind. It's that simple, folks. Why, in Heaven's name, have we made this so difficult for ourselves? That's just par for Creation, even for the best possible creation.

Given the cosmic mind, we then have less than zero need for a physical universe. The concept of a physical, space-time universe becomes an atavistic addendum to a failed reductionism. Get over it! Just say, 'No'!

My Kingdom for a horse? No. My Kingdom for a banana!

While I'm on this hobby-horse, let us reconsider those Platonic Ideas. Again, aren't we seeing an incipient problem of the void. Those Ideas cannot just be swerving in the void. Thus must we have recourse to a plenum of holism and coherence. Holism might seem a rather passive concept. Coherence is much less so. Nothing can be coherent, absent a comprehending subject. Holism may be interpreted objectively. Coherence has no objective measure.

We have gone one step further. You show me a 'banana', and I'll show you the cosmic Self. The concept of 'banana' cannot exist in a void. It can exist only in a cosmic mind that coheres upon a cosmic Self, of which our own selves are intimate reflections or reverberations.

Is this a leap of logic or of faith? This is hardly more than a baby step. Consider the prolonged history of reductionism, and contemplate the logical gymnastics and contortions that we performed, all in the avoidance of the excruciatingly obvious. What an exercise in self-deception! What an excursion into sophistry!

This excursion might only begin to make sense as a shadow of the Eschaton.

In giving up reductionism we must also give up inductionism. (N.B. This is not to give up either reduction or induction, only to give up their globalization.)

An irreducible entity will be left dangling on a skyhook if it is not incorporated into a larger scheme. This larger scheme, no matter how holistic, must have a deductive aspect. In a purely relational scheme, the deductive process would logically proceed from the more to the less relationally entangled nodes.

It seems that the most entangling of relations known or knowable to us is love. Therefore, any globally deductive scheme would focus on the concept of 'cosmic' love which in its turn would presumably be focused on the relation of Creator and Creation. Any hypothetico-deductive scheme must proceed from some such guesstimated origin. If you have a better guess, feel free. One would be remiss not to note that the origination of this particular guesstimation harkens back just about two thousand years. Too much hypothetico-deductionizing can land one in a heap of trouble, it seems.

The principal version of skyhookism is 'emergentism'. Does emergentism make any more sense than skyhookism? Well, it might if it is considered in the context of Rupert **Sheldrake**'s theory of Morphogenesis. On Rupert's hypothesis, the cosmic mind is a blank slate. Evolution writes on this slate, and the results are propagated non-locally, as the mind is wont. Thus we have such things as the 'hundredth monkey' syndrome, or the alleged fact that English school children can learn Japanese nursery rhymes more readily than similar juxtapositions of nonsense syllables.

I was once a staunch proponent of Morphogenesis. But that was back in my days of **quantum dualism**. Once I graduated from space-time containerism, I recognized that Morphogenesis was much too dependent on our very parochial notion of the strict linear directionality of time. Every Podunk universe that came down the pike would be reinventing this same wheel. Morphogenesis would get old very quickly and demand *habeas corpus sub specie aeternitas*. (Will someone please turn off the Latin!) This is just about the time for God to get in the act. Morphogenesis might have played a role in a hypothetical primordial, quantum-like **chaos** of potentialities far, far beyond space & time. This might be something for God to be concerned with, but not for us to bother our pretty, pre-eschatological heads with.

So, even in its most charitable, Morphogenetic interpretation, any non-trivial emergentism quickly collapses into a minimal, pre-established cosmic coherence.

Then there are the philosophers, bless their hearts, who worry about the 'carburetor' problem [and a more [recent take](#)]. Is there not a place in Heaven for the Platonic essence of carburetorhood? Yes and no. There are a lot of other folks in our little four dimensional world who could not get to temple on Friday to express their cosmic love were it not for carburetorhoodornament and and other such essences. It's definitely a part of our pre-eschatological cosmic ambient holism. Its essentiality differs only in degree from that of a lung, say. They are both significant parts of the necessary, level-playing-field, atomo-metabolic schema of our four dimensional best possible creation. That is saying a mouthful, but we have been over this [metabolic](#) ground before. Will there be a post-eschaton carburetorhood? I'm thinking, 'Let it be a surprise!'

The next topic is looking to be [downward causation](#). This ought to be relevant to issues of coherence and theism.

[Draft Project Proposal- Self-organization- a conceptual analysis](#) -- Menno Hulswit:

My paper consists of three parts. In the first part, I will provide an analysis of the concept of downward causation as used in recent scientific and philosophic literature. I will show that it is a misleading concept, which entails a disguised reintroduction of the (Aristotelian) concept of final or formal causation.

Next, I will argue that self-organization is indeed a teleological concept, and that it must therefore be explained in terms of final causation.

Finally, I will argue that, whereas Aristotle's substance based theory of final causation is hard to combine with contemporary scientific insights, a (Peircean) process approach to causation may be useful in explaining what goes on in self-organization.

I'd like to see the paper.

I should have done my homework on downward causation before launching the latest foray into reductionism. This topic may be the focus of an actual anti-reductionist initiative that I was despairing of earlier today.

Looking through the first hundred hits on "downward causation" I am not seeing anything new that has not been alluded to here in other contexts. **Jaegwon Kim** is the principal contender and he defends physicalism. Instead of an anti-reductionist initiative, I see mainly the reductionists retrenching at this last line of defense.

Here is a puzzle of evolution: if traits or functions did not entail downward causation, then on what basis could they be selected? I don't recall the source for this puzzle, but it is often mentioned with regard to consciousness: the alleged epiphenomenality of consciousness ought to preclude its biological selectability.

I recall that 'general systems' theorists, following Bertalanffy (c.1940), also speak of autonomous levels with downward causation.

How to See

Doesn't just about everything depend on our ability to see, or to perceive? We must be in dire straights then, because, as we have been seeing (sic), there is considerable confusion about what we are seeing, if anything.

Perhaps this confusion is only a symptom of reading too much philosophy. Perhaps. Philosophers get paid to make sense of the world, and evidently it is rough going. Their job is to make explicit the implicit assumptions that underlie our perceptions. If you pay them a little extra, they may even venture an opinion on those assumptions. Philosophical confusion is likely to be a reflection of a more endemic confusion.

For awhile, with the ascendancy of reductionism, we thought we were getting down to the nitty-gritty of reality. We were hoping that, by reducing things to their lowest common denominator, we would be increasing our common understanding of what there is in the world and perhaps even about what makes it go around.

I was once in training to be a part of that effort. I was training to be a particle physicist. I dropped out. Then a few years later Congress refused to pay the 100+ billion dollars to build the Super Collider, to be the world's most powerful microscope. It seems that reductionism had about played itself out, without much result. The much anticipated Theory of Everything remains a glimmer in the eyes of the handful of mathematical physicists who are able perceive the exceptional algebras of eleven-dimensional manifolds.

But life goes on, and so does philosophy.

As an ex-reductionist, I have been searching diligently for a post-reductionist initiative. I remain disappointed. Here you see my attempt at a one-person post-reductionist initiative. I may fail, but, for the life of me, I don't see how It can fail, not if We are to survive our state of global confusion and often militant contention concerning what there is and is not.

Yes, there is postmodernism: a sometimes militant refusal to speculate or allow others to speculate about what there is or is not; or, at least, to do so in a public venue.

Then along came the Internet and Google. Never has the opportunity or need for a public coherence been greater. There should be no doubt that more than a few people will be rising to this historically unprecedented occasion.

You don't believe me? Well, just watch us!

And this postreductionism is not going to be rocket science or brain surgery. One will not need to know the exceptional algebras of eleven-dimensional manifolds. One will not need the library card for a million+ volume research library. One will not need access to a 100+ billion dollar microscope.

One only needs to know how to see; how to perceive.

Oooooops! Pardon my Physics chauvinism. But in this holographic world of ours, one can see the macrocosm reflected in every microcosm, if one **looks** with sufficient care.

There were two other places where reductionism was ascendant, but now has also played itself out, in a rather timely fashion: Artificial Intelligence and Biology. We have been **seeing**, right here, with Google on the Internet, that those on the frontier of AI are turning their efforts now to metaphysical and

ontological research, and they are not kidding about that, as I had at first assumed.

Meanwhile, the Human Genome Project has finished its task, under budget and ahead of schedule! Now that they have all the molecular pieces strung out on their lab bench, they have no choice but to try to put that poor Humpty Dumpty back together again. That might not be quite so easy as taking it apart, do you think?

So, yes, post-reductionism is in the air. We can all see it.

But where do we start with our post-reduction seeing? How about seeing that 'the cat is on the mat'? That's getting pretty ambitious, already. But, heck, we gotta' start someplace.

Can we actually see the cat on the mat? Or are we just inferring that there must be a cat on the mat? That is no small issue. In some sense, everything rides on it. Those of us in the minority who claim to actually perceive the cat on the mat are 'direct' realists. I have not taken a poll, but most of those realists are thereby, at least, latent idealists; and show me a latent idealist, and I'll show you a latent theist. Give me two hours with a latent theist, and we will be deep into a very serious discussion about the Best Possible World and Millennial Eschatology -- all because of that poor little kitty on the bitty.

Yes, we critical realists have a God problem. Everyone else? They have a Reality problem. Ultimately, as we shall see, these two Big problems are the same.

If you are not a realist, you are a reductionist, a skeptic or a mystic. Let's look at the reductionist.

Are not the reductionists also realists? Yes, and no. They are wannabe realists. Their problem is that they are not sure what to be real about. They wanted to believe that atoms were real, but then along came quantum physics and now they are not so sure. Atoms are just probabilistic configurations of quarks, and quarks are..., well, they're waiting for Congress to shell out \$100 billion to see if quarks are real.

And that is only the beginning of their problems. What about the cat on the mat? OK, a photon leaves the Sun and hits the cat and then bounces into your eye and is focused on the retina. After that, things start getting complicated. Then there is a miracle: that objective physical complexity is converted to a subjective sensual complexity. Then there is another miracle: that sensual complexity is converted to the abstract conceptual understanding that there probably is a cat on the mat, unless.....! Or, perhaps there is no subjective sensing at all; because, 1. there are no real persons, 2. there is no mind or consciousness, 3. we merely speak as if there were persons and minds, and we talk that way so much that we end up with those erroneous 'beliefs'.

Where does that leave our poor *chat*? *Sur la mat*? Maybe. But is it not also quite likely that both we and the cat are the simulation products of a not so distant future Metaphysical and Artificial Intelligence Research Lab, probably in some parallel universe? Which all sounds to me rather like the God problem, which is what I anticipated a few paragraphs back. The skeptic and the mystic would tend to agree that the world is indeed illusory.

So much for philosophy? Must we all become skeptics or mystics? That is an option which an increasing number of thoughtful people are taking.

But life goes on and we are faced with many other choices, some of which will determine our survival as a civilization or even as a species.

The other option is reconstruction: the reconstruction of a coherent worldview that would inform us as to whence we come and whither we go.

This would be a true miracle! Yes and no. As we begin to appreciate the miracle of our being able to perceive the reality of the cat on the mat, we will realize that it would not be that much greater of a miracle for us to see the essential nature of that reality and what it all means for us.

Once again, where do we start?

We start by suspending our skepticism and our mysticism.

We see, as if for the first time, the cat on the mat. But how do we avoid those doubts that keep intruding? We roll with those doubts, we don't try to fight back. Fighting back is to demand certainty and objectivity, but as we have seen, the pursuit of certainty and objectivity, while always on the lookout for the bed rock of an absolute....something, leads us down endless blind alleys. The postmodernists throw up their hands in defeat.

This pursuit of certainty was not wasted. If you can read these words, it is partly because, evidently, there was some light at the end of at least one of those tunnels.

But why was there this pursuit to begin with? It had to do with our egocentric predicament. Julian Jaynes speaks of the 'breakdown of the bicameral mind.' Very early in our mythic, dreamtime development, we had some sort of proto-verbal, intuitive, psychic umbilical cord to some collective, proto-conscious intelligence. Something happened, suddenly or gradually. The umbilical cord atrophied. Like it or not we were being weaned. We were thrown out and back onto our meager, individual, egocentric resources. We floundered within an ambience of increasing alienation. With religion we tried to replace that primordial cord. Success was elusive. The Scientific quest for an objective, absolute certainty, was a quasi-religion pursued by other means.

We are left with bits and pieces of truth, broken on our lab benches, burnt on our altars.

So the cat is still on the mat, we know. We accept that knowledge as given to us, really as a gift of unknown provenance. We know that if we try to pry open and look into the horse's mouth, we may learn a lot of things, but we will find no ultimate answers. We will neither banish doubt nor escape our egocentric predicament.

[11/1]

Realism, of the sort we take up here, is radical. This is also direct or critical realism. When I perceive the cat, there are not thereby two cats: one on the mat and one in my head. There is not even a representation of the cat in my head. Radical realism is not representationalism. How can this be? It's very simple. The cat and my knowledge of the cat are of a piece. There is nothing intermediating between me and the cat. The void, the photons, the retina: what about them? Are they not real, too? They have a derivative, relative reality. Everything is relative. Relative to what? That's a good question.

Radical realism is very strange, seeming to us moderns. The best analogy we have is that of authorship and *dramatis persona*. The lazy author and playwright do not actually have to do any work. All they have to do is invite the characters to take up residence in their minds and let them do all the scripting. The characters become their own muses. You can see where this is going. You can see there is no logical gap between radical realism and idealism.

But wait! The cat may be all in my head, but where am I? You, my friend, are in the mind of your cat, or of whomever. But then aren't we back where we started, with multiple copies, and won't Occam disapprove? Yes, he would. The only way to keep Occam happy is to realize that, logically, there can

only be one mind. There can only really be one author, and that is the big Author in the sky. Like I said: show me a realist, I show you an idealist; show me an idealist, and I show you a theist. End of story? Yes, that's the Eschaton! Is this rocket science? It's make believe, writ large, taken seriously. And it is not just our lives that depend on the outcome.

In the cosmic mind, how do we keep everything from happening all together, all at once? We don't, it does. That is the aspect of eternity. Your dream happens in no time. There is a knock on your door. As you awake, the knocking pulls a temporal plot line out of your slumber in a seemingly teleological fashion. The knock becomes the final cause of your dream. The Eschaton is the final cause of this dream from which we are awakening. (I'm reminded that the British sometimes refer to this particular manner of awakening as of one's being 'knocked up'. I suppose it might have something to do with the ecstasy of it all, don't you think? Or does it just mean that we're f***'ed?)

Is this straining your credulity (and your good humor)? Do you prefer the cat on the mat plus the puss in the head? That's fine, but then try explaining to a six year old how it is that you are able to see the cat in your head? The six year old can see perfectly well that your eyes open outward. Are you telling him that you have another set of eyes inside your head? The child will not have to know Occam to know that this sounds crazy. Why doesn't it sound crazy to us adults? Well, we have been housebroken by modernism. Our spirits have been broken, too, almost. But now the Eschaton is knocking and its time to awake.

It's high time for us to open our eyes and **see** the **radically real** world.

Alice Through the Looking Glass

How did we come to believe that there had to be two cats: one on the mat and one in our head? It wasn't too difficult. We might, rather, ask first why we would not always have thought there were two cats.

That should be simple. You see one cat. I see one cat. There is but one cat. There is not the cat that you and then the cat that I see. We both just see the same cat, but maybe from different angles.

It was, perhaps, the invention of the mirror that started getting us confused about how many cats there were. With the mirror there now seemed to be two cats: one on the mat and one in the mirror. With mirrors, we started thinking about optics and about perspectives. Then our paintings changed from being depictions to being perspectival representations.

Originally, if we thought about it at all, we thought of our sense of vision as operating in an active manner, just like our sense of touch. With our eyes we could reach out and caress our beloved, etc. If we were all blind and without mirrors, representationalism would never have occurred to us, not in a million years. If we had invented radar before mirrors, the eye would have been thought of as an active radar.

But history had another trick coming. We took the optical path, figuratively and literally. And it was no accidental journey. We were not accidental tourists in our Looking Glass World. We came to see ourselves as merely the mirrors of nature. Perspectivalism run amok puts us on one side of a mirror and the world on the other side. This is representationalism. We are cut off from the world as if in a hall of mirrors in a fun house. This was also Cartesian dualism. All the life and quality was drained out of the world, and left floating like phantasms in our subjective, epiphenomenal consciousness. Only then could Science take over and have its way with the 'REAL' world, measuring, quantifying and abstracting it, almost to death, and leaving us existentially isolated in our phantasmagoric, egocentric predicament.

To escape from our egocentric predicament, we will, like Alice, have to step back through the mirror, back into the real, live, sensuous world. This is a big step for any person; it will be a much bigger step for humankind. I stood staring at that mirror for about five long years, before I realized there was no other rational choice but to take that plunge back into radical reality. Come on in, the water is great! If I can make the plunge just a little easier for you, and you for the next person, very soon we will all be swimming again.

Does this leave Science stranded high and dry. Yes and no. Science is all part of the Big Game, all part of our cosmic Drama.

Earlier today, on the previous page, I alluded to the 'lazy author'. You didn't have to be overly perceptive to realize that I was committing a, perhaps, not so minor blasphemy. (Last time I checked, anyway, 'lazY doG' was not one of the 99 Official Names of God.) A little iconoclasm goes with this territory. Show me a prophet who was not also an iconoclast and I'll show you a demagogic fraud.

Haven't you seen the paintings of God with his protractor, measuring out the foundations of the world? No, no, no! That's not the God that I know. The God whom I know invented the Scientist and let the scientists invent the protractor, and then measure the world. But even that is an underestimation of God's laziness.

God is the Alpha and the Omega. God keeps them apart, kind of like the not so bright, muscles for brains, Atlas, and also strings them together with one silver cord, or is it a chord? That is the way one builds a suspension bridge. You plant two posts, and fly one skinny cable between them. Then you call the Steel

Workers Local. It's that simple. God didn't really have to invent Scientists, she only had to invent humans, who happened to like to play dress-up: in funny white coats and other costumes.

Come to think of it, she didn't even have to invent humans. All she had to do was look at herself in an imaginary mirror, and the rest is, well, Herstory. In looking in that mirror she may well have experienced a prefiguration of our alienating egocentric predicament when we, more or less, imitated that act. She is as anxious as we should be, for all of us to step back through that mirror.

The closest thing to a god with a protractor may have been those megalithic archaeoastronomical Pythagorean Priestly Masonic Architects, who actually did lay the foundations of the world and even may have helped to set the Heavens in their course. Is this far fetched? It all depends which side of the mirror you're on.

Our modern scientists have taken over from those priests and with their modern alchemy they whip Nature into shape so that you and I may freely and easily exchange ideas on from whence we came and whither we go. Yes, Nature has felt the lash. Nature, too, is ready to be rapturously reenchanting as we step through that looking glass. Now we have to pay \$40 a month for broadband. Then it will be, well, a lot cheaper and a lot broader. I did finally sell all the Microsoft. Better late than never! I think I'll go wireless. Direct realism is kind of like Direct PC, but without the satellite dish and, well, without the PC, too!

If I'm supposed to be the prophet of direct realism, why won't God let me go 'wireless' right now? That's a good question. I'll have to put that to her, for sure. It might save on the jawboning and the carpal tunnel.

Oooooops! Hey, Big Mama in the Sky, you don't think I really meant that thing I said about you, do you?? And while I have you on line, what about this Direct Realism thing? No, scratch the DR! I was wondering about those 72 Virgins. Do you think you could make that 77? Just checking!!

Direct Realism

As they say, better late than never: [direct realism](#).

Ah, yes, I can remember why I hesitate to plunge into this topic. Why I am more of a radical realist than a direct realist.

Here is the [Wikipedia](#):

A theory of perception that claims that the senses provide us with direct awareness of the external world. This is contrasted with [indirect realism](#) or [representationalism](#), which claim that we are directly aware only of internal representations of the external world. Direct realists sometimes claim that indirect realists are confused about conventional idioms of perceptions. Perception is an exemplar of direct contact with something. Examples of indirect perception might be seeing something in a photograph, or hearing a recording of a voice. Direct realists often argue, contra representationalists, that the fact that one becomes aware of a tree in perception through a complex neurophysical process does not argue in favor of indirect perception. It merely establishes the method, undoubtedly complex, by which direct awareness of the world is secured. Arguing that perceiving a tree directly requires a magical, acausal mirroring of the tree in the mind is akin to arguing that traveling directly to grandmother's requires that one magically appear at her doorstep. The inference from the fact of a complex route to indirectness may be an instance of the [genetic fallacy](#).

I'm not so big on sensations. I believe more in telepathy than **telephony**. And now I remember why we don't need to wait for God to give us free broadband service, because we already have it. We just don't realize it; we go along with the Ma Bell version of reality because being a 'lineman for the County' has its diversions, not to mix electrical metaphors.

Consider wireless, phonic conversation. We don't really listen to the words, we perceive the ideas directly. You are simply giving me a guided, telepathic tour of your mind, which is not really separate from my mind, anyway. Words, letters, bits and the like are to communication, what atoms are to metabolism. They are logically necessary props or epiphenomena of deeper and direct communication processes. Materialists say that ideas are epiphenomenal and idealists return the favor.

But then what is the point of communication, anyway. If it's all just one big mind, why bother? What is the point of shuffling ideas around, when there is really just one big Cosmic Omniscience?

Good point! I think it must have something to do with creation. We make babies. Why? Because they're so cute, among other reasons. Why are they so cute? Because they act like ignorant little blank slates that we can cram full of our precious wisdom, among other reasons. But how many of us really think that babies are that stupid? Isn't it more like amnesia? Remember how our souls have to swim across the River Lethe? That is the real trick. I sure don't know how it works, but it is usually pretty effective. Every once in awhile, though, some smart ass soul does get through, just to keep us parents humble.

Where were we? Communication? Disseminating and inseminating our precious seeds of wisdom. Let's face it, we are all wannabe prophets, authors, artistes, etc., but we couldn't be that without the selective amnesia. Without the circulation of ideas, there would be no cosmic economy. So there has to be planned scarcity. Our holographic, microcosmic crystal balls have to be a bit cloudy to keep those ideas circulating.

But there is more to it than that.

There is only one Creation, as far as anything that we could imagine being called that. There is no practice. We and God learn on the job because that is the best possible, and really the only way to learn.

Everything has to get sorted out right here, on the spot. Everything that can happen will happen right here, and will be put in its proper place, as we move on up on the curve of history to the Eschaton, our final cause, our awakening.

We have all sacrificed for this day, and for this End. Everything we sacrifice we gain back many times, including God, her Son. Whoever tells you that God has not suffered is being criminally obtuse.

Every bit of ignorance we endure, we gain back in knowledge by much more than a million-fold.

This is the game of Creation. It is the greatest show in the Cosmos; it is the only show. God and we do not need to reinvent this best possible 'wheel'.

Atoms, words, sense data all have a logical role to play in the game of Creation. They are real only in that logically derivative sense. They are props along our way to the Hierogamos. As soon as they have done their job, they will be set aside. Now we see through this glass darkly. As soon as we are ready we will see clearly and directly. That is direct realism. It is here now in all its potency. God is always totally present. It is only our own illusory historical properties or baggage that ever come between us. Telephones, books, paintings all point us toward the ultimate. They are also crutches, ready to be set aside. As we live and breath in that certain knowledge, we are becoming Real.

Any 'realism' less real than this is incomplete and incoherent on its face.

And back to the list, [direct realism](#):

Let us [recall](#): [ARISTOTLE'S DIRECT REALISM IN DE ANIMA](#) -- by [Michael Esfeld](#):

Aristotle can be read as proposing a direct realism instead of a representationalism: a causal medium notwithstanding, perception and thought are directly about qualities, things, or events in the world. The received sensible or intelligible forms are instantiated in the acts of perception or thought. I argue that this direct realism presupposes Aristotle's ontology according to which the world has a somewhat conceptual structure: our percepts and concepts are qualitatively identical with the very forms of the things themselves. In conclusion, I point out that contemporary positions of a direct realism are committed to a conceptual structure of the world too. Thus, the challenge for a direct realist is to either accept such an ontology or to show how a direct intentional relation of thoughts to the world is possible without such an ontological commitment.

As stated earlier, Aristotle appears to be more of a realist than his earlier interpreters were claiming, bringing us all closer, hopefully, to a consensus on ultimate reality.

With the above two exceptions, and having skimmed through the rest of the first seventy items under 'direct realism', I have to report a failure to link, in general, direct realism with idealism, latent or otherwise. The 'realism' is generally taken to imply that the 'external' objects of perception are mind-independent or material objects. This view is sometimes, even more ambiguously, called 'naive' realism. It is a view that is alleged to be experiencing some revival. Taken in this apparently dualistic sense, I am not able to comprehend it. As long as mind and matter are taken as distinct then there is going to have to be some form of problematic mediation between the two. There is no logic supporting direct perception. I'll give the benefit of my incomprehension, however, to these struggling neo-realists, and hope to gain

comprehension later.

In support of incomprehension: Andrew Chrucky, ["Critique of Wilfrid Sellars' Materialism"](#), 1990:

The global problem of materialism for Sellars is to combine, if possible, the Manifest and the Scientific Images-of-Man-in-the-World. He argues, however, that these Images are incompatible, and are, therefore, impossible to combine.

The Manifest Image includes the view of **Direct Realism**, which holds that physical objects have such continuous (homogeneous) secondary properties as colors. For example, a common sense table has a continuous brown surface; while the table as described in microphysics is a gappy, colorless swarm of molecules. Which table is real?

I wonder, too.

Then, further down the list, we have ["Experience and the Mind: An Essay on the Metaphysics of Perception"](#), by Robert Alva Noë, arguing for his version of direct realism:

In Chapter One I argue that the content of experience (how experience represents things as being) is the same as the content of the judgments we would make on the basis of experience, were we to take experience at face value. The representational content of experience, like that of judgment, is fully conceptual. In Chapter Two I examine and criticize the view that experience has, in addition to representational content, irreducibly subjective, nonconceptual, phenomenal content.

The upshot of these discussions is that experience is an epistemic notion. To have an experience is not just passively to have sensations; it requires the exercise of understanding. The relation between experience and reality is not causal, but normative: to have an experience is to take things to be some way or other, and how things are gives us reasons for taking them to be that way. In Chapter Three I argue that the Causal Theory of Perception misdescribes the place of causation in an account of perception and that it relies on an unsatisfactory conception of experience.

OK, I can sort or understand this, but this is a highly nonstandard view of perception. This seems to be a move toward the conceptual (direct) realism that Esfeld ascribes to Aristotle, [above](#). But Robert, instead, goes on to take up computationalism.

Is it not fair to say that these dualistic theories of direct realism are desperate attempts to avoid the obvious problem of regression that is inherent in any form of indirect or representational theory of perception? These are then versions of the Higher Order Thought (HOT) theories of perception which are taken up by the AI community, as evidenced by Robert's computationalism.

Does direct realism not distinguish between the ascription of quantitative and qualitative properties, in contrast with indirect realism?

Larry Hauser, ["Don't Go There"](#):

What the direct realist denies is not intervening media of transmission between the distal object and visual experience thereof. What she denies (at the very least) is any intervening medium of pictorial representation....

Jerry Fodor, ["A Science of Tuesdays"](#), 2000:

Disappointingly, however, neither Putnam nor anybody else in his direct realist pantheon is prepared actually to offer an account of how perception works. Rather, 'in my opinion, "direct realism" is best thought of not as a theory of perception but as a denial of the necessity for and the explanatory value of positing "internal representations" in thought and perception.'

Is there any clear distinction between non-idealist direct realism and any of the varieties of eliminativism? I don't think there is any cognitive difference. That is why the AI crowd supports it. Why are they being

let off the reductionist hook?

Thomas Reid, an 18th-century exponent of direct realism, says that 'the knowledge which I have of things past, by my memory, seems to me as unaccountable as an immediate knowledge would be of things to come; and I can give no reason why I should have the one and not the other, but that such is the will of my Maker.' There's nothing I admire more in philosophy than a well-bitten bullet.

;-). Fodor goes on to speculate that the argument over realism is really more about meaning than about perception. The non-idealist direct realists are typically also eliminativist about meaning, along with the postmodernists. They, consistently enough, wish to eliminate both mind and meaning. They might say that words connect directly to (material?) objects rather than to meanings or to representations.

[11/3]

A reasonable person might think that the bizarre quality of the arguments over non-idealist realism would be forcing the disputants into the arms of idealism. I think that is probably happening, quietly. Once people fully grasp the futility of the arguments, they drop out, and turn to other pursuits, one of which might be idealism. Realism then comes more or less for free. The interesting questions then do not concern analysis. There is a visible weariness with these arguments that have been recurring at least since the time of Descartes. There is a steady attrition among the disputants, simply through aging, if nothing else.

Non-idealist realists are up against the wall. The disputants will have to decide which is more important to them. Realism or materialism. They can't have it both ways.

Postmodernist ranks are filled with those who have taken the implicit third option: anti-realism and, by the same token, anti-rationality. This is clearly the most popular reaction to the futility of analytical reason: an anti-rational pluralism. This also describes much of what now passes for 'naturalism'.

Some of us have taken the fourth option: pursue a speculative, synthesizing rationality. This is just the pursuit of coherentism which leads quickly and inevitable to rational theism. This is a big leap for those raised in the culture of secular philosophy. The neo-theist philosophers who are trickling into the profession are evidently eschewing cosmological speculation. They stick to quasi-analytic studies of mainly ethical concern. Taking up cosmology would likely force them into the midst of the Creationist-Darwinist circus. Not a career move.

There is no fifth option of which I am aware, or which is even logically possible. Back a ways I was able to count just 'two and a half' options: materialism, rationalism and mysticism. That's just about what we have here.

Where does that leave us immaterialist cosmologists? It leaves us beyond the pale, but with lots of room for maneuver. We can carry out raiding parties and maintain forward observation posts, with the impunity of invisibility. At some point we will begin showing up on the Google radar screen, and then, well, God knows!

Do Ideas Count?

And the next question is, 'Should they?'

The point I want to make is that if ideas count at all, then they should and probably do account for almost everything.

According to materialism, ideas don't exist, except maybe in our imagination or in our speech, which don't amount to much of anything either.

Almost everyone agrees that materialism is wrong. There is precious little agreement, though, on how, or by how much it is wrong. Since it was invented, in ancient times, there have been endless attempts to improve it, to make it less obviously false. I say that this was throwing good reason after bad metaphysics.

Why have we invested so much thought in a system which makes the claim that thoughts don't exist, which claim is, in itself, just another non-existent thought? Has this whole effort not been incoherent on the face of it? What could possibly explain such bizarrely irrational behavior on the part of what were alleged to be some of the best 'minds' in the world? That's hard to say, and with each passing year, as materialists dig their hole deeper, it gets harder to explain.

There are rational alternatives. Aren't there? Maybe not. Maybe that's the problem. I've been arguing that there is only one rational alternative. What if I'm right? That would be the end of philosophy as we know it. It would likely be the end of a lot of other things as well, up to and including the eventual end of the world -- as we know it? Nay, even as we can possibly imagine it. That sure prospect is the only rational explanation for all the irrationalism abroad in the land.

Based on this 'analysis' it would be fair to say that materialists' behavior is most readily explained as 'ideophobic'. They realize, consciously or not, that if you give ideas an inch, not only will they move into your neighborhood, but very quickly they will take over the whole world. Not just any old ideas, mind you. We're talking and they're fearing the One Big Idea. The Perennial Wisdom, if you will, that is knocking on their door; that already has its foot firmly planted in their door. They won't believe it is only my foot. They are sure it is an 800 pound gorilla. But it's a friendly gorilla. It has to be, or it could not possibly have already won the battle of ideas. It would not be here if it were not teleologically based. But even the best destiny in the world has a degree of finality and that does take some getting used to. We humans are world class, cosmic level procrastinators. We wouldn't be here if we weren't. The irresistible force meets the immovable object. We're going to have to learn a new trick.

[11/4]

I'm still working on the [direct realism](#) list, up to 300. I had not been considering direct realism from a relationalist point of view as suggested by one of the articles. My direct perception of something constitutes my relation to it. All relations are perceptual.

As part of a coherent non-materialist direct realism, there must be eternal essences. Every being partakes of such essences and is perceived as a special composition of them. These eternal essences are not prohibited from containing a temporal aspect, which would include their dynamical and historical relations in a teleological fashion. One could even call these 'super-essences'. Individuals would be identified with subsets of the super-essential relations. There would be a quasi-hierarchy of essences, up to and including theocentricity.

Percepts and concepts comprise and, in turn, are comprised of these essences and their relations.

As the cosmos is populated with conscious beings, these essences become stretched out to their maximum degree of individuation and detail of resolution. This maximum of particularity corresponds with the ascendancy of materialism. Then comes the coherentism which begins to reverse this particularization.

[11/5]

[Essentialism](#) surely has a mixed press, and much baggage. In other words, it should be fun.

I doubt that ideas and essences could ever be fully distinguished, and certainly not idealism from essentialism.

At the opposite end of the spectrum would be the anti-essentialism of nominalism and behaviorism.

Perhaps the most significant issue of essentialism concerns the existence of the soul, and closely related to this is the question of **personal identity**.

It should be noted that Physics has a very strong essentialist bent of a Pythagorean sort.

Not to be abstemious, let me hit on the soul, up front. The reality of the soul derives directly from the reality of God. The reality of God derives from the reality of love. There is a cosmic pecking order. The soul is fairly high on the list, but our essential being or presence is to be found in love. That is the one source of all being. It is conceivable that my soul might come between me and love. In that case the soul has got to go, and it would be the last thing to be jettisoned. People speak of the 'cleansing' of the soul. A cleansed soul is a transparent soul. A transparent soul is a non-existent soul. Cosmic love is the ultimate soul cleanser. It is the singular essence of everything.

All essence and identity derives directly from the requisites of love. Nothing else would make sense, not in a million years.

It's that simple sports fans. Whatever you have learned that does not support this necessary, singular truth is less than worthless. It's what puts everything into a coherent perspective. If you truly understand this, you will never have to understand anything else. Indeed, there is nothing else that can be understood.

Oh dear! Now that I have said everything that can be said, what is there to do? It's all just picking up the pieces: cleaning up around the Ranch, from here on.

Gyula Klima, in the final section of [Contemporary "Essentialism" vs. Aristotelian Essentialism](#), provides a strong defense of essences. All it takes is one essence to destroy materialism, even if that sole essence happens to be material.

Contemporary materialists are wont to point out that there is no such thing as life, no vital essence. But should we not infer then that it is impossible to die? One could believe that, if one chooses to be absurd. Much too much of our valuable time has been spent playing games with skeptics, usually on their irrational terms.

I like this one: [Topological Essentialism](#), Casati & Varzi. This gets down to the nitty gritty of parts vs. wholes and holes, too. It does make the whole (sic) notion of atomism seem more than a bit silly. If we each had a nickel for every stone placed on the grave of materialism we would all be millionaires. No, we would inherit heaven.

Perhaps, historically, the last political hurrah of materialism will be situated in the 'anti-essentialist' social critiques of some feminists, homosexuals, etc. A prevalent undercurrent of this sentiment is in evidence in this list. This is a misguided, myopic way to confront essential (sic) social problems. There is also some evidence of a corrective response: 'A Critique of Social Constructionism and Postmodern Queer Theory' by Rictor Norton : [Essentialism](#). Let us hope that the cooler heads prevail. In this regard, note [The Blank Slate- The Modern Denial of Human Nature](#) by Steven Pinker. Be treated to spectacle of a materialist defending essences. True, Steven is allegedly just talking genetic 'essences' and he does still believe in qualia according to one reviewer. Many strive for coherence, few succeed. It is also eminently debatable whether Darwinism eliminates natural kinds. OK, perhaps this is the next topic.

[11/6]

We'll come back to essentialism soon, and in the meantime take a look at '[Why are natural kinds supposed to stay fixed?](#)' to see some alternatives to Darwinian anti-essentialism.

I want now, however, to consider mental essentialism or [conceptualism](#). This is the part of essentialism and idealism that is the most difficult to refute. It might also be called meaningism. What I believe is fundamental is felt meaning. This is a decidedly holistic view of meaning. The whole problem with Plato was that he had an atomic view of essences. I don't know why. This atomism has been a tremendous drag on idealism since. These atoms of meaning were the seeds of idealism's self-destruction. Hegel's dialectical method should have corrected the atomism, but it was not until the post-reductive holism of Quine that things begin to turn around. It is feeling and reasoning that account for the coherence and holism of essences, not to mention teleology.

This looks like a good introduction: [Nominalism, Realism, Conceptualism](#). Notice especially the incarnational critique of Platonism.

From one perspective, conceptualism is a form of representationalism. How does this relate to reductionism? Are both concepts and representations taken to be reducible?

[Realism, Nominalism, and Conceptualism](#) provides a more concise exposition than the one above, and it deals more explicitly with the reduction issue.

Conceptualizing often entails abstracting. From a subjective point of view, the process of abstraction is generally found to be implicit. It seldom explicitly involves verbal analysis. The resulting concepts are holistic and open ended. Dictionary definitions fall far short of capturing our ability to elaborate even simple concepts on the spur of the moment.

More comprehensive is '[Meaning and the Problem of Universals, A Kant-Friesian Approach](#)'.

If a representation or concept is reducible to something else then we need an explanation of how we recognize or process it.

If there is no representation then we have 'direct' realism which, with a bit more candor, would be called magical realism, owing to its explicit lack of explanation.

[11/7]

It should be noted that the modern version of conceptualism is synonymous with the Higher Order Thought Theory of consciousness (HOTT). On the other hand, direct realism is used as a proxy for the connectionist theories of mind.

The question then is whether the HOTT can be given a reductionist interpretation. The fact that the HOTT is prevalent in the AI community would seem ensure its reductionist pedigree. However, the increasingly [ontological and metaphysical cast](#) to AI might suggest otherwise. The processing of concepts requires a comprehensive ontological schema. Is such a schema reducible?

Let's get to the nitty-gritty: [ontologies & reductionism](#) (523 hits).

What species of reduction would be accomplished in the competent computerized processing of concepts?

Another question is the anti-reductive pedigree of holism. Has it not also become a proxy for connectionism?

[11/8]

I find this to be an interesting paper: [Ontological Progress in Science](#) by Burian & Trout. Superficially they make a very modest claim. It is simply that the theoretical entities of science have causal powers. In as much as some of these entities may not be elementary particles, then, by just that much has reductionism been defeated.

1. The ontology of science is intensely compositional and hierarchical.
2. Although much of science is reductionistic, the reductionism in question is generally not eliminative.

We shall utilize this framework of theses to suggest some preliminary responses to the sceptical arguments of such philosophers as Larry Laudan and Bas van Fraassen against the idea that there is ontological progress in science. There is not space on this occasion to attempt a proper rebuttal of the arguments they employ to undercut scientific realism, but the general line that we would pursue in constructing such rebuttals will become clear in the course of this paper.

We have been greatly influenced by many recent writings attacking and defending scientific realism [\[1\]](#)....

Boy, have I been dumb or what? I never thought of using scientific realism to defeat scientific reductionism and materialism. How could I have been so dense? What is the date of this paper? Who is winning now? Some times my obtuseness takes my breath away. How many times have I conflated scientific realism with scientific materialism? At least twice a day for the last thirty years. I doubt that I'm the only dummy. Has there been a communication breakdown here? I even took a philosophy course that included scientific realism at Maryland in 1977, and I sure don't recall the issue of reductionism. What is going on?

[Richard M. Burian](#) and [J. D. Trout](#), "[Ontological Progress in Science.](#)" The Canadian Journal of Philosophy, 25 (1995): 177-202.

This is Richard's only publication listed as online. Same goes for Jack, but he does have four books listed, all more or less on topic of realism.

Now I am understanding that this realism is the thesis of Naturalism and distinguishes it from Physicalism. It also opposes itself to the reductive Unity of Science thesis.

Take a look at [CONTEMPORARY MATERIALISM: A READER](#) Edited by Paul Moser and **J.D. Trout** (Routledge, 1995). An interesting lineup.

Yet another nail in the coffin of materialism. How much does the cadaver have to stink before we adjourn this wake? Haven't we run out of beer yet?

On the Unity of Science question, undoubtedly people are (deliberately?) conflating the methodological and metaphysical issues.

Burian & Trout put considerable stock in [Ian Hacking](#). Let's look at his book review articles. Sorry, I guess we won't. You have to pay. Am I the only one getting the feeling there is a bit of a blockage here?

Take a look at [The Social Construction of What](#) by [Ian Hacking](#) (HUP 2000). This reminds me of the [Science Wars](#) with physicist [Alan Sokal](#): physicalism -- **good**, psychologism -- **bad**! Scientific realism is not allowed to trespass beyond the boundaries carved out by the dictates of the American Physical Society ('We invented the **BOMB**, or did we discover it?? Don't upset us, and definitely don't confuse us!'). Are those boundaries "**physical**", Alan? And what about mathematical physics? Is mathematics a "**construct**", or what?

I feel like I've been missing out on some fun. Nothing like playing catch-up!

Here's a review of Ian's book: ['Phony Science Wars'](#) by Richard Rorty:

Philosophers like Latour and Kuhn, wary of the idea that reality has an intrinsic nature that scientific inquiry is destined to reveal, are inclined to say that science might have done as good a job if it had never come up with either quarks or genes. As they see it, scientific progress is like biological evolution: no particular life-form is destined to emerge, and lots of different ones might have turned out to be equally good at survival.

A useful description of constructivism. And now at length:

...In this view, scientific theories are tools that do a job. They do it well, but some other tools might perhaps have done the same job equally well.

As Hacking says, many scientists find this view absurd. He himself is dubious about it, but he is inclined to be even more dubious about the idea that reality has an intrinsic structure that science accurately describes. These latter doubts are aroused by the notorious, persistent, seemingly insoluble perplexities to which the notion of "intrinsic" gives rise. The most familiar of these is the question How can we ever hope to compare reality as it is in itself, naked and undescribed, with our descriptions of it? Many philosophers have given up on the notions of "intrinsic" and "in itself," as a result of their failure to answer that question.

The stalemate that Hacking brilliantly describes but does not try to break is between many scientists' intuition of the inevitability of quarks and many philosophers' suspicion that the claim of inevitability makes sense only if the idea of the intrinsic structure of reality makes sense. This teeter-totter between conflicting intuitions is, Hacking rightly says, a genuine intellectual problem. Which answer one gives to his third question -- about the source of the stability of the most reliable bits of science -- is likely to be a matter of which side of the seesaw has most recently descended.

These alternating intuitions have been in play ever since [Protagoras](#) said "Man is the measure of all things" and [Plato](#) rejoined that the measure must instead be something nonhuman, unchanging, and capitalized -- something like The Good, or The Will of God, or The Intrinsic Nature of Physical Reality. Scientists who, like [Steven Weinberg](#), have no doubt that reality has an eternal, unchanging, intrinsic structure which natural science will eventually discover are the heirs of Plato. Philosophers like Kuhn, Latour, and Hacking think that Protagoras had a point, and that the argument is not yet over.

The most vocal and inflamed participants in the so-called science wars are treating the latest version of this fine old philosophical controversy as a big deal. In the very long run, perhaps, it will prove to be one. Maybe someday the idea of human beings answering to an independent authority called How Things Are in Themselves will be obsolete. In a thoroughly de-Platonized, fully Protagorean culture the

only answerability human beings would recognize would be to one another. It would never occur to them that "the objective" could mean more than "the agreed-upon upshot of argument." In such a culture we would have as little use for the idea of the intrinsic structure of physical reality as for that of the will of God. We would view both as unfortunate and obsolete social constructions.

Rorty does not mince words here as to his own Protagorean proclivities: I am also on this teeter-totter, tilting toward theism, but realizing that without a Creation you don't got no Creator.

This has been an interesting discursion, but where does it leave us with reductionism? Obviously reductionism is being given short shrift in the Science Wars, but I submit that it lurks in the arena.

First, we must revisit the divide between the Anglo-American and Continental traditions. I think it's fair to say that the Continental tradition is older, more multicultural and perhaps even 'wiser', certainly more tolerant. Pluralism is its stock-in-trade. Their closest approach to absolutism was in Hegelianism. Descartes was opinionated, but also managed to make the world safe for both Science and Religion. Britain bequeathed us Newton and Darwin, not to mention Hume. The Anglo-American version of pluralism is a dichotomy between scientific absolutism and philosophic skepticism. Yes, we do have a streak of Pragmatism, and now an imported Postmodernism. The Continental pluralism naturally favors phenomenology and existential subjectivism. We Anglos, though, want to be more objective and tough-minded, either in our realism or in our skepticism, but not subjectivism. The frontier spirit of man into the wilderness was part of this tough-mindedness. John Wayne just doesn't make it as a phenomenologist. I can understand from whence John cometh.

[11/9]

Yes, I'm having some difficulty finding the proper focus, but please bear with me. This is not a trivial pursuit. There are uncharted waters here that run deep.

We have discussed the Anglo-American experience in the history of ideas, but there is also an American (US) angle. On the questions of 'creationism' and 'right-to-life' there is a unique US experience. In both cases there is a widespread, emotion laden, political confrontation between contrasting metaphysical views. This dualistic, dichotomous type of division has a long history that has somehow been exacerbated here. Some of that dynamic and psychology may be relevant to the issue of reduction and its ultimate resolution. My gut feeling is that if something does transpire around this issue, there are likely to be some historical parallels; although, if there is a line in the sand, it will have a different direction in a different location.

In the preface to [The Social Construction of What](#) Ian Hacking points out that the Science War of Sokal's provenance has generated two very different responses: here and elsewhere. Here it has been blood in the streets, elsewhere it is 'bemusement'.

Also relevant here is the nascent issue of Intelligent Design. This thesis represents a marked advance beyond Creationism, moving somewhat in the direction being suggested in these pages. But still there is an obvious materialistic, or mechanistic emphasis of ID that sets us apart. Their notion of **irreducible** complexity ought to be suggestive, however. Whether there may ever be a direct intellectual link between that mechanistic irreducibility and this metaphysical irreducibility remains to be seen. It might seem a small step, but it could turn out to be a giant leap. Naturally, I will be paying close attention to the former, to both its substance and its form.

I have been pointing to several related issues and intellectual trends. The question for us is where will the reduction question most likely come to the surface. Somehow the Science War is just missing this mark.

How could it come so close without a direct hit?

In the Science War the issue is between social constructivism and reductive realism. The closest thing to our non-reductive realism is found in the neo-rationalism of [Fodor](#) and the 'genetic' epistemology Chomsky and Piaget. As [noted previously](#), Dan Dennett has already accused Jerry of providing ammunition for Creationists. I'm not sure how Jerry and his fellow neo-rationalists are reacting to this accusation. I would like to see the Creationists eventually take up this issue, but I'm not holding my breath. It would be preferable to initiate an intellectual discussion, as on these pages, before involving the sectarian interests. Let me reiterate that the heterodox theology involved in immaterialism and neo-rationalism is going to be a major obstacle for any sectarian, and that is probably just as well.

I would rather see the life-science community take up non-reductionism first. However, their escalating confrontation with the sectarians over 'irreducible complexity' may already have rendered that scenario unlikely. Our potential arena is correspondingly small. This has advantages as well as disadvantages.

Sometimes I forget about Marx, but do recall that I have addressed the Canton branch of the Society for the Study of the Dialectics Nature. Fred Engels was staunchly non-reductive about his materialism. Yet he managed to avoid Platonism. Yes, he was an emergentist but he also believed in the inevitability of history. So there was an element of teleology. How did he avoid the chain of being? What about Darwin? There were supposedly some smart Marxists. But there is a fundamental irrationality here. Does that mean there were a lot of smart people who were blinded by emotion laden ideology. You bet'chya'. Are scientific materialists and non-reductive postmodernists similarly blinded? Well, you tell me:

[I'm doing [anti-reductionism](#), for those of you keeping score]

[Emergent Representations: Dialectical Materialism and the Philosophy of Mind](#) -- Joe Faith, 2000

Philosophically speaking, Darwin solved two key problems. He not only naturalised functional explanation in biology but also naturalised normativity, i.e. he found a way of deriving normative properties from non-normative properties — oughts from is's. Darwin explained why hearts beat and also why hearts ought to beat. He found a way of determining what made a heart a good heart.

In the last chapter I argued that Marx discovered a mechanism underlying social evolution that is analogous to the mechanism that Darwin discovered underlying natural evolution; and showed how we can use this to naturalise functional explanations in sociology. In this chapter I explore whether it is also possible to use the same theory to naturalise social norms, such as our criteria of truth, goodness, and beauty.

If Joe is right, God is wrong. Place your bets, sports fans!

[11/10]

I'm still trying to get a handle on Joe's view of reductionism. So far he is leaning toward Strong AI, which would suggest that any emergence would have to be purely epistemic, which would not even qualify for conceptualism.

[I'll have to break here for Ravens v. Bengals. Don't go away.]

[11/11]

I'm not getting far with Mr. Faith. He obdurately eschews metaphysics. The representational emergentism that he advertises is left dangling. He, of course, rules out skyhooks, but then the existential status of the floating representations is not specified. His realism is strictly pragmatic. I'm under the impression that Engels was metaphysically less timid with his dialectics of nature.

The upshot is that robots stand to acquire conscious minds, given the properly pragmatic engineering input. Joe is down on 'East Coast' theorizing about symbol systems. This puts Joe in the Transhumanist circle and in flagrant violation of any human ethic, worker or otherwise. Is this befuddlement of Marxist thought just sloppy thinking, or another example of intellectual anti-rationalism, as if more of same could possibly serve a purpose.

At best, Joe is a holistic mechanic. I believe that Engels was a bit more ambitious than this.

Reductionism [redux](#): [downward causation](#). This is good: [PHYSICALISM, EMERGENCE AND DOWNWARD CAUSATION](#) -- [Richard J. Campbell](#) & [Mark H. Bickhard](#) (2001):

The critical point is that quantum field processes have no existence that is independent of their configurations: quantum fields are processes, and can only exist in various patterns. Those patterns come in many sizes, of many different physical and temporal scales, some as large as a human person, or a social institution – but they are all equally patterns of processes. There is no 'bottoming out' level in quantum field theory – it is patterns of process all the way down, and all the way up.

That is the rub. To be a reductive physicalist (or an 'eliminative materialist') at all, is to believe that 'higher-level' entities are nothing other than complex configurations of lower-level entities, in such a way that the higher-level properties and powers are explicable in principle in terms of the properties and powers of the lower-level entities (or at least, determined by them). Consequently, some entity is reducible just in case it is a configuration of lower-level entities. But now the supposed base-level entities are nothing but configurations of process as well! If there is no 'bottoming out', there are no bases to which all other phenomena can, even in principle, be reduced. Our reductive physicalist has lost the ground on which he wants to stand. If being configurational makes a property or power epiphenomenal, then everything is an epiphenomenon. That is the *reductio ad absurdum* of this position.

This is an intelligently provocative restatement of the non-locality of QM. It makes Steven Weinberg's contrary statement in [Reductionism Redux](#) (NYRB, 1995) appear disingenuous, to put it euphemistically. Steven certainly knows better. His professional colleagues who silently tolerate such blatantly biased editorializing will not escape censure, either.

Back to Richard and Mark:

Reductionist physicalism is false precisely because there are no elementary physical particles that can serve, in the required sense, as 'emergence bases'. Since everything is an organization of quantum field processes, more complex organizations of processes can yield emergent properties and powers, but it is the higher-level organization itself that is doing the work, not whatever might be its 'constituents'. (That is why we earlier emphasized Kim's invocation of relations and configurations.) Any field view destroys the seduction into a micro-particle reduction because configurational and organizational properties make differences in causal power, not just in the working out of lower-order causal power.

This may be valid, but it needs to be fleshed out. What may be even more significant is their exposure of Jaegwon Kim as favoring at least one substantive form of emergence, and they cite another author with the same opinion. If this holds up, it is the most damaging case against reductionism, yet. Kim is the most thoughtful and conscientious of the reductionists of which I am aware. A far cry from Steve.

I hasten to point out that Richard & Mark claim to be non-reductive naturalists. I would like to find just one paper that exposes the oxymoronicity of non-reductive naturalism. If Darwinism is not reductive it

looses most or all its force, I believe. This is being pointed out by the IDers with their irreducible-complexity argument against Darwin. For instance, if any aspect of consciousness is irreducible, then we are faced with the pre-existence of mind and intelligence, obviating the Darwinian thesis.

I have mentioned before that the only way around this anti-Darwinian conclusion is by means of a [Sheldravian](#) 'mechanism' of spontaneous morphogenetic resonance. Such an anti-mechanical mechanism, just in itself, however, would be a large foot in the door for all kinds of teleological mischief. Give us an inch; we take a mile. That's exactly why the wizard's of scientific secularism, Weinberg & Co., are being so hardnosed about reductionism. Don't the 'naturalists' get it? By the way, my singular meeting with Rupert was in a crop circle. Need we say more?

How the non-reductive naturalists avoid this realization is the mystery of the moment. Has no one bothered to clue them in? There must be a reason for the divide between physicalism and naturalism; a reason that is being downplayed, evidently. Why is reductionism so much debated if it does not have far reaching consequences? The naturalists are naturally reluctant to speculate as to how far reaching these consequences are. What then is their motivation relative to the reduction issue? They may think that they are merely supporting scientific realism, particularly as it applies to the life sciences. But at the very least this makes them vitalists, and even panpsychists. How many inches between these and pantheism, and then..., you know what?

I recall more than a few theistic authors complaining about scientific reductionism. Is it only ideology which prevents a joint tactical anti-reductive effort?

Back to search mode. Or is it head-scratching mode?

As if in answer to my question, my next click was on [Downward Causation](#) by Claus [Emmeche](#) [Danish Biosemiotician], et al., of nonsectarian demeanor. But, then go to the Amazon [listing](#), and what do we see? It is paired with a book by Dembski, a ringleader of the neo-Creationists, but with no explanation for the selection. Evidently, I am not the only one anticipating a tactical fusion of anti-reductive interests.

And it appears that [Naturalism : A Critical Analysis](#) (Routledge Studies in Twentieth Century Philosophy, 2000) by [William Lane Craig](#) (Editor), [J. P. Moreland](#) (Editor) might answer some of the above questions. It includes this article: '[The Incompatibility of Naturalism and Scientific Realism](#)' by **Robert C. Koons**, 1998. But this latter turns out to be one of the most opaquely argued pieces I have come across in recent memory. Too bad. [But [here](#) I am in a more congenial mood.]

[11/12]

I am presently reviewing Claus's [homepage](#). I notice that he maintains links to [Radical Constructivism](#) (Austrian site, Heinz von Foerster, et al.) as well as to the [Creationism debate](#), quite eclectic. Radical constructivism has strong immaterialist tendencies, with ties to biology and cybernetics. Notice the link to [Stephen C. Pepper](#). Stephen's root metaphors and world hypotheses have been influential for me, from early on.

Clearly biosemiotics is important for us, and Claus appears to be the most eclectic thinker in the field. [Gilles Fauconnier](#) is another person on this fringe, yet to be reckoned with.

I have yet to find a point of direct confrontation between biosemiotics and reductionism. There is not the deliberate provocation that we find with [Richard Campbell](#) above. I notice that Richard has considerable background in the philosophy of religion. For an academican to stick her neck out in this arena requires more than a little fortitude and experience with the big picture. Being on the verge of retirement is another likely factor. Unfortunately, this is Richard's only publication presently on-line.

I'm reading Alexei Sharov's [personal philosophy](#) relative to biosemiotics. He emphasizes his pragmatism, but note the priorities:

Religious experience has proven to be useful for billions of people. But other people may not need it. Because people have different Umwelts they cannot come to agreement on whether the God exists or not. But this disagreement does not prevent them to communicate using overlapping portions of their Umwelts. It is not the goal of science to prove that God does not exist; science has other more important [sic] goals.

Biosemiotics is rather close to [evolutionary epistemology](#) in the following aspects. It considers knowledge as a natural phenomenon which can be studied using the evolutionary theory. Biosemiotics is a descriptive science and rejects normative epistemology and normative ethics.

However, most people who develop evolutionary epistemology are realists, including the founders (Campbell, Lorenz, and Popper). [Popper](#) thought that scientific language has fixed meaning, and therefore scientific knowledge is objective and absolute. I think that there is no absolute (observer-independent) knowledge. However, there may be levels of "objectivity" depending on the scope of usefulness of knowledge (how large is the group of people who apply this knowledge and how successful this application was in the past). In this sense, scientific knowledge is more "objective" than superstitions.

I see a peculiar (politically correct?) form of quasi-realism at work -- constructive realism? The unaddressed issue is conceptualism. What is the ontology of our concepts? How does semiotics obviate semantics? What is the ontic status of a sign? Why not 'biosemantics'? This might be worth pursuing. Are semiotics and constructivism both reductionistic? Are they just neo-materialist? But wait, what about informatics? Is there a distinction between informatics and semiotics? What is the ontology of the former?

Is the avoidance of ontology deliberate? How long can it persist? Without a realist ontology, science will quickly slide into idealism. With a realist ontology the slide will just be a little slower! Either way, we see that science and realism are on a collision course. Thus the avoidance and denials of the inevitable show down.

OK, back to Google: [semiotics & reductionism](#): and right back to Claus: '[Modeling life- on the semiotics of emergence and computation](#)':

Artificial Life may help us to see that the idea of universality of the fundamental principles of life may be a presupposition, a metaphysical prejudice with a questionable basis.

The dualism between structure and process, form and function, part and whole, inheritance and environment, contingency and necessity, holism and **reductionism**, vitalism and mechanism, energy and information, concept and metaphor. The construction of Artificial Life may help to dissolve some of these dualisms, or maybe combine or re-invent them in more fruitful ways, and inseminate new ideas about the nature of living beings. In this perspective Artificial Life can be seen as a new way of 'reading' the science of biology. Using a metaphor from literary criticism we may call it a deconstructive reading: Alife actuates a deconstruction of the Good-Old-Fashioned-Biological Life.

Oh dear, I'm disappointed with Claus. I would say he is putting too much stock in Artificial Life, whose main function is simply to help us avoid and deny the problem of reductionism.

Let's try again: '[The cybersemiotic model: An evolutionary view on the threshold between semiosis and informational exchange](#)', Soren Brier:

The present paper discussed various suggestions for a philosophical framework for a trans-disciplinary

information science or a semiotic doctrine. These are: the mechanical materialistic, the pan-informational, the Luhmanian second order cybernetic approach, Peircian biosemiotics and finally the pan-semiotic approach. The limitations of each are analysed. The conclusion is that we will not have to choose between either a cybernetic-informational or a semiotic approach. A combination of a Peircian - based biosemiotics with autopoiesis theory, second order cybernetics and information science is suggested in a five -leveled cybersemiotic framework . The five levels are 1) a level of Firstness, 2) a level of mechanical matter, energy and force as Secondness, 3) a cybernetic and thermo dynamic level of information, 4) a level of sign games and 5) a level of conscious language games.

Well, we shall see.....

But Peirce's semiotics is a very good non-reductionistic framework to start from since it takes its point of departure in semiotic mind.

The conception - especially of Maturana and Varela and also von Foerster - also comes close to Jacob von Uexküll's Umweltslehre. It is a kind of bio-constructivism. Unfortunately it tends to be rather idealistic, sometimes even solipsistic in certain formulations while, at the same time, it insists on the material reality of a biological observing system. Von Uexküll is a declared vitalist, who sees living systems as species, stretching theory Umwelt bauplans through time eternal. This makes him an anti-Darwinist. But Lorenz, on the other hand, used part of Uexküll's theory to found ethology. He fitted it into a neo-Darwinian paradigm,....

In Peircian semiotic philosophy these levels can be bound together by Synechism, Tychism and Agapism combined with the evolutionary view of the interaction of Firstness, Secondness and Thirdness. The view of Firstness as a blend of mind and matter qualities and as containing qualia and living feeling with a tendency to take habits is crucial to understand the self-organizing capabilities of nature and how, what seem as dead matter, through self-organization in evolution can become autopoietic and alive with cognitive/semiotic and feeling abilities.

The ontology is all over the map. Claus and Alexei reject all ontology; Soren accepts all ontology. I'm not sure that there is any practical difference.

The term quasi-sign suggests an answer to the question whether there can be semiosis in a machine of the kind which Peirce knew. A quasi-sign is only in certain respects like a sign, but it does not fulfill all criteria of semiosis. While some criteria of semiosis may be present in machines, others are missing.

Well, this is something.

When information theory attempts to encompass the area of meaning and semantics it passes and destroys the semiotic threshold too, but now in the other direction blurring the difference between informational and semiotic processes, and thereby between mechanical signal manipulating or quasi-semiotic systems and living systems. This produces all sorts of simplistic theories about intelligences that are not able to grasp the cognitive processes special for embodied living systems, not to speak of conscious socio-linguistic systems.

....and better still. I suspect that the upper echelons of Semioticians continue to respect these ontological distinctions, in keeping with their Continental phenomenology. It is the worker bees who may try to cut these ontological corners in order not to upset the mainly Anglo-American scientific establishment, which confronts Creationism on a daily basis.

Peirce's view that we cannot with any good reasons split the concepts of mind and matter from the beginning, is very sound and a profound basis. I do not see any good reason why the inner world of cognition, emotions and volition should not be accepted as just as real as the physical world as well as our cultural world of signs and meaning.

Finally to both the spiritualist and the materialistic, embodied life, even with only one cell as the body, has to be a basic part of, or a component of constructing a reality. We are thinking in - or maybe even - with the body. The psyche and its inner world arise within and between biological systems or bodies. With Peirce one may say that there will always be some kind of psyche in any kind of biological

autopoietic and code dual system. Still, a partly autonomous inner world of emotions, perceptions and volitions, only seems to arise in multi-cellular chordates with a central nervous system. Lorenz (1973) argues that such a system with emotions and experiences of pleasure is necessary for animals to have appetitive behavior, searching for the objects or situations that can elicit their instinctual behavior and release the motivational urge built up behind it. This is qualitatively different from how reflexes function on a signal, which is a proto-semiotic informational level. Instincts sign function is on a genuine semiotic level.

....to be perfectly frank about it.

[SEMIOSIC BODY-MIND \(THE\)](#) -- Jesper Hoffmeyer:

20th century life sciences have been characterised by two major trends. One trend is molecular and genetic reductionism. This trend is well known and need no further comment. Beginning as an undercurrent to this trend, however, another much less noticed but in the long run just as important trend has gradually been unfolding: The semiotisation of nature.

....and in the other corner, Semiotics.

While it is understandable that biology as a profession prefers to base its understanding of basic life processes on a concept of information having been developed in the safe world of physics, this way of saving the life sciences from the muddy waters of interpretative processes nevertheless seems increasingly illusory the more we learn about the true subtleties of those processes.

There can be no doubt that reductionism in the life sciences has been healthy considered as a research strategy, and it should be pursued as such. But when it comes to theory, it seems that reductionism and the dualism on which it is justified, has run into serious problems. To explain life as 'nothing-but-interacting-molecules' leaves out a whole dimension of life, which the reductionist research strategy has itself helped digging out, the dimension of semiosis.

...not to mince words.

[A semiotic cosmology](#)

"We must understand our world in such a way that it shall not be absurd to claim, that this world has itself produced us" (Prigogine and Stenger 1984). With this statement Prigogine and Stenger want to remind us to the logical problem implied by a traditional scientific world view: If our physical theories explain nature as a stupid thing, how come that this 'thing' was as a matter of fact capable of creating us? Creativity cannot logically grow out of a non-creative world. Ironical as it is, traditional science therefore needs miracle (or alternatively it may of course eliminate creativity by claiming absolute determinism - but that leads us into the absurdity of believing that we couldn't possibly have believed other than what we believe, which is then not a belief but a kind of mental spasm).

Jesper keeps getting better. This is nice! When will creationism discover semiotics? There is probably already a Creationist Establishment which sees Semiotics as a threat to its job security, no doubt.

What I suggest, then, is that the development of individual intentionality in clever animals was preceded by the development of an evolutionary intentionality (which itself was preceded by a cosmic quasi-intentionality (Hoffmeyer 1998)). Rather than excluding un minded bodies from the kingdom of semiosis by applying the rigid criterion proposed by Eco I suggest we accept the idea that semiosis is itself an evolutionary phenomenon exhibiting different degrees of freedom. Evolution might then be seen, as Gregory Bateson suggested, as itself a kind of mind process, and by implication all bodies in the world are in a way minded bodies. As I have suggested earlier one might even say that the unfolding in our universe of increasing semiotic freedom is what evolution is all about.

...teleology, anyone?

['Has Biosemiotics come of age?'](#) -- Marcello Barbieri (2002):

The third paper, by Frederik Stjernfelt, begins with the announcement that "Jakob von Uexküll's theoretical biology is a main contribution to the developmental, or epigenetic, trend in the biology of recent centuries, a lineage involving scholars like Goethe, Saint-Hilaire, von Baer, d'Arcy Thompson, Spemann, Driesch, Waddington, Brian Goodwin, Rene' Thom and Stuart Kauffman". This lineage has been the historical antagonist of the 'mechanistic' approach of Galileo, Descartes, Newton, Lamarck, Darwin, Mendel, James Watson, Francis Crick and Jacques Monod, an approach which has produced what is still the main paradigm of modern biology. This special issue, in short, not only presents a revolutionary idea of biology, but also announces that such a revolution comes from the heirs of the historical opposition to mechanism. And this is no isolated announcement. 41 distinguished academics from 15 different countries have produced a 828-pages-long volume with papers on history, philosophy, theoretical biology, ecology, linguistics, arts, literature and computer science, and all come, by varying degrees, to similar general conclusions. The volume owes in fact its remarkable overall unity to this ideal convergence, and there is no doubt that its aim is to strike at the very heart of the life sciences.

Mainstream organicists and qualitative organicists may well be responding with enthusiasm to the "United against mechanism?" rallying question that Malte Herwig is launching from this special issue, but I am not. The best chances to solve the new problems of life are still likely to come from where all our solutions have always come in the past: from good, rational, old-fashioned machine-like models.

It sounds like a confrontation to me.

Unfortunately, only two other publications of Marcello's are available on-line. His promise to reduce semiotics to mechanics remains just that. Nor have I found any other mechanists willing to debate the semioticians.

[11/13]

There is no question that semiotics in general and biosemiotics in particular are anti-reductionistic. Semiotics, *simpliciter*, also has an anti-naturalistic aspect. Should we check that out?

[Semiotics & naturalism](#): and it would appear that we have a date with [Robert S. Corrington](#), Prof. of Philosophical Theology: [A Semiotic Theory of Theology and Philosophy](#) (CUP, 2000):

Reviewer: Elena Vishnevskaya from Madison, New Jersey USA

In this beautifully written and concise book, Professor Corrington presents to the reader the capstone of his six previous books as they have developed his unique perspective of ecstatic naturalism. This form of naturalism, while rooted in classical Euro-American forms of naturalism (think of Dewey and Buchler here), makes a decisive break with the past by arguing for the primacy of the unconscious dimension of nature and for the reality of the potencies that enter into the world often when they are least expected. In order to frame his general philosophy, he engages in an ongoing respectful dialogue with psychoanalysis (especially that of Jung, Reich, and Kristeva), semiotic theory in the Peircean tradition, and a universalistic religiosity apparently shaped by his encounters with Hinduism and American Unitarianism.....He has an almost mystical sense of the presemiotic ground of nature and sees it as the birthing ground of the potencies (taking this word from Schelling). The other dimension of nature natured is explored in terms of an evolutionary semiotics that is bold enough to see sign usage in all of the prehuman order of the world.

This may not be supernatural, but it sounds like Supernature to me. There is certainly nothing here that a scientist, *qua* scientist, would recognize. Clearly we have to be on the lookout for pantheists attempting to purloin the banner of Naturalism, and, by the same token, be on the lookout for crypto-pantheistic 'naturalists'. 'Evolutionary semiotics' merits examination. Semioticism appears bound for cultic status.

Concerning semiotics and reductionism: Britannica 2001: Semiotics:

This interest in the structure behind the use of particular signs links semiotics with the methods of **structuralism**, which seeks to analyze these relations. Saussure's theories are thus also considered fundamental to structuralism (especially structural linguistics) and to poststructuralism.

...and Structuralism:

Two important points arise here: first, that the structural approach is not in principle restricted to synchronic linguistics; second, that the study of meaning, as well as the study of phonology and grammar, can be structural in orientation. In both cases "structuralism" is opposed to "**atomism**" in the European literature.

Little work on semantics has been done by structural linguists because of their belief that the field is too difficult or elusive to describe.

Did no one apprise the AI community of this latter result?

[SEMIOTICS:](#)

Center for Semiotics

U N I V E R S I T Y O F A A R H U S

Semiotics has always been both an inquiry into the nature of signs and—since signs convey meaning—a philosophical field of rational reasoning on world- and meaning-related questions, such as the following: Is meaning part of the world? Or is it the human mind's own pure invention and therefore not part of the world?

There are, however, many different versions of this **semiotic 'naturalism'**:

One is Thom's and, roughly, Lakoff/Johnson's: there is a macro-physical, or 'pheno-physical', domain of objectively given spatio-temporal and causal states and processes; these have given formal properties that our minds pick up and interiorise, if they significantly affect our bodily interaction with them; this interiorisation is schematism. The **gap** separating 'physis' and 'meta-physis' is thus bridged by 'pheno-physis'. The rest is metaphor. The rest includes affect, notional meaning, deontic values, linguistic and otherwise semiotic behavior.

Another is Talmy's and Fauconnier/Turner's: there is a neurally specialized mental function which can make incoherent, or partial 'ceptions' (perceptions, conceptions) into coherent meanings by filling in from a stock of mentally available ready-mades that language helps us store as 'fictions'; the result is an ongoing process of creative construction that blends the fictive and the referential ingredients into homogeneous, meaningful semantic wholes (a semantic "kitchen"). The central assumption is that there is a mental "cooking-pot", a cognitive mechanism of conceptual integration that neutralizes the difference between semantic domain addresses, modal values, provenances etc. of the ingredients and treats them all alike. The mind is generous. Here, the **gap** between physicality and meaning is bridged by a neuro-semantic integration; metaphor is just a special case.

Notice the scare quotes on 'naturalism'. This is a very phenomenological version of nature as opposed to scientific. And mind the '**gap**', please.

['Semiotics this side and the other side of structuralism: the connection between modern and postmodern, structuralism and poststructuralism'](#) -- Roland Posner, Technical University Berlin (1993)

In the beginning of the 20th century, structuralism has responded to the materialism, atomism, historicism, and naturalism of academic research by introducing a theory of its own, built around the dichotomies of signified and signifier, paradigm and syntagm[?], diachrony and synchrony, langue and

parole. Poststructuralism did not reject this theoretical apparatus in favor of a new one, but explicated the paradoxes behind the structuralist dichotomies and tried to overcome them by undermining the first concept of each pair and emphasizing the second concept.

...in case you were wondering, and recalling the seminal relation of structuralism and semiotics.

I had not been sufficiently aware of the anti-reductive motivation for structuralism.

I would speculate that there is already a transatlantic, anti-reductive symbiosis between semiotics and our own [computational epistemology](#).

In regard to semiosis vs. reduction, I am reminded of [Wilfrid Sellars's](#) dichotomy (c.1962):

His most explicit account of the central task confronting contemporary philosophy aligns it firmly with the modernist project of achieving a rapprochement between our humanistic understanding of ourselves as free and rational agents, at home among meanings and values, and the thoroughly "disenchanted" picture of the world being painted by an increasingly comprehensive natural science. Sellars thematized this contrast as a confrontation of two "images": the "manifest image" whose primary objects are persons, beings who can and do conceive of themselves as sentient perceivers, cognitive knowers, and deliberative agents, and the "scientific image", whose primary entities are some sophisticated version of "atoms in the void". "The scientific image," Sellars wrote, "presents itself as a rival image. From its point of view the manifest image on which it [methodologically] rests is an 'inadequate' but pragmatically useful likeness of a reality which first finds its adequate (in principle) likeness in the scientific image."

[Research Project: Rationality and Non-Reductionism](#) (van Tilburg University, NL):

The program takes issue with two trends in the philosophy of science and epistemology: relativism and reductionism. While relativism undermines the rationality of science, reductionism undermines the ontological status of the subject matter of the so-called special sciences and hence their autonomy.

[Emergent properties](#) (15,000 hits):

[The biosemiotics of emergent properties in a pluralist ontology](#) -- Claus Emmeche: an excellent summary of the many possibilities.

[11/14]

[Emergent properties & causal](#) (2,300 hits):

Here is an [outline](#) of Kim's "Epiphenomenal and Supervenient Causation" (1984). He argues against macro or downward causation.

[CARL GILLET](#) was a student of Fodor's at Rutgers. He is a critic of physicalism. Only abstracts of his papers are available.

[Henry Stapp](#) is a person to watch. I first met him about twenty years ago. He is a physicist at Berkley. Here is a lengthy excerpt from a [letter](#) (1997) of his:

So in this austere quantum ontology there is an element of reality associated with each alternative possible entire classical world. This includes realities associated with each alternative possible state of my entire brain. So we now have some realities that can reasonably be imagined to correspond to the complex structure of human thoughts.

But this complex reality, rich as it is, is only part of the quantum reality: something that lies outside and beyond that physical ontology is needed to complete the full dynamical description. A fair description of this extra thing would probably be to say that it is something like "**the mind of God**", because it must

do such high-powered things.

In each of the various quantum ontologies that has been proposed the other realities must do important things. I will stick here to a Bohr/Heisenberg/vonNeumann/Wigner interpretation.

The extra reality must do three things: 1. select a question (choose a basis) 2. answer that particular question (actualize one of the basis states) 3. bring the physical state of universe into concordance with that answer.

Most importantly, insofar as we know today, each question must be a question about what some human experience will be, and the answer must bring the state of the brain of that human being into correspondence with that experience. This is the way the theory is set up, in order to account for **all** phenomena, including phenomena adequately described by using the classical approximation.

Although only events associated with human experiences are required by the theory, the theory allows similar events not associated with human beings. But no evidence for their existence has yet been uncovered.

This completes my explanation of why I reject the classical-physics ontology, and how our conscious experiences fit into a quantum-physics ontology.

There is some tension here between a mere quantum physicalism and a full-blown theism. In most of his writing, Henry hews close to the former, conservative position.

[THE NATURE OF AUTONOMOUS AGENTS AND THE WORLDS THEY MUTUALLY CREATE](#) -- [STUART A. KAUFFMAN](#), (1996):

I point out that "downward causation" is utterly non-mysterious. The last trilobite jumped the wrong way when some starfish caught it for dinner. But with the extinction of the organism - the trilobite - the earth lost its unique molecular species. Hence the extinction event, due to actions and effects among whole organisms, has changed the molecular unfolding of the biosphere. Causes run upward and downward seamlessly.

We'll be [hearing](#) a lot of this from the 'anti-mysterians'.

[Self-organization & downward-causation](#) (254 hits).

[11/15]

[Weak emergence](#) (128 hits):

[Weak Emergence](#) -- Mark Bedau (1997; his phrase first [referenced](#) in 1995):

An *innocent* form of emergence - what I call "**weak emergence**" - is now a commonplace in a thriving interdisciplinary nexus of scientific activity - sometimes called the "sciences of complexity" - that include connectionist modeling, non-linear dynamics (popularly known as "chaos" theory), and artificial life. After defining it, illustrating it in two contexts, and reviewing the available evidence, I conclude that the scientific and philosophical prospects for weak emergence are bright.

'**Toothless**' would be a more accurate description.

'[Varieties of Emergence](#)' -- David Chalmers (2002):

We can say that a high-level phenomenon is **strongly emergent** with respect to a low-level domain when truths concerning that phenomenon are not deducible even in principle from truths in the low-level domain. Strong emergence is the notion of emergence that is most common in **philosophical** discussion of emergence, and is the notion invoked by the "British emergentists" of the 1920s.

We can say that a high-level phenomenon is **weakly emergent** with respect to a low-level domain when truths concerning that phenomenon are unexpected given the principles governing the low-level domain. Weak emergence is the notion of emergence that is most common in recent scientific discussion of emergence, and is the notion that is typically invoked by proponents of emergence in **complex systems** theory. (See Bedau 1997 for a nice discussion of the notion of weak emergence.)

Yes, it is important to note that the Complexity Gang at the Santa Fe Institute has done a professional job of hijacking the once philosophically respectable and objective notion of **emergence** and trashed it with their postmodern subjectivist spin, to be perfectly frank. How long would SFI's NSF grants have held out if their 'emergence' had not been **defanged**?

'Strong emergence' clearly separates the foxes from the hens. Any serious anti-reductionist active since '97 would be sure to reference 'strong emergence'. The fact that there are less than 71 distinct entries above, strongly limits the field of us foxes. I am not yet amongst those, and there may be others like me, still not on the radar. We shall soon see.

Here's the list of active **anti-reductionists**, extracted from [weak emergence](#):

1. [Gregg Rosenberg](#)
2. [John Collier](#)
3. [Carl Gillett](#)
4. [David Chalmers](#) and see his [list of 15 online papers](#) by others on reduction and emergence.

And that's about it, unfortunately. Next I'll take a look at Chalmers' list:

1. [Mark Bickhard](#)
2. [Claus Emmeche](#)
3. [Tim O'Connor](#)
4. [John Post](#)
5. [William Seager](#)
6. [Larry Shapiro](#) is sitting on an interesting fence.
7. [Michael Silberstein](#), only one paper is online.

This gives a cumulative total of eleven active anti-reductionists. Except for Gregg, they all hold academic positions. The non-academicians may be harder to identify, but they ought to show up on Google. Claus and John C. are the only two not located in this country. This present bias needs correction.

If there were to be a paradigm shift away from scientific materialism, some of the above would be on the front lines. Each one is anticipating some such shift.

This list represents the bottom-line of my Internet sleuthing since 7/10/02. It will be important to maintain and hopefully expand it. One practical question is whether there is any collaboration amongst the listees, or even any sense of solidarity.

Anyone on the lookout for the big shift need only access a few of these websites periodically to check its status.

And moving right along, here are three people to watch from Larry's page: [Colin Allen](#), [Malcolm Forster](#) and [Valerie Hardcastle](#). Like Larry, each is on her own fence.

Thanks to Bill: [Postmodernism R.I.P.](#) No other relevant links.

I notice that John P. has wide ranging interests.

Clause maintains a [lengthy list](#) of possibly relevant people that will have to be perused. Off the top we

must add [Howard H. Pattee](#). Howard was first recommended to me about 25 years ago.

Mark has an interesting [biographical sketch](#). Sound familiar?

Carl has collaborated with [Barry Loewer](#).

John C. links to [Semiotics, Evolution, Energy, Development Journal](#) which contains a possibly useful article, '[The Status of Biosemiotics](#)', and to this mailing list, [Organisation, Complexity, Autonomy List Archives](#).

There are some interesting leads from the above lists, but there is a dearth of cohesion, just in case any were expected.

[<-- Prev](#) [Next -->](#)

[Topical Index](#)

11/3/02

A Semiotic Answer?

The title of this page derives from the article, '[The Status of Biosemiotics](#)', mentioned at the end of the last page. Semiotics provides the closest thing to cohesion on the anti-reductive front. But the answer is not to be found in the article.

[updates to this subject: [12/3/03](#)]

[11/16]

So far I'm not having much luck with semiotics. I'm continuing to peruse the [Semiotics, Evolution, Energy, Development Journal](#). Like the complexity theorists over here, the semioticians are under much pressure to hew to the established reductionism.

Will Claus come to our rescue?

[The Chicken and the Orphean Egg: On the Function of Meaning and the Meaning of Function](#) -- Claus Emmeche (2002):

The traditional paradigm in biology which encompasses a number of experimental methods, normal scientific working procedures, neo-Darwinism and its mathematical population models, etc. alone is not and cannot be sufficient to answer the following key question: *How did meaning originate in biological systems? And what is it (if not meaning, i.e. the creation of signs, and semiotic processes in general) that makes biology something special, something that on certain points fundamentally differs from the types of systems studied, for example, by physicists and chemists?*

(1) biosystems (organisms) contain genetic information;

(2) biosystems (organisms) have functions.

The former, of course, is a cryptosemiotic concept, for even here biologists admit indirectly that it is necessary to use semiotic concepts to describe biological systems. It is just that biologists do not attribute any particular significance to this: after all, they typically say, 'genetic information' is just a **metaphor** for certain molecular processes that are organized in a certain way. Here the biosemiotician steps in and interprets the occurrence of such metaphors more **realistically**,....

Here is the critical point for biosemiotics. How do we parse this difference between metaphor and reality? Is this where we transgress reduction? How do we do it?

In physics the assertion or question of function (such as the one mentioned above) can be rewritten without loss of meaning to the purely causal question of direct cause-and-effect contexts in the traditional classical mechanical sense, in which a cause precedes an effect in time, but both cause and effect exist on the same ontological level, i.e., they are of the same nature, as in the example of the relationship between the sun and the earth's climate. This is a matter of material physical processes on the macroscale. As shown by the past 30 years of discussions on the concept of function in the philosophy of biology it is far more complex to state the connection between causality and functionality in biology.

Essentially, the reason for this difficulty is that in biological systems there is an **inner connection** between the informational (which, without hesitation, we will call here the semiotic aspect of a living system) and the functional aspect. This is a connection that has been largely overlooked in the past and we will examine it in greater detail now.

Inner connection?? An essential internal relation?

The material elements of the system have a certain agency of their own, or a local semiotic capacity to act, if you will, and consequently the cell's molecular system of signs is self-organizing and self-interpreting, i.e., these signs are characterized better by the Peircean concept of sign as sign action than by the Saussurean concept of sign as an abstract system of differences. To a great extent, the cell is an interpretation system that is controlled by what Peirce called 'final causation,' the type of causation in nature that has to do with organization, habit formation, memory phenomena, information, appropriateness and purposefulness, evolution—all phenomena of the category of Thirdness (Santaella Braga 1999).

And where or how do we cross the line between the epistemic and the ontic? If it is ontic then it is vitalistic.

The crux of the matter here is that the relationship between the parts of an organism and the whole organism is a mereological relationship of a particular specific nature: it is also an 'intrinsic semiotic relationship,' that is, it is in its very nature semiotic. And, it should be noted, its semiotic character is **not merely** something **attributed** to it, just as our consciousness is not just due to the fact that other people attribute consciousness to me, but I am actually conscious and it is part of the concept's sine qua non that being conscious is not derived from anything else. Apart from this formal similarity, the intrinsic semiotics of the cell has nothing to do with consciousness in the human sense.

'Not merely attributed'?? I'm still not getting the crucial cross-over, do you?

If at first we don't succeed.....

[Code Duality Revisited](#) -- Jesper Hoffmeyer (2002):

In 1991 Claus Emmeche and I suggested that 'the chain of events which sets life apart from non-life.... needs at least two codes: one code for action (behaviour) and one code for memory—the very first of these codes necessarily must be analog and the second very probably must be digital.' This principle of code-duality played a major role in our initial ideas on biosemiotics.

The hen is in all of her behavior, her physiology and her anatomy, as much a message of an eventual egg as the egg is a message of an eventual hen. As a hen the egg is just figuring as an analog coded physical continuous and sensually appealing message. It was exactly this dimension of nature, its swarming plenitude of messages, which natural science eliminated by taking dead nature (the nature of physics) as a model for living nature (discussed in Hoffmeyer 1984)). Logically enough we thereby have ended up being threatened by a 'silent spring.'

Looking back it strikes me that the concept of code-duality was from the beginning linked to the idea of life as a chain of codings and recodings, i.e. life was not seen as an organismic property but rather as a property of chained codes. Or to say this in other words, the view of code-duality implies that the organism cannot be the privileged unit in biology and neither can the genome. Life is a semiotic process carried forward in time by the lineage in its interaction with changing environments.

It is no wonder that a theory which sees the organisms as causal dead ends in the evolutionary process would sooner or later give rise to the idea that the organisms are in fact just instruments for the strategies of the genes. This was the essence of the well-known theory of the selfish genes proposed by Richard Dawkins (Dawkins, 1976). In Dawkins' conception the individual organisms are nothing but survival machines or vehicles which serve the genes in their attempt at being carried on to the next generation. We thus get the distinction between vehicles and replicators....

As Sterelny and Griffiths put it in their thorough analysis of gene selectionism "if genes are just arbitrary DNA sequences, then most of them will have no more systematic relation to the phenotype than an arbitrary string of letters has to the meaning of a book" (Sterelny and Griffiths, 1999: 79).

We must always divide the world into two parts, the one being the observed system, the other the observer That this boundary can be pushed arbitrarily deeply into the interior of the body of the actual observer is the content of the principle of the psycho-physical parallelism—but this does not change the fact that in each method of description the boundary must be put somewhere, if the method

is not to proceed vacuously. (von Neumann (1955), quoted in Pattee, 1997).

Now maybe we're getting somewhere, thanks to a bit of physical intuition.

The point is that the function of measurement cannot be achieved by a fundamental dynamical description of the measuring device, even though such a law-based description may be completely detailed and entirely correct. In other words, we can say correctly that a measuring device exists as nothing but a physical system, but to function as a measuring device it requires an observer's simplified description that is not derivable from the physical description. The observer must in effect choose what aspects of the physical system to ignore and invent those aspects that must be heeded. This selection process is a decision of the observer or organism and cannot be derived from the laws (Pattee, 1997).

Since not only human beings but living systems at large are fundamentally engaged in observations or measuring processes it follows that: "we must define an epistemic cut separating the world from the organism or observer. In other words, wherever it is applied, the concept of semantic information requires the separation of the knower and the known. Semantic information, by definition, is about something" (ibid). And thus according to Pattee in all living systems we must have one part of the system operating in a linguistic and time-independent mode (i.e. the DNA) and one part operating in a dynamic and time dependent mode (i.e. the protein system).

I apologize for these unending quotes, but there has got to be the **germ** of this idea somewhere.

Pattee underlines that he is not suggesting a Cartesian dualism here but only a 'descriptive dualism,' for although a measuring process depends on choices which cannot be derived from laws, such choices are seen by Pattee as functions coded in DNA and ultimately generated by natural selection.

But this appeal to natural selection as the mechanism for bridging the Cartesian dichotomy between knower and known is not convincing. How could a purely mechanical process like natural selection possibly push non-knowing dynamical systems across the logical gap separating such systems from the realm of measurement and knowledge? Many people apparently entertain this illusion of natural selection as a mysterious bridge across the Cartesian Divide.

Rather than taking refuge in such powerless ideas of what for every one of us is life's deepest and most real content, I will suggest that we give up the ontology of natural law by following the lead of Charles S. Peirce who recommended that we see natural laws as themselves a result of a cosmic evolutionary process. "This supposes them not to be absolute, not to be obeyed precisely" and they cannot therefore be expected to explain exhaustively our world. In the Peircean vision nature's tendency to take habits comes first and explains the growth of all kinds of regularities in our universe such as those regularities which we account for by natural laws. Since a habit is essentially an interpretation it follows that in the Peircean vision semiosis has primacy and acts by guiding efficient causation.

As Peirce himself observed: the formation of a habit implies that an event will (nearly) always provoke the same response, so that therefore the response is not just accidental but must be related to the event. Habit formation thus is the core of semiosis.

This is a rather sharp turn toward idealism.

Code-duality transgresses the Neumann-Pattee thesis by claiming that the linguistic or symbolic mode and the dynamic mode are both fundamentally semiotic modes. The distinction does not separate a semiotic mode from a non-semiotic or dynamic mode but rather posits two different kinds of semiotic coding. Thus semiotic processes characteristic of the 'linguistic mode' are based on digitally coded symbols, while the semiotic processes characterizing the dynamic mode are indexical or iconic and analogically coded.

And so is this. A mere panpsychism would not strong enough to cover this, IMO.

Smoke refers to fire and enzyme refers to protein. Is the latter referral more intrinsic than the former? Is functionality the key? Is there also any measurement?

Obviously, analogic codes may eventually become digitized by becoming part of higher order digital

codes. In itself, for instance, a drawing of an owl is usually just an icon but in ancient Egypt such a drawing when presented in the context of hieroglyphs came to signify the phonetic value 'm.' Or a painting may become part of an exhibition and thereby become digitized into a representative for a given artistic epoch or style of painting so that its reference is now determined primarily by the setting of the exhibition and only secondarily by its original iconic power.

Considered from above, what happens is that the concentration of cAMP has become a switch by which the cell can turn on and off its energy consumption. In the course of evolution, as the bacterial systems eventually learned to use cAMP, it became more and more detached from its original biochemical setting, namely as a release mechanism for specific transcription processes which provide mRNA strands for a series of enzymes needed for metabolic pathways involved in the degradation of non-glucose sugars.

As pointed out by the Danish biochemist Mogens Kilstrup, cAMP in this case is both an icon (as a specific molecular conformation), an index (for ATP), and a symbol for glucose starvation (Kilstrup, personal communication).

The transformation of analogic codings to digital codings through the evolutionary formation of new contextual settings is probably involved in many or all cases of biological emergence.

It was one of Gregory Bateson's greatest contributions to show that human or animal communication systems are deeply dependent on paralinguistic or paralogical settings. The concept of code-duality was meant as a tool for conceptualizing this theme as a general theme for evolution. The perpetual accumulation of new mutations in the genomes of the species of this world is of course necessary for the evolutionary process to proceed, but code-duality points to the necessity for a semiotic contextualizing of the process. Following Pasteur's famous saying that 'only the well prepared will profit from good fortune' I should like to suggest that evolution is not at all a result of blind mutations, but is caused rather by those semiotic integrations which allowed biosystems to profit from the eventual appearance of 'lucky' mutations.

I would gladly continue quoting from Jesper, but unfortunately this is the end of the article. Am I liable for unfair usage? Not whilst visitation is zero!

People certainly are groping for something. One ought to be able to reach out and touch it. Touch what?

A recurring theme is the primal distinction. I am reminded of Spencer Brown's 'Laws of Form' with its 'mark of distinction'.

There are no purely physical distinctions. Distinction comes only with function and information. We are so embedded in semantics that we can imagine neither a pre-semantic nor even a proto-semantic state. That super-imagination is what the semioticians are groping for.

The whole point of theism is that this quest is futile. There is no such thing as half of a meaning. There are no demi-gods. The mind of God is indivisible. The closest thing to a proto-God is a toti-Potency. The toti-Potency is the proto-Creator. As creatures it is logically impossible for us to imagine a creationless Creator, except as the ultimate mystical state of empty bliss: the Alpha and Omega of all distinction. And it's all down hill from there! Mostly kidding.

The 'Holy Grail' of Semiotics is exactly the Holy Grail. Sorry 'bout that! Realizing that is the hardest thing we will ever have to do. The Eschaton will then just be an anti-climax. Upon realization, our first act is to kick ourselves for not realizing it sooner.

Semioticians are looking for God in all the wrong places. They strangle themselves in words, trying to avoid the obvious. It is a painful but necessary exercise. Theirs is lesson well learned.

[11/17]

What I just said from yesterday raises an obvious issue. To what extent is semiotics purely intellectual, as opposed to being, let's say, 'extracurricular', e.g. political, emotional, etc.?

Europeans tend to be more subtle about a lot of things, but particularly about religious matters, we may suppose. Even with that caveat, the fact that I have not yet encountered any theism in the semiotic context seems remarkable. The other European philosophies of existentialism, phenomenology and idealism, all have strong and explicit theological dimensions.

Perhaps the structuralist provenance of semiotics is partly to explain this. Structuralism was intended as a quasi-mathematical theory of language and ritual. It was meant to be purely descriptive in the fashion of, say, mathematical physics. But semiotics is definitely pushing that purely clinical(?) envelope, to the extent that metaphysics comes to the fore, and with that must come all the usual metaphysical suspects. That they don't come is perhaps due to a European version of a Gentleman's Agreement. Well, us 'Amurricans' have a tad less couth. And I think I noticed a similar lack on the part of the Muslims in this same context. Perhaps the Europeans are overplaying their role, or is it just their parole, so to speak. The Europeans allegedly learned their subtlety at the wrong end of a Hundred Years war. Now that we are headed for another one, perhaps we should all be their students, a development that would certainly meet their expectations. In other circumstances, this might be good advice, but there is the small matter of the Eschaton and its disposition. I continue to labor under the impression that its disposition is at least partly up to me, until such time as I am relieved of said task. The semiotical evasions are not helping, quite frankly.

Having said all this, thank you very much, I do now recall [Raphael Capurro](#) with his angelical semiotics. How could one forget? I guess we'll have to ascertain the degree of Raphael's anomalousness. [5/21/03 - I just received a brief note from Raphael acknowledging my acknowledgment of his work. This would not be terribly noteworthy were it not the first spontaneous communication I have received in reference to these pages. May I conclude that Google has finally stumbled upon my humble abode? Raphael points out that more of his work is available, including some in English, [here](#). I will be investigating further, but now I must resume with photo-realism lest I lose that thread. I can only wonder if Raphael garnered a clue as to what transpires hereabouts.]

From [Robert Corrington](#) I notice this article: "My Passage From Panentheism to Pantheism," *The American Journal of Theology and Philosophy*, Vol. 23, # 2, May 2002. Too bad it's not available, but I'm not sure that was a good move, though.

Along these lines I was struck by the following:

Philosophy -- based increasingly since the last century on theories of language -- has begun, in people like Eco, to shift its position in order to encounter a post-modernist scepticism and irony which has not always proved fatal to theism. Eco's notion of irony is profoundly creative and liberating: in *The Name of the Rose*, it is God who has the last laugh. For who are they which survive the apocalypse? Against all odds, Baskerville and Adso emerge from the intended death-trap: the first, to become Holmes' great-great ancestor, the other to chronicle the human condition faced with the mysteries of the cosmos: we can not know, yet we continue to hope, and to believe.

It is important to note that William of Baskerville is no sneering ironist himself, but a faithful Christian monk and priest, devoted to the "poverty of Jesus" in the Franciscan order to which he belongs. While he questions, doubts, expresses dismay over the lostness of the Church in some of her ways, at no time does he mock. An interviewer writes, "I ask Eco -- a lapsed 'militant Catholic' -- about the notion of

an absent deity that haunts his writing. Laughing, he offers only the mischievous retort, 'God hides because He doesn't want to appear in Vogue!'"²¹ In Foucault's *Pendulum*, the Eco-character, Caussabon, pronounces tellingly on those who would love secrets more than faith in a possible truth:

"Hadn't Agliè spoken of the yearning for mystery that stirred the age of the Antonines? Yet someone had just arrived and declared himself the Son of God, the Son of God made flesh, to redeem the sins of the world. Was that a run-of-the-mill mystery? And he promised salvation to all: you only had to love your neighbor. Was that a trivial secret? And he bequeathed the idea that whoever uttered the right words...could turn a chunk of bread and a half-glass of wine into the body and blood of the Son of God and be nourished by it. Was that a paltry riddle? And then he led the Church fathers to ponder and proclaim that God was One and Triune and that the Spirit proceeded from the Father and the Son, but that the Son did not proceed from the Father and the Spirit. Was that some easy formula for hylics? And yet they, who now had salvation within their grasp... turned deaf ears. Is that all there is to it? How trite...The mystery of the Trinity? Too simple."²²

To laugh is not to mock; Eco so loves humour, and attributes great health of mind to seeing the humour in any given situation, that even his most technical textbooks on semiotics manage to produce a smile now and then; yet the dignity of certain subjects is never sacrificed to humour. And this is because it is precisely the "sense of the sacred, of limits, questioning and expectation", which provides the basis for his profound humanism. He writes:

"Accept for a moment the hypothesis that there is no God: that man's appearance on earth is the result of an unfortunate mistake, that not only is he consigned to his mortal condition, he is also condemned to be aware of this, and is thus the most imperfect of creatures... -- he achieves, in the fullness of time, the religious, moral, and poetic power to conceive of the model of Christ, of universal love, of the forgiveness of enemies, of a life offered in human sacrifice for the salvation of others. If I were a traveller from a far-off galaxy and I found myself facing a species that had been able to offer such a model, I would fall down in admiration of such God-creating energy; yet discovering it to be responsible for so many atrocities, I would deem it pathetic and despicable and would see its redemption only in the fact that it had succeeded in wanting and believing its story to be the Truth... but let us admit that if Christ was only the subject of a great story, the fact that this story was imagined and desired by immature fledglings who knew only that they knew nothing, would make it every bit as miraculous (miraculously mysterious) as the fact that the son of a true God was truly incarnate."²³

Not bad for a lapsarian, huh! Is not Umberto arguably the best known semiotician? It was in regard to him that I recall first hearing this word mentioned, maybe only ten years ago. This lengthy passage and quotes are from '[God, Truth, and Meaning, in the Post-modernism of Umberto Eco](#)' by Niki Lambros, [I've seen a lot on the web, but this is [something else...](#)] and let me not stop here:

Philosopher Paul Ricoeur has called Marx, Nietzsche and Freud, "masters of suspicion¹;" yet he also notes that though they sought to undermine traditional ideas, they were able to "clear the horizon for a more authentic word, for a new reign of Truth, not only by means of a 'destructive' critique, but by the invention of an art of interpreting²". In a similar way, Umberto Eco can be seen as both a post-modernist sceptic and a champion of truth and meaning. From a Christian point of view, one must be very suspicious of a post-modernist philosophy that will not allow the possibility that God, truth and meaning can exist: in a conversation sponsored by the Cambridge University Faculty of Divinity last year, Rowan Williams and George Steiner noted that the "suspicion" or scepticisms of Derrida and Foucault are not suspicious enough for this reason: they do not allow themselves to suspect that truth may indeed exist. We must read Eco in the light of just such a suspicion; while Eco is sceptical of simply accepting traditional religion or modernist conclusions, he yet shows himself to be even more suspicious of philosophy which does not seek truth and meaning, but is content with nihilism and the void. The "art of interpreting" or, "deduction" in Eco, still leads a careful reader, if not to an absolute knowledge, at least to hope; and Eco sees a profound meaning in hope.

Damn!

Then, of course, there is [Charles Saunders Peirce](#), the mere father and *Godfather* of semiotics and pragmatism, providing some interesting gleanings besides the above:

[Favorite Quotations](#) -- Kevin Jessup:

"Shortly before he died, Carl Sagan wrote to say he had reread my 'Whys of a Philosophical Scrivener' and was it fair to say that I believed in God solely because it made me 'feel good.' I replied that this was exactly right, though the emotion was deeper than the way one feels good after three drinks. It is a way of escaping from a deep-seated despair. William James's essay 'The Will to Believe' is the classic defense of the right to make such an emotional 'leap of faith.' My theism is independent of any religious movement, and in the tradition that starts with Plato and includes Kant, and a raft of later philosophers, down to Charles Peirce, William James, and Miguel de Unamuno. I defend it ad nauseam."

-- [Martin Gardner](#)

The following is from [William James](#):

A glance at the history of the idea will show you still better what pragmatism means. The term is derived from the same Greek word [pi rho alpha gamma mu alpha], meaning action, from which our words 'practice' and 'practical' come. It was first introduced into philosophy by Mr. **Charles Peirce** in 1878. In an article entitled 'How to Make Our Ideas Clear,' in the 'Popular Science Monthly' for January of that year [Footnote: Translated in the Revue Philosophique for January, 1879 (vol. vii).] Mr. Peirce, after pointing out that our beliefs are really rules for action, said that to develop a thought's meaning, we need only determine what conduct it is fitted to produce: that conduct is for us its sole significance. And the tangible fact at the root of all our thought-distinctions, however subtle, is that there is no one of them so fine as to consist in anything but a possible difference of practice. To attain perfect clearness in our thoughts of an object, then, we need only consider what conceivable effects of a practical kind the object may involve--what sensations we are to expect from it, and what reactions we must prepare. Our conception of these effects, whether immediate or remote, is then for us the whole of our conception of the object, so far as that conception has positive significance at all.

This is the principle of Peirce, the principle of pragmatism. It lay entirely unnoticed by anyone for twenty years, until I, in an address before Professor Howison's philosophical union at the university of California, brought it forward again and made a special application of it to religion. By that date (1898) the times seemed ripe for its reception. The word 'pragmatism' spread, and at present it fairly spots the pages of the philosophic journals. On all hands we find the 'pragmatic movement' spoken of, sometimes with respect, sometimes with contumely, seldom with clear understanding. It is evident that the term applies itself conveniently to a number of tendencies that hitherto have lacked a collective name, and that it has 'come to stay.'

['Glory Met in Unspeakable Flux: A Critical Comparison of the Semiotics of Religious Experience in the General Theory of Signs of Charles Morris, the Semiotic of Charles Sanders Peirce, and the Philosophy of Symbolic Forms of Ernst Cassirer'](#) -- Paul Burgess (Burgess as in Burgess batteries).

The title says it all? ---

In the years since then, and especially since the early 1960's, the field of semiotics has undergone considerable development. Thomas A. Sebeok distinguishes three major strands in this course of development, which he designates the biological, the philosophical, and the linguistic traditions. The first tradition is rooted in medical practice and diagnostic methodology; Baltic biologist Jakob von Uexküll brought this approach to explicitly semiotic form in his study of animal behavior and perception between the two world wars. The second tradition leads from Plato and Aristotle through Augustine and the medieval scholastics via Leibniz, Locke, and others to thinkers such as **Peirce**, "the real founder and first systematic investigator of modern semiotic." The third tradition in its overtly semiotic form leads from Ferdinand de Saussure to writers such as Louis Hjelmslev, Roman Jakobson, and Roland Barthes. Although there has been creative borrowing among these traditions, Sebeok notes a continuing tension between more linguistically oriented and more philosophically oriented semiotic approaches.

Charlie's theism, whatever it may have been, has left an interesting paper trail, or provides a major cross-link in many such trails.

Given all of the above, how are we to explain the studied, silent agnostics of someone like [Emmeche](#)? How can he dig this deep without hitting pay-dirt? What is this game? Oh, yes, now I recall something about radical constructivism and shamanism. What do those two danglers add up to, pray tell? Claus does neither, it would seem.

So I guess the ball is back in his court: '[Closure, Function, Emergence, Semiosis and Life](#)' (Emmeche 2000):

The aim of this brief note is to consider partly hidden ideas about theoretical biology and its subject matter, living beings, organisms in their ecosystems -- which means beetles, cows, worms, bacteria cells, green algae, and dinosaurs, their history and interactions, their development and evolution, their structure and function, their origin, self-organization, the extinction of individuals as well as species, and the genesis of higher modes of life. In other words, an extremely multifaceted subject. First, however, recall an observation on the fate of general systems theory, which in the 1960s and 1970s had the ambitious goal of synthesizing the general fields of cybernetics, information theory, operation analysis, and specific fields, such as evolutionary theory and thermodynamics. That goal was not achieved and various reasons may be given for the failure, but an important factor might have been a too high level of theoretical **generality** in accounting for the highly different types of systems included in the ambitions of systems theory [1]. With this in mind, we could ask for the possibility of facing a similar situation with respect to the current trends in systems thinking.

Or, perhaps there was insufficient generality, insufficient to point to or include anything transcendental.

[EXPLAINING EMERGENCE](#) (Emmeche, 1997):

We argue that what is needed is an ontological **non-reductionist** theory of levels of reality which includes a concept of emergence, and which can support an evolutionary account of the origin of levels. Classical explication of emergence as 'the creation of new properties' is discussed critically, and specific distinctions between various kinds of emergence is introduced for the purpose of developing an ontology of levels, framed in a **materialistic** and evolutionary perspective. [...] Recent research in self-organizing non-linear dynamical systems represents a revival of the scientific study of emergence, and we argue that these recent developments can be seen as a step toward a **final** 'devitalisation' of emergence.

Am I the only one confused? Claus is a shamanic, non-reductive materialist? Whatever!

...let us as an example look at Friedrich **Engels** and his **so-called** dialectical materialism. According to Engels, it is not possible to reduce complex objects of one level to less complex objects on a lower level. Each level contains materialistic entities, but of different sorts, and being created at different times during an evolutionary process beginning from the physical entities. What controls this evolutionary process is not a vitalist immaterial principle, but the famous dialectical laws. The only teleological principle in these dialectical laws is the idea that evolution as such is not able to regress - you cannot "develop backwards", - but only forward, that is, the union of complex entities will always synthesize into more complex units. At a certain point in the evolutionary process, the dialectical development will cause quantitative elements to synthesize into qualitatively different elements.

Are you suggesting, Claus, that you're not one? Dialectical materialism remains the only non-reductive alternative to theism. Do you have another idea? A devitalized, disenchanted, materialized semiosis is precisely that. So sorry! And, by the way, were not the Marxists social realists? Does that not mean that they believed in the downwardly causal, historical efficaciousness of allegedly objective entities like capitalism and communism? If this were not the case, what would have been the point of advocating a workers' revolution?

As far as we can see, there is only one possibility if constitution of a level presupposes higher levels with boundary conditions - and that is an idealistic ontology, where every level and every entity are potentially existing and exerting attracting influences downward in the level system (the organism as attractor for the cell). We think this idealistic concept of potentiality can be refused on ontological

grounds; we do not hereby want to refuse every sort of potentiality, but only in this holistic level-constituting sense.

As can be seen, any evolutionary theory presupposes this kind of potentiality (as in the Darwinian case: the host of species extinct or unrealized at various steps of development (from zygote to ecological niche) which we can never know as actual but must be posited as a potential to explain the selection of the known species.

This water is getting even more muddy.

My impression is that Emmeche is a very weak emergentist. Although he gives lip service to ontology, he is only doing epistemology. I have yet to see him reference Jaegwon Kim who argues effectively against the coherence of non-reductive physicalism. There is no **downward causation** with Claus, and, without that, talk of emergence is palliative. I can see no daylight between Claus and the Complexity Gang in Santa Fe. Did I say that Claus was an agnostic? I think I'll have to retract that: shamanism -- shmamanism.

There has got to be a biosemiotician out there who will take exception to Claus's palliation. Where shall I find this person?

My intuition is that mere epistemological emergence is self-contradictory. Intuition? Nay, logic: If I can rationally entertain the concept of a cat, then that concept is logically irreducible; because, if my rationality is not illusory, then that individual, indivisible concept must causally participate in my cognitive processes. And, furthermore, if there is any possibility of scientific realism, then the actual cat must partake of some very similar, and, thus, a causally irreducible felinity. Is this Rocket Science? Has no one else ever thusly confronted these so-called 'emergentists'?

[11/18]

This last anti-reductive argument is indirect, relying on the holistic notion of rationality. It would have no impact on an advocate for Strong AI. I would like an argument that appeals directly to biology.

One such argument uses the idea that irreducible traits are a necessary underpinning for natural selection. Selection could not operate without an objective substrate of real traits that are downwardly causal. Traits must be ontological and not just epistemological. A species is a super-trait, and so this is an argument for the ontology of cats, for instance.

Another type of argument starts with the very basic idea of **personal identity** or ontology and then proceeds to include a wider range of identities. Personal identity must serve some evolutionary role and so it must be downwardly causal or it could not have been selected. This same argument is more frequently applied to the ontology of consciousness. Presumably, rationality also has a survival value, and is a selectable trait like consciousness, bringing us back to our original argument. Would this cut any more ice with the AI people? Intentionality is a functional illusion, they are wont to say. But such a deep-seated, widespread illusion must have some evolutionary significance. [Setting aside, of course, for the time being, and, as will be the case with all such arguments of mine, that, as a radical idealist or immaterialist, I put very little stock in this whole Darwinian, materialist worldview, to begin with. [That was just nine commas [,'] by my count! It still may be a new personal record. Would anyone care to check?] But sometimes you do have to play in order to win.] It would be very peculiar, and be a definite setback for evolutionism, if evolution were found to play no role in what are evidently the most distinctive and significant features of our species, illusory or not. Illusions can play a causal role, regardless of their ontic status. Imagine the poor chap in the desert crawling a mile to an illusory lake. That illusion would have a dubious survival value, but still be causal. [And, yes, I realize that this is an externally generated illusion, but you get the point.] Let me hasten to point out, as many have before, that the entire notion of

causation has a decidedly idealist, non-physical aspect. A cause is just an event or a state of affairs, a strongly emergent property. To say that an asteroid impact caused the dinosaur extinction is a flagrant exercise in rhetorical arbitrariness, from a purely physicalistic point of view, but it also represents the epitome of rationality. Rationalism and physicalism have been antagonists from the git go.

Downward causation is necessarily teleological, and thus vitalistic and definitely anti-physical. [By the same token, dialectical materialism is an oxymoron, but, of course, that did not prevent cadres of intellectuals from devoting their lives to it.] This is to say that Claus's weak emergentism is a non-starter. It is a verbal palliative. Jaegwon Kim's arguments should have put all this to rest years ago. These weak emergentists are like the Energizer Bunny. The founders of Structuralism and Semiotics took a decidedly metaphysical turn, but now their biosemiotic followers are opting for Scientific Correctness. Is there no shame?

Biosemioticians, like the Systems Theorists before them, wonder why the scientists pay them no heed. The reason is that these philosophers expend most of their energy apologetically aping them, rather than actually engaging the scientists in serious argument.

What is the excuse for all these anti-rational materialists? It's all a part of the larger eschatological, teleological drama. The only real lesson is that if you don't take cosmic intelligence seriously, you will surely be its dupe. It also shows that intellectualism and common sense often get their wires crossed. There is no substitute for old-fashioned wisdom.

Another point is that the philosophers have been spending most of the last century simply tidying up around the scientific ranch. This is normal philosophy. As they clean up the little problems, the bigger problems become more glaring, but, unfortunately, the cleanup crew does not have in its armamenta the industrial strength cleanser that is now needed. What is now required is vision on a cosmic scale. That can only come from whence all visions come: out of the telic blue. The only possible precedence is likely to be found in the prophetic lineage. There is, however, some difference of opinion as to the date of the last such vision. If I'm in the right ballpark, the well known incident in the seventh century was anachronistic in that it seems to have been mainly an updated recapitulation of the Old Testament lineage. The prior intervening incident was notoriously interrupted, due largely to its radical nature, and, was, accordingly, self-proclaimed as teleologically incomplete. From what we can see now, its completion would logically have to wait for a postmodern venue. Am I being sufficiently diplomatic about this logistics problem. I trust that no one will take offence at this quasi-non-linear historicity. Think of that other incident as having been an artistic *intermezzo*. And the more recent 'mishap' might not otherwise have been possible, and, again with much due **apology** [biosemioticians not being the only ones skilled in this sometimes fine art], to say that this most recent piece of physical drama was world-class might be an understatement, in my Monday morning estimation, and by way of further apology. Is the price of all this theater rather too high, you might well wonder? Well, consider then, if you will so kindly, the price of Creation. That Show goes on. [I can see room for ambiguity in the designation of events, but let that be, and the more general point still stands.]

We might wonder if there is no downward causation in the case of a computer running some specific program. There is the ample intentionality of all the users and programmers, but what beyond that?

I would say that there is nothing essential to the machine other than what we impute to it or design into it. I would be reluctant to say that of a biological organism. The ontogenesis of any organism or organ, and then the maintenance of it surely involves downward causation, if anything does. So too would its proper continued functioning, that is, at the very least, within the holistic psychosomatic, immunological system of the organism, if we are speaking of a specific organ.

The last paragraph was not well conceived. Let me try something else, please.

The downward causation of interest is teleological. I have suggested before that Creation has proceeded from both the Alpha and the Omega, and primarily from the latter. The existence of our world is due mainly to its final cause, the Eschaton. The Alpha is a mere shadow of the Omega. In a similar fashion, matter is the shadow of mind. Final causation is most evident to us in the ontogenesis or ontogeny of biological organisms. So I would reverse the evolutionary dictum to say instead that phylogeny recapitulates ontogeny.

Ordinary efficient causality is the habituation of the mind. Mathematics is one means by which nature fills in the gaps between our visions and intentions, yielding physics. As we ascend the chain of being, final cause gradually replaces efficient cause. We use our artifacts to amplify the final cause, the Internet being but the latest example, by which means and through efforts like this, the Final Cause will be made the explicit source of our intentionality, thus further accelerating our historical *denouement*. As telephony gives way to telepathy in the final eschatological stage, teleological acceleration will be more than impressive: mind supplants matter, downward causation supplants all else.

Final cause is so hard to detect instrumentally, because it is so pervasive in the organic realm. Removing it would be like removing the head from a body: all systems grind to a halt. Nay, all systems vanish. Matter is the shadow of mind. The organism is the shadow of its spirit or essence. God and spirit clone themselves organically.

What medicine accomplishes with chemicals is but a shadow of what will be accomplished with spirit. Between chemistry and spirit resides alchemy. A neo-alchemy will provide the historical continuity, as it already is in undetectable fashion.

Biosemosis when freed of its materialist shackles will be the wave of the future. Emmeche & Co. have a reasonable fear of the unknown. To them the immaterial future is remote and faceless. Someone will give it a face and render it immanent. That presence is the second coming. As we anticipate we emulate and as we emulate we become. There is no other resolution.

Scientific instrumentation will not be instrumental in detecting the telos. That is the purpose of the mind, no, the telos is the essence of the mind. As matter shadows mind, so does mind shadow the Telos.

You see why Emmeche and the biosemioticians are having trouble. They peer into every corner for a sign of the Telos, when, in Truth, it is about to swallow them whole.

[11/19]

If we are going to actually see the vital force objectively it would likely be by inferences based on measures of biomolecular efficiency, such as with enzyme efficiency. Part of this putative excess molecular efficiency may be attributable to quantum computing effects. If performing a cellular function may be compared to computation, then we know that quantum superpositional effects may be employed to boost computational efficiency, and so one would expect to find similar boosting effects *in vivo*; while, admittedly, we are setting aside the not inconsiderable decoherence problem.

Quantum physics, you may say, is still just physics. Maybe yes, maybe no. Delayed choice and observational effects are supposed by many knowledgeable folk to overlap with mental processes. The quantum domain could well provide a loophole in the physics, sufficiently large to give vitalism and consciousness a foothold in the otherwise sterile Newtonian desert of classical physics. This gives rise to a **quantum dualism**, where the quantum loophole plays the connecting role between mind and matter that Descartes speculated might be played by the pineal gland. It was through this same loophole that I was able to carve out a quasi-rational path of migration from materialism to immaterialism. A quantum

vitalism might well provide a similar stepping stone for our befuddled biosemioticians, presently suffering a failure of imagination, along with a subliminal stage fright.

For a quantum immaterialist, such as myself, the Cartesian duality between mind and matter is replaced by a dichotomy between quality and quantity. When one conceptually passes through the quantum loophole into the metaphysical realm of pure felt meaning, one looks back at the physical side and can see only abstractions, mainly of the mathematical kind, among which the Monster Group stands out like a Rock of Gibraltar. (If we are ever able to quantize gravity, it should then be possible to 'quantize' the Monster, and so render it more amenable to our subjectivity. Just a thought. And, speaking of which, here is a sight for sore eyes: [Fotini Markopoulou Kalamara](#). You don't suppose she's related to Calamari? Bet she could turn you into one, though. If I were the Monster, I would be very afraid.)

Now where were we? Yes, there seems to be a major conceptual divide between Semiotics and Biosemiotics, between the imaginal, semaphoric reach of an Umberto and that of a Claus. How do we close that gap, without having to teach them, and everyone else, quantum gravity *a la* Kalamara? That is doable, but there must be an easier way. (I wonder if the semioticians could borrow any ideas from [memetics](#).)

Here is another thought: Idealism suffers considerably from the [Platonic Carburetor Syndrome](#) (PCS), in which ideas are taken to be individually written in stone in some Platonic heaven, or taken to be like those windowless Leibnizian atomic monads. Let us get some relief by taking some memetics and [Quinine](#) water. Memetics focuses of the dynamic quality of the memetic manifold. Quine focuses on its holism. Unfortunately the Quinine holism is too easily interpreted in a purely structural, formal, syntactic fashion by the AI types. With all that holistic form, where's the content? Are our minds just syntactical engines? I don't think so. Where does all that (illusory?!) felt meaning come from? If not from the atoms, it must come from the manifold. Was it Jim Maxwell who prematurely revived the Ether, soon to be shot down by [Mike & Mo](#)? Perhaps we need a Platonic memetic ether. The Hindus call it the Void or *nirvana*, the Great Emptiness. Tim & I call it the Big Bliss. Somehow and dynamically, the virtual atoms of meaning create themselves out of the Big Bliss. Yes, we concentrate the energy, like some atom smasher, and that concentrated gamma energy is [Comptonically](#) and dialectically converted to idea and anti-idea. Was it not said that the opposite of every great idea is another great idea? (Uh, oh, where is the anti-Creation? The Eschaton is our recombination?) We're still just talking a kind of Feynman-diagrammatic syntactics. For the electron to acquire content or mass, we must invoke the Higgs vacuum bosonic mechanism. (Am I beginning to sound like [Alan](#)? I swear, this is **not** a hoax. Please excuse me! My parents had to pay big bucks for all that physics, this is the least we could do.) Somewhere in the *Rig Veda* you are bound to find a Higgs reference. Please let me know when you do. In the meantime, I invoke it to explain how we smuggle semantics into our little syntactic noggins. (Any more questions? Just ask Dan, the Science Man, or, better yet, ask [Fritjof](#). And, besides, no one is paying me enough to be serious about all this stuff! Haven't I used up my nickel yet? Help, Lord!)

Is it not reasonable to suppose that the semantic manifold has a holographic and fractal structure? Our individual minds are like the repeats of the core pattern in the **Mandelbrot Set**, just chips off the old block. Most every pixel of that set contains a whole universe. The Mandelbrot still invokes a spatial manifold, even though it is complex-imaginary. Imagine an infinite dimensional, Hilbertian manifold, if you will.... I'm running out of mathematical metaphors. One does when confronting raw meaning. All of math is contained in three words: 'one', 'zero', 'and'.

Consider the Mandelbrot [generating formula](#): $z' = z^2 + C$ ($C \rightarrow M$ when z remains 'small'). Something as basic as this could have been the Cosmic Logos: *Thus Spake Zarathustra*. What would 'C' and 'z' actually represent in such a case? Even God might not know for sure. She sure wouldn't be able to explain it in English. Maybe in Swahili, but not English. Then again maybe 'C' stands for love in Swahili, that's *Amore*!

Back to [downward causation](#), and looking at contributors to Claus Emmeche's book: [Downward Causation](#):

[Peder Voetmann Christiansen](#) is a Quantum Semiotician. He is attempting to rectify Peirce's logic with quantum physics.

[Alvaro Moreno: Downward Causation at the Core of Living Organization](#):

In this paper we argue that biological systems cannot be explained only in terms of physical laws, but that their organization also depends on the action of informational records which control the construction of the organism's phenotypes. This information is shaped by natural selection through a collective and historical process. By controlling the lower level of molecular interactions, information acts as a kind of explicit formal cause which restructures matter according to a given pattern. As the construction of informational patterns is an open process, essentially organization, independent of the dynamics of their material support, information exhibits compositional capacity which, besides allowing open-ended evolution, constitutes the main difference between formal and physical causation.

Should a computer exhibit downward causation?

Alvaro has also contributed to a **Special Issue** of *BioSystems*: [The Physics and Evolution of Symbols and Codes: Reflections on the Work of Howard Pattee](#).

[Special Issue on "The Quantum of Evolution"](#) may be of interest.

[11/20]

Teed Rockwell is someone to reckon with: [A Defense of Emergent Downward Causation](#):

Troubles with **Functionalism**.....

However, the view of scientific progress revealed by the New Wave reductionism of Bickle, Hooker, and Churchland seems to indicate exactly the opposite i.e. that belief in emergent causation is not only compatible with modern science, but may be the only thing that can save it from skepticism. If we believe that the entities described by the reduced discourse are genuinely real ontologically, and yet not reducible in the old tough sense produced by elimination or identity, an inevitable consequence of this is that the reduced and the reducer are to some degree ontologically independent of each other. The only way we could eliminate this ontological independence would be to say that these blurs are apparent, rather than real, and that everything that occurs at the macroscopic level is actually identical to something at the microscopic level, even if we don't know what it is. Given that the newest work in history and philosophy of science reveals that we have never found such identities, and probably never will, we therefore have a choice between accepting the partial ontological independence of each layer, or claiming that reality has an essential nature that science will probably never reveal. If we accept the latter alternative, however, we can no longer use scientific realism as a way of dismissing emergent causality.

Yes, I do believe that the functionalist view is essential to science, and is essentially irreducible to physics. Natural selection could not operate without functional properties to select. I'm still not sure how this argument applies to machines. And how do we distinguish the epistemic from the ontic? Cannot machines be adequately explained by classical mechanics? [James Garson's reply](#) to Teed raises these same questions. It is not easy to find a firm footing in all this scree. Yet, we must try.

Perhaps machines are not adequately explained by mechanics. This had never occurred to me. Mechanical engineering is not strictly a science, if you think about it. Consider the genius of invention. We would not need a Patent Office if design were a science, if it could be mechanized. But, given a

machine, its functioning is purely mechanical. No? Well, this may not be so obvious. 'Functioning' is a peculiar word. Notice that another, necessary word has been omitted from the previous statement. I should, more precisely, have said: its **proper** functioning is purely mechanical(?). Now we have a clear contradiction. We have introduced normativity. Physics and normativity are logically disjoint concepts. Normativity is essential to the concept of a machine, but not to mechanics. Machines fail, mechanics doesn't. Physics or mechanics alone cannot describe the propriety of anything, and particularly not of a machine. So, what is going on here? How do we distinguish the semantics from the physics?

Machine = physics + function.

Otherwise it is a hunk of metal, or a doorstep, if you will. But does this mean that machines violate the laws of physics? No, but it does mean that they must transcend physics. Physics alone cannot describe or explain a machine. So where is the problem?

This conceptual problem is more serious with evolution and natural selection. Functionality emerges. [Realize that I am winging this....now and always.] An organism is a **functioning** collection of molecules. It is a molecular machine. Is this not also just: Chance + Necessity? Atoms in the Void? No, because that explains nothing, and the function of science is explanation. Physics is able to explain atoms and the void, and it does so in functional terms. Well, certainly in counter-factual terms. But, yes, with the quantum we must employ the concepts of measurement with all its explicit and implicit intentionality. But forget the quantum. Counter-factuality employs the concepts of events and causality, both of which transcend physics proper (sic). At the very least we are talking non-reductive naturalism, rather than reductionistic physicalism.

And don't forget all the abstractions, mathematics and realism that is employed in Physics. And where can we draw the line between Physics the discipline and the physics that is its subject? Where do we draw the line between the noumenal physics and the phenomenal Physics? That is the precisely the issue of **Metaphysics**. As an idealist, I say there is no line. You disagree? Then show it to me!

All of the blatant, notorious metaphysical problems of quantum physics are already latent in the essence of classical physics and mechanics. It is just that there is no rug left down there, under which the problems may be swept.

This is nail number what, in the coffin of materialism? Are we not losing count? What is that unpleasant odor?

How do Teed and his correspondents resolve this mess?

Let me first say that in these discussions of ontology, much is made of the distinction between ontology and epistemology. This may be a valid distinction under some metaphysical suppositions, but it is not valid for idealism. In this latter case there is no dichotomy between the subjective and objective realms. I recognize that at present we see through the glass darkly, but most of that obscurity is due to our confusion with materialism. As soon as we remove those blinders, the vista will open before us. With idealism we have direct realism. It is then a vision problem and not a knowledge problem. The notion of perception by representation is coming between us and our being truly and directly present in the world.

Back to Teed. I notice that his reply page for the discussion of his downward causation essay remains blank. I believe that this was also the case when I last checked several months ago. We move to consider the several responses listed.

As already noted, [Jim Garson](#) insists on a strong distinction between epistemological and ontological

emergence, thereby foreclosing the discussion.

[Robert Kane](#), like Jaegwon Kim, finds the concept of downward causation incoherent. The paradigm case of downward causation is telekinesis. Is that incoherent? If it is incoherent, why are most people able to grasp the idea? For a somewhat less controversial example, what about lucid dreaming? Is that incoherent? Let me not fail to mention the most common example of all: psychosomatics. Has psychosomatics never been cogently discussed in the medical profession? If I have correctly characterized Robert's concern, it is very reminiscent of Daniel Dennett claiming that the concept of consciousness is incoherent, or the logical positivists unilaterally declaring all metaphysical statements vacuous. As an immaterialist, I am sometimes tempted to declare all physical statements vacuous, but usually I manage to restrain myself. Just don't get me started on telephony! Such a non-response is a tried and true rhetorical device, or perhaps just tired. One more try, Robert: is Creation incoherent?

Am I being unfair here? Please, somebody, help me out! But this leaves us with [U.T. Place](#), and poor Google thinks I'm looking for Salt Lake City. But anyway, Utah Pl. is critiquing some other paper of Teed's. Just a slight displacement of URL's, I suppose. There you have it, then, for the state of the known (to me) art of downward causation, which is arguably the issue that is now the most pertinent to everyone's future, given even the remote possibility of an eschatological *denouement*. It may be a long-shot, but very likely it will be our only shot.

[11/21]

Here's a thought: if concepts were reducible then why have we not reduced any? May not the concept of 2 be reduced to $1 + 1$? Not really. Not without additional information and constraints. Not without a considerable formal apparatus. Dictionaries perform word reductions only to a very limited degree. For instance, bachelor and unmarried man can, and usually do, have very different nuances, differences that will depend on context.

Cannot the complete thought expressed by a sentence be successfully decomposed into its individual words? The meaning is then lost. Each sentential composition of words might as well be its own ideogram. This ideogram can be decomposed into words with not much more success than a word can be decomposed into letters.

An AI person might argue that a sentence can be syntactically and grammatically reduced without any semantic residue, and then be reconstructed in another language. This is how machine translation is supposed to work.

But there are the problems of holism, context and levels of meaning. A given sentence could have vastly different meaning depending on its function in a particular story. And there is no upper limit to the hierarchy of levels. The same story could have very different meanings or functions in different cultures, and for each individual listener, as well.

Consider the irreducible nature of songs. If I were a better connoisseur of music, you could read me a list of say 100 musical compositions and I would be able, almost immediately, to attach some distinctly recognizable feeling or meaning to each one, almost as if each were a sort of ideogram. Are these musical ideograms decomposable? Not without loss of essence. There are notes and there is a tune. A tune can be decomposed into notes, but clearly there is a very complex relational pattern that constitutes a tune. And these are not self-contained patterns. The recognition of a tune or story entails the triggering of countless associational significances, without the essence of the tune devolving into incoherence. These associational meanings are not external or incidental to the essence of the song, but somehow contained therein.

A machine can perform the function of pattern 'recognition', in an apparently decomposable fashion. It

could be programmed to accurately recognize excerpts of a hundred different tunes. It could be programmed to perform that function in many logically distinct ways. Would anyone thereby suppose that this artificial process had any essential similarity to the mental process? One would have to, at least, simulate an integrated human intelligence before we might reasonably entertain the notion of actual musical cognition.

But what would it mean to construct an integrated human intelligence? Would this mean to simply add more recognition modules, and then add more memory modules? There would then have to be a master recognition module, to somehow integrate and make sense of the outputs of the sub-modules. At what point and in what manner might this increase in the quantity of information be transformed into something that might resemble a natural coherence?

Does the lower level information not have to be patterned and sequenced in some particular manner at a higher level to make it coherent? But then we are just starting a second level of patterning. It would be like patterning sentences into a coherent story. In Turing Test fashion, the computer could take a musical input and convert it into a coherent and relevant verbal output, let us suppose. Have we thereby effectively reproduced a instance of human-like musical cognition? A behaviorist might be impressed, but what about the cognitivist?

The cognitivist would need to open up the black box and inspect the functional and/or connectional architecture. She would find many logical subroutines and network patterns, and could trace the flow of information and activity patterns, as might some super-MRI scanner, all the way from the musical input to the verbal output. But where in that convoluted process might we locate anything even functionally resembling a recognitional episode?

A human auditor could be expected to produce a virtually unlimited variety of coherent, relevant verbal outputs for any given musical input. And, yes, we could build a randomizing associational module in our musically adept android. The point is, however, that the recognitional episode occurs quite independently of any particular output, or, indeed, of any output at all.

But, here's the rub. Recall that the conversion from a musical tune to word-like symbols or patterns was originally intended to be a part of the internal recognitional process or episode, as simply a specific instance of a mental process. Yet, the recognition cannot be captured by any sort of a pattern. A musical pattern is converted to some other sort of pattern, as in a stimulus-response experiment, but here it is an internal response. There will be a chain of these internal patterns, with each stimulating the next until some actual output pattern occurs. But to what steps in that logical or functional sequence can we assign recognition? At the least, one would have to stipulate something to the effect that recognition proper occurred mainly between steps M and M+N. But that sequence of N patterns could be taken to be a single pattern just in itself, or under some other processing regime. At best, one could say that this internal pattern somehow represents the initial musical pattern. But that does not get us one step closer to the explanation of recognition, *per se*. If we look inside any system, all we see are patterns, we can nowhere point to recognition. No one, yet, has attempted to postulate a self-recognizing pattern at the logical end of the sequence. It is just more patterns all the way up or down.

We were attempting to construct a hierarchy of recognition modules, with a master recognizer at the top, rather like the notorious 'grandmother-cell', which allegedly lights-up in our head when we see Granny. But what you have just seen is all that we can get out of any such construct.

Each definable pattern is causally related to the input, and each represents that input in some fashion, but at what point in the process may it be said that I recognize Granny? It might be at the point when I am first disposed to say to myself, 'There's Granny!' But what exactly might this disposition entail? More pertinently, how would I recognize the disposition, without falling into an infinite regress? A brain surgeon wielding a 'cerebroscope' might be able to recognize my brain pattern, and say to me in my

groggy state, "You are now disposed to say, 'There's Granny!'" But, normally lacking such a cerebroscope, how am I to know my own disposition, without, say, hearing myself actually utter the words? That utterance would just be another pattern in dire need of recognition.

But, yet, at the very least, there is a strong subjective illusion of actually having recognized Granny. How does one explain that illusion? Just calling it an 'illusion' does not explain it, nor make the experiential reports of it go away. How can one deconstruct an illusion? And don't we have a causal conundrum? Is it the 'illusion' causing the disposition, or the disposition causing the 'illusion'? There is an objective disposition, and there is an actual illusion. Are these entities identical? There is an objective dispositional brain state and an objective 'illusional' brain state. Are these the same state logically?

I notice someone walking in the room. I recognize that it is Granny, and this recognitional event, or illusion thereof, then causes me to be disposed to react in various ways. Would the cognitivist not have to recognize this causal sequence? Something must cause the dispositional state. The cause must precede and be able to account for the effect. The changing of dispositional states is the effect. What could cause me to make the transition to a Granny-recognitional disposition or mode other than an actual recognition of Granny? Can a neuroscientist legitimately switch from nominalism to realism in the middle of this causal sequence? Can she be a nominalist about the recognition and then be a realist about the subsequent disposition and still remain coherent? I'm thinking, 'no'. Can this alleged inconsistency be further analyzed, or be restated with greater clarity? How significant is it? [In the paragraphs below, which were actually written just prior to the last several above, I take the Complexity people to task for a similar metaphysical switch. Are we establishing a significant and endemic pattern of inconsistency? Has this pattern been duly noted previously?]

The Granny-recognitional disposition is at least as objective as any other cognitive dispositional state. There is no logical way to characterize this dispositional state other than as being Granny-recognitional (period!). What else then could possibly be said to be the cause of this particular disposition other than the recognition of Grandmother? Is there a need for any further qualifications or for the deployment of scare quotes? I think not. Is there any way to deconstruct this bit of 'folk' psychological realism without deconstructing most of cognitive science at the same time?

This seems an almost trivial exercise in semantics. It could just be another straw in the wind, or it could land on the overstressed back of some poor camel.

But then, like the Complexity folk, we are forced to postulate **self-organizing** systems. So I was wrong when I stated three paragraphs earlier, that no one had postulated a self-recognizing pattern. This is, in effect, what scores of Complexity theorists do for a living. So, couldn't we say that any act of cognition is fundamentally an act of self-organization on the part of the brain? Is this coherent, however? The Complexity folk point to innumerable instances of inorganically and spontaneously generated patterns in nature and under laboratory conditions. Life and mind are natural extensions of this purely physical tendency. I wonder. Take the primordial soup, stir in some self-organizational potency, and *voila!*

Somehow this natural potency became exponentiated in our brains, and that is our *homunculus*, nay, that is us, to make a long story short. I still wonder. How does this differ from panpsychism? I see nowhere to draw that line, nor do I see any particular desire on the part of Santa Fe folk, etc. to draw any such line. Is it not in their professional self-interest to encourage themselves and the rest of us to believe that there is such a stairway to heaven and that they are already on the Nth step? Why not? But is it coherent, I wonder.

Having accomplished the Democratesian dream of atomistic deconstructionism, the Complexity people have set about the daunting task of reconstruction. They will need a great deal from that self-organizing potency. But is this potency for real, or is it just an illusion? Where are their deconstructive, nominalistic

instincts now? Is not the shoe of realism now on the other foot? Are they not playing both sides of *El Camino Real*? And should we let them get away with this *leger-de-pied*? Let me think about that, hmmmm.....No way, *Santa Fe*! Let us see how they like the *Alameda de las Pulgas*, all too familiar to many a weary idealist.

[11/22]

An example often cited in the literature as counting against mental (or historical) realism is that of 'England declaring war on France'. Which argument I am unable to locate presently. It presumably raises the issue of reductionism and of upward vs. downward causation. To what extent are particular events just paradigmatic (nominal) or actually causal (real). A state of war is largely dispositional. What causes that state?

The event of recognizing something cannot logically be reduced to a physical state, or can it? When a smoke detector detects smoke it is disposed to buzz. Does that make me just a Granny detector? And how might this relate to the 'declaration of war' example? One difference might be the formality of it: putting on fancy clothes and signing a piece of parchment. No smoke detector can do that! But that's not quite the point. Recognition is a formal or abstract concept that is used to describe events in which it may or may not be instantiated or play a causal role. There is nothing significantly abstractable about a Granny detector, beyond the abstract physics, but there is presumably about a Granny recognizer.

But wait. Now we are back to the issue of whether a machine is mechanical. The proper **functioning** of the detector is just as formal (Platonic) as that of the recognizer. Without that normativity the concepts are incoherent. In a word, there cannot be **real** detectors (material) without **real** detection (formal). Otherwise, science, engineering,..., human activity lose all coherence. But this is just what the skeptics and cynics have been saying all along. So what else is new? Without the concept of detection we cannot design or become detectors? But lions became effective zebra detectors, presumably without benefit of the concept. Now we are getting down to the nitty-gritty. We either have to bite the skeptical bullet, or promote our mere concepts to Plato's Formal (Granny, Carburetor, Smoke Detector?) Heaven. We can perform the latter promotion coherently only in an immaterialist world: Plato's Heaven may be an illusion, but then so if everything else, my friends.

It is a exquisite fact of life that humans are most reluctant to bite either of these bullets! Fence sitting is the best defense up to a point. Until what point? Until we are willing to consider the price of incoherence.

But speaking of '[mental realism](#)' consider:

[The Mind Paradigm - a Unified Model of Mental and Physical Reality](#) (Introduction by Eric Carlson, Foreword by Huston Smith) -- KEITH CHANDLER (2001)

The Mind Paradigm dispels with finality the specter of the Cartesian Dualism. Descartes, along with Newton and others, bequeathed his successors an irreconcilable dualism between mind and "matter" which saw the universe and everything in it, including life, as soulless, mindless machinery completely incapable of affecting or being affected by everything most important to the human heart and soul: consciousness, ideas, beauty, purpose, values, spirit, love. *The Mind Paradigm* argues that the Cartesian dualism was a fraud from the beginning and puts in its place **Mental Realism**, a worldview in which the universe is a thought process of a Cosmic Mind and the world of conscious experience a diffraction of the pure, infinite consciousness of the same Mind through models it creates in the brain. The book describes the new paradigm that is emerging in every area of science from cosmology to cognitive science and is restoring purpose and value to our models of the universe. Finally, it shows why science and mysticism share such a deep complementarity and why each has a place in the single

world view of Mental Realism.

All I can say is wow! Your book looks very impressive and well researched and cuts to the quick in dealing with the materialist-dominated view of consciousness by thoughtfully showing the fallacy of such a viewpoint. I would say this is necessary reading for anyone interested in a complete overview of the relationships of science, consciousness and spirituality.

Fred Alan Wolf, author of *The Dreaming Universe* (1995) and *The Spiritual Universe* (1998)

And I have been a fan of Fred's from the time of *The Dreaming Universe*. You see what mental realism can get you into.

And while we're still onto [mental realism](#):

[The Dimensional Structure of Consciousness: A Physical Basis for Immaterialism](#) -- Samuel Avery (1995):

The Dimensional Structure of Consciousness is a radical interpretation of modern physics. Rather than consciousness existing in space and time, it is suggested that the strange phenomena associated with quantum and relativity physics are better understood if space and time are structures within consciousness. Light is vision itself. Matter does not exist outside of consciousness. Mass is a second time dimension.

Here is a useful review of semiotics from a metaphysical point of view: '[Semiotics and Cognitive Science: The Morphological Turn](#)' -- by Jean Petitot.

[Topical Index](#)

11/15/02

El Camino Real

Stairway to Heaven?

(I know my Spanish is from the *Alameda de las Pulgas*, or was it Eastwood(?), but grant me this indulgence. Besides, I was running out of [parchment](#) for that last page and had to come up with something.)

Let's see how **reality** is faring these days: [Mental realism](#) (122 hits), [mental causation](#) (2,600 hits), [downward causation](#) (1,200). No too bad. Now, on with the [mental realism](#) list:

['CONSCIOUSNESS AS EXISTENCE'](#) -- Ted Honderich (from a book in progress, post 9/11):

This paper is owed to a common conviction among philosophers, that the Philosophy of Mind, as distinct from the science of the mind, is on the rocks and going nowhere, and that something different is needed. It is certainly different.

A little honesty and innovation might get us off to a good start on the royal road.

['CONSCIOUSNESS AS EXISTENCE AGAIN'](#) -- by Ted Honderich:

The account is in part similar to direct realism -- in the account, perceptual consciousness is intrinsically made a matter of something not in the head. It will thus be apparent that it is open to something very like the long-running objection to direct realism, this objection also being an argument for a representative theory of perception. The long-running objection and argument is essentially that in perception we cannot be aware of physical objects, since hallucination, where there are no such objects, is indistinguishable from perception. What we must therefore be aware of in both cases is objects internal to ourselves.

These direct realists are quite convinced they are not on Plato's royal stairway. We'll have to see how they come to this conclusion.

In my opinion, the best defence against all such objections, which certainly are **troublesome**, is an attack on the views being argued for, representative theories of perception.

Well, it looks like Ted is not quite up to the task of illumination. He is clutching desperately to the solid(?) rock of an external space-time container. He would much rather be lost in space than lost in the mind of God. Who will volunteer to break the bad news to him? This is rock-solid Existentialism: majorly Agnostic: the naturalist version of direct realism.

Then check this out:

International Conference:

["FOUNDATIONS AND THE ONTOLOGICAL QUEST. PROSPECTS FOR THE NEW MILLENNIUM"](#)

JANUARY 7-10, 2002, Rome, Pontifical Lateran University, Piazza San Giovanni in Laterano, 4. 00120 Vatican City.

The Church is sure to keep an iron in this fire. I just hope it doesn't get too hot in the Pontifical kitchen.

IV SECTION: "ONTOLOGICAL CONNECTIONS"

- BERNARD D'ESPAGNAT -- [Quantum physics and the ontological problem](#)
- JOHN POLKINGHORNE -- [The new physics and opportunities for ontological initiatives](#)
- BASARAB NICOLESCU -- [Levels of reality and the sacred](#)
- HORST SEIDL -- [About the ontological foundations of natural sciences](#)

My, my! Will it be a hot time in the Ol' City tonight? Better check those 'connections'. Is it who you know, or what you know? Now, if this were a Mormon Church there would be a concealed trapdoor in the ceiling to facilitate the Second Coming. Just a thought.

[11/23]

Well, they say you should not look a gift horse in the mouth. But coming as this is from the horse's mouth, itself, I could hardly resist. You'll be my witnesses that if there are teeth to find, I will, but, so far, I've found nary a one. Are we surprised?

The poor Vatican is stuck between a rock and a hard place with ontology. They know they must rein in the postmodern nihilists, but without providing ammunition for us ontology freaks in the hinterland. Let us be content with the gesture. I'm beginning to wonder if the Protestants even know what ontology means. It is not a word that springs to the lips of any fundamentalists.

With respect to ontology we have had the extravagant Platonic thesis, and then the exceedingly Spartan, Steven Weinberg, antithesis. What is going to be the synthesis, if not actually Hegelian? That is the question which the Vatican is naturally hesitant to address. When that trapdoor finally opens, the Keeper of the Faith knows that he will have to take his iron out of the fire and pack his bags. Will there even be a golden parachute?

I was about to quote from BERNARD D'ESPAGNAT -- [Quantum physics and the ontological problem](#), on the question of 'radical idealism' which begins on page eight, but the Keeper of the Faith has other ideas. You'll just have to suffer my paraphrasis. Suffice it that Bernie's not big on idealism. He recommends an 'open realism', which reminds me of a baseball story: the count stands at 1-1 as a fastball sizzles across the corner of the plate. 'TWO!' screams the ump. 'Two what?' enquires the batter, 'yeah, two what?' growls the equally intimidating catcher. 'Too close to call,' mumbles the umpire.

Yes, it's tough being in the ontological trenches. Bernie begs for an MIR, 'Man-Independent-Reality'. [N.B. Bernie is not saying it's **Mind** independent!] If this is not meant as a pleonasm, then we are falling back on dualism, because surely there is also a dependent reality, i.e. 'Existence'.

But wait, here is from another, auto-translated source: [Abbaye Saint Paul de Wisques](#):

Bernard of ESPAGNAT defends, as for him, the idea of the existence of another level of reality beyond space and of time. He decides for a kind of Platonism where the prevalence of the ideas would not make pour the thought in the idealism, but would lead to the design of a veiled Reality, "a reality independent, remote, probably not located in the space time" (B of Espagnat, an atom of wisdom, 1982). This reality, we perceive a kind of projection in fact imperceptible. It is this buckled Reality which gives its direction to our level of reality. The vision of Bernard d' Espagnat is very a indeterminist, it leaves a broad place to the mystery of the world that certain theologists, impressed by science materialist, had wanted to evacuate.

And Bernie is sticking to his quasi-Platonic guns back here at the Vatican. So, sharpening my pencil: "But I wonder if, then, it [this conception of reality] would not be of such a nature as to give rise to a revival of interest for the deep and basic debates on the relationship of God and Mankind that, in the XVIIth [how Romantic!] century, involved Spinoza, Malebranche, Fenelon[??] and others. And it would be remarkable indeed if such a revival were inspired by contemporary physics!"

Yes, I wonder about that, too. I ain't no Spinoza, but, heck, I've got TWO masters degrees, BOTH in physics, no less! Is it OK, Bernie, if I give it the old college try? Then the only thing I'll need is someone

to hack into Google, hint, hint. Better watch out, [Joe](#)! But I just had a horrible thought. Doesn't the Vatican treasury hold stock in Google? They'd better grab up a few more shares, quick. Remind me to ask Ron about them apples.

All we have to do is synthesize pragmatism and Platonism. And functionalism points the way. We ran smack into functionalism on the last page with our Granny detector. Yes, we need a transcendental Functionalism. Creation is a Function, is it not? Along with our Functionalism, comes a divine Conceptualism, almost gratis, not too mention major Teleology, as we follow Bernie far beyond the 'sensitivity' of space and time.

Doesn't that just about wrap it up? With regard to Functionalism, all we have to do is ask ourselves 'WWGD', what would God do?. The only sensible answer is the BPW, best possible world. Then, as regard to the Eschaton, it's not a matter of whether, but when. And, once again, there is a perfectly sensible answer. This is not Rocket Science, Bernie, it's not even Quantum Science! It's just what any reasonable person would come up with, when [Steve](#) and [Joe](#) are looking the other way. We're all just chips off the Ol' Block. You don't believe that? Do you believe atoms in the void? (I'm not talking to Bernie now, I'm talking to YOU!!) Well, forget it, that nonsense just isn't flying anymore, and, come to think of it, it never did fly in the first place. Atoms were ever and only a lousy excuse for us not to have to think about what makes the world go 'round. Once that excuse is ripped from our death-grip, we have to wake up and smell the ontology. QED.

I rest my case. Strike me dead, [Steve](#) & [Joe](#)!

Speaking of Ron, I can't help but notice the breaking news this morning:

Newsweek [Isikoff] said, however, the FBI uncovered financial records showing payments to the family of al-Bayoumi from a Washington bank account held in the name of Princess Haifa Al-Faisal, wife of the Saudi ambassador to the United States and daughter of the late King Faisal.

I had a series of rather interesting communications with Ron between Sept.1st and 16th of 2001, including extended meetings on each of the specified days. The general nature of these interactions led me, in accordance with my long established '**Chicken Little**' protocol, to, subsequently and publicly, raise the issue of prior knowledge. No one, even including myself, took this terribly seriously.....until now???

What would be the point of such a possibility? There are larger reasons, mainly taking into account the various Eschatological logistics and scenarios, whereby it would be both necessary and mutually advantageous for there to be intercourse[!] between the Cosmic and Central intelligences. You may recall [my previous apologetics](#) in this general regard, which may now be coming home to roost. Better keep an eye on that Ron. No comma[,] and no further comment.

But why this awesomely unsubtle paper trail? A royal snafu? Just bread crumbs in the forest, my dears, on the way to Granny's house!

And what about Ron's golden parachute? I think he'd better talk to [Joe](#) about them apples.

[By Michael Isikoff And Evan Thomas
NEWSWEEK Dec. 2 issue

Interestingly, Osama Basnan showed up in Houston last April when Saudi Crown Prince Abdullah came to town with a vast entourage en route to President George W. Bush's ranch. According to informed sources, Basnan met with a high Saudi prince who has responsibilities for intelligence matters and is known to bring suitcases full of cash into the United States.....]

Do functions exist?, we'd like to know.

E.g., does reproduction exist in any ontic or Platonic sense? Is this even a coherent question?

Reproduction, like all functions, is normative just by definition. Where are these norms? They are somehow immanent in the reproducing entities, whose existence depends upon the existence of those norms. How many such norms could there be? This may not be coherent. Normality is a quality, something not to be quantified over. There is an input and an output, and there is success or failure, with occasional ambiguity.

Consider mutation, in its most inclusive, even spiritual sense. How do we classify a mutated reproduction? To a considerable extent that will depend on the progeny. Is it a dead-end, or the cornerstone of a whole new world? As with all functions, the teleology suspends judgment until, well, Judgment Day. There can be no real functions then, or, for that matter, a real anything, without an eschaton. But we're not talking about any old eschaton. Logically there can only be one such, given history. Anything more or less would render the Telos unintelligible, taking all meaning down with it. There is just one norm, the Norm of the Telos. All else is relative. That is why it is called Judgment Day.

You see why philosophers have such a struggle with meaning. It is surely not amenable to analysis. There can be only one Meaning, like the one Norm, that does not dissolve into relativity.

It had not come to me quite so clearly until today that ontology, logically and coherently, has got to be an all or nothing affair. There is no middle ground with ontology. It is everything, or nothing. Ontology is necessarily relational with grades of total relatedness. A creator would be of the highest grade. With ontology there can exist nothing beyond the pale. The convergent teleology of functionalism helped to bring home this message.

The analysis of functions is a method of very limited use, especially outside of engineering. Engineering is no small consideration, but overemphasis on it has had an unbalancing effect on the rest of culture. Control without wisdom is ultimately fatal.

These ideas are pervasively implicit, but they do need to be made explicit at this time in history.

The gestalt-like quality of ontology is impossible to demonstrate in a piecemeal fashion. It cannot be ladled out. There is a leap. Very few, indeed, will not make this leap. The personal drama of it is not incidental to the meaning of our existence. Life is always an all-or-nothing affair. The holism of the wisdom of life simply underscores this truism. Future generations will find it nearly impossible to conceive of the present degree of the fragmentation of human knowledge which has reached its nadir at this turning point. The resulting pain and confusion would almost instantly kill anyone who was acclimated to any other existence. The individual human psyche has been forged in this hellfire for reasons that, of course, we cannot presently imagine.

Let me say that the more mystical traditions have attempted to strike a balance between the all and the nothing, thereby reducing, to an extent, the tension of modern existence. Those on this path may still anticipate a leap. No one will be immune, regardless. No one can avoid history. It is certainly not an intellectual exercise, nor can it be a strictly individual process. It will be historical. I can talk about it, many can, but what do any of us truly know now? We all breathe the same air.

I am, let's be clear, talking about the spiritual transitions that will lead us up to the Eschaton, still generations hence. There is no need to storm heaven. We still have all the time in the world to get our

house in order. That is what we are here for.

[11/24]

The only ontology that can count is functional. Functions are essentially relational and normative. Normativity is determined through agency. Agents, at minimum, are self-organizing entities. But agency, too, is essentially relational and open-ended. Agency is essentially microcosmic, as in the case of the nuclear family. The agency of any 'primitive' cannot be assessed other than in a tribal context. Tribes always and everywhere maintain an essential, self-organizational microcosmic mythology, by way of defining and conferring agenthood. There is literally no existence for such 'primitives' beyond that pale.

Then there are organisms. Organismal identity is essentially ecological. Existentialism is unknown in the world of ecology, as in the tribal domain. Would it be unfair to say that existentialism, indeed Existence, is essentially a literary conceit?

Then there are atoms. Yes, atoms are self-organizing, but atomic identity can only be chemically instantiated. Plus, the metaphysical exigencies of the Quantum loom large in this microcosm. Without a Bohrian-type Quantum mythos, identifiable atoms would only inhabit the dreams of Democritus. Individuated atoms exist only at the behest of observational protocols, which are essentially normative, and so are semi-permanently subject to revision, with an emphasis on the **vision**.

This is ontology in a nutshell. This is *El Camino Real*. Ontology is essentially an open book. It is an unfinished story: an unfinished vision. The existence of the merest atom is relative to the protocol of the Eschaton. The cosmic Ecos is contained in that Telos. It is only in the Telos of the Eschaton that the wave function of the probable potency of the Cosmos finally collapses. If that is not Judgment Day, then what could it be, pray tell?

And what is the only extant, non-nihilist alternative to *El Camino Real* ([~4,000 hits](#))? It is the *camino* of [self-organization](#) (243,000 hits).

It appears that *El Camino Real* is the [Hinayana](#), while the *camino* of self-organization is the [Mahayana](#) of postmodernism.

I used to have a brother-in-law who was wont to say he was a 'self-made man'. I wondered about that then, and I wonder about 'self-organization' now. Are they not perhaps symptoms of a similar mindset?

Clearly, self-organization is rampant today. To what do we owe this phenomenon? What is its provenance, etc.? Has anyone bothered to look this Gift Horse in the mouth, I wonder?

Off the top, [self-organization](#) presents a mixed bag. Most generally it is presented as the essence of evolution. It might even be more accurate to say that self-organization is thought to be the **quintessence** of evolution. I use that word advisedly:

[The Quintessence:](#)

From the Golden Casket of Benedictus Figulus comes the following wisdom: "For the elements and their compounds in addition to crass matter, are composed of a subtle substance, or intrinsic radical humidity, diffused through the elemental parts, simple and wholly incorruptible, long preserving the things themselves in vigor and called the Spirit of the World, proceeding as it does from the Soul of the World. This is the one certain Life filling and fathoming all things, so that from the three emanations of sentient beings (Intellectual, Celestial, and Corruptible), there is formed the **One Machine of the Whole World**. This spirit by its virtue fecundates all subjects natural and artificial, pouring into them those

hidden properties that we have been want to call the Fifth Essence, or Quintessence.

If you can find a more historically apt precedence for the 'self-organizational' ethos than the 'quintessence' of alchemical romance, please bring it forth. There is even the same naively robust, often explicitly Luciferian, animistic hubris. This is the same breathtaking hubris that we previously encountered in **Transhumanism** ([here](#), [here](#), etc).

We must also recall **vitalism**. If you can see daylight between the vital principle and the principle of self-organization, your powers of discernment are greater than mine.

The scientific and intellectual core for the ethos of self-organization is usually alleged to be at the [Santa Fe Institute](#). The, hot off the press, centerpiece of the Institute's effort appears to be:

[Evolutionary Dynamics Exploring the Interplay of Selection, Accident, Neutrality, and Function](#) -- Edited by [JAMES P. CRUTCHFIELD](#) and PETER SCHUSTER (OUP, 9/20/02):

This book is an assessment and review of the recent progress in **integrating** evolutionary modeling and computation, molecular and developmental evolution, and nonlinear population dynamics into evolutionary theory. It brings together a wide range of eminent researchers in evolutionary dynamics in order to formulate a comprehensive theory that builds on nonlinear mathematics and physics. The text is divided into four sections: macroevolution; epochal evolution; population genetics, dynamics, and optimization; and evolution of cooperation, each containing several in-depth chapters and discussions.

As is evident on his home page, Jim has irons in several fires of interest. But I'm having difficulty locating an intellectual core or vision, amidst the many detailed and descriptive excursions. There are many ducks, but no particular alignment. I see no overarching thesis or **integrating** principle. I felt somewhat less adrift in the domain of biosemiotics: at least they have the **SIGN**. With self-organization must there not be a principle of the **SELF**? How can there be a discipline based on 'self-organization' with no coherent concept of the self? Is this an unfair question?

If I recall, it is [Stuart Kauffman](#) (mentioned [previously](#)) who is generally considered to be the elder statesman of Self-organization & Complexity. His most recent and only online publication: [INVESTIGATIONS: THE NATURE OF AUTONOMOUS AGENTS AND THE WORLDS THEY MUTUALLY CREATE](#) (1996). Here is his most recent book: [At Home in the Universe: The Search for the Laws of Self-Organization and Complexity](#) (OUP 1995). In what is often alleged to be a burgeoning field, might we not expect an update from the master? The following is the unusually [brief preface](#):

We live in a world of stunning biological complexity. Molecules of all varieties join in a metabolic dance to make cells. Cells interact with cells to form organisms; organisms interact with organisms to form ecosystems, economies, societies. Where did this grand architecture come from? For more than a century, the only theory that science has offered to explain how this order arose is natural selection. As Darwin taught us, the order of the biological world evolves as natural selection sifts among random mutations for the rare, useful forms. In this view of the history of life, organisms are cobbled-together contraptions wrought by selection, the silent and opportunistic tinkerer. Science has left us **unaccountably improbable** accidents against the cold, immense backdrop of space and time.

Thirty years of research have convinced me that this dominant view of biology is **incomplete**. As I will argue in this book, natural selection is important, but it has not labored alone to craft the fine architectutres of the biosphere, from cell to organism to ecosystem. Another source---**self-organization**---is the root source of order. The order of the biological world, I have come to believe, is not merely tinkered, but arises naturally and spontaneously because of these principles of self-organization---laws of complexity that we are just beginning to uncover and understand.

The past three centuries of science have been predominantly **reductionist**, attempting to break complex systems into simple parts, and those parts, in turn, into simpler parts. The reductionist program has been spectacularly successful, and will continue to be so. But it has often left a vacuum: How do we use the information gleaned about the parts to build up a theory of the whole? The deep difficulty here lies in the fact that the complex whole may exhibit properties that are not readily explained by

understanding the parts. The complex whole, in a completely **non-mystical** sense, can often exhibit collective properties, "**emergent**" features that are lawful in their own right.

This book describes my own **search** for laws of complexity that govern how life arose naturally from a soup of molecules, evolving into the biosphere we see today. Whether we are talking about molecules **cooperating** [sic] to form cells or organisms cooperating to form ecosystems or buyers and sellers cooperating to form markets and economies, we will find grounds to believe that Darwinism is not enough, that natural selection cannot be the sole source of the order we see in the world. In crafting the living world, selection has always acted on systems that exhibit spontaneous order. If I am right, this underlying order, further honed by selection, augurs a new place for us---expected, rather than vastly improbable, at home in the universe is a newly understood way.

A word from the wise: as I was told in graduate school, whenever '**search**' appears in the title of a scientific paper, you may automatically insert '**unsuccessful**' in front of it. Is this then an example of hubris, just plain chutzpah, or the dream of an ageing scientist?

It is far from me to hold a brief against dreaming, but when a scientist does it, does that make it Science?

At this point I was about to compare Kauffman with his non-reductionist colleagues the Intelligent Designers. But let's listen in on Dembski himself: [Alchemy, NK Boolean Style](#):

Appropriately modified, the joke about Rudolf Carnap can be retold about Stuart Kauffman and the scientific method he employs in *At Home in the Universe*. According to the modified joke, Kauffman's method is to begin any scientific investigation with the statement "Consider an NK Boolean network." Indeed, throughout *At Home in the Universe* just about every real-world problem gets translated into a toy-world problem involving NK Boolean networks. As with Carnap's formal languages, NK Boolean networks have the advantage of complete logical precision. But they also suffer the disadvantage of losing touch with reality. And it is this disadvantage which ultimately proves the undoing of Kauffman's project.

[.....] Indeed, Kauffman admits that he is searching for laws he has yet to find. An obvious question therefore arises: Whence Kauffman's confidence that such laws even exist?

Kauffman's confidence rests in an analogy. In the non-linear dynamics of physics and the simulations of computer science, Kauffman finds self-organizational scenarios that are suggestive of what might have happened in biology. Kauffman's project therefore is to use non-linear dynamics and computer simulations to massage our intuitions, make the search for laws of self-organization seem plausible, and ultimately facilitate the discovery of such laws. And of course, the main analytic tool for carrying out this project is his NK Boolean networks.

Before considering the details and merits of Kauffman's project, it will help to understand the motivation behind it. Throughout his book Kauffman makes very clear that he is after a non-mysterious account of the origin and development of life. For Kauffman such a non-mysterious account is one that appeals only to natural laws and is devoid of any reference to a "master choreographer" (p.208). Appeals to intelligent design are therefore ruled out from the start.

All the same, Kauffman is not wholly without a sense of mystery and the sacred. At the end of his book Kauffman encourages us to "reinvent" the sacred. Indeed, a religious impulse underlies Kauffman's rejection of strict Darwinism, with its exclusive dependence on mutation and selection. As Kauffman sees it, strict Darwinism makes the universe a giant test tube within a stochastic chemistry lab. To reinvent the sacred, Kauffman needs the universe to be more than a test tube--it needs to be our home. And for the universe to be our home, our place in the universe must be assured. Laws of self-organization hold such a promise. Thus Kauffman will write, "I would rather life be expected in this unfolding since the Big Bang than that life be incredibly improbable in the time span available" (p. 304).

Let us now turn to the details and merits of Kauffman's project. To strict Darwinists like Richard Dawkins and Daniel Dennett, Kauffman's project will seem thoroughly misguided. Indeed, what is the point of positing unknown laws of self-organization to explain biological phenomena when these same phenomena have already been adequately explained in terms of mutation and selection? Kauffman's project casts doubt where there ought to be certainty. Kauffman's project problematizes what ought not

to be a problem. For the strict Darwinist, laws of self-organization are leeches whose only effect is to sap a perfectly good theory (i.e., the neo-Darwinian synthesis) of its vitality.

Or consider Kauffman's ubiquitous NK Boolean networks. An NK Boolean network is a set of N nodes, each of which is assigned a value of 0 or 1, and which in being reassigned values depends functionally only on the values already assigned to K fixed nodes ($K < N$). No doubt, Kauffman's NK Boolean networks are capable of exhibiting many interesting behaviors. But to call the nodes "genes," as he is wont to do, and then take what he interprets as self-organizational behavior by the Boolean network as evidence for self-organization in the formation and development of life is utterly gratuitous.

Nowhere does Kauffman even attempt to establish a correspondence between the mathematical models he runs on his computer and the actual processes matter must undergo to form a biological system. I find this omission unconscionable, for it represents a descent into mysticism worse than any Kauffman claims to avoid. Kauffman will write, "it is not implausible that life emerged as a phase transition to collective autocatalysis once a chemical minestrone, held in a localized region able to sustain adequately high concentrations, became thick enough with molecular diversity" (p. 274). This is not science, but alchemy (cf. p. 277 where Kauffman actually uses the word "alchemy" to describe what he is doing).

I could not have said it better myself. Are there any articulate defenders of Kauffman, we might wonder? However, this purloined description of NK networks reminds me of something more recent:

[A New Kind of Science](#) by [Stephen Wolfram](#) (2002). What I have previously gathered from the reviews is a mathematics considerably advanced over Kauffman's, but equally lacking in connection to the real world.

We might wonder if Complexity Theory, for lack of a generally applicable theory, is running out of steam? What might supplant it in the minds of our neo-alchemists?

Would it be fair to say that the Complexionists are running into problems similar to those of the Connectionists? I suspect as much. They both get very bogged down in the notorious intractability of networks. Attempts to render them natural, seem only to contribute to that intractability.

The complexity site listed second on Google features this essay: [Neo-Transcendentalist Philosophy](#)[!]:

It is characterised by taking the best aspects from spiritual thinking, adding the down to earth approach of science, merging with the creative flexibility of mind and then stirring the whole with the lure of a better future via evolutionary choice. This is not Utopian, it is not Other Worldly, nor is it Materialistic. It transcends those static categories and offers a dynamic, complexity related, way of thinking that treats the whole not the part, one eminently suitable for the 21st Century.

As you can see, the New Age has gotten its teeth into Complexity and is not about to let go. It is not clear that Kauffman & Co. would find this even slightly embarrassing.

Whether we take the philosophical idealist stance that the world doesn't exist outside such thought or take the realist version that the world itself gave rise to the thought matters less than the recognition that such abstractions are instrumental in determining how we behave. They themselves do have reality and are causally effective, but at a higher level than material objects, and are what we call in complexity thinking 'emergent properties'.

Eclecticism is the order of the day. I know of no postmodernists who would have problem with this. What I see is simply a non-reductive naturalism with a pinch of Transhumanist utopianism. Another name for this might be [Scientific or Natural Pantheism](#). Another term of choice among the Complexity people is '**autopoiesis**':

[THE ONTOLOGICAL FOUNDATION OF AUTOPOIETIC THEORY](#) -- Kent Palmer, Ph.D:

Philosophizing on the basis of an avowed ignorance of even the rudiments of Western philosophy is common. Another factor is the prevalence of nihilistic and extreme schools of thought within philosophy itself, such as Analytic Philosophy, Deconstructionism and other related Post-modernist movements. Most of these lines of thought are repugnant to scientists and reinforces their distrust of philosophy. However, without philosophy the meaning of scientific theories and facts remain obscured. And many of the implicit philosophical positions within science are just as nihilistic as the philosophical schools that cause folks that think of themselves as scientists to blanch. In fact the Crisis that Husserl pointed out in Western Science is still in full swing. Science has become detached from the lifeworld and teeters on the abyss of meaninglessness and nihilism through this disconnection from the consideration of meaning and the rise of instrumentalism. What we need to do is bring the best insights of recent Continental philosophy to bear on our scientific practice and use that as a context for understanding the phenomena that are addressed by **autopoietic** theory and its extension into the social realm.

This brings us nearly full-circle to Biosemiotics.

There is a widespread desire and need for some sort of macro-realism. Mathematics has been critical in establishing a micro-realism (modulo the quantum, of course). But the attempts to use math to extend realism to larger scales, notably the attempts of Thom, Kauffman, Wolfram, etc., have had very limited success. The inadequacy of mathematics opens the door to semiotics, and other more speculative initiatives, this being one of those.

The simple fact is that meaning is holistic. There is no way to compartment it. When Quine discovered the holism of meaning he failed to follow up on it, certainly not in the grand manner suggested herein. Existentialism attempts to compartment meaning to individual human existences, e.g. to you and me, separately.

[11/25]

The Self-organizing, Autopoietic Complexionists wish, in effect, to extend Existentialism to cover any individual system. The idea is that ontology, meaning, emergence, functionality, rationality, etc. can be individually compartmented within each given system. The news of the Millennium may be that this compartmentalization is not possible.

Each special science and discipline would like to have its own autonomous ontology and epistemology. This is what pluralism is about. This is the American Way, is it not? Perhaps, but it may not be the way of reason.

There is the issue of holism. Consider the holism of mathematics. The integers, for example, are a logical whole and cannot be ontologically partitioned. The even numbers cannot be understood apart from the odd numbers. This seems trivial, but neither may the integers be understood outside the context of the rationals, nor the rationals apart from the real continuum. But did not the early mathematicians manage quite well in ignorance of the irrational numbers? True, but they also missed a great deal in their understanding of the integers because of that ignorance, as modern number theory testifies.

Similarly the subjects of algebra and geometry were once treated as quite separate disciplines, but now we have trigonometry, algebraic topology, etc. In modern mathematics there are still specialists, of course, but the greatest strides have come in discovering deep homologies between the disciplines. Thus the structural knowledge of one mathematical discipline can be imported wholesale into another, leading to remarkable cross-fertilization and an explosion of knowledge. And don't get me started on mathematical physics. We may be under the impression that we are managing quite well in our pluralism, but what are we missing?

Imagine attempting to do mathematics without the concept of infinity. This is just what the mathematical constructivists attempt to do, and by all accounts it is a very ineffective method by comparison. The inductive approach of science may be equally ineffective, and it would be impossible in many areas without recourse to the deductive power of a robust mathematics.

It is likely to turn out that the notion of the transcendental is to our general knowledge of the world, as the notion of infinity is to our mathematical understanding. The reductionists, like the mathematical constructivists, argue that we have no proof of the infinite or the transcendental, and so any reference to it is illegitimate. The difference is that no one pays attention to the constructivists.

There is much indirect evidence that the transcendental is the foundation of our intelligence. Not many years ago it was being said that metaphysics was a 'disease' of language. The point is that language is irredeemably holistic and metaphysical: intentionality be a hallmark of the latter. Like their constructivist colleagues in mathematics, the analytical reductionists hoped to put language on a crash metaphysics-free diet. A century these ambitions have vanished without a trace.

The reductionists next took on the seemingly less onerous task of being the ontology police of Science, using Occam's razor as their disciplinary whip, if you will. But with the proliferation of ontology laden special sciences, the outcome for them is appearing no less dismal. The reductionistic physicalist is becoming an endangered species, if not already extinct. I keep a careful watch for this rare bird, and I cannot report a single sighting in, say, the last five years. If you know of one, I will gladly put out a 'rare bird alert'.

The very last bastion of those folk of a reductionist persuasion is now, as we have seen, under the banner of 'naturalism'. The naturalist shtick is simple: only establishment scientists are allowed to play the ontology game. The rest of us are encouraged to go and, well, play with ourselves, not to give it too fine a point.

One might suppose that the theologians would feel left out, if not downright offended. Well, think again. The message from the naturalist to the theologian is: *'Après moi, le deluge.'* The theologians are most receptive to this dire warning. They know, as well as any, that we natives, we ontology freaks, are restless. The scent of 'gunpowder' is in the air. There is a line being drawn in the sand. There is a siege mentality on the part of the secular Intellectual Establishment. Their professional sectarian colleagues, seeing the storm clouds, are keeping a low profile. The Intelligent Design contingent may think they are storming these barricades, but, in truth, they are seen as little more than a nuisance. What then is the focus of their trepidation? Surely, it's not yours truly. No, but these folk are sufficiently wary of the metaphysical instability to know that the bullet that hits them is the one they won't see coming. Here's my prediction: the bullet in question is the demystification of the Eschaton. Nothing less focused nor less forceful will pierce the veil, and nothing less can account for the irrational anguish of the besieged. Suffice it to say that this observation was not made from an armchair.

Enough of social psychology, it's back to naturalism.

It is still a big leap from non-reductive naturalism to eschatology, and that's putting it mildly. As the naturalists would have it, the only ontological furniture in the world is that which emerges spontaneously: the mind being everyone's Exhibit A. Is the mind natural? This might be more palatable if we had only the possibility of animal minds to consider. The significant problem comes rather closer to home.

There were those, of course, who would deny us our minds, but their odd gambit has lost its traction. Radical connectionism appears to have been their last hurrah. The real battle has shifted now to the ontological definition of the mind. At this point I can't resist the urge to mangle another metaphor by

suggesting that the mind is the soft underbelly of naturalism. Persuading psychologists to toe any ontological line presents as inviting a prospect as herding cats. Here the naturalists are going to have to maintain the barricade themselves. This is become a fulltime job: the neuroscientists and AI people presumably have to struggle to keep their day jobs.

Now it may be that the very success of science is turned against its self-styled defenders. In delving into the realm of the mind, epistemology is transformed into ontology. With the blurring of that distinction, the scientific knowledge explosion becomes a major ontological headache.

[11/26]

To the holistic nature of language, we may add the apparently irreducible nature of our innate grammatical sensibility. Our universal mathematical proficiency is another, quite probably undeconstructible talent, among many others.

Then there is the developmental psychology that is our epistemic foundation. There is an extraordinary, innate proclivity for the acquisition of new talents that is the source of all our remarkably diverse and constantly expanding repertoire of abilities.

All of this actual and latent ability comes under the rubric of natural intelligence. Is it not fair to say that the more we learn about natural intelligence, the more stark becomes its contrast with artificial intelligence? There has not even been an attempt to define the limits of natural intelligence. Even its qualitative outline remains obscure.

Nonetheless, even just a perceived threat from the ranks of strong AI has, in the past, kept a lid on the metaphysics of the mind. However, the split in the AI community between the connectionists and the computationalists, may have radically diminished that perception. There is no longer even the perception of a coherent program emanating from that direction. Their respective strategies are strongly incommensurate, and each one postures itself on the all too obvious weaknesses of the other. Are we not in the terminal phase of a mutually assured destruction? At this point the AI people are literally on their knees praying for a divinely inspired breakthrough. Can I stand here and swear to you that God will not answer their earnest entreaties? No. Would God have given us the Quantum if she did not want us to build a Quantum Computer? No. I would be among the last to deplore such a development. Why will it not exacerbate the rampant metaphysical speculation already engendered? The Quantum is already a metaphysical nightmare for the materialists. Nay, it has turned into a metaphysical tar baby. The actual process of attempting to tame the Quantum is showing no prospect of diminishing its metaphysical stickiness. It continues to maintain the upper hand.

In metaphysics there are no guarantees. God is not going to write us a contract. There will always be an extra mile. And, most significantly, there will be an irreducible, indestructible element of faith. Faith is an essential core, if not the actual essence, of human nature. I doubt that the Creator would, or even could, ever deny that to her creatures. What proof there is, is ever only in the pudding.

[12/2]

I was out of town for a few days, so let's recapitulate. There is a continuing struggle with realism. My insight from last night was in the form of an increased emphasis on the holistic and relational nature of realism [i.e. its gestalt quality, as noted [above](#)]. There are different possible starting points for realism, and then one proceeds to construct a coherent web of reality.

One idea from last night was that our mathematical ability would be a logical starting point. It is very

difficult to account for mathematics from a biological point of view. There is a minimal required intersubjective conceptualism. The precisely rational manipulation of mathematical structures provides a robust basis for conceptual realism. This realism includes a downward or final causality for these concepts.

I then would like to extend this realism back down the evolutionary ladder, and see how far we can reasonably go in that direction. This is toward the general notion of biological functionalism. For the previous several days I had been trying to make the case for biological pattern recognition for something as basic as enzymes. Following Pattee, I believe, one could argue that enzyme activity involves the Quantum measurement problem, bringing in metaphysics and ontology through that back door. But this is too big a leap from conceptualism. Thus I reverted to the general problem of nutrient acquisition, or just hunting, from a higher perspective.

A more general rubric would be mental modeling. Survival entails the predator and prey in a mutually escalating competition of anticipatory modeling. (One should be reminded of the basic ability of 3-D mental rotation studied by Shepard. Conceptual realism was surprisingly vindicated thereby.) One would expect some such modeling ability to extend rather far down the food chain. At the highest end of that chain we would have the the imaginative power of writers to create realistic characters with quasi-autonomy, which in turn, carried to a pathological extreme, would constitute a **multiple personality disorder**. This is just self-organization or autopoiesis carried to the next higher power. The web of realism is already well extended.

Linguistic capacity is a form of mental modeling. Words must be endowed with an irreducible causal efficacy if we are to take seriously our communication skills.

Given this tentative foothold for realism, the next extension of it might be organismic ontogeny. This is the realm where biological reductionism most severely strains our already overtaxed credulity. Ontogeny provides a possible bridge between mental and biological ontology, or between conceptualism and vitalism: a material based autopoiesis at its most impressive. Once the balance starts tipping away from reductionism and toward holism, that reversal of fortune is soon to become dramatically irreversible. No longer will mere atoms tyrannize our spirits. That day has been a long time coming. No need to be other than cautious and deliberate.

[12/3]

Yesterday I neglected to mention biological traits as prime candidates for realism. How else could they be selected? Notice, however, that they are not completely objective nor precisely defined, but evidently they are sufficiently real for all natural purposes.

On the issue of realism, the life sciences are caught between the vitalists, broadly construed, and the skeptics. Most scientists evidently feel that they can go about their business while ignoring the ontological issue. We point out to them that there can be no science without ontology. (A nominalistic science is tantamount to idealism.) The scientific status of an organismic biology is then the same as that of psychology or sociology. This is hardly shocking. Mathematicians are seldom exercised about the ontology of their subject matter.

The only folk who care about ontology are those of a religious persuasion. Theirs has always been an uphill battle. They should take heart from the ontological ambiguity of the sciences, but, so far, that comparison has not had much practical benefit.

And what about the ontology of meteorology? History? Persons?

Are persons real? Why are we not exercised about this? This may be the crux of the reality issue.

Consider the ontological vs. the legal status of persons. The abortion debate is just one facet of this issue. There is a liberal conservative divide as to whether the locus of reality is with the person or the society. Nature vs. Nurture, etc. Do persons make history or are we its products? What are the various causes of history? Biological and economic determinism are closely related issues. Of course, the ontological status of persons and souls are closely correlated.

The status of persons is also at issue between the prophetic and mystical or pantheist traditions. In general, the mystics are the great skeptics about many things, including especially gods and persons. On the other hand, even the atheist existentialists take persons, and their angst, seriously. Personal angst may be the only thing they take seriously.

A peculiar and remarkable facet of modern existence is the degree to which Physics has co-opted ontology. This is not particularly the doing of the physicists, it was mainly a role that was thrust upon them by outsiders with ulterior motives. I don't doubt that some aspects of this role have been manipulated in a political or even conspiratorial fashion, but the great bulk of it has been simply the modern ethos, the *zeitgeist* (real?), if you will. The historians will not have an easy time explaining the ascendancy of the idea (sic) of materialism. It may well be the most difficult fact they will ever have to explain.

But how about meteorology? Are storms real? Is this a coherent question? How might the ontological status of meteorological taxonomy differ from that of its biological counterpart, for instance? Is it a matter of degree or of kind? Are storms a natural kind the way species are? Most planets and stars have (recognizable) storms, but only one is known to harbor species, setting aside the BPWH (hypothesis).

The physicalist would argue that storms are reducible to physics, like everything else. But are they not, more accurately, (strongly?) emergent bulk phenomena? Is there not a *bona fide* phenomenology of storms. (By the by, did you know that Physics is replete with phenomenology? I had almost forgotten this little skeleton in Physics' ontology closet.) The status of nuclear physics wrt to Physics is virtually the same as that of meteorology. It is difficult to deny the reality of nuclear weapons or of hurricanes, but that is not quite the issue. We're talking final causes. Nothing is real without a final cause, including, especially the world, *ergo*, eschatology. Formal and final causes may be identified for this larger, historical purpose. Does an electron have a formal cause? That may depend on the 'transworld' validity of Steve's Standard Theory of Physics. The formality of the electron is guaranteed only by the BPWH.

I should note that the reality of storms is not just an academic question for us idealists. Idealism does not rule out the possibility of upward causation, and the logical conflict between upward and downward causes in idealism could be a sticky issue. How much control might God have over the weather, and how might that control be exercised? Physics is a legitimate aspect of creation. Physicalism has a role, but just how limited is that role? That is something we'll need to deal with, at our early convenience:

The concept of the Alpha and Omega, and creation as a suspension between these pillars may be relevant. Take Alpha as the efficient cause and Omega as the final cause, and one has a model for balancing the upward and downward causes in a given time slice. These two, quasi-orthogonal, dimensions of causation could be the warp and woof of Creation. I'm struggling here folks, help me out!

The TV Weather lady doesn't need the BPWH, presumably.

[12/4]

Let's face, there wouldn't be so much physicalism if God did not love the physicalists. I was one once, myself, and but by the grace of we know whom, there still goeth yours truly.

But when it comes to obstructing El Camino Real, the postmodern skeptics are more effective than the remnant physicalists. It is political correctness, more than physical correctness that is the obstacle. Rationality has always been at a disadvantage relative to politics. And this politics has been severely polarized by the political excesses of the right-wing 'christian' crowd. A polarized polity bodes ill for rationality. Will the Muslim excesses just exacerbate the irrationality? There are limits to irrationality. Modern Cartesian irrationality has about played itself out. There is a latent demand for coherence. The radical nature of immaterialism is the remaining barrier to a postmodern coherence. El Camino Real beckons.

We are seeing the last hurrah of **fundamentalism**. Its superficial literalness was always the servant of the demagogue. It does not serve the spirit. The spirit hungers. The spirit will be served in the end.

Fundamentalism was merely a creature of modernity. It will not stand to the corrosion of postmodern scrutiny. As fundamentalism self-destructs, there will be a demand for coherent alternatives. People, though, are not yet spiritually prepared for the singular shock that awaits us on this front. To some it will seem that we are jumping from the frying pan into the fire, and they will not be entirely mistaken!

Gospel of the Real

El Camino Real is the high road. It is ours. These are glad tidings!

Build a better mousetrap and the world will beat a path to your door. Build a better road and the world will not have to beat a path to your door. There is simply now the Gospel of the Real.

So where is the world in its regard of the Real? How do we find out? Will Google work its magic?

The coherent gestalt of the Real is not easy to pin down. The point of greatest general concern ought to be the reality of persons. This would be the point on which Science would diverge most radically from public sentiment. Philosophers argue mightily over the status of folk-psychology. The status of persons is what is at stake.

I am not aware of any concerted postmodern view on the matter of persons. One might think that they maintain an embarrassed silence and just look the other way. Phenomenology is the intellectual bastion of personhood. I suppose that postmodernity maintains an uneasy alliance with phenomenology. Semiotics may be the wild card in this intellectual stalemate. Humanistic psychology and existentialism also provide safe harbors for persons.

Semiotics vs. AI might be the point of greatest cognitive dissonance with regard to [personal identity](#) (130,000 hits) [previously mentioned [here](#), [here](#) (w.r.t. the politics of human nature) and [here](#)]. Not bad. Let's investigate. Adding 'reductionism' yields only 1,200 hits:

'Parfit, and the problem of personal identity in two philosophical traditions':

It is, therefore, refreshing to find two significant new books treating persons and personal identity from the perspectives of philosophy and Buddhist Studies, respectively, that defy convention and intellectual taboo each by nodding in the other's direction. Derek Parfit's *Reasons and Persons* and Steven Collins' *Selfless Persons* are concerned not only with personal identity, to be sure, but because it is a central theme in both books and also their point of intersection, it will be the focus of this essay. *Reasons and Persons* represents the radical elaboration of a theory of persons derived ultimately from Locke, which holds the facts of personal identity to be wholly explicable in terms of continuity and connectedness, while *Selfless Persons* is a remarkably thorough analysis and interpretation of the themes relating to the concept of persons in Theravada Buddhist discourse.

[Parfit] asks that you consider in what sense, if in any, you are the same person after a tele-transporter beams you to Mars. Your terrestrial brain and body are destroyed and an exact replica appears a few minutes later on the Red Planet. The replica has your memories, intentions, habits, and tastes. He will carry out your projects, care for your family, and so on. In short, he is continuous with you in all relevant respects. But have you survived your tele-transportation? Parfit argues that "this kind of continuity is just as good as ordinary continuity," and that, on certain criteria of personal identity at least, "my Replica ... would be me".

Derek's analysis ought to constitute a *reductio ad absurdum* for any insubstantial view of persons.

The most familiar sort of Non-Reductionist View is represented by the Cartesian doctrine of spiritual substance; but there are other versions as well, for example, the Further Fact View, which maintains that "though we are not separately existing entities, personal identity is a further fact, which does not just consist in physical and/or psychological continuity.

Rational agency and rationality proper are founded on personal identity. There is no coherence outside of personal coherence. Theism and **personalism** are logically inseparable. All identity is necessarily

founded on personal identity.

Take note of Chalmers' [list of sources](#).

I'm being sidetracked now onto [The Identity Theory of Truth](#). It sounds not unlike direct realism.

[12/5]

I have not yet found a focus in the battle for the reality of the self. There is a broad line of demarcation between humanistic and behavioral psychology, but no real battle is in evidence. The two sides manage to ignore one another.

[Parfit, Lewis, and Sperry on Personal Identity](#) -- Eugene Marshall:

Imagine a person, John, will be subjected to a fission operation where each hemisphere will be transplanted into the empty skull of a new and different body. John's body is disposed of afterwards. We will call the resulting bodies John1 and John2. The problem, as Parfit raised it, is this: how can John1 and John2 be identical with John, but not with each other?

Aren't those philosophers clever? Analysis (surgery) is used to defeat identity. I have a bit more faith in integrity. Let me point out that the integrity of the self is transcendental: Self & Love being the ultimate organizing principles of the cosmos. This matter was broached in the context of autopoiesis and [multiple personality disorder](#). We are the multiple personalities of God, but that does not reduce God, just as Tom Sawyer and Huck Finn do not reduce Samuel Clemens. If you wish to perform experimental psycho-surgery on God, well, good luck!

If personal identity is the foundation of reality, it would seem that reality inhabits a slippery slope. That is the whole point. There is a chain of being, but certainly not in any biological or Darwinian sense. The holistic nature of being eludes all analysis and gives comfort to skeptics and nihilists. That is the price one pays for this stairway to heaven. What about the spiritually challenged? Is there no handicapped entrance? Not to worry, salvation is universal. So when you look around and notice that you are the last one at the nihilists' keg party, just be sure to turn out the lights before you leave.

On this same analogy, physicalism serves as grease on the stairway to heaven. It can expedite passage in either direction, depending on one's frame of mind. The chain of being is then not a stairway or even a chain with discrete links. It is more like a fire pole. It is physics that fills all the gaps. And it is God, too. How they manage this joint effort is perhaps our Gordian knot. Surely the Monster Group gets into this act, but don't ask me how, or from whence It came.

Reality does not provide us with a spiritual crutch. Believing in one's own self is a struggle, as it was meant to be. Believing in God makes that struggle rather more manageable in the long haul. The abyss is an ever present reality. People do fall off the edge of the world, every day. Fear does play a constructive role. The abyss is like the wolf prowling on the edge of the herd. She keeps us on our toes.

Because of ontology's notorious **slipperiness**, the professionals have, with good reason, largely abandoned these slopes. Now we have amateur hour on the slopes. We are enjoying the ski party. How long will it last? The party will last until things get serious. When will that be? At about the time when the Eschaton starts making noises off-stage. I'm trying to make all the noise I can, but Google is not cooperating, is she? Does this make me a party pooper? If you think this is a party, well, you ain't seen nuthin.

Speaking of which: [slippery ontology](#) (1,200 hits) [and recall [Computational Epistemology](#)]:

[Some Organizing Principles For A Unified Top-Level Ontology](#) -- Nicola Guarino (1997):

...it shows an open-minded attitude towards the subtle distinctions of philosophy and the **slippery** issues of natural language and commonsense. The philosophical field inspiring this trend is that of formal ontology, which has been defined as "the systematic, formal, axiomatic development of the logic of all forms and modes of being". As such, formal ontology is a recent expression of traditional ontology, intended as the branch of philosophy which deals with the a priori nature of reality. In its current shape, formal ontology can be seen as the confluence between a school of thought which has addressed metaphysical problems within the mainstream of analytic philosophy, and another school more closely related to phenomenology, in the tradition of Brentano and Husserl.

Ain't the beer cold! The AI folk cannot stand on ceremony. They have to go out in the trenches and wrestle ontology with their bare hands.

Hanjo Glock, University of Reading, Title: [Does Ontology Exist?](#) (COLLOQUIUM SERIES THURSDAY, MARCH 29, 2001)

Many early analytic philosophers regarded ontology as a branch of metaphysics that is either trivial or meaningless. But from the fifties onward, attitudes changed. Instead of having a good laugh about Heidegger's 'The Nothing noths', analytic philosophers took up ontology themselves, and with a vengeance. The war cry that philosophy should concern itself with things instead of words, with reality instead of concepts, has gained wide currency.....

Quine, who has been the main inspiration behind analytic ontology. Quine's naturalistic ontology purports to help science in drawing up an inventory of the world. Through logical paraphrase it seeks to identify and reduce the ontological commitments of our best scientific theories. Against this programme I shall argue that Quine's conception of **ontological commitment** is inadequate, and that his logical paraphrase cannot contribute to the exploration of reality, but at most to the clarification of our conceptual framework .

So the analytical folk preceded the AI folk. And, yes, it's time to put those neo-ontologists in their place!

[Ontological commitment](#) (2,700 hits):

[Ted Sider](#) is not shy about his ontological commitments: [Trenton Merricks, Objects and Persons](#) (2001):

Many otherwise reasonable philosophers are impatient with ontology. These philosophers will probably have little time for Objects and Persons, which claims that while there do exist "atoms arranged statuewise", there do not exist statues; while there do exist atoms arranged tablewise and atoms arranged chairwise, there exist no tables and chairs.

Yes, I believe that chairs exist, but only as **cosmic** furniture: only in virtue of their cosmological function in fulfilling God's love. So that make us God's tools? Yes, and so is God ours. And, to some non-negligible degree, I am the tool of my chair. This is just functional relationalism; basic to any dynamic idealism. But does this entail a downward causation relative to chairs? Yes. Chairs are subjects of and to all sorts of causation, as are we.

Nihilist philosophers of Merricks' ilk [except for atoms & humans, as noted below] forcefully remind us that any ontological commitment at all is not a casual, piecemeal affair. If chairs exist then as clearly as night follows day, so must God exist. Are you able to resist this logic? Perhaps, then, you need some remedial logic.

Merricks makes an exception to his causal overdetermination argument for human beings. In addition to atoms arranged human-wise, there also exist humans. On its face, this exception is theoretically unsatisfying, all too convenient, and even tender-hearted. But Merricks's justification for the exception is interesting: humans have causal powers beyond the causal powers of their micro-parts. Indeed, the property consciousness, instantiated by human persons, does not even globally supervene on microscopic physical properties, and it conveys distinctive causal powers.

Vitalism and psychism are not about to go away.

I need to consider '[scientific realism](#)'. Does it imply an ontology broader than physicalism? I gather that scientific realism is equivalent to naturalism in its commitment to the ontology of the theories of science. There may be degrees of commitment to particular ontologies, but this is not spelled out. My question is the degree to which scientific realism is anti-reductionist.

But see [The Incompatibility of Naturalism and Scientific Realism](#). Koons does not consider reduction, *per se*, but he points out that scientific realism necessarily entails an irreducible **normativity** that is incompatible with naturalism. A good point. [Apparently my neurons have grown [more tolerant](#) of Robert's pedagogy.]

Let me mention [again](#) the [Research Project: Rationality and Non-Reductionism](#) (van Tilburg University, NL). Remind me to investigate this project. One participant is [Dr. M. V. P. Slors](#). Like the other participants, Slors struggles mightily to placate both the emergentists and the reductionists. They are of the school that all differences can be analyzed away. This, in itself, constitutes a reductionist outlook. Is this philosophy or is it arbitration? I think the latter. On second thought, I am also a monist. We believe that all differences will be resolved in the end. Instead of downward reduction, I anticipate an upward reduction which is the hierogamos.

[12/6]

Continuing with ["scientific realism" & physicalism](#) (400 hits):

I am finding no one remarking on the logical incompatibility of scientific realism and physicalism. Are the philosophers asleep at the switch? At the very least, scientific realism entails the reality of universals, beyond those entailed by physics.

[The Deep Problem of Physicalism](#) -- Bryan Wesley Hall:

Many philosophers of mind attempt to "explain away" the mental via the physical. This explanation has had many permutations over the years. Barbara Montero, in her recent article "The Body Problem," makes the point that all of these physicalist explanations require that one have a consistent and coherent definition of the physical. If one does not have this definition, then any attempt at explaining away the mental in terms of the physical is questionable.

Hempel's Dilemma: this dilemma has two horns. The first horn of the dilemma states that if one defines the physical using contemporary microphysical entities, then physicalism is probably false. In every likelihood, the contemporary posits of microphysical science will seem as abstruse to physicists one hundred years from now, as aether, phlogiston, or Aristotelian elementals seem to us today. The second horn of the dilemma states that if one defines the physical by reference to a yet-to-be-completed microphysics, then our definition of the physical is conceptually **vacuous** but trivially true.

After several decades, Hempel's dilemma still stands. Physicalism remains logically **vacuous**. Why then does its ghost still haunt the philosophy of science? It is because Scientism is still alive in the land. Where is the silver spike that can be driven into the heart of this Zombie? The Postmoderns have made a go at Zombie killing, but their own notorious metaphysical indulgences (i.e. incoherent pluralism) render any such attempts highly suspect.

[A Kantian Critique of Scientific Realism](#) -- also by Bryan Hall:

Our purpose is to revisit the scientific realist debate from a Kantian perspective. Kant was certainly not

this kind of scientific realist, and if his theory is shown to be damaging to the scientific realist's cause, then I believe the whole history of philosophy that fell out of the scientific realist position becomes highly questionable. This is particularly true of scientific essentialism. The purpose of this paper is not to challenge scientific essentialism per se, but rather to challenge the thinking that led up to the advent of scientific essentialism, namely, scientific realism.

Neither physicalism nor scientific realism stand up to scrutiny. Isn't it time to look elsewhere for coherence and rationality? In the meantime, the postmoderns are content to wallow in their own quagmire.

I am reminded that Physics is replete with abstract mathematical constructions and universals. Also, like any realism, physicalism has to invoke normative standards. If norms and abstractions are irreducibly entailed by physicalism, then on what basis may anything of a mental nature be excluded, even without appealing to the Quantum? How any version of materialism ever achieved a status above that of moonshine will be the enduring mystery of modernism.

Naturalism : A Critical Analysis (Routledge Studies in Twentieth Century Philosophy) by [William Lane Craig](#) (Editor), [J. P. Moreland](#) (Editor). Have I not already noted this title [[here](#)]? It is reviewed here by the 'Infidels': [Review of- Craig, William Lane, and Moreland, J.:](#)

Of course, it can hardly be denied that there are **enthusiastic** naturalists who fit the characterization offered by Craig. The next chapter illustrates the widespread confusion or conflation of scientific materialism with science. Machines are described in anthropomorphic terms which are then re-applied to human beings. Wallace gives examples from journalistic articles and textbooks, but reserves his main analysis for the philosophical conflations of John Searle, who does nevertheless reject some of the more crass materialistic approaches to consciousness but cannot finally extricate himself from its assumptions. This leads into the final chapter on scientific materialism as an ideology, which begins with a masterly statement of the overall view. If you disagree with this you must be either ignorant or irrational! However, as Wallace repeatedly observes, the astonishing thing is not materialism itself (as Crick maintained) but the fact that people 'so enthusiastically embrace an unconfirmed speculative theory that utterly denies the validity, even the very existence, of their personal, inner life' (p.161). The ethical implications of such a view have proved disastrous in the past and may do so again. Moreland. Moreover, it is true that those naturalists are enemies of theism. However, even if the collected essays manage to land some effective blows on those naturalists, it does not follow that the cause of theism has been advanced in the least.

Really, now! I'm certainly relieved to know that the Infidels are **not** enthusiastic about naturalism. They have excellent reasons not to be. The naturalists must be hurting if even the infidels are keeping them at arms length!

[12/7]

Still on the topic of ["scientific realism" & physicalism](#):

The Taboo Of Subjectivity -- B. Alan Wallace, Oxford New York, 2000, [Reviewed](#) by David Lorimer:

Subtitled 'Towards a New Science of Consciousness', this is a landmark book in consciousness studies in the grand tradition of William James. Indeed it is the kind of book that James would have written had he been updating his writings 100 years on.

A section on the ideology of scientific materialism unpacks the key assumptions in a way not unlike the manifesto contained in this issue: objectivism, monism, universalism, reductionism, the closure principle and physicalism. While these may hold up for the world of scientific materialism, they are lead to an impoverished understanding of reality as a whole.

More generally, the sceptical approach of science is not applied to its philosophical assumptions as

these remain for the most part unconscious.

The next chapter illustrates the widespread confusion or conflation of scientific materialism with science. Machines are described in **anthropomorphic** terms which are then **re-applied** to human beings. Wallace gives examples from journalistic articles and textbooks, but reserves his main analysis for the philosophical conflations of John Searle, who does nevertheless reject some of the more crass materialistic approaches to consciousness but cannot finally extricate himself from its assumptions. This leads into the final chapter on scientific materialism as an ideology, which begins with a masterly statement of the overall view. If you disagree with this you must be either ignorant or irrational! However, as Wallace repeatedly observes, the astonishing thing is not materialism itself (as Crick maintained) but the fact that people 'so **enthusiastically** embrace an unconfirmed speculative theory that utterly denies the validity, even the very existence, of their personal, inner life'. The ethical implications of such a view have proved disastrous in the past and may do so again....

In his conclusion, Wallace suspects that consciousness may be the cloud on the horizon at the end of the 20th century, comparable to the **ultraviolet catastrophe** [physicists take note] at the end of the 19th. From a contemplative perspective, the current scientific world-view is fundamentally flawed since it has failed to take into account the role and significance of consciousness in nature. He sees contemplation playing a mediating empirical role between science and religion as they overlap in the mind itself.

The natives are getting restless.

[Nicholas Rescher](#) appears on the list. He is one of less than a handful of senior professional philosophers in this country pursuing contemporary idealism. From his incredibly voluminous list of publications, not a single one is posted as being online. This is a major handicap. He does have a list of 94(!) books on [Amazon](#). What little I have seen of his work, I find murky. I have not been able to discern any narrative of a world view. Lack of any narrative sensibility goes with the analytic territory. But even an Umberto Eco can only project his continental hermeneutic skill onto the past. The future remains a blank slate for us non-materialists. I remain convinced that it is the Eschaton that lurks beneath this deceptively placid surface. The Eschaton is the *telos* of all narration. The closer that one approaches to the metaphysical foundation of the Eschaton, the deeper is its shadow. No narrative of less than biblical proportion can illuminate that shadow. This is the eschatological barrier to all narration of the future. The breaking of that barrier entails a *Parousia*. It's that simple. The coherence we struggle for here is simply the *Logos*, in all its historical singularity. While the Cat is away, we mice have no choice but to keep on playing.

[Nicholas Rescher, *Objectivity- The Obligations of Impersonal Reason*](#) Reviewed by Scott Ryan:

Nicholas Rescher, probably the single **most prolific** [!] author among contemporary philosophers, here provides a sturdy defense of objectivity based on the primacy and inevitability of practical reason.

Objectivity hinges on rationality -- as a matter not simply of logical **coherence**, but also "of the intelligent pursuit of circumstantially appropriate objectives." From its requirements follows a sort of "**rational economy**," the principles of which are very obviously objective and universal although they may (and do) have different applications in different situations.

On this foundation, Rescher takes on a host of contemporary critics of objectivity -- anthropologists, historicists, sociologists of knowledge, personalists, feminists, Marxists and class-interest theorists, post-modernists, and social activists. He finds that each attack on objectivity involves a misconstruing of what it is all about, and devotes the remainder of the volume to showing why this is the case.

A '**rational economy**' outside of a cosmological, eschatological context would be throwing good money after bad. **Coherence** is not sold retail.

As always, Rescher's presentation is clear and cogent.

You recognize, of course, that my use of 'murky' for someone of Nicholas' provenance is being relative in the extreme. He is fighting the good fight. I'm just not sure that he is aware of Godzilla in the wings.

The awareness of that Presence must entail a new gestalt. How can he be so close, and yet be so far? The only clue may lie in the compulsive nature of his publishing, as if to keep the Monster at bay. I am only two feet on the other side of that fence.

Now!, from the Helsinki Metaphysical Club (at the University of Helsinki, 'an open discussion and study group, which is primarily focused on the investigation and advancement of **Peircean** philosophy and sign theory'), we bring you:

[EMERGENCE THEORIES AND PRAGMATIC REALISM](#) -- Charbel Niño El-Hani & Sami Pihlström, Draft version, February 2002. [Comments welcome](#). **Please do not quote.** (Shhhhhh.....)

The re-emergence of the emergence debate is related to the great development of the sciences of complexity, interdisciplinary fields of research concerned with the complex properties of life and mind, in the 1990s (Emmeche 1997). Another reason for the strong comeback of this philosophical doctrine lies in the collapse of positivistic reductionism and the related ideal of an unified science since the 1970s. We can think of the fortunes of reductionism as inversely correlated with those of emergentism, and, thus, the **fading away of reductionism** and the enthronement of non-reductive materialism as a new orthodoxy would simply amount to the resurgence of emergentism (Kim 1999:5). The revitalization of the emergence debate is also related to a number of emergentist hypotheses about mind and consciousness that have been proposed (e.g., Sperry 1969, 1983, 1991; Searle 1992; Baas 1996). The very term 'emergence' and its derivatives have become popular in the context of computer models of non-linear dynamical systems, complex systems research, Artificial Life, consciousness studies etc. As the concept of emergence is increasingly used, it becomes more and more important to keep the exact meaning of the central ideas involved clear. Moreover, it is crucial to discuss in detail what kinds of **metaphysical commitments** [?] are necessarily involved in emergentist thinking, inasmuch as many scientists and philosophers still think that emergentism is **incompatible** with basic metaphysical commitments of the **current scientific discourse**. In fact, there are now at least **two** different research **programs** dealing with the notion of emergence (or, at any rate, using the term 'emergence'), one which is clearly materialist and **naturalist**, and another which aims at the alleged **synthesis of science and religion** that some classical emergentists, as Lloyd Morgan, dreamt about (Blitz 1992). Several examples of papers affiliated with this latter research program can be found in Zygon, a journal devoted to the examination of the relationships between science and religion (e.g. Polkinghorne 1991; Peacocke 1991, 1993, 1994, 1999; Ashbrook 1996; see also Hasker 1999).

'Metaphysical commitments'? Eschatology, anyone?

In view of the difficulties faced by supervenience physicalism as a non-reductive stance, we have to search for alternative paths to the **middle road** between substance dualism and reductionism that many philosophers find attractive. In this connection, it is worth investigating if a combination of supervenience and emergence might fulfill the double requirement of dependence and determination, on the one hand, and non-reducibility, on the other.

'Middle road'? Is this metaphysics or arbitration? Is it the thesis of pragmatism that truth is arbitrated?

Here we are getting close to what might be labeled **pragmatic pluralism** regarding different approaches to the human mind.

If you are going to be pluralistic you will have to include theism. With God and Physics we have the irresistible force and the immovable object. May the best **One** win! Atheistic pluralism in oxymoronic. Sorry 'bout them apples, fellas. Mark my words, in the **End** it will be idealism versus materialism.

...reminding scientists that the mind remains psychological [...] even when its capacities are neurally or physiologically explained.

Sure, Hani, as long as you are willing to eliminate all essences, you may think whatever you please.

For some purposes it is better to employ the standard physicalist notion of effective causation; for some others one may adopt an 'Aristotelian' variant; for still others one might prefer a non-causal account. This pluralism liberates us from the dilemma to which Kim has led us, although, admittedly, some

tensions do remain between the positions we propose.

Good, then. On Sundays we can believe in God, and on the other days we can be materialists. Will God cooperate? If She doesn't, will just have to put Her in Her place. We'll keep Her in the kitchen for the rest of the week. I wonder if God's love is always quite so pragmatic. The mystics might be dubious on this score.

And then there was murkiness. And more murkiness.

Perhaps I'm forgetting though, that, despite or because of all their Pragmatism, James and Peirce are generally considered to reside in the idealist camp. Pragmatism then serves mainly as a smoke screen for their idealism:

The tradition of pragmatism, in particular, has strongly emphasized the practice- and discourse-embeddedness of the real world and its properties that we take our discourses and theories to be about. It is meaningless to speak about the reality of emergents absolutely independently of human theories and conceptualizations.

Yes, keep your eyes on the shell with the pea.

This is not to deny that emergence is, primarily, an ontological notion; rather, it is to say that ontology is not clearly separable from epistemology, because it concerns a **humanly structured** conceptualized **reality**.

If it walks like an idealist and talks like an idealist,.....

It is from Putnam that we adopt the pragmatist idea that ontological commitments depend on the conceptual **frameworks** within which they are made, frameworks which in turn depend on the human purposes and interests they serve.

And which framework is God's, pray tell?

Well, are we getting the idea?

According to this pragmatist approach, not even basic ontological notions such as existence have one fixed metaphysically privileged meaning or use (see, e.g., Putnam 1990:96-97). Our language and mind "penetrate so deeply into what we call 'reality' that the very project of representing ourselves as being 'mappers' of something 'language-independent' is fatally compromised from the very start". What counts as 'objects' or as 'properties' is as much up to us as it is up to the world, partly depending on how we use these words in the language-**games within which our ontological structurings are created**.

This sounds like a **fun game**. Can **God** play, too?

[12/8]

The convoluted issue of emergence has effectively blurred the boundary between ontology and epistemology. Scientific realism and naturalism are thus beholden to the normativity and functionality essential to epistemology. This is a big step toward idealism. Pragmatism, as we have been shown, is a significant waypoint on this path.

[The Biological Notion of Self and Non-self](#) by Alfred Tauber:

Without pursuing the ramifications of the cognitive approach to **immunity**, it is still evident that this turn in the language—"perception," "memory," "learning"—are in service to a more elusive "**knowing entity**."

Thus hidden within new formulations, the **self** still resides, reflecting a deep struggle over the character of biology, one that has its roots in Bernard's original understanding of autonomy, and now linked to our own more complex ecological views of agency and determinism.

I just wanted to underscore the ontological travails of the biologists. A travail which, evidently, they share with the organisms they seek to know.

It is possible that biology will become the primary battleground of contending metaphysical projects.

[12/9]

Presently I am listening to Nancey Murphy's presentation, 'Physicalist Anthropology and Resurrection: How Much Can we Know?' at the Berkeley [Eschatology, Immortality, and the Future of the Cosmos](#) conference (2001). Her limited web page at Fuller Theological is accessed only through their search page:

Nancey Murphy joined the Fuller faculty in 1989. She is highly sought as a speaker at nationwide conferences on the relationship between theology and science. Murphy also serves on the boards of the Center for Theology and the Natural Sciences at Berkeley, and is a member of the Planning Committee for conferences on science and theology, sponsored by the Vatican Observatory..... {She} is an **ordained minister** in the Church of the Brethren.

I would use Google: [Nancey Murphy](#).

['Nancey Murphy, Supervenience and Causality'](#) -- abstract by Lindsay Cullen

Nancey Murphy argues in *Beyond Liberalism & Fundamentalism*, that a post-modern approach to metaphysics, based on a **non-reductive physicalism**, will allow a fruitful bridging of the gap between interventionist and immanentist views of God's interaction with the world. This is achieved through her contention that there are causally significant 'higher level' laws which can affect interactions and which are neither constrained by, nor reducible to, lower level laws (such as the laws of physics). Whilst her aim is to be applauded, her methodology is somewhat flawed. In particular, her scientific defence of a non-reductive view is shallow and **unpersuasive**, and her use of the philosophical concept of supervenience is both eccentric and unhelpful. Thus her argument regarding higher-level laws founders, taking with it her basis for a rapprochement between 'liberals' and 'conservatives' on this particular topic.

To call herself a 'physicalist' distorts that term beyond recognition. Why Nancey hangs onto that term is mainly to disclaim the dualism to which her theological colleagues continue to maintain despite its incoherence. The contrast with Cartesian dualism is why 'non-reductive physicalism' remains current despite Kim's refutation of it as physical. Non-theists of a non-reductive persuasion may call themselves naturalists. Non-dualist theists, not willing to take the immaterialist leap, are left with a serious problem of nomenclature, not to mention logic.

[A Brief Examination of Nancey Murphy's Nonreductive Physicalism](#) -- By Sean Choi

This paper will briefly examine Nancey Murphy's "nonreductive physicalism" as she presents it in the book *Whatever Happened to the Soul?* (Fortress Press, 1998). After presenting her view, I will argue that Murphy's position is caught in the horns of the following dilemma: either the mental causally overdetermines the physical, or the mental is causally inert with respect to the physical. Since Murphy desires to save mental causation, her nonreductive physicalism gets impaled on the horns of this dilemma.

Yes, it's that simple. All of her disregard of logic just to avoid idealism. When the philosophical barrier to idealism is broken there will be a flood. Yes, it will be an eschatological flood of biblical proportions.

In terms of the distinctions drawn above, Murphy's "nonreductive physicalism" is a physicalist view in the philosophy of mind which accepts ontological reductionism, but rejects causal reductionism and reductive materialism. In her own words, "it denies the existence of a nonmaterial entity, the mind (or soul) but does not deny the existence of consciousness (a position in philosophy of mind called eliminative materialism) or the significance of conscious states or other mental (note the adjectival form) phenomena."

Her distinction between ontology and causality is remarkably incoherent. If you're an anti-dualist and an anti-materialist, there ain't much choice.

In summary, I have argued that given Murphy's nonreductive physicalism and her desire to maintain mental causation, she is stuck between the rock of causal overdetermination and the hard place of mental epiphenomena. I tentatively conclude that since neither of these positions are acceptable to her, it might serve her well to reevaluate her nonreductive physicalism.

Well, Nancey, when are you going to bite the bullet? It looks like your physicalism has got to go. Let's see then, non-materialism & non-dualism = immaterialism. No? It looks like it's time to bone up on Berkley, Nancey. Berkley (CTNS) is the Big Game rival of Stanford, but this is more important.

[CiS-St Edmunds Lecture series - MENTAL CAUSATION - Nancey Murphy](#)

John Taylor: Response to Professor Murphy's paper: Now, a **non-reductive** physicalist is in some sense seeking to avoid the problems of dualism and yet not veer towards a strongly reductionist position and one way in which the intuition behind that gets going is the thought that mental properties, even though they may be properties of a physical thing, are of a different kind.

But if you're a non-reductive materialist, what are you going to say about the causal efficacy of mental properties: do you want to say that the mental can, in some sense, make an intervening difference to the physical level. If you say that it seems that you've gone down the route that the **dualist** goes down.

This is quite an **acute dilemma** which has been pushed in a different variety of contexts in philosophy of mind literature.

...do we really get round the problem, the epiphenomenal question, by introducing the distinction between structural and triggering causes?

Nancey Murphy: The concept of structuring causes was employed in order to talk about how the brain gets structured so that causal sequences realize or instantiate rational sequences.

Nancey has taken a page from the book of Alexander: *How to solve the **Gordian Knot***.

All I really intended to do tonight is to work on one tiny piece of the puzzle, how can you reconcile rationality with causality. You've asked the big question about consciousness, which I don't attempt to deal with. I think it's got to be left for farther down the road when we know more about how the brain works. I am convinced, as a physicalist, that somehow or other the activity of our brains gives rise to consciousness, but I'm not at all sure that we'll ever have much **subjective** sense of understanding how that happens.

I think that your interlocutors would settle for some **objective** sense.

So all those questions are extremely important ones; they've got to be worked on in the future but the fact that I can't answer them now does not detract from the validity of the **tiny** little first piece that I've done.

A **tiny** step for Nancey, a **cosmic** leap for humankind. Nancey has the best intentions in the world of smoothing over the rough spots, but the Eschaton is not quite in her league.

I believe that the notion of self-transcendence is extremely important for understanding how we avoid neurobiological determinism.

Janet Soskice: Every aspect of our reality is created reality, and the big contrast in theology is not between mind, spirit and body but between what is created and the One who creates, that is the **fundamental distinction** and it is far more absolute than 'things that go bump in the night'.

What early theologians had to contend with was various kinds of neoplatonists who did argue for an immortal soul and indeed which participated in the divine - a chip off the divine block. Christianity and Judaism did not believe that because they believed that the human being was totally a creature,

But you need to emphasise creation: spirit is created, soul is created, body is created; in one sense you could say they are all material realities, that would be a direction you could take and be consonant with historical Christianity.

Nancey Murphy: I think that adopting physicalism is a very healthy thing for Christians because it establishes the **ontological dividing point** just where it should be, which is **between God and everything else**, rather than half way up the great chain of being.

This last exchange explains a whole lot about just what us idealists are up against, w.r.t. professional theologians. They would rather burn us **monists** at the stake, than have to grapple with the foundations of the world. Can we blame them?

[12/10]

What we see happening with [Nancey Murphy](#) (2,100 hits) may constitute a genuine phenomenon. Just off the top, it may be a preliminary mainstream Christian **reaction** to the [Tucson Consciousness](#) phenomenon of [David Chalmers](#) (8,700 hits) provenance.

The mystics were effectively monopolizing the ample spiritual dimension of the academically oriented consciousness movement, so I use the term '**reaction**' advisedly. The mystics are exploiting the intellectual concern with consciousness to work their monistic magic. The Christian dualists are beginning to react, finally.

The orthodox Christians have always felt extremely threatened by the various monistic and pantheistic heresies that perennially threaten their orthodoxy. It is fair to say that this conservative reaction was a primary motivation behind that other phenomenon: the Inquisition, which, in its turn, gave rise to Cartesian mind-body dualism and thus to the worldview of Scientific materialism. But now that the Scientific materialists are threatening to engulf the mind in their materialist maw, the non-materialists are forced, with no small trepidation, to enter the fray.

The first out of the blocks were the mystics. They are an independent lot, some of whom are willing to tilt at any given windmill. Our orthodox prophetic brethren and sistren are rather more corporate and reactionary in their *modus operandi*. Why? Well, they are carrying a heavy prophetic burden. Theirs is the Eschaton. It's not walk softly and carry a big stick. It's carry a big stick, and therefore you darn well have to walk more cautiously. That is unless you have designs on the second coming.

But when the prophetic types see that the mystics are, against all odds, actually scoring points in the Mind Wars, they have to respond. Their almost knee jerk response is to throw their lot in with the naturalists, promoting a non-reductionist panpsychism as a stopgap against the dreaded pantheism. This is where Nancey is. She is leading the troops in this reaction.

Where then are the [theistic idealists](#)? Total silence? One may trace this movement up from the ashes of the Inquisition into Germany, England and then on to our fair, transcendental shores. Since the first War, the transcendentalists have either vanished or become speechless. The Twentieth Century was not at all kind to idealists of any stripe. Will the Twenty-first be any more hospitable? I guess we're about to find out.

My fervent hope is that Nancey & Co. will smoke out my fellow theistic idealists, just as the pantheists succeeded in smoking out the theists. Will Google work its magic through all this smoke? Will that radar show any blips as my co-idealists find their stealthy way into this nascent arena?

Perhaps [Wolfhart Pannenberg](#) (1928-) (3,400 hits) can shed some light on the matter, taking my cue from [Dramatic Theology as a Research Program](#). Wolfhart emphasizes holism and hermeneutics as a bridge between the sciences and humanities including theology.

For Pannenberg, the question whether the entire history makes sense or whether there actually is a **comprehensive totality of meaning** or truth is identical with the question about God.

Show me a coherentist and I'll show you a theistic idealist.

Therefore time is the condition and the measure of the infinite's appearance in the finite, since the difference between future and presence veils the barrier of the present and lets it shine in the full light of the infinite, as long as its time lasts. Therefore a definite manifestation of God is not possible until the **end of history**.

Furthermore, show me a coherentist and I'll show you an eschatologist.

In the context of this understanding of science and the world, it is important for Christian theology that Jesus acted in an apocalyptic horizon, i.e. that he anticipated the end of the entire history of mankind and the **resurrection of all the dead**. Only in this context could he talk about God as a reality determining the entire history. However, since Jesus did not appear at the end of the world, but could only foresee the totality, his proclamation remained only a subjective anticipation and consequently problematic and hypothetical.

Pannenberg actually has - almost as the only theologian - got involved in Hume's criticism in an open and honest way. [...] As the bases for determining all concepts are completely different in Hume's and Pannenberg's theory, both systems cannot be directly compared with each other in **Murphy's** view: they are incommensurable. [...] Moreover, Pannenberg's methodology is unworkable since it finally follows an evolutionary view. In this way one could always describe afterwards only how things have actually developed and there are no clear criteria which theory should be chosen and preferred for the future.

In our view, Murphy's criticism of Pannenberg is not convincing in important points. First of all, the anticipation of the end of history is no longer a merely abstract or even abstruse claim in our days. [...] Finally the epistemology of Pannenberg is not incommensurable to Hume's epistemology, but just more comprehensive, since it is not only "past-entailing", but "past"- as well as - "future-entailing".

After her criticism of Pannenberg, Murphy proposes an alternative method for theology and refers to [Imre Lakatos](#) in this context.

"Neuro-Science and the Soul" -- a talk given by Dr. **Nancey Murphy**, [reviewed](#) by Norman Hall:

She warned her audience that she would make no hard distinction between mind and soul, but would discuss the long-standing question of the mind/soul as a single or dual entity. Most philosophers and scientists, she admitted, are monists, now that neuroscience has completed the Darwinian revolution, attributing mind to the brain, and not to any immaterial entity.

So the resolution [according to Murphy] of the problem posed by these multiple levels of description is not to be found in the identity of the phenomenon described, but in "supervenience," which preserves both a non-reductionist description of the person, and allows for divine action in the world of mental events.

To relate what she was saying to other trends in modern theology, Murphy invoked the theology of Arthur Peacocke, who places theology at the top of a hierarchy of sciences, calling it the most encompassing of the sciences. Peacocke's position is not pantheistic (wherein there is said to be but

one reality, consisting of God identified as world), but is one of "**panentheism**," wherein the world is in God, but the divine reality must include more than the world. This, she says, fits her "supervenience" concept, where there is more to the mental than brain, that irreducible "more" being found on the social level.

I am pleasantly surprised that Nancey looks with favor on panentheism.

Nancey Murphy should be ashamed of herself for trying to pull such an obvious piece of bait-and-switch flim-flam as she did in her formula for the defeat of reductionism.

At least she has raised the ire of the 'godless' scientists.

The question for Nancey is that if it is OK for the mind-soul to be supervenient on the body, is it OK for God to be supervenient on the world? If not, does this not place God entirely beyond our reach, and is that dualism the purpose of her 'physicalism'? The answer appears to be, 'yes'. But this is not the thesis of Panentheism of the world in God.

['Is Science Good for the Soul? Then sings my psychophysical somatic unity!'](#) -- Matt Donnelly (Christianity Today):

In recent years, Murphy has been saying that human beings do not have a soul, at least not in the way that soul has traditionally been defined—"the spiritual part of a human being that is believed to survive death,"....

...throughout the history of the church, philosophers have carried on esoteric debates about the precise nature of soul that had little impact on believers in the pews. So what's new? What really matters is that, as believers in Christ, we know that when we die, our souls will not perish. [...] Right? Not exactly, says Murphy.

..."while Christians are mostly consumed with opening yet newer rounds in their century-and-a-half-old war with Charles Darwin, they have scarcely the faintest idea that the new consciousness enthusiasm"—that is, the broad consensus represented by secular thinkers such as Dennett, Pinker, and Patricia and Paul Churchland and Christians such as Murphy and Jeeves—"is by far the greater threat to the integrity of Christian belief." The case against dualism, Guelzo suggested, has by no means been definitively made.

What is the case is that Nancey believes in the resurrection: we stay in the grave 'til Judgment Day. But since she is an irrationalist about the future, allegedly in deference to Darwinism, she can disavow all discussion of this topic. This is a bizarre spiritual cocktail that Nancey is brewing. All this to avoid what? A little coherence?

There is a great desire to protect the mystery of God. Any transgression of the veil of God would be apocalyptic. Yes, that is my point. All of this irrationality is by way of a spiritual filibuster. But the show must go on.

While talk of conscious robots or cloned humans may sound like science fiction, Christians must be prepared to engage this brave new world by articulating a vision for the future of humanity that combines scientific knowledge with biblical wisdom. The world is watching. It remains to be seen how Christendom will respond.

Yes, it does remain to be seen.

[Books & Culture Corner: "Daddy, What Is the Soul?" Does the church have an answer?](#)

By John Wilson 12/10/2001 (Christianity Today):

The same period has seen an explosion of scholarly interest in "consciousness." There is a vast and steadily growing literature in the field of consciousness studies,... Oddly, while all of this has been going on, the church hasn't paid much attention. Sometimes it seems as if everyone *but* the church is

talking about the soul.

Perhaps the theologians are waking up and smelling the coffee.

['The Methodological Equivalence of Design & Descent: Can There Be a Scientific "Theory of Creation"?' by Stephen C. Meyer - Reprinted from *The Creation Hypothesis*, ed. by J.P. Moreland \(InterVarsity Press, 1994\)](#)

Most scientists who are theists also accept this same conception of science. As Raymond Grizzle wrote in a prominent evangelical scientific journal recently, "God cannot be part of a scientific description. . . . [Further], any description that implies a creator will probably also be looked at as improper by most scientists." **Nancey Murphy**, a philosopher and Fuller Seminary professor, agrees. She wrote recently in the same journal: "Science qua science seeks naturalistic explanations for all natural processes. Christians and atheists alike must pursue scientific questions in our era without invoking a Creator. . . . Anyone who attributes the characteristics of living things to creative intelligence has by definition stepped into the arena of either metaphysics or theology."

However Christian intellectuals might go about defending methodological naturalism, secular defenders of the principle assure us that the prohibition against invoking God or creative intelligence is anything but arbitrary. Instead, they assert that good independent reasons exist for the conventional exclusion of such notions from all scientific theories. Theories of design or creation do not, they say, meet objective standards of scientific method and practice. Such theories do not explain by reference to natural law, nor do they manifest a host of other features of true scientific theories such as testability, observability and falsifiability.

Here we see a creationist taking on the theistic defenders of naturalism. An intra-theistic debate on metaphysics cannot hurt the cause of rational theism. Idealism finds itself somewhat in the middle of this argument. The creationists take materialism rather too seriously. We are confronted with contending dualisms: mind-body, and Creator-creation. The creationists have so far avoided the mind-body problem, but they are not taking the Deistic path of Murphy & Co. This may be my final accusation against Nancey: she is a deist. Her strict dualism allows no other view. Her favorable mention of pantheism does not jibe with her other beliefs.

[12/11]

If truth be known, I'm not enamored with the soul. I am glad that Nancey is sticking it to the theologians about the obsolescence of this, their pet concept.

The soul, incongruously, has been the mainstay of both mysticism and Cartesian materialism. Within those opposed systems the soul constitutes the main barrier against coherence. Thus is the soul the great enemy of idealism. If process philosophy has taught us anything, it ought to be that the soul, along with God, is a process. We and God are all creatures of the overriding process of love.

At most, the soul is a repository of potential energy, like a spring, a spring weighted down by its accumulated karmic memories. Like a compressed spring, it is inherently unstable. In its relaxation, it returns to and is consumed by love. That is our salvation and our ecstasy. God holds the key to our forgiveness. We cannot work it out by ourselves, no matter how many lives we might spend. That is the key to the Kingdom, and I would not be particularly surprised if it had something to do with the cryptographic potential of the **Monster group**. That extreme mathematical object is essentially the memory, or 'soul', of the material aspect of the world, which must overlap with each of our individual memories. Topologically, all of Creation along with the Creator is held together as a virtual chain of stitches. This is also reminiscent of the coiling of the cosmic serpent. When the trumpet sounds....., well, you get the picture.

This topological, non-atomic analysis of the soul is possible only in a system that is monistic and

coherent. This is also in agreement with the holographic and fractal nature of reality. Our souls are the product of a lengthy, historical process of symmetry breaking, as we see in the physics of field theory. In the eschatological regime, we witness the reversal of that symmetry breaking. These mechanical metaphors are only to be used as analogical, conceptual aids. The actual processes are metaphysical in nature.

The idea of an atomic soul is like a 'zeroth' approximation used in calculating a physical process. As we move to higher order approximations, the symmetry and topological continuity are restored. Theologians, not surprisingly, are working with this 'zeroth' approximation of the soul. They will have to be nudged repeatedly to get them off this mark, and onto a more refined and coherent model of metaphysics. The first step is always the most difficult. After that first big step to the next higher approximation, all the other steps will come rather easily.

The postmodern anti-foundationalism is necessary to deconstruct our atomic concept of the soul, so that a more coherent reconstruction of it may begin.

Time out for a little [idealism](#): it's always worthwhile to check the latest sources:

[Pluralistic Idealism- Only Mind, Many Minds](#) -- [Alan Anderson](#) (1997). He provides a synopsis of modern idealism. Alan participates in the [New Thought Movement](#), allegedly based on idealism

[The Personalist Forum](#) is another bastion of contemporary idealism.

[Borges, the Apologist for Idealism](#): Marina Martin argues that Hume was an implicit idealist, and traces a complete lineage.

[Current Issues in Idealism](#), eds. [Paul Coates](#) and [Daniel D. Hutto](#) (1997): just this blurb:

This collection of original papers, the **only current anthology** on twentieth century idealism, shows the debate between idealism and realism to be as important now as it was at the beginning of the nineteenth century. It brings together an exciting range of views by some of the most distinguished writers in the field.

Focused on the idealist/realist dispute, contributors also discuss the relation of idealism to ethics, metaphysics and epistemology. The volume also deals with the distinction between ontological and conceptual forms of idealism, the place of idealism within the analytic tradition of philosophy and the coherence of the idealist/realist distinction.

The contributors include: [Donald Davidson](#), [Timothy Sprigge](#), [Tom Sorrell](#), [Phillip Ferreira](#), [Leslie Armour](#), Michele Marsonet.

Not exactly a ground swell, not yet. [Nicholas Rescher](#) is not a contributor, and none of his many articles is listed as online. That Davidson is an idealist would be a surprise to me.

[INTERNATIONAL CONFERENCE ON ANGLO-AMERICAN IDEALISM](#) At the Olympic Centre for Philosophy and Culture and the Municipality of Pyrgos of Elia, Greece, 20th-25th August **2003**. It sounds nice. Includes a long list of participants.

...and (iii) a discussion of the continuation and revival of Anglo-American Idealism in the work of Dorothy Emmet, Errol E. Harris, [Rex Martin](#), Peter P. Nicholson, Nicholas Rescher, Timothy Sprigge, and others.

The first two listed are no longer with us. Still no groundswell. I see no linkage between this list of idealists and our previous list of [anti-reductionists](#).

Despite the paucity of these lists, I'm under the impression that, of the philosophically active theists, most are also idealists of one sort or another, and *vice versa*; Nancey Murphy being a very conspicuous exception. This important fact of philosophical life has not registered with the theistic community.

'[Mereological Considerations in Vasubandhu's "Proof of Idealism"](#)' by [Matthew Kapstein](#), University of Chicago, for the [Studies in Yogacara Buddhism seminar](#) of the [American Academy of Religion](#) (1998):

Vasubandhu, the founder of Buddhist philosophical idealism, has been the object of considerable philological research since the latter part of the 19th century. Historical data alone justify the efforts that have been made, for, with the translation of his works into Chinese, Tibetan and not a few other languages, Vasubandhu's thought became, from about the 6th century onwards, a dominant force in central and east Asian intellectual life.

It is instructive to ponder the considerations which led Aristotle to shun idealism in favor of his continuity-theory, and which led Vasubandhu to make just the opposite move. For the Stagirite, the notion that a body might be "nothing but an appearance" is patently absurd, and is tantamount to maintaining that ". . . its constituents are nothings, . . . it might both come-to-be out of nothings and exist as a composite of nothings." If we agree that this is not possibly correct, and reject atomism at the same time, then we have no choice but to seek, with Aristotle, an alternative theory of matter.

Vasubandhu, on the other hand, aims to demonstrate that the atomic theory is both false and necessary: ". . . atomic distinctions must be supposed; and there can be no simple atom." Wherefore, matter is naught but ideal. Vasubandhu, if he is to make his case, must demonstrate the truth of the premises of a simple modus tollens argument: (1) If material things exist independently of the perceptions in which they are given, then they must be atomic in composition. (2) But they cannot be atomic in composition. Therefore, (3) material things do not exist independently of the perceptions in which they are given.

[12/12]

My contention in these pages is that anti-reductionism entails idealism. The arguments of Vasubandhu appear to be supporting this view. But let's continue:

At this writing, I am not at all certain that Vasubandhu's four counterexamples can be made to do the work demanded of them, i.e. demonstrate that, on the assumption that matter is real, atomism necessarily follows. They do, however, underscore several of the difficulties which must be resolved by the continuity-theory, if it is to be made capable of fully expressing our commonplace intuitions with respect to parts and wholes.

Vasubandhu sought to prove idealism by demonstrating, like Kant, that our concept of composite material wholes necessarily entails there being simple, atomic substances; and that atomism is false. In so doing, he, no less than the latter, underestimated the potential strengths of the continuity-theory, and of the point-particle theory. It may be asked: would even a fully successful argument of this type be sufficient to demonstrate the truth of idealism?

It looks like I have to bone up on my [Yogacara](#). I'll be using materials from the above mentioned seminar.

I should have been investigating eastern idealism before this. I was not aware of the analytic aspect of that tradition. As a coherentist, I am not keen on the analytical; however, putting an analytical nail in the coffin of materialism may prove very useful.

A major issue with Buddhism will be the reality of persons. I am not an absolutist about souls. They exist in God's 'memory'. We'll see how that works out with our Buddhist buddhies.

'[External Objects Do Not Exist](#)' by **Dan Lusthaus**, Florida State University (1997):

Maatra ("only"), according to this interpretation, acts as an approving affirmation of mind as the true reality. However, the Yogacarin writings themselves argue something very different. Consciousness (vijñāna) is not the ultimate reality or solution, but rather the root problem. This problem emerges in ordinary mental operations, and it can only be solved by bringing those operations to an end.

Sounds like eschatology. Perhaps there are two minds: mundane and not so mundane.

That the term vijñapti-maatra has been valorised while no one would dream of valorizing the other - maatra compounds is perhaps a testament to the pernicious persistence of bhaavaasava, the compulsion to assert something existent to which one can cling. That is one of two extremes from which the middle way is designed to steer us (nihilism is the other). Yogacara is deeply concerned about the human propensity to posit things we can appropriate.

Yogacara tends to be misinterpreted as a form of metaphysical idealism primarily because its teachings are taken to be ontological propositions rather than epistemological warnings about karmic problems. The Yogacara focus on cognition and consciousness grew out of its analysis of karma, and not for the sake of metaphysical speculation. Two things should be clarified in order to explain why Yogacara is not metaphysical idealism: 1. The meaning of the word "idealism" and 2. an important difference between the way Indian and Western philosophers do philosophy.

OK, let's get down to business:

Tellingly no Indian Yogacara text ever claims that the **world** is created by mind. What they do claim is that we mistake our projected interpretations of the world for the world itself, i.e., we take our own mental constructions to be the **world**.

Are my buddhies drawing a line in the sand? Didn't someone already say, 'A **world** is a **world** is a **world**.' Is there some other **world** that I missed? If I were to save the world, which world would I be saving? I can only do one. Is the world an illusion? Of course, but it sure as heck ain't our illusion. It is God's. Only a slight emendation. Of course, we are God's helpers: like the elves at Christmas.

The arguments Yogacara deploys frequently resemble those made by epistemological idealists. Recognizing those affinities Western scholars early in the twentieth century compared Yogacara to Kant, and more recently scholars have begun to think that Husserl's phenomenology comes even closer.

But there are also important differences between those Western philosophers and Yogacara. The three most important are: Kant and Husserl play down notions of causality, while Yogacara developed complex systematic causal theories it deemed to be of the greatest importance; there is no counterpart to either karma or enlightenment in the Western theories, while these are the very *raison d'être* for all Yogacara theory and practice; finally, the Western philosophies are designed to afford the best possible access to an ontological realm (at least sufficient to acknowledge its existence), while Yogacara is critical of that motive in all its manifestations.

['Yogacara Buddhism in China'](#) by CHEN-KUO LIN:

Unhappy about some scholars, 'mainly from the Anglo-Saxon cultural sphere', having challenged the Yogacara 'idealist' ontology of 'nothing but cognition', in his paper entitled 'On the Problem of the External world in Ch'eng wei shih lun', Lambert Schmithausen vigorously argued that 'the existence of "extra-mental" material (or other) entities' is rejected not only as objects of cognition but also as such without any qualification. Although he might not have the final word, Schmithausen's paper can be seen as one of the most significant responses to the dispute initiated by Alex Wayman in the 1970s and espoused by many scholars since, including Dan Lusthaus, who strongly challenged a non-idealist interpretation.

[...] As expected, a sort of anti-idealist stance is clearly demonstrable in Lusthaus' hermeneutics.

Yes, all this is just a bit confusing! Back to you, Dan:

In contrast to the cognitive karmic dimension, Buddhism considered material elements karmically

neutral. The problem with material things is not their materiality, but the psychology of appropriation - desiring, grasping, clinging, attachment - that permeates our ideas and perceptions of such things. It is not the materiality of gold that leads to problems, but rather our ideas about the value of gold and the attitudes and actions we engage in as a result of those ideas.

The mind doesn't create the physical world, but it produces the interpretative categories through which we know and classify the physical world, and it does this so seamlessly that we mistake our interpretations for the world itself. Those interpretations, which are projections of our desires and anxieties, become obstructions preventing us from seeing what is actually the case. In simple terms we are blinded by our own self-interests, our own prejudices (which means what is already prejudged), our desires. Unenlightened cognition is an appropriative act. Yogacara does not speak about subjects and objects; instead it analyzes perception in terms of graspers and what is grasped.

This sounds like a preachy version of Kant. How 'bout that Noumena? The Noumena is the Unconscious. No? Let's not complicate things. Dan does not say what the world is, all by its lonesome. Someone terribly more crass than myself might say, 'Put up or shut up, Dan!'

['Conceptions of the Absolute in Mahayana Buddhism and Shinran'](#) by [John Paraskevopoulos](#):

In closing, I would like to reiterate the great importance of an adequate and satisfying conception of the Absolute as being indispensable to the Buddhist path. In a climate of increasing scepticism and **reductionism**, especially in certain Buddhist scholarly circles in the **West**, it is imperative that one does not lose sight of the fact that without such concepts as Dharmakaya, Suchness, Nirvana, Sunyata etc. being grounded in a true and existing reality which both **transcends** and suffuses all things, Buddhism is left without any foundations and stands on nothing, thereby losing all sapiential and **soteriological** efficacy. In the attempt by some to make Buddhism more fashionable by **denying** that it has anything much in common with views of **ultimate reality** in other spiritual traditions, it does itself a great **disservice** in failing to recognise clear parallels where they exist - parallels, indeed, which should not surprise anyone. To speak of all these terms to describe the Absolute as 'symbolic' in an attempt to somehow downgrade the reality of the ultimate object of aspiration is sheer folly - of what exactly are they symbols? To be sure, these terms do not exhaust the fathomless depth of the reality to which they refer but, on the other hand, neither are they empty symbols created by us in order to fulfill some kind of nostalgic and delusory quest for the Infinite which has no basis in the true nature of things. A spiritual path which cannot offer any deliverance from that which is finite, imperfect and illusory, to that which affords eternal blessedness and liberation from suffering and the painful clutches of samsaric existence, is simply not worthy of the name.

Soteriological? Now we're talking! Yes, those reductionists are wont to run roughshod over almost everything. But what can they do about those atoms? Those atoms are tough titties.

['The Theory of Evolutionary Process as a Unifying Paradigm'](#) by Frank Barr, MD

As Alfred North Whitehead (1929) has facetiously pointed out: "Scientists, animated by the purpose of proving they are purposeless, constitute an interesting subject for study."

[Nirvana and Samsara Are Not the Same](#): [Adi Da Samraj](#)

But both of these great conceptions have frequently been reduced to popular ideas or beliefs and conventional ideals of the beginner's mind and the earlier stages of life. Indeed, the larger tradition of the Mahayana was specifically oriented toward this popular **reductionism**, because it intended to be a popular religion rather than a "hard school" reserved exclusively for those who were capable of the most mature and advanced kind of practice. It is this aspect of the Mahayana that represents a tendency to decline from the original attitude of the Buddhist tradition, and it is this will to popularize Buddhist institutions that is the seed of the false views or conventional **reductionism** I have just described. Indeed, the pressures created by the needs of a popular institutional system are what have created the greatest problems for all esoteric and **Transcendentalist** traditions. The **will to "save" everyone** (or to reduce the profound disciplines and intuitions of the Way of Truth to a path that is acceptable even to those who have neither the time nor the inclination to submit themselves to the Truth) is the cause of all the most devastating compromises in philosophy. Of course, the intention to serve and Help others also

has undeniable merit, and so all Teachers and traditions must struggle to serve humanity and yet retain the authenticity of confinement to Truth.

Is Universalism that bad?

East is East & West is West

[(12/17) This started out to be a contrast of the prophetic vs. pantheist traditions, but I was soon distracted with the metaphysics of existence, until the [last paragraphs](#). My plan this morning is to again take up this contrast, but now in the context of [Creation](#), on the next page.]

And now the twain will meet. (And once again, as you see, I ran out of [parchment](#).)

Yes, I have given lip service to the immaterialism of the East, but the next step is, as usual, well past due. Not being under the Inquisitional pall that has dogged the prophetic West, the East is more like a Rorschach inkblot. You cannot peer into that multifaceted pattern without catching at least a glimpse of your own reflection. I am making no claims as to objectivity, that is not my shtick, anyhow. Objectivity is not the Eastern shtick, either.

The linking of the immaterialism of East & West will finally push immaterialism over the top, and it may happen in our lifetimes. It will also be the death of that Inquisitional step-child, fundamentalism, scourge of the prophetic tradition.

It is true that reductionists of various shades have found comfort in the metaphysics of the East, but, trust me, we immaterialists will be finding ammunition. The East was way ahead of the West in deconstructing God and Self. And that is always a useful exercise in anti-absolutism. But unlike our materialists, they long ago moved beyond reductive nihilism. Those moves will be most instructive to us postmoderns.

Does the East have anything to learn from the West, besides building bombs? Yes, they will be learning about the Second Coming and the BPW, yes, and Singularity. And it may go easier for them, not being trapped in orthodoxy to our extent.

'[Buddhist reductionism](#)' -- Mark Siderits (1997):

There has been much recent discussion concerning the relation between Parfit's Reductionism and the view of persons to be found in early Buddhism and Abhidharma. Some have claimed that Parfit is wrong to see in the Buddhist position an important anticipation of his own view—since the Buddhist view is not, as he supposes, Reductionist, but rather Eliminativist. Others suggest that while certain of the Abhidharma schools might have held a Reductionist position, early Buddhism may defensibly be interpreted as Non-Reductionist in character.

Parfit distinguishes between two versions of Non-Reductionism: the view that persons are separately existing entities (such as Cartesian Egos) and the view that while we are not separately existing entities, the existence of a person involves a **further fact**, over and above the "more particular facts" of the existence of a brain and body and the occurrence of a series of interrelated physical and psychological events.

I think we can settle these disputes by realizing that we exist in the mind of God and *vice versa*. But what about atheists, animals and atoms? How do they exist? Parasitically. Parasitism is the whole game: nothing is exempt. It is not fair to say that people are a cancer on the world. With monism there is a coherent spectrum, and perhaps a Wilberian spectrum of consciousness, too. Nothing is subtractable from or addable to the singular BPW, and everything in its own time and place, including revolution. Just as we become God, so does God become us. The singular cosmic cycle is one big revolution. Am I a singularity nut? No, just a monist nut. Am I opposed to diversity and ultraterrestrial civilizations? What is ultimately coherent is what we get. That's all. The only thing missing are the square circles. However, it may be possible to square the circle using the Monster group, along with a non-standard analysis of some kind. Never say Never.

Personal identity, like a flame, is a process. We can relight the candle at any time, especially when we

realize that both candle and flame are figments of the cosmic imagination. And we can always play it again, Sam. You and I could be instant replays. Everything is play and replay. Does that violate singularity? The exceptions prove the rule. Past, present and future, memory and anticipation are not as distinct as we pluralists sometimes like to think.

The doctrine of the two truths distinguishes between what is called conventional truth and ultimate truth. [...] This device allows us to resolve the seeming contradictions in Nagasena's position. When he claims that adult and infant are neither the same person nor distinct persons, he is stating what he takes to be an ultimate truth. Since persons are conceptual fictions, any claim concerning the identity over time of a person must be ultimately false. His assertion that adult and infant are the same person he takes to be only conventionally true.

No. This is not coherent. Persons and concepts of persons are not distinct. The world is a fiction. It is literally a cosmic narrative. The ontic and epistemic are no more distinct than the analytic and synthetic. Holism is the only game in town.

Distinctions are fictions. They are useful pedagogical devices. Just don't take them too seriously. Should we take the world seriously. Yes, some of the time, because it's the only one we'll ever really get.

But let's go back to [Vasubandhu with Matthew](#), and some free association. It does not make much sense to say that a perceived object is composed of invisible atoms. A silver atom does not conduct electricity, but silver does. A chariot is more than the sum of its parts. Each part of a chariot has an irreducibly functional existence. Can we distinguish between the chariot and our concepts of it? How? But what about the Earth's molten iron core? Or that distant supernova? The fact is that the iron came from a supernova: one logically entails the other. But does logic exist apart from reason? But what about simple causality? Causality is contextual to a high degree. So is existence. Does anyone claim that relational contexts are mind independent?

But surely there are unobserved supernovas and planets. Yes, but only as a logical background to the actuality of our experience. That which is superfluous to experience is as inconceivable as a square circle, and with no more claim to existence. The larger context is the Best Possible World. The BPW and idealism are mutually dependent. Anything else is inchoate. Contexts cannot be inchoate. Existence is relational, but the whole of it is all or nothing. Existence is complete. Existence and meaning are practically synonymous and they share a thoroughly holistic nature.

A question in my mind concerns the decentralization of causation. Coherence and the Principle of Sufficient Reason might seem to invoke a single source of causation. With the Big Bang theory there is a single cause, everything else is mechanics. Can we invoke some of that mechanics and not conflict with the PSR? In our case it is an idealized mechanics that facilitates the equitable distribution of agency throughout Creation. This has to do with the idea of the level playing field amongst the creatures, where the action is metabolically constrained. What is the nature of those constraints in the case of immaterialism? Can we substitute logic for physics, or is there even a difference? Can we not invoke logic in the manner that Physics invokes mathematics?

Also at our disposal are memory and habit to serve as constraints. And, of course, there are atoms, which exist in the appropriate circumstances. But atoms are no longer the sole, or even the primary mediators of action, even in the inorganic realm. Nature is replete with habitual, cyclical processes in which the creatures participate.

How does non-atomic water learn how to behave? Who takes it to school, and where? But first, let it be noted that we do not have an atomic theory of water. Starting from quantum physics, no one has derived the vital bulk properties of water. Non-physicists would be **shocked** to find out how irreducible are virtually all the physical processes in the world. They all come under the rubric of '**phenomenology**'.

95% of physics is not derived from basic principles. Actually make that 99.9%. Even at the level of **elementary particles**, 95% of the 'Physics' is phenomenological, and that's being conservative. It takes the most powerful computers in the world hours to make even crude estimates of one quark hitting another. And as for 'string theory', we don't even have the algorithms to put into the computers. Has any one ever wondered how the heck the particles know how to behave? Is there an even bigger computer in heaven? The whole idea of materialism and reductionism is so absurd, it is easily the biggest put-on in history. It is a conspiracy so vast and effective that only God could have pulled it off, thank you. If you think I'm kidding, well, ask your neighborhood physicist. We need some fresh ideas.

Back to water. If quarks don't explain water, then what does? The story starts with God dreaming about going for a swim. Is this being too crude? In the not so long-run, it will provide a more robust understanding of water than quarks can ever hope to. God likes the concept of water. So let's work it into history, and see how our characters respond. Shall we say that the creatures go with the flow?

But wait, how is God able to dream **without** a brain? I could ask you how you are able to dream **with** a brain, but I'm too nice of a guy to ask rhetorical questions. The point is that since we have not the slightest idea of the nature of the causal relation between mind and matter, it is totally arbitrary to suppose that one is logically prior to the other. But regardless of the logical precedence, the main problem of explaining the world comes with having to explain **self**-organization. Am I being biased in suggesting that the concept and functions of **selves** is much more amenable to the realm of mind than it is too matter?

But why should brains exist if they are not necessary for experience? What does the PSR say about this? Any 3-D game requires 3-D objects of various kinds. Animated sensory agents would be essential for most such purposes. Having sensory organs that are correlated with sensory capacities would seem pretty reasonable. Does that mean that God had to sit down and design eyes and ears? I would doubt it. God just imagines the main contexts and then lets the protagonists work out their own optimizations. It is self-selection, operating at the level of the self, not the DNA. That is what we are here for. The chemistry would work itself out later. Even Darwin would not feel terribly slighted. Continuity of forms is a major aspect of coherence.

[12/14]

Despite the lack of any known causal or logical connection between mind and brain, neuroscientists do find a high degree of correlation between the two realms. How do we explain such correlation if it is not causal?

The materialists go about explaining everything from the bottom up. They have no other choice. Materialism is simply the rule of atoms. We immaterialists have more choice. With our panpsychism, we can invoke upward and downward causation. With only one direction of causation permitted to the materialists, they can explain only half of the world, and it is the half that, by definition, is unobservable. What a shame!

Mind-body correlation is simple for us immaterialists. On the 'zeroth approximation' it's all in the mind: the cosmic mind, that is. But for the benefit of the creatures we need higher levels complexity. On the first level, we invoke bodies to be the foci of individual creaturely minds. One body, one mind. The body could be marionette, or a computer sprite that we move around on the world stage by remote control, but that would be artificial and clumsy. Consider the concept of natural continuity and integration of mind and matter. This is the only reasonable way to proceed with Creation. How much of the design work does God have to do? I think, not much.

Obviously mind is a powerful organizer. It can organize upwardly and downwardly. Upwardly through voluntary cooperation, downwardly by individual will-power. We can profitably remain agnostic about the pre-creational state of the cosmic mind, particularly as to the degree of its integration. In other words,

the primordial level of entropy remains indeterminate. Primordial self-organization could have taken many forms and operated on many levels before the BPW began to take shape. This multi-level action would proceed into the domain of Creation proper, involving the BPW. The cooling down of the mental entropy leading to multifaceted symmetry breaking would have occurred on many levels, with just the minimum necessary coordination from on high. There would always be an ecology of mind. The symmetry breaking represents the formation of the interdependent ecological niches. There would, in effect be a self-speciation of mind, with the attendant bodily forms being gradually optimized through habituation. The potency of an evolutionary-style chain-of-being would play a major role in coordinating this process. It is through this back door that Darwinism enters the picture. The molecular details of the genetics can work itself out in the fullness of time. Very likely the Genome projects are, in a quantum-like or even alchemical fashion, forcing the molecular arrangements into their definite states, as we speak. If this sounds too teleological, well, that is the whole point of the Eschaton, so we had better get used to it.

During this whole ecological self-organizing process the integration of body and mind proceeds by all means on all levels. A seamless integration that we call Nature is the result. The further we probe the brain, the greater the resolution that we will find. But what will that prove? Not much.

[12/15]

Evolution is a great and compelling story. But is it the whole story? On its own terms, yes, it is. Do we have reason to suspect those terms? Our primary reason for suspicion has to do with the existence and nature of the mind. There are significant aspects of the mind which seem superfluous to the scheme of evolution. But if mind does seem profligate, we readily acknowledge that it is not evolution's only seeming profligacy. There being no objective measure of profligacy, we are left with anecdotes.

The primary feature of the mind is its organizational ability. This is also, of course, the primary feature of evolution. The issue of the completeness of Darwinian evolution obviously hinges upon its capacity to account for the natural order, not just in its details, but *in toto*. The Darwinists are comforted by the lack of any organizational measure. Natural selection could well suffice. Surely it accounts for some of the order, so why not all of it? Why drag in other speculative causes? Where is the compulsion to do so?

What is the rationale to consider alternatives to Darwin? The human mind is naturally speculative, why thwart it? Yet there is palpable resistance to such speculation. There is certainly no institutional support for the sort of fundamental speculation you see on these pages. And one does not have to be a brain surgeon to understand why.

Civilization has always been a precarious balance of competing forces, as is all of nature. Just ask Darwin. New ideas can and have disrupted that balance. Ask any scientist, politician or theologian. In fact, the outstanding standoff, the one that actually defines modernity, is the balance between science and religion. That armistice is based on one speculative metaphysical idea: the Cartesian dichotomy of mind and matter.

It is true that many scientists and philosophers are being paid to nibble around the edges of that dichotomy. The result of all that nibbling seems only to have been a reinforcement of Descartes' original intuition. Not too surprising considering the sponsors. Nonetheless, the apparent intractability of the Cartesian gap is a thorn in the side of evolution. A thorn not diminished by time.

The amazing and accelerating progress being made in molecular genetics across the entire spectrum of evolution, is serving to highlight the Cartesian gap in our understanding of the natural order. There has also been considerable progress in neuroscience, but none that speaks directly to the Gap. There has been comparable progress in Artificial Intelligence, but that too has provoked no new insights into the Gap. There is no discernable research program that directly addresses the issue. No such program has even

been suggested that has been endorsed by anyone beyond its original proponent. Behaviorism and functionalism are the apparent exceptions, but the wide consensus is that they are failed stratagems aimed primarily at ignoring the problem.

David Chalmers' characterization of this Gap as the toughest intellectual challenge ever, has been widely touted. No one has offered a cogent demurral of this characterization.

At some point we will give up nibbling at this problem. There are already clear signs of fatigue on the part of even the most conscientious nibblers. If nibbling won't suffice, there is but one reasonable alternative. Swallow the problem whole. Such a strategy can only be based on an essentially non-reductive metaphysic. But what is that?

There is plenty of talk these days of emergence. What is that? It is non-reductive metaphysics. If it is the answer, what sort of answer is it? The basic issue is whether the term 'non-reductive naturalism' is oxymoronic or not. Is it fair to say that modernity hangs in this balance? Almost certainly.

By definition, emergence cannot be explained from the bottom up. It is non-reductive. But what would a natural explanation look like? There seems only to be the hope that a lot of little gaps will add up to the big Gap. *Voila*, the big Gap is reduced to little gaps, and modern life proceeds: business almost as usual.

There is a slight problem. No one agrees on how even to begin to carve up the mind. The mind has no agreed upon joints or seams. This fact does not bode well for naturalism. How do we begin to explain the mind if we cannot begin to analyze it. If nibbling doesn't work, people will try gobbling. But there is no evidence that anyone has even gotten their teeth into the problem. Non-reductive naturalism appears to be a non-starter, when it comes to dealing with the problem it is intended to solve. If nature tolerates one indigestible entity, the next entity in line will be the whole mind.

But wait. Is there not clear evidence that mind evolved? Yes, as long as we don't make the additional Cartesian assumption that all other animals are insentient. There is no clear reason for assuming that the snail's mind is not some fraction of ours. So there! We just have to figure out which fraction it is. And there's the rub. How can we speak intelligently of any scheme of fractionation without penetrating the mind in question? And, yet, even with all the benefits of language, to what extent can we penetrate our own individual minds or those of our closest acquaintances? We have another non-starter.

[I have a theory that snails are smarter than humans. Snails exist almost entirely in their **collective unconscious**, which ought to be rather more capacious than our individual consciousness. QED.]

Anyone for brain surgery? That is where we are with neuroscience: reasonably sophisticated brain maps, correlated with a spectrum of subjective experience. Those brush strokes are so broad that we cannot even distinguish between the connectionist and computationalist aspects of the mind, except to realize that neither model nor any combination of them is making sense or even getting us to square one with natural intelligence. Is there some new breakthrough model out there just waiting to be discovered? If it is non-computational, non-connectionist, non-reductive, non-local, non-verbal, non-mechanical, etc., aren't we running out of possible metaphors? This is why, in our desperation, would-be cognitivists turn to the strangeness of the Quantum in what appears to many as a last resort of naturalistic(?) speculation. But the Quantum is a decidedly mixed bag for naturalists. Its paradoxical reliance on **observational** processes and openness to **unobservable** processes renders it rife for dualistic speculation. But that is why it is so attractive to its proponents.

I'm not suggesting that naturalistic research be terminated. The naturalists should be given more than enough rope to hang themselves. We non-naturalists can afford to be generous in that regard. History indicates that research programs almost always implode from within (pleonastically?). What I am suggesting is that, Golly, maybe we should think about alternatives to naturalism. And, Gosh, what might those be? Let me think. Non-naturalism? How about something with a bit more of a ring to it?

But never mind. Heck, I kinda like being the only (Is it a fact?) non-naturalist speculator on the Web. It's a conversation piece at cocktail parties or a great pick-up line. And enough of this frivolity!

[12/16]

East & West? This was supposed to be the topic.

I have remarked previously on the seeming unfairness of the prophetic tradition. Prior to the advent of the electronic media, prophecy was a decidedly local phenomenon. 'Accidents', speaking colloquially, of birth and history would be paramount in determining who had access to what traditions. However, given Universalism, these 'accidents' are rectified in the end.

One of these 'accidents' was the compartmentalization of the prophetic and pantheist or immaterialist traditions. Had there not been this compartmentalization, there would not have been the opportunity for a **dramatic convergence** of the theist and pantheist traditions, attendant upon the exhaustion of materialism: a dramatic turn toward theistic idealism providing an intellectual revolution that would be integral to a messianic or parousiac event. The working out of the mutual completion of those two traditions would be nearly universally accessible in real time. Everyone could participate in one manner or another.

12/13/02

Creation & Maya

[A brief [summary](#) appears at the end of the page.]

I have previously broached the subject of [Creation](#) on several occasions. Here I hope to look at it particularly from the contrasting views of the prophetic and pantheist, or [Eastern and Western](#), traditions.

My second favorite Creation story is that of Vishnu dreaming up the world. This has always made a lot more sense to me than the various other creation stories that generally depict God as an artisan rather than as author or inventor. A typical example is the story in Genesis of God creating Adam out of clay. I recall that there are two separate creation stories in Genesis, and the one referenced is the second, and perhaps earlier one. But probably the most 'primitive' of known stories, and my **all-time favorite**, is from the Australian aborigines where there is simply a reference to the primordial 'dreamtime'. I don't recall that there was any specification of a particular dreamer. The implication is that it was all beings. This is even closer to my immaterialist, participatory view of the matter. Obviously I will need to brush up on my Creation stories, and I like to think that able assistance will be on the way, once Google wakes up and smells the BPW, but I may just be dreaming!

Several things need remarking. Hinduism is generally regarded as atheistic, so the popular myth above that casts the Vishnu as Creator confirms the pluralist tolerance of the East. Nonetheless, it is peculiar how the contrasting stories of dreamer vs. artisan so clearly demarcate the monism and dualism of the East and West respectively. Hopefully we can eventually get a handle on which came first: the metaphysical ethos or the creation narratives. I wouldn't put it past the Creator to have planted the respective narrative seeds, just with the immanent [dramatic convergence](#) of the parousia in mind. Or it could be that the Aborigines have been the most conserving of the **one** aboriginally planted story, out of Africa: the rest being various *ad hoc* emendations. Further historical research is clearly indicated.

With these preliminaries behind us, it's time to Google on [Creation](#) (12,000,000 hits). I guess we'll have to be a bit more specific:

[Aboriginal Dreamtime](#) (4,500 hits). [Vishnu's dream](#) (23 hits). (The more orthodox Hindu view of the origin of the world is [maya or illusion](#) (48,000 hits)).

[Hinduism](#) by Joseph Campbell:

Hence, we are all one in Vishnu: manifestations, inflections, of this dreaming power of Vishnu; broken images of himself rippling on the spontaneously active surface of his subtle mind stuff. Moreover, this sleeping god's divine dream of the universe is pictured in Indian art as a great lotus plant growing from his navel. The idea is that the dream unfolds like a glorious flower, and that this flower is the energy-or, as the Indians say, the shakti or goddess-of the god.

[12/18]

The following are extended excerpts taken from seven sources on the [maya & illusion](#) list. These are mostly for my own record. Following the excerpts will be a discussion of them. **You are invited to skip ahead** several screens to the [discussion](#), and then refer back to the excerpts as appropriate.

[Maya- The Grand Illusion](#):

Maya or illusion is a very potent instrument of the Divine Prakriti, the Primal Nature. Through the force of illusion, It holds the beings under its sway.

The beings under illusion cannot see the Invisible God and so they cannot correctly comprehend Him. They cannot see Him in all and all in Him.

It is possible to overcome the influence maya by following the teachings of Lord Krishna taught to Arjuna in the middle of the battle field. By following the Gita, one can develop stability of the mind, through the control of the senses and desires; become a humble devotee of God,

MAYA AND ILLUSION -- Swami Vivekananda

Much later on, in one of the latest Upanishads, we find the word Maya reappearing, but this time, a transformation has taken place in it, and a mass of new meaning has attached itself to the word. Theories had been propounded and repeated, others had been taken up, until at last the idea of Maya became fixed. We read in the Shvetashvatara Upanishad, "Know nature to be Maya and the **Ruler** of this Maya is the Lord Himself." Coming to our philosophers, we find that this word Maya has been manipulated in various fashions, until we come to the great Shankaracharya [[Sankara](#) (c.700-750 CE)]. The theory of Maya was manipulated a little by the Buddhists too, but in the hands of the **Buddhists** it became very much like what is called **Idealism**, and that is the meaning that is now generally given to the word Maya. When the Hindu says the world is Maya, at once people get the idea that the world is an illusion. This interpretation has some basis, as coming through the Buddhistic philosophers, because there was one section of philosophers who did not believe in the external world at all. But the Maya of the Vedanta, in its last developed form, is neither Idealism nor Realism, nor is it a theory. It is a simple statement of facts--what we are and what we see around us.

Thus we find that Maya is not a theory for the explanation of the world; it is simply a statement of facts as they exist, that the very basis of our being is contradiction, that wherever there is good, there must also be evil, and wherever there is evil, there must be some good, wherever there is life, death must follow as its shadow, and everyone who smiles will have to weep, and vice versa. Nor can this state of things be remedied.

Thus the Vedanta philosophy is neither optimistic nor pessimistic. It voices both these views and takes things as they are. It admits that this world is a mixture of good and evil, happiness and misery, and that to increase the one, one must of necessity increase the other. There will never be a perfectly good or bad world, because the very idea is a contradiction in terms.

Attempts have been made in Germany to build a system of philosophy on the basis that the Infinite has become the finite. Such attempts are also made in England. And the analysis of the position of these philosophers is this, that the Infinite is trying to express itself in this universe, and that there will come a time when the Infinite will succeed in doing so. It is all very well, and we have used the words Infinite and manifestation and expression, and so on, but philosophers naturally ask for a logical fundamental basis for the statement that the finite can fully express the Infinite. The Absolute and the Infinite can become this universe only by limitation. Everything must be limited that comes through the senses, or through the mind, or through the intellect; and for the limited to be the unlimited is simply absurd, and can never be. The Vedanta, on the other hand, says that it is true that the Absolute or the Infinite is trying to express itself in the finite, but there will come a time when it will find that it is **impossible**, and it will then have to beat a retreat, and this beating a retreat means renunciation which is the real beginning of religion. Nowadays it is very hard even to talk of **renunciation**. It was said of me in America that I was a man who came out of a land that had been dead and buried for five thousand years, and talked of renunciation. So says, perhaps, the English philosopher. Yet it is true that that is the only path to religion. Renounce and give up. What did Christ say? "He that loseth his life for my sake shall find it." Again and again did he preach renunciation as the only way to perfection. There comes a time when the mind awakes from this long and dreary dream....

We see, then, that beyond this Maya the Vedantic philosophers find something which is not bound by Maya; and if we can get there, we shall not be bound by Maya. This idea is in some form or other the common property of all religions. But, with the Vedanta, it is only the beginning of religion and not the end. The idea of a Personal God, the Ruler and Creator of this universe, as He has been styled, the Ruler of Maya, or nature, is not the end of these Vedantic ideas; it is only the beginning.

<http://www.totallyok.com/secret/056r.htm>:

Sankara says with senses there is no possibility to know whether the thing confronting you is real or unreal. And if there is no possibility to know whether it is real or unreal, Sankara calls it MAYA: it is illusion. Illusion doesn't mean unreal. Illusion means an impossibility to decide whether it is real or unreal -- remember this.

In Western languages MAYA has been translated very wrongly, and it gives the feeling in Western terms that "illusion" means "unreal." It does not! "Illusion" means the inability to decide whether the thing is real or unreal. This confusion is MAYA.

Try to understand this: I may dream in the night that I have become a butterfly, and I cannot decide in that dream whether this is real or unreal. In the morning I may be puzzled like Chuang Tzu whether instead the butterfly may have been dreaming. These are two dreams, and there is no way to compare which is real and which is unreal.

But Chuang Tzu is missing one thing -- the dreamer. He is thinking only of dreams, comparing dreams and missing the dreamer -- the one who dreams that Chuang Tzu has become a butterfly, the one who is thinking that it may be quite the reverse: that the butterfly is dreaming that she has become Chuang Tzu. Who is this observer? Who was asleep and is now awake? You may be unreal, you may be a dream to me, but "I" cannot be a dream to myself, because even for a dream to exist a real dreamer is needed. Even for a false dream a real dreamer is needed. Even a dream cannot exist without a real dreamer. So forget dream. This technique says forget dream. The whole world is illusion, you are not. So don't go after the world, there is no possibility to gain certainty there. And now this appears to be proven even by scientific research.

If the whole world is unreal, then there is no shelter in it. Then you are moving after, following shadows, and wasting time and life and energy. Then move inwards. One thing is certain: "I am." Even if the whole world is illusory, one thing is certain: there is someone who knows this is illusory. The knowledge may be illusory, the known may be illusory, but the knower cannot be. This is the only certainty, the only rock on which you can stand.

This technique says look at the world: it is a dream, illusory, and nothing is as it appears. It is just a rainbow. Go deep in this feeling. You will be thrown to yourself. With that coming to one's own self, you come to a certain truth, to something which is indubitable, which is absolute.

Maya:

Thus the world of experience the world of discernment is an illusion. For nothing in it has a real or separate existence in its own right. Ultimately there is something behind the world that cannot be perceived by the eyes or the senses. It is knowledge and discernment of its elements that generates maya the world of illusion. Of course this illusion itself comprises also the perceiver which makes things even more difficult. For the perceiver has to - not only free themselves from the illusion of the world that appears to be around them but also from the illusion of the existence of themselves as separate egos - individuals. This is compounded by the fact that even the desire to free them selves of this illusion becomes part of the illusion. The need to achieve to grasp at understanding the problem is also maya.

Maya:

Maya (Sanskrit: "wizardry," or "illusion") is a fundamental concept in Hindu philosophy, notably, in the Advaita (Non-dualist) school of the orthodox system of Vedanta.

Maya denotes the power of wizardry with which a God can make human beings believe in what turns out to be an illusion; by extension it later came to mean the powerful force that creates the cosmic illusion that the phenomenal world is real.

Maya, as per Hindu thought, is illusion, and what mankind understands to be reality is in fact the dream of Brahma. Brahma is the creator and great magician who dreams the universe into being. The dream itself is maintained by Vishnu, the Preserver, who uses maya to spin the complex web that we know as reality.

It is not that the world itself is an illusion, only our perception of it. Whereas we suppose the universe to

be made up of a multitude of objects, structures and events, the theory of maya asserts that all things are one. Rational categories are mere fabrications of the human mind and have no ultimate reality

[Advaita & The Bhagavad Gita -- SWAMI B.V. TRIPURARI:](#)

Sankara differs principally from the other schools of Vedanta in that he does not acknowledge the ultimacy of the personhood of Godhead. For Sankara, all is one, and there is no difference. The individual soul is illusory, as is the appearance of God, and the world. Although speaking of a personal God (isvara) and soul (jivatma), Advaita Vedanta in the final analysis denies the existence of both of these truths at the 'paramarthik' (ultimate) level of reality. According to advaita, the material world is also unreal. It exists only as a dream of the imaginary jiva, who can realize that he himself does not exist as an individual or as anything definable (neti neti) by meditating on the illusion of a personal God (isvara, Krsna). As silly as this sounds, Sankara has amassed considerable logic and scriptural references to support his conception. However, unless one has heard at least his basic logic and scriptural twist before hand, it is impossible to arrive at his conclusion from straight forward reading of the Bhagavad Gita. An unbiased reading of the Gita leaves one with God, soul, and real material world, with devotion as the means to liberated life, and the liberated expression of that life.

At times Sankara associates maya with a power of Brahman, by which he makes the rope of the undivided reality appear as the snake of the manifold world. Brahman is said to engage in this **magical act** for the purpose of **creation**, thereby making himself available for the salvation of his devotees.

It should be obvious that Sankara's explanation of maya creates further problems. To whom or what does Brahman present the illusion of maya? Furthermore, if Brahman is simplistically one, as defined by Sankara, how can an illusion which is by definition different from Brahman in nature exist at all? If there is no other, as per Sankara, how can Vedic revelation such as the Gita have any meaning, when it presupposes a difference between seeker and that which is sought?

Sankara's explanation of this sutra is his own invention and it departs radically from the text of Badarayana's, in which there is absolutely no mention of anything remotely resembling the notion of a two tier Brahman in the entire treatise. Here Sankara is guilty beyond a shadow of a doubt of attaching his own doctrine to the Vedanta Sutra in order to make the sutras themselves, Vedanta, appear compatible with his own doctrine of advaita!

[Concept of "Maya": Vedantic and Shaivistic points of view](#) by Prof. K. N. Dhar

In the earlier Vedas-the first book of Humanity-'Maya' has been used in the sense of supernatural or extraordinary prowess attributed to the pantheon of gods. In more ancient Vedic hymns it is praised as 'world sustaining power'. But the later Vedic literature comprising the upanishadic lore, it began to convey the sense of illusion, though in subdued tones. So, this philosophic content relating to this word, had already been spelt out in the time of Upanishads. The later philosophic treatises in the classical age of Sanskrit must have taken a cue from the meaning attached to this word in the Upanishads and have remarkably kept its intonation in tact.

The logical Realism (Nyaya) of Gautama a virtual reaction against Buddhist scepticism has no concern for this word 'Maya', but substitutes it with the appellations Doubt (Sanshaya), fallacy (Hetuvabhasa) and Error (Mithya Jnana). To speak precisely, doubt is wavering knowledge, Fallacy is inconclusive knowledge and Error is defective knowledge. All these three attribute of knowledge definitely provide the base on which the superstructure of 'Maya' was installed later on.

As regards Maya, Shankar's [**Sankara's**] premise is that it is an antithesis of Brahma because of being inextricably connected with the world (Jagat). Brahma is real (Satyam) while world is transitory or unreal (Mithya). It is definitely part and parcel of Brahma-the very basis of creation. As nothing can be created out of a vacuum, in the same way Brahma being the only eternal entity, the world does emerge out of it only. At this stage Ignorance (Avidya) intervenes to confuse the human mind and intellect by mistaking the Finite form of Brahma with its Infinite form. Therefore, ignorance is the progenitor of Maya (Illusion), unreal seeming as real. "Since Maya is deceptive in character, it is called 'Avidya' or false knowledge, it is not mere absence of apprehension but positive error." Toys and pots made of clay, though bearing different names and shapes from each other, are nothing but clay; similarly this 'Maya' through 'Avidya' gives rise to plurality without scanning the inherent unity. When Brahma projects itself into myriad forms

and names, or transforms itself into the world; this kind of activity inherently of Brahma is called Ishwara with relation to the world and the power to procreate is alluded to as Prakriti. (Ishwarsya MayaShaktih Prakriti). Therefore Maya is the energy of Ishwara, His inherent force by which He transforms the potential into the actual world." It has no separate identity, it is in Ishwara as heat in fire. Maya through the machinations of false knowledge (Avidya) or erroneous perception (Mithya Jnana) exhibits its modus operandi (Vyapara) in two ways of concealment (Avarna) and misrepresentation (Viksepa). It hides the truth and at the same time mis-represents it.

Non-discrimination (Aviveka) has been explained by its commentator KshemaRaja as follows: "Paramartha Svarupasya Aprathana Svabhavah." The nature of non-projection of the highest form of Truth.

This would clearly denote that the stage of non-projecting or non-extending of the supreme spirit is 'Maya'. In other words, it would connote the inability of the supreme consciousness (Samvit) to transfer its consciousness to the objects around. This kind of non-perception and subsequent non-identification between the self (Atman) and the objects (Padartha) will precisely convey the purport of Maya in shaivistic thought: shaivism has treated maya as shakti (Energy), even the primeval Energy or Nature (Mula Prakriti). It is identical with the immanent form of Shiva; His transcendental form is unaffected by it.

This very approach of shaivas marks their fundamental difference with the vedantists. The shaivas take Maya as an inevitable aspect of Shiva when releasing His shakti (Energy) from His fountain-head. Even though He is universe incarnate (Vishvarupa), yet He feels the urgency of creating a universe, so that His shakti (Energy) can have full play. This Maya is called a veritable screen which conceals the real form of things (Tirodhanankari) deluding us into believing the multiform of universe, which in essence is uniform. The moment, the realizer through his perceptive cognition (jnana), takes the blue (neela) and the yellow (peela) as one, and only one entity, the Maya stops her machinations. Therefore shaivas treat Maya as not as unreal but momentary. As against it, the vedantists proclaim that Maya is unreal (Ayathartha), coinciding squarely with their thesis that universe is unreal (Jagat Mithya). Shaiva scholars are at pains to argue that this whole creation is a reflection (Abhasa) of the Super-self which is real, omnipotent and self-dependent (Svatantra): therefore, the relation between the world of appearance (Vishvamaya) and that of Transcendence (Vishvateerna) is that of the reflected object and the reflector. If the reflector is real, how can an object, its reflection, be unreal; since the reflected object has no separate entity from its reflector. Hence Maya has to fulfill her role in transmuting transcendence into immanence. It is thus a veritable hide and seek between the primordial and subliminal aspects of the same force which is Shiva. Vedantins taking Maya as a perennial deluding force, treat this world as unreal, illusory, but shaivas do not subscribe to this view. As argued earlier, they take this world as real-an image of superconsciousness (Chaitaynam) which to all intents and purposes is self-dependence (Svatantrva) incarnate. Hence shaivas invoke Maya as the progenitor of the world of objects as a whole (Sakala Janani), or as Casual Matrix (Amba). The attitude of shaivas towards the concept of Maya is positive, affirmative in the sense that as long as the equation between shiva and shakti is disturbed, it has to be there. As against this, the vedantins treat Maya as negation of vidya (Avidya).

Shaivas contend that a realizer can attain emancipation while living (Jivanmuktavastha) in this world, that is when his coalition (Jnana) is complete and does not waver in seeming diversity around him, he can attain bliss of unity, being in perfect health, mentally as well as physically. The line of thinking adopted by vedantins is that life being false needs to be abjured, while shaivas treat enjoying life (Bhoga) as a preamble to meaningful renunciation (Yoga). In this context Abbinavagupta has asserted emphatically that this world is essentially Truth. Therefore, in vedantic school of philosophy we come across with a galaxy of ascetics having renounced all earthly concerns (Sanyasins), but in shaivism we are confronted with spiritual guides (Acharyas) who have owned life and also have risen above it; with them matter is as important as the spirit.

Hence the conception of Maya as outlined by the **vedantists** is above the average quotient of intelligence possessed by an ordinary man. Shaivism, on the other band, has given a straight and simple definition of Maya, in consonance with the average intelligence obtaining in an ordinary mortal.

Even though vedantins and shaivas are at variance with regard to the conception of Maya, yet their destination is same-ennobling human intellect and awakening human spirit. This is exactly the rhythmic

jingle of the heart-beats of Indian mind from times immemorial.

Discussion of the previous seven sets of excerpts:

Toward the [end of the last set](#) of excerpts, Prof. Dhar states that the more pessimistic, vedantist view of maya is reserved for the intellectuals, while the more optimistic, shaivist view is more suitable for the masses. A similar polarity is often noted and even touted in the West, as between the atheist intellectuals and the theistic masses. There is a twist however. The secular intellectuals in the West tend to be positive about human nature, while the sectarians see human nature, when not imbued with divine grace, in negative terms. Science, of course, provides no rationale for any value judgment concerning human nature.

The original meaning of maya was 'magic'. It referred to the [magical act of creation](#) on the part of one or more deities. As in the West, and with the disenchantment of the world generally, magic became synonymous with illusion. There are many holding the view that theism is the last modern remnant of this atavistic strain of primitive animism. On that same scientific view, the pantheism of the East is less objectionable in that it does not personify its metaphysics. As a practical matter, however, theism has been rather more hospitable to science than has pantheism.

The modernists who look upon theism as irrational are making the large and unjustified assumption that intelligence is reducible. They are betting the world on Artificial Intelligence. Implicitly they endorse a Transhuman, i.e. non-human, future. Oh, there may be some token humans, but their fate will be in the hands of the self-reproducing, self-evolving robots.

They may be right. However, the combined postmodernist and fundamentalist reactions to the cyborg futurism are holding those scientific ambitions in check. And, perhaps more to the point, the diminishing returns in the AI arena are instilling a greater sense of caution in the materialist rank and file. Finally it is the bare facts of non-reductionist life that are giving pause to the overweening reductionists.

It is finally on the issue of reduction that theism, pantheism and materialism confront each other over Creation. Only theism offers [El Camino Real](#). Correction: there are no longer any reductionists [[an exception](#)]; it is the question of emergence that has come to the fore. Stated most bluntly: is naturalistic emergence an oxymoron? Can emergence replace Creation? Can emergence replace the 'sky hook', the downward causation, the teleology that is explicit in Creation?

On the issue of emergence, it appears that the pantheists and postmodernists side with the naturalists in their non-reductive materialism.

Naturalists believe that emergence is entirely spontaneous. From the view of complexity theory there are 'attractors' that pull errant system trajectories into their domains under specified conditions of instability, as the system hunts for a new 'dissipative structure' one step further removed from the primordial chaos. Presumably there exist a non-denumerable infinity of such attractors and structures. Evolution is the random, stepwise selection of some finite sequence of these potential structures.

[12/19]

It appears that Hinduism has been set aside temporarily in deference to **complexity theory** and [dissipative structures](#) (5,000 hits). But prepare again for a lengthy set of excerpts, mainly for my own benefit. Once again you are invited to skip ahead to the [comments](#).

'[Existence Itself: Towards the Phenomenology of Massive Dissipative/Replicative Structures](#)' by David M. Keirse. I also excerpt from [another page](#) of David's.

There are very few scientists that would admit to being reductionists, but we all are, to a large degree, inheritors of [Newton's brilliant mistake \[Rosen 91\]](#). But, besides lamenting the sins of reductionism [\[Rosen 91\]](#), [\[Goodwin 96\]](#), [\[Oyama 86\]](#) and pointing out its weaknesses, there needs to be a methodology for going beyond the criticism and helping to generate new ways of understanding and building conceptual models which include the both the characterization of context and the "system" of complex phenomena.

There are many ways to define the word "complexity"[\[5\]](#). And there many connotations of the word "complexity" deriving from the work trying to answer some basic scientific questions, such as computational complexity, algorithmic information complexity, [logical depth \[6\]](#), [thermodynamic depth\[7\]](#), and [effective complexity \[4\]](#). All of these usage's are valid and useful for understanding nature, but these usage's of the word "complexity" are sophisticated in ways that are difficult to directly relate to naturally occurring "entities" such as elementary particles, atoms, molecules, cells, and organisms as we know them in the world.

Part of the problem with using the concept of complexity is the problem of defining exactly what consists of "the system" or the entity which encompasses the complexity. We will argue that some delineation's of systems are more natural than others for understanding how the complex things arise, such as living organisms.

'[Dissipative structures](#)' by [Cosma Rohilla Shalizi](#): The following is skeptical report on the attempts to analyze or explain emergent structures.

[Ilya Prigogine](#) (NL) coined the phrase, as a name for the [patterns](#) which [self-organize](#) in far-from-equilibrium dissipative systems. He thinks they're unbelievably important, and says so at great length in his books. Some of us physicists believe him; some are skeptical; I am leaning towards skepticism.

And then there is the matter of [Prigogine's] scientific peers --- not the systems theorists and similar riff-raff, but the experts in thermodynamics and statistical mechanics and pattern formation. One of them (P. Hohenberg, co-author of the latest Review of Modern Physics book on the state of the art on pattern formation) was willing to be quoted by Scientific American (May 1995, "From Complexity to Perplexity") to the effect that "I don't know of a single phenomenon his theory has explained."

This is extreme, but it becomes more plausible the more one looks into the actual experimental literature. For instance, chemical oscillations and waves are supposed to be particularly good Dissipative Structures; Prigogine and his collaborators have devoted hundreds if not thousands of pages to their analysis, with a special devotion to the [Belousov-Zhabotinsky reagent](#), which is the classic chemical oscillator. Unfortunately, as Arthur Winfree points out (When Time Breaks Down, Princeton UP, 1987, pp. 189--90), "the Belousov-Zhabotinsky reagent ... is perfectly stable in its uniform quiescence," but can be disturbed into oscillation and wave-formation. This is precisely what cannot be true, if the theory of Dissipative Structures is to apply, and Winfree accordingly judges that "the first step [in understanding these phenomena], which no theorist would have anticipated, is to set aside the mathematical literature" produced by a "ponderous industry of theoretical elaboration".

Somewhat more diplomatic is Philip W. Anderson, one of the Old Turks of the [Santa Fe Institute](#), and himself a Nobelist. I refer in particular to the very interesting paper he co-authored with Daniel L. Stein, "Broken Symmetry, Emergent Properties, Dissipative Structures, Life: Are They Related", in F. Eugene Yates (ed.), Self-Organizing Systems: The Emergence of Order (NY: Plenum Press, 1987), p. 445--457. The editor's abstract is as follows:

The authors compare symmetry-breaking in thermodynamic equilibrium systems (leading to phase change) and in systems far from equilibrium (leading to dissipative structures). They conclude that the only similarity between the two is their ability to lead to the emergent property of spatial variation from a homogeneous background. There is a well-developed theory for the equilibrium case involving the order parameter concept, which leads to a strong correlation of the order parameter over macroscopic distances in the broken symmetry phase (as exists, for example, in a ferromagnetic domain). This correlation endows the structure with a self-scaled stability, rigidity, autonomy or permanence. In contrast, the authors assert that there is no developed theory of dissipative structures (despite claims to the contrary) and that perhaps there are no stable

dissipative structures at all! Symmetry-breaking effects such as vortices and convection cells in fluids --- effects that result from dynamic instability bifurcations --- are considered to be unstable and transitory, rather than stable dissipative structures.

Thus, the authors do not believe that speculation about dissipative structures and their broken symmetries can, at present, be relevant to questions of the origin and persistence of life.

Some quotes from the paper itself:

"Is there a theory of dissipative structures comparable to that of equilibrium structures, explaining the existence of new, stable properties and entities in such systems?"

Contrary to statements in a number of books and articles in this field, we believe that there is no such theory, and it even may be that there are no such structures as they are implied to exist by Prigogine, Haken, and their collaborators. What does exist in this field is rather different from Prigogine's speculations and is the subject of intense experimental and theoretical investigation at this time.... [p. 447]

Prigogine and his school have made a series of attempts to build an analogy between these [dissipative far-from-equilibrium systems which form patterns] and the Landau free energy and its dependence on the order parameter, which leads to the important properties of equilibrium broken symmetry systems. The attempt is to generalize the principle of maximum entropy production, which holds near equilibrium in steady-state dissipative systems, and to find some kind of dissipation function whose extremum determines the state. As far as we can see, in the few cases in which this idea can be given concrete meaning, it is simply incorrect. In any case, it is clearly out of context in relation to the observed chaotic behavior of real dissipative systems. [pp.454--455]

'The Self-Made Tapestry: Pattern Formation in Nature' by Philip Ball: [reviewed](#) by **Shalizi**:

In particular, Thompson made a point of not invoking natural selection, indeed of leaving any kind of history out of the story. "A snow-crystal is the same today as when the first snows fell": so, too, the basic forces acting upon organisms, so why bring history into it? The early years of this century are littered with biologists with little use for natural selection; they are now almost all deservedly forgotten. Thompson owes his continuing influence to the fact that his alternative doesn't beg questions at every turn.

Since Thompson's day, then, there has been a **tension** in the study of morphogenesis between **evolution** and (other kinds of?) **self-organization**, and this is one of Ball's themes, though not the leading one. Partly it is an argument about logical and theoretical questions --- what is natural selection competent to explain? what features of organisms could not be modified by selection? to what extent is self-organization unavoidable? --- and partly it's about where the balance between self-organization and evolution lies in actually existing organisms.

The case for the self-organizers can be put very strongly, at least for multicellular organisms, for metazoans. These are not bloated sacks of protoplasm but (as the biologist say) "differentiated" --- there are different chemicals in different parts of the body.

So there has to be some particular differentiating influence. It cannot be the genes (on which natural selection acts), since genes only encode information about proteins, i.e. about what chemicals to make, not where to put them. So it would seem that differentiation, morphogenesis, must be due to some internal process, some reaction of the proteins and their associated chemicals which sorts out what goes where; but this is to say that there needs to be spontaneous pattern formation, that development must be self-organizing.

It may, admittedly, look like we're in trouble with some obvious facts, that this argument leaves genes and natural selection with no purchase at all on morphogenesis. But not even the most enthusiastic of the self-organizers, the ones with the least use for Darwin (e.g., Brian Goodwin) goes that far. [...] The genes twiddle the knobs, so to speak, and then let self-organization do its voodoo.

This is a pretty convincing line of argument; at least, I'd like to think so, since it convinced me for years. No longer; let me try to say why with a fairly concrete example.

The experimental study of biological development is more than a hundred years old now, and advances in it fill scores of fat journals every month. In all this vast wealth of detail, there is not a single case where a kind of self-organization proposed by theorists has been confirmed (though there are a few likely-looking candidates), and many cases where self-organization is definitely known not to take place. As the old joke says, "If it's slimy it's biology, if it stinks it's chemistry, and if it doesn't work it's physics."

This doesn't mean, of course, that the whole exercise has been a waste of time, much less that there is no role for theory in developmental biology, that the current find-a-gene-sequence-it-and-move-on mania is the last word on the subject. Between the DNA and the extra fingers there are a whole host of biophysical problems from the shapes of molecules to the mechanical properties of muscles which we need to solve before our knowledge of morphogenesis will be reasonably complete. As a theoretical physicist interested in biology and anxious about long-term employment, I find this comforting.

Shalizi is a self-avowed reductionist working out of the Santa Fe Institute. His pessimistic outlook on his own field of physicalistic explanations of emergence warrants consideration. He has not given up on reductionism, but he is not hopeful that anyone will find the formula for self-organization.

Evidently there are dynamically stable structures in the world, but very few of them show promise of physical explanation. Where does that leave the naturalists? It leaves them uncomfortably near to their vehemently disavowed vitalist forerunners, but still on the lookout for strange [attractors](#) (102,000 hits):

[Complicity and the Brain- Dynamics in Attractor Space](#) -- Peter Henningsen:

Section 2 builds on the book "THE COLLAPSE OF CHAOS" by Jack Cohen and Ian Stewart, who bring a refreshing new perspective to bear on the science of complexity. They complement the standard paradigm of reductionism that explains the behavior of a system through the interaction of its parts with a view that takes into account constraints imposed on a system by its interaction with other systems. Similar complementary views of the process of self-organization were developed by Ilya Prigogine, who pursued the bottom-up, reductionist approach, and Hermann Haken, who focused on how global attractor states constrain the possible dynamics of subsystems. Cohen and Stewart make a good case that the **reductionist approach to complex systems is one-sided**, and try to map out the territory from which a paradigm complementary to reductionism might emerge. They introduce some useful new terms, such as features and complicity, for which we give a short introduction here.

It appears that I will need to become familiar [Robert Rosen's work](#):

[ROBERT ROSEN: THE WELL POSED QUESTION AND ITS ANSWER-WHY ARE ORGANISMS DIFFERENT FROM MACHINES?](#) by Donald C. Mikulecky

2.1.4 **Final cause** and anticipatory systems

With a little more imagination we can construct interesting descriptions of systems this way in which, as in the example of the house above, final cause carries a connotation of anticipation with it. This idea is highly developed as a characteristic of complex systems by Rosen. It is important for this discussion to note the way in which causes become mixed in a complex system. This is in distinction to the way they stand separate in simple mechanisms (Rosen, 1985, 1991). The way that final cause and anticipation are realized is in the ability of complex systems to incorporate a model of their environment into their behavior. This allows them to anticipate future events and to also correct their behavior as new information sheds light on the anticipatory process. One simple example of such a system at the level of metabolic processes has a mechanistic realization that has been examined in some detail (Rosen, 1985, pp 349-354; Mikulecky, 1993; Prideaux, 1995)

Another facet of final cause being acknowledged is the recognition that future events can cause present behavior. In the case of final cause and anticipation, the causality flows backwards so to speak. What would have once sounded like mysticism becomes perfectly reasonable in a dynamic system. The nature of causality introduces this new directionality in time in a way that the Newtonian Paradigm made

impossible.

2.2.3 The [Metabolic, Repairing] system as a **relational** model of the organism

The History of relational models goes back to a seminal paper by Nicholas Rashevsky wherein he made a radical change in his approach to living systems (Rashevsky, 1954). After pioneering most of the mechanistic models we know about today, including reaction-diffusion systems and artificial neural networks as far back as the 1930s, he took stock of what he had learned and realized that he was not any closer to understanding what living systems were all about. He then decided to take an entirely new direction. His goal was to keep the organization of the living system while basically **throwing out the physics**. His tool for this was **topology**.

[...] The concept of analytic models that do not reduce to synthetic models captures this formally. The task then is to formulate an analytic model of the organism that captures the organization even if it must sacrifice the physics. For this task, **category theory** is the method Rosen saw as capable of doing exactly what he wanted. He applied category theory to the (M,R) system to answer the question of why an organism was different from a machine.

More information on Robert's ideas is available at [Robert Rosen - Understanding Life and Physics](#), and [Anticipation.info](#).

[Rosen, Moltmann, and the Anticipatory Paradigm](#) -- DAVID C. COTTINGHAM (1990):

This article begins with discussion of Robert Rosen's Anticipatory Systems, outlines the concept of biological modeling processes, and connects the notion of anticipatory model with the notion of psychological archetype. The Great Mother is given as example. Rosen is cited on the distinction between teleonomy and teleology. Jurgen Moltmann's theology is referred to, in particular his idea that the universe is an anticipatory system. **Telos** is proposed as a unifying term. The paradigm is then applied to biblical hermeneutics, with typology seen as anticipatory progression; the raising of archetypes into succession of new contexts. The conclusion ties the three approaches together.

[On semiosis, Umwelt, and semiosphere](#) -- Kalevi Kull:

A cognitive turn in biology can be foreseen very soon. At least, this is an impression readers of Jesper Hoffmeyer's (1996) book on an approach to biosemiotics may get. The term '**cognitive turn**' in this context is taken from psychological thinking a couple of decades ago, when the prevailing behavioristic approach was to a great extent replaced by another model of research, allowing methods and criteria which would not be accepted by behaviorists as 'scientific'. Since then, developments in psychology have been very stormy, paradigm changes became a common thing in the science of mind. In biology, the situation has been much more stolid and unexciting. The sound achievements of molecular biology have met with little enthusiasm among true theoreticians. The Darwinian view, in its neo-Darwinian versions, dominates in universities all over the world. The proponents of the power of natural selection have developed its logical consequences in regard to society and ego (e.g. in sociobiology by E.O. Wilson, or gene-ethics by R. Dawkins), and this has cemented the Darwinian monolith. Opportunistic voices have been rare, and have mainly been restricted to continental Europe and Russia (e.g., the nomogenetic view of L. Berg, A. A. Lubischev, S. V. Meyen in Russia, and its parallels in the West - cf. Brauckmann, Kull 1997). However, only a few of these voices have been based on a belief in the methods developed in the humanities, which have been applied to the solution of biological problems via the epistemic renewal of methods.

We're waiting, too. A big question to my mind is when will the people in the consciousness movement take this '**cognitive turn**' and realize that their compartmentalization of the '**hard problem**' can only result in dualism.

[12/20]

Back to the lists: [Robert Rosen & biological](#) (580 hits):

[Review of Incursive, Hyperincursive and Anticipatory Systems - Foundation of Anticipation in Electromagnetism](#) by Daniel M. **DUBOIS**:

The main purpose of this paper is to show that anticipation is not only a property of biosystems but is also a **fundamental property of physical systems**. In electromagnetism, the anticipation is related to the Lorentz transform. In this framework the anticipation is a strong anticipation because it is not based on a prediction from a model of the physical system but is embedded in the fundamental system. So, Robert Rosen's anticipatory systems deal with weak anticipation. Contrary to Robert Rosen's affirmation, anticipation is thus not a characteristic of living systems. Finality is implicitly embedded in any system and thus the final cause of Aristotle is implicitly embedded in any physical and biological systems, contrary to what Robert Rosen argued. This paper will review some incursive and hyperincursive systems giving rise to strong anticipation. Space-time incursive parabolic systems show non-local properties. Hyperincursive crisp systems are related to catastrophe theory. Finally it will be shown that incursive and hyperincursive anticipatory systems could model properties of biosystems like free will, game strategy, theorem creation, etc. Anticipation is not only related to predictions but to decisions: hyperincursive systems create multiple choices and a decision process selects one choice. So, anticipation is not a final goal, like in cybernetics and system science, but is a fundamental property of physical and biological systems.

Is this a neo-reductionism or something more transcendental? It may be in the eyes of the beholder.

Robert Rosen argued also that anticipatory systems are characterized by **finality** and connected to the fourth final causation of Aristotle. So, scientists believe that the finality of anticipatory living systems deals mainly with cognitive sciences in relation to language, intention and conscious. I will show that final conditions are implicitly embedded in any mathematical models and are related to the Maupertuis **least action principle** in Newtonian mechanics and quantum relativist physics.

Yes, and shades of Leibniz. It would be amusing if mechanics were found to be irreducible in this fashion. Any formal system is, almost by definition, unnatural and unphysical to a significant degree. This has to do with the irreducibility of any semiotic system, including language, mathematics and logic. This semiotic irreducibility is at the heart of failure of Analytical Philosophy and Artificial Intelligence. It is synonymous with the irreducibility of reasoning. That mechanics is unnatural should not be a surprise. The bottom line, however, is that Nature must be unnatural in some very significant sense. How could this be? It pertains, at least in part, to the impossibility of distinguishing between the **epistemic** and the **ontic**, rather in the fashion of [Quine](#) [and [here](#)]. This despite Quine's compulsive posturing as a naturalist.

What Daniel is doing here is old news to physicists, as he readily acknowledges. The 'absorber theory' of radiation goes back at least to Wheeler and Feynman in the 1940's. Why has it taken this long to make the connections? One reason is that the Absorber Theory was always considered an embarrassment to Physics, because of it's obvious 'unnaturalness'. The same is also true to a degree of the least action principle. One could say that Leibniz went off that 'deep end'. This is all about the [BPW](#), etc. The time for the rest of us to take the Leibnizian leap is drawing nigh.

Along these lines I recommend you peruse the following seminar outline: [Phenomenological Foundations of Cognition, Language, and Computation](#) organized by [Terry Winograd](#).

Then check out [CYBERNETICS & HUMAN KNOWING A Journal of Second Order Cybernetics, Autopoiesis & Cyber-Semiotics](#).

<http://lists.oasis-open.org/archives/humanmarkup-comment/200203/msg00002.html>

I know what you have said to be true. The motivation of the true founders of Topic Maps clearly had a grounding in the social and cognitive realities of what should be, but is not, regarded as the nature of "ontology" by the IT standards folks.

The point that I have for so long suffered the TM community with is that the market forces distort the

original intent of anything that is properly having of a "epistemic" gap between one complex subject (a human) and the computer world. We forget about the Nash equilibrium theorem, and a whole host of other "stratification" considerations. We forget about Wittgenstein and Whorf. We forget about Robert Rosen and Roger Penrose. We forget about all cognitive science except that fringe that cow tows to the IT influence lobby at NSF/DARPA and to the **strong AI Dream** (that a machine can think and that a machine is the proper model for studying biological intelligence.) Write the AI Dream in you NSF proposal and get funded. But flip this, and write that IT should more deeply adopt the **biological model** of intelligence and you are wasting your grant writing time. Yes?

Tell me about it!!

The notion of an non-addressable subject is the notion that the problem of ontology is not reducible to what exists in the machines. yes? The insistence in no way changes the reality that the topic map was supposed to have the nature of a mental event. Late binding of scope is the core technical issues that can not, in theory, be resolved. Wow, a unsolvable problem. And one that we can define a cottage industry around!!!

The work on visual abstraction can be viewed at: <http://www.ontologystream.com/SLIP/index3.htm> where we have free software for research purposes. The export of formative ontology into a Topic Map with HyTime rendering of actionable affordance is reasonable; but would take anyone who worked on this away from the demands of these powerful social forces (such as the **CIA** representatives etc.) intent on reductionism. Someone needs to hit them folks over the head and tell them that their view of the world is a **national security vulnerability**. Other systems of ontology representation in Russia, for example, is specifically open as a conscious attempt to over come the Western IT infrastructure in time of a great war. (This goes back to the very large programs funded in since the 1960s). These systems have not been economically viable for reasons that have to do with the selection of which innovation school gets funded by capitalists.. so the deep struggle between capitalism and socialism is a root cause of the vulnerability.

Capitalism may lose on this one.

Nature does not and will not take sides on this one. **Scientific and methodological reductionism linked to capitalism and then put in control of our democracy defines the vulnerability**, and there is simply no relationship between Paul Prueitt and the fact that this vulnerability has existed and will continue to be a problem for the Nation.

Love that politics!! Somewhat less demagogically, this has more to do with Descartes than with Capitalism, *per se*. Capitalism is really just along for the ride. What the capitalists don't know is just about everything. They just work here. The only reductionism they can grasp is just the **bottom line**.

[Ontology Based Document Understanding](#) -- [Paul S. Prueitt](#), PhD:

Differential ontology aids text summarization and generation systems as well as text translation and situational modeling. The theory of process compartments, each compartment having its own ontology, provides a means to ground differential ontology to compartmentalized network dynamics. A mathematical framework based on weakly coupled oscillators illustrates the variety of structural outcomes from differential geometry. If ontology is associated with a compartment, and multiple compartments are possible, then the theory of process compartments provides a means to understand why some concepts are easily translated while others might not be translatable without significant effort. However, the assumption that multiple compartments exist is not justified easily.

The nature of paradox, complementarity and emergence have physical correlates that are studied at the quantum level by physicists. It is not too much to expect help from this community. Quantum physics is a mature science that has faced a number of hard problems of this type. We can borrow some of the formal tools, developed to study elementary particle interaction, and extend quantum mechanical analytical methods to address the hard problems found in computational document understanding. First, we borrow the notion that a finite and quantal distribution of possible interpretations is driven by an underlying, and knowable, organization of the world. This enables the disambiguation of meaning, in most cases. In cases where novel emergence must occur in order to find an appropriate container for representation; then we hope to use the notion of entanglement and the formation of a new

compartments through complementarity and observation.

Dmitri Pospelov identified, in the early 1960s, a flaw in modern control theory based on formal systems. Independent Western researchers, like **Robert Rosen**, have also identified this flaw. Formal systems require a closure on what can be produced from rules of inference about signs and relationships between signs. This means that the formal system, no matter how well constructed, will not always be able to perfectly model the changes in a non-stationary world. Biological systems, however, are capable of constructing new observables through a process of perceptual measurement. How is this accomplished?

[Mind: a site dedicated to exploring](#). This one covers some familiar bases.

And one may wonder if the AI freaks will ever come around: [Living Machines: Overview](#) -- Rodney Brooks:

Perhaps we are **missing something** fundamental and currently unimagined in each of our various models of behavior, perception, cognition, evolution, natural selection, morphogenesis, etc. If this turns out to be true, then we will need to have some new ways of thinking about the issues of living systems if we are to make progress. This would be **disruptive** to all the sciences of living systems.

Summary:

Its getting time to wrap up the page. Has anything been learned?

We have learned that Hindu metaphysics comes in many varieties, including theistic and atheistic. One of these two has a more positive, constructive outlook. Is there doubt as to which that is?

In the East, idealism is implicated primarily with the concept of maya. The Hindu philosopher most closely associated with the concept is [Sankara](#) who espoused a non-theistic Advaita (non-dualist) Vedanta. His teachings were part of the Hindu reaction to the once dominant Buddhism. His reaction against the Buddhist idealism left the concept of maya somewhat obscure, at least to my thinking.

India's closest approximation to pure idealism is to be found in the Yogacarin Buddhist teachings of [Vasubandhu](#) who lived in the fifth century CE. Clearly our sojourn to the East remains far from complete, but being able to focus on these two names should expedite our next expedition.

Meanwhile, back at the ranch, I am gaining further appreciation of the increasing incursions of semiotics and old-fashioned rationalism into the former bastions of AI. The one-time reductionists are taking up the cause of biosemiotics with vigor. Rodney Brooks' [Living Machines](#) project is a case in point: a decisive departure from what used to be Artificial Life. Attempts by the Complexity Theorists to short-circuit the biological aspects of emergence are proving futile. The specter of vitalism is readily apparent. With his teleological interpretations of physics, [Dan Dubois](#) is giving Biophysics a whole new meaning. Seemingly, the [Stagirite](#) is poised for a dramatic return; a development which would not surprise his many loyal and patient adherents.

Where does this leave **Creation**? It is still in the balance.

What may be most pertinent is the [collapse](#) of the venerable distinction between **epistemology** and **ontology**. Is not this collapse implicit in the ascendancy of semiotics? If this is correct then the entire phenomenon of emergence can only be regulated by some form of intelligence. I suspect that the Advaitin non-dualism of Sankara and Vasubandhu may speak to this issue. If beyond mere emergence, we still find an overriding nomos or logos, then we will have to consider a teleological or eschatological theism. The logos entails the telos which entails the theos. The short-circuiting of the logos in the East may not be

unrelated to the tension between Sankara and Vasubandhu, between Hinduism and Buddhism. Otherwise, we might have ended with a semi-prophetic Creator, i.e. no messianic second coming, *per impossible*? We'll have to consult with Leibniz on that one.

The Epistemic/Ontic Divide

(So here's the [next topical](#) list: [epistemic & ontic](#) (980 hits).)

The first hit is on the [Islamic Finance Net: The Epistemic-Ontic Circular Causation and Continuity Model of Unified Reality](#) -- Dr. Masudul Alam Choudhury (1994). My reputation must have preceded me: Masudul is not allowing me to copy anything. Please, someone, try to understand this essay and explain it to us. Only skilled typists need apply!

But I refuse to let Masudul shame me. My very next opportunity to cut & paste comes from B. G. Montero -- [The Epistemic/Ontic Divide](#) (2002). I must be incorrigible. Bless you, [Barbara Gail](#)! But, oh dear, even amongst us C&Pers there is honor. We will not copy w/o cutting, but in this case that may not be possible. If so, this would be a first. What greater testimonial? It turns out that I am spending considerable time with Barbara's [essays](#) on various aspects of the mind-body problem. If she has a definite position on the matter, it is too subtle for me to pick out; however, her characterizations of the physicalists and naturalists as either vacuous or self-contradictory are as cogent as any I've seen. Her sympathies are certainly not with the dualists. I gather that she regards the mental as something primordial with the world and not separable from the rest of the world. Indirectly, then, her arguments count against the Divide. The essay referred to above considers how the alleged epistemic and ontic gaps figure together in the mind-body debates.

One place where the epistemic and ontic seem necessarily inseparable is in the close relation between conceivability and possibility. This fusion, if not confusion, comes out in the arguments over the possibility of zombies. With this in mind I should once again attempt to comprehend Chalmers' [papers on modality](#). Last time I got lost in the intricacies of [two-dimensionalism](#). What will I do when we go to three-dimensions? A similar lack of separation appears in the 'ontological' proofs of God, and in understanding the import of Aristotle's **conceptualism**.

Don't let me forget the **Quantum** domain, where the entanglement between what there is and what we know remains unresolved. The ontic status of the collapse of the wave function is the crucial issue. Associated with the quantum problem is the ontic status of **probabilities** in general.

Then we have **complexity theory** and emergence. The whole issue of **scientific realism** hinges on the ontic/epistemic divide with respect to reduction, bringing us back to the mind-body problem. Further complicating the reductionism issue is the question of direct vs. indirect realism.

With the ascendance of **information theory**, once again we are confronted by where to place the divide. Semiotics is a further elaboration, or perhaps a survival course on how to live without the separation.

And then there was **Quine**: [Philosophical Dictionary](#):

analytic / synthetic

Distinction between judgments or propositions. A judgment is analytic if the concept of its predicate is already contained in that of its subject; if the concepts of its subject and predicate are independent, it is synthetic. Alternatively, a proposition is analytic if it is true merely by virtue of the meaning of its terms or [tautologous](#); otherwise, it is synthetic. For example:

"Golden retrievers are dogs." is analytic.

"Dogs enjoy chasing squirrels." is synthetic.

[Empiricists](#) generally suppose that this distinction coincides with the [a priori / a posteriori](#) and [necessary / contingent](#) distinctions, while [Kant](#) held that [synthetic a priori judgments](#) are possible. [Quine](#) has argued that no

strict distinction can be maintained, since the analyticity of any proposition can be denied, with suitable revisions of the entire system of language in which it is expressed.

[The Analytic-Synthetic Distinction- A Critique and an Alternative Hypothesis](#) -- Diana Hsieh (1997).

Through all of Kant's philosophy, his most enduring legacy has surely been the analytic-synthetic distinction. Disputes over what particular statements are analytic or synthetic aside, most philosophers today accept the distinction, in some form or other, as legitimate. Quine's influential attack on the distinction in "The Two Dogmas of Empiricism" has reportedly had little impact on Kant scholars. Regardless of present-day philosophers' acceptance of the analytic-synthetic distinction, it is clear that it lies at the heart of Kant's transcendental idealism. Without it, his attempt to ground metaphysics in synthetic, a priori principles becomes a meaningless project. But more importantly, criticism of the analytic-synthetic distinction brings Kant's basic views about the nature of concepts and relations between them into question. This examination could be far more devastating, or illuminating, to Kantianism than a simple elimination of the analytic-synthetic distinction.

Remind me to follow up on this.

[Between Chance and Choice](#) -- Edited by Harald Atmanspacher and Robert Bishop (2002):

Atmanspacher in his contribution distinguishes between determinism and determinability using a distinction between ontic and epistemic states in physical descriptions. Lombardi, using this same distinction, addresses Putnam's notion of internal realism in the context of physics, arguing that there is no single, pre-given ontology because the questions we ask, both theoretical and experimental, "cut into" reality in a way determining much of the chosen **ontology**. What is ontic and what is epistemic **depends on the questions scientists ask**.

[Iceberg Epistemology](#) -- David Henderson and Terence Horgan (c. 2000):

We suggest thinking of the epistemologically relevant cognitive processes in terms of the metaphor of an **iceberg** -- the accessible and articulable states that have been the exclusive focus of much epistemology must comprise only a proper subset of epistemologically relevant processing, even as only a part of an iceberg is exposed to view. When one focuses on the interaction of accessible states and articulable information, the structure of epistemic justification looks rather like what has been called structural **contextualism**. It might also be called quasi-foundationalist. Yet, given the sort of creatures we are, in attending to our epistemological tasks we must rely on processing that is sensitive to information that we could not articulate, that is not accessible in the standard internalist sense. When one focuses on the full range of epistemologically important processes, the structure of what makes for justification may be rather more like that envisioned by some **coherentists**.

If the separation between the ontic and the epistemic is too great, we fall into skepticism and irrationalism. If the separation is too small we fall into idealism. Philosophers in the West generally manage to stick to the middle ground, but more than a few, particularly in the East, have strayed into the depths of skepticism and idealism.

With postmodernism, the middle ground has been widened, under the aegis of a consensual ethos of pragmatic pluralism.

[However, it is in the nature of pragmatic consensu to be ephemeral. Under stress, perhaps due to the clash of cultures, there is a tendency toward polarization. Such forces could not fail to impact metaphysics. Neutral ground becomes scarce, being replaced by a slippery slope. In the case of our metaphysical divide there would be a slippery slope from idealism to skepticism.] This may be true, but it sounds more like a threat than a promise. Let us stick to the positive.

Frankly, I expected to find more useful material on the epistemic-ontic list, but the first 200 hits have been pretty sparse.

How about: [mind independent reality](#) (700 hits)? [Noumenal](#) produces 6,300 hits.

[12/23]

I will be using the [Kant & noumenal](#) list:

[Kant's error](#) by [Titus Rivas](#):

The author shows that there is a common epistemological basis for Kant's rejection of **rational** psychology and contemporary identity theory in the philosophy of mind. He shows that Kant was mistaken about his claim that the distinction between **noumenal** and phenomenal reality would also apply to the conscious mind. This implies that the identity theory can no longer be upheld, since it rests precisely on such a mistaken Kantian distinction. The only viable ontologies for contemporary philosophy of mind thereby turn out to be dualism and **idealism**.

There's a thought. Perhaps, more than any, Kant and Descartes are the culprits of modernity, bless them. Descartes turned rationality against coherence by setting up his mind-matter dichotomy. Kant then turned against rationality by multiplying the dichotomies to include the analytic-synthetic distinction and the epistemic-ontic divide. These further dichotomies are alleged to follow from his various 'antinomies of pure reason'. Rationality never recovered. Modernity is the triumph of unreason and incoherence. We have only to look around us to see the Kantian imprint. If the parousia takes the form of a Platonic 'philosopher king', then Kant would be high on the list of antichrists. Kant, almost single-handedly, killed philosophy. It was damnation with his Germanically ponderous, faint praise. His work may go down in history as the pinnacle of the art of obscurantism. Most of the ills and excesses of the modern intellect may be laid upon his obfuscation of reason. Philosophy since his time has run rampant with pettifoggers who rush to hide behind the ample Kantian skirts whenever reason or coherence have attempted to reassert themselves. Postmodernity is Kant's last hurrah. And, of course, it was also Kant who wrecked theology. But without his antichrist as the foil, there could have been no parousia. It is a small price to pay. Hegel made a brave, but historically premature, effort to extricate himself from the Kantian morass, and half of his struggle was with that same oppressive language. I'm surely biased; however, the German language lacked the singular genius of Shakespeare. The fact that these words can be written and understood universally is owed almost entirely to that one incisively brilliant wit. In contrast, Mozart was a mere consolation prize. Billy was God's answer to Babel. It all went down at the Globe.

OK, Manny, what the heck did you do with our *Imago Dei*? Cough it up, please. There's a boy!

Kant's intellectual blow torch, directed against reason, cleared the way for modern atomism. All we have to do now is pick up the pieces.

One of the main lessons Kant wants to teach his readers is that, contrary to common metaphysical doctrines, we have absolutely no knowledge of noumenal reality. For example, we don't know if anything noumenal corresponds to the phenomenon of matter. And if there is indeed something which corresponds to it, we have no way whatsoever to find out what it is. Similarly, what phenomenally appears as mind, might in noumenal reality be something entirely different.

I hope that the epistemological correspondence between this Kantian position and the modern position about the ontology of mind called identity theory, is clear immediately. Both Kantian and modern identity theory distinguish between mind as it appears to us, from a "first person perspective" ("by acquaintance"), and mind as it is in itself. Mind can be considered both subjectively and objectively according to both positions. It is hardly surprising therefore if Karl Popper (1977) traces the identity theory back to Kant via Schopenhauer, Clifford, Schlick, Feigl and Russell.

However, there is an important difference which should not be overlooked. Kant clearly states that one can never know the true nature of mind, only mind as it appears to us. On the other hand, identity theory usually is certain that the true nature of mind is material, that mind seen from an objective ("third person") perspective is precisely the brain or part of it. Kant would doubtlessly characterize the identity theory position as a groundless metaphysical claim of rational psychology.

Still, the identity theory would be nowhere if Kant could be shown to be wrong in his general rejection of rational psychology. There is something paradoxical about this, because if Kant is right about rational psychology, identity theory would be a form of groundless speculation, as any other type of philosophy of mind would. However, if Kant is wrong about rational psychology, that would mean that we do directly know something about mind as it is, from our private first person perspectives, so that the distinction between phenomenal and noumenal underlying identity theory would collapse. Either way, within the context of an evaluation of the Kantian critique on rational psychology, immediately it becomes surprisingly clear that identity theory isn't viable.

[Philosophy letters- Margaret \(4\)](#) -- Geoffrey Klempner:

On Kant's 'Refutation of Idealism': The important thing here is that, despite what he says, Kant is not arguing against Berkeleian immaterialism. (Don't be surprised that Kant misunderstood Berkeley: misunderstanding each other is something that philosophers do all the time, and the 'great' philosophers do most frequently.) 'Dogmatic idealism' the target of his attack is the theory I call naive or 'unrefined' subjectivism; a far cry from Berkeley. The naive subjectivist makes the fundamental error of thinking that one could have a coherent notion of a 'subject' or 'self' without a correlative notion of 'world'. If there is nothing to judge or say but how things subjectively are, then there is nothing to judge or say, period. You can't piece together a self that makes judgments without the notion of correct/ incorrect memory. But the notion of correct or incorrect memory presupposes an account of personal identity or continuity, which in turn presupposes a theory of a world within which the continuing self is located.

The theory of phenomena and noumena is a very different kind of 'rejection of idealism'. Here Kant is rejecting Berkeley, but his reason for doing so is that while Berkeley rightly recognises the necessity of a distinction between our perceptions and what those perceptions are ultimately of (for Berkeley, the mental 'archetypes' or blueprint in the mind of God) where Berkeley goes wrong is in supposing that we can have positive knowledge of such 'things in themselves'. For Kant, noumena are not 'material' or 'mental': we cannot know what they are (or what it is: as Schopenhauer later pointed out, even talk of number is unjustified here).

The difficulty reading the Critique of Pure Reason is partly accounted for by the fact that it was patched together in six months, then hastily revised for the second edition. Apparently, German philosophy students prefer the English translation by N.K. Smith to the German original, with its page long sentences!

[Tony Bellotti- Essay 3](#)

The characteristics that Kant placed on noumena leads ultimately to the question of how we can justify a belief in them. Kant argued that they must exist because phenomena are appearances, thus they must be appearances of something, and that something must be noumena. But surely we are not justified in calling them appearances a priori. [...] There is no essential property of phenomena which make them appearances. Ultimately, Kant's noumena are unknowable and, as Russell pointed out, 'the "thing-in-itself" was an awkward element in Kant's philosophy, and was abandoned by his immediate successors'.

Kant was aware that the external world was limited by our understanding, and noumena are introduced partly as proof of this (i.e. noumena are the limits of human understanding). It is the noumena that play the role of independent existences beyond the thinking subject. They have ontological objectivity (in contrast, for Kant we do not stand in any relation to them, as the very notion of a relation cannot be applied to them). As such it is noumena that Kant needs to defend against charges of idealism, in addition to empirical reality. As they are 'unknowable', it is difficult to know how this defence can be made.

[Essay 4](#)

Since "intuition and concepts constitute the elements of all our knowledge" [2; B74], it follows that if object is in neither of these, it must fall outside knowledge. If the object is outside knowledge, then Kant possibly intended it to be the thing-in-itself. So, when I look at my chair, what I am seeing in sensation and conceiving in my mind is mere representation of the chair, which as an object is beyond this representation, and exists as a chair-in-itself. According to Kant, however, beyond our knowledge of the world there is no form or structure, since space and time are properties of mind used in understanding the world. Thus, any thing-in-itself must lack such form and structure. The very idea of a chair-in-itself is nonsense following this reasoning. In general, by "object" we mean some individual thing that exists spatially and temporally in relation to all other objects. So Kant's notion of object cannot be the thing-in-itself after all. As it is not representation and not outside representation, Kant's object seems to be in a kind of limbo.

[On Peirce's Four Incapacities of Man](#) -- John F. Sowa:

So it is best to read the paper on the "Four Incapacities" as a rejection of some of Kant's basic assumptions. One of Kant's distinctions was between the observable phenomena and the "things in themselves", which Kant called the "noumena". Kant claimed that the only things that could be known were phenomena, and the noumena were absolutely unknowable. Peirce called that claim Kant's greatest mistake. His rejection of the "absolutely unknowable" should be viewed as a rejection of Kant's concept of noumena, which Peirce believed is a useless appendage to Kant's theory. In short, it has no explanatory value whatever.

Is there anyone out there defending noumena? I have yet to encounter such a one.

[Gardening the numinous:](#)

noumenon (pl noumena) 'Thing-in-itself', contrasted with appearance or phenomenon in the philosophy of Kant. Noumena are the external source of experience but are not themselves knowable and can only be inferred from experience of phenomena. Although inaccessible to speculative reason, the noumenal world of God, freedom, and immortality is apprehended through man's capacity for acting as a moral agent.

[Pan (1979) Dictionary of Philosophy]

[Hyponoetics - Glossary:](#)

The intelligible world of noumena is known by pure reason, which gives us knowledge of things as they are. Things in the sensible world (phenomena) are known through our senses and known only as they appear. To know noumena we must abstract from and exclude sensible concepts such as space and time.

(Ted Honderich: The Oxford Companion to Philosophy, Oxford University Press 1995)

[Philosophical Critiques- Why Kant is Wrong](#)

Is it not strange that a man of Kant's undoubted intellectual gifts did not notice here an absurd contradiction? Why, he has just finished explaining to us, in great detail, the whole nature of the human mind; and now he concludes that we cannot know the nature of anything!

We merely mention the "antinomies" because we discern in them an element of materialism in the heart of an idealistic theory. This materialism was to appear in full form in later philosophies which took inspiration, at least in part, from the doctrines of Immanuel Kant.

Kant's philosophy is fundamentally wrong and is one of the major contributors to the intellectual insanity which we see today.

I sincerely apologize to anyone who came here thinking they would have an opportunity to personally beat up on Manny K. You will just have to take a number and wait your turn. Patience is in order.

Down through the ages philosophers proposed many ways to carve up the world. Descartes and Kant were the outstanding exemplars of this tradition which culminated in the analytical movement that dominated the first half of the last century. Analysis finally reached its limit with Quine's holistic thesis. No division of the world remains credible today.

A moderate panpsychism or neutral monism is the least radical successor to the analytic, reductionist worldview. Such a view provides the only common basis for a postmodern, pragmatic pluralism.

Even a minimal panpsychism is not compatible with naturalism. Naturalism is an ill-defined, *ad hoc* position. It is not unfair to characterize it as incoherent. I am aware of no detailed definition or comprehensive defense of it. It is simply a label being deployed to cast a positive light upon what could otherwise only be seen as a disorderly retreat of ex-materialists.

The label of 'naturalism' conveniently points to what may be the final barrier to be broken: that between the natural and the 'unnatural'(?). Let me think.....'sub-natural', 'extra-natural', 'quasi-natural', preternatural? We need a word with more of a ring to it. Any suggestions? Why does a certain word stick in our throats?

What will happen when we finally summon the courage to pronounce this word? Will the sky fall on our heads? Will lightning strike? There is only going to be one way to find out. After you, Alphonse!

[12/25]

My contention is that the failure of analysis leads to the breakdown of all metaphysical barriers and distinctions. The crucial, and nearly direct consequence of this failure is panpsychism. This is simply because, with the failure of the analytic movement founded by Descartes and Kant, Kant's notion of a mind independent reality is no longer logically supportable. That leaves us with panpsychism. With the advent of panpsychism, naturalism goes by the boards, leaving us to contend with supernaturalism.

The postmoderns succeed in ignoring this logical consequence of the breakdown of the analytic dichotomies. How they manage to do so, so blithely, is the mystery that goes with their territory. It is the skeleton in their family closet. It is mainly Kant's anti-metaphysical skepticism that is preventing the neo-rationalists from spreading their gospel of coherentism. From our last Google list it appears that Kant's unwarranted, anti-rational skepticism is serving as a rallying point for a spectrum of rationalists. How many of these are rational theists remains to be seen, but unless I am badly mistaken it is a very slippery slope from an unadorned anti-skepticism to theism and beyond. Once people start sliding down this slope, the pace of metaphysics will pick up rapidly. It is ironic that Kant, in all his negativity, may end up as the point of departure for a cooperative constructive venture. Being able to see this historical departure in real-time is no small privilege. The idea of possibly participating in such a venture is not easy to assimilate.

[12/26]

I am still using the [Kant & noumenal](#) list.

[Kant and the Question of Noumenal Ontology: A Critical Assessment of Kant's Antithetic of Pure Reason in View of his Denial of a Metaphysical Proof for the Existence of God](#) by Mario Derksen

Nothing is more repulsive to a scholastic spirit than an antinomy of pure reason. Throughout the middle ages, philosophers inspired by the Platonic and Aristotelian traditions were convinced that the proper use of reason could lead the intellect to the attainment of the highest and profoundest metaphysical truths. With the advent of the 18th-century British skeptic David **Hume**, however, this position seemed

no longer able to be justified. A radical empiricist, Hume proposed to demonstrate that non-trivial knowledge is in fact impossible. Intimidated by the devastating epistemological conclusions of Hume's seemingly air-tight logic, the critical idealist Immanuel Kant saw only one way out to save knowledge from utter destruction—by limiting it immensely, basing it on a revolutionary hypothesis, which proved to have a fatal outcome as far as the most important kind of philosophical study—metaphysics—was concerned: it made metaphysics, at least as it had been traditionally understood, impossible, reducing it to mere unverifiable and therefore meaningless speculation.

This forlorn outcome of Kant's critical philosophy was, though originally unintended, a slap in the face for those metaphysicians who immediately preceded Kant, such as Wolff, Locke, and Leibniz, but it also would have met with serious criticism in the ancient and medieval days of Aquinas, Averroës, Aristotle, and Plato. In fact, throughout the middle ages, metaphysics was considered the "Queen of all the sciences," and to hurl against it, as Kant did, the charge that it yields only paradoxical conclusions and therefore mere nonsense—at least as far as true knowledge is concerned—would have been the height of impudence for the great scholastics, most notably St. Thomas Aquinas.

It shall be the purpose of this paper to examine Kant's accusations against traditional metaphysics in light of two of his four "antinomies of pure reason" to see how they, if valid, nullify pre-Kantian metaphysical claims. I shall also attempt to offer a possible **neo-scholastic** critique of Kant's antinomies to show a way to rehabilitate the pre-Kantian conceptions of metaphysics at least to a limited extent.

Though Kant himself asserted that he "found it necessary to deny knowledge, in order to make room for faith," it is important to emphasize that the Christian scholastics would have seen his "faith" as a pure **fideism**, a distortion of faith, and radically different from that faith which has to rely on divine revelation to come to the knowledge of those truths which reason alone cannot attain, e.g. that God is a Trinity.

Henceforth, science was to be the only path to indisputable knowledge. However, the postmodern turn would not leave science exempt from a similar skepticism. This latest development forces us to either capitulate to **nihilism** or to undertake a complete reassessment of epistemology and ontology. The only move against nihilism is to shift to a coherence theory of truth, and one that does not exclude teleology, as no complete system can. There is still ample room for the play of faith, but metaphysical skepticism is no longer ceded the pole position in our quest for truth.

There are really only two ways to demolish Aquinas' **teleological** argument: (1) by claiming that design doesn't need a designer but could be the result of chance; or (2) by claiming, as Kant did, that there is no design in the world, that it is something **merely imposed** by the mind.

When the first moon rocket took off from Cape Canaveral, two U.S. scientists stood watching it, side by side. One was a believer, the other an unbeliever. The believer said, "Isn't it wonderful that our rocket is going to hit the moon by chance?" The unbeliever objected, "What do you mean, chance? We put millions of man-hours of design into that rocket." "Oh," said the believer, "you don't think chance is a good explanation for the rocket [hitting the moon]? Then why do you think it's a good explanation for the universe? . . ."

[...] Kant asks us to think about how reality might be while at the same time insisting that the only way in which we can think about reality is in terms of transcendently imposed order and design—which, a priori, eliminates the very possibility of thinking of reality as undesigned and chaotic.

[12/27]

Let us conclude with Mario:

However, an attack on Kant's antinomies is not the only nor perhaps even the best way to critique him, of course. Catholic phenomenologist Dietrich von Hildebrand points out that Kant's entire epistemology is problematic from the bottom up:

Kant dissolves the authentic meaning of knowledge as the grasping of a being such as it

is objectively . . . by replacing it with the notion of the construction of the object. We must stress again and again that this implies an immanent contradiction . . . in the interpretation of knowledge. . . . In claiming to reveal to us the real nature of knowledge, Kant presupposes the notion of knowledge which he denies in the content of his thesis.

Why is it, then, one may wonder, that Kant's Copernican revolution has found such wide appeal? Why was it so influential? I believe the answer to this is simply that most people thought and continue to think that the only way out of Hume's dilemma is through Kant, which, however, is not true at all. The true answer to Hume has always laid in the abandoned scholasticism, which seemed obsolete and dry to the moderns, and which, for that reason, they never deigned to look upon or search through in order to find answers. Now it is up to them and to their successors to deal with the Kantian legacy.

I would give Kant a bit more credit. Metaphysics cannot be the same after him. There was much room for improvement in the medieval scholasticism. Hume and Kant force us now to make those emendations.

Here are some significant dates: Descartes: *Discourse* (1637); Leibniz: *Monadology* (1714); Hume: *A Treatise of Human Nature* (1740); Kant: *Critique of Pure Reason* (1781). [Hegel: *The Phenomenology of Mind* (1807); Kierkegaard: *Fear and Trembling* (1843).]

Significant portions of Aristotle and Leibniz will turn out to be our main legacy from the traditional Western metaphysics. There is a neo-Thomist, Catholic community which is an important cultural artifact, but which is too conservative to contribute to speculative metaphysics. Otherwise we are faced with a Protestantism that has never been open to philosophy, and, partly as a result, is now mired in controversies over fundamentalism. Speculative metaphysics is left practically devoid of concerted theological input. Individuals are free to pursue metaphysics, with very little institutional competition or concern. By their nature, institutions cannot foresee radical alternatives to the status quo.

Any sort of intellectual revolution requires an individual charismatic vision. This is the only manner in which the prophetic tradition has ever been able to renew itself. This is the singular dynamic element of the West. Renewal in the East has usually been indirect: Buddhism being the significant exception. Even with Buddhism, there has been a remarkable lack of coherence in the vision. Coherence of vision is necessarily a call to action. It is necessarily evangelical. Buddhism remained on the contemplative side of metaphysics, mainly by its rather arbitrary renunciation of theism. I'm not aware of any concerted effort to explain this renunciation. It was almost surely related to the greater social stratification in the East, but any causal relation is unclear.

The prophetic phenomenon logically can be universal only in its final phase. Up until that point, the coverage will be spotty. We find ourselves on the verge of that final phase. Many people seem to sense the imminence of some such development, but, of course, the vision awaits the visionary.

[1/6/03]

I am wondering about reductionism in relation to math, logic, computer programs, or even individual integers. An article of possible relevance is:

[Subject Reduction of Logic Programs as Proof-Theoretic Property](#) -- Pierre Deransart and Jan Georg Smausy -- February 6, 2002

It is surprising that this question (of ultra-simple reduction) is not more frequently discussed, or has not already been settled. There may be a definitional problem for 'reduction'. Such a problem would

constitute a self-refutation: Is the term 'reduction' itself reducible? Probably not. There is a continuing philosophical debate as to its meaning. What is the distinction between ontic and epistemic reduction?

Is '12' reducible, and, if so, to what? Pretty obviously it is not. Certainly 'pi' and $\sqrt{2}$ are not reducible. A configuration of two atoms is not reducible to singletons, because the new relational facts (relative position, velocity, etc.) have to be included.

- (-1) is not completely reducible to +1. Is it? There is some extra semantic (operational?) content to the former expression. There would even be a semantic distinction between +1 and plain '1', depending on various contextual considerations. This brings us back to the problem of holism, the problem of the semantic horizon, and even the (impossible?) distinction between syntax and semantics. Is there such a thing as a purely syntactical system, and what does that mean?

Are algebraic expressions reducible, or only simplifiable. There is much difference. The same distinction holds for formal or functional expressions, programs, models, proofs, types, orders, etc., etc. There is no question of reduction, *per se*. The broader the horizon, the greater or deeper is the potential, irreducible semantic content.

Considerations such as these should make us wonder that the analytical movement was simply ill-conceived. Do we understand the real motivation. It may have been just a filibuster against the inevitable rise of idealism. Darwin may have been the principle inspiration.

An analysis of any given expression presupposes what, and is supposed to result in what? Analysis may turn out to have been a kind of aesthetics: ultimately very subjective in form. It should be amazing that ecology came as a surprise to most of us.

How can there be learning without conceptualizing, or conceptualizing without real, irreducible concepts?

How close did Kant, with his semi-constructivist synthetic *a priori*, come to Aristotle's [Platonic version](#) of conceptualism? The notion, deriving from Kant, of mind independence is either vague in the extreme, or is simply incoherent. The recognition of this Kantian failure signals the end of the ontic-epistemic divide, and, concomitantly, the end of naturalism.

It's all gone, folks. Three centuries of intellectual effort to eliminate metaphysics has ended by demonstrating its essential, irreducible nature.

The only remaining question is whether there is any logical or practical alternative to a thorough going coherentism. The practical implementation of a coherentist initiative ought to be self-organizing, if it is not to be self-refuting. However, this initiative does seem to be slow in starting. This hesitation may well reflect the implicit messianic quality of any such initiative. Once that signal is given and received, there can be no turning back.

The reductionism of choice is physicalism. How may we apply the above points in this case? Physicalism implies exactness and formality. Otherwise it is self-contradictory.

[1/7 -- I was **struggling** to say something here. In as much as Physics is formal, it is unnatural, i.e. it is mathematical and conceptual. However, if it is treated as informal or natural, then it remains open to vitalist influences due to its natural(?) **imprecision**. This natural informality of physics overlaps to some degree with the probabilistic quantum realm. The Quantum is a metaphysically strained attempt to formalize the natural informality of physics. There is the formal, conceptual or epistemic '**Physics**', and then there is the informal, natural or ontic '**physics**'. Non-reductive 'naturalists' are concerned with 'physics'. Physicalists are concerned with 'Physics'. Physicalists like to think that Physics is monotonically converging upon physics, but I would suggest that this convergence is only in the manner, that we now see

was pure artifice, that the Ptolemaic epicycles were once thought to be so converging. That was before the Copernican revolution. We are overdue for an encore. These pages attempt to outline and expedite that encore.]

[1/7 (cont.) -- Between Physics and physics there is somewhat the distinction as between phenomenon and noumenon. Kant with his constructivism and conceptualism was struggling with approximately this same problem. His anti-scholastic politics prevented his taking up the rational coherence proposed herein. His sophistic anti-rationalism quickly lead to every form of nihilism under the Sun. That was our darkest hour. Kierkegaard's Lutheran based anti-rationalism was no small part of this trend.]

[Arguments against Reductionism, Materialism and Epiphenomenalism](#) -- Sean Robsville. This provides some good summaries. It is written from the point of view of [Kadampa](#)(?) Buddhism.

I am following [physicalism](#) and presently re-reading [PHYSICALISM, EMERGENCE AND DOWNWARD CAUSATION](#) -- Richard J. [Campbell](#) (and [here](#)) and Mark H. Bickhard.

In effect, Kim has identified a *reductio ad absurdum* of physicalist metaphysics in general. Clearly grasping why physicalism is untenable, however, opens the logical space for a fecund notion of genuine **emergence**.

Mark has an interesting [list](#) of publications focusing mainly on emergence.

[1/7]

My objection to Richard and Mark's paper is that they are putting too many eggs in the quantum basket. I see the quantum as merely symptomatic of immaterialism, but the implication of their focus on it is to make it the basis for a dualistic ontology. Elsewhere I refer to this as '[quantum dualism](#)' (also [here](#)), an important stepping stone toward a robust coherence.

[See [insert](#) above.]

[Why Physicalism and Constructivism Will Never be Able to Understand the Mind](#) -- [Riccardo Manzotti](#) (2002): Commentary on [Principles of Cognition, Language and Action: Essays on the Foundations of a Science of Psychology](#) -- Nini Praetorius (2001). (a)

The book is a sort of epistemological version of the 'naked king' fable. The role of the king is played by the problem of the nature of mind (and therefore of language, meaning, truth). Current scientific or objective epistemology correspond to the esteemed burghers of the city pretending that the naked king was dressed in all his regal finery. Professor Nini Praetorius doesn't share all this admiration and develops an impressive attack on the principal strongholds and tenets of the current theories of mind, semantics and language. First she argues that the old division between **materialism** and **idealism** is still alive albeit disguised under the clothes of physicalism (naturalism) and constructivism. Yet, as she claims, even if "we had a much more detailed picture of the intermediate stages of the processes than Locke, we are still struggling with the problems which for Descartes' and Locke's critics were the stumbling block, namely how physico-chemical processes in the organism, no matter of what type, can possibly give rise to the experiences of the every-day world of objects which occur in our consciousness.

[...] Praetorius looks for a starting point. She finds it in what she defines the principle of the general correctness of cognition and language, called the "Correctness Principle". She claims that we have to presuppose, that we have knowledge of reality and a language which may be used to say something about reality - or of whatever we talk - which is true or correct. If we did not so presuppose, we would not know what we were talking about when we talk about reality, nor about description or propositions about reality which may be true or false. After all, this is a reasonable claim that corresponds to the classic reply against solipsism. If we could say nothing true about reality and ourselves, nor determine the correctness of what we say or know about reality and ourselves, we cannot say anything more, not

even about what we do not know.

I am spending time with Riccardo's other publications, hoping to find a convenient summary.

[Intentionalizing Nature](#) -- Abstract for Tucson 2000 (deadline 15 October 1999)

In this paper an attempt to found reality on intentionality is presented. Instead of trying to naturalize intentionality we try to intentionalize nature. That is to develop a framework in which intentionality is the most elementary component of reality and nature derives from it.

Several solutions have been proposed to fill the void left by the mind (emergent properties, functional states, linguistic entities, information processing, and material objects among the others). Unfortunately, it can be shown that it is impossible to define such entities without falling into some kind of dualism or without adding new ontological 'realms' (as Frege did). Besides, these entities require conscious observers in order of being meaningful. As a result, the separation between the ontological and the epistemological problem has been one of the main sources of controversies by producing several apparently unsolvable problems, including the mind-body problem and the related problem of how it is possible to naturalize intrinsic intentionality, and inasmuch, to explain representation (in the sense of Kantian phenomenon) in a purely extensional world.

Given these premises, we argue that, although it is impossible to naturalize intentionality, the solution is to intentionalize nature (equal to reality). Reality, as it is experienced, is the result of what we are and of what we are in relation with. Nothing can be said of being without being in relation with something . . . To represent this fundamental reality, a new unifying principle called **intentional relation**, capable of being the foundation of epistemological and ontological framework, is introduced.

By using the intentional relation it is possible to produce a constitutive theory of the self by reconsidering fundamental concepts like reference, meaning, causation, subjective experience, objective knowledge. Because mind is, at the same time, a 'piece' of reality and a representation of reality, mind is the natural place in which the question about what there is and about how we know what there is must converge.

Being an event is a condition of existence. It is impossible to be, in any meaningful sense, without being an event too. It is impossible to divide the property of being from the property of being an event, which is something that provokes effects on the rest of the world. Things are thus derived from events. Further, these last considerations bring us to the natural conclusion that being is being in relation with.

If this is true in a strong sense, there must be some kind of **basic relation** between events that must precede any possible attempt of description in terms of objective entities (which should be entities belonging to the ontological dimension limited to those entities describable by the objective side of the epistemological dimension). Besides, if all that matters about the true being of something is its being in relation with, the power of this copula is strengthened to its maximum. It would mean that being is identical with being in relation with. A natural consequence is the introduction of a label to identify this elementary relation. We call it the **intentional relation**, ...

In other words, **causation** is the perceived intentional relation between two basic events.

This is simply relationalism. I find it difficult to distinguish relationalism from idealism, and I'm not aware of anyone who so claims, aside from the Platonic tendency to treat ideas atomistically, which is incoherent. Riccardo's attempt to discover a universal elementary relation seems ill-conceived. Relations are not likely to be compositional in any useful sense.

I see that Riccardo does not conceive of a primordial self. The self is alleged to be derivative. It will be useful to understand his rationale for the avoidance of the logical primacy of the self.

Papineau, David, [Thinking about Consciousness](#), (OUP 2002), previously mentioned [here](#). Another of his books: [Philosophical Naturalism](#) (1993).

[1/8]

As I continue to peruse the [physicalism](#) list I am struck mainly by the fragmentation. It seems to be a case of dog eat dog in the metaphysical arena of mind vs. matter. There are barely any identifiable research programs. Even the same authors reserve the right to frequently change their minds on basic issues. If there is some combination of ideas that has not been touted by someone, it is not for the lack of trying.

Is this just the perennial disarray of philosophy or are we witnessing a significant interregnum? I opt for the latter. A little bit of coherence could go a long way amidst the rampant incoherence.

[Physicalism and Its Discontents](#), eds. Lower & Gillett (CUP 2001) (reviewed [here](#) by Bernard Linsky), gives as coherent an account of the current scene as any. Its title accurately captures the ambient malaise. Here's Bernie:

One prominent variant is to argue that while mental properties are distinct from physical properties, they nevertheless supervene on them. This might be because the physical properties are the "realizers" of the proper functional role or in some other way constitute the higher level states. The greatest number of the articles in this book criticize these alternatives, claiming that supervenience is somehow untenable, or that in fact it is [in?]compatible with physicalism. The less popular alternative to physicalism is to argue that there is simply no contact between mental properties, attributed by psychological theorizing, or "folk psychology", and the properties of physical theory. The other part of the defense of physicalism, then, is to attack this view. These defenses of physicalism are generally sweeping, handling several sorts of resistance at one time, lumping them together a bit more than one would like.

Part II, titled "Physicalist Discontents", contains defensive replies to physicalist arguments, insisting that functional or other higher level properties might well enter into causal relations and be legitimate parts of the physical world, without having to be seen as reduced or reducible to lower level physical properties. There are no Cartesian dualists, and indeed only the faintest hint of epiphenomenalism. Everyone in this section pays some lip service to physicalism, yet still resists. Perhaps the book would better be titled *Reductive Physicalism and Its Discontents*.

There is a tone of battling programs here rather than detailed argument and reply.

The physicalists continue to gerrymander physics into impossible contortions in attempting to force it through the burning hoop that is the mind. They would much rather reside in this frying pan than leap into the fire of immaterialism.

But now let's get back to [David](#) for a moment. He has two theses: the historical inevitability of physicalism, and his message to its army of in-house critics: 'get over it.' There is the not very subtle subtext: '**It's Us or Rust.**' Yes, there is much to be discontented with in physicalism, but this is where history has brought us, and you will not undo physicalism without overturning history. This is rather in keeping with the eschatological tenor of rational theism, wouldn't you say?

David is pleading for an end to the debate: not on any rational grounds, but purely out of respect for the sweeping course of history. This has indeed been a long march into materialism. David only covers 300 years of it. This sojourn could as well be projected right back to the dawn of history.

If there is any light in the spirit, then surely we look for a new dawning. For what does David look? He is simply marking the territory that is the end of reason, and, perforce, the end of history. There is no pot of gold at the end of his rainbow. Is there one at ours? Well, either faith and hope are God given, or they are not. According to David, *les jeux sont fait*.

On the Side of Reason

Perhaps a few years from now, we will be willing to agree that [David](#) Papineau may be afforded the singular distinction of having had the last word for materialism. There is the expression, 'It's all over, but the shouting.' Well, David's ought to be and can be the last shout.

David did not even have to shout. He had only to, very candidly, admit that materialism spells the end of reason. Ever since materialism raised its head at the dawn of philosophy, there have been few illusions about its ultimate hostility to reason. So what is new with David?

Here's what: history. David clearly senses an historical precedent. Everyone agrees that the mind itself is the last frontier of materialism. David has only to side with the 'mysterians', which he does in a muted fashion, and then to put this position into its proper historical context, which is also done in a low-key, but, nonetheless, unmistakable manner. The resulting eschatological message is almost subliminal; it may not even have been deliberate, but is better transmitted for not having been so. This is pure, totally innocent, eschatology, and so it may be seen as such only when viewed in retrospect.

End of story? No, just the beginning of the end. Only the Millennium now stands between us and God. David's message ought to be the signal that frees us to turn our minds and hearts to the imminence of the Millennium. If I am unable to act accordingly, it will just be another one of probably many missed opportunities. It will then only signal, once again, my lack of faith.

Where to, with the Millennium? Nowhere for now. I have said most of what I can say. I just keep hanging out here waiting for some action. I can only wait for more people to opt for coherence. The world will beat a path to whomever can spell out the most reasonable and coherent cosmology. Google should make it easy for us coherentists to cohere. I am not the only one who senses the materialist blood in the water. Materialism will be an easy act to follow. Many would-be visionaries hang out their shingles on the Internet. One of us will be the first to break through the noise and skepticism. This may already have happened, but I have not spotted it. I may be looking in all the wrong places, but there are only so many words that a radical coherentist can avoid using, and that Google can miss. If I don't have a decent handle on that venue, then I have surely missed a calling.

Every morning is a new day. Every time I put a search term into Google, I know that it could be my last blind search. It may not sound like much, but I do have that much faith. It would not take many of us to turn the Internet around, and to light the lamp of reason that will never be extinguished. It is a new day in a new year, and my patience persists. For what more could anyone ask?

Perhaps the next step is to give a synopsis of rational theism. What is its motivation and what are its consequences?

[1/9]

In a seemingly paradoxical fashion, it is the rise of science that may be most closely correlated with the decline in our regard for human reason. As already pointed out, [Kant](#) is the pivotal figure in this reversal of fortune. But to get a better handle on Kant we must consider his intellectual milieu, the Enlightenment:

Bernard de Fontenelle, popularizer of the scientific discoveries that contributed to the climate of optimism, wrote in 1702 anticipating "a century which will become more enlightened day by day, so that all previous centuries will be lost in darkness by comparison." Reviewing the experience in 1784, Immanuel Kant saw an emancipation from superstition and ignorance as having been the essential characteristic of the Enlightenment. [Britannica 2001, here & ff]

Before Kant's death the spirit of the *siècle de lumière* (literally, "century of light") had been spurned by Romantic idealists, its confidence in man's sense of what was right and good mocked by revolutionary terror and dictatorship, and its rationalism decried as being complacent or downright inhumane. Even its achievements were critically endangered by the militant nationalism of the 19th century. Yet much of the tenor of the Enlightenment did survive in the liberalism, toleration, and respect for law that have persisted in European society. There was therefore no abrupt end or reversal of enlightened values.

The perceptions and propaganda of the philosophes have led historians to locate the Age of Reason within the 18th century or, more comprehensively, between the two revolutions--the English of 1688 and the French of 1789--but in conception it should be traced to the humanism of the Renaissance, which encouraged scholarly interest in classical texts and values. It was formed by the complementary methods of the Scientific Revolution, the rational and the empirical. Its adolescence belongs to the two decades before and after 1700 when writers such as Jonathan Swift were employing "the artillery of words" to impress the secular intelligentsia created by the growth in affluence, literacy, and publishing. Ideas and beliefs were tested wherever reason and research could challenge traditional authority.

The scholars of the Enlightenment recognized a joint inheritance, Christian as well as classical. In rejecting, or at least reinterpreting, the one and plundering the other, they had the confidence of those who believed they were masters of their destiny. They felt an affinity with the classical world and saluted the achievement of the Greeks, who discovered a regularity in nature and its governing principle, the reasoning mind, as well as that of the Romans, who adopted Hellenic culture while contributing a new order and style: on their law was founded much of church and civil law. Steeped in the ideas and language of the classics but unsettled in beliefs, some Enlightenment thinkers found an alternative to Christian faith in the form of a neo-paganism. The morality was based on reason; the literature, art, and architecture were already supplying rules and standards for educated taste.

[...] The philosophes knew enough to be sure that they were entering a new golden age through rediscovery of the old but not enough to have misgivings about a reading of history which, being grounded in a culture that had self-evident value, provided ammunition for the secular crusade.

"The new philosophy puts all in doubt," wrote the poet John Donne. Early 17th-century poetry and drama abounded in expressions of confusion and dismay about the world, God, and man. [...] The method expounded in [Descartes'] *Discourse on Method* (1637) was one of doubt: all was uncertain until established by reasoning from self-evident propositions, on principles analogous to those of geometry. It was serviceable in all areas of study. There was a mechanistic model for all living things.

A different track had been pursued by Francis Bacon, the great English lawyer and savant, whose influence eventually proved as great as that of Descartes. He called for a new science, to be based on organized and collaborative experiment with a systematic recording of results. General laws could be established only when research had produced enough data and then by inductive reasoning, which, as described in his *Novum Organum* (1620), derives from "particulars, rising by a gradual and unbroken ascent, so that it arrives at the most general axioms last of all." These must be tried and proved by further experiments. Bacon's method could lead to the accumulation of knowledge. It also was self-correcting. Indeed, it was in some ways modern in its practical emphasis. Significantly, whereas the devout humanist Thomas More had placed his Utopia in a remote setting, Bacon put *New Atlantis* (1627) in the future. "Knowledge is power," he said, perhaps unoriginally but with the conviction that went with a vision of mankind gaining mastery over nature. Thus were established the two poles of scientific endeavour, the rational and the empirical, between which enlightened man was to map the ground for a better world.

Reason has never recovered from the debacle that followed the Enlightenment. Was this the failure of reason? No, it was the arrogance of reason. The failure of the Enlightenment stands as a great lesson concerning the evil that can result when reason denies its own source.

Human reason does not naturally deny its source. It has to be provoked, and mightily provoked it was by the sectarian history that preceded the Enlightenment.

Until the final revelation, the prophetic tradition stands on the authority of God, as defined by its prophets. Recognizing its own prophets was the major challenge facing this tradition. Another problem is that all prophets cannot be equal. If history is to have meaning or value, then it can only be in the context of a progressive enlightenment of humanity. This observation can even be inverted: the very idea of a universal history originated in the prophetic context.

It is only with the Enlightenment that the notion of a progressive history became self-conscious. If only the Reformation and the Enlightenment could have conspired, might not much of the evil of the past two centuries been avoided? If this were, indeed, the Best Possible World, would that not have been the scenario of choice? Why was this hope seemingly held out to us and then taken away? Why could not this final revelation have come at least two centuries earlier?

The real question thus becomes, Why couldn't history have ended at least two centuries earlier? That question becomes much more difficult. It is tantamount to asking, Why history? Why creation? The final revelation answers that question.

But there is a caveat. History is the story of our separation from and then our rejoining with God. This is the fundamental premise of all prophecy. It has never been a secret. The function of the final revelation is to convince the world that history is coming to its logical conclusion. The subsequent Millennium is just that reasonably protracted concluding phase. It is the grace period in which all our unfinished business is finished. All our debts are settled. A thousand years should be considered as a reasonable upper limit for this denouement and rapprochement.

The final revelation makes sense of history and creation. In this regard, there is just one little secret that is not really a secret, but which, nonetheless, must be officially 'revealed'. Creation is not gratuitous. As I will continue to emphasize, without a Creation there is no Creator. Even God cannot ignore that simple, analytic tautology. Indeed, creation is the primary function of any self-respecting god, nay, of any god.

But there is more to this non-gratuity than mere tautology. There is the pantheist insight that Creation is the essence of God. In some sense, God = Creation. Having achieved this mystical insight, pantheists, much too often, go on to devalue creation, history, life, God. They set their spiritual sight on a realm beyond the tangle of Creator and Creation. How many of us have never contemplated the trading of life for nirvana? One can hardly blame them. N.B., however, mystics are much less inclined to suicide than the general population. That should tell us and them something. The life of the mystic is about as far from being absurd as one can get. No small paradox, that!

Hinduism had its combined Reformation and Enlightenment in Buddhism. It was, like our own Enlightenment, eventually rejected. Why? I'm afraid that the answer was all too mundane. Buddha was unable to overcome the Caste system. (Has Jesus fared better? You'll have to be the judge of that.)

But was that Buddha's fault? No. You will have to blame it on the system, the system of Creation, not Caste. Buddha somehow had to play the logically scripted role of the non-prophetic prophet. This might actually have been a greater spiritual challenge than anything on the other side which was naturally meant to be more straight forward. Just ask me about straight forward!

Creature and Creator are essential to each other. Why have the authorities always gone to such lengths to obfuscate this simple fact? The authorities take it upon themselves to intervene between creature and Creator, a role that is not entirely at odds with the prophetic process of mediation. Thus we have the 'divine mandate' of popes and kings. The Cabots speak only to the Lowells, and the Lowells speak only to God. That is not supposed to be a two way street, we think. We like to have our kings be kingly and our presidents be presidential. If today the President called you to ask for your advice on Iraq, how would you feel? You might feel just a bit put out. Then imagine if it were God on the other end of the line. Let the

preachers preach so that the rest of us can mind our own business, thank you.

The final revelation is that we are all in this little boat together, and I do mean 'little'. Creation may not be perfect, but it is the best one possible, and I do mean 'one'. There is no second best creation. There is no second best creator. Secondness is the beginning and end of all incoherence, nay, of all absurdity. The Savior and Santa Claus are not the same. Santa Claus has to jump down every chimney. The Savior has but one. Ours was it. Despite the superficial materialist appearances, there is no spiritual redundancy in the Cosmos. There is only that supposedly mysterious *second* and final coming that we are about to witness in all of its down-to-earthiness. The final coming is meant precisely to break the seal of Creation. The key is in our own, oft-maligned minds, hidden in plain sight. It is just our universal power of reason - a reason that knows only one authority -- love. That is our ticket to heaven.

Do you feel less than convinced? Well, don't take my word for it. Go talk to [David](#). His is the last word for materialism. Does that spell the end of reason? No, that is just the beginning of a universal reasoning no longer cowed by the specter of atomism.

[1/10]

Since at least the time of [Bertie Russell](#), *The Analysis of Mind* (1921), folks have turned to '**neutral monism**' as a means to avoid the incoherence of materialism and dualism, without having to embrace the dreaded immaterialism.

David Hume, an 18th-century Scottish skeptic, developed a theory of knowledge that led him to regard both minds and bodies as collections of "impressions" ("perceptions"), the primary data of experience. Bertrand Russell, a 20th-century British logician and philosopher, called the neutral entities "sensibilia" and argued that mind and matter are "logical constructions." William James, the American pragmatist, held that the neutral primary stuff is not a series of atomistic perceptions but is a "booming, buzzing confusion" that he termed "pure experience," with mind, or consciousness, and body as names of discernible functions within it.

Neutral-monist theories have been criticized as inadequate in their account of either mind or body. Hume himself said (*A Treatise of Human Nature*) that his concept of mind as a bundle of perceptions inadequately accounts for the identity and simplicity of the mind. Others have criticized the notion that physical bodies comprise some sort of primary experience as implicitly idealistic. Hence, the central problem for neutral monism is seen as that of specifying clearly the nature of the neutral stuff without qualifying it in an exclusively mental or physical fashion. [Britannica 2001]

Neutral monism has taken a variety of forms, but mainly those of phenomenalism and, more recently, informationalism. This latter form covers David Bohm's 'implicate order' by which he attempted to provide a 'hidden variables' interpretation of the Quantum. Even the standard Copenhagen interpretation is virtually a neutral monism. I would submit that panpsychism and pantheism, when not purely immaterialist, are versions of neutral monism. Kant's noumenal realm is yet another version.

More to the point, naturalism and even non-reductive physicalism strongly overlap with neutral monism. Unless one is able to pretend that there is a very strict epistemic/ontic divide, then one is bound to deal with some form of neutral monism, at the least.

Let's see now. We are left with naturalism and, of course, supernaturalism. Off to the side is immaterialism. Supernaturalism is, to most folks, the same as dualism. If we shuffle these three cards once again we get neutral monism, dualism and idealism. The theistic dualists hold the incoherent wild card. If they ever saw the light of coherence available in idealism, our premillennial game would be over. Most theologians verge on idealism, but they will not confront the scientific establishment. The Creationists do that, but they are wedded to their dogmatic dualism. Without foreseeable support from the non-rational theists, we immaterialists must be the ones to confront the naturalists with their own

incoherence. That is the only opening for rational, ideal theism. [Confrontation? Maybe just a nudge in the [right direction](#).]

The naturalists fall back on the limited coherence of the scientific cosmology. Their weakest link is in explaining the evolutionary emergence of the mind. Except for the few remaining non-reductive physicalists, most naturalists assume a neutral monism that is tantamount to panpsychism.

It seems to me that it is a very **slippery slope from naturalism to vitalism to panpsychism to pantheism to panentheism to a monistic theism**. Where the naturalists find themselves on this slope is not something they are wont to advertise. No thoughtful naturalist could be unaware of this slope and of the non-existence of any logical retaining wall on their side of theism. They just see no reason to brag about the logical tenuousness of their position. Darwin and the Big Bang are their fortress. It seems a formidable fortress until one inspects its foundation.

There are mountains of evidence supporting the scientific cosmology. Those mountains may be shifted with one's little finger. This is accomplished by yanking the materialist rug out from under the scientific edifice. The smallest amount of panpsychism may then provide the grease to set that edifice adrift. It might as well be floating in mid-air, which is exactly the claim of immaterialism. It's all in the mind, be it cosmic mind or whatever.

Is there no alternative to panpsychism for the naturalist? What about all those dissipative structures and spontaneously emergent properties of the [complexity theorists](#)? The issue we found there was whether there can be non-trivial self-organization without a non-trivial self.

Biology is replete with apparently non-trivial emergent properties. But, by definition, an irreducible property is unexplainable scientifically. It cannot be explained by physics. The realm of the irreducible, should it not then be identified as some sort of projection of Kant's noumenal realm?

All of the emergent properties of which we shall ever have cognizance will pertain to living systems. If their noumenal source is other than some kind of **vitalism**, we could never know it. Naturalism tends naturally to vitalism. Do the naturalists deny this? Not to my knowledge. They simply don't brag about it.

But now it gets worse. There are a plethora of irreducible emergent properties with which we happen to have more than a nodding acquaintance. These are the states of our own psyches. It is often suggested that this acquaintance is so intimate that it is, at the least, unimpeachable. No one can vouchsafe our own mental states. Indeed, our own mental states may not even exist outside of our experience of them. Thus do we see how vitalism naturally and easily spills over into **panpsychism**.

There are caveats. We have to consider unconscious mental states, as well as the possibility of an artificial intelligence.

[from the PDA, not wanting to break the natural (sic) flow]:

Friday, January 10, 2003

6:05:51 PM

- [@GreenSpring Courts]
- There are caveats. We have to consider unconscious mental states, as well as the possibility of an artificial intelligence.

- [from 'On the Side of Reason' page.]
-
- These two considerations may be related.
- The computationalists like to think that our uCs is where the bulk of our information processing takes place.
- It is only our HOT's ['higher order thoughts'] that become conscious.
- Once again we find a possible venue for Kant's noumenal realm.
- Naturalists can avoid vitalism only if connectionism or computationalism can take up a significant amount of the noumenal gap.
- There are strong indications that these approaches are mutually negating. Only if some unknown amalgamation of them can be concocted, is there a way out of this logical dilemma.

My claim is that 'strong' AI is the only thing that stands between naturalism and vitalism or panpsychism. Thus is strong AI the last retaining wall on the slippery slope from naturalism to theism.

Once theism is back on the intellectual radar screen, immaterialism will then have its entrée onto that same screen. And once theism and immaterialism can no longer be intellectually dismissed, rational theism, as herein specified, will come into its own. This will complete our premillennial phase.

This is the most likely foreseeable course of events. The timing is now the last unknown. Within this decade? How about 2012 as the drop dead date? Let's give the Mayans their due. Why not? If we can bring it all in before then, well, so much the better. (And how many would-be cosmologists can say that only their ol' man knew D-day? Crypticism was never my strong suit.)

Here's a page for the record; this was on the [neutral monism](#) list: [Neutral Monism & the Mind/Body Problem](#). This page is from the [Holoweb](#). It belongs to [Keith](#) Choquette. Notice the similarities and differences between our two sites. So near yet so far??

[1/11]

Let me attempt to recapitulate yesterday, as well as some earlier material. I think there has been some progress in my assessment of the tenuousness of our scientific grip on reality.

A significant factor is that the materialists have run out of ideas. The more thoughtful and candid amongst them, Jaegwon Kim and David Papineau are conspicuous examples, have admitted as much. They have run out of new arguments without making any significant dent in our natural, non-materialist intuitions concerning the nature of our own minds. The philosophical ball is now officially in the court of the non-materialists. And this is just for starters.

The complexity theorists are also running out of ideas for explaining the emergence of novel properties in complex systems, despite the tremendous advances in our computational ability to model such systems. As if to add insult to this injury, the Artificial Intelligentsia is now picking up the cause of ontology that had been dropped by the philosophers. They are looking at the minimum, irreducible ontologies that must

be posited so that we can move ahead with our knowledge enhancing systems. Philosophers ought to be taking notes.

The philosophers who are taking note are the Continental semioticians. The phenomenology minded semioticians are effectively ganging up with our own computational ontologists to roll back the Anglo-American initiative in analytic philosophy that dominated our academies in the last century.

Lacking any analytical alternatives, philosophers are reluctantly being pushed toward logical synthesis and metaphysical emergence on a number of fronts. Notions of vitalism and panpsychism are being reconsidered with what some might consider **alarming regularity** by our workaday philosophers.

For the modern non-materialists, the metaphysical battle is now theirs to lose. Barring some totally unforeseen change of fortune, the momentum is increasingly and very perceptibly shifting away from materialism. Looking back, with 20/20 hindsight, one can almost pinpoint the turning point as having occurred at mid-century: [W. V. Quine](#) (and [herein](#)) (1908-2000), 'Two Dogmas of Empiricism' (1953). Did Willard sense the magnitude of what he had wrought. Only privately, if at all. He was no evangelist and surely no eschatologist. All the more for the rest of us!

[1/12 -- Many folks would place the discovery of the Quantum, at the turn of the last century, ahead of any philosophical development in helping to reverse the fortunes of materialism. There is a cottage industry of **Quantum Minded** physicists, formerly led by David Bohm, and now by Sir Roger Penrose and Henry Stapp. [Keith Choquette's Holoweb](#) site provides an excellent synopsis of these developments occurring on the fringes of Physics. His book, [The Holonomic Paradigm: Biophysics, Consciousness and Parapsychology](#) (2002), goes into much greater detail. I [take exception](#). Yes, me, with my two master's degrees in Physics, beg to differ with some of the greatest minds in that field.]

This turning point came despite, and, one is tempted to speculate, almost because of a continuing wave of startling advances on the scientific and technological fronts. Only now, at the bi-millennium, is this wave beginning to dissipate. A thoughtful person could have anticipated that science might be working itself out of its own job. Either science would naturally find its own limitations, or the worst nightmares of transhumanism would quickly be descending upon us. Oh, yes, there are plenty of self-styled 'futurists' out there who keep the transhumanist faith, and you are very welcome to do the comparison shopping, but I don't think you have to be a brain surgeon to sense that their faith rings hollow. The human intellect and spirit are restless. If the 'futurists' cannot offer us new nourishment, we will be, and we are, moving on to other pastures, other futures.

I just got a response from [Keith](#) inviting me to peruse his material. Here are some excerpts from his [Overview](#) and the succeeding pages:

Ilya Prigogine, the Nobel prize winning chemist, is a colleague of Pribram's and has written on the relevancy of chaos theory to Bohm's physics. In his work on chaos theory, Prigogine described the **spontaneous reorganization** of far from equilibrium systems. The emergence of correlations far from equilibrium due to fields that were ineffective in a less chaotic system is the same principle that Bohm appeals to as the basis of effects from hidden variables of the holonomic order. **Subtle fields impose an unexpected order** on chaotic systems through a **top down constraint** upon the system. Bohm refers to the emergence of correlations between electrons in superconductive material at very low temperatures as one example. Pribram also describes the holoscape as a chaotic system, susceptible to the same sort of top down constraints.

[...] Much as Copernicus taught us that the earth is not the center of the world, the holonomic paradigm indicates that the world manifest to our senses and our instruments is not the whole world but only a corner of a vast reality beyond what has been imagined.

[...] Based upon that assumption and the data of recent studies, Puthoff has gone on to describe basic

properties of matter such as mass, inertia and gravity in relation to this zero-point field. Others have suggested that the hidden energy of the vacuum develops a pronounced **coherence in living organisms** and bears upon life processes in important ways, even as the basis of consciousness.

[...] Consciousness is a fundamental part of reality in Walker's theory. There can be nothing physical according to Walker, without consciousness to complement the physical potentialities and bring them to actual physical states. Does this mean that there was no physical reality until the evolution of conscious observers? Not according to Walker, because consciousness was always present in the world, right from the big bang

[...] Consciousness does not emerge from the physical forces recognized in the standard model. Rather consciousness is a hidden variable necessary to accommodate the data of physics....

[...] Pribram argued for a pluralistic monism in which "informational structure" remains neutral to the apparent distinction between mind and matter. He goes on to note that the implicate order Bohm described introduces such information structure in the hidden variables of the implicate order, beyond the material system.

[...] Yet when one looks back to the dawn of the scientific age and the presentation of Newtonian physics, it is easy to understand how the enthusiasm of the scholars of that time fueled new hope that everything about the physical world would be comprehensible to human reason. The age of enlightenment ensued and the match between a rational world and the rational observation of it seemed perfect. Einstein once said "The most incomprehensible thing about the universe is that it is comprehensible". **The holonomic paradigm suggests that what can be comprehended is really just a small corner of a vast reality reaching beyond the stars, forever hidden behind the veil.**

Keith,

Please excuse this open response. I will post your reply only if you desire.

Why the pessimism? I agree that reality vastly transcends the built-in limitations of any purely objective science. But this deeper, implicate order to which you and many others expectantly refer: what is its nature? Is it not much closer to the nature of mind than of matter? You say that the implicate order is responsible for the self-organizing potential of matter. Is it not likely or conceivable that much or even most of our own mental processes are embedded in the implicate order, beyond the structures of space and time? Is not such a collective mental field necessary to explain the data of parapsychology, not to mention psychology and biology?

The fact that we cannot drag our scientific instruments into this domain, is hardly cause for despondence. Our most powerful instrument of discernment is already ensconced in the heart of that noumenal world. For what more could we ask? Is it not the birthright of everyone of us to have a ringside seat under the noumenal Big Top?

I need not point out to you, of all people, that our puny little egos are not the biggest show in the cosmic mind field. Surely the spontaneous organizing potential of the implicate order has realized mental powers that transcend our own. In fact, it may well be that our present egos relate to the cosmic mind rather as the mental power of an individual neuron relates to you and me. Is this cause for pessimism? Only if we can't figure out how to put our heads together. Does not the Internet serve as a prime accelerant in this inevitable process of global coherence? Here we are reasoning together about from whence we have come and whither we shall go. Our intellectual weblogs may or may not converge. Those that do converge and cohere are likely to set the pace and tone for what is to come.

Only a minimal faith in the universal power of reason, as amply demonstrated in mathematics and other fields, is necessary for all of us to win the cosmic mind game. For what other reason could we have possibly come this far from out of the primordial chaos?

If that is not good enough, we can always cheat. A little clairvoyance can go a long way in the teleological field of the implicate order. If we are not chips off the old block that is the cosmic mind, then someone is trying hard to fool us. All we have to do is collectively remember from whence we came.

Am I being too optimistic?

Dan

[1/12]

I am taking exception to the [Quantum Mind](#) brigade. I have several times favorably mentioned my own experience with what I call '[quantum dualism](#)' (also [here](#) and [here](#), etc. I just realized, though, that 'quantum' appears in none of my page titles. This oversight will have to be corrected.). I recognize that the main intent of the Quantum Mind people is precisely to avoid Cartesian dualism, and one can only applaud their efforts to this end. But, as with Bohm, we are left with the explicate and the implicate orders, reminiscent of [Kant's](#) phenomenal and noumenal domains. These domains cannot be treated as ontological equals, despite Descartes' supposition that we could have the equal reality of both mind and matter. The nascent scientific enterprise was quite happy to grab and run with their half of the ontological loaf. Only in the last half of the last century did that establishment dare attempt to complete their ontological heist.

That is water over the historical dam. The Quantum brigade is resorting to a partial roll-back of the materialist juggernaut, rather in the spirit of postmodern pluralism, i.e. let sleeping dogs lie. It is my intent to demonstrate that any such partial measure is too little and too late. We cannot now turn the clock back toward dualism and pluralism. There is a global need and desire for coherence on all levels.

But, I will hardly have to lift a finger. I have only to point to the [slippery slope](#). Give the psyche an inch and it will take a mile. If there is an ontological domain for the human psyche in the implicate or noumenal realm that has little or no regard for the limitations of space and time, then surely there is room for supra-human intelligence in that same realm.

We then have a stark choice to make. What shall we take to be the primary ordering principle for the cosmos? Will it be the space-time manifold, or will it be the mind. Kant and Bohm and many others, including other physicists, have realized that space-time could only play a derivative role. There had to be a 'pre-geometric' or noumenal order. Surely the mind, conscious and unconscious, human and supra-human, is a part of this order. We then need only choose between pessimism and optimism. The pessimist supposes, with Kant, that the noumenal order is a primordial chaos, almost totally opaque even to the supra-human mind.

The optimist finds this notion of cosmic incoherence hard to swallow, especially after three centuries of progress in the mind's penetration of nature. There is an ordering principle, alright. Darwinism is surely not sufficient. There is also an Anthropic principle at work. Then there is the 'unreasonable effectiveness' of mathematics within physics and beyond. Does that mean that the supra-human intelligence is limited to mathematics? Is there not always a close correlation between mathematical and musical aesthetics? Witness the creations of Mozart.

Science has led us to see virtually to the end of nature. We now confront the noumenon. It is either an alien domain or it is our one true source and home. Our ecos, our logos, our telos. Is not pessimism just born of the desire to avoid our inevitable time of reckoning with our own destiny?

Messianism

My last major [excursion](#) into the issue of messianism was last August. [Then](#), as [now](#) there was a bit of a provocation: failed communication. [To set the record straight there has been a subsequent communication in the latter instance]. When communication fails, one is not generally afforded an explanation. One can only surmise. I claim, in no casual manner, to be a reasonable person. When I get into trouble in communicating I can only surmise that it is due to the fact that I intentionally carry or push reason to its limits. It is my nature to be persistent, and I simply persist with reason beyond what most others might consider to be reasonable, politic, or even just polite.

Am I then a trouble maker? Perhaps, in the sense that moderation in all things is often held out as the prescription for avoiding trouble. Can one be too reasonable or too rational? I would say that it depends on the context. I think it is fair to say that our world is in as precarious a situation today as at anytime in its history, and there is the live prospect that things could get much worse before they get better.

Is there a better way? If there is, we will discover it only by reasoning together. And there is the catch: human reason has been much maligned, now as much as ever.

Human reason has been caught between a rock and a hard place. For the last several centuries, the power of human reason has been demonstrated mainly in the domain of science. Science, however, has been unable to discover the source of human reason, beyond speculating that it exists merely as an outdated(?) survival mechanism. The defenders of reason are left defenseless against modern and postmodern cynicism concerning any and all human motivation. Cynicism becomes a self-fulfilling prophecy as the technology spawned by science, lacking more inspired or humane application, is diverted wherever possible to its basest and most dangerous uses.

Down through the ages, when faced with seemingly insurmountable problems of their own, people have appealed to higher sources. This has been seen in both the prophetic and mystical traditions. Is that happening today? The aggressive and nihilistic materialism that lies just below the surface of modernism has seemingly created its own evil twin in the upwelling of reactionary, fanatical fundamentalism now seen around the world. The voices of reason on the spiritual and theological side of the modern world have been virtually silenced by the centuries of systematic brow-beating that they have endured at the hands of the secular intellectual establishment. There is no sign of a reasoned institutional response to the rising chorus of secular cynicism and sectarian fanaticism. These, indeed, are the rock and hard place between which human reason is now skewered.

I see one hope for reason. That is right here on the Internet. Only here might it be possible for individual voices of vision and reason to coalesce into a force to be reckoned with by all the other forces of unreason. Coherence is the name of this game. It will be up to us to come up with the vision of light and reason that can overcome the tide of darkness.

We can put this much trust in our reason only if we can believe that it has a source beyond the material dimensions of the scientific cosmos. Together, we can and must reach for that higher source. Thus this effort necessarily transcends material survival, as it takes on the character of a quest for our own salvation.

We who expect to find a coherence in accord with a higher source of reason can only do so effectively in the context of a salvific cosmology. The mystical and prophetic traditions, wherever they eschew pessimism, open themselves to a messianic drama from within history. Can we ignore that history, that metanarrative of all the human traditions?

Here's the next list: [messianism & \(Moshe\) Idel](#) (192 hits).

[MESSIANIC MYSTICS](#) -- Moshe Idel (Yale Univ. Press 1998):

From [Booklist](#):

A running controversy with fellow Judaic scholar Gershom Scholem drives Idel's wide-ranging argument about the relationship between messianism and mysticism. Scholem sees the two as incompatible, but Idel offers substantial evidence that they can coexist and, for a number of important thinkers, have coexisted. Idel is particularly interested in opening investigation of cabala (esoteric Judaism) to a rainbow of messianic models. One effect of that interest is the shifting of messianic ideas from a distant, apocalyptic future to a transformative present. Moreover, discussion of *tikkun* (cosmic repair) as completion of the deity is relevant not only to Jewish messianism, Idel notes, but also to a range of mystical traditions in Judaism, Christianity, and Buddhism. The conception of every moment as a gate that may admit messianic transformation of the world imparts a seriousness to everyday action that belies popular perception of mysticism as otherworldly. Idel's treatment of a most intriguing subject will stretch nonspecialist readers but richly reward them, and his thorough documentation points out excellent avenues for further exploration.

'[From Celebrities to Zionists, Kabbalah an Endless Source of Solace](#)' -- New York Times/March 20, 1999 , by Edward Rothstein

In a major new book, *Messianic Mystics*, Idel expands a project he began more than a decade ago, questioning his mentor's views on almost every major issue. The arguments are complex, but they have important implications for understanding Jewish history and popular religious belief.

The notion of messianism is central to these disagreements. For Scholem, the Kabbalah after the 13th century developed a new system for making sense of the trials and exiles that scar Jewish history.

Just as the human body was created in God's image, these mystics believed, so every human act had its counterpart in the divine realm; earthly history was but a reflection of the history of the Godhead; both realms were riven by alienation and exile.

A cabalist, by properly performing ritual, could begin to heal not just the mundane universe but the spiritual one as well. This mythology, a version of which is incorporated into contemporary pop Kabbalah, made Jewish history and personal experience part of a grand theological drama of exile and restoration.

But what happens, Scholem asks, if a savior, a Messiah, promises to complete this process of repair and reparation, **bringing the drama to an end**? Scholem argued that such a figure would be revolutionary, not evolutionary. A Messiah would shatter the tradition (as indeed, the figure of Jesus did when his disciples founded Christianity). **Scholem called messianism a "theory of catastrophe."**

In a magisterial essay, "Redemption Through Sin," Scholem described such a catastrophe in the 17th century, when a mentally unbalanced man, Sabbatai Zevi, declared himself the Messiah. Sabbatai engaged in bizarre and provocative acts, even instituting a new blessing praising "that which is forbidden."

[...] But eventually, Scholem suggests, it caused a widespread crisis that undermined the foundation of Jewish faith. Only the spirit of national and spiritual yearning remained, a yearning that led to the **Enlightenment** and eventually to **Zionism**.

[...] Scholem sees messianism as dangerous and catastrophic; Idel sees it as a part of ordinary mystical expectations. Scholem says the sense of exile was central to much cabalistic thought; Idel, rejecting traditional views of Jewish history, disagrees.

Scholem stresses the importance of ideas; Idel emphasizes the nature of experience and the mystic's drive toward union with God. Idel values variety and diversity over unity and coherence. (He even wonders if he is being too **post-modern**.)

One might hope that somewhere between these two scholars there may lie some truth.

And where, you might ask, do reason and mysticism come together?

[1/15]

The following is an edited excerpt of a recent communication.

[-----],

Yes, there is a whole new world opening up. It is a world that appears to be more amenable to what you frequently refer to as a 'top-down constraint'.

There are, of course, the 'holonomic constraints' of classical physics which, in a purely formal, or 'nomological' manner, recognize macroscopic, i.e. mechanical causation.

Both of us (many of us!) are looking for less mechanical types of causation that would be open to psychological and parapsychological application. And, almost certainly, the quantum, implicate, noumenal and/or pre-geometric realms are less resistant to mental causation than is the classical domain. And, furthermore, from a non-dualist perspective, we would expect any sort of implicate order to have a strongly mental component.

Jack [Sarfatti] and Henry Stapp both see 'qubits' as having a mental nature. Jack uses the hidden variable interpretation of Bohm, while Henry follows von Neumann and Wigner in focusing on the dynamics of the 'collapse'. (I am already rusty regarding Jack's ontology. I will need to consult his new books @ <http://www.1stbooks.com>.)

Any move toward making physics more hospitable to our minds will, of course, make it more hospitable to all minds. There is likely to be some natural, spontaneous self-organizing, on the part of the cosmic mentalities, into a structure that might have some attributes relevant to theology.

Given some probability of a theo-physics, I am naturally inclined to take my questions and concerns right to the top. People engaged in the more traditional brand of physics, even possibly including Jack, see this as a shameless cheat. It is more akin to speculative philosophy (dare we mention it!) than physics.

The bottom line is that I try to take the perspective of the Big Gal upstairs. Unless I were totally incompetent as a creator, there would be certain optimizing strategies that I would endeavor to employ, especially including a maximal participation in the Creation on the part of the creatures, along with certain security measures, of course: viz. Ron P. (I'm embarrassed to admit that I have just run across the notion of 'tikkun' ("Repair of the World") which is the cabbalistic take on Wheeler's 'participatory universe'.)

Jack was my original metaphysical mentor via his first version of Space-Time & Beyond (1975). Now that Jack has returned to physical sanity, he rues his contribution to a generation of metaphysical delinquents, including yours truly.

But, glancing at his recent missive copied to you, there may be some hope of a latter-day collaboration between sanity and insanity.

[...]

Dan

And yet another missive:

[Jack](#), [also see <http://www.1stbooks.com> (Sarfatti)]

Sure, I can meet you in DC. If you would like Ron's participation, you had best make a personal entreaty.

By the way, I have a bit of a Sufi connection, myself. My sometime guru's guru is a Sufi elder who officiates at the dome of the rock. There might be some strategic value there: Location, location, location.

>>I now think I understand both consciousness and gravity and how they connect as physical processes. How they connect is how the UFOs fly. Remember for me physical and material not equivalent. Mentality is also physical. It's Wheeler's IT - BIT distinction. There is a physics of information and meaning that is not purely subjective. Our inner experiences are physical phenomena in the broader sense. I could be wrong, but let's see how my concepts and equations hold up in the normal science process. I will be presenting at APS meetings now.<<

You and I differ mainly in the tail vs. dog department. In the natural, primordial state there is a great mixture of the mental and physical, or subjective and objective. The mental dimension is able to exercise active voluntary coordination and thus is able to overpower the more passive 'physical' dimension. However, when it comes to creation, the mental-physical tables must be turned so that our creaturely egos have a relatively stable and level playing field on which to freely and individually interact. This is ensured by a strictly enforced physics based on the Anthropic principle.

Only as we work out our interpersonal relations, and communication technology, are we able to coordinate our minds on a global scale sufficient to where we can help inaugurate a Millennium devoted to 'tikkun' or cosmic repair, leading to the hierogamos of creation and creator, closing the teleological loop that is history.

Nothing here is particularly original, nor even deep. If I can bring anything to the messianic table it is perhaps a peculiar post-modern bed-side manner that may go with the territory, at the same time as being able to attend to certain academic subtleties, when not hounded by security guards. Also, being able to defer most moral and spiritual issues to an illustrious predecessor is a major leg up on the prophetic incline.

>>The problem is to avoid the creation of new UFO Death Cults like Heaven's Gate. I saw that possibility in Joe which is why I reacted so strongly to try to leash him in. His phrase that he was ready to die for his cause raised my alarm.

Well, I may have managed to involve myself in that mini-eschaton by passing a potentially incendiary piece of info from Rick Doty to Richard Boylan who then broadcast it. Live and learn.

>> It's important you read Stephen's book "The Two Faces of Islam". I need to connect up again with Robert Dickson Crane. His trip is similar to Steve's. I did not know he had been a personal advisor to Richard Nixon when I dated his daughter Maiti 20 years ago.

>>[Later] Read Stephen Schwartz's "The Two Faces of Islam" for some deep enlightening connections on the broader cultural stage that is your main interest beyond the physics

>>Basil Hiley on his webpage <http://www.bbk.ac.uk/tpru/BasilHiley.html> discusses the "non-mechanical" in depth. Stephen Schwartz and I are relating this to Sufi Metaphysics.

Osama & Co., bless their hearts, are giving us a 'crash' course in postmodern ecumenism. The saber rattling and fence building can go just so far -- at some point we will have to learn to talk to these folks. The Sufi connection will have to be the primary channel. The Christians and Jews will need to demonstrate more than lip service to Allah. It is difficult to believe that 9/11 did not have some cosmic significance. The shouting and shooting will wind down. The cosmology will heat up. Some of them, 'the other face of Islam', are more serious about cosmic matters than we are. We will get more serious, or else....

>>This is beyond ordinary micro-QM and corresponds to Antony Valentini's "avoidance of sub-quantal heat death". Brian Josephson first pointed this out in his "Biological Utilization of Nonlocality" with Fotini Pallikari. Bierman's teleological "presponse" is built in. See also Colonel Robert Hickson's piece in my "Destiny Matrix".

(I'm impressed that you got on with Robert. He did not like my presentation last time -- I may have had more than my share of the wine bottle, but I might still get another chance.) The "philosfawzers" are just beginning to wake up and smell the non-local, 'emergent', irreducible, teleological properties. The general acceptance of just one such

property at the biological or psychological level might well do as much harm to the scientific cosmology as a fleet of ufos, IMHO. We may differ on this point.

But, one way or the other, the sky is going to fall on the heads of some intelligent folks. This, especially under the gun of 9/11, is likely to set off a significant intellectual panic. You and I, and just a few others perhaps, have most of their options covered. Coming to us would be like one stop shopping. We would be making it easy for them and us. All we have to do is act naturally.

Dan

Aren't I a busy little correspondent!

[1/16]

And more of same.....

Jack,

I may be wrong or you may be wrong, but we cannot both be wrong! That is the beauty and the 'spirit' of the Jack-Daniels Show.

You have a lot of **self**-organizing being referenced in your message below [not presently supplied], but I don't see any **selves**, except after the fact, as a finished product. The Self is Johnny Walker (Wheeler?) come lately.

I would suggest to you and Bohm, and quite a few others that there can be, and logically must be, primordial, virtual, potential selves, wherein resides all the discretionary cosmic potency, because were else could that potency reside?

Your flow of information goes mainly from the objective to the subjective. This may be fairly accurate in our present situation as creatures in the pre-Millennial, pre-Tikkun phase of History. BUT, with the Creator and and with us creatures in the Millennial, Tikkun, psychokinetic, cosmic restitutional phase, that flow of informational bits is increasingly going to be reversed and be flowing from the Subjective to the 'Objective'. That reversal accelerates us beyond the event horizon of the Eschaton. That is one model for the Hierogamos.

If you attempt to work out an eschatology without appealing to an informational ebb and flow as just described, then there is no closure, no cosmic bootstrap. Some such loop is embedded in every mythos known to us. Without some self-containment and self-consistency there can be no cosmic significance. You are left with the Apeiron, dreaded by the Greeks. I am suggesting a basis for the Logos. The transcendental infinities and potencies lie in the subjective-qualitative dimension, not in the objective-quantitative dimension.

Again it comes back to the primordial dog and tail, or chicken and egg problem. I am suggesting to my former physics colleagues that Anthropics and the 'unreasonable effectiveness' of mathematics are a sure sign that our physics is at least one big step removed from the true primordial, chaotic Apeiron. What comes between us and the Apeiron is the potency of a virtual Logos or cosmic Self. Creation, thus, is the **self-realization** of the virtual Logos. The eschaton is the completion of the creation and the restitution of creation to Creator.

Like I say, we can't both be wrong!

Dan

[1/21]

This email exchange with Jack Sarfatti continued for several days:

Jack, [1/19]

I'll grant you that one of us is confused. Let's see who it is.

You say that I make a category confusion. Well, the game of metaphysics is all about categories. I challenge your categorizing, particularly in regard to mind and self:

I believe I have explained consciousness as a physical phenomenon within the laws of nature in the paradigm of modern science better than any of my peers in the field (Stapp, Penrose et-al).

I challenge your categorization of the mind as a natural phenomenon. That is the whole point of our discussion, Jack.

The theory of emergence bottom->up is given by PW Anderson. The theory of Bohmian downward causation is given by Basil Hiley.

This is where your 'naturalism' crashes on the rocks.....:

There is on Basil's [website](#) just one online [paper](#) that references the mind: . It nowhere contains the word 'causation', let alone the phrase 'downward causation'.

In your two books, 'causation' appears just three times, each time in reference to 'future causation'. The word 'emergence' appears only once in a quote from Anderson.

It would appear, Jack, that you have not been doing your homework. If you would like to begin understanding the issue of emergence and downward causation I would suggest that you start with my page on [Creation](#) and follow the hyperlinks therein. What is still the most frequently cited paper on the topic is by Jaegwon Kim, a philosopher of physics at MIT. Here is a review of his paper: [PHYSICALISM, EMERGENCE AND DOWNWARD CAUSATION](#) -- Richard J. Campbell and Mark H. Bickhard. Jaegwon has demonstrated that the idea of emergence and downward causation is incompatible with any scientific notion of law-like behavior.

You should also check Google: "[downward causation](#)" (1,200 hits) and "[emergent properties](#)" (16,000 hits). Together these now constitute the single biggest topic in the philosophy of science. Much of the substance of the Sokal 'Science Wars' concerned this issue.

If you have something useful to say on this topic, you are guaranteed a large and attentive audience. I would suggest, however, that you first put your ideas down on paper, and be sure to include the appropriate references and footnotes.

But let me see if I can save you and others some time by providing a synopsis: this is not meant to excuse your own study. The major issue here is scientific realism. What is real? That is the basis of my challenge to you, to name just one real thing.

You claim to be physicalist: the only real things in the world for you are just those things are necessarily referenced in the laws and theories of physics. This is to say that all of the other sciences and all the rest of human discourse makes reference only to entities of social convenience. For instance, if I speak of a 'heartache', well, there is nothing real being referred to, nothing objective. But even if a surgeon speaks of a 'heart', that too exists only according to the arbitrary functional conventions of anatomical discourse. The heart does not exist as a thing in itself, i.e. it is not an independent causal entity. The heart may be reduced to and explained entirely in terms of physics. There are no vitalistic or downward causal forces pertaining specifically to an objectifiable 'heart' entity. Such is your system of belief. Correct me if wrong.

The developing consensus among philosophers and many scientists is that physicalism is simply wrong, and possibly even incoherent. Atheistic philosophers no longer refer to themselves as materialists or physicalists, but rather as 'naturalists'. They believe in irreducible, spontaneously emergent properties.

The rest of us question this notion of 'spontaneity', especially as it applies to the mind. Spontaneous is simply defined as unlawful. There is no rhyme or reason to the emergence, it is all accidental. Once having emerged, Darwinism presumably takes over. Naturalists, however, have to spend much of their time defending themselves against the charge of 'vitalism'. How else can they explain the downward causation that constitutes real emergence?

They point out, in their defense, that Darwin was also a vitalist just because natural selection could not function unless there were real, downwardly causal biological traits upon which natural selection could operate. In other words, the phenotype has to be just as ontologically real as the genotype, in order for genetics to make sense.

In claiming to explain the mind, Jack shares the ontological problem of the naturalists. There must be special (ad hoc?) biological laws and forces in addition to the laws and forces pertaining to the inorganic realm. Where do these laws and forces come from? If they don't come from 'below' then they must come from 'above'. And where is this 'above'?

However, if we are to consider ourselves responsible moral agents, then you and I are partaking of this vital downward causation, every time we act. This is just the emergent, causal reality of the human self or soul or spirit.

What Jack and many others fail to comprehend is the necessary unity of any truly emergent phenomenon. He fails to comprehend the staggeringly obvious idea that consciousness does not and cannot occur in an ontological vacuum. There is no floating consciousness. There is no unattached mind. Jack supposes that consciousness is just another thing, like electrons and muons, independently, objectively existing. Jack egregiously ignores the most basic fact that consciousness exists only for someone. There is nothing in the realm of physics that has this peculiar attribute of existing only for something else.

Jack has totally neglected to address the dual problem of intentionality. The one distinctive feature of all mental phenomena is that they exist only for someone and only about something else. Nowhere in the realm of physics can Jack point to anything that has these basic attributes. Failing to explain what is the very essence of the mind is failing to explain the mind, period.

Jack, you have mesmerized yourself with your formulas. It is time for you to think about what you are doing. If you just want to be a saucer mechanic, fine. But if you want to explain to us the meaning of life and mind, well, that involves categories like intentionality, of which you do not yet appear to have any knowledge or interest.

Dan

Jack, [1/20]

Here's the funny thing, though. You may turn out to be right about Bohmian-style physics, but for all the wrong reasons. The Copenhagen Interpretation looks about right for someone who is a either a latent or a blatant Cartesian dualist about mind and matter. But for us monists, however, be we physicalist like you or metaphysicalist like me, the Quantum leaps and collapses, and all the dice rolling, just don't wash. This may be the only thing about which we can agree.

Bohm, and you too, are visionaries after your own fashion. You look at the envelope of physics and figure just how far you can push it without being considered clinically whacko. And that is just about how far you push it. And me? Well, that's another story.

I look at the preponderance of the evidence, and I notice something peculiar about it. I notice that it is a movable target. I notice that how one sees the evidence and how one weighs and balances it, depends almost entirely on what sort of worldview one brings to the table. This is pretty much the observation that Thomas Kuhn made almost forty years ago when he wrote about the incommensurability of paradigms.

You are the revisionist, I am the revolutionary. The revisionist may attract more scorn from her colleagues, simply because she shows up on their radar screen. I'm practically invisible. I plant my banner right in the middle of no-man's land, at the empty intersection of every previous worldview. Everything is off of every chart. Messianism?? Well, ho hum, what else is new?

My premise is that every significant worldview must contain some element of truth. But all of them thus far have failed to find the Whole Truth. Everyone so far has been looking for truth in all the wrong places. Then I notice that there exists a logical intersection of all the previous worldviews, an intersection that, almost miraculously, has been totally overlooked. It is the only remaining possibility, and darned if it doesn't make a lot of sense.

Then I see you. You're looking at approximately the same piece of logical real estate, but you're looking at it through

the wrong end of the telescope. I am struggling to get you to see this simple fact, or actually feel it, but it keeps slipping off your peripheral field of vision. It remains subliminal relative to your physicalist instincts. If I had a better grasp of it myself, there would not be this problem. I need one of those interstitial, **connecting ideas**, but it is hard to pin down. [Or maybe not!]

Amazingly, we both agree that there are emergent properties that may exert 'downward causation' on the 'physical' substrate. And furthermore that you and I as humans individually instantiate just such an emergent property, exerting downward causation as for instance when we act as deliberate moral agents.

So far so good. This is saying quite a lot, really. But where's the 'but'?

The 'but' comes with the question of design. I am suggesting that downward causation does not end with us. I am looking at your teleological 'future causation', which, yes, again(!), is a form of downward causation. This is the 'quantum computer in the sky' that once spoke to you. Do you realize that you are not the only one with a computer in the sky? Frank Tipler, a student of John Wheeler, has his Omega Computer as the cosmic endpoint of a Transhumanist evolution. His Omega operates in something of a quantum bootstrap (shades of Geoffrey Chew) fashion. It is teleologically responsible, at least in part, for the apparent Anthropic elements of physics. It is almost literally our Transhumanist God of the Future.

Evidently the Godelian (shades of Douglas Hofstadter) Omega Device (**G.O.D.**) can exert no inconsiderable influence over our direction of evolution, almost surely including genetic manipulation. Thus do we secure both G.O.D.'s future and our own. This fulfills much of Wheeler's vision of a participatory cosmogony.

So, when it comes to downward causation, is it not logically possible, and perhaps even logically necessary to include G.O.D. in our cosmic creation bootstrap?

The view that I have just presented to you should fit well within your cosmological specifications. It is not quite up to my expectations; however, it may be good enough for government work!

My emendations would focus more on the Anthropically inspired manipulations of the emergent properties, as compared with genetics. I am suggesting to you that the possible and actual emergent properties are not randomly arrayed within physical phase space. There is a pattern to their alignment that particularly impacts the mental aspect. For instance, G.O.D. would be able to influence our consciences in ways that promote our social and future well-being. G.O.D. probably also makes possible or enhances the emergent properties that pertain to technology, both present and future.

And don't you say that your 'cosmic consciousness' does indeed shape the primordial gravitational fields??

This is about as far as your physics may allow you to travel. G.O.D. conveniently provides the **connecting vision** referred to above. Having gotten this far, it should be much less difficult to then turn your ontological telescope around. That would be the next course.

Dan

P.S.

I should have noted in this previous message that the notion of G.O.D. described herein, is at least functionally similar to Bohm's idea of the downwardly causal Super Implicate Order. Is it not?

Jack, [Later yesterday]

Well, gosh! What then do we disagree about? Perhaps I was not giving you enough credit!

What then about the **BPW**? With all this possibility of a G.O.Dly design & guidance shouldn't we expect that this world, if not yet perfect, is, at least, perfectible, and mainly by us. We simply combine our previous knowledge of upward causation with our new knowledge of downward causation. Thus could we complete our cosmic sojourn from the Alpha to the Omega, fulfilling our part of the cosmic bootstrap bargain in this BPW.

You and I might disagree on the timing of the Omega point. What time do you prefer?

And then we just have the small matter of the messianic logistics to work out. We simply see about getting a better mesh between your mathematical formulations and my verbal formulations.

Anything else? We need to see if we can sell any of this to the Sufi's. That would be helpful in the short run. We ought to run this by R. H. again. And check with A. P. in the meantime.

Dan

And there it stands. I don't know to how big a list Jack was copying his replies, but typically it is several dozen.

A lukewarm response from Jack.

I have suggested that he, Alan and I work on a proposal to Robert H., Stephen S., Ron P. and Kit G. I expect to have to do most of the arm twisting.

I might as well put it together here. Need to finesse a couple of things, starting with the physics.

[1/26]

Here are the rest of my messages to Jack:

Jack, [1/23]

Sorry for being a little slow on the uptake here. I'm just collecting my thoughts.

Here is my very modest proposal, along with some background.

Among your physics colleagues you have demonstrated an unusual degree of willingness to not only talk about things that touch on the spirit, but also to do something about them, from within a Physics context. This rare trait is something worth encouraging by those of us who are more metaphysically inclined, particularly if we do not subscribe to the notion of the Cartesian or Quantum dualism of mind and matter that is espoused by those many folk of the Copenhagen persuasion with whom you do frequent battle, as well as by most theologians.

[---] and I are not the only ones in these environs, it seems, who share this interest. So perhaps we can widen this conversation, hopefully on a more permanent basis than what we have experienced in the past.

The three of us seem to agree that the events subsequent to 9/11 do lend some greater urgency to deliberations of this nature. The clash of cultures is upon us. Whatever science may offer, directly or indirectly, to promoting reasoned discussions between folk of differing spiritual outlooks is to be commended and actively pursued.

There are many discussion topics that come to mind. Comparing and contrasting the spiritual and technological perspectives on our future would certainly be germane.

But, no, I don't see this as being a debating club. The urgent need is for something more proactive and visionary. That is what we need to be working on.

I suggest a preliminary round of discussion between the three of us, as we hammer out our similarities and differences. We maintain a very informal, evolving position statement, or perhaps just talking points, that we then use to foment a wider discussion. It will be important to maintain a sense of progress throughout, and to keep people on, at least, a parallel set of tracks.

Before this interlude, you and I were discussing 'upward' and 'downward' causation. This may well be where the spiritual rubber meets the physical road. This might be as good a point of departure as any.

You are the main mail-list person amongst us. It will be mainly up to you to manipulate the lists, if you are so inclined.

At an early point we should approach Hickson and Schwartz. I'll be happy to enlist Ron to further facilitate our interaction with Robert.

I look forward to replies and rejoinders from both of you.

Dan

Jack, [1/24]

This is a good start.

In my mind there is a collaboration here between the physicist and the metaphysicist. The implied duality is no longer between mind and matter (a la Descartes), or between observer and observed (a la Bohr). Now the duality is between **downward causation** and **upward causation**, also between the explicate and implicate orders, and this is thanks mainly to your buddy, Bohm.

So now, since there is no longer a logical discontinuity between the two realms, there can be a real collaboration between the upward and downward perspectives. This is where you and I come in. We may, if we so choose, be the originating collaborators. If this collaboration is instrumental in bringing about the final paradigm shift, i.e. introducing the gnostic saving knowledge, then we would be playing a messianic role. Or we are the original participators in a universally participatory messianic denouement to history. Someone has to get this show on the road, or on the net, as the case may be.

We are the Laurel and Hardy of messianiacs (sic). This will not be a difficult act to follow, because everyone will be able and invited to do so.

We just need to try it out in various focus groups to get it down pat. For right now we are privileged to have Alan as our focus group. Why don't we see how he likes our act so far. Where are we weak, where are we questionable. If we can pass muster with Alan, then we're half way to the moon. Next we ask Robert and Stephen to join our little focus group.

It's that simple, Gaston.

Dan

Jack, [1/24]

Before there is a workshop, you and I would need to agree on a protocol. I see dialog between interested parties, as the starting point, and perhaps even the end point. This is more of a participatory scheme. This is tied to the envisioned scheme of salvation. It is also well suited to the Internet.

If you and I are serious about our messi-mania, then we must bring a sense of urgency to the timing. The end of this year is a long time away. We have our dialog and Internet work cut out for us here and now. Who needs to stand on ceremony?

Besides, you already have your physics books. This is something quite different, certainly less didactic.

Dan

There has been no response from Jack since this last message.

I'm thinking about what will be the next topic: Destiny (another look at eschatology), Downward

Causation, ...?

Downward causation and reduction are still the biggest topics *vis a vis* the naturalists. No one other than **Jaegwon Kim** has made a major issue of the evident conflict between naturalism and non-reductionism. Since Kim, naturalism should be considered incoherent. Kim simply pointed out that a non-reductionist could not be a physicalist. The next logical step would have been to point out that non-reductionism is inherently unnatural. Thus, even the phrase 'natural kind' is a virtual oxymoron if the phrase is meant to have any ontological significance.

Maybe it is time for some more Google. Note that essence carries some of ontological significance of **natural kind** or irreducible property. 'Psychological essentialism' is an interesting subset. 'Theory of categorization' is a related subset.

What I have found nowhere is the observation that a single irreducible property will cause the **sky to fall** on materialism and naturalism. If people believe otherwise, then there ought to exist arguments to the contrary, which I have not seen. Jaegwon has barely touched on this larger issue.

There is the epistemic-ontic issue of water as a natural kind, whose essence is sometimes alleged to be H₂O, or as something more observable. Here essence might be conflated with substance, but then is water reducible in the usual chemical sense? An idealist, of course, cannot be a substantialist, or can she?

No, because an idealist does not respect the epistemic-ontic divide. The concept and substance may not radically differ.

Griffiths, Paul (2002) [Is Emotion a Natural Kind?](#):

[...] natural kinds are categories about which we can make scientific discoveries.

Does this definition imply irreducibility or downward causation?

Fortunately, it is easy to generalize the idea of a law of nature to the broader idea that statements are to varying degrees 'law-like' (have counterfactual force). This broader conception of a law-like generalization allows a broader definition of a natural kind.

Many law-like statements apply generally and exclusively to humans, for instance. Does counterfactuality have any sort of ontological implication? 'If I drop a glass, it will break.' Does this say anything about the ontology of glassware, or about the property of fragility? This question also, obviously, involves issues of mereology.

The communicability of concepts must speak to their compositionality, or rather their lack thereof. (Collections vs. sets?) With mere resemblance, then everything can resemble everything else. A manifold of meaning need not subvert the real particularity of meanings. How do we deal with the interstices? Meanings tend toward the analog rather than the digital. So what? Is Plato the subverter of analogical ideas? This is just a restatement of semantic holism.

[1/27]

[---],

Jack has not responded to this request just to continue the present conversation. Instead, as you have seen, he is holding out for an advanced payment on some vague idea for a workshop.

I am focusing back on my website and recollecting my thoughts. It is my contention that the materialists, and naturalists have dug themselves into a conceptual hole in regard to the issue of irreducible properties, emergence and downward causation. Once the implied teleology is confronted, the evident coherence of phenomena is no longer amenable to naturalistic explanation.

I am in the process of fleshing out this basic idea on the website, and in a few days I may be ready to confront Jack. In order to do this over Jack's evident non-cooperation I may need to put together an independent cc. list.

Jack is sufficiently perceptive to see that once this conversation comes around to theological issues, most of his alien technology shtick will go by the boards.

I'll let you know when I think have an appropriate 'manifesto'.

Dan

Rather than atomic meanings, as prior to Quine, there is a manifold of meaning. How that manifold is verbally dissected is arbitrary. There is a spectrum of meaning. The primary colors are arbitrary. We do not have meaning perceptors *per se*, except, perhaps, in the case of some 'felt meanings'. There are some instinctive emotions, no doubt. Certain instinctive felt meanings provide the psychic anchors for a multidimensional spectrum of verbalizable, abstracted meaning.

It is this manifold of meaning that is the basis of epistemic and ontic coherence. This manifold must logically have a primordial potency. It is the **life force**, if you will. And, as Jack might say, it is our 'destiny matrix', looking at it historically, teleologically and eschatologically.

It is this manifold that is the basis of idealism and which is missing from all materialist accounts.

Mathematics has the character of a logical manifold, and is thus a sub-manifold which may provide structure to the larger space of meaning, and provides the symmetries of the spatial dynamics, i.e. physics. The logic manifold provides filler for the numerous gaps or blind spots in the space of meaning, as occur particularly under the 'alchemical' aegis of science. Logic has much to do with the process of abstraction.

There is scant room for epistemic or ontic dualisms in this space of coherence. But is there not the duality of internal and external relative to the psyche: a duality of micro and macrocosm? This could be handled in some holographic fashion. It might, at most, indicate a doubly connected cosmos as is often signified with the gnostic **ouroboros**.

[1/28]

Using the list: ["natural kinds"](#) (5,300 hits):

[Commentary](#) on Tom Radcliffe and Carolyn Ray's "A Conceptualist Interpretation of Quantum Mechanics" by David V. Ward. This is a worthwhile essay.

But let's get back to the 'manifold of meaning' concept. What I see now is a functional segmentation of this manifold, as in a jointed skeletal structure. There is an increasing refinement of this structure up toward the end, until there is a total and vital plasticity, with a merging of the macro-micro-cosms, which are the ontic and epistemic domains, respectively.

If this is mostly correct, then what? We need to work out the connections between micro-macro-cosms. This is tough to visualize. How does the feedback work, and how do we minimize the implied duality?

The manifold takes on the shape of an ouroboric [Adam-Kadmon](#) (4,600 hits), which is also a projection of the primordial human onto the tree of life.

[Adam Kadmon- Primordial Man](#):

The symbol of Primordial Man, the first being to emerge with the creation of the cosmos is common to a number of religious and philosophical traditions. The Upanishads describe a primal man composed of the very elements which were to become the world. According to the Upanishads this "gigantic divine being" is both infinitely far and deposited near the innermost recesses of the human heart. Indeed, in the Hindu tradition, the Primordial Man is identified both with the entire Universe and the soul or essence of all things.

In the Nag Hammadi text, the *Apocryphon of John*, we learn that this anthropos is the first creation of "knowledge and Perfect Intellect" and the first luminary of the heavens. This Anthropos becomes the heavenly model through which the demiurge forges an earthly Adam. Other Gnostic sources relate how the "archons" (conceived of as female demigods corresponding to each of the seven planets) formed an earthly Adam to fulfill their sexual desire for the heavenly anthropos who was beyond their spiritual reach.

Now we need to give A-K a holographic & toric or ouroboric twist. Still not sure how to divide & connect the noumenal and phenomenal parts of the semiotic manifold.

[1/29]

Articulation ought to be a useful word in the above context. Cosmogony involves the articulation of a semantic, thought-like manifold. The genesis of language and of the cosmos are thus interrelated. In this regard I have spoken [previously](#) of the cosmogonic/apocalyptic role of the 'thunderwords' of Joyce in *Finnegans Wake*. This is a modern version of the logos (also see **Zim-zum**, syzygy, etc.).

[1/30]

I'm getting set to start a new page. I have mainly been taking notes off-line. I want to address the metaphysical problem of mereology & the articulation of manifolds, and the connections between the semantic and the spatial.

My only mention of a primordial **chaos** on this website was [here](#). It appears that we may have to 'bother' ourselves with it, after all. This chaos played a major role in the cosmology described on my previous website, but now, in the context of the BPW and of coherence, its role has been diminished. However, its presence on the fringes of reality cannot be neglected.

The stricture of relationalism as applied to the semantic manifold, or mind field, demands coherence. Random sense data or percepts do not exist in isolation. There must be a perceiving self, and there must be a coherent context or background. Also, Leibniz' Identity of Indistinguishables works to minimize random, isolated sensa. And, as with colors, there may be only a finite number of primary sensa.

'Before' Creation there is a primal manifold, *Ain Soph Aur*, 'divine light' or cosmic potency. Creation is the process of analysis and re-synthesis of this manifold. We articulate the cosmic potency. We realize the Adam-Kadmon, or Anthropos. This is done through a prism-like analysis or decomposition of the pure light into every conceivable combination of primary sensa which we then reconstruct in a teleological fashion into the tapestry of the Metanarrative. Our individual dreaming is the private phenomenal part of this process. Our waking lives are the public part.

The creatures are the articulation of the cosmic self. Atoms are the limit of the articulation. The spatial manifold is logically necessary to support this articulation. That is the *raison d'etre* of space and time. Physics is the rationalization or habituation of the space-time articulation. It is the semantic manifold that is the locus of coherence and which predominates in the proximity of the Alpha and Omega.

I am reminded of the [Ichneumonidae](#) wasp. It lays its egg on an orb weaver spider. While living off of the vital fluids of the spider, the wasp larva instructs the spider to weave a cocoon where it will take up residence when the spider is depleted. I suspect that our relation to God is not unlike that of the larva to the orb weaver. Our dreams are the flesh of God -- this much has been imputed to certain fungi. The world is our cocoon. The omega is our **metamorphosis**. And so on. The more we understand, the more we will see nature as metaphor. The role of weaver may be reversed. It may be God who instructs us. There is also a greater mutuality in the dependencies. Since this is not a repeated cycle, all the mutuality must be present in a bootstrap manner. Analogies are meant to stretch the mind, not limit it.

[1/31]

I need a way to bring together the macro and micro-cosms. Functionality is the key connecting factor. On the smallest scales we have bio-functionality. On the largest scales we have anthropics and teleo-history. This functionalism is the basis of coherence. This is the basis of the upward and downward causation.

The point to get across is that functionality exists only in a cosmic context. This is its one rationale. There cannot be partial functions. Functions can exist only within a rational telos. This is the basis of the cosmic self. The epistemic meets the ontic at the function. Downward causation exists only if the irreducible property is intelligible. These properties must comprise a coherent network. Has this not been the assumption all along? Perhaps it was not sufficiently explicit.

The epistemic and ontic meet in the coherent network. This argues against spontaneous emergence. This is where the 'skyhook' comes in, and there can only be one hook. This is what Kim argues against. He sees that downward causation implies coherence. How do we argue this against the naturalists? Whitehead's processes may speak to this issue. Can the above material on articulation help? Articulation is the substitute for evolution.

You just cannot escape meaning. This is how Aristotle tried to correct Plato's disjointed forms. Ari looked to the manifold of life. This is what panpsychism is about.

[<-- Prev](#) [Next -->](#)

[Topical Index](#)

1/14/03

The Force is with Us

The secret is out: I'm an optimist. This is not a great day for an optimist. Yes, we are about to go to war for umpteenth time in the last century, but this is not the real problem. This is about as close to the problem as I can see right now:

'[Conflicts rage across the globe](#)' by Christy Oglesby, CNN, Friday, January 31, 2003

(CNN) -- Iraq and North Korea have dominated the world's attention in recent months, yet in countries and regions around the globe, strife smolders with sporadic notice.

Civil war. Mutilations. Threat of nuclear deployment. Human trafficking. Starving babies. Those are some of the seeds and harvest of conflicts in Africa, Asia, Europe and South America.

And, no, I don't think we are going to muddle through this one, but it won't be for lack of trying. We are, after all, the paragon muddlers. There is a light at the end of this tunnel, but we won't see it until we see it. I claim to see it. More than that, I claim to be able to point to it. There are not many people on the Internet today who are making such a claim. Let's see if I can back it up.

The point is that we are not here by accident, and we will not depart this scene until we have finished our business here. We have much unfinished business, just now. Don't you agree?

The light at the end of this tunnel is not a 'smoking gun', fortunately. The force that is with us is something all-pervasive. It is sometimes referred to by economists as the 'invisible hand'. They just don't realize how invisible it actually is, to them. They speak of subtle 'market forces', as if they had their finger on that pulse. They are won't to give themselves Nobel prizes for writing the formulas for market stability, etc. They had better think again.

The tiniest tip of this 'iceberg' is the Anthropic Principle, and how many economists ever worried their pretty little heads about that? They have not the foggiest notion of what makes this world tick. And ditto for almost every other intellectual presently pontificating. These same ones speak so knowingly of the 'dark ages', as if they could see the light! It has never, and will never be darker than it is today. That is my promise to whomever can read these words.

The invisible hand is far from idle. It has no time for the Devil's work. It is God who is in these details. Life is the one monument to the life force, as if that were not sufficient!

Exhibit A, which just recently came across my screen: "[Protein Interaction Networks](#)" (975 hits).

It is almost amusing to peruse this pages. The scientists speak so confidently of their understanding of these 'PINs'. Give it a name and it belongs to us! Who was the last person who got a grant of money from any source for professing ignorance? Not in our lifetime!

Just one little caveat.

[[Shuttle and crew lost](#) -- terrible.....]

[2/2/03]

I sense a contest today between my chutzpah and NASA's hubris. I will win. We will all win this one for the Gipper.

Yesterday was the end of the space age. Yesterday, true to my words, was the darkest day of that our darkest age, launched by the one who may have been our darkest President. The words above were written just before Debbie called me with the news, upon leaving the gym at 9:45 am.

Unless my orbital physics and armchair psychology is all wet, those astronauts would have been saved were it not for NASA's hubris, and its last ditch effort to save the space shuttle program.

The administrators could probably guess that an inspection of the shuttle from the space station would have resulted in its permanent docking (tethering, this one had no dock) right there. The crew would had to have been off-loaded with shared suits and brought back to Earth in the embarrassingly (to NASA) trustworthy Soyuz. That would have been the end of the Shuttle anyway. Deep in the communal subconscious of the Agency was just one thought: Let's go out with a bang!

Yes, this was *the* day of infamy. It will be the turning point which we have all been expecting.

This marks our very dramatic turn to inner space, where our attention finally belongs.

[The Space Shuttle Must Be Stopped](#) -- the only thing left to fly at NASA will be recriminations. Never again will Texans have to awaken to retrieve body parts from their front lawns.

My attention turns back to complexity. It is in complexity that we will discover the force that is with us, and, yes, within us.

The limit of natural complexity is our own brain. The limit of artificial complexity is this net. The materialist minded complexity theorists run their spontaneous self-organizing principle up against the primordial human self. I will prove them wrong, ultimately, by replacing Google on the Internet with the authority of a cosmically inspired sense of coherence. That is the long and short of it. Against this chutzpa, NASA's hubris will hardly hold a candle.

Now, back to my 'caveat'. I was about to say that '[proteomics](#)' (270,000 hits) is perhaps the newest science; it was not in the ms-dictionary. It is not easy to trace the history of proteomics before 2000, when so much attention was being focused on genomics. The decoding of the human genome in 2001 was the last hurrah of materialism. It was a brief swan song. After that it is complexity all the way down. 'Proteomics' is a convenient label for this unending vista of complexity. The only way out will be upward -- all the way up. There will be no half-way point. A few of us are pointing to the telos. One of us will break through the noise.

Yes, there is limit to how much complexity materialism can carry before its back is broken. I'll bet that proteomics is the final straw. It is just a question of when will come this break. I'm thinking two years, just off the top. One of us will be ready.

With proteomics there is so much to be organized. What is the organizing principle? Where does it reside? To what could it possibly be reduced? The known complexity of cells has been doubling on the average of about once a year since when? Since 1665? Just about! Our ability to explain the coordination of this complexity has been falling further behind for these last three centuries. At some point we will invoke a coordinator. The necessary ultimate singularity of this coordinating agency will not be difficult to appreciate, once we start thinking about it. When will we start? Will we have to wait another three centuries before we get off our reductionistic kick? I'm doubting it.

Yes, there are subtle forces. But they are not all that subtle when we confront them in the deepest recesses

of our being. Sometimes our conscience can be every bit as subtle as a brick bat! Wake up, people! The only thing we have to lose is our incoherence.

It could well be the *Columbia* that starts this snowball rolling. At some point it will find its direction, and that cannot happen spontaneously, or even naturally. We'll know very well when and how it happens. We will also know who. What greater monument to the seven heroes?

For now, we just need to find those who are questioning the spontaneity of all this complexity. These days, with everyone questioning authority, who is questioning the alleged non-authority of the complexity? Who dares question its 'naturalness'. Yes, there are the 'irreducible complexity' folks, but they only question its origination, not its coordination. A small difference in emphasis, but a gaping chasm in perspective. 'Vitalism' is not in their dualist lexicon. Vitalism smacks of animism and paganism in their mechanistic view. They care only for the 'watchmaker', while the nature of the watch eludes them.

[Biological complexity](#) (4,900 hits).

[SYSTEM-LEVEL GENETIC CODES: AN EXPLANATION FOR BIOLOGICAL COMPLEXITY](#) by John F. McGowan.

[2/3]

I have been perusing the above list. Here is the bottom line on biological complexity: **there is no bottom line.**

What I mean to say is that with complexity of any kind we confront our now almost familiar friend: the [epistemic-ontic divide](#), or, rather, the lack thereof.

With the early completion of the genome project, complexity theory is coming into its own, with a vengeance. The only problem is that there is no theory. There is an expanding plethora of theories, yes, but there is no encompassing theory to integrate the field. Thus there is no single measure of complexity in general or of biological complexity in particular.

Bottom line: complexity is complicated, and no one is in a position to say just how complicated it is.

After [genomics](#) (788,000 hits) comes [proteomics](#) (272,000 hits), [metabonomics](#) (1,080 hits), [metabolomics](#) (3,600 hits), [transcriptomics](#) (2,600 hits), etc...??? And, yes, it gets even better: [Omes Table](#). This table lists a number of 'Omes' (and see '[Ome Sweet 'Omics-- A Genealogical Treasury of Words](#)' by Joshua Lederberg and Alexa T. McCray) along with their Google and Pubmed counts, and the first year in Pubmed. Twenty-four Omes are listed, including the Secretome, Pseudome and **Unknome**. I kid you not. Are they kidding? I'm afraid to ask right now: 'To add new and innovative Omes to the list email: dov.greenbaum@yale.edu.'

Is my point taken? What is my point? What is their point? Biologists are able to poke fun at themselves, but there may be a more serious issue behind this professional humor.

The genomic reductionism apparently contained the seeds (sic) of its own deconstruction. Before the final, dramatic decoding of the human genome, biological complexity was a theoretical abstraction best left to those Santa Fe odd-balls. But now this complexity is exploding in all of our faces. Biologists and mathematicians are just beginning to try to pick up the pieces. We don't wish to rush to judgment do we? Yes and no.

I believe that I may be under some possibly 'cosmic' pressure to look ahead, to look at certain kinds of

contingencies, as is pretty well covered here.

The '**Ome explosion**' may be an omen. It may signal a public and consensual breakdown of the very traditional epistemic-ontic divide. This straw, nay, this haystack will break the back of materialism. Am I shifting from my contingency voice to my prophetic voice? I, personally, don't see how it can fail to have this effect in the almost foreseeable future. By that, I mean within this decade, and that is being optimistic relative to the half-life of materialism. More realistically, as speculated above, I give materialism a half-life of about two years from *Columbia* day. Its breakup will be even more spectacular, and will be carried live.

There are many now, and will be many more in the months ahead, who, when asked, will say that I am beating an already dead horse. They may be correct. Perhaps I should be speaking of materialism's wake. It will be more like a party, really a celebration, as all good wakes are supposed to be (see, again, *Finnegans Wake* -- talk about prophetic, I'm just the amateur in this neck of the woods).

This will be a universal wake. Attendance, nay, participation will be virtually mandatory. I will not be the party-pooper. This time I will be the party-planner. Just recall that this is the before-party. We are talking pre-millennialism. I am the wedding planner. I'm the Hierogamos guy. The *Columbia* crew got to celebrate their nuptials just about a thousand years early, those lucky stiff. The Heaven's Gaters don't really count: they were party crashers; although, on second thought, and to be perfectly honest, I was standing at that gate.

How exactly will the 'Ome explosion' subvert the epistemic-ontic divide? Without a central theory of complexity, without a Grand Unified Theory of complexity, there can be no coherence in the mushrooming Omic fields. There will be no single measure of complexity -- no single definition of it. Complexity will necessarily be an ad hoc science, a pragmatic science. Complexity will have to be defined in terms of ad hoc, pragmatic and functional considerations. These consideration are all strongly subjective in nature. The now exploding science of complexity will be the first **objectless** science. Epistemology and ontology will be officially reintegrated.

Is not psychology already an objectless science? Yes, but just for that reason, most scientists did not consider it to be scientific. But now with biology teetering on the brink of objectlessness, with the entire medical system hanging in the balance, the scientific establishment is going to have to do a public soul-searching concerning the nature of science. Just when it seemed that the biological sciences were poised to switch from 'soft' to 'hard' science, the ontological rug has been pulled out from under them by the 'Ome explosion'. As biology slides back into the softness of the soft sciences, it will threaten to pull the rest of science with it. There will be last-ditch resistance from the hard-core scientists. The (Sokal) 'Science Wars' will re-ignite. This time the hard-core objectivists will find that their end of the stick will be much shorter than it was just a few years ago. Thus will end objectivism and the epistemic-ontic divide.

[On complexity and emergence](#) -- Standish, R. K.

Numerous definitions for complexity have been proposed over the last half century, with little consensus achieved on how to use the term. A definition of complexity is supplied here that is closely related to the Kolmogorov Complexity and Shannon Entropy measures widely used as complexity measures, yet addresses a number of concerns raised against these measures. However, the price of doing this is to introduce context dependence into the definition of complexity. It is argued that such context dependence is an inherent property of complexity, and related concepts such as entropy and emergence. Scientists are uncomfortable with such context dependence, which smacks of **subjectivity**, and this is perhaps the reason why little agreement has been found on the meaning of these terms.

[2/4]

How much **complexity** is too much for biology? That depends on how much can be explained.

There will only ever be one natural explanation for biological complexity: natural selection. How great is the explanatory burden which natural selection can bear? The good news is that we do not know the limit. The bad news is that we do not know the limit. In other words, we have no idea as to the explanatory power of natural selection. The saving mantra of the naturalists is that there is no alternative explanation. How long can they maintain this stance in the face of the explosion of complexity? I guess we'll find out. So far, they are putting a brave face on it -- keeping a stiff upper lip.

Occasionally it is suggested that natural selection can explain virtually no complexity. How often do the naturalists have to remind us that there is no direction to evolution? They readily admit that there is nothing in natural selection to suggest a secular or temporal increase in complexity. Complexity is not a trait, *per se*, which would ever be selected for. Complexity might augment adaptation, or it might not, depending on the particular circumstances. This is just another aspect of the objectlessness of complexity. The objectlessness of traits is another matter.

Certainly in engineering it is **simplicity** that is golden. There was an overriding imperative to simplify the functional designs of our artifacts until, it would seem, we came to the computer age. There has, subsequently, been an explosion of complexity that is frequently compared with biological complexity. Does this artificial complexity provide any explanation for its biological counterpart? It hardly seems so. In fact, it is just the '[bioinformatics](#)' (992,000 hits) being made possible by computers that is mainly responsible for our exploding awareness of biological complexity.

Is there a biological limit to complexity? Is there any way to predict how much more complexity we may be discovering? Will our ability to discover biological complexity be limited only by epistemology? Were any biologists ten years ago predicting the explosion of complexity we have witnessed in the past ten years? I seriously doubt it.

Was there not a general impression among biologists that biological complexity must be limited by the amount of information that is contained in the genetic code? What has happened to this notion? Is the current explosion not seriously threatening any such limitation or linkage, if it has not already overrun it? Is there not emerging a very serious **information gap** between the cell and the gene?

It will be more than curious to watch the impact of the biological complexity explosion on Artificial Intelligence. It is now requiring supercomputing power simply to delve into the complexity of just few aspects of a single cell. Where does that leave us with regard to simulating the the brain power of the interactions of 10^{11} of such cells? Does this not foreshadow an indefinitely widening gap between natural and artificial intelligence, just when the pundits were predicting that we were on the brink of having our carbon rendered obsolete by silicon.

Nowhere is the genetic information gap greater than when it comes to explaining biological or natural intelligence. One can almost do the calculation on the genetic side. The human genome carries less than 40,000 functional genes, with an average of 72,000 base pairs each, and they are $>\sim 99\%$ identical to those of chimpanzees. The difference in native intelligence between the chimps and us is to be explained by no more than something on the order of a megabyte of code. Imagine that! When I last checked, Windows XP was 500 megabytes. Are to we believe that blind and random natural selection is so much more efficient and direct than 30,000 Micro-softies hammering diligently at their keyboards? And besides, at every conception of a new human, how much of that one megabyte total for our IQ code is being randomly scrambled by the natural process of genetic recombination? Imagine what would happen if we were to randomly recombine my binary code for XP Home with my wife's binary code for XP Professional (Library Edition). What would be the IQ of the resulting mish-mash? I think our son would have been institutionalized long ago.

This is hardly rocket science, is it? But where else on the Internet is anyone keeping score for materialism and naturalism? The only other articulate skeptics are the Intelligent Designers. But they are much more mechanically minded, in their very narrow pursuit of Design, than even are their naturalist opponents. They are more genetically minded even than the geneticists. Their view of Creation is every bit as clunky as that of the UFO-nauts with their alien breeding stories. For the Creationists, the notion of vitalism is as welcome as Witchcraft. (Forget Harry Potter!) Their God is the one painted on the ceiling of the Sistine Chapel, and they don't even have the gender right!

There is a stonewall of silence when it comes to a holistic and substantive critique of the Scientific worldview. That barrier of silence will be broken, right here on the Internet.

There is an apparent information gap between the genes and the rest of biology. This is not unlike the 'missing mass' or the 'dark matter' that is believed to comprise almost ten times as much mass as the visible matter in the universe. In biology we have missing information. Where is it? Is it in the genome, the proteome, the metabolome, etc.? It is manifested in all of these places, but resides in none of them. Consider how much information is contained in all the laws of physics. Where does that information reside? Certainly not in each one of the elementary particles. Like organisms, the elementary particles exhibit many law-like traits, but we do not suppose that these traits are coded in their genes. It may be that the genetic information simply serves to trigger and amplify an information that is much less particulate or even physical.

It may well be that there is holistic, informational 'mind' field. It may have holistic properties rather like language. The eight letters of the word 'elephant' certainly do not contain all of the information of the word. The information is to be found in the relational properties or associations of that word with all the other words of the language. Thus it is with genes and proteins, etc.

What about the Mandelbrot set? How much information is contained therein? It would naively appear to be infinitely complex, and yet it can be generated simply by the formula of its 'genetic' kernel $z' = z^2 + C$, which contains, at most, a few bytes of information. Is there not a similar disconnect between the manifest infinite complexity of the Mandelbrot and its simple genetic formula?

I would suggest that the Mandelbrot exhibits the holographic-like complexity of the entire number system. Every number is a holistic construct, having no meaning in isolation. There is only a number field. There is a similar biological field, with a potentially infinite holographic complexity. The genome operates within and upon that field. Unlike the number field, the biological field has teleological properties that are manifested particularly in our mental states as an intentionality.

At this point it is no great stretch to postulate several intimately related fields or manifolds which contain or carry a spectrum of meaning and functional information. These would be the mental, biological, mathematical, and linguistic manifolds. We should not forget the space-time manifold which manifests the symmetries and laws of physics, and which seems closely associated with the mathematical manifold. Each one of these manifolds has its peculiar ontic and epistemic aspects. The quantum, entropy, anthropics, relativity and the directionality of time all seem to conspire to introduce a strongly epistemic quality into the alleged objectivity of the space-time manifold. If we knew the deeper relations between these several manifolds we would hold the keys to the kingdom. We will have plenty of time to work this out.

In the meantime, we only need to appreciate that reintroducing aspects of vitalism into the semiotic flux of biology would be a very natural step when seen in this larger context. The remaining resistance to vitalism is just the death rattle of materialism. Let us respect its senescence while we plan for its wake.

Also realizing that the misguided Creationists may, ironically, be the final source of resistance to vitalism. The force will be with them, too.

[2/5]

To underscore that last point consider:

[CAN FUNCTIONAL LOGIC TAKE THE PLACE OF INTELLIGENT DESIGN? A RESPONSE TO WALTER THORSON](#) by [William A. Dembski](#) (2002):

Thorson's methodological naturalism leaves room for teleology in nature, though a teleology that falls short of full intelligent agency.

For Thorson, getting the scientific community to admit the reality of this functional logic and to make that logic a fundamental focus of scientific investigation would constitute the sort of paradigm shift in science with which he would be entirely happy. He sees Michael Behe's work on irreducible complexity as feeding into such a paradigm shift inasmuch as Behe's work shows that a functional logic pervades biology all the way down to the molecular level (below which biology gives way to physics and chemistry). Nonetheless, Thorson is not willing to follow Behe to his conclusion of intelligent design. Why is that?

The problem according to Thorson is that any sort of designing agent responsible for that functional logic in biological systems would be a scientific surrogate for divine agency. Indeed, from a Christian perspective it is hard to see what a designing agent responsible for biological complexity could be other than the Christian God. Intelligent design, if it could be developed as a scientific theory applicable to biology, would thus have immediate theological implications, not the least being that God's handiwork in nature was empirically detectable and therefore not inscrutable.

But this for Thorson is theologically unacceptable. Following Karl Barth and a theological tradition that places a premium on divine inscrutability, it is unacceptable to Thorson that God's agency in the world not be completely shrouded in mystery. In addition to Barth, Thorson cites Austin Farrer, who argued that the metaphysical joint at which divine agency intersects the created world is fundamentally inscrutable. Thorson concludes that "divine agency is essentially mysterious at every level."

I've long ceased to be impressed by claims of divine inscrutability. Whenever I'm confronted with such claims, I invariably recall G. K. Chesterton's epigram, "We don't know enough about the unknown to know that it is unknowable." To be sure, it might serve certain theological interests to keep God, and divine agency in particular, inscrutable. But the claim of divine inscrutability, just as any other controversial claim, needs an argument if it is to be judged in the market of ideas.

I'm going to have to investigate Thorson on my own. His functional teleology seems closer to a rational theism than does Dembski's watchmaking Mechanic. Why Thorson sees functionalism as favoring the inscrutability of God is presently inscrutable to me. Unfortunately, Thorson's article is not yet available on the [ASA](#) website.

What I do notice from perusing [biological complexity](#) is that the IDers are continuing to rock the scientific boat. Even though their mechanistic conception of creation is wrong, their boat rocking could well create an opening for a more metaphysical view. I do notice some polarization between the IDers and the ASA contingent. The ASA might provide a platform for a less mechanistic account, as they did for Thorson. Their journal is not posted to the web until one year after publication. If they want to participate in the premillennial politics, they will have to be more expeditious than that. However, they probably will not wish to associate with someone with my radical view of spiritual politics. Once again, we'll have to pray to the Google gods!

Here is the latest scoop:

[DARWIN AND DESIGN: A debate about the latest defense of intelligent design.](#) -- William A. Dembski and H. Allen Orr (12/02).

The primary attack on Dembski concerns his mystagoguery. I agree with that criticism. Bill will never be able to squeeze any rational coherence out of his Cartesian dualism.

Dembski refers to [James Shapiro](#) (Univ. Chicago) associated with [ISCID](#):

The International Society for Complexity, Information, and Design (**ISCID**) is a cross-disciplinary professional society that investigates complex systems apart from external programmatic constraints like materialism, naturalism, or reductionism.

That sounds promising!

[A 21st Century View of Evolution](#) by James A. Shapiro:

Molecular genetics has amply confirmed McClintock's discovery that living organisms actively reorganize their genomes. It has also supported her view that the genome can "sense danger" and respond accordingly. The recognition of the fundamentally biological nature of genetic change and of cellular potentials for information processing frees our thinking about evolution. In particular, our conceptual formulations are no longer dependent on the operation of stochastic processes. Thus, we can now envision a role for computational inputs and adaptive feedbacks into the evolution of life as a complex system. Indeed, it is possible that we will eventually see such information-processing capabilities as essential to life itself.

Had I not been forewarned, I might have missed Jim's still implicit anti-naturalism. What he may say in private to Bill is another matter.

There is now a burgeoning field of '[evolutionary computing](#)' (27,000 hits). I am not aware of any pervasive anti-naturalist sentiment in this field. Most of the workers seem to feel that they are actually exploiting Darwin, not refuting him. Where Jim and the ISCID part company with this nascent industry needs investigation.

[Genome Organization and Reorganization in Evolution: Formatting for Computation and Function](#) by James A. Shapiro (2001):

Molecular discoveries about mechanisms of DNA restructuring show that cells possess the Natural Genetic Engineering functions necessary for evolutionary change by rearranging genomic components and reorganizing system architectures. The concepts of cellular computation and decision-making, genome system architecture, and natural genetic engineering combine to provide a new way of framing evolutionary theories and understanding genome sequence information.

This is a bit more explicit. This seems rather like the functionalism that Dembski was just criticizing in [Thorson](#). Jim continues:

The most profound, and most challenging, new aspect of thinking in a 21st Century fashion about evolution will be the application of information-processing ideas to the emergence of adaptive novelty. A major problem, often cited by religious and other critics of orthodox evolutionary theory, is how to explain the appearance of complex genomic systems encoding sophisticated multicomponent adaptive features. The possibility that computational control of natural genetic engineering functions can provide an answer to the problems of Irreducible Complexity and Intelligent Design deserves to be explored fully. Contrary to the claims of some Creationists, these issues are not scientifically intractable. They require an application of lessons from the fields of artificial intelligence, self-adapting complex systems, and molecular cell biology.

[...] One philosophical question that has proved extraordinarily contentious concerns the respective roles of design and chance in evolution. This topic is so heated because it touches on fundamental differences between materialistic assumptions and religious faith. However, I argue that molecular

discoveries about cellular information processing, epigenetic modifications of the genome, and natural genetic engineering place this issue in a **new** (?) **naturalistic** perspective. We can now postulate a role for some kind of **purposeful, informed** cellular action in evolution without violating any tenets of contemporary science or invoking actors beyond experimental investigation. It remains to be established how "smart" cellular networks can be in guiding genome reformatting and sequence reorganization towards adaptive needs.

Say what?? We have here a 'naturalistic' 'purposeful' action!! On previous occasions I have resorted to using the word 'oxymoronicity'. I think here the phrase '**Oxymoron City**' would be more apt. George Orwell could take some pride in this exemplar of Doublethink. Am I being too tough on Jim? That remains to be seen. Perhaps his use of 'new' needs further examination.

From [ISCID](#):

James Barham asks important questions on design, teleology and the considers the notion of "**thinking matter**" ... [\[more\]](#)

[...] No doubt, most readers will assume that empirical science passed a negative judgment on this idea long ago. They will feel that today thinking matter is at best a bare possibility, not a live one. Certainly, the proposition that a certain kind of matter has an intrinsic power of thought flouts the spirit of the Mechanistic Consensus. However, I shall argue below that the Mechanistic Consensus is mistaken in each of its main theses: (1) present-day physics and chemistry do not provide the conceptual resources for a complete understanding of how living things work; (2) natural selection does not provide an adequate ground for naturalizing the normative teleology in living things, which is no mere appearance, but rather objective reality; and (3) thinking is not just a matter of computation, nor does the normative character of thought have anything to do with brains per se. The upshot of these negative arguments will be that living matter is special. Finally, I will conclude on a more positive note by briefly reviewing some ways in which we might begin to understand this specialness scientifically.

Now we're getting down to the nitty-gritty. Is this what Jim S. was talking about? Jim B. continues:

A term like "second messenger," they say, is a metaphor that, while not strictly necessary, is useful in order to avoid intolerably verbose descriptions of the mechanistic interactions that underlie the appearances. Such a *façon de parler* is a promissory note redeemable in the hard currency of physics and chemistry. But like any IOU, this promise issued by molecular biology is only as sound as the other sciences backing it up. If they cannot make it good, then the note is worthless. Therefore, it behooves us to take a closer look at the conceptual solvency of the Mechanistic Consensus.

[For later reference: [BACK TO THE STOICS: Dynamical Monism as the Foundation for a Reformed Naturalism](#) (Talk Delivered at Calvin College, May 25, 2001) JAMES BARHAM. '**Reformed naturalism**'? OK, that's what Jim S. must have been alluding to [above](#).] Now continuing from 'thinking matter':

To say that a chemical compound "survives" or that a crystal "reproduces" itself is to employ metaphors that obscure the point at issue. The very thing we are trying to explain is how it is possible for an organism to direct energy in a way that promotes its self-preservation, and not in other energetically equivalent ways. Thus, the notions of survival and **reproduction** already contain the **normative** feature of striving to achieve particular preferred states. They are far from the unproblematic mechanistic concepts that a successful reduction would require. Rather, they demarcate the boundary between the living and the nonliving, and so constitute the very heart of the problem of **teleology**.

Yes, I meant to say that earlier!

However, this does not mean that we are forced to accept the Intelligent Design conclusion. We may just as well reject the premise, instead. In that case, we may say that the "design inference" (Dembski, 1998) constitutes a *reductio ad absurdum* of the proposition that organisms are machines. If we drop this premise, then we are free to view organisms as active and fully integrated systems, in which a change in one part leads to appropriate changes cascading throughout the system in accordance with functional logic. In this case, evolution begins to make sense from a physical point of view. But now

Darwinism has forfeited all of its reductive power! We have simply assumed the functional organization of the cell, which is the very thing we claimed to be able to explain by means of the theory of natural selection.

Darwinians often complain that such criticisms are based on a misunderstanding. It is not chance, they say, that bears the explanatory weight in their theory, it is the selection principle. Natural selection is said to act as a **ratchet**, locking into place the functional gains that are made, so that each new trait can be viewed as a small incremental step with an acceptable probability. But what Darwinians forget is that the way a ratchet increases probabilities and imposes directionality is through its own structure. In the present context, the structure of the ratchet is simply the functional organization of life. Darwinians are only entitled to claim that the explanatory burden of their theory lies on the selection "ratchet," thus avoiding the combinatorial explosion problem, provided that they also acknowledge that the structure of this ratchet consists precisely in the intrinsic functional correlations among the parts of the organism. But now they have merely assumed the very functional organization that they claimed to be able to explain, thus sneaking **teleology** in by the back door.

Has it really taken us a century and half to finally articulate these most basic facts of life? The Darwinians have been having a free logic lunch all these years. When these chickens come home to roost, it will be a hot time in the coop. Did I say 'two years' from *Columbia* day? I'm being very generous!

[2/6]

It appears that [ISCID](#) (International Society for Complexity, Information, and Design) could be an important resource. It is more open to metaphysical speculation than are the IDers. It does not have a theological agenda, as do the IDers, despite their frequent protests to the contrary. I will be looking out for connections between ISCID and the [biosemiotics](#) groups previously discussed. I can't recall having seen this site before now. I may have confused it with one of the many ID sites. I'm going to be looking over the rest of their material. James Barham appears to be the most relevant for me. I gather that the IDers are ambivalent about ISCID. They simply don't know what to make of it. Wait 'til they grok on biosemiotics. The fields of biosemiotics, informational ontology, and complexity theory seem to borrow in part from cybernetics and systems theory (see [here](#), [here](#), [etc.](#) (12,000 hits)). I am a bit rusty in this area. The whole game is about transcending the epistemic-ontic divide. It is a very tricky business.

I am struck by Barham's take on [reproduction](#). If he is correct about its being irreducibly **normative**, that puts normativity at the center of Darwinism. Notice **Rex Kerr's** [response](#), posted on 2/4:

But by using words like "normative" here, we're immediately in danger of being misled. Does present-day physics and chemistry have the conceptual resources for a complete understanding of how living things work? Yes, as far as they go. It is inconvenient to use the language of physics and chemistry to describe systems of such complexity, though, so we use additional language. Barham seems to be implying that our use of additional language imposes some **deep philosophical burden** upon us.

Yes, that is precisely Jim's point. Jim's respondents don't quite appreciate the depth of the burden. Perhaps it could stand further explication. I was missing this simple point myself until Jim's remarks hit me over the head with it yesterday.

Biological reproduction is an open ended, indefinable concept. It greatly transcends even the basic concept of copying, which is itself fraught with ambiguity. Just look at the concept of 'copy'. It is an almost entirely **normative** in meaning, unless taken in a purely **abstract**, digital context. And if taken in its most abstract form, you would then have to contend with the **deep** metaphysical issues surrounding Leibniz' Identity of Indiscernibles.

Does that mean that biological reproduction is metaphysical? Yes and no. Any particular instance of it could be perfectly physical or mechanical. But Darwinians are **not** talking about instances. They do and must appeal to a universal concept of reproduction. Evolution is not an instance of anything. If it is

anything at all it is a very general pattern of inheritance.

Darwinians assert that reproduction, along with mutation, is the basic 'mechanism' of evolution:

Reproduction + mutation --> (cause) evolution?

But is reproduction a causal entity? Is it fair to say that hurricanes cause destruction? It is fair for a layperson to say that, but that does not make it a scientific statement. Hurricanes happen and destruction happens, and there is some correlation between the two, but that is not science: it is not cause and effect.

Darwinians claim to understand evolution. Biologists claim to understand reproduction. Let us grant that biologists do have a good grasp of many of the particulars of 'reproduction'. The problem comes when you subsequently attempt to employ 'reproduction' as an ontological or causal entity.

The most that Darwinians can legitimately claim is that reproduction happens and evolution happens, and the two processes seem to be correlated. Who knows where the causality resides?

I am a teleologist. From my perspective evolution causes and comes logically prior to reproduction. It is the primordial, metaphysical necessity of the Telos that causes and ultimately explains the emergence of biological and reproductive phenomena.

My teleological claim is just as much justified by the observed correlation between evolution and reproduction as is the Darwinian claim.

Darwinians appeal to our mechanistic and materialistic sensibilities. Evolution is alleged by them to be reduced to reproduction and mutation, both of which may or may not be further reducible. They postulate a hierarchy of phenomena where all the causation is mechanistic or 'upward'.

Is their claim just a '*facon de parler*'? I think not. I think that they think they have worked it all down to the 'brass tacks', to the 'nuts and bolts'. There is nothing in the phenomenon of evolution to suggest whether the causes are upward or downward or both. The only thing to suggest otherwise is the Darwinian appeal to an illegitimate ontology of 'reproduction' and many other **emergent** entities which are every bit as much epistemic in substance as they are ontic. As such they are neither physical nor mechanical and may not legitimately be appealed to as if they were, or even might be!

James Barham is pointing out that the Darwinians need to get serious about their logic and ontology, after a century and a half of very loose talk.

[The substance of the above argument is [posted](#) on the ISCID site.]

Now may be the time to look at '[evolutionary computing](#)'. The implicit and sometimes explicit claim is that by using the technique of 'natural selection' we can spontaneously produce artificial and perhaps even natural intelligence. Thus might evolutionary computing demonstrate the truth of Darwinism. This could also go a long way toward substantiating the tenets of Transhumanism. Perhaps the force is not with us. It is with artificial life. We had better take a look before it is too late! [This is postponed temporarily in favor of the ISCID forum.]

[2/9]

The **conversation** on the ISCID [forum](#) continued through yesterday. I invited Mark Szlazak to compare and contrast his views with those of [Gregg Rosenberg](#), whom Mark has quoted several times. Gregg

shows up on a [list](#) of active anti-reductionists that I was putting together back in November.

While waiting for Mark to respond, I might as well attempt my own assessment of Gregg's work. I have only briefly reviewed his book, so first, by way of placing his work in an historical, intellectual context, let me start with some general comments on the status of anti-reductionism.

Active anti-reductionism presently exists in three principal areas. Two of these are driven mainly by philosophical considerations. On the Anglo-American side there is the continuing fall-out from the several failures of the analytical enterprise that arose near the beginning of the last century, which in its turn was an attempt to ground philosophy with a few simple and self-evident truths, rather in the spirit of Descartes and of axiomatic mathematics. Striking from within its ranks, Godel and Quine had managed to effectively derail this enterprise by mid-century. Since then, analytical philosophy has lived on, mainly as a style of thinking and writing. Several people on the above mentioned [list](#) pursue their anti-reductionism in the analytical style. Gregg is one of them.

On the 'Continental' side there is a different philosophical story. There it was Kant who set the stage, and it is a more complicated story. Kant's [strategy](#) for dealing with Humean skepticism was mostly one of containment. According to his 'critical idealism', only Science could be protected from Hume's skepticism. The attempts to rebuild metaphysics after Kant had to borrow heavily from the few glimmers of his idealism that he allowed to shine through his critical armor. Out of this reconstruction came the doubly contrary Dialectics of Hegel and Marx. What survives now is Phenomenology, which is a curious amalgam of Kant and Descartes. Semiotics has spun itself off from the phenomenological and structuralist traditions. Lacking any firm attachments, it threatens to drift in the analytical direction. This is particularly true of its youngest sibling: biosemiotics.

The third front in anti-reductionism is being driven, ironically, by the Artificial Intelligencers. As noted [previously](#) the practical demands of knowledge based systems are forcing its practitioners to take up the ontological enterprise eschewed by their philosophical colleagues. Surprisingly they are launching into this task with some gusto, and even performing some metaphysical peregrinations of their own.

It is no secret that these anti-reductionist efforts are singularly lacking in coherence, both individually and as whole. There is only the strongly implied hope that their patient labors in the analytical trenches will, as it seems to have with their scientific colleagues, reward them eventually with a full blown cosmology that can stand up to, and ultimately surpass that of science. These workers see themselves mainly as revising, reforming and extending the awesome scientific edifice. For now, they labor, barely noticed, in its deepest shadows.

I am skeptical of any analytical effort to resurrect metaphysics. I believe that it is self-defeating. The best that can result is a papering over of the numerous antinomies of materialism and analytical philosophy, along with the grafting of some ungainly appendages. This reformist mentality is not taking seriously the notion of a Kuhnian paradigm shift, and the resulting incommensurability between old and new paradigms. It is somehow hoped that the now bloated analytical apparatus of the old system can be imported, more or less, intact into whatever is to be the new system.

With a new paradigm, we will have to make a new start. The task appears daunting. How could we ever hope to compete with, or even significantly influence, our colleagues on the other side of the metaphysical divide, without strongly emulating their now traditional enterprise?

There is, I believe, only one strategy that is even modestly inviting. This is to appeal to a coherent, comprehensive rationality. One might suppose that this would be a fairly obvious and well-trodden path. However, as my search for fellow sojourners on this path continues in vain, I can only conclude that it is the necessarily radical nature of the resulting rationale that keeps the mere voyeurs at bay. Furthermore, the resulting coherent rationale cuts right across the major metaphysical schools of the past. Someone who is even moderately comfortable within any one of those schools, will not have sufficient desire to venture out across the various metaphysical no-man's-lands that are the gaps between the traditional systems.

Furthermore, one has to also be willing to take on the prophetic and proselytizing burden that goes with any such radical departure from historical norms. This is not merely an intellectual journey. It is a metaphysical journey in the full sense of that word.

[2/16]

Several days later, and the **conversation** on the ISCID [forum](#) still continues. I'll use this space here to collect my thoughts and look ahead. My part of the conversation is with a physicalist and a naturalist. I will try to persuade the physicalist to retreat to naturalism. The next real sticking point will likely be the MIR (mind indep. reality) in view of the apparent depth of time and space, relative to human consciousness. But I would argue that is just a subjective matter of relative degree, as between oranges and apples. Why would it be more difficult to reject the MIRH just given the phenomenal existence of another person, as compared to that of another galaxy? How much more difficult?

In fact, I would argue that our intuition primary intuition of an MIR comes from other people. It is then to the rest of the world that we extend that notion. This is a fact of epistemology.

Suppose that one were a King of Shangri La, with a virtually static history. Where then would the be the MIR? The concept of possible worlds is not live.

[2/22]

I was **removed** [x] from the [ISCID](#) forum last night. That means I am no longer allowed to post a message there. The topic to which I was posting '[thinking matter](#)' was closed at the same time. The postings, however, are supposed to remain in their archive. This was only my second attempt at participating in a forum, not counting the [Sarfatti](#) mail list. The last time was eight or nine years ago on the [CompuServe UFO forum](#), which ended in a similar fashion. I doubt that as much time will elapse before I make another such attempt. Each time is a learning experience. Permit me now to collect my thoughts, and rethink my strategy.

Off the top, it appears that I have very little difficulty in significantly stirring an already controversial pot, but how does one poke around a hornets' nest and not get stung? It's not that I am opposed to being stung *per se*, but in the process of getting stung one usually looses the thread of the discussion, both figuratively and literally in these cases. It is distracting for all involved. It's also like a high-wire act: the balance will always be precarious.

I need to be aware of the 'politics' involved. How much of the politics will simply be reflex reactions, and how much will be deliberated? I need a technique for sounding out the 'political' tendencies of the various parties, to anticipate the optimal point balance. This is not easy when deeply controversial issues are involved, as they are bound to be in the case of religious beliefs. In such cases the participants will harbor many unconscious motivations. A mere sounding-out may trigger the unwanted reactions.

How does all this relate to the **Eschaton**? I would say that things remain on track for the imminent messianic introduction of the Millennium and subsequent eschaton. Not many more forays like this should solve any problems relative to Internet visibility via Google, and the like. At the same time, in the process of sharpening my rhetorical skills, I can use the intermezzos to tighten up the presentation of these topics here, which still leaves much to be desired. By getting a better feel for the relevant psychology and spiritual politics, I can be more discerning about the optimal targeting of the eschatological message. So I will probably use the next few days here to work out a better outline of my ideas, and then contemplate another testing of the waters.

In the meantime I'll be taking in the [Gods and Generals](#) movie -- four hours of it, I am told.

[2/23]

Norms are an inescapable core of reason. They are stronger than mere convention. There have functional and teleological aspects. Thus are norms inescapable in both the physical and life sciences. The normativity cannot be disentangled from the objectivity; and, furthermore, objectivity itself is normative. Mathematics is similarly invested with the norms of reason. The normative methods cannot be removed from the results. There is nothing natural about math. All abstracting is normative.

The normativity of science is reflected in its use of counterfactuality. Modality is essentially normal, and *vice versa*. Normality is about modality. Causality is both normal and modal.

How are norms unnatural? They are intentional, aesthetic, pragmatic and you name it. They make it possible for us to analyze, reflect and 'objectify' the world. They are often universal. Norms are built into every artifact. They cannot be formalized, but every formality is normative.

Thought cannot escape from its own norms. If there were a non-normative, mind independent reality, we could not know it. Both quantities and qualities are ineluctably normal. Reductionism and analysis are essentially normal. There is no mind independent nature. It would be inconceivable. But are the monster group and big bang normal?

What does the normality of reason imply about AI? Normality comes out of thought; but it cannot be put back into it, certainly not in any piecemeal fashion. Norms like thoughts and language are holistic. Like functions, they cannot be analyzed. They are self-referential.

But what of the BB & MG? Are they not both MIRs? How could they not be? Are they convenient, theoretical fictions?

The past is a fiction. I can be effective only through the present. Time is surely a fiction, especially in its directionality. All events are fictions, especially in their causal aspect. But especially is the luminous (specious?) present a fiction. Consider presence and absence.

Why, historically, was there never a non-prophetic theism, and ever only one of the other? Rational theism must contend with that history. How do we rationalize around that singularity? There are devotional mysticisms like Krishna consciousness, but there is no story or codification. Historical theism is singular. The prophetic and historical elements must be inseparable. Why only one chosen people? Only one contract? One savior? One God of history? How can full theism be considered rational if it is so rare?

Consider the subjectivity of presence. Also of relationality. But what is reality w/o relations? Even the concept of the real is subjective and modal. It implies an unreal.

If we were so wrong about an MIR, how can we not now be skeptical of God? It is a question of logic and reason. We reason to a source.

Relations are ineluctably normative.

God is just the ultimate norm and normalizer. There must either be an ultimate subject of object. Either God or universe. God is just the BB of norms. All Hubble 'norm' shifts point back there. It is a simple triangulation with norms.

After the big Norm, then we're off to the BPW and eschaton races.

How are norms normally deconstructed? That is not possible with holism.

Non-reductionism. Any irreducibles would be normative. These also point to a Source, using the self as a stepping stone. Norms, coherence, relations and self are all inseparable. Relations are irreducible and immaterial.

The self is the necessary purveyor of coherence. Those two functions are inseparable.

The imminent deconstruction of science. Ironically it will hinge upon scientific realism. Can we drop back to instrumentalism and conceptualism?

The pragmatics of complexity is forcing us to reconsider ontology.

Why? From the unreasonable effectiveness of math, to that of science and language. The notion of progress is problematic as well.

The incoherence of reductionism. Science has never been comfortable with it.

But there are no isolated irreducibles. Holism reigns there, as well. There is only functional and telic alignment. These point to a supra-mundane telos: a source of coherence.

It may seem like a great stretch, but it could be that the MG is responsible for our psychological projection of the MIR. It could even be associated with a primordial fear of some kind.

All the anomalies of materialism are beginning to come into coherence. We needed to be able to look at the world, modulo atomism.

[Topical Index](#)

2/1/03

Unreasonable Coherence

[Unreasonable coherence](#) (0 hits). Are we surprised? Only mildly. By contrast, [unreasonable effectiveness](#) has 1,740 hits. This stark contrast of counts indicates to me a curious unwillingness to move from one very promising idea to the next in what ought to be a logical progression. Let us not fear to tread where none have trod, at least not within range of Google. [For more background on this topic please see the pages listed under [relational metaphysics](#).]

My takeoff point is the [Coherence Theory of Truth](#) (1,500 hits). But let's back up one more step: [Quine & holism](#) (1,700 hits) and see my [Quine](#) page and [here](#), etc. It has been just 50 years since 'Two Dogmas of Empiricism'. (In the idiom of the 1930's, I am tempted to say that the interim has been a '[three dog night](#)'. We'll see if we can't warm things up a bit.)

Despite all our efforts, linguistic, scientific, logical, political, etc., to chop up reality, everything still hangs together to a remarkable degree. What holds the world together? From whence cometh coherence? I have the temerity to suggest that coherence is not merely a human artifice, no more than is the mathematical coherence of physics.

I suggest that there is a strong correlation between the [coherence of the world](#) (175 hits) and the [unity of consciousness](#) (2,800 hits). If the unity of consciousness is not a total illusion, as many used to allege, then its source is something that we often refer to as the self. If there is indeed an irreducible, immaterial self, then we must look for an irreducible source for the self. And so, logically, we must consider the possibility of a [world soul](#) (12,000 hits) which would be the transpersonal source of the self and its cohering world. I submit that this logical progression is now and forever the rational basis of all theism.

The closest approach to a rational theism is to be found in Platonism, and in the closely related **Thomism**. Hegel made a last ditch, pre-Darwinian effort to resurrect a rational theism. It has fizzled. It is curious that nothing approaching Platonism is to be found further east. The crowning irony is that it is the pantheist traditions of the East which stress a monist metaphysics. The West, despite its rationalism, has been more friendly to dualist and pluralist ontologies. Rationality begins logically in the carving up of the world. If the carving up is not restrained, however, it ends in the reductionistic nihilism that has engulfed modern culture. At some point we have to confront the task of reconstruction. That task has no recourse other than in the logical progression leading to rational theism, as outlined above.

This is the one thesis that I nail to the door of Modernism.

Darwin, more than any other individual, is responsible for modern nihilism. Darwinism remains a powerful force in the world. It embodies a simple minded logic that is compelling to the point of coercion. Its logic leads inexorably to the graveyard of reason, if not of life itself. There is only one way out of this hole that we have dug ourselves into. That is my thesis.

Now I need to find a likely door for my post-it note. Google has a list of about [50 philosophy forums](#). About a dozen of these are likely prospects.

[2/25]

Peter Suber also has a list of philosophy forums on his [Guide to Philosophy on the Internet](#). Here is a

[listing](#) of online religion forums using Google, but I'm finding few if any that would be suitable. The [coherence of the world](#) listing yields little of substance. For [coherentism](#) (1,700 hits) there are a number of useful links. The standard alternative to coherentism is foundationalism.

[2/26]

I continue to be impressed by the [Monster Group](#) (see [here](#)). The best source for 'monstrous **moonshine**' is [John Baez](#) (also see [Tony Smith](#)). No other object in mathematics appears to function as a greater relational nexus or irreducible source of coherence than does the Monster. Thus in mathematics it plays a role similar to the self in relation to the mind in general. It is only somewhat speculative to say that the Monster is also the primary source of coherence in physics, in as much as it is likely to be intimately involved in any final theory. Once [again](#), I point to the polarity between the cosmic self and the Monster (see also e.g. [here](#)). Where would the Creator be without the Monster? Who created It?? I wouldn't want to meet that person in a dark alley!

According to [John](#) (and see [week 193](#)), the **octonions**, which have a special quantum, projective role, also have a special role in the exceptional groups. The octonions might thus be a link between the Self and the Monster, given the 'high octane' (E8xE8) observational aspect of QM. In this same week, John also compares 'classical' and '**exceptional**' beauty.

[3/1]

Comprehension is a universal value. We comprehend that which is coherent. There are two types of coherence: formal and substantive, or syntactic and semantic, or objective and subjective. Objective, syntactic or formal coherence is rule drive. Subjective coherence remains undefined, and is often considered to be a matter of aesthetics.

Coherence taken to its limit is cosmology, which correspondingly comes in two extreme flavors: scientific and theological. There is no doubt that scientific cosmology is a crowning human achievement. There is also little doubt that it is, by and large, an already completed endeavor.

The one very significant question facing scientific cosmology is the outcome of evolution. There is only the general consensus that in the long-run, life in this universe will cease. Of great practical and immediate concern to our own species is the technological prognosis. There are widely diverging prognoses, but again there are two easily recognized extremes: technophilic and technophobic.

And just at this point in our very brief synopsis of the human situation, we confront irony and even predicament or paradox. The issue concerns the 'limits to progress'. Here rises, potentially at least, a cognitive dissonance between science and teleology. How do we describe it?

From a purely parochial, and short term perspective there is no great issue. Science proposes, politics disposes. The deeper issue arises only when we ask the larger question. How far can or will technology go; or, again, what if any are the limits to progress?

The closest that science comes to providing an answer is to be found in its treatment of the Anthropic Principle. This principle deals with the suitability of the cosmos with respect to the evolution of life. To make a long story short, there is the considered opinion that this suitability is remarkable to a degree that warrants an explanation. The forthcoming scientific explanation invokes the notion of an ensemble universes. Implicit, however, in this simple proposition are deep issues of logic, probability, and even objectivity and reflexivity. With this caveat, the closest thing to a scientific prognosis is the [doomsday hypothesis](#). The dissenting, 'scientific' view is to be found in [Frank Tipler's](#) Omega hypothesis.

The doomsday scenario reflects the non-teleological, scientific view that evolution is non-directional. There is no natural guarantee of 'progress'. What progress we see is only a reflection of an anthropic bias, and it must therefore be ephemeral on the cosmic scale. On the other hand, Frank sees in the quantum observational reflexivity a cosmic mandate for observers, and thus is lead to a strongly teleological and technophilic conclusion. A transhumanic, universal progress is wired into the laws of physics. In these wildly diverging prognoses lies a fundamental paradox of science: its own unnaturalness; its own unreasonable effectiveness. All of this lies behind the notion of '**unreasonable coherence**'.

Science is content, and very candidly has no recourse, but to let this matter rest. At the end of the day, what can it say besides, *Que sera, sera*? I believe, however, that this fundamental agnosis will not stand. Science reflects an essential human urge toward gnosis. It is not in our nature to be left in the dark, especially not after coming this far in our quest for knowledge. The show must go on. Can we possibly restrain our powerful collective proclivity? A crucial historical observation to make at this intellectual juncture is that gnosis and religion have never been compatible. The last several centuries of antagonism between science and religion are but one chapter in a dramatic, historical dialectic. With that major caveat, let us continue our exposition of coherence.

Coherence would be much less unreasonable if we were to take a more **substantive** view of the world. I use the word 'substance' advisedly. Substance encapsulates the pre-scientific notion of substantiality. It hinges on the twin ideas of being and presence. It looks at existence from a non-abstract, phenomenological point of view. Science is the great abstractor. It has abstracted substance beyond all recognition. In science the pursuit of substance has devolved into an arcane mathematical discipline of theoretical physicists, in which the most likely **being** is the '[Monster group](#)'. One does not have to be an unregenerate skeptic to imagine that something of *being* has been abstracted out. We can, however, take a very useful lesson from the Monster: substance is something irreducible, the Monster is the awesome epitome of mathematical irreducibility. I will go a step further: substance and being are the essence of irreducibility.

Permit me to elaborate briefly. Science attempted to analyze substance. Scientific materialism was the result. We are left with atoms in the void. But these are not just any old atoms, mind you. Standing behind the atoms is the Grand Unified Theory of physics, and behind that theory, as just noted, appears the Monster group. Comprehending the Monster is a task for only the most accomplished mathematicians. It is the epitome of irreducibility, yes, and it is more. It is also, and even more strangely, almost paradoxically, emerging as the epitome of mathematical coherence. This last observation remains controversial even amongst its connoisseurs. I look to it not as a foundation, but merely as a potential pointer to a far greater coherence, that is truly the foundation of being. The Monster poses as the Gordian knot of mathematics. Many lesser puzzles of that discipline hinge upon its convoluted structure. This is decidedly contrary to common sense. One would expect that such a 'freakish' entity as the Monster would be self-consigned to a mathematical hinterland, but such seems remarkably not to be the case. It seems more to stand as the nexus of manifold complexity. But we need not and should not dwell on mere speculation. We have more **substantive** issues. Merely observe that motivation for aspects of our perennial gnosis can arrive from the most advanced fringes of the scientific gnosis. If we peer deep enough into the cosmos, are we not, **fancifully**, reputed to see the backs of our own heads, or at least our own tracks? What kind of reflection do we see in the 'Monster' that holds together the atoms and lends its coherence to the physical world?

My proposal for substance is at once radical and logical. Certainly it is phenomenological. In a phrase: to be is to relate. Existence is purely contextual. To posit an unknowable, unobservable existence or noumenon is to take the illogical, ill founded step of reifying the inconceivable. This proposed relationalism is tantamount to coherentism: all relations are internal or essential to the being in question. This is antithetical to what superficially is the scientific downplaying of relations by taking them to be external or accidental.

Let us consider further the contrast between internal and external relations. It was Isaac Newton's absolute

reification of space that transformed what, up to then, had been a much more organic view of reality. Living as we are in the 'space age', it is at least as difficult to conceive of a non-absolute space as it was for Einstein's contemporaries to conceive of the curved space of general relativity. In particular, the odd notion of being lost in space was inconceivable to anyone before Earth was displaced from the center of the world. But even the now seemingly quaint geocentric view was a wild abstraction for the pre-Columbian mind. For the Aristotelian mind, there was not space, but rather places. Everything had its proper place in the world. For things to be misplaced in the world was a symptom of organic distress, disorientation and disease. Alienation was not a concept that would have sprung readily to mind.

Am I now suggesting that Copernicus and Newton were wrong? That Giordano Bruno got his just desserts?! No, but I am sure that there will be those who will want to caricature a postmodern, relational sense of space in this pre-modern fashion.

I have already suggested that, with the [Columbia disaster](#) (truly the 'displacement of a star'), we are witnessing the end of the space age. No longer can space hold the personal promise and fascination that it once held for those of us who came of age with *Sputnik*. Coming to an end is external exploration. The pundits may lament an 'inward turning', but was not the essential vision of the space age not just the Gaian vision of the Spaceship Earth? Ironically, it is ecology that is our psychic inheritance of the space race. Our burgeoning sense of ecosystems and general systems portends our postmodern conception of an organic world. Thus does space return to its more proprioceptive, functional sensibility. The Internet plays no small part in this conceptual shift. The essential metaphor of postmodern space is just cyberspace.

This might sound like the end of the story, but it is a bare beginning.

[3/2]

The antithesis of coherence is reductionism. Reductionism is our legacy from scientific materialism. The first step of our long journey back to coherence will be to roll back reductionism. This first step has already been taken countless times in the last half century, but for some reason the lesson has not sunk in. Reductionism is still considered a live option by far too many of us. Reductionism seemingly has nine lives. I would contend that it is already on its ninth life. Is there not just one more straw to find in order to break its back?

No, that will not be my strategy. That is the implicit rationale of postmodernism. Postmodernism seemingly wants to keep all options open, including that of reduction. Its vast stockpile of irreducibles are like so many Lilliputians against the Gulliver that is the residual coherence of materialism. Reductionism may be contained, but it is still very much kicking. It is not more Lilliputians that we need. What we need is a wooden stake.

Coherence is a vastly underestimated force. Or perhaps not. Postmodernism may only be truly understood as a loose but resolute coalition against coherence. Whence the resolve? Whence the intransigence? Like all intransigence, it is founded in fear. And, yes, fear of coherence.

The only way I know, or any one knows, how to deal with fear is to confront it. Naturally, we are doing anything but. Instead, on the few occasions where the issue of coherence has surfaced, there is denial backed by scorn, etc. The fear remains inchoate.

What gives? In the 'good old days' we gnostics were simply dispatched at the stake. No muss, no fuss. Now it is not quite so easy. Nonetheless, the cacophony of postmodernity has served to keep the ambient noise level well above the threshold of any nascent vision of coherence. That calculus, however, disregarded the Internet. The simple logistics of the Internet provides an almost clear channel for coherence. The ball is in the court of coherence. A little bit can go a long way in cyberspace. In

cyberspace the shortest distance between two points is the coherent line. The self-organizing phase change from chaos to coherence should be virtually spontaneous. A butterfly flaps a wing and the currents of coherence are set in motion. The butterfly is a virtual, virtuous handful of truth seekers who overcome their fear. If there is a comprehensive, comprehensible truth out there, and half a dozen people are able to discern it, it will be all over but the shouting, thanks to WWW. Chaos and ignorance are on notice.

So, yes, for the last fifty years, the very worst kept secret is that there is more under the sun than 'atoms in the void'. That materialists now call themselves (non-reductive) 'naturalists' serves as exhibit A. The final guise of reductionism is not to deny the undeniable plethora of irreducibles, but rather to deny their coherence. The reductionists' cooption of the label of 'naturalism' is as explicit as they need to be concerning their fears of whatever monstrosity might conceivably exist beyond mere nature. For instance, we have already met the 'Monster', and I maintain that it is but a shadow. Whose shadow? Ultimately it is our own collective shadow, and that is quite naturally our greatest fear. Aren't all of our fears 'just' the projection of our own inner darkness? Yes, and we have ample, justified reason to be sore afraid of our own demons, collectively multiplied and magnified.

Indulge me, however, while I say a few more words while on this subject. The original and residual strength of reductionism was never predicated on its merits. In over a century now, there has not been one single successful, uncontested instance of anything ever having been reduced to any other thing. The closest such case, and the one most often cited, has been that of thermodynamics being reduced to molecular kinetics. Let me just say that thermodynamics contains mysteries that remain at the forefront of physics research. The directionality of time and the loss of information are still among the greatest puzzles in physics.

The real problem lies with non-reductionism. By the same token as above, I can point to nothing that is incontestably irreducible. I submit that these twin failures are two sides of the same coin. The coin of the realm, the only legal tender is coherence. The substantiality of coherence is unanalyzable. You cannot, to the great frustration of the atomists, carve out a piece of coherence and place it under a microscope. In contrast, one can, famously, manipulate atoms under a microscope to spell out 'IBM', proving the reality of atoms? True, but only if physics can be identified with metaphysics, which is the whole issue from the start. Should theologians be surprised that God has not appeared in our telescopes?

Thus do the reductionists think they have succeeded when they place any, more or less tangible, piece of reality in their analyzer and proclaim that after exhaustive analysis that there is nothing left but tinier bits of reality. That is true, and it is notoriously true of the analysis of biological organisms, but there is a catch. The analysis never survives the analysis.

The portent of coherence lies in the very 'success' of analysis. The more we analyze, the greater is the 'complexity' that we discover. I only need aver that complexity is in the eye of the beholder. In the realm of complexity, the barrier between the epistemic and ontic becomes fully transparent, or should I say, totally permeable. Complexity theory is, on its own merit, the antithesis of reduction.

The reductionists claim the self to be an illusion. I agree. But, it is only a relative illusion. It is only an illusion relative to the reality of the cosmic monad. Otherwise, our own self is the most enduring reality we can possibly experience. It is simply the one nexus of all our experience and knowledge. Remove that nexus and what do you have? One blathering idiot. In this age of alienation, our lives all too often seem to disintegrate before our eyes, 'in real time', as we are wont to say. My only claim is that what little of coherence we are able to salvage from our lives can only be attributed to our beleaguered personal monad. The intellect is not everything, but it stands to reason that an intellectual appreciation of the greater coherence of the world would serve to ameliorate our alienation from it. Who knows, an

integration of the psyche might be taken to heart.

I am just saying that coherence, if given any benefit of any doubt, can easily seem to overflow the strict confines of scientific cosmology. And I am not here to beat you over the head with coherence, but I do ask you, if you were never to give coherence a chance, how would you know what you had missed?

The gossamer of coherence lies in the ubiquity of relations. No one will vouchsafe that relations are all that we can ever know of the world. Things are merely a rational construct of their interactions with other things in general, and their interactions with us in particular. The reductionist maintains that relations are all spatial and temporal accidents. The coherentist demurs. Space and time, she avers, are merely abstracted from the essential, functional relations that comprise reality. The coherentist is a functionalist. We can never know anything outside of a larger functional, systemic context. Even, or especially, in a mechanistic context, nothing is left to chance. The place of everything is preordained in a cosmic causal context. The only idea that the coherentist needs bring to the mechanist's feast is that the universe may be more like a great thought than a great machine. Certainly, most, if not all, of the gears of Newton's clockwork universe have long since been replaced by the mental constructs of mathematical physicists.

From the view of developmental psychology, space and time are hardly innate concepts, but only develop very gradually out of conceptual generalizations of our functional, proprioceptive interactions. Contemplate the incomprehensibility of a simple map to a pre-modern mind. The Cartesian division of reality into the extensional and intensional or intentional is a nearly incredible conceptual leap, yet materialism is its legacy. How strange that our modern sense of substantiality came to be founded upon such a leap of the mind. How much stranger that we can hardly, anymore, grasp its utter strangeness. How do we find our way to disentangle ourselves from our own abstractions whose once very fashionable functionality we have already outlived? It will take some getting used to. Let us not, please, allow ourselves to be ground down by our own abstractions.

[3/3]

Enough of the fluff, right? Let's do the nitty and the gritty. What holds the stars in the sky? Where is Atlas when we need him? And how about mother Nature?

I take atoms seriously, but just not quite as seriously as my former physics colleagues. And I take the Monster group more seriously than most mathematicians. So here's the deal:

Ultimately I blame it (the starry sky, etc.) on logic, more than on God. There is no point in overworking God. Let's let God off the hook, as much as possible. In the BPW, there are ample reasons for a minimalist take on the big girl upstairs. *Sua sponte*, as they used to say in grammar school: it's up to us. I hold nothing against Mom, but let us not always hide behind her skirts.

Our two points of departure are Anthropic and the Quantum, and don't they just about amount to the same piece of logic, anyway? It all comes back to Wheeler's tautology: no phenomenon is real unless observed. Reality, then, is, practically by definition, egocentric. I recognize that this sentiment flies in the face of modernism and even postmodernism. Where is the humility? Should I not apologize? Not on your life. Instead I bite the bullet, the messianic one, that is. The above logic compels me to go the full distance. Copernicus was big. Whoever can overthrow Copernicus will be bigger, and we're talking biblical proportions. You get the picture. The logical coherence of our *fin de siecle* context demands that our would-be Copernicus II give obeisance only to JC. But that is not all. Crank in the previous observations concerning a minimalist theology, and realize that the 'Death of God' might be something more than a clever turn of phrase. Jesus was not the Son. Jesus was the sacrificial remnant. If that does not scare the Bejesus out of you, then, by God, you are not paying attention. Egocentric? Better call it

Christocentric. In short: Copernicus2 = JC2. (I was always a big fan of indexicality!) The ultimate cosmic irony is that Jesus, in claiming to be merely the son of God, was committing a virtual prevarication, simply to help preserve our sanity and sense of cosmic security for another two millennia. But now the truth is out. Science has just been an acting out of this same cosmic charade, but not anymore, folks. It's no longer atoms. It's no longer God. It's just you and me, sister. And I'll do my messianic best to make that stick, right here at WWW. What do they say, 'Give it the ol' messianic try'? You and I know that this is mostly just a formality, but in this little formality lies a big chunk of history, and history is for keeps, after all is said and done.

Does any of this help to explain the starry sky? It is all part of the one big coherent picture. The best possible picture of the best possible world. There is, and will be no World2. The logic of the stars is simply teleo-logic, backed by the Monster. It is the Monster that disciplines our cosmic dream. We did not invent the Monster, nor it us, but we make the best of what we've got. The **Monster** might have been bigger, or maybe smaller. But where would we be without it? What if it were not the optimal size? Would this still be the BPW? Einstein wondered if God had any choice in creating the world. God wonders if Einstein had any choice in inventing general relativity. Just how coherent is our Monster friend?

As I have noted before, you can forget your pretty little starry sky, the Monster is the closest thing to an MIR that we are ever likely to encounter in this vale of tears. Close, yes, but no cigar. Nonetheless, it surely is the Cosmo-logical knot. There is a paradox in the combined mindfulness and mind independence of mathematical objects. How can something be so mindful and 'mindless' at the same time? The Monster is a stand-in for the final world enigma. Does it not cast its shadow on our little Millennial festivity here? Medusa could barely hold a candle to this mother. We might do well to employ the ruse of Perseus in avoiding eye contact. And where are those constructivists when we need them?

[3/5]

I have not yet declared defeat in my role of Perseus/Alexander/George vs. Gorgon/Gordian/dragon.

I remain desirous of resolving the apparent conflict between Anthropics and the Monster. Here are some points to consider:

- math genius
- number theory
- ellipses -> eccentricity -> modules -> exceptionals,
- TOE <-> Monster
- observer problems
- *numerical '**coincidences**' (e.g. [e^pi - pi ≈ 20](#), etc.)
- Godel
- 'organicity' of math

Are the above just a dustbin of mathematics, or something more? The numerical coincidences smell fishy. There is no explanation for most of them. The other points may or may not be related to this problem.

I want to show how the Monster might have been created, but is it not also nice to have a true MIR? There is ambivalence.

There were bound to be exceptional groups; and, perhaps logically, there was bound to be the largest one. These exceptionals would figure in the various mathematical exotica, and possibly in math genius. Primality is primal.

Math genius may pick up on the resonances of the near misses. With no miss, there is no resonance. Quantum computing could do likewise. There could, on further speculation, even be an optimal observer bootstrap loop; and that, of course, would be the crux of the matter. Could there be an irresistible force hereabouts to move our favorite immovable object?

There may be virtual, shadow, 'imaginary' monster-like 'resonances' (an infinite number of them?) of even larger dimension. We see now just the largest 'real' one. We're talking imaginary 'roots' of some larger system. It may be that our world exists 'off the mass-shell'. It is reified teleologically, and the reification of the monsters or exceptionals is related to that. More or less! This speaks to the putative **organicity** of mathematics. Math, as a purely mental construct, cannot be exempt from hylozoism. Can it? Could we conceive a logic incompatible with our existence?

There is an optimal size for the largest real exceptional group. That's the one we observe. That is no coincidence. That is a logical necessity. Logic is not absolute, nor is the resultant math. There is a 'gravitational' warping of the logic. Any extant logic space must be closed epistemologically. Math is not exempt from the necessary epistemic-ontic connections. This closure is just the foundation of coherence. This is the source of the 'unreasonable' coherence of the world.

How and where does this hylozoic 'warping' of logic operate? It operates on the fringes of our cognitive abilities, and it operates there with sufficient coherence to be virtually undetectable. It operates in the realm of genius, which remains the foundation of mathematical truth. It is the universal resonance of genius. It will be as elusive as vitalism to detect. Consider the dog that chases its own tail! It can only be seen coherently or holistically.

$e^{\pi} - \pi \approx 20$? Does this not just compute, mechanistically? Is the circle warped? Yes and no. Forgive me if I point out that 'e' is the number of life, and π is the number of closure. How could there not be this near closure of life? Is this too spooky? (JC2 = 20C AD as the closure of history, but don't complain to me, I just work here!) This latter is only meant as semi-serious, but it does point to something truly serious: the organicity of the world and all its 'abstractions'.

Could we conceive of e^{π} as anything else? How did we fudge these numbers? No, they fudge themselves. This is a true panpsychism, just as advertised. Is this not a gross overdetermination? And what else is new in the BPW? Even the numbers conspire, for they could do none other. The natural logarithm is a vital, organic concept. It must resonate, and $e^{(i*\pi)}$ is only the mother of all resonances. Better stop me before I commit any worse crime of numerology. But do recall the antagonism between the decimal and the duodecimal forms of 'closure', as apocryphally pointed out by the Jews to the heliophantic Egyptians upon the occasion of their exodus, with the first ever 'recorded' street gesture, and this despite their more traditional Davidic semiotics. Thus we do not have a mod of 24 as might have seemed more 'natural'. 10^{10} , it turns out, is more natural or organic than 12^{12} . The logic of numbers appears fixed just because of our fixation with it. *C'est la vie, mon amour*. Is Pythagoras turning in his grave? If he is, it is to a 5/6 rhythm.

I recognize that I am terribly far from the semblance of an explanation; but do, please, recall that this is an exercise in minimalist messianism, and so: *sua sponte*, my friend. Your work is cut out for you. I'm just the entertainer here. I'm the one with the squeeze box, when I last checked on Google.

I'm surprised to find only the above reference to the e^{π} coincidence. It was not even reported until 1988, which seems rather late in the game. I can only conclude that mathematicians must find it somehow embarrassing. A less peculiar coincidence involving the [sqrt\(163\)](#) has at least 50 references, probably because there is an 'explanation' involving the 'j-functions' that are related to the [Jacobi elliptic functions](#) [see the [Heegner numbers](#)]. [3/11: I'm still not seeing the 'explanation'. Does anyone else?] [9/1: There is an ambiguity as to whether the e^{π} coincidences determine the j-function or vice-versa. The 'rationality' of the 'j' is the issue. From whence does it come?]

[3/10]

I don't usually take up the Pomo cause, but here is an exception:

[CONSENSUS AND COHERENCE IN MATHEMATICS - HOW CAN THEY BE EXPLAINED IN A CULTURALISTIC VIEW?](#) by Susanne Prediger, PoME journal 16, July 2002

[3/11]

To posit mathematics as cultural, as Susanne virtually does, is simplistic. Yet how much less cultural than chess is it? I would venture that math is more 'cultural', given the greater rigidity and simplicity of the rules of chess. The concept of 'proof' is notoriously vague and controversial, as are the various axioms of logic. The various treatments of infinity and the calculus are cases in point. The role of conjecture is absolutely essential to its advancement.

Does any of this consign the Monster and e^{π} to the status of artifact? Yes and no. Suppose we speak of a cosmic artifact? Does this present another picture? Is 'e' not an artifact of some culture? It emerges from the culture of calculus. It is an article of that culture's coherence. Is not 'pi' an epitome of some kind of culture? Both depend upon controvertible notions of infinity.

I would say further that mathematics has no choice but to be optimally coherent. We're talking FLT (Fermat) type coherence. We don't yet fully appreciate the psychic status of 'deep' math, any more than we do of deep ecology. Maybe we do see the back of our own head, after all -- no longer quite so ['fanciful'](#) -- coherence is the only thing left unbounded ([Universe as Doughnut: New Data, New Debate](#)) [Dr. Spergel added, "If the universe were finite, then this would rule out inflation and require something new." [...]. Moreover, the idea that dimensions could be curled in loops occurs naturally in theories that try to unite gravity and particle physics, several physicists pointed out. (**Micro/macrocsm!**) Anyone for coherence? All this harks back to the Greek abhorrence of the [Apeiron](#)]. Until we understand the deep ecology of math, we cannot dismiss the 'coincidences' of e^{π} . Numerology and astrology are not wanton. One could hardly imagine a culture without them. Coherence resides in those shadows. Was [Ramanujan](#) (1887-1920) not just the ultimate numerologist, much to the chagrin of many of his less well endowed colleagues?

Gosh, I was thinking I had already made ample reference to the Ram, but spell-check tells otherwise. He is surely exhibit A, but for what crime? Whodunit? Hedunit. There is a very peculiar resonance between our deep psyches and deep math. The three journals devoted to the ram-ifications of his thought processes are a small testimony to that....deep coherence? Should he not be ensconced in any prophetic pantheon? He is already in mine. The Ram has put the genie back in genius. Case closed? Math is no less optimally coherent than ecology. The BPW is the notice of a cosmic ecology, nay, a cosmic teleology. Gaia is written on that wall.

Can we Ramify Jesus? It is a similar idea, but different orders of magnitude and quality. It is also about being in the right place at the right time. Tell me about that!

Mathematicians are sitting on a metaphysical goldmine, or is it a time-bomb? They keep quiet about it lest they upset their hard-nosed, scientifically established colleagues. The unreasonable effectiveness of math is forcing the issue on the larger community. The larger community looks askance. The larger community dreams of the genome and then the proteome and the [unknome](#) raise their heads. Complexity knows no bounds, other than those of an ultimate coherence.

The deeper we look the more we confront an irreducibly organismic (unreasonable?) coherence in math,

physics, psychology, biology, etc. Where is the epistemic/ontic divide? When will we admit there can be none?

Have I slain the Monster? No, but I have tamed it. To everyone's satisfaction? Not quite yet.

Does the rational theist wish to tame God? Do I wish to place God in the traces of our telic ambition? The cosmic self has a mind of its own. We would not be here to extol it, had it not. God will be tamed only to the optimal degree. And whose optimum is that? That is just love's maxim. And if you think love will be tamed, well, do I have news for you! This truly is news from nowhere and now here.

Back to [Susanne](#):

In short: coherence in mathematics emerges, because mathematicians immediately search for solutions to level inconsistencies whenever they appear. In consequence, inconsistencies do not exist in mathematics, because they are not tolerated.

By the way, '[coherence in mathematics](#)' yields only 31 hits, and all but this one deal only with math education. Unreasonable coherence is unreasonably unattended.

The Pomoists miss the bigger picture. They scarcely distinguish mathematics as one among many cultural artifacts. I suggest its role is crucial. It is the most direct probe of the universal psyche. Indeed it points to that universality, as nothing else can, abstractly and outside of religion. Am I positing the quantitative nature of the psyche? No. I am positing the unique, qualitative nature of mathematics. I posit the emergence of sheer quality out of sheer complexity. Complexity is the Rorschach, mathematics is the test. Mathematics is the end of complexity. The Riemann hypothesis and the classification theorem point to that end. There is a closure to complexity. The unboundedness of love is a singularity unto itself; the rest of the world is its shadow. Mathematics circumscribes that shadow as nothing else can.

Ultimately, of course, coherence cannot be analyzed. Mathematics comes as close as possible. Beyond that, coherence can and will be celebrated. It will be lived. It is our magic carpet: the genie of our genius and genus.

The unreasonable effectiveness of mathematics is owed to its logical circumscription of chaos, of the Apeiron. We see its tracks in the [micro/macrocasm](#). It is the testament to the logical confluence of ontology and epistemology. Mathematics has tamed the noumenon and placed it in the traces of love. Sorry, but there is no more analytical way of stating it.

[3/13]

From whence comes math?

Consider all the mathophobes. Is math really necessary? Couldn't the BPW be mathless? I can sympathize. I consider math to be a sometimes entertaining spectator sport, along the lines of chess, but that does not mean I would ever want to spend more than a few minutes at a game.

I submit that, indeed, it is games that are the ontological source of math in the world. Why games? They are entertaining. It is often hard to distinguish between life and sheer gamesmanship. Darwin took this basic insight and turned it into a *reductio*. We need not go there.

Games entail rules, and rules entail logic and randomness generators. Where would the game of life be without the laws of physics? Metabolism is a major part of that game.

It may be that in heaven there is no metabolism and no physics to speak of. Why not just skip all the restrictions under which we operate here? It comes back to spiritual gravity. There has to be a place where the risks and stakes are high. Again, there is no way to avoid this sort of game talk. Heaven may defy gravity, but it has to wait upon the game down here. Otherwise the world would not be serious. It would resemble a joke, even more than some claim it does now. There is something about truth and consequences that we cannot ignore.

There is another possible consideration relative to the necessity of math. In the quantum world, math enters in a more fundamental fashion than in the Newtonian world. This has to do with the discreteness of observations and the entailed probability distributions. The stability of matter depends on these rules of observation. If there were not a rule concerning minimum photon energies, the world would implode in a microsecond, a very warm microsecond. If there is to be a coherent microphysics, quantum-type rules will come into play, and so will the attendant mathematization.

With quantum systems, one has to deal more directly with system states. Such states have formal observational classification schemes, which entail sophisticated mathematical structures, and there is no getting around it. Such schemes do have game theoretic overtones, although I am not aware of any formal analysis of this nature.

In classical mechanics, the formalization is something that may be appended to the underlying dynamics, often in an arbitrary fashion. With quantum physics, however, the formal aspects are right there in your face. There is no way to define such a system without being explicit about the mathematical machinery. With the quantum realm, the epistemic-ontic divide is explicitly overturned, and it is done so in a necessarily **rule driven**, mathematical, computational fashion. Quantum logic is virtually a pleonasm, whilst Newtonian logic borders on the oxymoronic.

The rule driven nature of games makes them eminently suitable to computerization, up to and including the simulation of the contestants themselves. But how do we get from the normative character of games to the inviolable nature of physics? Probabilities likely play a role in this transition. And what plays the role of the computer in this informational mechanics? How are the rules enforced?

There is something about the natural discreteness of information that should be considered. Is information more naturally digital than analog?

[3/14]

To come to grips with my questions about the place of mathematics in the natural order, I need to appeal to creation. Is there any logical order of emergence outside of the Darwinian model?

Perhaps the most primitive of all systems is just the **cycle**. I would submit that the lineal logically emerged from the cyclical. The myths of cycles appear to be the most primitive. The cycle combines key semantic, semiotic, physical and mathematical concepts. It is a root dynamic. A crucial aspect of the cycle is the resonance, which combines space and time in fundamental fashion.

In considering the semiotics of resonance one can hardly miss the nearly universal presence of **OM**:

OM, like Amen and Ahmeen means the Divine which manifests as all that is. OM is the "word" as in; "in the beginning was the word" which means primal sound or vibration from which all other names and forms arise and to which we all return. OM is the Alpha and the **Omega**.

In theses senses, OM is logically prior to the more lineal prophetic logos, or the **Zim-zum** of the Kabbalah.

Pi is the measure of the cycle, but, a much more self-contained and dynamical representation of the cycle is $e^{i\pi}$. The imaginary unit ($i = \sqrt{-1}$) is a resonance within a resonance. e , i , and π are a virtual **trinity** for the discipline of mathematics, not to mention for physics, and especially for quantum physics. No other quantities can match their power or ubiquity in the most basic and esoteric realms of math and physics. The cycle cannot be considered to exist independent of these quantities. They exist together at the most primitive of all ontological levels. If there is a confluence of psyche and *physis*, mind and matter, or quality and quantity, it would be here.

It is the magic of the Zim-zum or lineal logos to break, *temporarily*, out of the cycle. That temporality becomes our history. Six is the circular number and five is the lineal number. I would equate the pentagram with the Zim-zum. The peculiar [decimal syzygy](#) of $e^{\pi} - \pi = 19.999099979...$ cannot be ignored in any such context. If this syzygy does not point to the breaking-out nature of the Zim-zum, then someone is trying hard to fool us. There is a semantic necessity here which overrides mere numerical necessity in a manner which is reminiscent of the Anthropic role of the Monster group. The coherence of mathematics and the world hang precisely in such a delicate balance. Is any of this unreasonable? No more so than the coherence to which it gives rise. The implicit numerology is just a minimalist version of panpsychism. At the end of the day, numbers cannot and will not alienate themselves from the mind from which they arise. One can no more remove numbers from the mind than one can remove mentation from the numbers. Should this logical reciprocity not have been more obvious to us? What mental block led to the modern epistemic-ontic divide, especially with regard to numbers, of all things?

[3/15]

There is in the world a ubiquity of cyclical phenomena. The numerical quality of cycles is essential to them. The cycle is *a priori* irreducible, both quantitatively and qualitatively. Nowhere are the epistemic and ontic more closely conjoined. The simple cycle should have been a sign to those who so glibly sought to put asunder that which is logically indissoluble.

Can there not be cycles beyond our ken? Does that not depend on 'our'? The notion of a cycle is conflated with the notion of self-identity. Most everything else is trivially or tautologically self-identical, but not a cycle. Its self-identity is non-trivial and essential to its existence as an irreducible, emergent property. One such property is frequency. Frequency is not an arbitrary measure. Frequency is essentially and physically relative. Frequency is essentially observational. Could we not say the same of extension or duration? I submit that frequency is more basic than either. This fact is formally recognized in the designation of the metric standard in terms of wavelengths of light. Length and duration are both derivative relative to a standard frequency. The absolute nature of the velocity of light speaks to this same logical and physical relativity. And through Einstein, even mass is reduced to frequency. The reduction of energy to frequency forms the basis of quantum physics.

[4/21]

Well, gentle folk, you may have wondered at my absence. Among other things, I have been wondering whether, if I were to be shot, the hole in my head would be caused by the bullet, or would be psychosomatic, and how I would know the difference. This might seem a far cry from the e/π syzygy, and it is. I think it is easier to explain the starry sky, given the likely necessity of a sunny sky, than a hole in the head. Cycles are certainly more obviously involved with Sun and stars than with bullets.

I have taken about 100K of notes on cycles and stuff, off-line on my PDA, but I have nothing that is sufficiently succinct for these pages, yet. To wit:

Friday, April 11, 2003

9:33:13 AM

- • creation may be like rebuilding a society such as Iraq
- • a society is composed of ring structures built out of ring psyches as a magnet is built out of individual spin atoms
- • the will is the direction of the spin
- • alignment is the problem
- • cloning of spins, and then a reproduction cycle
- • social space v. phys space
- • sexual repro is a trick
- • that is about the biggest leap from the pure psychic realm
- • what is the prototype?
- • repro has a lot to do w/ atoms
- • can we do a Feynman ring diagram for repro, and have it connect w/ atoms?
- • s-repro is a way to prevent cloning
- • what is the primal prototype?
- • primal seeds?

See! Take my word for it. Talk about bullets....

A problem that is inverse to the bullet hole problem is that of walking, or not walking, through walls, which reminds me of the 'bullet hole house' in Concord, but that is another story. Normality is more of a challenge for immaterialism than is paranormality. They don't shoot ghosts, do they? How do we invoke the Pauli Exclusion Principle, without invoking atoms? I don't mind atoms too much, we can derive them from cells, as cells are derived from organisms, given some sort of scheme reminiscent of 'object oriented programming' with inheritance and the like. But is that too much of a stretch? Speaking of stretches, how many people are aware that the PEP depends on fermi statistics, which, in their turn, depend upon, I believe, something like PCT symmetry, and don't ask me what that derives from? Sometimes physicality is not quite as physical as some of us might like to think. Nothing like a little physics to disabuse one of physicalism.

Looking at it from another perspective, we normally avoid the superposition of heads and bullets, but doing so is usually related to the problem of Schrodinger's Cat. Who observes the hole in my head? Is it the same Gal who observes Berkley's tree on the quad? And how does the shooting of bullets relate to the chucking of spears? How many spears would a....? I don't mean to make lite of the silver bullet-hole problem, but what else can a body do?

When I get serious, imagine that, I get serious about the continuity of cause and effect. Given the A&O and the BPW, everything else has to fall into place, *a la* the PSR. The manifold of reason is quite continuous. You can stretch it out, and the Lord knows we do, but you can't break it, anymore than you can break a gluon string. Can we not work the superposition problem as well from the top-down as from the bottom-up? Perhaps even better if we have to invoke the indefinable notion of observations and record

keeping. It might be easy to make a record, but not so easy to keep one. Just ask the IRS, but please don't tell them I sent you.

Reasons are manifold. Less often are they manifest. Does not a reasonable world become grossly overdetermined? But that overdetermination is just what keeps the roulette wheels in Monte Carlo honest, honest! Sure there is psychokinetics, and there are also casino bouncers. Being discrete is not an option down here, it is the best possible law. I need the PSR like I need a hole in the head. We all have holes in our heads, it's just that they are hard to observe. Well, they would be easier to observe, if we weren't so darn persnickety about them! It's not necessarily God that keeps the trains running on time, it is more likely our own insecurity. That good ol' 'invisible hand'. And that is what the Omega is (not) about. It is just about **homeland security**, if you catch my drift. If you shoot me in the head I will die, but not out of necessity. Out of insecurity. It's like the evil eye, only more so. And if you ask me no more questions.... It must be time for another vacation, or another war. The telephones don't really work, it's just the commercialization of telepathy, to slightly oversimplify the matter. Have you noticed that when the wife calls, the ringer is practically superfluous? It's only the telemarketers who really need phones. You mean you didn't know that communists don't use phones?! Shame on you! Or was it the Amish? Anyone for a little shoo-fly pie? How about a telepathically telemarketed shoo-fly pie? You see the problem, don't you? So, will the glory train be running on time? Yes, if it runs on Internet-Google time.

[4/22]

And what about SARS? Is it eschatological? Is it another embarrassment for immaterialists?

As you may have noticed, I am not easily embarrassed. Not by nature, just by profession. Will this be the Big One? How will it play in the hinterland? Will it genetically combine with HIV? Well, yes and no. Be scared, but fear not. Will we be robbed of our Millennium? What do you think!

There is talk that SARS may take down the Beijing regime as effectively as the Marines took down Baghdad. That would not terribly displease us, if we can contain the loss of blood, minimize the looting. It is possible that SARS could be restricted mainly to China, where there could still be millions of deaths, and perhaps Africa, where the HIV recombination would be almost foregone. There would at least be a behavioral transformation on the Sub-continent, if not in the Third-World. The cost is great. What is the reward? Is this the price of the Millennium? Are those the ashes from which the Millennium must rise? We will shape up or ship out.

Along with Beijing, Islam, as we know it, may be another casualty of SARS/HIV/terrorism. Kim Jong's days are numbered. He is the wrong person playing the wrong game at the wrong time. He might not last out the year.

What then of idealism? Will there be a break or a new opportunity in this game of global dominoes? Will there be a new crack in the pall of materialist orthodoxy? I can't yet place it.

And why SARS?

Could there be symbiosis without parasitism? Could there be biology without symbiosis? This is what ecology is about.

Creation vs. Evolution

It has only been a few months since the last foray into [Creation](#). That last attempt turned out to be a two pronged attack on the subject. The first prong was an attempt to recruit pantheism to the cause of creation. Creation is hard put to find a point of repose within the pantheist schema, or lack thereof. Furthermore, the western shoe has a hard time connecting with the mayan tires. The fact that maya has no tires to kick, may exacerbate the problem, if you see what I mean. Think of one shoe tapping. Never mind.

Kickable tires were more available when we turned to the problem of emergence. Emergence is the evolutionists' answer to Creation. Strain though they do, nothing notable or non-biological has yet to emerge from the exertions of the emergentists. They simply cannot forego the skyhook of teleology and downward causation. Anytime that a physicalist departs from the Lucretian picture of atoms swerving in the dark, she is asking for metaphysical trouble. One trouble is that any emergentist ontology is bound to collide with epistemology. The [epistemic/ontic](#) divide is insufficiently robust to withstand the cross-currents of biosemiotics, the '[Ome explosion](#)', and the like.

Failure of one's opponent is one matter, one's own success is another. How are we to ward off Samuel Johnson's fateful kicking of the stone, in refutation of immaterialism? A mere [dream atom](#) is altogether insufficient.

Sam is distracting me. This is not a stone kicking contest, this is about Creation. *Ex nihilo* is our problem. It would seem that a symphony can be created *ex nihilo*, but can a stone? Why should it seem so much more difficult to create a stone than a symphony. Mozart was a mere genius, while Sai Baba is a spiritualist for all his alleged *siddhi*. A symphony is created out of the mind, a stone out of atoms. With the 'dream atom', I wished to suggest that atoms had a similar provenance, but tell that to Sam. Sam never met the big Baba, and neither have I.

The emergentist would contend that given atoms, symphonies are bound to follow. I contend quite the opposite.

Here's the problem. Creation and evolution are two extremes. Many of us seek a golden mean, but that is not so easy if you are not a dualist or a deist, as are the Intelligent Designers, for instance. An IDer sees God as a literal micromanager. I beg to differ, but the IDers do have a point: where would Mozart be without a flagellum? And I'm sure that Sam would agree.

Why didn't God just commission Gabriel to create the 'Jupiter'? Who needs Amadeus with all his flagella? That is such a good question that I probably don't have an answer, but you know me, I'll give it the ol' messianic try. And I don't have to answer every question that comes down the pike. All I have to do is give the skeptics a run for their money.

God need not be a micromanager. Once she gave the BPW process a kick-start, she could kick back and watch us sweat the details. Serves us right, huh? I'm sure there is a hole in the heavenly fence for the angelic sidewalk superintendents. God did not create the parasites. God created creation. God created ecology. Nature has its cycles, we have our norms. Our norms complete the ouroboros.

Two details come spontaneously to mind: Amadeus' flagella and Sam's stone. I would blame both of them on 'ecology', rather than on either God or evolution. This is about relationalism and the manifold of (felt) meaning. And let me not forget cycles. That's what I was using my PDA to cogitate upon during this last intermission.

What's with a **cycle**? This goes back to the e/pi [syzygy](#). Nowhere do epistemology and ontology become

more conflated than in mathematics. I suggest that the lowly cycle is the inheritor and manifestor of this amalgam. In the game of reductionism, I replace atoms with cycles. The cycle is the common denominator of all emergence, from the ouroboric A&O cosmic cycle, down to the orbital atom and the spinning flagellum. There are many cycles, but only one cyclicity. There is an irreducibly vital, even panpsychic core to the phenomenon of cyclicity. There is no such thing as an objective cycle. There is a **normative** recursion and even self-identity at the core. Counting is one such vital cycle at the heart of mathematics.

Does not cyclicity obviate the whole problem of Creation? It would seem so, according to the pantheists. But then they hardly appreciate the singularity of the BPW. That is precisely where the theism is irrevocable.

Relationalism in a global context is a web of cycles contained in cycles. The space-time manifold is constructed of such a relational web in the style of Penrose' 'twistors' or 'spin-nets'. The cycles become aligned into a cosmos rather in the fashion that our neural nets are aligned into a conscious self. Is it magic? Yes, there is always a bit of that: enough to keep everything interesting. The world wide web is another manifestation in another space.

Flagella and stones are nothing if not ensconced in a relational web. 'Being kicked by Sam' bespeaks a web of startling proportions. No cycle is an island.

[4/25]

I would understand if you were to compare my authorship of these pages (un)favorably to that of a monkey supplied with an electric typewriter, knowing that no disrespect for our simian foremothers was thereby intended on your part. Nonetheless, watch out, as with the apocryphal conspiracy theorist, some day, some theory may turn out to have been correct.

What I wish to say about immaterialist creation is that we can have our immaterialist cake and eat it too. Both George Berkeley and Samuel Johnson will turn to have been correct. In keeping with the spirit of the BPW, we can have the best of both their worlds, and of all worlds, for that matter. Our dream atoms will turn out to be eminently kickable.

How do we arrange to have our BPW and eat it too? By using evolution, of course. But not exactly as the Darwinians are wont to understand it. It is notorious that some of my Christian sistren are down on Darwin, and I sympathize. It is no secret that Charles harbored the most serious reservations regarding his own theory. A monkey on a typewriter is capable of vastly more moral and aesthetic motivation than are the cosmic rays that are alleged to help rearrange our DNA codon letters.

Unlike the cosmic rays, God has a plan. That plan includes Amadeus' flagella, but not directly. God dreams up evolution, rather in broad outline, but then, using teleology to its utmost, is able to implement it mostly in reverse order. That's cheating! Well..., all's fair in love & Creation. But what if a Kim Jong Il, just as a for instance, were to come along and nuke it? Wouldn't that mess up the plan? Well, that's a pretty big 'if'. The way I reckon it, that's just not going to happen. Either a Bush, a Bubba or a Baba would intervene. But, hey, don't take my word for it. Let's just wait and see.

You question whether it would be possible to reverse engineer evolution, Kim Il or no Kim Il. I'm telling you that where there's a will, there's a way. If the reverse engineering of evolution would keep Samuel, George and maybe even Charles, happy, well, God would just outdo herself. The big payoff is that with the overarching evolutionary schema providing an enormously cohesive coherence, our dream atoms become, as I have earlier remarked, eminently, relationally, kickable and, yes, eatable, potable, and otherwise functionally promoting of cosmic intercourse. The only downside is that with all the kicking going on, we kickers are also wont to kick the bucket. But, hey, just how much of this lovely cake can

one person possibly eat? You don't want to get a BPW stomachache, do you? And, besides, how many proms can a parent put up with?

[4/26]

The only thing that anyone of any metaphysical persuasion could find wrong with the idea of evolution is the materialism implied by it. What is right about it is its internal coherence. Who is to say that we cannot have the coherence of evolution without all its materiality? There is nothing wrong, and almost everything right with natural spontaneity. Why go through the labor of an arbitrarily imposed, top-down creation, when there exists a schemata for a 'natural' creation? Why should God not let 'nature' do what nature can do best?

It is my contention that the BPW entails an optimal balance between God and nature. I see absolutely no reason to believe that this optimal balance is not being achieved, considering especially that we now stand at the threshold of the Millennium.

The obvious way for God to empower her Creation is to exploit natural spontaneity to its utmost. An evolutionary style of coherence is the *ideal* agent of that spontaneity. Thus are we able to achieve an optimal balance between the creative push of spontaneous adaptation and a teleological pull. We and nature push, while God pulls. In the process we are also exploiting the positive powers of vitalism, panpsychism and pantheism, while avoiding the incoherence of dualism and deism. And who is to say that such a BPW is not possible? Why should we suppose that we are not its living testament?

The only problem with evolution is evolutionism, i.e. the granting of metaphysical exclusivity to matter and chance. The extraordinary properties of mind and consciousness ought to give lie to evolutionism, materialism and naturalism. All too obviously, there are more things than atoms under the Sun.

Outside of the 'fundamentalist' or 'hard core' ranks in both science and religion, almost everyone is willing to accept the compatibility of science and religion. Belief in a teleologically directed evolution provides the basis of the alleged compatibility. This is a minimalist teleology. It is a residual teleology that is left after granting everything else to scientific materialism.

I take strong exception to any minimalist teleology. There can't be a teleology without a telos, any more than there can be an expanding universe without a Big Bang. Teleology entails an Omega. Teleologists don't deny the Omega, but they take pains to postpone, downplay and ignore it. Gradualism and a strong distaste for any millenarian enthusiasm are the benchmarks.

Appending an Omega or Telos to the Big Bang cosmology borders on the incoherent. It becomes a *deus ex machina*. Yes, one can imagine a universally convergent evolution, but converging on what? Surely not just on a [Tiplerian](#) or [Transhumanist](#) computer in the sky. At some point there would have to be a [Teilhardian](#) spiritualization of matter or at least a separation of the two. The cosmic logistics of the Teilhardian Omega would be prodigious and unseemly, at best. The main problem would be the unreasonableness of any temporal coordination. Would every potentially life bearing planet have to wait for upwards of billions of years for the very last planet to reach its Omega, or would each planet just go popping off on its own Omega like so many spiritual supernovas?

If each planet were to converge on essentially the same Omega, this would seem to transform a spiritual process into a virtual assembly-line. The planetary redundancy would then serve no qualitative purpose, unlike the multifarious communion of souls within a given world. With a virtual infinity of worlds, no world is essential. Any given world is spiritually expendable.

One might try to imagine that there are more than the apparent four levels of being, i.e. atom, cell, self, God. We might be to our planetary god as she is to a cosmic being, and so on. This (unlimited?)

polytheism has no conceivable rationale. It would remain logically incoherent to us. There would be no coherent end of the possible levels. Salvation would ever only be partial and provisional. The story would have no conclusion. We would feel just as lost and disoriented in that spiritual infinity as we feel now in our spatial infinity. Even the concept of the BPW would become incoherent. Without an overarching rationale, every conceivable world exists, and there is no longer any essential meaning for creator or creature.

Polytheism, pantheism and atheism become indistinguishable, according to our non-prophetic sisters and brothers. An essential God is a singular God with a singular salvational economy. Only that one God ultimately speaks to us, and only to that one God do we ultimately answer. That Being is our Creator and the Creator of our one best world. That is the Alpha and Omega of coherence. That is the one light. All else is merely a shadow.

A personal and loving Creator is necessarily self-containing and all-containing. Such is the best possible Being. If you can conceive of a more sublime being, this would be an auspicious time to reveal it to the world.

Thus may the Telos and the Logos be identified. The evolutionary schema that we call nature exists to serve the Telos. Nature can be fully comprehended and appreciated only in its teleological, eschatological context. In that sense, nature is a pure creation. We are the creatures who increasingly identify with the Creator. The evolutionary schema underlies the coherence of the world. God is the author/conceiver of that and all other schema and rationales.

[4/27]

Much of the above has been a roundabout rationalizing of what most, even semi-educated, people would consider a giant leap backward, reverting to a pre-Copernican worldview. There is no point in trying to soft-peddle this mind-boggling conclusion.

Regarding the impending immaterialist implosion and inversion of the scientific worldview, atoms and evolution come off **relatively** unscathed, but the stars....well, they've gotta go. Isn't that a bit like the dentist telling her patient that his teeth are OK, but the gums have to go? Sorry, about that....about the bad joke, but not about the stars. I've been warning NASA all along that they're going to have to do some serious retooling. Ultimately we have to choose between inner space and outer space. Metaphysics cannot treat them as equal without succumbing to a complete incoherence. Even the most rabid Creationists would hardly contemplate such a radical inversion of the modern worldview. I am simply following the path of immaterialism to its logical conclusion. I can do no other, without doing violence to the power of reason.

Our mission, should we choose to accept it, is to pick up the pieces of the shattered materialist cosmology, and begin the reconstruction of its immaterialist successor. I will not be offering anything like a finished product, rather I will apply some very broad, preliminary brush strokes to a work that is going to be in progress for the duration of the Millennium.

But what are the pieces that are pickupable? A ubiquitous feature of the scientific world are its cycles, yet cycles lack a definite ontological status. The inference is that they might serve as a bridge between materialism and idealism. It's worth investigating.

Very often the notion of cycle and process are interchangeable, and I would commend to you Whitehead's Process Philosophy. Even several years ago, when I attempted to study PP, much of it was beyond my ken. Do not blame Alfie for any significant part of what may follow.

I contend that non-trivial cycles, and almost all are, are irreducibly phenomenological. Even the swinging of a simple pendulum can be far from trivial if it is not grossly abstracted. I have already attempted to rhapsodize on the metaphysical depth of cyclic phenomena. The organic world is composed almost entirely of such processes, and the inorganic world is hardly innocent of same. Organic cycles cannot be identified without consideration of their functional context. The biological cycle is the basis of biological holism and, yes, vitalism. Let the reproductive cycle be a case in point, and then recalling how ontogeny tends to recapitulate phylogeny helps to underscore the unbounded scope of even the most basic of cycles.

Quite simply, biology is not a science of objects, it is a science of processes. There is an unbounded, relational network that is truly cosmic in scope. Given this relational, process oriented perspective, even physics gives up the ghost of its abstracted linearity. Causality and functionality can hardly be disentangled on any level. That entanglement, mathematically formalized in the quantum domain, is pervasive. Organic and inorganic, epistemic and ontic are distinctions that lose their thrall under the aegis of any pragmatic concern.

The otherwise mind-boggling move from materialism to immaterialism may be greatly facilitated by focusing on the lowly cycle as a point of reflective equilibrium, while the rest of our world is stood upon its head.

Let us shift our gaze back to the stars. Recall poor Ptolemy. His **epicycles** have become the icons of an obsolescent worldview, the objects of our sophisticated derision. Yet, our literally exploding cosmological models seem on the verge of self-deconstruction. No longer do we have to contend with mere epicycles, now we confront epi-cosmoses. The only way to avoid the functional implication of the Anthropic Principle is to multiply our Big Bang hypothesis *ad infinitum*. 'Many Worlds' are breaking out all over: in modal theory, particle theory, in astrophysics, quantum physics, etc. It would seem that we have leapt from the Ptolemaic play pen, into a seething cauldron of exploding, inflating, laminating cosmoi. Goodbye Cosmos, hello Apeiron.

With 20/20 hindsight, perhaps Cardinal Bellarmine should be attributed more than a bit of metaphysical prescience. I am not suggesting that we renounce the history of science. I am merely suggesting that science has its own internal agenda and *Aparat*. Consider the possibility that human destiny may transcend those and any other particular strictures, including especially any implicit ones of my own.

The bio-cycles could, without great difficulty, subsume the epicycles, in so far as we can lend ontological credence to Anthropics. Your basic terrarium with 24x7 fluorescent lighting might be a nice place to visit, but who would want to live there? Your more sophisticated models will have built-in light, tidal, climatological and even astroidal impact cycles, etc., etc. Everyone of these cycles may add enormously to a dynamic, hierarchical network of ecological niches. The Terrestrial, multi-cyclic model of terrarium is world class, is it not? Perhaps it may turn out to be the best possible terrarium.

Perhaps God did dream up the Sun, but how do we explain sunburn? An Eskimo could dream of the Sun all winter long and still turn out peaked in the spring. Sunburn is a process. It is a spin-off of a plethora of much more functional processes, most of them cyclic in nature. Heliotropism is observable throughout nature, not just on Pompano Beach. So which came first, Helios or the **Heliotrope**? For the immaterialist, that is just another chicken-and-egg type problem with, I would submit, a similar, and even quasi-evolutionary answer. It's just cycles all the way down, ma'am!

In the beginning there was just the Alpha and the Omega, and before that there was just the Om. The cosmic, phenomenological symmetry breaking is virtually all cyclic in nature. Call it cycle inflation, if you will. Cycles beget sub-cycles. Species beget subspecies. The more sub-cycles you cram into the Krebs cycle, the more metabolic bang you get for your citric or photosynthetic buck. That is just

thermodynamics if you are into physics, and it is also information explosion if you are into metaphysics. Information multiplies and mutates in the dissipative economy.

[4/28]

At least to a first approximation, the linking of cycles into a network requires nodes of intersection and interaction. At that point the network takes on the appearance of an extended Feynman diagram: the points of interaction are connected by 'propagators' into a lattice structure. If the interactions are strictly binary, as in the Feynman case, the lattice will be two dimensional, but that is not the case biologically.

Reminiscent of projective geometry, there is an approximate duality in networks between the loops and their intersections. This partial duality helps us to avoid an unnecessary ontological commitment to the particles in lieu of the loops. Materialist, analytic thought reifies the particles at the expense of the process. Relational thought focuses on the network. On the relational view, the particle nodes serve as accounting tokens for the vital, underlying processes they represent. The processes are teleological and subjective. The particles are purely objective, or so our thinking has gone. Quantum theory forces us to consider the interactive cycles as being essential to the observational protocol of QM. A chemical cycle is a minimal self-measuring and recording system. As such, it is the minimal building block of a quantum world. Quantum theory and ecology are gradually nudging us toward a more relation view of the world.

The logic and *raison d'etre* of particles is just their atomicity: their supposed independent, objective existence. A persistent cycle, however, must be part of a dissipative system which must include an energy source, ultimately of a solar variety. This brings us back to helios and heliotrope. The heliotrope is a node in a vast ecosystem. That entire ecosystem, including helios, could be logically reconstructed in holographic fashion from the information that is explicit and implicit in that one organism. The same is not true of the Sun. In an atomic world, the Sun is the ultimate atom. In a relational world, the heliotrope is a paradigmatic node.

In a cycle based, panpsychic world, heliotrope holds sway over helios. In the great thought that is the universe, the phenomenological ecosystem is virtually self-spawning, self-reifying and ramifying. The solar logos emerges as a coordinating nexus of the various metabolic nets. This evolution is circular and teleological. Its linear chronogram lends only one, highly abstracted, distorted, perspective, which is not representative of the cosmic system taken as a whole. Or understandable bias toward the prophetic breaking of temporal symmetry leaves us **mesmerized** by a singular arrow of time. As we approach the apparent Alpha/Omega ouroboric discontinuity, we will become more cognizant of the non-linear dimensions of time. We too easily view time as just another objective fixture of the world, brushing over its paradoxical and subjective nature. Only in the fullness of time does its supposed linearity become less imposing.

Sun and atom, S&A, are the very useful cognitive spin-offs of our cosmic cycle. In as much as those abstractions serve the larger order, we attend to them. When they threaten to subvert that order, it is time to rebalance our thinking and restore them to the larger context. That process is just beginning. It has no conclusion short of the eschaton itself.

[4/29]

Sun & Atom are two primary nodes in our relational network. They define our spatial manifold in the way that A&O define the temporal. S&A/A&O are the anchors of our space-time physical reality. Every microcosm, every cycle reflects these four nodes. The Sun is the organizing nexus for the sky, as is the Atom for the earth. A&O organize history.

Who is the Atlas who holds up the sky and Sun? And how is it so held? God, as the author of our BPW terrarium, has scripted the four anchors of our reality in broad outline. We creatures work out the details that will necessarily reflect the Anthropic Principle. Our habit formation, our memories gradually flesh out the broad outline given to us. The principles of object oriented programming, OOP, may be reflected in the process.

Coherence is necessarily maintained throughout. Logic *cum* mathematics provides the analytical skeleton of the coherence. Logic and **math are flexible** to a degree, and they too become optimized in and through the process of habituation. The mathematical structures such as the Monster Group are upheld in our collective memory.

I have not given much emphasis to the role of memory. This is not an oversight. It reflects the trepidation I have in tackling such an enormous, convoluted issue. Suffice it to say that I conscientiously abstain from all materialist rationales for memory. Show me where the laws of physics are stored and I'll show you where your memories are stored. Even the physicalists throw up their hands in despair.

As a teleologist, I contend that memory and anticipation are two sides of the same coin. Creation, to an optimal degree, works backward as the reification and final cause of our memories. As a **direct perceptionist**, I don't make any hard distinction between the world and our collective comprehension of it. That object/subject amalgam is the basis of coherence. Creator and creatures are the partners in the amalgamated coherence. The S&A/A&O/MG (monster group) are the cornerstones of our coherence. Exactly how that works, the cosmic 'mechanics' of it..., my guess is about as good as yours. Relationalism is the fact of cosmic existence. Which fact strongly implies that nothing more nor less than the BPW can logically exist. It exists in the eternal potency of its self-organizing logic and, yes, its love. Nothing else can compete. Everything else is a mere shadow. As the Sun is the organizing nexus of the sky, so is God of love. God writes the book of love. The Sun is a significant prop. How much more than this will we need to know in preparation for the eschaton? Our need to know is part of the coherence, and curiosity is, of course, a legitimate need.

On further thought, I suggest as a sixth anchor the reproduction cycle. Thus we have:

A&O/Repro/S&A/MG as the Big Six.

This may seem a mixed bag of tricks, but such is our diversity. A would-be creator must pay special attention to the interaction and integration of these primary components. As for the seventh component, I haven't a clue at this point.

With just these six components, one is well on the way to the creation of the BPW. Is this too easy? It's not rocket science or even brain surgery, but it is a very extended exercise in staying focused.

[4/30]

I have been on the lookout for a Creation scheme from the beginning of this metaphysical quest. The individual six items listed above have been prominent in my mind for much of that time. The Monster Group is the most recent addition, and that has been a focus for a year or more. The A&O scheme coincides with my shift to eschatology some fifteen years ago. Atoms are a holdover from my years in physics. The Sun is the granddaddy of cyclical phenomena. Reproduction is, well, inescapable.

The six items segregate conceptually into groups of three, perhaps as two interlocking triangles in the fashion of a star of David. The two triangles are logically connected mainly between the reproductive and atomic vertices. One may consider reproduction as the primary biological cycle, and, as such, it represents all metabolic phenomena. Metabolism, in its turn, provides the primary rationale for the existence of atoms.

The atom may be depicted as a miniature solar system, and thus may it partner with the Sun as the twin organizers of the large and small. Deciphering the mechanics of the solar system has been the primary impetus behind mathematical progress since the beginning of recorded history, up until the last century when its role in that regard was supplanted by the atom. The solar and atomic mathematics is essentially represented in the singular structure of the Monster Group.

The above six aspects of creation are the ones which demand the greatest attention on the part of the creator. If these can be implemented, somehow, by hook or by crook, the rest can be filled in, to a larger extent, by us creatures. You might well object that the above list ignores the most important part of creation: the creatures. If there is a special creation on the part of the human, it would be mainly as in the image of God. That then would not qualify as a separate creation as in the other six items above. The *imago Dei* is more to be seen as part of God's self-creation, a matter that I have alluded to from time to time in these pages.

Besides any special human spirit or consciousness, there is the question of speciation. I am suggesting that speciation can best be subsumed under the category of reproduction, and I will attempt to justify that logical dependence in what follows.

From the perspective of the creator there is a six-point plan of creation. Let us attempt to divine how this plan might best be implemented.

[5/1]

Please allow me to recapitulate some basic points:

Lest there be any doubt as to what I'm doing here, let me remind you that it is **speculative** philosophy, with the indicated emphasis. There is a widely held opinion that the materialist worldview is due, at the least, for serious revision. I am among those who are skeptical of the prospects of any mere revision. I am reasonably convinced that the mind-body problem is sufficiently severe for materialism so as to warrant the adoption of an immaterialist system. That is the work in progress on these pages.

Obviously the human mind has a capacity for reasoning and rationalizing. Every cultural system including the modern and postmodern ones provide frameworks for the deployment of our reasoning abilities. Down through the ages it has been the myriad versions of rational theism and/or gnosticism which have provided the widest latitude to the reasoning impulse. I propose the immaterialist BPW scheme as the logical culmination of this tradition.

I believe that the materialist tradition has been a necessary and useful phase in the evolution of human thought. The problem of the mind, however, presents not just another puzzle for science to solve. It appears to be presenting an ontological challenge of the highest order. We have to ask ourselves, which is the cart and which is the horse. I am suggesting that materialism has put the cart before the horse. I proceed here to restore the horse to its proper position, and examine the consequences. If immaterialism is to be more than an exercise in mysticism, it must make a strong appeal to rational theism. The concept of the BPW provides, I submit, the necessary foundation for any rational scheme of Creation.

Evolution is a powerful ordering principle, indeed, it is the primary rationale behind the entire modern worldview. Postmodernism, for all its sound and fury, has hardly dared to even ruffle the feathers of evolutionism. What I propose here is an immaterialist, idealist version of evolution. The world is a great thought rather than a great machine. Let us see how that thought evolves. Let us see how the phenomenology of evolution may be explained and exploited from an idealist, theistic perspective. And that is what we have been doing. I am not here to challenge evolution, I am here to repossess the phenomenality of it on behalf of the Creator.

That rational theism is a minimalist theism can hardly be overemphasized. This is not going to be the Hollywood, special effects version of Creation. This is the Tom Sawyer version. This is the Anthropic version. God sets the minimal stage and then lets the actors run the show. We are the mainly unwitting actors.

The minimalist 'props' or organizing principles for Creation might consist of the six items I suggested yesterday. This is simply a first approximation. It is a very rough sketch meant only to stimulate further thought. Let us proceed in that spirit.

How might these 'props' be deployed? The primary organizing principle for Creation is simply the historical narrative. God is responsible for the A&O as well as for the significant prophetic events. To the extent possible, we actors are then left to our own devices. The extent of our freewill is a factor to be balanced in accord with the BPW concept. The creation of the narrative proceeds in a manner not unlike the creation of an author setting out to write the Greatest Story Ever Told.

A reproductive cycle serves multiple purposes. Each life history is a partial reflection of the cosmic history. The parent-child relation reflects the relation between Creator and creature. Sexual reproduction and mutation ensures maximum diversity and novelty, with minimal divine intervention. A universal genetic schema maximizes the continuity of 'nature'. How is the reproductive cycle implemented? I submit that it is implemented in the process of creating even the first creature. Creation and Creator are a reflection of each other that comes about through a (deliberate?) cosmic symmetry breaking between primordial (cosmic) self and other self. This same symmetry breaking is partially manifested in the distinction between Alpha and Omega. Time is a product of the symmetry breaking as manifested in the ouroboric, A/O cycle. There is a reciprocal temporality between Creator and Creation. The existence of one complements the other. God pours herself, even sacrifices herself, into the Creation which then completes the cosmic reality. *Sub specie aeternitas*, there is but one singular spirit. To put it most succinctly, the reproductive cycle is but the logical spin-off ouroboric cycle.

Given a reproductive, genetic schema, the existence of an evolutionary tree could almost be an afterthought. It would be a waste not to exploit the logic and rationale of evolution to flesh out nature in as spontaneous a manner as possible. That does not mean that evolution is to be taken as a literal fact, but rather as a narrative device. I would suggest that dinosaurs, for instance, existed in a parallel 'prehistoric' virtual sub-world unto itself, a kind of **Jurassic Park** if you will, whose logical overlap with Creation proper is witnessed in the fossil 'record'. Thus permit me to suggest that the quasi-linear phenomenological time as we now experience it covers a period not much greater than that of recorded history. We're talking something on the order of the time frame of the mythologically crucial equinoctial cycle of ~ 25K yr. The details of nature are filled out by us creatures in teleological, Anthropic fashion, somewhat in the reverse order of history. Creation can then operate on the assumption that all's well that ends well. According to one well-known theory of dream psychology, our dreams are created in a similar retroactive fashion in the process of awaking under a particular stimulus. Dream time is purely subjective in that case. The eschaton is simply the awakening of us into God. Like I say, this is nothing more than the roughest of sketches. If you are hereby provoked to compose a more credible rationale, my mission will have been accomplished.

Notice that here and throughout, I am not drawing a hard distinction between the why and the how of creation. Given a primordial cosmic will, no prior constraints on the operation of this creative will need be, or even can be, posited beyond the internal ones of self-consistency. And perhaps the alleged optimization scheme is best regarded as but a part of the internal consistency. Logically Creation has no seconds, and so the matter of choice is moot.

[5/2]

To my way of thinking, the most difficult thing to create, setting aside God's self-creation, would be the Sun. This is the most objectively physical item on our list of six. The Sun is our source of light and energy. It cannot be conceived as just another component of the ecosystem. It is clearly a dominating object.

Conceptually, light and energy are very different things, and it is not at all obvious that they should be combined electromagnetically. Our dreams are illuminated, evidently without benefit of the Sun or any other particular source. Why should our waking illumination have such a specific source, and how is that source put in place, etc.? And how about all that photoelectric and thermodynamic stuff?

The idea of a Sun would take the Creator rather far into the realm of physics. Solar dynamics just about covers the physical waterfront. This is a major deal. Heliotrope is one thing, Helios is quite another. That is a very asymmetric relation. Where does one start?

We're modeling creation as something of a divinely organized lucid dream that is being shared with various proto-creatures, which participate in it on various levels. God has to get the ball rolling and then arrange for the creatures to pick up the slack and fill in the details. Availing ourselves of teleology, this is a push and pull exercise.

Illumination is a funny thing. Think of the light bulb over the head of the cartoon character, or the halo on the religious icon. They represent a deep mystery about thought, consciousness and their distinction from the unconscious. Can we think without any audio-visual-tactile imagery? Consciousness is phenomenal, or it is nothing. That phenomenality can only involve the known sensory modalities: the ones engaged by the external world. Can we entertain abstractions without phenomenality? I have been partial to felt meaning over pure meaning, although I would be at a loss to describe the feeling of 'constitutional government'.

Where do thoughts and memories go when they are not being thought or remembered? There are many thoughts that we hash over, put aside, and then take up again. Then there are those occasional thoughts that seem to spring to mind, unbidden and almost fully formed. There must be mental processing that is unaccompanied by phenomenality.

Panpsychism is the notion that the mind pervades the world, I submit it is the world the pervades the mind. I am not a fan of representationalism where there are two worlds, the real one and the mental one. An idealist has no need to posit two worlds. There can be different perspective without there being different worlds. The world is a great idea which exists in the collective consciousness and unconsciousness. On the day side of the Earth the Sun is conscious, on the night side it is unconscious, more or less. My train of thought is usually precariously balanced between the literal and metaphorical, and don't ask me to tell which is which. .

Given a three dimensional world, there is bound to be something like optics. Surfaces will convey or broadcast information in a more or less lineal fashion. This is true even for sonar. But why and how do we have independent sources? If everything is already in the mind why bother with optics and all the rest. Why not just have a memory like access to the whole world: kind of like remote viewing, but all the time? There would be no communication or transportation problems. Things might work like this in heaven, if there is such a place, but, evidently, not down here. I would suggest it has something to do with metabolism, i.e. with reproduction and the like. There must be a connection between the Sun and reproduction. Did I mention Pompano beach?

[5/3]

Metabolism demands the conservation and sequestration of energy, which in turn require that there be discrete sources of energy. Furthermore, consideration of communication bandwidth calls for an optical-visual type of channel. And so does the consideration of discretionary communication, as opposed to a more intrusive or telepathic mode.

Optics, however, is not feasible without there also being a distinction between sources and sinks. Otherwise there could be no flow of information. Consider, for instance, the structure of the eye and the *camera obscura*. With optics as with energy, there is a logical requirement for discrete sources. In as much as optics involves the flow of information, it must also entail a flow of energy. Given then, two disparate requirements for energy sources, we might wonder about their possible relationship.

Here is a further consideration: in order to minimize the number of sources and maximize the area of dispersion, it behooves us to employ remote sources, very remote. Thus do we come to embrace a single, combined and remotely placed optical-energetic source. Furthermore, we need a 2 + 1 dimensional configuration to maintain separation of source and sinks. For a dynamical system there will have to be a constant force field to maintain a vertical segregation. If we then wish to avoid external supports, we are on the brink of reinventing a planetary system, and along with it a Newtonian dynamics. Furthermore, photo-energetics will require a rationale for balancing the two. There will have to be photo-metabolic pathways and reactions. This entails a photo-electric effect of some kind, which, in its turn entails a Planck relation between the energy and the cyclicity or frequency. These considerations put us on the verge of reinventing the Bohr model of the atom with its planetary electrons, solar nucleus and discrete energy states.

What we have witnessed in the last several paragraphs, and in previous pages, is a redeployment of the Anthropic Principle in a more fundamental fashion than how it was originally introduced. Originally, the anthropic principle was intended to start with the physical world as a given, and then see to what extent this world is constrained by the consideration of biology. Here, in keeping with our immaterialist bias, we deploy the anthropic principle in a more phenomenological and thoroughgoing fashion.

Coherence becomes a primary consideration. Given a phenomenal ambience, how would that ambience be structured or organized to optimize its coherence. And why coherence? Coherence, Creation and Cosmos are all of the same stamp. They imply a subject/object polarity, but not a dichotomy. To avoid the dichotomy, the polarity is conveniently made circular or reciprocal. The creator/creation polarity is made reciprocal in some kind of Alpha/Omega schema. There must also be a macro/micro reciprocity as between creator and creature.

Reciprocity is impossible without coherence and *vice-versa*. Reciprocity and coherence imply mutual and universal comprehension. But reciprocity also entails a dynamic cyclicity of comprehension. Coherence is not a stasis. There need be a dialectic circuit in the broadest sense. A dialectical, evolutionary, reciprocal scheme is what the doctor ordered. The optimal such would be a singular 'recycling' of the spirit. Gnosis and agnosis are thus complementary and dialectically dependent. Continuity must also be juxtaposed with discontinuity on all levels, and thus do we come to the consideration of an eschatological/salvational/revelational scheme that invokes the Alpha/Omega discontinuity of the ouroboric sort.

The prophetic tradition incorporates these dialectical structures in a relatively pure fashion. Pantheism falls rather short in taking advantage of any spiritual dialectic. It is a reflection of a gratuitous cosmic pessimism and even despair. Any step beyond materialism will entail theism or pantheism. Why settle for the inferior product, when its complement is freely offered? In the end, can there really be a choice?

[5/4]

How do we sit now with the Sun? I show that the Sun is the minimal logical nexus of various

considerations. Further, it is my contention that in an idealist system, logical necessity is tantamount to ontological prescription. It stands to reason that the how and why will not be disparate questions as they are in a dualist system. It is not just that the Heliotrope begets Helios, but rather that heliotropism, in its widest possible sense, begets and maintains Helios. And I certainly include the Pompano sunbathers and the Egyptian solar worshipers as significant elements in the phenomenology of heliotropism. God is responsible to load the dice of nature in a heliotropic fashion. Then the anthropically stabilizing, concretizing elements kick in. I have no doubt that more than a few of the actual exigencies of this bootstrapped creation process may be found recorded amongst our various creation myths.

The BPW does not have to be the most difficult world to create. To the contrary, considering the great reciprocity of the bootstrap model we employ, it may even be the easiest, if not the only world that may be created. This is not to deny anything of Creator or Creation, but rather to keep them in the proper relational, reciprocal, dialectical context.

Have we solved the creation problem? Indications are that we are headed in the right direction, and that is what counts. Once we take off our materialist blinders, new vistas open up. In short order we will have moved to take up intellectual and spiritual residence in these wide open spaces. Breaking down the artificial mental barriers is all that is required. All we have to do is break the ice of materialism, then we discover the ocean of the spirit, which is our rightful home, our promised land.

What finally can we say of the Monster Group, our remaining sixth element of Creation? The MG is to math as the Sun is to metabolism. It is an organizational nexus. I have already indicated that the MG should not be treated as something independently given. Mathematics is no more immune to relationalism than is anything else in our relational world.

Do the axioms determine the MG or *vice-versa*? I submit the latter. **Teleology can operate in mathematics** as elsewhere. We are told that there exist only 26 sporadic groups, of which the Monster is the largest. I suggest that we will discover an infinity of virtual sporadic groups. We will find logical spaces in which there are infinite analogs of the sporadic family. Furthermore, we will discover among the 15,000 pages of proof of the 'classification theorem' that there are hidden assumptions which speak to the admixture of simple axiomatics along with much more subtle anthropic-style biases. Am I needlessly sticking out my neck on this seemingly esoteric matter? Is this just another example of a postmodernist-style of critique run amok? Rather, I submit that an anthropo-theocentric idealism will turn out to be the one vital justification of the entire postmodern endeavor.

The above matter has to do with the 'unreasonable' effectiveness of mathematics in the 'real', physical world. Members of the sporadic family play a very significant role in particle theory. No, I mean to say it is the exceptional groups that play this role. And guess what? I don't know the difference. I must have missed that class. It's back to the drawing board, sports fans.

OK, Richard Borcherds points out in his [moonshine](#) lecture that there are indeed intimate relations between the sporadic and exceptional groups, having to do with the geometry and string-theory physics of 26-dimensional spaces. He also points to the [syzygy](#) problem, which he says may not necessarily be related to the moonshine, but I would be willing to speculate that it rather points to some super-moonshine. The point of moonshine is the unreasonable coherence of mathematics. It is more organic than anyone could have supposed naively. The MG turns out to be a core feature, or a nexus of a significant part of the [organicity](#). The unreasonable effectiveness of math indicates that the coherences of mathematics and the rest of the world, are, in some manner, mutually supportive. It would be hard to imagine that this mutuality could be accidental, even if we were not idealistically biased.

It is also difficult to think of **math in vitalistic terms**. There must be another dimension of mathematical 'time' in which the organism can live. The math we know is just one optimized slice of that organism. In that larger dimension of mathematical gnosis there could be an infinity of sporadic groups.

[5/5]

There must be many undiscovered relationships between the sporadic groups. Some of those relations must be extensible to a continuing sporadicity in some significant sense.

I invite you to inspect the [Proceedings of the Organic Mathematics Workshop](#), as well as [Complex Zeros](#). Also recall the [Ramanujan](#) phenomenon. What these considerations point to is that panpsychism is likely to entail a panmathism, which is just the unreasonable effectiveness of mathematics along with our ability to ascertain and entertain same.

We think of panpsychism as being a touchy-feely phenomenon comprising a manifold of vital felt meanings. But now we suspect that this same manifold includes a vital, organic panmathism. The touchy-feelies and the mathematics complement each other in a fashion that escapes our present understanding. Undoubtedly, the comprehension of this super-coherence will entail a whole new understanding of understanding.

Consider the discoveries of Neptune and the Omega particle. How does our enhanced panpsychism help to explain such developments? The Omega, *per se*, is fairly straight forward in that it completed a fairly obvious grouping of the elementary particles based on their quark composition. The quarks, however, bring us to the threshold of the MG. That particle accelerators should be able to tap into our Ramanujan style collective unconscious is a bit more esoteric. Particles have to have properties, and those properties will cohere in an optimal anthropic fashion. Particles push reality beyond the limits of feeling and meaning. Beyond those limits, the only source of coherence is math and the MG. Relationalism demands that any available source of coherence be used to the utmost in any phenomenal setting. Quantitative organicity is a logically necessary offshoot of the qualitative, panpsychic manifold. Panmathism might be viewed as being the exoskeleton of the qualitative manifold. It couldn't not exist and be accessible in instrumental and psychological fashion.

Neptune presents a somewhat different picture. Telescopes are a logical off-shoot of our energy-optical system. We were bound to turn them on the starry, planet filled sky. From a purely metabolic point of view, only the Sun and Moon play a role. All the rest is gratuitous. The fossils are a direct product of the evolutionary logic lying behind the ecological context of biology. There is nothing so anthropic for the stars. They are window dressing in a rather pure sense.

Suppose there were no stars. It would be, well, quite unnatural. Nature abhors a vacuum. A blank sky would be a psychic vacuum. Evolution would be incoherent without a cosmic context.

What could that context be? The cosmic background could either be a steady state or not. The Big Bang phenomenology lends itself to considerably more coherence than does the steady state. Well, all of its incoherence may be ascribed to a single singularity. It is tidy that way.

That is the why of the stars, what about the how? The Sun, in all its glory, as we discussed [earlier](#), is closely tied to the heliotropism that pervades nature. Given a fair nudge in the heliotropic direction, the ecological web ought to be able to snare itself a Helios, rather like our own phenomenological Sun, without undue difficulty. The Pompano sunbathers would hardly constitute a critical component of the nearly universal heliotropism.

Such is not the case for the stars. The logically prior presence of the Sun and Moon will certainly help to prime our ontological star pump, but we may need some additional input of the Pompanic variety. What I am groping for here is an astro-archeo-mythological system. This astro-tropic system will be a substitute for the less anthropocentric heliotropism employed above. Star worship may not be quite as gratuitous as Sun worship. The fact that the entire megalithic culture was laid out on a foundation of astro-geodesy is noteworthy. Sacred geometry, calendri, feng shui, etc. were all a part of the ancient, high cultural wisdom. The ancient hierarchy, with divine collusion, did hold the stars and planets to their appointed

rounds, using every psychic, projective power at their disposal.

The enchanted, vital, zodiacal, mythopoeic sky, was gradually devitalized, perhaps in a metamorphic-pupal fashion. Yes, that original sky was our psychic cocoon, shielding us from all the other things that might have gone bump in the night. Our psychic boundaries were ever so much thinner and more fluid back then. Now we may be seeing a bit of a reversal. Is not the Hubble now helping to revitalize the sky, awakening us to a more organic worldview?

All of this just to set the stage for Neptune? Did Neptune not arise out of that same ocean of unconsciousness? But first things first. Among the first things seen as the telescope was pointed heavenward were the four Galilean Moons of Jupiter. Surprise?

Those moons didn't have to be there. There might have been only three. How did they get there if the Big Bang didn't put them there? As I've said before, it was magic. Idealism is no foe to magic, so you may as well get over that scruple. And on the same subject, how 'bout those Saturnine rings? God truly outdid herself.

The Jovian moons and Saturnine rings I would chalk up to a [Jurassic Park](#) type phenomenon. Somewhere God has a creation park or virtual alchemical laboratory, if you will, in the dim recesses of her mind. Genetic and fluidic experiments abound. Randomness is given a freer reign. Whenever a sapient creature stumbles upon a blank stretch of Creation, Creation Park is accessed in an alchemical fashion that will maximize the aesthetics and minimize the incoherence. Novelty will be a factor. A bit of **Xerox Parc** will add to the flavor. Add in a strong dose of teleology, pop it in the oven for a few minutes and presto-kazzam, you've got yourself a world class Creation system.

Is any of this less credible than a Big Bang *cum* Darwin? That is a very subjective judgment, I would submit. You pays your money and you takes your choice. I say that a little cosmic intelligence might go a lot further than a Big Bang. I don't expect any hard core materialists to be persuaded. But there are people sitting on many different ontological fences, and if even a few of them feel the sweet breeze of cosmic reason, my mission is accomplished. And then even God gets to rest sometime.

[5/9]

Some progress has been made, but each bit of progress points up the distance remaining. There are still significant gaps in the coherence. There is also the need to find a way to balance upward and downward causation. Idealism should not be forced to take the opposite extreme from materialism in this regard. The emphasis on [cycles](#) was meant partly to offset this tendency. Besides the reproduction cycle in the [Big Six](#), there are also included the Sun and atom as a means of facilitating upward causation.

Part of this upward causation initiative is the [Jurassic Parc](#) strategy. The JPC is intended as a way to short circuit evolution in an ouroboric fashion. It is a combination of Jurassic Park and Xerox Parc, or biological *cum* intellectual incubator. Yes, perhaps this is just a slight, experimental extension of the Garden of Eden strategy. If we go that route, there is then the problem of interfacing the mental realm with the JPC/GoE. This is the residue of dualism that is still present in the tension between upward and downward causation. I need to reduce or rationalize this tension. This may also be related to the problem of rationalizing the effectiveness of mathematics.

One of the problems associated with downward causation is the achievement of dynamical stability. The mutually stabilizing influences of the Big Six were chosen accordingly. The MG provides a form of downward causation mainly in regards to the atom. Cyclical processes are perhaps the principal stabilizing influence.

[5/12]

Next to explaining the Sun, the atom is the biggest challenge for the immaterialist, and it may even be bigger. We will at least have to bring out the big guns.

Materialism and atomism are virtually synonymous. Atoms rule. Atoms make the world go 'round. A great explanatory bulwark has been erected upon the diminutive atom. How can immaterialists tap into that bulwark without becoming mere atomists? Clearly we will need to make the best of the immaterialist ingredients in quantum physics. However, a primary reliance on QM would make us overly reliant on atoms.

It appears that [vertex algebra](#) may be a connecting link between QM and several areas of mathematics, including Fermat's theorem and the MG. Riemann's hypothesis has its own [links to QM](#) via quantum chaos. There must be a quantum connection between the physical effectiveness of math and the observer participation. These multiple links are part of the explanation for the coherence of the world. Atomic physics is an exercise in working out the implications of the observable symmetries.

Such Stuff as Dreams Are Made On

I wish to argue that dreams inevitably lead to atoms. It may be a long way from dream stuff to a nuclear weapon, yet that is where the logic of the BPW does lead. In the dream state the 'why' and 'how' become naturally intermingled. Coherence requires atoms. Without an 'atomic logic' our dream world would dissolve.

No one questions our ability to dream of atoms, but they do question the efficacy of those dream atoms *per se*. How does a mere dream impart that efficacy? What is the force of coherence? I claim it is the most powerful force in the world. It is the only force. Correction: coherence and the life force are the only ones.

[5/13]

And did I hear anyone mention love?

But today it is atoms that are the main challenge. I am still inclined to assign metaphysical priority of atoms over the stars, i.e. the Sun, but it remains an open issue of perhaps more than academic import.

I believe I have mentioned the close association between atoms and cycles: a primary cycle being of the chemical type. Consider also the hydrological and meteorological cycles. Water is the substance of life as we can either know or imagine it to be. Life without water remains inconceivable and possibly even incoherent. As the basis of life, water must have uniformity. It must have elemental and formal properties. It must be capable of transport in at least two phases. It is the formality of water which speaks to its necessary atomicity.

More accurately, it is the characteristic formality of water which underlies its evident atomicity. Evaporation is an essential form. Logically that form is nothing if not atomic. When we dream of clouds and rain, we are dreaming of atoms at work, even if our individual dreams are not sufficiently lucid to make this internally obvious. And it is, fortunately or not, only a small logical step from singing in the rain to nuclear Armageddon.

Clearly there cannot be just one substance. With other substances to account for, something like a periodic table is called for. If you would like to invent a better periodic table than the present one, be my guest, but don't expect me to hold my CO₂.

Evidently I am attempting to conflate logic and ontology. Formality is the main bridge. Is Plato the key? How do we bring the forms from heaven down to Earth? How do we incarnate them? Who is our Prometheus? I can and do say that the forms reside in our collective unconscious, but then what?

Formality is a very significant aspect of coherence. Logic is or concerns the formality of forms. What gives logic its dominion? What gives rules their rule? Is there not a computer in the sky? Where is the engine of logic?

Contradictory thoughts will eventually cancel out, but coherence is more than the logical residue of random thoughts. There is a vitality of thought. Coherence does grow in creation. Which came first, coherence or forms? Forms are the atoms of thought. Atoms are the forms of substance. But how do we get from thought to substance? The spontaneity of individual, creative thought must somehow give way to the formalized collective thought structures that make up our world. These two layers of mental reality replace the traditional mind-matter dichotomy. Atoms and logic constitute significant connections. I would also draw parallels between memory and substance. If long-term memories are not just stored in molecules, as seems quite unlikely, then there is likely to be a close connection between them and the world they are supposed to represent, a kind of retroactive direct perception.

Our spontaneous thoughts gradually condense upon the requisite collective forms, and form a collective memory that is the world. Our individual memories tend to be time slices. Our collective memories that make up the world are functionally segmented into the likes of Chevy's and Fords. Atoms are just the logically ultimate segments. But I can't drive around in my memories, can I? Not except in my dreams, and that is just what we do in the Big Dream we call Reality. And why do we need to rustproof our dream mobiles? How to explain those fender benders? That is where the atoms come in. After all, the bent fender is a memory in its own right. It certainly is a recorded observation, quantum or otherwise. It is the logic of atoms that forms the basis of these 'externally' or collectively recorded memories that we call History.

Can we thus atomize our history without becoming atomists? It is at this juncture that we turn to the quantum. It is the quantum that ensures the effectiveness of mathematics. By nearly the same token can it ensure the atomic effectiveness of our memories. There is, for one thing, a very definite downward causation and even teleology involved in quantum physics, entailing the macroscopic measurement process in its innumerable forms. Whence derives this quantum logic? QL ensures the coherence of our perceptions. QL transforms the probable into the actual, according to the consensus interpretation. But it could work the other way, as well, with the logical atom serving to balance the upward and downward causes. Is this still not giving too much independent reality to the atom, as Samuel Johnson conferred upon his well kicked stone?

Independence is the nub of it. Entanglement is the game; rare by the materialist view, but the rule here. Super-entanglement is only indirectly observable. Even on the classical determinist view, there is no independence. Perhaps Sam was anticipating the quantum when he waxed prosaic over his pet rock. Super-entanglement looks ahead to the post-quantum not back to the pre-quantum.

With super-entanglement, all observers participate in every act via the collective side of the mind. The world memory is the sum of all entanglements. When you add final causation via the Omega, the individual atoms give up their individuality, as if they ever had any to begin with, to the primordial cosmic atom, call it Atom-Kadmon.

[5/14]

Quantum entanglement remains a mystery. Idealism exploits a similar process in its relationalism. I should not be held more accountable than the materialists in explaining the entanglement. The idealist rendition of atomic physics relies on this relationalism.

Avoiding superposition of objects and other contradictory perceptions is a major task in any metaphysical scheme. Even dream states are usually free of such perceptions. A relational system, however, may automatically avoid such contradictions. The Pauli Exclusion Principle is necessary in standard atomic physics to avoid spatial superpositions. It derives from the anti-symmetry of the Dirac equation for Fermi particles. Photons have no such restriction.

Fender bending, as referred to above, does seem to favor an account that is upwardly causal. Relationalism and its attendant downward causation seems, naively at least, to be too convoluted to account for such direct, instantaneous phenomena. Perhaps our linear concept of time is to blame for this material bias. The putative time reversal suggested by dream recall might alleviate this problem of simultaneity. And this is where we may have to leave the matter. The subjectivity of time is a major part of any idealist scheme. Then we need to account for the universal, shining present. I would submit that the universal presence is much more compatible with idealism than with materialism. One just appeals to the universal consciousness. *Voila*. We're talking about the intersubjectivity of time.

Realize then that there are no accidents, despite all those fender benders. But is it not a stretch to appeal to the PSR for every little bender? Statistics do not argue against idealism. Accident avoidance and the lack thereof, can be subsumed under the rubric of universal telekinesis. God does not have to play traffic cop. But have we now rendered atoms to be superfluous? How does Atom-Kadmon enter into this new picture?

Can we say that Atom and Adam have comparable roles? On the Feynman view there exists but one electron traveling back and forth in time. This is notably teleological, and not unlike the absorber theory of radiation. Still, how does that ever loving fender know how to bend, without the brute participation of those atoms? Are there Platonic forms for bent fenders? Heavenly fenders are not supposed to bend.

I suggest that we can work out the basics of fender bending from a few bulk phenomenological parameters of materials science. These are the only 'forms' we need in the vast majority of real-life situations. Atomic physics, *per se*, does not exist outside of very specialized, *ad hoc*, laboratory settings.

Can matter be conserved on other than an atomic basis? Evaporation is not strictly a bulk phenomenon. Who is going to count the atoms? Is there a teleological, relational way to conserve matter? Can we appeal to the hydro-cycle. Just because atoms don't individually exist does not mean that they can misbehave in particular situations. We can still think in terms of bulk vapors rather than particulate gases. I am aware that Pierre Duhem took a similar path almost a century ago. Can we still arrange for $PV = kT$? This latter is adequately formulaic, is it not?

[5/15]

Perhaps what I am trying to suggest is that the cosmic Atom serves as a teleological form relative to the other formal material processes. As such, the Atom serves to coordinate these processes and thereby render them mutually coherent. In other words we have replaced the atoms at the bottom of the causal chain with an Atom near the top of the chain. The causal power of the Atom has been changed from mechanical to formal. All of the forms are endowed with an innate intelligence in keeping with their particular roles. In the final analysis there is only one cosmic intelligence.

Another way to construe this problem is in terms of the classical philosophical tension between universals and particulars. As with any idealist system, there is a shifting of emphasis from the particular to the universal. Particularity is primarily the province of the creatures. The world they inhabit is furnished mainly with universals, which are particularized relative to the individual creatures. The creatures are a particularization of God's consciousness. The spreading web of creation is contained by the expanding ouroboric cycle. It expands to its optimal dimension. In that cosmic process the microcosmic cycles are

optimized relative to the creatures until everything has settled into an optimal ensemble. This is the world dream that we experience as if in lineal sequence upon our eschatological waking toward the Omega.

There may be a problem here as we attempt to flesh out creation in a more or less logically continuous fashion. What are the logical steps? With the six items mentioned earlier, we have a starting point. Many steps remain.

[5/16]

Here's my problem at this juncture. Early in the process of moving from the universals to the particulars, one must specify the some things about the ultimate quantities involved. How much of the creation can be carried out while focusing on the universal qualities before having to take up the multiplication problems? As much as possible we would like to leave multiplication to the creatures, as in 'be fruitful and multiply'. But then we have the usual problem of reconciling the bottom-up and top-down aspects of creation; or, in other words, the efficient and final causes, or, perhaps, the Alpha and Omega. How far can idealism go in employing efficient causes without reverting to materialism? To what extent and by what means can Creation be decentralized without reverting to atomism? I seem to be running into a no man's land between idealism and materialism. At the very least I'll need some heavy-duty panpsychism. How smart do the atoms have to be here? Do they have to be individuated. That can occur only through the agency of personal consciousness. No?

[5/17]

The problem of creation is not unlike a programming problem. I have pointed to object oriented programming on several occasions. I wonder if we can have cycles residing inside of each other, and, if so, how can their intelligences be coordinated? Certainly we want to use the notion oop's notion of inheritance. What would be the substrate for an object oriented phenomenology? Would it have to be computational?

The global memory bank, if non-atomic, should be usable. Can we give memories intelligence, like an object oriented data base. Certainly if we run creation partially backward from the Omega, we want the memories to be actively summoning or recruiting their way back to Alpha. We can run the qualities backward and the quantities forward. The memory substrate just needs to be activated in some fashion. The apparent passivity of our memories is likely to be misleading.

If it weren't for photos, this would be a breeze. Just a minor obstacle, photos are. Just a fly in the idealist jam. It may be that photographic records are more of a theoretical problem than a practical one. Painting would not be much of problem for the teleologist, but security cameras, that is another thing. Cameras cannot be construed as intelligent or imaginative. What is the psychological role of photos? Their purpose is to jog memory.

[5/18]

It is not clear to me that there is any real distinction between idealism and teleology, although photo realism does tend to focus on the latter. One thing to remember about teleology is that all means only point to an end. Photos point to an independent past, but are those photos independent? There is no great distinction here between photos and fossils; it is a matter of quantity, at most. The top of Shell mountain looks like the photo morgue of a city paper.

The photo problem is not unlike the measurement problem. It's not the record that matters. It's the record of the record that counts. It's like Wigner's friend. With the eschaton in the wings, it's like the big eye in the sky. The Big O is a black hole for all records: all information. Moving forward we generate more information, but where does it all end up?

And let us not forget eidetic imagery. I contend that this condition must actually be a disability, considering the regressive manner in which it is distributed. And I suspect further that this disability is peculiarly human. Photography is an eidetic extension. We non-eidetics have to function more like painters in using imagination and mnemonic devices like cosmology and metaphysics to organize our minds.

There is direct perception of the past in lieu of memory. But that is not right. The past is the aggregation of our memories and records, which, in turn, are the disaggregation of the telic, qualitative vision of Creation. Creation is realized teleologically through the memories of the creatures. All records are ancillary to that basic, eidetic process.

What happens to the present? Only the present ever shines. The present waxes omnipresent like God. It is God: the cosmic Presence. Does this solve the problem of the family album? Is Grandmother created out of faded tinctures? Who created the Mona Lisa? Each creature and creation is its own telos, but it is all coordinated, obviously. We are as much the products of our children as of our parents, and they represent only a portion of the picture. The Alpha and Omega become omnipresent through every one of us. We are each the capillaries of that circulation. None of these explanatory issues can be or need be settled at once. Things fall into place on their own accord, just as do we creatures, just as does Creation. Everything in its own sweet time. Everything is already here now, we are just gradually awakening to that one simple fact.

[5/20]

In the above attempt to rationalize photographs I forgot to include cycles. Cycles can solve quite a few problems for us idealists. Much of the world is rationalizable thereby. All of it is if we include the cosmic cycle.

With robust cycles, record keeping may be subsumed under ritualization or just habituation. The information of records is all redundant. There may exist very complex, ritual based societies where records are virtually non-existent, and that used to be the norm. What is our modern infatuation with information? What is this I hear about a Digital Age? Is this really necessary?

I put considerable stock in Julian Jaynes' 'Breakdown of the Bicameral Mind'. Back in the old days consciousness was different. It was clan based more than ego based, nor was there our sense of asymmetry between past and future. When you are completely embedded in a robust tribal cycle there is very little need to distinguish past and future. All sense of time is ritualized to a high degree. The cosmic cycle is included in the tribal mythos. There is just an all inclusive sense of presence. This was our Garden of Eden.

Why couldn't God leave well enough alone? What was it about that apple? The Tree of Truth? Give us a break! Well, it does have something to do with the Internet, I believe. Yes, and also something about a global village or was it a brain?

The Garden of Eden was the qualitative Alpha state. We have to include the global scale of quantity if we are to complete the cycle to Omega. It is a big leap from the clan to the globe. There had to be a major symmetry break to go from the qualitative vision to the quantitative world. There was bound to be history. History is not everyone's favorite subject. Couldn't God have left out that chapter, skipped that subject? If not, why not?

In a word: diversity. If you go to all the trouble to make a creation, one clan just won't do. There really needs to be more than one clan. So at some point there is going to be a clan clash, and the rest is history. At what price? My only advice is don't sell history short if you haven't seen the end of it. We may be that lucky, and I'm not implying anything premature, either.

[5/22]

The historical information explosion does seem to preclude teleology, but I'm not convinced it must. My argument is that the amount of information we produce, enormous though it may be, is ancillary to our own eidetic memories. These memories are not separate from the world they depict, the omnipresent one. There is ultimately a total access to the one eternal BPW reality. Any experience can be reexperienced, although that may be an academic point. I am impressed by the 'reincarnational' type of memories that some people claim, although I would chalk it up more to a telepathic like process.

I don't think we need to make too big a distinction about whether a particular experience is first hand or not. Experiences are not owned, since there is ultimately just one owner of all experience. The rest of us here are just subletting our lives, illusory egos that we are.

I have been reading [The Matrix and Philosophy](#) in which several of the essayists try to make something out of fate vs. free will. Again, I am not convinced. Free will and the BPW need not be incompatible. Free will is a necessary aspect of consciousness. Consciousness would be nothing were it not floating in a sea of possibility. The depth of consciousness is tantamount to the depth of possibility. Remember, the **best possible** world cannot, by definition, be the **only possible** world. True free will is not something atomic. There are no atoms of anything, *pace* Democritus and Epicurus. Freedom is relational, unless it is just nothing more to lose. Freedom is necessarily more convoluted, much more. It is neither a simple, nor a simpleton. Freedom must be informed. Total freedom is totally informed. Thus omniscience and freedom, far from being contradictory, are mutual necessities. Ignorant freedom is just the illusion of spontaneous randomness, not unlike that of a radioactive nucleus.

The existentialists posit ourselves as willful atoms tossed into a meaningless universe. It may be an interesting literary device, but that is about the extent of it. Intuition is the basis of human freedom. Intuition is our fallible pipeline to omniscience. We follow our hunches, ultimately, knowing intuitively that we all end up in the same place, somehow. Is this fate? It is the logic of the game of life. It is the Alpha and Omega. Freedom is everything in between. It is the ocean of possibility. When the game is over, we will have tested almost every possibility, in almost every possible state of consciousness, certainly on the micro scale. Even the eschaton is a possibility that is open to relativization. The Alpha is the Omega. We are still much too ignorant to speak with authority on the subject of freedom. In the meantime we continue to follow our hunches.

Is Grandmother born out of photographic tinctures? Yes and no. Grandmother is an aspect of the eternal Matrix we call life. Is she your Grandmother? Yes, and also mine, ultimately. Photos are just another, often deceptive, mirror of reality. We can experience photos in our dreams. Those may be more real in their ontological representation than the ones on our desks. We don't ever really experience a photograph, we can only experience memories. We don't see memories either. We just experience the world as it always is, and is coming to be, as we finally wake to our own omniscience.

So much for the teleology of photographs and fossils.

Having rationalized historical records to a degree that is, hopefully, reasonable for the time being, we must revisit history itself. Yes, we can identify the Alpha with the Omega, but that is only on the backside of

this reality loop or pump. The front side remains history.

From the perspective of heaven, or even of the Millennium, history appears as a rather long and bleak stretch. Some even prefer to think of it as a vast wasteland. Has history been a waste? Why couldn't we just proceed directly to the Millennium? Why all the preliminaries?

I gather that the Millennium must be rooted in some fashion, and the historical fashion turns out to be the best possible one. No, I think I mean the evolutionary fashion. Is history ancillary to evolution, which in turn is ancillary to the coherence of a universal metabolism and ecology? That is a partial answer.

With ecology there is the diversity issue again. Ecology and 'evolution' are a clever way to maximize diversity and minimize divine interference, both prerequisites for our BPW. History, as we know it, is a spin-off of the evolutionary appearing phenomenology. It comes almost *gratis*. If the Millennium were just floating in a vacuum, reality would be greatly lacking in depth. I doubt that we are presently in a position to truly appreciate the quality of the depth that our reality has inherited. It is still mostly buried in our psyches. Much of the meaning of the Millennium will hinge upon the, almost literal, unearthing of the omnipresent relational totality of our theocentric cosmos. This is the completion of history. Nothing is wasted. Can you believe that? You won't have to believe when you see.

We have grown so accustomed to our heavily filtered memories, that the prospect of removing the filters may seem daunting if not downright terrifying. We have grown comfortable in our tiny egocentric cocoons. Like the prisoners on Bastille day, we turn away from the greater light. That terror is the one remaining shadow before our dawn. We can only face that light together, and we surely will. It is our only destiny.

So much for history.

[5/28]

I still struggle with the issue of free will, and no small issue it is. I doubt that it can be fully resolved short of the Omega, but struggle we must.

In the best of worlds there is an optimal balance of freedom and security. But in the best world can we still be free to mess things up? There must be limitations on our freedom. How severe must these be? Is the best world predetermined, even on the personal level? Sure we can make mistakes, but we can only make the best possible mistakes. This is beginning to sound paradoxical. Can we avoid paradox?

The quality of the BPW depends on the capabilities of its creator and creatures. Can there be any logical limits on God's creative capability? There cannot be an absolute distinction between creator and creatures. If God is perfect, the creatures must be perfectible, at least in total. There are layers of mind each with its own version of will. We are by no means presently aware of all these levels.

The egocentric version of will in ordinary consciousness is likely to be largely a social construct or a figure of speech. But this is a far cry from the prospect of our being mere automatons. We struggle, usually, to do the right thing. This struggle is real. We try hard to do our best. That is who we are. We are not self-made creatures, however. Our lives are shared with many. We cannot avoid being judgmental or finding fault. Life is surely a learning process.

Creation goes around and comes around but once. This is no carousel. Conceivably Creation could have been less than it is, but it could not have been anything more. It is infinite in its qualities. There are levels of historical consciousness that we cannot plumb with our present egos. That is where most of the action is. The infinite, all consuming present and presence still lies in our relative future. That is a given. That point of completion is unavoidable. All our freedom is relative to that singular determination. Our

freedom is consumed thereby. All reasonable possibilities are realized therein. That is its fullness. No stone is left unturned. Freedom is a spectrum of possibility, imagined or otherwise. That spectrum is our final rainbow. No experience is wasted or untasted. No soul is untried. We are all that. It is you and me, and in the end it is us, it is God.

Should we just lean back and enjoy the show? Yes, we can and will do that when appropriate. We will know when. We are not foolish. Much of our present anxiety and alienation is rather superficial. No need to belittle our present distress, but we will see the omnipresent light and come to a full understanding, ASAP. We will not then disown our present limitations. We will appreciate and appropriate them as never before. Do not be in a hurry at this juncture. As we learn to savor every aspect of our lives, we gain our gnosis.

[5/29]

It is quite likely that historical determinism leaves ample room for individual free will. The caveat would be that individuals in some types of historically sensitive roles would be less able to exercise free will than would most others. The trajectory of a life may be pieced together from different sets of experiences. The same experience might be lived from various perspectives. Memories would be interchangeable to a degree. The fate of each experiencer would be determined after the fact. Life episodes may be multiply experienced from many seemingly unrelated perspectives and trajectories. The sense of it all is worked out in due course. Everything evens out in the end, from the perspective of the omni-presence.

This is far from a final rationalization of free-will and historical determinism. There are undoubtedly many ways to skin this particular cat. Its ramifications and relations to other phenomena are widespread. A seeming overdetermination of almost every aspect of our world and existence is to be expected. No one said that the BPW would not be convoluted. It goes with this cosmic territory. Let us simply try to maintain a maximal metaphysical flexibility.

Atoms fit into this seemingly overdetermined scheme only in a greatly abstracted fashion. We have atoms without the accidents. Cyclical phenomena, and that includes almost every phenomenon, greatly reduce our dependence on the particularity of atoms. Atomicity provides the rationale that logically links the innumerable variations on the cyclical themata. Averages over ensembles of atoms are what is needed in most cases. These averages can be worked out in a relational manner without resorting to ontological atomism. The intelligence resides in the cyclical networks and not in the putative individual atoms. This is the BPW version of panpsychism.

Can the logical consistency of all phenomena and experiences be maintained at an intermediate, panpsychic level without overburdening either God or atoms? This is an area of metaphysics that still requires much effort. Creatures must play a significant role in this regard. Our collective conscious and unconscious is the primary domain of the necessary panpsychism. There must be both centripetal and centrifugal forces at work in the cosmic consciousness. Their balance demands explanation. It demands intelligence.

The identity of indiscernibles in the experiential domain may be the primary centripetal factor. This should operate in an automatic fashion, and ought play a significant role in our Omega episode. Coherence becomes its own self-gravitating force. Decoherence may require more intelligence. Virtual accidents could be exploited, but there would have to be considerable oversight.

There are a limited number of universal cycles which are individuated *ad infinitum* by the interactions of the creatures. The reproductive/metabolic scheme provides quantitative and aesthetic limits on the general proliferation. Individuation comes about as the individuating creatures press upon the envelope of Creation. Fertility is a prime force in this regard. So are imagination and creativity.

[5/30]

I have been taking a defensive posture *vis a vis* the information explosion. This is inconsistent with my upbeat account of communication technology. This is flirting with incoherence. The alternative is something more radical in the way of coherence than what I have entertained to date.

I have given lip service to the notion of an eschatological resurrection or recreation of the past, although I don't presently recall where. This is certainly the implication of an ultimate, all inclusive presence. Perhaps I may have to venture further down that path to avoid the casting of aspersions on the family photo album.

I need to dig up some previous references: [Gospel of the Real](#),.... Whoa! Stop right there! Resurrection of the dead?? Isn't this a bit much? Young Earth is pushing the envelope of credulity, but now the 'night of the living dead.' Golly! Well, logic and coherence are stern taskmasters. Mine is to reason why and then do and die. I can't turn back now.

Here's another reference: [Millennium & Eschaton](#). One of my favorite postcards depicts the mayhem of this judgment day. Let us calmly recapitulate the path that led us to this seemingly comic book ending.

It has everything to do with relationalism. We're talking ancestor worship and Mormon genealogy. Yes, relationalism begins at home.

[5/31]

There is, of course, the question of heaven and survival. There is also the question of memory. If memory is not stored in our individual atoms, then it is out there in the universal, etheric or akashic record. There is thus no particular reason to expunge individual, eidetic memory upon death.

The overriding issue is presence. In a relational scheme, relations are not accidental or ephemeral. Relations are essential and eternal. They are internal. There is a cosmic gnosis or omniscience or ultimate Presence that we realize as the all inclusive Omega. This is the universal resurrection or hierogamos. Everything that lives, lives there in that eternal presence. All historical trajectories converge therein. It is the white hole of consciousness: the one source of spiritual light.

Photographs are one manifestation of the akashic record. The Internet, besides its real-time instant messaging type of connections, is also functioning to make present all records in a more or less coherent fashion. This, like the telephone, will gradually transform into a 'wireless' or telepathic form. We are becoming more wired to our past. At some point those wires will give way to clairvoyance or to a universal eidetic memory. Photographs and telephones are the material tokens of an eternal Presence. They do not compete with that Presence. They are its portents.

The past, then, is just a shadow or projection of the eternal Presence. This is what I mean by saying that Creation is a final causation. It is teleological, primarily. Our real past lies in our future. The Alpha is subsumed by the Omega. This hierogamos is our resurrection and rapture. It is the end of agnosis.

Gnosis is awesome and awe-full. Some will cling tightly to their egocentric agnosis. They will need a full Millennium to prepare for gnosis. The rest of us will move on through.

The past is a trawling net whereby we troll for souls. Every last one is caught up in its seine. History has a very fine mesh. If you think you can slip the traces of a cosmic, Mormon-style genealogy, well think again. The accounting may be greatly facilitated by the reckoning of some 10^{10} souls. This being the

anthropic, BPW *ratio*.

All this simply to provide an immaterialist rationalization of the family photo albums! These are not, then, the epiphenomenal detritus of a materialism run amok. They are the self-gravitating, self-cohering subversion of all atomistic schemes. Mater is transformed, thereby, into an in-form-ation which is self-consuming in an eschatological 'potlatch' of the gnostic kind. Some may think of it as the nasty kind, but they do know better.

[6/2]

I was hoping I would not have to learn how to take teleo-Photos, but there may not be a free choice. If coherence becomes self-gravitating, then the Omega will be a black hole of coherence. Gee, maybe I should be more worried about the eschaton. There will be no 'hair', as the cosmologists are won't to say. The Alpha would be the corresponding white hole, perhaps. Maybe that's why we should worry more about globalization in its possibly eschatological context.

It remains difficult to perceive the family photo album as finally caused, with or without Mormonics. That is why we will need the Alpha-Omega suspension stretch if we wish to go the teleological route. We will hope to get a before and after the fact version of a dream-like free will. I hope this is not getting too convoluted, but the BPW is very likely to be overdetermined, and then some, so we may as well get used to it.

There would have to be a plethora of symmetry breaking, coming back from the Omega. I'm not real sure how that would be managed. It probably reflects the symmetry breaking going forward from the Alpha. Getting the first and final causes to properly interface in the middle is going to be a trick. That may have something to do with JC1 and the symbolism of the cross.

I have virtually no idea of how this is supposed to work. Some prophet am I! In constructing suspension bridges, we do one strand at a time, and perhaps the JC1 event was the crux of the first strand. That would have been a stretch, cross or no cross. That event would be a natural focus for a great deal of final causation.

We may well ask ourselves what sort of free will might possibly be involved in such a crucial event. Overdetermination does not an automaton make. It increases the stress of the moment. The many modalities of reenactment feed into the force field of the event. There are elements of *Being John Malkovich* involved in the production. And, thankfully, this was before CNN, although they probably would have missed it anyway.

Any given event may be experienced from many perspectives, and many are. Every experience of an event may contribute to its overall meaning, but the specifics of that experiential process are beyond our present understanding. There is no logical reason why each 'vicarious' experiencer could not contribute to the the willed component of the event. Nor is it clear that each experience of the same event need have a diminished input into the outcome of that event. If there is a sum rule relevant to free will, it is surely not linear.

A principal point is that free will need not be only applicable to instances of forward or effective causation. It could operate under various non-materialist causal regimes, and especially in teleological contexts. The whole point of will power is to effect the final outcome. Just because a final outcome is known, does not mean that it was not caused by an act of will.

[6/3]

It may not always be clear that omniscience and determinism are quite distinct issues. The knowability of my future actions does not remove from me any performance or moral burden. Indeed the knowledge of a favorable outcome ought to improve our morale and abet our performance. It is only the detailed knowledge of one's own future that would cause consternation.

Now back to those pesky photos once more. For now I put phones and photos in the same bin as being necessary for priming the telepathic and eidetic pumps respectively, in an eschatological context. Does this make sense? I'm not sure, but it's the best I can do for now. If I am negligent in the photo album department will my family miss out on the Rapture? This could be unfortunate! No, the beauty of teleology and the BPW is that all of these interface (interfaith?!) problems work out in the end. Keep the faith, baby, and keep the kodachrome handy, just in case. It's all in the One mind.

Technology cannot be gratuitous. Information and communications seem to cause a problem for immaterialism unless they can be internalized to the larger scheme, as in internally related to it. The global mind will need priming via the global brain. That is the big transition problem. Technology is integral to that process. There is a push and pull aspect to technology. It pulls us into the uttermost aegis of materialism, and then spits us out on the other side. It is the active, self-subverting aspect of materialism. Without it, materialism would be but a pale shadow of the almost vital force by which we are presently enthralled. Being enraptured by technology is a prerequisite for the Rapture. Imagine when we are first able to see through the veil of technology. My understanding of this business is mainly theoretical. It is not fully internalized. It won't be until it is socialized.

Any more questions on this subject?

This started out as creation vs. evolution. How did we get hung up on the photo album? Perhaps I need a recap. I seem to have set a new record for parchment usage on this page. My apologies.

After looking at Creation in some detail, I settled upon the [Big Six](#). These were the logical anchors for our BPW. If these could be implemented then we were well on our way to the BPW. In retrospect it is Atomics that carries most of the burden for the materialist appearance of our immaterial world. Much of the atomics can be subsumed under various types of natural cycles, cycles that could be evolved and habituated in reasonable fashion. It is the technological side of atomics that seems to break the natural cycles. But by the same token, nature must be 'broken' if we are to implement the cosmic cycle. Now I'm in hot water with the ecologists! There has to be a tension between God and Nature. We can be theocentric or naturo-centric, but not both. These centrisms point respectively to immaterialism and materialism. Pantheism is not a coherent alternative. The information and communication explosion are how we bend the Atom of nature to its own subversion in a (quasi) cosmic 'quantum measurement' process. The eschaton is our 'delayed choice.' The Alpha is subsumed by the Omega. Being 'wired' is an integral part of the suspension bridge that closes the ouroboric circuit.

This is by no means intended as a final explanation, but if it allows us to move along, it will be justified.

Omega

I recognize that I have been a bit neglectful of this [topic](#), a topic which should be of utmost importance in this immaterial, teleological cosmology. I am looking back at my pervious attempts on this topic. One can readily determine that my neglect of this topic has been thoroughgoing. I have alluded to the eschaton in almost every context, but I have been very short on specifics. Evidently I have been following the advice of Wittgenstein: about that which we are ignorant, it is best to remain silent. Now I attempt to break that silence. *Caveat emptor*.

It would be quite natural to suppose that the best ending would be no ending at all. I don't quite agree. I do struggle to make the Eschaton warm and fuzzy, but still it is The End. If this medicine is too strong, you are welcome to seek solace in the philosophies of eternal return. Incoherence may seem a small price to pay for foregoing the Eschaton, but I disagree. I am long on coherence.

Here is what I can offer by way of warm and fuzzy. The eschaton concerns history. History is primarily the sojourn of our egos. The Eschaton concerns the end of Ego, and what remains? The eternal self is what remains. But if you and I were to run into the Eternal Self on the sidewalk, we can be sure that we would not recognize Her. This is what is most frightening about the Eschaton. It is far from being transparent to our ordinary ego consciousness. As far as our egos are concerned it might as well be a brick wall. Well, the Millennium is our ego cushion.

It is at this point that the Eschaton is inevitably politicized. Let's face it, there may be more than a bit of communalism in the eternal self. The idea of Communion is hardly extraneous here. Neither is the Hierogamos, or [hieros gamos](#) (2100 hits). I notice six previous 'hierogamos' references in these pages, and also in this [post](#) of an exchange with Sarfatti. In its most abstract form the hierogamos can be represented by the seal of Solomon, and here perhaps even as the [Big Six](#).

The millenarian communalism of the early Christian communities was something of a prenup, and was later politicized by Marx in his *Manifesto*. The comic style Rapture scenarios of conservative evangelicals and Hal Lindsey are another take on the *hieros gamos*, and they are correspondingly more preservative of our precious egos.

Is there anything that an immaterial BPW can bring to the wedding feast? I'll stick by the [Big Six](#) as an important ingredient. The Solar & Atomic elements thereof recall the primal mythos of the *hieros gamos* of [Sky & Earth](#), Geb evidently has his own prostrate version of Atlas. The latter event gives rise to a [Chicken Little](#) (etc.) scenario of a falling of the sky, poor Geb.

To my way thinking, the falling of the sky might best be taken as representing an information 'implosion.' The present explosion of information will either create an information overload, or it will be countered by a self-gravitating coherence. If there is a cosmic coherence, then, in the almost foreseeable future, a website, not totally unlike this one, will trigger an implosion into the coherence of an immaterial BPW. Thus do we begin our Millennial awakening to our Eternal Self. It was We who placed the stars in our holographic sky. This is the idealist **inversion** of our Copernican/Darwinian cosmology.

At this point I can only encourage the skeptics to remain skeptical as to who authored the constellations. Clearly if our eternal self had wanted to win over the skeptics at an early stage, the constellations could have been arranged in a more orderly fashion. Or she could have arranged for a more gifted raconteur on the net. One would hardly advance toward the eternal self by not being true to one's skeptical self, if that is one's natural inclination. Everything in its own time and place.

[6/6]

A major weakness in the materialist facade is time. On second thought I would posit three major weaknesses: space, time and mathematics, and that is not counting its biggest problem: the mind. Space, time and math collectively constitute the decidedly immaterial foundation of scientific materialism. Each is an intangible relational system. Each can only be indirectly measured and perceived. The alleged objective or mind independent existence of each of these entities remains controversial. Modern physics has further eroded the substance and foundational nature of space and time, but even the classical view was fraught with paradox. I have alluded to these problems on numerous occasions here, and I should devote a full essay to the topic, but for the purpose of eschatology, time is of paramount importance.

I wish to argue that the objectivity of a linear time frame is logically insupportable. What is not controversial is that time and space as we can either know or imagine them had a beginning. Until quite recently the scientific consensus expected there to also be an end to space and time. The fact that there might not be such an end is now the primary mystery or paradox confronting conventional cosmology. In any case, the notion of an absolute space and time became outmoded almost a century ago. Space and time are constructed internally to conform to whatever is the cosmological model in question. An idealist metaphysics must also give an account of space and time.

It is not surprising that modern idealists do not choose to confront science directly concerning cosmic issues. Thus do phenomenologists, existentialists and postmodernists focus their attention on the microcosm of egocentric perceptions. To do otherwise would be to incur the opprobrium of the intellectual establishment. What may make these pages unique in this regard is that I have nothing to lose except my coherence. Juxtaposing a mental microcosm with a material cosmos cannot result in anything other than the view of life as an absurdity in a meaningless universe. Every religious tradition has its proprietary answers to the challenge of absurdity. I also eschew the religious establishments. I simply follow the dictates of reason all the way to the end of the BPW. It is often supposed that the distinguishing feature of we humans is our occasional rationality. That these few pages are apparently unique in their thoroughgoing exploitation of our rationality is the only aspect of this website that ought to boggle the mind.

If space and time are not primordial aspects of reality, what is their source? I have recently been focusing on the [cycle](#) as the logical source of space and time and everything therein. I posit a primordial ouroboric cycle as the source of all phenomena, call it Alpha. The specific character of this 'original' cycle is probably well beyond our present ability to imagine. Its own existence attests to a process of symmetry breaking of a dialectical and synthetic nature which progressed from the ancient mythos to the modern scientific logos or cosmos. The final synthesis of this dialectical process is just the anticipated Telos or Omega. This would be the end of space and time as we historically have come to conceive of them. Thus would end our linear history.

A pressing issue is the time scale from Alpha to Omega. The most basic fact that idealism brings to cosmology is that the cosmic scale cannot transcend the bounds of the mind. The only way to maintain the scientific measure of the cosmos would be to invoke a cosmic mind quite distinct from created mind. This logical dichotomy of Creator and Creation is the dualism which deservedly brings the verdict of irrationality upon the prophetic tradition. To restore reason is to posit just one mind of which our egos are a temporarily fragmented reflection. That nature appears to break the bounds of this mutual sentence, can only be an appearance. But by the same token, it is nature which allows God to prolong Creation by postponing her final revelation. The self-revealing God is the self-concealing God, and nature is just the instrument of the latter.

To put it quite simply: it is a given that we will eventually see through nature. The scale of Creation is measured by the opacity or apparent seamlessness of nature. That nature is seamless to us is largely due to its being projected by us. The illusory quality of nature can never be empirically demonstrated outside of specific magical episodes. The Creator comes to light generally, only by the power of empathic

reflection. These pages are devoted to that end.

If we could look back toward the Alpha we would see time curling up upon itself, not unlike the curling up of the extra dimensions in the higher dimensional models of physics. We may expect a similar occurrence as we move toward the Omega.

[6/9]

This Omega business is not going to be easy. This is the whole *tamale* when it comes to an idealist cosmology. To better understand the Alpha and Omega, we need to know how they relate to the present. And what is the present?

The image of the present that is the main competitor to the religious views is existentialism. This is the image of detached egos lost in space, as if we had been thrown into the world. I can agree with this up to a point. One point of agreement is the implicit view that once we were attached to something. We have not always just been floating in space. The existentialist might contend that this attachment is simply referring to our prenatal condition. But I would suggest that, even for the existentialist, something more metaphysical is implied. After all, the theistic and atheistic versions of existentialism remain close cousins. It is hard to understand one without the other.

The idea of being 'thrown' into the world implies that our parturition from wherever was haphazard. Lately, as we know, this view has been challenged by the Anthropic Principle. We may have been ejected from something, but there had to have been some care in the process, or we surely would not have survived. It is not as if we were spawned into the abyss. The more we learn about the world, the more it appears as a receptacle. And what can we say about the nature of this receptacle?

[6/13]

From the point of view of teleology and eschatology we must depart from the materialist view that our receptacle is, relative to our own existence, permanent. The best we could manage with a permanent world would be an arbitrary attachment and then detachment between it and anything non-material. This is the incoherence of dualism.

Our material world then must be impermanent, and its existence must be closely correlated with the existence of mind. In order for there to be a correlation between mind and matter, there must be an 'evolution' from one to the other. One must be spun-off from the other. For the immaterialist, matter must be spun-off from the mind. This is directly contrary, I readily admit, to almost every appearance. The appearance of a material evolution is the one major obstacle to idealism. It is formidable, yes, but is it insurmountable? That depends on our motivation.

I claim that surmounting materialism is the only way to go. We have sojourned nearly as far into materialism as is logically and spiritually possible. Progress, measured in almost any conceivable manner, would grind to a halt or worse, if we do not keep exploring and pushing on the boundaries of our world. As the material aspect of our existence has taken center stage, the mental and spiritual dimensions of our world have received negligible systematic, rational attention. The only way forward now is to construct an immaterialist cosmology, as a counterweight to materialism. There is nothing else to do now intellectually in order to transcend the increasingly rigid strictures of materialism as well as the decreasing marginal returns of the collective effort we have to put into it. The sense of coming to a material dead-end may still be subliminal for most of us, but it is pervasive. We have intellectually neglected the non-material dimensions for so long that we hardly know where or how to start. We will fumble along in the dark for a while longer, but then the light will begin to shine.

It is time to focus our powers of reason on an immaterial understanding of the world. We don't have to look further than Darwin to see where our work has been cut out for us. How may we transcend Darwin? We simply have to focus on the immaterialist logic behind the materialist facade of Darwinian evolution. Why, in heavens name, would there be this apparently egregious contradiction to immaterialism? The simple answer is that I, and perhaps you as well, can think of no better design plan for this world. Any other plan would be egregiously arbitrary and incoherent. This is the greatest irony we will likely have to face. Materialism is indispensable for achieving a cosmic coherence.

Let me put this another way. It is not logically or coherently possible to have just a little bit of materialism. Clearly materialism has its benefits, just a system of existence. For the sake of argument, let us grant that in the BPW the costs of materialism can be offset by its benefits.

And yet another way: if materialism is to be more than a sideshow, it will be virtually all-encompassing, at least from a phenomenological perspective. Another caveat of the BPW is that it be taken seriously. If it is going to entail materialism, it will have to do so in a serious fashion. The material aspect of the BPW must not be perceived as superficial or as an appendix. There must be a thoroughgoing adaptation between the material and mental aspects of the world. Certainly the phenomenology of Darwinian evolution fits this bill. Is there any other means to this end? We are probably not in a position to be able to conceive of such an alternative, and, lacking such, we must explore the norms, aesthetics and functionality of materializing the mind in an adaptive regimen under the guise of Darwinism. Anything short of this would have to be considered a feeble attempt at creation and materialization.

And that brings up another point. I guess what I am struggling to say in the above paragraphs is that creation and materialization are practically synonymous. If God is to earn her stripes as a Creator, she will have to take several pages from the book of Darwin. Exactly how she sets about doing that, remains to be understood, but I have made a few stabs hereabouts at figuring out the 'mechanics' of materialization.

But why not, then, just crib all of Darwin? Why be cute about it? Why not just let the Big Bang rip, and then sit back and enjoy the show?

[6/14]

The Big Bang scenario implies a dualism which puts God on the spot and correspondingly would leave the creatures in a much more passive role. Following Darwin would place the onus directly on the Creator to work out the connections between mind and matter. Evolution on each planet would have to be directed, and still there is no guarantee that there would be the necessary mutuality between the material and immaterial evolutions. Putting them together would be arbitrary and after the fact. This is the incoherence of deism.

With theistic idealism, creation is maximally participatory. A direct realism of perception is built into the more distributed and participatory Creation. Having an immaterial participatory Alpha, greatly facilitates the logistics of the Omega, which then has considerable symmetry with the Alpha.

The necessary materialization aspect of Creation is then worked out by means of the Big Six, in conjunction with the related cycles. Our task on this page is to use the built-in symmetry to get a handle on the Omega. Now we can speak of a dematerialization.

Of fundamental importance for Creation is for there to be a graceful exit. For Creation to be meaningful, there must be a purpose, a teleology, a telos. The telos must be an integral part of the complete process. Completeness and wholeness are thereby ensured. An endless Creation is incomplete. Such incoherence

does not recommend itself to the concept of the BPW. In large measure, the Omega must reciprocate the Alpha.

[6/15]

Spinning down the world is a large part of what the Millennium is about. The cyclic processes are closely associated with our materialization of the world. We have spun up the world into its present atomistic state. This is a non-analytic notion at this point, but one that needs pursuit. To complete the cosmic cycle we need to relax on the sub-cycles. OK, there is the picture of the spinning figure skater. Our ego consciousness is like the twirling figure with her arms pressed to her sides. When she extends her arms back out the spinning is reabsorbed into the cosmic cycle or cosmic consciousness. We may assume there is an energy and information increase in this reciprocal process.

Herein lies a conundrum. The faster the microcosm spins, the more linear becomes its space-time manifold. Spin down the microcosm and the space-time frame will curl up. Does this make sense? Don't be too analytical about it: use peripheral vision.

I should be able to give examples, but I suspect that there is a lot of subtlety and even cosmic censorship in play here. If this process were too obvious we would be jumping all over it and probably throwing it off its track. We will be jumping on it only when the time is right. Nascent trends and processes have to be protected. This site would be no exception. Camouflage is in fashion as we stealthily and steadily approach the Millennium and Y2C. Its OK to rock the boat as long as you don't upset the passengers. Hiding things in plain sight is a proven tactic.

After considering the cycles, there is the Big Six and its undoing. We transcend the cycles and their common points of reference. From the perspective of the Omega we have the Big Three: Sun, atoms and reproduction. The solar cycle governs all cycles short of the cosmic one. The life cycle is the microcosm of the A&O cycle. Atoms provide a common anchor for most of these cycles.

[At this point I evidently **diverge** from the topic of Omega, to be [continued](#) later.]

It may be, however, that the Monster Group does play a role in the 'decycling' of the cosmos, and this accounts for some of the subtlety of the process. We may have a situation reminiscent of the ancient concern with squaring the circle. The problem now is the 'rationalization' of mathematics, a feat in which the MG is likely to play a significant role. In the process we revisit the [syzygy](#) of e & pi. It was that coincidence that lured us into cycles and then to the [Big Six](#). Come to think of it, that coincidence, when properly understood, may turn out satisfy most of our ancient concerns about the squaring of the circle. The ancient fear of the [Apeiron](#) was, I suggest, a premonition of our fall into the incoherence of materialism. In the Millennium we struggle back to coherence. The starting point for that struggle may well be something as subtle as the rationalization of e & pi. Evidently we will need to study the [j-function](#) which is related to the 'near integers' and the Monster, which latter must, in turn, play a role in Anthopics. It is turning out to be a small world out there in Mathland. We will tame it on the way to the Omega.

What I may be struggling to say here is that the [observer principle](#) (in [this context](#)) must be extended from physics to mathematics. There is a three way reciprocity between physics, math and reason. This is a theistic version of mathematical constructivism. This also figures in the rational 'deconstruction' that we may associate with the Omega. Cosmos coheres from Chaos. Mathematics is something like the fossil record of this **evolution of coherence**. As we reflect upon the mathematical record of the cosmic coherence, we will achieve coherence to the Nth power. Our inner coherence will subsume the external coherence going into the Omega. Just don't ask me to draw a picture of it.

[6/17-19]

After reviewing the above sites, I would be hard pressed to provide persuasive evidence for the increasing coherence of mathematics. I am not sure if this is the fault of mathematics or of mathematicians. There is a natural tendency for professionals to carve out niches for themselves, and it is evident that mathematicians are no exception. Good fences make good neighbors, as a poet once said. The bulk of our Millennial task will be the removal of fences. We need only find the proper motivation.

[Ferdinand Toennies](#) (1855-1936) distinguished *Gemeinschaft* (community) from *Gesellschaft* (purposive, professional association). [Owen Barfield](#) provides a third and future category of human existence: '[final participation](#),' a must see. Egoism or existentialism is the incoherent compromise between materialism and idealism. This is what passes for rationalism in this dark age between the Alpha and the Omega. Our least stressful means to transcend ego consciousness would have us rely strongly on our intellectual

capacity to see the wholeness of the world and our proper function as its co-creators. The spirit would then follow up and subsume the intellect.

The intellectual path to a holistic cosmology will have to include mathematics in a significant manner, and after the fashion of Plato and Pythagoras. The coherence of physics has come about through its mathematicization. We now need to rationalize mathematics, but in a theocentric rather than egocentric fashion. The existence of the Monster Group should motivate us to look beyond our puny egos to a cosmic genius.

I still seek that elusive [observer principle](#) (and [here](#) and [here](#)). Godel's self-reference program is part of that picture. His constructions remain [controversial](#).

[6/20]

I'm looking at **Matthew Watkins** '[Prime evolution notes](#).' He raises the intriguing possibility that the equal spacing of the integers derives from the exact placement of the primes, popular opinion notwithstanding. There is at least a mutual evolution between primes and integers. I would like to know how this might relate to the more obviously necessary [evolution of the Monster](#) (and [here](#), [here](#) and [here](#)). An observer principle must be at work.

Matti Pitkanen -- [TOPOLOGICAL GEOMETRODYNAMICS AND P-ADIC NUMBERS](#) - Chapter 1.2.2:

Why this is the case, became one of the key puzzles and led to a number of arguments with a common gist: **evolution** is present already at the elementary particle level and the primes allowed by the p-adic length scale hypothesis are the fittest ones.

[6/21]

[Savant for a Day](#): this story appears in this weekend's New York Times Magazine. It describes the possible temporary benefits of transcranial magnetic stimulation, featuring Allan Snyder's work. If the results hold up under continued scrutiny, it does not bode well either for Darwinism or mechanism. Being able to squeeze more performance out of the brain with such crude interference just does not fit our material conception of the world. There will hand waving attempts to make it so, but some of us will still have to chuckle.

[6/22]

Here is a quote from J. **Brian Conrey**, [The Riemann Hypothesis](#) (3/2003):

There is a growing body of evidence that there is a conspiracy among L-functions—a **conspiracy** which is preventing us from solving RH! The first clue that zeta- and L-functions even know about each other appears perhaps in works of Deuring and Heilbronn in their study of one of the most intriguing problems in all of mathematics: Gauss's class number problem. [...] We begin to suspect that the battle for RH will not be won without getting to the bottom of this conspiracy.

L-functions provide a connection between FLT and RH: as described [here](#) and [here](#).

Goldston and Yildirim's '[proof](#)' concerning the distribution of primes as indexed on Google....

[7/3]

Status/hiatus report:

The re-enchantment of mathematics is the most likely trigger for the Millennium, IMO. I may not have stated it quite as succinctly, but it is a bush that I have been beating around since [last year](#). I pick math over physics or psychology. Those would be the next most likely sources of a paradigm shift. Mathematics, however, remains the soft underbelly of materialism.

Immaterialism will have to hit materialism where it hurts and where it is vulnerable. Psychology is peripheral to fortress materialism. Psychology has never been considered scientific by 'real' scientists. They do not consider it to be their concern. Physics is the key to physicalism, obviously. The cutting edge of reductionistic physics is high energy physics, but it has been running out of money, and energy. The bastion of reductionism has thus shifted, of necessity, from the experimental atom smashers to the pencil and paper crowd of theoretical or mathematical physicists. The crunching of the Riemann Hypothesis has become of greater concern to hard core science than has the smashing of quarks, in my political/psychological estimation, at least.

Let's look at Riemann, or at least at the primes. If materialism is correct, the prime numbers are random. So take a look [here](#) (and [here](#), [here](#) and [here](#) ([here](#)!)) ([explanation](#)?), and recall [this](#), etc.) [**Ulam Spiral**]. To what extent can patterns such as these be deconstructed or reduced? This may be the biggest skeleton in the materialist closet. Will such pictures trigger the Millennium? Certainly not by themselves.

The space telescope and supercomputers reveal cosmological and numerical patterns, respectively, that strain our modern credulity in reductive explanation. So does [biology](#). But it is in the mathematical realm that our intellectual attention can be most readily concentrated and guided. We would eventually like to know if mathematics is a science or an art.

[7/4]

I seem to be hearing contradictory statements about the primes.

There is a general agreement that there is a deep connection between the distribution of the Riemann zeroes and the primes. It is also agreed that the distribution of the zeroes can be fully explained or modeled by the distribution of the eigenvalues of random hermitian matrices. Yet we have the phenomenon of the '[jumping champions](#)', **Odlyzko**, et al, 1997. The 'explanation' for this jumping phenomenon turns out to be heuristics based on a conjecture.

Quoting from Odlyzko:

Conjecture 1. The jumping champions are 4 and the primorials 2, 6, 30, 210, 2310,....

[...] There seems to be little hope of making any progress towards a proof of Conjecture 1 without assuming at least a quantitative form of the k-tuple conjecture. However, as we will show, even assuming the strongest form of that conjecture that seems reasonable in view of our knowledge of prime numbers, we are still left with formidable obstacles that prevent us from obtaining a complete proof of Conjecture 1.

We have certainly come a long way, thanks to Godel et al., from Hilbert's strictures on decidability at the turn of the last century! But my issue here is the compatibility of the Odlyzko conjecture and the alleged randomness of the primes. I have yet to locate a discussion of this question.

Check out [Lehmer's Phenomenon](#), and then: [An improved bound for the de Bruijn-Newman constant](#), A. M. Odlyzko, *Numerical Algorithms*, 25 (2000). Andy is hot on the trail of something, and this is just his

hobby:

The lower bounds support the conjecture of Newman that $L \geq 0$. This conjecture says that if the Riemann Hypothesis is true, it is barely true, in that even small perturbations to the zeta function lead to counterexamples.

[7/22 -- here is another [reference](#).]

[Thoughts on the Riemann Hypothesis](#) -- [Gregory J. Chaitin](#), IBM Research (2003).

Of the authors of the above four books on the RH, the one who takes Gödel most seriously is du Sautoy, who has an entire chapter on Gödel and Turing in his book. In that chapter on p. 181, du Sautoy raises the issue of whether the RH might require new axioms. On p. 182 he quotes Gödel,* who specifically mentions that this might be the case for the RH. And on p. 202 of that chapter du Sautoy points out that if the RH is undecidable this implies that it's true, because if the RH were false it would be easy to confirm that a particular zero of the zeta function is in the wrong place.

[...] The traditional view held by most mathematicians is that these two assertions, $P \neq NP$ and the RH, cannot be taken as new axioms, and cannot require new axioms, we simply must work much harder to prove them. According to the received view, we're not clever enough, we haven't come up with the right approach yet. This is very much the current consensus. However this majority view completely ignores* the incompleteness phenomenon discovered by Gödel, by Turing, and extended by [my own work](#) on information-theoretic incompleteness. What if there is no proof?

I am certainly not a randomness freak like Gregory, but I do agree that the public attention being focused on the RH will force mathematicians to depart from their business as usual and deal with the more foundational and philosophical issues raised by the uncanny precariousness of the RH. It has the character of a syzygy. What does this mathematical fragility say to us? Is this another manifestation of an 'invisible hand' at work? What is the nature of the [conspiracy](#) that is present? Perhaps the new thinking is already out there: we need only locate it. If not we must anticipate it.

[7/5]

What is the significance of the RH? So what if it fails?

The RH is not just about the randomness of the primes. Clearly they are not. The Ulam spiral and the de Bruijn constant testify to structure that is hidden between zeta and the primes.

The RH has become a cornerstone for a significant portion of the mathematical edifice. There is no visible architectural substitute. Number theory would become chaotic for at least awhile if the RH were toppled. But even if it does not fail, we must contend with the slimness of its validity. It is as if the realm of numbers were being deliberately maintained at a critical point on the boundary between order and chaos.

[7/6]

Searching on "[prime numbers](#)" & chaos:

[Quantum-like Chaos in Prime Number Distribution and in Turbulent Fluid Flows](#) -- A.M. Selvam (1999):

The model concepts enable to show that the continuum real number field contains unique structures, namely prime numbers which are analogous to the dominant eddies in the eddy continuum in turbulent fluid flows.

[Finite Temperature Strings](#) -- Mark J. Bowick (1992)

We hope that the above exposition has given a flavor of the important connection between arithmetic gases and multiplicative number theory. Much remains to be understood for the case of statistical systems that arise from string theories and conformal field theories.

Continuing the speculation of Matthew Watkins from [above](#): we could add something to the view of Leopold Kronecker that "God made the natural numbers; all else is the work of man." If God wished to make the integers wholesale, she could start with a quantum chaotic system with the approximate statistics of the zeta zeros and take the Fourier transform to produce the primes and then fill in the composite integers, making sure that the distributions of the zeros would iterate to produce the equally spaced natural numbers. Just a thought. Would it not be undignified for God to have to count that first time with her fingers and toes? This is just a fanciful way of restating the holographic principle that every bit of the world reflects and contains all of the information in its internal, essential relations with the rest.

[7/7]

A consistent idealism envisions a [participatory universe](#), all aspects of which are essentially and internally related. The strong anthropic principle already pushes the envelope of what science can tolerate along these lines. We must go further. Idealism and immaterialism will necessarily contain strong elements pantheism, panpsychism and vitalism as part of their monistic repertoire. A materialist science cannot tolerate such elements. So much for materialism.

In a monistic and participatory universe there will necessarily be elements of parapsychology, alchemy and astrology. This is simply how an immaterial world manages to hang together. These are logically entailed by a holographic, holistic and, yes, a *rational* view of reality.

What I have been entertaining on these pages since at least [last year](#) is an idealist version of numerical participation. Critics will wish to label it 'numerology.' Well, it was not I who first pointed to the 'unreasonable effectiveness of mathematics.'

There is a possible conflict between this unreasonable effectiveness and the anthropic principle. Given the supposed inalterability of mathematics and the mathematical basis of physics, particularly w.r.t. exceptional structures such as the monster group, did God ever have a significant choice in Creation?

To put this point more succinctly, which came first: mind or math? If the materialists have all become Platonists in their embrace of mathematical physics, where does that leave us idealists? We have been elbowed out at the banquet table.

We will have to take a stand somewhere. The Riemann Hypothesis looms too large now for us not to have an opinion about it. Mathematicians and materialists both wish to see it proven expeditiously: business as usual. The looming presence of the RH could prove embarrassing if not otherwise proven. How so?

There is apparently a considerable resistance to treating the RH like the Continuum Hypothesis. In the case of the CH, it's validity was proven to be independent of the other axioms of set theory, and so we were free to take it or leave it. The clear consensus was to adopt the CH as an additional axiom.

With the RH, however, the feeling among mathematicians is that it ought to be provable. It is too closely integrated to the realm of number theory to be considered, or be proven, to be independent of that body of knowledge. Failure to prove it would be more like the albatross on the neck: not easy to ignore. It would raise issues of epistemology and ontology. It must be real, but we can't know it. We have to take it on faith! This recasts the Riemann Hypothesis into the mold of the God Hypothesis. This would not sit well with the materialists, one can imagine.

Here is another angle. You may have heard of the Skewes number, weighing in originally at $10^{10^{10^{34}}}$. This is many more zeros than there are atoms in the universe. Even if you could turn the universe into a roll of ledger paper, you would not be able to write it out. It has since been trimmed down to a very modest 10^{371} . This is the number before which the prime count must first exceed its asymptotic form as given by the prime number theorem, and given the RH. Even at this modest size, we might never have a computer big enough to actually calculate this first crossing point. There are known to be an infinite number of such crossings further out.

If the RH fails, there will be that first zeta zero which falls off the critical $1/2$ line. The first [440 billion zeros @ ZetaGrid](#) as of today are right on the money. And it took several days to calculate the first fifteen zeros back in 1903. It does not appear that the [Bruijn-Newman](#) constant is in jeopardy of being forced positive by these new results, but I would like to see a plot of its more recent values based on the [close zeros](#) data. The record for closeness is well over a year old now. There ought to be an alarm bell for the next record. This effort might be compared with [SETI@home](#). Which is more likely to have a positive result?

Although SETI presently has garnered much greater interest on the Internet, in the BPW the ZetaGrid ought to be the way to go. It could be more ambiguous and thus more insidious, but the eschatological significance would ultimately point to the same Omega. It has taken awhile for me to get [back](#) to the page topic, but there it is. Think about it.

There would be considerable irony in such a Y2C event. Jesus was supposed to come back in white robes on a flying saucer, shades of SETI. With ZetaGrid, Jesus comes back on a Pentium (R) chip, so to speak. It would be a much more subtle and less disturbing advent. But how could we link [JC](#) to [Lehmer's Phenomenon](#)? Well, that's one way!

The first non-Riemannian zero would be the most significant number in mathematics, just short of pi, perhaps. We could make something of it. And, unlike pi, its provenance would be much more open-ended. There is not a closed formula to calculate any of the zeros. In holographic fashion, each zero contains information about every prime number. There are various computing tricks to obtain approximate information about their locations.

[THE RIEMANN-SIEGEL FORMULA AND LARGE SCALE COMPUTATIONS OF THE RIEMANN ZETA FUNCTION](#) by GLENDON RALPH PUGH B.Sc., University of New Brunswick, 1992

Here it gets a little tricky. Find theoretically or computationally the first non-conforming zero and start computing its deviation from the critical line. This computation will be an open ended process requiring additional theoretical progress. I would guess that in this extended process additional coincidences such as that of [e & pi](#) would show up. We would gradually be lead to a more organic or vitalistic view of mathematics, a perspective from which we could understand how the existence and physical role of the Monster Group could be compatible with the Anthropic Principle. In effect, we would see that mathematics in all its Platonic glory is not exempt from the teleology that governs our macro and microcosm.

This increase in our understanding of the coherence of the world could come about without the intervention of a deviant zero, but let us afford ourselves just this minimal bit of drama or external stimulus. If there is an eschatological teleology of mind over matter, there will have to be some such minimal numerological component. To increase the level of the drama, it could probably be arranged for there to be a more conventional, or SETI style, message somehow embedded within the numerical coincidences. This much to placate Hollywood.

One might as easily arrange for there to be a message embedded in the positions of the galaxies, say, and meant to be viewed by the Hubble telescope. Perhaps, but this would have nothing to say about astronomy per se. It would necessarily be more epiphenomenal than what might be possible in exploiting

a mathematical medium. It would be too much like just exploiting the SETI medium. God is known to be arcane.

[7/8]

Numerology is an almost lost art. It is due for revival. [Ramanujan](#) was the last great numerologist. He had a direct knowledge of numbers that was unencumbered by layers of analytical education. Numbers have been disenchanted to become mere labels, no longer having intrinsic meaning. We turn away from the [e & pi](#) coincidence as we might from seeing a ghost. Mathematical physics has demonstrated that numbers are bound up in the atoms. How do they leap from the atoms to the mind of a Srinivasa? Such genius is possible only if the world is a hologram, waiting for us to comprehend the coherence of the micro and macrocosm.

Riemann's zeta function and the monster group are just two slices of that hologram. Each number comes alive inside every other number as part of the universal resonance. That resonance manifests most dramatically as our Omega. 'e' and pi taken separately are just labels. Taken together they possess a harmony that even Srinivasa could not completely decipher. We can and will cultivate that genius once we understand its natural necessity. It will take something like the drama of a 'misplaced' zeta 0 to trigger our deeper curiosity. That 'misplaced' zero would act as the irritant forcing us to bend our minds toward the reestablishment of the larger harmony. If this is not sufficient to set us on course to the Omega, then something else will be.

We understand the significance of 'little' alpha, the fine structure constant, with a value of $\sim 1/137$. We know that if it differed by more than one or two percent, carbon based life would have been impossible in this universe. This is just a piece of Anthroics. We don't know how it came to have this magical value. Some suppose that it is merely a random number in each of an infinite set of universes. It is what it is because we are here to measure it. That is weak anthropics. I am a strong anthropicist. There is just this one BPW in which everything is held together in optimal coherence, this despite the apparent and superficial pre-Millennial incoherence.

I suggest that Srinivasa II will find a 'formula' for alpha in terms of e & pi, and then will be able to explain it to the rest of us, along with the meaning of the misplaced zeta 0. Such a 'formula' would summarize the holographic involution of mind and matter. No small order, this.

[7/10]

I'm perusing the [class number problem](#). This relates to the near integral value of the Ramanujan number: $e^{(\pi \sqrt{163})}$. This might shed some light on $e^{\pi} \approx 20 + \pi$, or it might not.

[Uniform Distribution of Heegner Points](#) -- V. Vatsal, 2001.

[HEEGNER ZEROS OF THETA FUNCTIONS](#) -- Jorge Jimenez-Urroz and Tonghai Yang

[7/11]

[Rational points](#): 9800 hits.

It is clear that mathematicians are into rationalization in a big way. The study of rational points on elliptic curves is major. But I can't tell you what it is about. I may be dense, however, there is a dearth of

background explanation as the mathematicians go busily about their work. Are they concerned about rational points just because of the intrinsic challenge, or is there an ulterior motive?

Why do I care about rational points? It goes back to the natural and venerable impulse of wanting to square the circle. It is a desire for closure. That is the point of reason, not to play on words. The materialist impulse has been taking us precisely in the opposite direction: embracing the *Apeiron* that was anciently abhorred. Is it too late to put the *Apeiron* back in the tube? Certainly that would be the consensus view if anyone bothered to ask. Yet there is this residual interest, whatever its provenance.

For instance, take a look here: [Rational Points on Elliptic Curves](#). It is as though someone were trying to refute Fermat's last theorem: $A^3 + B^3 \neq C^3$. But no word of explanation: quite peculiar. Maybe I should mind my own business and not poke my nose in other folks' playpens.

But then go here: [Overview of "Mathematician's Secret Room"](#). I am being reminded that number theory is about numbers, after all, not about those nasty irrationals (sic). It was a terrible day for the Platonists and Pythagoreans in 500 B.C. when [Hippasus of Metapontum](#) (Hyper-bridge?)

used geometric methods to demonstrate that the hypotenuse of an isosceles triangle with legs of length one (i.e., $\sqrt{2}$, sometimes called Pythagoras's constant) cannot be expressed as a ratio of integers. A number of this type is now called an irrational number. Legend has it that Hippasus made his discovery at sea and was thrown overboard by fanatic Pythagoreans.

And can you blame them? Ever since, there has been a tension in mathematics between the rationalists and irrationalists. The rationalists remain stranded in number theory while their irrational colleagues help to explore the, no longer rational, heavens. Leonhard Euler attempted to bridge this chasm back in the 18th century with his invention of analytic number theory. His goal remains elusive.

One answer to the above question is simply: the computer or the information explosion. This is the commercial motive behind the revival of number theory and the renewed, but still in the closet, interest in squaring the circle. Yes, Pythagoras' dream of the harmony of the spheres was reawakened first by digital music. We often refer to mathematical physicists as Pythagoreans, but the true Pythagoreans would have thrown them overboard right along with Hippasus. Only Roger Penrose might have been spared from among them.

All that we rationalists are asking for is an ouroboric closure. We will even grant you the *Apeiron*, but it must be the best possible *Apeiron*, and it must serve the Ouroboros.

Number theorists continue to strive mightily to contain the inherent wildness of the primes. Theirs is truly a mission unto the wilderness. Among other treasures they bring back is the [Euler-Mascheroni](#) constant ($\sim 0.111^{1/4}$). Imagine if it turned out rational. That possibility could well be related to the disposal of the RH.

[New Math Formulas Discovered With Supercomputers](#): (p.7)

In April 1993, Enrico Au-Yeung, an undergraduate at the University of Waterloo, brought to the attention of Jonathan Borwein, his professor, the curious fact that:

$$[\text{a double sum over inverse integers}] \sim 17\pi^{4/360}$$

based on a computation to 500,000 terms. Borwein was skeptical of this finding -- if there was such an identity, why hadn't the theory behind it been discovered by mathematicians centuries ago? Borwein tried computing this sum to a higher level of precision in order to demonstrate to the student that this conjecture really did not precisely hold. Surprisingly, in subsequent computations by Borwein to 30 digits and by myself to over 100 decimal digits, this relation was upheld. Needless to say, it is rather unlikely that a mathematical relation could hold to such high precision and yet not really be true.

Then see [Integer-Relations](#).

My objection to this approach is that it sacrifices rationality for precision, which is what got us into our analytic fix in the first place. This approach would miss the [near integers](#), for instance. Heegner's insight would be lost.

[713]

[Integer relations](#) (632 hits):

[Experimental Mathematics and Integer Relations](#) by Jonathan M. Borwein, 2002:

Mathematicians increasingly use symbolic and numeric computation, visualisation tools, simulation and data mining. This is both problematic and challenging. For example, we mathematicians care more about the reliability of our literature than other sciences. These new developments, however, have led to the role of proof in mathematics now being under siege.

[...] Many of my favourite examples originate in between mathematical physics and number theory/analysis/knot theory and involve the ubiquitous Zeta Function, of Riemann hypothesis fame.

One thing they do at [CECM](#) is attempt to distinguish between algebraic and transcendental numbers. On a related issue see [Is Visualization Struggling under the Myth of Objectivity?](#) Also see [Euler sums](#) in Math World, and [Visible Structures in Number theory](#) -- Peter Borwein.

Let us note again the [j-function](#). It is responsible for the near integers associated with our $e\pi$ syzygy, and for the structure of the MG. This is taking us back to [moonshine](#) (and [here](#)).

[week173](#) -- John Baez:

The dimensions of the irreducible representations of the Monster are closely connected to the coefficients of an important function in complex analysis, called the **j-function** - this connection is known as Monstrous **Moonshine**.

[week66](#):

[...] what interests me most about this stuff is the whole idea of "**exceptional structures**" - symmetrical structures that don't fit into the neat regular families in classification theorems. The remarkable fact is that many of them are deeply related. As Geoffrey Dixon put it to me, they seem to have a "**holographic**" quality, meaning that each one contains in encoded form some of the information needed to construct all the rest! It thus seems pointless to hope that one is "the explanation" for the rest, but I would still like some conceptual "explanation" for the whole collection of them - though I have no idea what it should be.

[7/14]

[Modular Form -- from MathWorld](#):

Modular forms satisfy rather spectacular and special properties resulting from their surprising array of internal symmetries.

[Langlands program](#).

[Modular Forms and Elliptic Curves: Taniyama-Shimura](#)

For a particular elliptic curve, the number of integer solutions in each clock arithmetic forms an L-series

for that curve.

A modular form is defined by two axes, x and y , but EACH axis has a real and imaginary part. In effect it is four dimensional (x_r, x_i, y_r, y_i) where x_r means real part of x , x_i means imaginary part of x , and similarly with y_r and y_i . The four-dimensional space is called hyperbolic space. The interesting thing about modular forms is that they exhibit **infinite symmetry** under [modular] transformations....

[Richard E. Borcherds](#) by C. S. Rajan

Even before the **monster group** was proved to exist, hints of its intricate connections with the theory of modular functions began to appear. It was observed by Ogg that in a certain naturally occurring sequence $\{S_n\}$ of modular curves, S_p has genus 0 (namely it is the Riemann sphere) for a prime p if and only if p divides the order of the monster group. McKay and Thompson found interesting connections between dimensions of vector spaces with irreducible representations of the monster, with the coefficients of the Fourier series expansion of the elliptic modular **j-function**.

[...] An example of a vertex operator algebra is given by the Fock space of a string propagating on a torus. The moonshine module is obtained by combining a twisted as well as an untwisted vertex operator module associated to the **Leech lattice**, and amounts to a theory of a string propagating on an orbifold that is not a torus.

[week 95](#) -- John Baez

[...] Well, in dimension 24, there are 24 even unimodular lattices, which were classified by Niemeier. A few of these are obvious, like $E_8 + E_8 + E_8$ and $E_8 + D_{16}^+$, but the coolest one is the "**Leech lattice**", which is the only one having no vectors of length 2. This is related to a whole WORLD of bizarre and perversely fascinating mathematics, like the "Monster group", the largest sporadic finite simple group - and also to string theory. I said a bit about this stuff in "[week66](#)", and I will say more in the future, but for now let me just describe how to get the Leech lattice.

[...] However, Conway doesn't seem to explain **why** the Weyl vectors have this ascending form. So I'm afraid I really don't understand how all the pieces fit together. All I can say is that for some reason the Weyl vectors have this ascending form, and the fact that the Weyl vector is also light-like makes a lot of magic happen in 26 dimensions. For example, it turns out that in 26 dimensions there are **infinitely many** fundamental roots, unlike in the two lower dimensional cases.

Just to add mystery upon mystery, Conway notes that in higher dimensions there is no vector v for which all the fundamental roots r have $r.v$ equal to some constant. So the pattern above does not continue.

I find this stuff fascinating, but it would drive me nuts to try to work on it. **It's as if God had a day off and was seeing how many strange features he could build into mathematics without actually making it inconsistent.**

[Re- The Monster and the Leech](#) -- John Baez

In dimension 26 we get **infinitely many** fundamental roots forming a Dynkin diagram with one node for each point in the Leech lattice, and edges in a pattern that depends only on the distances between these points in the Leech lattice.

[7/15]

[Information in the Holographic Universe](#): This article from the current issue of Scientific American points to a problem with most scientific speculation. In short, it is too little, too late, too superficial and too literal. It contrasts unfavorably with the more meaning based, metaphorical 'holographic' speculation of John Baez excerpted above. It would be nice if there were a clear path from physics to metaphysics via quantum information, but there is not. Quantum information is much too atomistic. Meaning, on the other

hand, is fundamentally irreducible. The path from materialism to immaterialism must pass through coherence and monism. It must first recognize the irreducible unity of all being. Short of that realization, scientific speculation is likely to be counterproductive, as is true in this case. Cosmic intelligence is to be neither quantized nor quantified.

It is this problem that has motivated me to look to mathematics as the soft underbelly of materialism. The physical quantum in this context is largely a red herring. It is a symptom of the underlying, overlying immaterialism, not its source. At best it is a doorway from physics into the realm of math. The Baezian 'holographic' unity of math is much closer to the cosmic 'holography' of the BPW than is the quantum of physics.

What is the meaning of '[exceptional beauty](#)'? At this point, no one really knows, but we can take a stab at it. The crux of the matter lies [here](#) with the interdependence of the exceptional structures. Naively we might suppose that mathematical complexity is epiphenomenal, that it only lies on the periphery of that domain. This is the impression given by chaos theory, where a very few commonalities are overwhelmed by the innumerable profusion of possibilities. Such is not the case with exceptionality. Exceptional complexity is truly sparse, and rather than inhabiting the periphery of the subject, it resides at its core, or so we are being lead to believe. How do we account for this surprising development? What does it mean, and how might it relate to the BPW hypothesis?

These exceptional structures are what appear to account for the organicity of mathematics. These form the vertebrae of the subject, held together by an underlying 'functoriality'.

[Representation theory - its rise and its role in number theory](#) -- Robert Langlands (1989). This review is a bit more accessible from a physics background.

[Where Stands Functoriality Today?](#) -- Robert Langlands (1997). This is a mildly pessimistic assessment of the field.

[7/16]

[Endoscopy and beyond](#) -- Robert Langlands (2000). Robert finds this endeavor more hopeful than functoriality.

[...] my goal is rather to persuade the younger, more vigorous members of the audience, that the path to a successful treatment of the number theoretical problems to whose solution functoriality promises to contribute may very well lie through the **trace formula** and that they had best be prepared to master it; it is not to discuss in any serious way the arguments that enter into the complete treatment of the formula. That would be a task not for a single lecture but for a year's seminar.

[Dimension of spaces of automorphic forms](#) -- Robert Langlands (1963). His early work on the **trace formula**.

["Trace formula" & endoscopy](#) (102 hits).

["Trace formula"](#) (6100 hits).

[Selberg trace formula and zeta functions](#) -- Matthew Watkins:

"On a compact (i.e. closed and bounded) two-dimensional surface of negative Gaussian curvature the classical motion [of a point mass] takes place on the geodesics, and it is as chaotic and nonintegrable as possible (being Bernoullian). On this surface there exists also a well-defined quantum dynamics, where the Laplace-Beltrami operator (the invariant Laplacian) acts as the Hamiltonian in the Schrödinger equation. A limiting procedure, exactly parallel to the semiclassical tradition in ordinary

quantum mechanics, takes the quantum theory into the classical one when the energy E becomes large, $E^{-1/2}$ playing the role of Planck's constant... If in addition the curvature is constant, this semiclassical transition is even understood in a certain sense, exemplified by the Selberg trace formula. This formula, which was motivated by Riemann's zeta function, relates in an exact way the spectrum of the quantal motion on compact surfaces of negative curvature to the classical motion. The so-resulting mathematical literature has **deep connections** with manifold theory, automorphic functions, number theory, etc..."

-- A. Voros and N.L. Balasz, "Chaos on the pseudosphere", Physics Reports 143 no. 3, p. 112.

The resemblance between this formula [Selberg's trace] and the Riemann-Weil explicit formula is such that the $N\{P\}$ correspond to the prime numbers, and the $r(i)$ on the left-hand side (which are directly linked to the Laplacian spectrum of the surface) correspond to the nontrivial zeros of the Riemann zeta function. Consequently, the resemblance is a major source of support for the spectral interpretation of the Riemann zeta function. Put very simply, the spectral interpretation argues that "the nontrivial zeros of the Riemann zeta function are eigenvalues in some setting".

[Selberg zeta function and trace formula for the BTZ black hole](#) -- PETER A. PERRY & FLOYD L. WILLIAMS (2001)

A Selberg zeta function is attached to the three-dimensional BTZ black hole, and a trace formula is developed for a general class of test functions. The trace formula differs from those of more standard use in physics in that the black hole has a fundamental domain of infinite hyperbolic volume. Various thermodynamic quantities associated with the black hole are conveniently expressed in terms of the zeta function.

[Peter A. Perry:](#)

Research Statement: **Inverse** spectral geometry is the study of the geometric content of eigenvalues of the Laplacian on a compact surface or the scattering resonances of the Laplacian on a non-compact surface. These problems model more realistic problems such as target identification through the scattering resonances of the target. [...]

Note that inverse (scattering) problems generally have a holographic basis.

[7/17]

At this point I am stuck on the math, trying to find the thread that leads to organicity, so lets bring in the big gun, which in our case is the [Big Six](#): AORSAM.

The connecting theme appears to be the cycle, and recall that it was the $e\pi$ [syzygy](#) that triggered the present tangent in an effort to resolve the apparent contradiction between anthropics and the MG. We were then led to consider the cosmogonic role of the [cycle](#).

For a cycle to be cosmogonic it must break its essential circular symmetry. It does so by becoming eccentric, i.e. elliptic. It is precisely the elliptic functions that are at the core of our '[exceptional beauty](#)', or so we are told. I can barely make out the thread.

Before the elliptic functions came the circular functions. These are the good old sine and cosine functions that dominate much of math and physics, particularly on the engineering side. The next step in complexity beyond the circular functions are the elliptic ones, and these dominate the rest of math and physics. Between them, the circle and the ellipse have a firm grip on much of our scientific or material reality.

The specific connection between elliptical functions and exceptional beauty is to be found in the [modular form](#):

Modular forms satisfy rather spectacular and special properties resulting from their surprising array of internal symmetries. Hecke discovered an amazing connection between each modular form and a corresponding [Dirichlet L-series](#). A remarkable connection between rational [elliptic curves](#) and modular forms is given by the [Taniyama-Shimura conjecture](#), which states that any rational [elliptic curve](#) is a modular form in disguise. This result was the one proved by Andrew Wiles in his celebrated proof of [Fermat's last theorem](#).

The circular functions are periodic. The elliptic functions are doubly periodic. There can be no [triply periodic](#) functions, according to Jakob Jacobi. In some significant sense, the ellipse defines the limits of complexity. Let us see, therefore, how direct is the path from the 'simple' ellipse to the monster group. Need we look any further than the [j-function](#):

It turns out that the j-function also is important in the [classification theorem](#) for finite simple groups, and that the factors of the orders of the [sporadic groups](#), including the celebrated [monster group](#), are also related.

For the explicit modularity of the j-function see [Klein's absolute invariant](#), J , by which it is defined:

Every [rational function](#) of J is a [modular function](#), and every [modular function](#) can be expressed as a [rational function](#) of J . The [Fourier series](#) of J , modulo a constant multiplicative factor, is called the [j-function](#).

And [recall](#) that the j-function is also probably related to our syzygy via class field theory, the [class numbers](#) and the [Heegner numbers](#):

The Heegner numbers have a number of fascinating connections with amazing results in [prime number theory](#). In particular, the [j-function](#) provides stunning connections between e , π , and the [algebraic integers](#).

The lowly ellipse has certainly managed to keep the mathematical pot boiling. Is there a Chef stirring this pot? What sort of seasoning has been added to come up with the recipe for the BPW? I continue to speculate that the answer may lie in our double syzygy: $e^\pi - \pi = 19.999099979\dots$. Here we have a transcendental manifesting as an almost rational to the second degree. In that numerical hiccup must lie a tale. Do I dare plug this into [Integer-Relations](#)? $19.999099979189475767266442984669 \implies$. I ask it to find the minimal polynomial and it returns two very large coefficients. I plug it into the Simon Plouffe - P&J Borwein [inverse symbolic calculator](#), and sure enough it recovers the above formula. Then I hit the browse button.... Here are the names that come up: [Thue-Morse](#) and [Lehmer](#). In the other direction appears [Fibonacci](#) and [Bessel](#). Arbitrarily switching a digit, i.e. 1997909997918947 , yields similar results. I see nothing yet that grabs my attention.

What does catch my attention is the browser itself. I had no idea! Imagine what Srinivasa could have done with this baby! I'll wager there's a Srinii II out there right now, hot on the grail trail of the organic math. Me? I'll just trip through some tulips.

If I plug in plain π , the nearest hit is $\ln(\text{Parking} + \text{Madelung})$. When I try e , the nearest hits are bunch of sums of different [integer sequences](#). I wonder what the story is there? With e^π , I don't see anything striking, but shouldn't I have gotten another 'Parking' ticket, or is my slide rule busted? It may be due to a shifted decimal. This could be addictive, however. Does it do horoscopes?

There must be an innocent explanation for all those sequences near to e . It must be rounding errors of some kind. Otherwise someone is really missing something. OK, it seems to be hitting on all the nearly sequential sequences of integers, i.e. $e = \sum (n/n!)$. Perfectly innocent! Well, another Fields Medal gets away. Somehow I think Srinii wouldn't have fallen for that one! Just checking.

There ought to be a way to filter through these symbol sequences to pull out significant hits and misses. Has this not been done? Is [this](#) the best we can come up with? Surely we are missing something. I'm still

wondering if Renyi ever met Madelung before they bumped into each other here at pi? Are they trying to stir up trouble, or are they just passing the time? Is there no cop on this beat?

One might choose to compare the elliptic generator with the Mandelbrot generator. Both are superficially simple and yet they both yield a nearly unbounded complexity, but is there any doubt as to which is more essential to math? The ellipse is in a class of its own. I don't think we fully understand its rationale. The area of an ellipse is $\pi \cdot a \cdot b$. The perimeter is something else. One of its most elegant approximations is $\pi(a+b)(1+3h/(10+\sqrt{4-3h}))$, due to Srinivasa. He calculated it on the toes of his left foot. Imagine pulling that out of the blue, and this is perhaps the simplest formula to appear in his notebooks.

[7/18]

This has to do with symmetry. A circle has too much, a blob too little. The ellipse rules symmetry, certainly in two dimensions. The symmetry at higher dimensions is a shadow of what happens down here on the flat. Those extra dimensions can only buy so much. Beyond twenty-six, the action seems to fall off. If there is a higher dimensional version of the Leech, it is unable to cast any longer shadow, certainly not onto anything arithmetical, and arithmetic is the ultimate arbiter when it comes to numbers.

There is a similar thing going on with the octonions. These eight dimensional matrices define the limits of matroid complexity and symmetry. What exactly are the lines between elliptic, octonion and Leech symmetry and complexity is not within my present purview, but who is to doubt that those lines have been drawn?

Numbers are what we have been talking about these last few months, and it is Riemann who still owns them, as much as anyone else. The ellipse, octonions and the Leech, if they are to give up their secrets to anyone, it will be to the RH. Will there ever be another RH? Perhaps not. After the RH, math will be puzzle solving. It will be picking up the pieces. What will we know then? I'm suspecting we will know something more Godelian than Godel. We will begin to know the secret lives of numbers, and how we fit into their picture and they into ours.

Can we not proceed on this not so minor assumption? Do we have a choice? Besides, I'll be on a short break here, and need to tidy up around the ranch.

Along with the RH will go the quantum gravity enigma. Both are pushing complexity to what appears to be its logical limits. Both will have to reckon with the Monster Group, and both will have to confront our lowly syzygy. That latter item might even be the toughest challenge.

This intellectual chore of tying up our numero-logical loose ends is a principle prerequisite to the Millennium. Yes, the Omega does cast its shadow upon the Monster, and not the other way around. The numero-logical key to the Omega and the Monster is almost within the present purview of the Symbol Calculator. We just need to know where to start looking. The syzygy is trying to tell us where and how. I just don't have the musical ear for it. Not here. Not now. Will Srini II have to be up to speed on the Omega? Yes, there will have to be some such eschatological motivation and insight to clear this final hurdle, to put it all into perspective.

It occurs to me that there must be something about Heegner that I'm not getting. It is this insight that will help to resolve our problem of the numerical coincidences. I have to remind myself that the same elliptical j-function that generates the almost integers also generates the Monster. e and π cast their shadow on the Monster via j . $e^{i\pi}$ is only the circle. Remove the i and we get the j or the ellipse, more or less. Someone is trying to tell us something here, but they'll have to speak up.

[7/19]

It is clear that e and π are the most overdetermined numbers in mathematics. They are definitely overworked. What is their provenance? What is their progeny? What is their prodigy? We'll have to find out.

One of their progeny is i . It has been noted that $e^{i\pi} = -1$ is the most remarkable formula in mathematics. It is hard to imagine how $\sqrt{-1}$ could have existed before e and π . It is this foundling that has done more to tame mathematics than any other numeral. It figures hugely in Riemann's strategy to tame the primes. Clearly it keeps e and π on a short leash. Take away that i and we get the Monster. Their i -less syzygy at 20 is the shadow of the one with i .

Mixed up in all of this is the j . According to John McKay, [Charles Hermite](#) (1822-1901) invented the j in his transcendental solution to the [quintic](#). The pentagon, by the way, yields up the golden ratio as nature's premier numeral. You gotta love Charles' general solution to the quintic in terms of Jacobi's elliptic exponential or [theta functions](#).

Thus do we see the elliptic j figuring in the differential cubic and the algebraic quintic. Nothing beyond the three and the five seem to figure in mathematical complexity. Note that the thetas are 'quasi-doubly periodic'. Just what does that mean? What should the 'quasi' signify in this context? I see the formula, but it doesn't tell me anything.

The Jacobi theta functions satisfy an almost bewilderingly large number of identities involving the four functions, their derivatives, multiples of their arguments, and sums of their arguments.

What are all these quasi-symmetries? From whence do they come; whither do they go? They have to do with the limitation of complexity. Complexity is bounded by the j . Why did Srinivasa have to invent a [mock theta](#)? I notice that his name appears in 249 entries at Math World. Gauss: 277. Riemann: 308. Euler: 547. Jacobi: 225. Fermat: 249. Newton: 225. (Not counting Lie, Abel/Abelian, etc.) Who is missing from the >200 club?

The optimization of mathematical complexity must be related to the observer/anthropic problem. If there were a bigger Monster, might we not have been eaten alive? We could not have tamed it. Do not the primes define and contain all complexity? A bigger or lesser Monster might have rendered mathematical physics less amenable or less fertile, respectively. There may be limits to diversity. We may be pushing that envelope. There may be moral considerations.

[7/20]

[Modular functions](#):

Here is an excellent exposition of the j -function, emphasizing its uniqueness:

[On the Modular Function and Its Importance for Arithmetic](#) -- Paula Cohen (2000). She refers to a proof by Chudnovsky of the algebraic independence of π and e^{π} . What does this imply about our syzygy? Might we infer that there are other folks out there beating around this same numerical coincidence? They are being mildly stealthy about it.

In the same volume of lecture notes is another interesting paper, [Algebraic Dynamics and Transcendental Numbers](#) -- M. Waldschmidt.

[7/21]

[week125](#): John speaks of the '12-ness' of elliptic curves.

[Harald Cramer and the distribution of prime numbers](#) -- Andrew Granville (1995).

[Unexpected irregularities in the distribution of prime numbers](#) -- Andrew Granville (1994): primes are not purely probabilistic, e.g. mind the gaps. Taming the primes is no simple matter. RH not true? Are the prime numbers independent of each other? Their peculiar gappiness indicates otherwise.

The distribution of the primes seems deeply implicated in the core structure of mathematics. They are part of its alleged organicity. This is how they are related. This relatedness should then be manifested by the failure of the RH. At present my optimal Y2C scenario would be for a theoretical disproof of the RH to be quickly followed by heightened awareness of math's organicity. Via mathematical physics and the Anthropic principle, immaterialism and the BPWH would finally become established, along with their eschatological implications. I can imagine no more subtle or benign way to introduce the Omega. I am suggesting an incompatibility between a fully self-reflexive, organic math and the RH. This might not be necessary, but involving the RH in this historically consummate turn-around would be my concession to a minimalist drama.

A failure of the RH would, at first, strike many mathematicians as a blow against mathematical coherence. I submit that the studying of the manner of that failure, however, will lead them toward a much deeper sense of the coherence between math and the BPW. The breakdown of the RH would be part of the vital loophole that allows the abstractions of math to be 'cognizant' of, or commodious to, life and mind.

The 'unreasonable effectiveness of mathematics' is part of an ontogenetic bootstrap. It is a bootstrap in which the cosmic mind must participate, and we as well, through that mind.

It is indisputable that conjecture is playing an increasingly vital role in the advance of mathematics, particularly in number theory. This may be as much a symptom as a cause of the organicity of math. This reliance on the conjectural approach does render mathematics more unstable and more amenable to changes of philosophy. It is as if mathematics were approaching a critical point antecedent to a phase change in its structure. We just don't realize yet how we will be fitting into this larger picture.

[7/22]

A question that has struck me as significant is the relation between the prime numbers and the Monster Group, or, more succinctly, the connection between the zeta function and the MG. The shortest path between zeta and the MG is probably the '[moonlit](#)' one, i.e. the modular elliptic j-function. Is there an elliptic aspect of the zeta? In 1937 Erich Hecke [showed](#) (also see the [above](#)) that if the Fourier coefficients of a modular cusp form are plugged into a Dirichlet L-series, then that series can be uniquely factored into an Euler product, i.e. a generalized zeta function. It was mainly [Taniyama](#) who connected the elliptic and modular functions, and his result was used by Wiles to prove Fermat. The moral of this moonlit excursion is that mathematical complexity has an ultimate source: be it the primes, the Monster, the j, or something beyond all of them. That source is vital to our 'physical' existence via anthropics.

The primes are not random, as we have seen above with [Ulam](#), [Odlyzko](#), [de Bruijn](#), the '[conspiracy](#)', etc, but presently I am rereading [Conrey](#). Much of the zeta problem comes down to finding elliptic curves with [many rational points](#) (see p. 352 in Brian's article).

[7/23]

This is the last gasp before leaving for Ireland this pm. Our connecting flight to Newark was cancelled yesterday due to thunderstorms, which are expected again today.

Brian's article is the best I have seen as an overview of the RH. His main thesis is to demonstrate how convoluted the effort to prove the hypothesis has become. I am still struggling to absorb his cogent comments.

Here are some leads from Brian:

- [Don Zagier](#): I am not finding a list of his publications; however: see his [Periods](#) (2001).
- An occasional collaborator is [Fernando Rodriguez Villegas](#): [Constructions of plane curves with many points](#), with Zagier (2000).
- [Henryk Iwaniec](#) -- no publication list. [Four of his books](#) are listed on Amazon.

On p. 351, note the connection between the Dirichlet and zeta zeros. And on p. 353:

The conjecture of Birch and Swinnerton-Dyer asserts that the multiplicity of the zero of the L-function associated with a given elliptic curve is equal to the rank of the group of rational points on the elliptic curve.

That's about it for now. Sorry to leave in the middle of this unresolved conspiracy.

[8/7]

I would like to attempt a better resolution of the above items, but first I must recall some old business. This is from way back when I first got into '**numerology**', from 3-84 to 2-86.

The only specific items that might presently be salvaged from that excursion involve the metric-English conversion. According to my notes it was not until 1959 that the U.S. defined the inch as 2.54 centimeters. I do not know the **situation in Britain**. [But see [8/12](#) on the next page.] Once again we are confronted with a possible 'conspiracy' when considering the following additional points:

1. [The Measure of All Things: The Seven-Year Odyssey and Hidden Error that Transformed the World](#) -- Ken Alder, 2002.
2. $100/2 * 1.27 = 39.370...$ inches/meter. ($3937 = 31 * 127$)
3. $2 * 31 * 127^2 = 999998$
4. $c = 299792458$ meters/sec.

One has to wonder if the French also had influence from across the channel, and to what end? And for the record, from the same notes:

1. $e/\phi = 1.67999005...$
2. $\pi/\phi^2 = 1.199982...$
3. $\pi * \phi^{1/2} = 1.9990...^2$
4. $\gamma^2 = 0.9996.../3$

and from before

- $e^\pi - \pi = 19.999099979...$

If mathematicians are not becoming a bit paranoid, perhaps they are not paying attention. Someone somewhere has been working overtime to square the circle. Was a member of the French Academy privy to this rationale? If there were such a rationale it would explain much of the ancient wisdom as captured

in the sacred geometry of the megalithic kind. The megalithic masons were operating on an intuition not unrelated to that of Srinivasa.

The **key** to these coincidences is still missing. If there were a convenient way to search for similar coincidences on the Internet, we might be close to putting 2 and 2 together, but see [numerical coincidences](#) (358 hits):

1. fine structure constant $\alpha = [31 \times (\pi)^6] / (21^5)$ (2 parts/million)
2. [Cosmic Numerology](#) -- Ivars Peterson
3. [Stonehenge- Key to the Ancient World](#) -- Richard Heath
4. [Re- Path-Integrating over Differentiable Structures...](#) -- John Baez
5. [Numerical Coincidences](#) -- Bill Debuque, et al.

Let's pause here. Bill points out that the e^π coincidence is related to the fact that $(\pi + 20)^i \sim 1$. I think this was also pointed out on [Math World](#), but the formulas have become illegible (conspiracy?). I just checked this page again and the formulas are now more legible. [9/1 -- It is apparently only my browser that is failing. Finally, I fixed this problem by deleting my Internet cache.] The latter source now yields:

- $163 \cdot (\pi - e) = 68.9996644\dots$
- $163 / \ln 163 = 1.999999984\dots^5$

The presence of 163 in these coincidences may point to Heegner.

Numbers

My [diversion](#) into 'numerology' on the previous page was extensive; the most extensive since my two year [numerical](#) engagement. Laying on the floor beside my chair are several hundred pages of handwritten notes from that period. I have mixed feelings about that effort and how it relates to the present one. On the one hand there was an almost obsessive desperation to find the '[key](#)', looking for relations between sacred geometry and astronomical data. Yet, I am certainly not the only one to have been bitten by the Pythagorean bug. The line between '[monstrous moonshine](#)' (and see [here](#)) and outright numerology is a thin one. Professional mathematicians and physicists are very wary of this occupational hazard. They are not at all comfortable with the Ramanujan phenomenon.

Pythagoras has been a constant companion on my sojourn from materialism into immaterialism. I cannot belittle or forsake that presence. Implicit in the Pythagorean mysticism is a numerical vitalism or even animism. What are these numbers that are both alien and familiar at the same time? From whence cometh the Monster Group, and why does it cast such a long shadow over mathematics and physics? How could we expect to rationalize the world without rationalizing the Monster. This rationale must be a vital one. Therein lies the key to Creation if there be such.

Numerical vitalism and holism are decidedly contrary to the analytic impulse that still pervades the intellectual arena. There is strong evidence that we are being led into a mathematical holism despite all analytical resistance. Every new discovery leads to new and unexpected connections. The challenge of the Riemann Hypothesis is the case in point. With every passing day there is more at stake with the RH. It provides a focus for much speculation. Any serious immaterialist can hardly avoid participating.

I am speculating that the resolution of the RH will necessarily involve more than mathematical business as usual. It will require a much more robust acknowledgement of the organicity of mathematics. In particular it will involve getting a better handle on some of the numerical [coincidences](#) considered previously. This in turn would entail at the least a greatly expanded version of the Heegner type of phenomenon. This new vision would incorporate important elements of the ancient numerical intuition, some of which may be gleaned from the annals of archeo-astronomy.

My most outlandish speculation pertains to the [evolution](#) of numbers. Mathematical structure comes about through the 'self-organization' of the number system. This might be thought of as an extreme form of mathematical constructivism or intuitionism. Where it differs from these ontologies is in its explicit appeal to teleology. The teleology of numbers is contained in the overarching teleology of the BPW. The convolution of these two teleologies is crucial for the overall coherence.

The eschatological aspect of this 'numerology' comes with the ultimate devolution of this system as it reverts to its primordial organicity. In this process the numbers will be reenchanting along with the rest of the world. All of Creation will participate in the reenchanting resurrection or rapture. I am inclined, quite ironically, to see mathematics as on the cutting edge of this reenchantment. It is furthest along in recognizing the organicity of its subject matter.

We have considered the [holistic turn](#) in twentieth century philosophy. The result of this turn, however, has not been an upsurge in coherentism. Postmodernism has been, rather, a celebration of pluralism. Coherentism necessarily implies theism. Professional philosophers are not paid to turn their collars. Their theological colleagues, in turn, are not paid to engage in the millenarian messianism that would be implied in any fundamental turn to coherence. There are historical, political and intellectual obstacles to a philosophical embrace of anything like the ancient wisdom. My speculation is that mathematics is much less prone to such considerations. To the contrary, Pythagoreanism has always been the Achilles' heel of scientific materialism.

If there is to be a minimalist 'Y2C' event, mathematics represents its optimal venue, IMO. This is the rationale of my mathematical *excursus*. Where I may be able to contribute to such a turn of events is in the elaboration of this rationale and in the collation of its putative mathematical ingredients. To be the metaphysical point person in such fashion would be no mean feat. That this role might have historical ramifications should remain an interesting possibility for all of us who are so inclined.

Let such considerations not prevent us, however, from continuing to pursue this same goal on other fronts as the occasion may demand.

[8/9]

Please permit me now, retrospectively at least, to attempt to justify my previous [diversion](#) from Omega to numbers. In the last three pages we have traversed from Creation to Omega to numbers. This would seem to imply that numbers may provide a connecting link between the Alpha and Omega. Recall further my admittedly somewhat arbitrary designation of the [Big Six](#), relative to [Creation and Evolution](#): A&O/Repro/S&A/MG. There was the Monster Group dangling, not too gracefully, off the end. Even a rough perusal of these pages would indicate that the Monster has been bugging me from early on. On the last two pages I have been attempting, fitfully, to turn the tables on the Monster. I am attempting to exploit the numerical coincidences in rationalizing it. I recognize that by doing so in such a cavalier fashion, I am going beyond the 'moonshine' protocol and into an almost blatantly 'numerological' stance. Well, all is fair in love and eschatology.

Let's focus on the number connection. I guess my contention here is that it is love and numbers that constitute the keystone in the A/O arch/ark of Creation. Love by itself is not quite enough. It needs structural support in the form of logic and its ramifications into a mathematical, anthropic style physics. It is numbers, along with love, that help to smooth out the gaps and rough edges of Creation. Numbers and their organicity are essential in bringing about the phenomenal depth of Creation. The Darwinian-style, global organicity of metabolism, which I crudely lump into the 'Repro' slot in the Big Six, is the other inducer of depth in Creation. I have yet to fully appreciate how Darwin and the Monster may be mutually rationalized. This Creation business is a holographic puzzle: any solution will be holistic. We can only hope that something like the Big Six will provide an apt nexus for our focus.

What concerns me here is the Logos of Creation. Logos includes both meaning and logic. Meaning is the meat and logic the skeleton of Creation. The natural languages focus on meaning whilst the artificial languages such as mathematics and computer programs focus on logic. The problem of Creation is to put the meat on the bones, not to be overly elegant about it. The [observer principle](#) may be crucial here.

The failure of scientific materialism has been just its attempt to put the meat on the bones. This is also its attempt to squeeze mind and meaning out of atoms. As we have seen on these pages, this attempt has been abandoned and postmodern pluralism has risen up in its stead. So perhaps I have misstated the problem of Creation. Perhaps it should be seen as putting the bones on the meat, again stating it as crudely as possible.

In the modern view, numbers and atoms are meaningless, *per se*. The meaning must be added on after the fact. This is just a slight realignment of the Cartesian dualism, with numbers now being relegated to the side of atoms and matter. Thus have we developed mathematical physics to such a fine art for describing pure matter.

The ancient holistic wisdom has been effectively defiled in the horoscopes of our daily newspapers. Astrology, numerology and alchemy are pale shadows of what evidently was once a vital art, and which provided much of the rationale for our early civilizations. The Enlightenment and the Inquisition may be seen as a kind of shadow boxing with the pale remnants of this wisdom. The Ramanujan phenomenon provides a very narrow and distorted glimpse of the potential power of this intuition.

The Omega is not about turning the clock back to the 'good old days'. It does, however, entail a thorough understanding of from whence we come. The Omega will be like the Phoenix rising out of those inquisitorial ashes. Without those ashes there could be no Phoenix, whatever may be the consolation of the martyrs.

Modern mathematics is a fossilized remnant of our onetime wisdom. It is not easy to reconstruct the vital animal from the lifeless remnants. We will have to do some serious cribbing.

Just as a for instance, consider archeoastronomy.

[8/10]

A lot can and has been done with the sundial. Then what?

Next is the moondial. There are no moondials, but there are lunar calendars, the Chinese being the best known of these, but so were the Greek and Julian calendars, among others. (Significantly the Greek word for moon, *mene*, is the root of both mensuration ([metrology](#)) and menstruation.) Why the moon? Well, because it is there, of course. But that is a bit too simple. Behind the fascination with the moon lie two sets of [syzygys](#): the Meton and Saros cycles:

Meton: $19 \text{ yrs} * 365.2425/29.53059 = 234.997$ lunar synodic months.

Besides the synodic month there are also the lunar draconic and anomalistic months, as measured by nodes and perigees, respectively. The latter two are 27.21222 and 27.55455 days. This last period is due to the **elliptic** nature of the moon's orbit. .

Saros:

$242 * 27.21222/27.55455 = 238.99345988...$

$223 * 29.53059/27.55455 = 238.99216...$

$223 * 29.53059/27.21222 = 241.998689...$

Should these simple facts not add a celestial dimension to our nascent numerical paranoia? To tell the truth, I had never seen these numbers together until I calculated them just now. How could one not be impressed? What did the ancients know, and when did they know it? How impressionable were they?

(And that is not the end of it: $223 * 29.53059/365.2425 = 18.0299980...$ years. I have no idea what this is about, or even if it has been previously remarked. [18.03 & Saros](#) (80 hits) yields no such remark.)

Furthermore there is the coincidence of the apparent diameters of the sun and moon, giving rise to spectacular solar eclipses, the most awesome spectacle afforded by nature.

The moon is unique in our solar system for its large size relative to its host planet. This fact is sometimes mentioned in the context of Anthropic and in the speculation about the frequency of life in the universe. The simple fact is that estuaries played an important, if not crucial role in the evolution of life. Tides play an important, if not crucial role in the estuarine biology. Go figure.

My contention is that we are very far from being sufficiently paranoid about the mathematical and celestial **coincidences** that seem to defy mere probability. My speculation is that they have a common source: the [observer principle](#), not unlike that of quantum physics with Schrodinger's Cat and the rest.

Of course, none of this makes sense within the restrictions of materialism. Materialists shun coincidences as if they were being confronted by Banquo's ghost at the banquet. The shadow of the Monster looms, however, in an utterly unmistakable fashion. It casts its shadow upon physics and Anthropics. Might the Monster also be lurking in the lunar shadow?

Permit me to summarize the 'observer principle': there can be no unobservable universes. This is partly a tautology, partly a quantum necessity, partly a relational requirement. It has a theistic, or at least a panentheistic implication. We suppose that both Creator and creatures are included in this principle. A principal role of the creatures is that of proxy cosmic observers. Thus do we have a 'participatory universe', that being the only possible (kind of) universe. Indeed, with the BPW hypothesis, it is the only universe.

Even, then, within the rubric of conventional physics and cosmology, the observer principle cannot be limited to the micro scale. And now, with mathematics playing an increasing role in physics, we have to consider how the observer principle also applies to that whole field. Thus does our problem devolve to that of the relation between the observer, the moon and the Monster, to put it most concisely. None is possible without the others, or so we surmise.

Our friend the syzygy seems to be in the thick of this conspiracy: always showing up at the scene of the crime, as it were. What are these numerical coincidences trying to tell us? Quite crudely: someone's thumb is on the *scala natura*. The thumbprint is remarkably like our own, considering its frequent decimal or digital nature. Yes, despite Bohr's protestations, God does not play dice with the universe. The die, at least, have been loaded and we are her proxies in this cabal. *Les jeux sont fait*.

Something that I am definitely not suggesting is that the above coincidences are any sort of quantum effect. Let us dismiss the possibility that they could be due to a quantum observational bias, as with the watched pot that is not supposed to be able boil, due to that effect. As an immaterialist, I am after bigger fish, or at least a bigger pot in this case. Let us remain focused on the [Big Six](#). The solar/lunar syzygys say something about the provenance of A&O/Repro/S&A/MG, I suspect. Recall the purported mutual dependence of [heliotrope](#) and helios. That the moon might act as the mensurational companion of the sun is a hint concerning our immaterialist cosmogony. The moon provides us heliotropic/anthropic co-creators with some extra needed leverage *vis a vis* the solar cycle; besides its purely, and not to be underestimated, aesthetic role. It is our handle on the otherwise overwhelming solar dynamic. By looking for other such handles on Creation and the Big Six, we might find similar syzygys, in which case things might begin to get interesting around here. Such handles shed light not only on the Alpha, but, more importantly on the Omega, I believe. The process of [spinning up](#) the world will have some connection to its spinning down.

[8/12]

This began as an [addendum](#) to the to the material from day 8/7 on the pervious page. I attempt to find an answer to the origin of the remarkable exactness of the ratio of the inch to the centimeter which involves the equally remarkable pair of integers: 31 and 127. One finds peculiar stories from both sides of the channel: (My speculation proceeds [below](#).)

From the Amazon [book review](#):

[...]Mechain, remarkably scrupulous even in his doctoring of the data, was driven in part by his conviction that the quest for precision and a universal measure would disclose the ordered world of 18th-century natural philosophy, not the eccentric, misshapen world the numbers suggested. Indeed, Alder has placed Delambre and Mechain squarely in the larger context of the Enlightenment's quest for perfection in nature and its startling discovery of a world "too irregular to serve as its own measure." -- Reed Business Information, Inc

Well, perhaps the jury is still out!

and from the [Internet](#):

It may also be noted that in 1964, an agreement was reached between the U.S. and Britain to define the inch as **2.54** centimeters. Prior to 1964, the inch was defined in the U.S. on the basis that a meter was exactly 39.37 inches long, which led to the inch being about 2.540005 centimeters long, and in Britain the inch was 2.5**39997** centimeters in length.

Pray tell, from what hat did the Brits pull their strange approximation?

From another [source](#):

Even as late as the middle of the 20th century there were some differences in UK and US measures which were nominally the same. The UK inch measured 2.5**3998** cm while the US inch was 2.540005 cm. Both were standardised at 2.54 cm in July 1959...

Who has the straight story?

[Wikipedia](#):

Later development of the British system continued by defining the units by law in the Magna Carta of 1215, and issuing measurement standards from the then capital Winchester. Standards were renewed in 1496, 1588 and 1758. The last Imperial Standard Yard in bronze was made in 1845.

[Pioneer of Precision](#) ~ Curated by Julian Holland, 1997 (Below are placards from the museum's exhibit:)

Largely forgotten today Captain Henry **Kater** (1777-1835) conducted pioneering researches in England in the early 19th century to improve the precision of weights and measures. Associated with this was the development of the reversible pendulum for gravity measurements.

[...] A seconds pendulum is one where the beat (half period) of the pendulum takes exactly one second. It was thought that the length of a seconds pendulum (from the point of suspension to the centre of mass) would provide a basis for reconstructing the yard measure. Using this pendulum Kater determined the length at London to be 39.13929 inches.

[...] The report of the Commission led to the Weights and Measures Act of 1824 which introduced Imperial Standards. Subsequently numerous copies of the new standards were required, in which Kater worked closely with several of London's leading instrument makers. [...] This bar is stamped with the numbers of inches from 0 to 40, but the only precise basis of measurement is provided by fine lines engraved next to '0' and '36'. A hand-written label in the lid of the case states: 'Value from 0 to 36 inches by means of 3 sets in different years - **35.998803** inches of the Imperial Standard Yard'. This is signed by Kater and dated 10 June 1830. The bar seems to have been constructed in the mid 1820s.

[...] The primary standards of weight and length in England were preserved at Westminster. When the Houses of Parliament burned down in 1834 - an event dramatically captured in two paintings by Turner - these **standards were destroyed** and new primary standards had to be prepared. Forty bars were cast in 1845 of which one was selected as the primary of the Imperial Standard Yard. Number 18 was supplied to the New South Wales Government in 1855 as the primary standard of the colony. The yard is measured between fine lines marked on a gold pin in the well at each end of the bar. **Kater's** work on standards of length in the 1820s provided a significant basis for **reconstructing** the primary standard.

If plot there be, thick it is.

[Nautical mile. British, Canadian and American inches](#) -- John H Harland

[...] That law regarded metric units as the fundamental and internationally-accepted standards for the United States. It was this law that formally defined the inch based on the conversion factor of 39.37

inches = 1 metre as stated in the Act of 1866. This ratio gives an inch approximately equal to 25.400 05 mm. In Britain the National Physical Laboratory made comparisons of the **Imperial Standard Yard** to the International Metre, which yielded differing values for the inch over the years. The 1922 value of **25.399956** mm per inch was arbitrarily selected for use in calibrating the most precise measuring devices.

Numerical Constants:

-- 39.37 "US survey" inches to the meter : "US Survey" inch. (1866, 1893)

This equivalence is now obsolete, except in some records of the US Coast and Geodetic Survey. The International units defined in 1959 are exactly 2 ppm smaller than their "US Survey" counterparts (the ratio is **999998**/1000000). [i.e. 2.54 cm/inch = **39.370078740...** inches/meter]

Did nobody then or now wonder about the origin of this (25.4) coincidence? Was it purely an accident of history? Were there no thumbprints on those meter or yard sticks? Do the metrologists sense no ghost in this closet?

Here is my present **speculation**. All the stuff about [inches and barleycorns](#) (1,250 hits) is just so much [John Barleycorn](#) (15,300 hits) nonsense: humor for the ignorant. There was something much more serious going on in the metrology closet, something to do with the ancient wisdom. Since when did 3 barleycorns amount to **25.399956** mm.? Did this not have more to do with the fact that $2 \times 31 \times 127^2 = 999998$? If the French Academy was truly interested in a decimal system, well, there it is, along with much else. If you suppose the ancients could not count that high, then consider the [Saros](#).

There has been a rash of recent books about the history of metrology, but they generally evince a terrific historical chauvinism or nearsightedness. It is as if the sun had first risen with the Enlightenment and everything before was darkness. What happened was that analytic thought overtook holistic thought and then became jealous and arrogant concerning its own power and priority. The barleycorn stories are not woven out of whole cloth, but, really, has not a single historian actually looked at this number: **25.399956**? How could one pass over it without wondering? Whatever happened to our natural curiosity? What untold tale of history lies in those three not so innocent nines? [8/31 -- Is it the three (five) nines or the three barleycorns that truly explain/define the inch?]

It is not easy to get good information about pre-Enlightenment metrology. There is surely an academic aversion to the subject which has been exploited by amateurs not unlike myself. One must read multiple sources and sort through multiple theories and agendas. Still, it is very hard to come away from the subject without being impressed by the amount of concern and effort that must have gone into the many aspects of archeo-astronomy and geodesy from megalithic times onward. If those three nines, and the attendant five nines, do not in some manner reflect and even punctuate that ancient punctiliousness, then very strange accidents do happen.

To round out our story we head back across the channel.

<http://www.sizes.com/units/meter.htm> --

The Assembly approved the proposed unit on March 26, 1791, and work began on realizing it. To replace the hated "royal foot" until the results of the survey were in, a **provisional meter** was defined, two of which equalled 6 pied, 1 ponce, 10 22/25 lignes of the toise du **Perou**.

[...]

The toise was the primary unit of length in France prior to the introduction of the metric system.

- toise du Grand **Chatelet**

- toise de l'Académie, also known as the toise de **Perou**
- toise in the System **Usuelle**, in France between December 10, 1799 and January 1, 1840, = 2 meters

toise du Grand Chatelet:

established in 1668 and said to have been based on half the width of the inner gate of the entrance to the Louvre.

toise de l'Académie:

A French unit of length introduced in 1766 to replace the toise du Grand Chatelet, about 1.949 meters (about 2.1315 yards). It was often called the toise de Perou, because it was used by the Academy's meridian-measuring expedition to Ecuador (at that time Ecuador was part of the Spanish Empire's presidency of Peru). The toise de Perou prototype was an iron bar made by La Condamine in 1735.

toise de Système Usuel

A decree of February **1812** carried this accommodation much further, and established the système usuel. While calling for the teaching of the "système legal," that is, the metric system, and its continued use by officials, the decree authorized use of traditional names but now with values much closer to their traditional ones. For most units, defining such values required the use of **common, not decimal, fractions** of the metric base units, thus **breaking a fundamental principle of the metric system**.

[...]

On November 28, 1798, the French convened an international meeting of experts from friendly powers and puppet states. One of the meeting's **committees** consisted of **four persons**, each of whom independently calculated the length of the meter from the measurements made by Delambre and Méchain (and from certain assumptions about the shape of the earth). Their calculations agreed. The meter was established at **0.144 lignes** of the toise de **Perou** shorter than than the provisional meter.

The story now comes down to the discrepancy of '**0.144 lignes**.' But, wait, the story is not over yet.

Since 1795 the former royal jeweller had been producing bars of platinum 4 mm thick, 25.3 mm wide and about a provisional meter long, with plane parallel ends. The lengths of these bars were compared with the length of the meter as determined by the survey. The one nearest that length (at 0°C) was deposited in the National Archives on June 22, 1799, and has since been known as the Mètre des Archives. The metric system itself was legalized on December 10, 1799.

The Mètre des Archives was, by definition, a meter long, from end to end. Metrologists call such a standard an end measure. End measure standards are not a good idea, because any simple way of measuring their lengths requires touching the ends, which causes wear and shortens the standard. A much better form for a standard of a unit of length is a pair of scratches on a metal bar, because the lines' locations can be determined visually. Such a standard is called a line measure.

International interest in the meter and the French proselytizing spirit led to two international conferences (Commission Internationale du Mètre) in 1870 and 1872 to discuss international standardization of the meter. The attendees favored replacing the Mètre des Archives with a new prototype which would be a line measure and made of a harder, platinum-iridium alloy (10% iridium, to within **0.0001%**). They also suggested that the meter be taken as the length of the Mètre des Archives, "in the state in which it is found," without reference to the quadrant of the earth.

In 1875, twenty countries attended the third conference. Eighteen subscribed to a treaty (the Convention du Mètre), which set up the Bureau International des Poids et Mesures. Production of the meter standard, however, proved very difficult. Besides having an extremely high melting point (2,443°C), iridium had not yet been produced in purities greater than **50%**. The bars from the first casting of the alloy, in 1874, were rejected in 1877, and the problem was turned over to the London firm of Johnson, Matthey and Co. They succeeded, and one of the resulting bars was made the provisional standard, even though it was **0.006 mm shorter** than the Mètre des Archives. In 1882 France ordered thirty more

bars, one of which (No. 6) turned out to be, as nearly as could be ascertained, exactly the length of the Mètre des Archives. This bar is the standard which was declared to be the International Prototype of the Meter by the First General Conference on Weights and Measures (first CGPM) in 1889: "This prototype, at the **temperature of melting ice**, shall henceforth represent the metric unit of length." The International Prototype continues to be preserved by the BIPM.

(Oh dear, 100 F in Paris with a blackout last night: bring on the ice brigade! All the more reason for the French to sneer at W.)

In [1812](#) the ligne was defined as **1/432** meter. Then the discrepancy of **0.144 lignes** from above is exactly a decidedly non-decimal **1/3** mm. (I was going to let that $144 = 12^2$ pass, but then I saw $4 \cdot 108$. Don't get us archeo-metrologists started on 108!) How, convenient and agreeable of the four 'independent' committee members.

But let us recall that the **speed of light**, $c = 299792458$ meters/sec. The new Delambre meter was 1/3000th shorter, and that made the speed of light 1/3000th 'faster', or the present **299792** km/sec rather than the 299692 km/sec that it would have been with the longer provisional meter. Just think if he had shaved off **one mm** rather than just 1/3 mm. Then this coincidence would have been impossible for the historians to simply ignore. Or, couldn't we have arranged for the Earth to be just a tad smaller?

[8/13]

Yes, one can easily imagine a third or fourth nine having emerged out of this intricate choreography. The back of our historical apathy would have been broken years ago, and all of us would have been born into a brave new world. So, yes, bring on the cosmic subtlety, and let us work for our keep. It is more fun this way, don't you think? God is not going to force the truth down our throats. We have to go 'Good Will Hunting.' (Does anyone else out there have a father-in-law who is such an intrepid Good Will hunter?)

Yes, again, we have to use our own heads and imaginations to put [two](#) and [three](#) together to come up with [five](#).

All these nines floating around here, isn't it a bit like a Chinese water torture? Without our missing key, this is all just recreational, and possibly frustrating as well. (Is someone playing a game with us?) What could this putative key possibly look like?

[9/1]

Provenance of the j-function.

The j-function appears to reside at the overlap of our concerns with those of many mathematicians.

[John McKay](#): (1/6/03)

We hear a lot about Klein's work on the quintic - perhaps because of his being a good self-publicist (see The Icosahedron - available in German, Japanese, and English) ... BUT [Hermite](#) is not getting the press he deserves. In Comptes Rendus, 1858, vol. 46, Sur la resolution de l'equation du cinquieme degre, he solves the quintic using the modular equation, $\Phi_5(j(z), j(5z))=0$, just as one today solves the cubic using the relation between $\cos(t)$ and $\cos(3t)$.

By the way, I am involved in writing up the history of the j-fn from elliptic integrals to present day replicable functions. If anyone has pointers or feels they may have some contributions to make, don't be shy in contacting me!

We'll see about that....

On Math World one can trace the [j-function](#) back through Klein's invariant and the elliptic lambda to the [Jacobi theta functions](#):

The Jacobi theta functions are the elliptic analogs of the exponential function...

I believe that these are the same theta functions that are used to express the spherical harmonics of angular momentum in quantum physics, and so are doubly(?) periodic on the sphere (torus?).

It seems to come back to the mother of syzygys: $e^{i\pi} = -1$. What is the rationale of this? Sure, we can all see the algebraic identities, but is there nothing more to say? e & π were discovered independently and long before this identity was discovered. Did there have to be such an identity? Does this question even make sense?

The issue is the connection between e and the trigonometric functions. e is the main link between geometry and algebra. It shows up particularly in the Fourier transform, wherein arbitrary functions are expanded as waveforms. This brings us to the underlying oscillatory aspect of nature. Often such oscillation is the result of interaction between exponential processes. Which came first, the cycle or the exponential? In Math World it is pointed out that e is minimally transcendental, and so we might suppose that it is more primitive than π , corresponding to the just mentioned intuition. In fact, π has the highest [irrationality measure](#) of the listed constants. The circle is a sophisticated abstraction of natural cycles. π must be constructed from e . This is what the syzygys are trying to tell us.

Then why 163? This simply tells us that π is related to e through the spherical harmonics of angular momentum. That is from where the j -function derives, and the rational point (163) of the j -function connects e & π . The circle may seem primitive, but only to the abstracted mind. Creation is not an abstraction. It is not a mind game. Creation is about the Big Six, and the opening to the telos. The Monster Group is part of the rationalization of e & π through the j -function. That function expresses the multiple resonances or spherical harmonics of e & π . The Monster comes from e through π and j . These intuitions are telling us something about how mathematics became realized in physics, or was it vice versa? We have to develop a feeling for it. All this comes in time.

[9/4]

Presently I am reexamining [Tony Smith's](#) a site wrt several mathematical issues raised here.

[9/5]

I am also reviewing the websites of [Matthew Watkins](#), [Matti Pitkanen](#), and [Henry Stapp](#).

Here is the present situation. Over the past few days I have been communicating with two individuals. The first of these (A) is also my first sustained contact through the website. He and two of his acquaintances have had experiences that appear to be relevant to a messianic dynamic. There is now a question of whether either of the other two individuals would care to join our discussion. I have not requested permission to post any of our conversation.

My second correspondent (B) also prefers anonymity, an occupational hazard in these parts, it seems. I have corresponded with him on occasion, over a period of several years. We came in contact through the [Sarfatti](#) list. Tony and Matti are also (former) Sarfatti listees. 'B', Tony, Matti, Henry and I all corresponded several years ago, but I don't recall the specifics.

If I wish to pursue the present mathematical inquiry, it would behoove me to make my interests known to these individuals. Even after reviewing their websites, I have almost no knowledge of their theology, if any. I continue to look for an entrée. On the other, hand, if there is a renewed exchange with A & Co., that would tend to distract from the math. We'll see which way this path forks.

[9/6]

On not hearing anything yet relative to plan A, I would like to proceed with plan B in the following manner:

An open letter: [b](#)

This is in the form of an informal open letter to the three above named mathematicians. For the sake of argument and pedagogy please permit me to speak as if Tony, Matti and Matthew were Pythagoreans. I don't know this to be the case, but I don't think it will fall too far off the mark.

In these last two pages it seems that I have been developing an argument against strict Pythagoreanism. This a line of reasoning and evidence that would favor a looser interpretation of that view that might tentatively be labeled as theistic Pythagoreanism.

This comes back to the question most famously posed by Einstein: Did God have a choice in creating the world? The strict Pythagoreans would like to be able to answer: No, God has to follow the numbers.

This general issue was addressed just a few days ago in the New York Times: [One Cosmic Question, Too Many Answers](#) By DENNIS OVERBYE (9-2-03).

Any theist, as I am, should be gratified that recent trends in mathematical physics seem to be favoring the Anthropic Principle, and thus leaving the door open to a designing Creator, unless we follow the materialists in positing all possible worlds. Correspondingly, the Pythagoreans are alleged to be chagrined.

But, on these last two pages, I have been taking a taking a somewhat different path. I am taking this occasion of an informal open letter to Tony, Matti and Matthew to perform a reality check concerning this path. First, has the soon to be described view ever been seriously considered before? If not, why not? Secondly, is there not any significant cogency to this path?

From the perspective of the above article, what I am attempting here might be viewed as a strategy to pull the Pythagorean iron out of the fire, and then enlist their support in a combined effort to defeat the Many Worlds argument being proposed mainly by the scientific materialists.

It is no secret around here that I favor the Leibnizian logic that ultimately there can be just one world and that it must be the best possible world, hence the title of this site.

Now here is the twist that I am attempting, and which I now bring to your attention:

At first blush, it might appear that I am reverting to numerology or a numerical animism, if you will, and, in fact, I am, to a first approximation. I am in the early stages of exploring a holistic or organic interpretation of numbers and mathematics. It is only at a higher approximation that pantheism or a theistic Anthropics would reenter the picture.

So where's the beef? If you quickly scan these last two pages you will see that I am trying to make

something out of various types of numerical coincidence. Moreover, I am attempting, tentatively, to bring these various coincidence under a single rubric. This is necessary. Without an overarching explanation, even the best of coincidences rapidly dissolve into just so many curious accidents.

[9/8 -- open letter continued]

Yes, obviously there is a resonance of numbers, or, more accurately, of structures of numbers. These resonances are capable of being sensed by the most sensitive of minds and are part of the explanation for mathematical prodigy. There is also a self-organizing, organic aspect to this phenomenon of numerical coincidence. This numerical intelligence is an important part of the cosmic intelligence and accounts for the success of Pythagoreanism. This self-organizational ability is manifested particularly in a singular structure like the Monster Group, and accounts for the 'unreasonable effectiveness' of mathematics in general and of the Monster in particular.

The numerical coincidences in mathematics, metrology, astronomy and physics point up the fact that numbers have a mind of their own and actively participate in phenomena, and are not just passive or abstract descriptors, after the fact.

Human and cosmic intelligence actively participate in the self-organizational, organic quality of numbers. This accounts, in large measure for the Anthropic Principle, and for the fact that the observer effect must be extended from the quantum physical realm to the mathematical realm. It does not suffice simply to say that God is a mathematician. There must be a Godelian type of self-referential capacity that transcends any particular formal system. This ground of being is what accounts for the possibility of cosmic coherence and meaning, and the fact that we could inhabit the best of possible worlds. Thus does God come in from the cold of a purely mathematical world.

This is my first stab at making sense of numerical coincidences. I doubt that it will be the last. Through this open letter I am inviting others, with similar concerns to partake of a more concerted effort, if such seems appropriate.

[9/13]

Here is a follow up on the above letter:

Matthew Watkins is the sole respondent, to date. His response is encouraging and we are exploring the possibility of a continuing dialog. He has academic responsibilities that limit his time. I am suggesting that we produce a joint communiqué to post here and send to the four non-responders. No other publication protocol has been advanced. Matthew has suggested including others in the conversation.

At this juncture I have had time to read Richard **Vitzthum's** [v Materialism](#) (1995), and [here](#) is his online summary. It was time well spent. The most remarkable thing about this book is its existence. By general acknowledgment, it is the first treatise on materialism in well over a century. The lack of any such recent treatise had simply not occurred to me. But now that I have read this latest (last?!) one, I can understand the hiatus.

As Richard readily acknowledges, the rug has been pulled out from under this philosophy. To paraphrase the witty dentist: the philosophy is fine, but the matter has got to go. Ouch! Such is the legacy of 20th Century physics. But never-you-mind, even without any 'teeth', Richard is going to keep on whistling the tune.

The disappearance of matter or substance from the scientific lexicon is not news around here. But it is instructive to see a true believer trying to cope.

An innocent bystander might wonder that the continued debate over materialism, on which we have dwelt here at length, is just beating a dead horse. Yes, and no. If materialists had any horse sense they would at least roll over and play dead. I just hasten to point out that having this much sense is too much to expect of the true believer.

We are really talking here, at the BPW, about a *coup de grace*. Yes, I have that much sympathy for their terminal agony, but there is a larger purpose, in which they are intended to be the unwitting accomplices. Materialism exists now as virtually a museum piece in the menagerie of 'philosophies' that constitute postmodernism, or, at least, that is what the postmodernists would have us believe. But if you look more closely at PM, you will notice a remarkable lacuna: no cosmology. It is all just variations of existentialism. The Metanarrative is eschewed.

In its cosmology, materialism casts a long shadow over postmodernism. That cosmology is the 800 pound gorilla in the wings, preventing the resurrection of the metanarrative. The BPW is nothing if not a metanarrative. If this story is ever to be told, it will have to upstage that cosmological gorilla. Postmodernism is, most simply, the label we attach to our despair of ever getting out of that shadow. The despair is ubiquitous, wherever you scratch the superficial *bonhomie*. We could put up with being lost in space, as long as our space ship was humming along. It seems no longer to be humming, or hadn't you noticed?

Synchronicity (serendipity?) is surely the most prevalent of all 'paranormal' phenomena. According to the materialists, is not life itself purely serendipitous? Yes, on the scale of the universe, life is certainly abnormal. But according to the materialists: sh*t happens. The Anthropic serendipity is lost on these good folks: they can just postulate an infinite ensemble of random universes. And they do!

Such is not the case with mathematics. If serendipity permeates mathematics, well, yes, that might be a bit of a shock. It might even stun an 800 pound gorilla.

Am I suggesting that one simple fact, $e^{\pi} - \pi \approx 20$, is going to overturn three centuries of scientific cosmology? Isn't this like the flea floating downstream and demanding that the bridges be raised?

Yes, mathematics could be that subversive to the entire materialist edifice. And if it isn't? We'll just have to give it a little push, wont we?

Richard Vitzthum is already a bit wary of mathematical physics. Instead of any material substance, or even any spatial void, all we have now are mathematical symmetries that somehow give rise to force fields, when they are broken (somehow).

But what is all this coziness between math and physics? We have come a long way from those atomic billiard balls swerving in the dark. Recall that much of modern physics might be derived from the (astonishing?) fact that $e^{i\pi} = -1$. Is this serendipity, or what? What multitude of symmetries lie hidden therein?

I'll just have to quote from Richard (p.220):

In other words, the formula $[Area = \pi \cdot r^2]$ doesn't exist except as vacuous markings or noises outside an intelligence capable of recognizing it.

That gorilla is looking a bit woozy. In attempting to steer clear of Pythagoreanism, Richard has (unwittingly?) smacked right into mathematical intuitionism. Yes, it can be a minefield out there in philosophy land. Is not any and all symmetry in the eye of the beholder? And what is physics based upon, other than symmetry? Is any phenomenon a real phenomenon if not observed?

Gosh, isn't the universe trying to tell Richard something? Is he having trouble hearing his own words? I can hear him, loud and clear.

Am I making a mountain out of a molehill? You bet'chya! That is just how the Creator operates around here in the BPW. Whenever you see a wagging dog, always look to the tail.

If there is a plenitude of symmetries buried in $e^{i\pi} = -1$, then how many more than that are manifested in $e^{\pi i} - \pi \approx 20$? That little squiggle covers a transcendental degree of possible symmetries. How do I know? Let's just call it my mathematical 'intuitionism'.

It was Steve Weinberg who once said, 'seen one electron, seen them all.' What truths are uttered from the mouths of babes! I wish I could have said it first. But first, let me say, 'seen one number, seen them all.'

This latter remark could be taken as a paraphrase of axiomatic (Peano?) arithmetic, but look how easily it spins. This is also the axiom of any holographic, holistic system, is it not? Imagine the ship-loads of human creativity that have gone into, and are still going into, the evolving meanings in the pair $\{0,1\}$ of numbers. The intellectual history of the human species could easily be contained as a footnote to this simple(?) binary. The boom and bust of the 'dot.com bubble' would be a footnote to a footnote. This is all that Matthew and I are trying to say, 'seen one number, seen them all.'

Sorry, but I just couldn't resist this little addendum as the dinner bell rings (and I may be the cook!):

An electron may be represented by its spin vector or 'spinor', $(0,1)$. The fact that this spinor transforms into $-(0,1)$ under an $e^{i2\pi}$ rotation (fermi statistics) is the 'reason' why you and I won't dissolve into gamma rays in the next microsecond. But, keep your fingers crossed, sometimes those physicists get their signs wrong! Just a heads-up.

[9/15]

$e^x \sim \sum x^n/n!$.

$\sin x \sim \sum (-1)^n x^{2n}/2n!$. And we might note that $\sin(\pi/n)$ has only two rational points: at $n = 2, 6$. Recall that the j-function has rational points only at the Heegner numbers $(-1, -2, -3, -7, -11, -19, -43, -67, -163)$.

Comparing these expansions yields $e^{ix} = \sin x - i \cos x$, and $e^{i\pi} = -1$.

I am wondering this morning if there might be some significance in the above identities that the professionals may be overlooking. We all lose our capacity for astonishment at an early age, which may be to our detriment.

An important related similarity between the exponential and trigonometric functions is their reflexivity under differentiation. This implies an essential self-similarity. This is, of course, what the cycle and circle famously exhibit.

Life would be nothing without its reflexivity and cycles. How much of life must be contained in $e^{\pi i}$? More than a little, considering how $e^{\pi i}$ are caught up in the Monster and anthropics. The organicity of mathematics is necessarily focused on $e^{\pi i}$. Their mutual syzygies simply reflect this fact. The organicities of math and life must reflect each other in an essential manner that we don't quite grasp. The observer principle must be built into math the way it is built into quantum physics. Quantum physics very much revolves around $e^{\pi i}$ and i . Let us not forget $i = \sqrt{-1}$. I recall that Spencer Brown made much of the peculiar reflexivity of i , not wholly unlike its bigger cousin, I . Recall that the syzygy of $e^{\pi i}$ exhibits an essential decimal signature. Then recall that the golden ratio, ϕ , is based on the root of the semi-

decimal. The further decimal [syzygys](#) of e, pi and phi should not surprise us.

Mathematics is nothing if not reflexive, even if it was not until Godel that this was logically demonstrated. Because of this it must be a resonant structure focused on e, pi & i.

What I am trying to say is that the Pythagoreans and Anthropists are natural allies in the greater scheme of the BPW. If we can stick together we will show that the Many Worlds gambit of the latter-day materialists is an otiose sham. We will tame the monster. We are only lacking Srinivasa II. And in so lacking, we must anticipate, and in our anticipation is the reality. This is the Millennial strategy of Y2C.

It is the imaginary 'i' that bridges (rationalizes) the gap between analysis/dynamics (e) and geometry (pi). The culmination of complex analysis is the Riemann Hypothesis. The RH is [related](#) to the quasi-modular (doubly periodic) nature of the sum (n^{-s}) or $\prod 1/(1 - p^{-s})$. How do the two sums, x^n & n^x , relate to each other and the larger scheme?

One question facing us is how this structure might have evolved, apart from the mundane historical perspective. On the strictly Pythagorean view, evolution is not an option. We anthropocists are looking for the logical bootstrap which includes cosmic intelligence. Spencer Brown's 'Laws of Form' includes an implicit evolutionary scheme. I might have to replace my lost copy of this book. That imaginary 'i' could be a key element. Is it not an essential part of the measurement scheme in quantum physics? The anti-commutator $[x,p] = i\hbar$. This is just the basic statement of the uncertainty principle. Position and momentum are dynamically related.

That 'i' is essential to q.m. is frequently noted, but has not been intuitively explained, to my knowledge. In physics, intuition and math are supposed to be separately compartmented. The essential role of conjecture in both math and physics ought to argue otherwise. One might argue that 'complex' numbers are merely a convenient formality, which could be replaced by vector notations. The formalist would say this about every mathematical entity: there is no intrinsic meaning or substance. It's all a game played with tokens. Pythagoreans are not impressed by the platitudes of the formalists.

Our iota is a primary distinction between classical and quantum physics. As in complex analysis, it is largely responsible for the opening of quantum physics to the dimensions of symmetry. The merely classical symmetries pale in comparison. [Riemann surfaces](#) or covers of the complex plane are a significant component of physical symmetry. One of the biggest advances in mathematics was the realization that the real and imaginary roots of algebraic equations could be treated on an equal basis. The ensuing expansion in our recognition of algebraic symmetries was the main incentive for the invention of group theory to study the new symmetries. [Could the Monster Group be far behind?] Also, it is fair to say that fractals essentially exploit the complex plane. The many connections between the Riemann Hypothesis and quantum physics also depend on this analytic continuation.

None of these many aspects of the iota seem to speak directly to the observer principle, beyond what is contained in the uncertainty principle. It may ultimately come back to the label of 'imaginary' that was fortuitously placed on the iota. A Pythagorean may well agree that this designation was serendipitous. When, in 1572, Rafael Bombelli introduced complex numbers (not to mention the minus sign as well!) to the world, mathematics crossed its Rubicon. That single leap from the real to the 'imaginary' on the part of an entire profession remains historically unprecedented. One may argue that real numbers are an MIR, mind independent reality, but the $\sqrt{-1}$? Yet, does not the above quantum anti-commutator place the iota squarely back into the MIR? Are not atoms an MIR? Well, not according to the 'wonderful' folks of Copenhagen. The essential role of the iota in the atom, underscores the 'mystical' Copenhagen Interpretation of the quantum. Most physicists quickly become jaded on the wonder of the quantum. Theirs is not to reason why!

I would argue with the Pythagoreans that the imaginary numbers ought really to convince us that all of mathematics must exist in a Platonic realm. The Platonists, however, were dualists concerning the

corruption of the mundane world. Not so the true Pythagoreans and myself. We are monistically inclined toward the singular BPW. Those same Pythagoreans, as we have seen, were reluctant to embrace the irrational, imaginary and transcendental within 'modern' mathematics. These latter artifacts imply a personal touch. Finding them, however, fully embedded in mundane physics should instead provoke us to the realization that great minds think alike. The cosmic mind and the human mind must be mutually reflective, and this does not apply just to Srinivasa I & II. All of us are invited to bask in the greater glory. Furthermore, the BPW does not end with mathematics, fantastic and transcendental though it is. That is just the beginning of the story. That is just our *aperitif*.

Did God and we merely discover the imaginary iota? I suggest not. It was the dynamic resonance of life and creation that spun off e , i & π . With the materialization of e , i & π in the observer based physical resonance of creation, the fate of the Monster was sealed. The Monster Group is indeed the tail-end of the Big Six. In this case, it is the five that wag the sixth, and not the other way. There would be no monster without the vital syzygys or resonances of e , i & π . There would be no e , i & π outside of the cosmic creative intelligence. We are simply taking mathematical constructivism or intuitionism to its logical cosmic end. It is there that these many philosophies converge. Let us not tarry in the hinterland. The Alpha and Omega beckon.

[9/16]

Dan struggles. See Dan struggle.

Don't we all love the constant juxtaposition of idiocy and sapience in our lives. Its all a part of the aesthetics.

One might think that, like Scheherazade, I filibuster the eschaton. That may be, but it is not my conscious intent.

What I struggle with is the juxtaposition of stark simplicity and utter complexity, in math as everywhere. In this holographic world, math is a microcosm. We might think that with math, we are beginning to see the limits of complexity. That, at least, is one of my hypotheses.

Is complexity limited in the BPW? Here are some reasons. Complexity is not an end in itself. In the BPW, everything serves the greatest good which is love. Love is the one thing of which there might never be enough. For everything else there is an optimum degree. Complexity is no exception. Creation cannot be more complex than what can ultimately be comprehended by the creatures. Every creature must be able to find its way back to the Creator. This is what coherence is about. The salvational economy hinges, of course, upon us sinners. Salvation is mainly our show. We set the pace for nature. Coherence and love are our only guides. Srinivasa II or Y2C are about our recall of coherence.

In our sojourn into complexity, we have forgotten about the coherence. We just need to remind ourselves that coherence is possible, that complexity is necessarily limited by the salvation economy. We can only sojourn half way into these woods. After that we are on our way home.

With e , i & π we see the juxtaposition of simplicity and complexity. Like three children, separately they are little angels, but together they can create untold mischief, up to and including the Monster. Their various syzygys or couplings are the path to the monster, but they are also our clues to its taming, to recasting its complexity into the service of love.

Unlike for e , there are a plethora of [formulas](#) for π . This probably has to do with its greater complexity or [irrationality measure](#). Yes, perhaps, I misspoke. π has been able to stir up a pot-load of trouble just on its own. e & i are responsible for recruiting π back into the service of the simple cycle, as in $e^{i\pi} = -1$. It is almost a right of passage into the mathematics club to come up with a new and clever formula for π .

New discoveries in math frequently lead to more such possibilities. e is easily the most ubiquitous, utilitarian constant, but it is relatively forthright in its appearances. π tends to rely more on stealth and cleverness in its frequent cameos. e is definitely blue collar, π is strictly top-hat. But put them together and add just an iota, it is a whole new ballgame. The j -function and its modular cousins are quickly recruited to the cause.

The Monster Group, by its definition, defines the limits of quantitative or 'classical' mathematical complexity. With the syzygies we are looking ahead to a qualitative, organic, entangled or quantum-like complexity. In a similar fashion, the genome defines the limits of quantitative biological complexity. The [proteome](#) looks ahead to a qualitative complexity. This shift from quantitative to qualitative complexity portends our shift from a materialist to an immaterialist understanding of the world. It signals our return to coherence. Coherence is how we finally tame complexity. In order to resolve the Riemann Hypothesis, I believe that we will have to come to grips with this qualitative side of math.

What will the Pythagoreans make of this shift from quantitative to qualitative complexity? Will they still be able to say that God is a mathematician? We may have to redefine what constitutes mathematics. In the last century, mathematics paralleled philosophy in its shift from the analytical to the holistic. As far back as 1931, Godel's incompleteness theorem dashed the hopes for a purely axiomatic or algorithmic program for math, even before the computer came on the scene. Mathematician could not be synonymous with computer. But now, with this new understanding of the qualitative nature of complexity, mathematics is being removed from its pedestal or intellectual compartment. The role of conjecture and intuition will have to expand to be more in line with that of other disciplines. What this indicates is that mathematical intelligence cannot exist apart from a general or natural intelligence. For instance, the aesthetic correspondences between music and math will have to be taken more seriously.

What I am pointing to is that, whatever else cosmic intelligence might be, it cannot be considered to be strictly impersonal. We will have to take more seriously the alleged correspondences between cosmic and microcosmic intelligence. To be more specific, the shift to qualitative, coherent complexity is a shift not just to immaterialism, but also toward **personalism** rather than to the impersonalism of the mystics and materialists. In other words, the coherence of the BPW is necessarily of, by and for persons.

Symmetry

[...]

*What immortal hand or eye
Could frame thy fearful symmetry?*

-- Wm Blake (late 1700s)

In my initial foray into immaterialism I postulated a [chaotic](#) primordial state: everything that could happen, would happen without benefit of time or place. Of late, I have turned more toward a primal symmetry.

The symmetry is totipotent. Actuality is realized in the breaking of the symmetry. The breaking could be spontaneous; however, an observable coherence would more likely be self-sustaining, and thus be the dominant process. That this coherence would include an 'aesthetic' dimension would only enhance its observability and so its self-perpetuation. That perception/conception is proactive in all processes has to be a given for any fully relational system.

And why couldn't we have left well-enough (Nirvana?) alone -- end of story? Only a fool would be so naive as to feel tempted by such a question, so just give me time.

It is, of course, impossible for us to conceive of pre-temporal or multi-temporal 'processes,' but, hey, what's a body to do? And, besides, I just work here.

'Early on,' numbers are entrained in the **symmetry breaking**. Numbers are a significant product of the process. The prime break might be abstracted as $\{0,1\}$, with all else contained in the $[0,1]$ interval. Is this not the A & O? Conceivability implies a prime persona, even manifesting as a 'prime mover.' The splitting persona (my poor head!) arrays itself into various configurations, and the resultant relational networks (in terms of small and not so small group dynamics) are the source of all logically subsequent mathematical physics. Such cosmic numerology is the force underlying our Pythagorean world. And if primal symmetry breaking is a rip-off of the Big Bang, well, our hats off to our physical cosmology colleagues. Cosmogony makes for strange bedfellows. Or was it the other way around?

[9/24]

'Originally', psychology, math and physics are virtually indistinguishable. We are now witness to their separate appearing niches, although our continued probing into their foundations provides ample evidence for their primal unity.

Primal symmetry breaking may be viewed as asymmetric cloning or partial mirroring. I can't really define the 'mirror' beyond a general self-reflexiveness of the prime unity, tantamount to mentation. The symmetry breaking must be self-generated, there being no externality to begin with. We are not talking dialectics here, either. At best, this process might be seen as a **reverse dialectic**. Does this imply that the Omega would be a forward dialectic? Well, OK, if that would keep our Marxist colleagues pacified.

Clonings can give rise to cyclical network dynamics. There is a reproduction cycle, which may be short on metabolism. Perhaps numbers could serve as proto-atoms in a primal metabolic scheme. Atoms, cells and numbers might be indistinguishable in our primordial alphabet soup. They would provide a common currency. More accurately, they would be the necessary product of a relational, circulatory network that requires lowest common denominations. Does this imply an economy? Heaven forbid? Problems of

conservation and memory arise, but from physics we know that conservation and symmetry go hand-in-hand. There must be countervailing trends of increasing and decreasing symmetry. The '1' of the primal unity is somehow replaced by the '0' or symmetric void of the space-time background. This is surely a trick: like pulling a hat out of a rabbit. Projective geometry and spin-nets might come into play, not to mention holography. Does anyone else feel like there are a few too many balls in the air at this point? A lot is up for grabs in our brave new world.

While all of this is going on, we must not neglect the A/O split, giving rise to our experience of a linear history. It is the sum over relational paths leading from the A to O. Each person represents a partial trajectory. Together we manage to optimize, with quantum-like constructive and destructive interference, the possibilities of our collective trajectory. Interpersonal dream work could be a significant part of this dynamic.

You may have noticed that while carrying on about Creation, I have had little to say about the Creator. My hunch is that our BPW Creator, while being a maximalist wrt Creation, is a self-minimizer. Besides, we are the resurrection of the primal unified persona. No point in getting in our way or unnecessarily interfering in what is a fairly 'natural' salvation economy. It happens even, or especially, while we sleep.

What I seem to be struggling for now is a sense of the creative **logos**. Yes, we may wish to know, how did the word become flesh. The new testament speaks of a pre-existent logos, sometimes identified with sophia or the christ. The logos mediates creation. This is an odd theistic admission, one might think, but still commensurate with a trinitarian scheme. Am I then to surmise that our friendly Monster was indeed coexistent with the creator, and later to be identified with Jesus? I'm not real sure we want to go there. That is just what I have been trying to avoid.

Rather, the logos must refer to a 'proto-logic' where word and number could be identified. Notice that with words we are still in the realm of indivisibility. Atoms, or literally particles, are logical remnants of the primordial unity. As such do they carry their essential holographic charge. By such do they participate in the telos. The logos mediates both the alpha and the omega. It would indeed carry a salvific charge and so be identifiable with the charism. How then could we distinguish the second and third members: charism (christ?) and spirit? This may have something to do with the bios, specially linked to #2. Quantum entanglement is just the very most superficial aspect of the teleological or even eschatological charism. The quantum mystics have a point, but they have neither the logos nor the eschaton.

Does any of this help us to pin down the logos? The logos may be the closest we come to an external irritant provoking the primal break: the seed for the pearl that is creation. It is the key to the A&O. It would be the essence of cosmic mystery, partaking of the mystery of the cross. Speaking of crosses, we shift to syzygys and the mysterious couplings of $e\&\pi$; all part of the warp and woof of creation.

There are some in the wisdom tradition who identify the logos or creative spark with the overflow of God's love, leading to creation. In such manner we may avoid externality, but how far can we get with the logic of love?

[9/25]

Words are the prototypical exemplars of the logos. I wish to extend that designation to various other significant entities. In the interest of continuity it would be worthwhile to identify the logos as the source of the [Big Six](#). More generally it is the source of the differentiation of the totality. In that sense it may be identified with Spencer Brown's 'mark of distinction.' Note that I have [previously](#) identified the logos with the Zim-zum and the syzygy. The logos is rapidly accumulating baggage. We'll have to sort things out a bit.

Of most immediate concern is how mathematical physics may have emerged out of the operation of the

logos. This, of course, is the primary point of contact between the logos and the physical or material world: the Pythagorean imperative. The important point is that the operation of the logos must be reversible. The symmetry breaking can be restored, but only after the logos has taken us to the limit of atomization and analysis. The ultimate reversal probably also invokes the third member of the trinity. I am tempted now to identify the third person with the charism of philo-Sophia. Philosophy was intended to be the flip-side of analysis. That philosophy became identified with analysis in the previous century is one of the profound ironies of history. The dramatic turn by which philosophy regains its true identity would signal the advent noted in John 16:12&ff. It is part of the Aquarium protocol that this first advent be identified with the second, sometimes designated here as Y2C. This would be our own little syzygy: logos meets sophia.

The logos is not a dead letter. It is not mere logic chopping. It is the proactive, vital process of creative distinction. It is the only way in which the totality may circulate, recycle itself through a total reflexivity. We are the pivots of that reflection, not the passive mirrors. Astronomers now deploy active-array mirrors: that's us when you add in quantum-like observer effects.

It is a point of fact that mathematics' primary purchase on the physical is mediated at the quantum level. This is where symmetry is given a free reign. The governing structure here is just the $e^{\pi i} = -1$ coincidence, or perhaps the numerical mother or seed of all (physical) a/symmetries. When we carve out $e^{\pi i}$, we are carving out a very significant part of the logos. This is a probe into its operation. This little syzygy, as previously noted, captures (or even generates) much of the mathematical corpus through its various ramifications. It is also implicated as a logical source of the observer effect.

Clearly $e^{\pi i}$ is no accident. Its reflexivities are crucial to the whole shebang. If e & π didn't already exist, God would have had to create them, or did she? Therein lies the secret of the logos, or even of the trinity, for heaven's sake.

Am I being too farfetched here? Yes and no, but I'm not finished. One does not have to be a mystic to see some [analogies](#). π stands for the totality or matrix, 'e' for the ramifying logos, and 'i' for the charism of the elusive spirit that ties everything back together. Is this 'ana-logos' purely fortuitous? Or is it the necessary projection of the **trinity** onto the realm of pure quantity? But it is just our numerological contention that there is no such thing as pure quantity. Quantity and quality are ultimately inseparable. We are trying to see how to realign and reunite them, as a significant part of the new philo-Sophia. This is also along the line of taming the Monster.

Quality conceives its own reflection in quantity. This is just the Pythagorean mystique. This is mathematical intuitionism raised to a new level. Quantity must be born out of quality, and we are beginning to see how. The numerical syzygys are the fossils of this birthing or evolutionary process, *pace* Darwin.

Let's go back a third time to the apparent jumping-off point for this present excursion: this time for the [OM](#), completing the **cycle**, as it were. In the primal potency all things exist in a virtual state. The primal syzygy is the circulating resonance, often manifested as the OM. If we project this resonance into the virtual realm of quantity, the static duality of e & π are set into motion by the essential ambiguity of the iota that now connects them. Which came first: the OM or the $e^{\pi i}$? The point, rather, is that they are symbiotic. Reification in this case is a bootstrap. The OM is the quality of motion 'before' the quantity of time. The OM is the seed of the Alpha & Omega 'cycle' whose asymmetry manifests the historical linear time of our Metanarrative. This logos is the logical source of physics. The 'numerological' or Pythagorean aspect of it was primal.

[9/26]

I need to be patient here. If this $e^{\pi i}$ business has any merit we will need to extract as much information

from it as possible. It could be our best handle on a very obscure dynamics.

The above distinction between quality and quantity is facile. It is just that distinction that I am trying to understand. I am trying to understand or justify Matthew Watkins notion of an evolving number system. An organic, **evolving numerical** system may actually not be anti-Pythagorean, but it is very un-Platonic. That numbers constitute a mind independent reality (MIR) is deeply ingrained, but it becomes a primary obstacle for monism.

There is not, then, simply a projection from quality *onto* quantity. It should be more like an extrusion of quantity from quality. This extrusion has something to do with symmetry, and it must go far beyond mere enumeration.

Two candidates for the ur-symmetry are the reflective and the cyclic. The former provides a basis only for enumeration. It is the cyclic symmetry that requires attention. Given a relational network of virtual mutually reflective psyches, there will be many possible circuits.... Sorry, but this still is not getting to the crux of the problem. The observer principle must be included explicitly. Now the observer is only implicit as in providing the (mental) basis of the relational network.

In quantum theory the observer is covered by the projection postulate, or by the collapse of the wave function. Looking back again, note the role of the [octonions](#). Hold on while I take another look.

With reflective symmetry, I was using the mirror as a simile for consciousness, but, in fact, mirrors imply the prior existence of Euclidean space, an assumption which hardly conforms with immaterialism. Closer to our needs and assumptions is projective space. It probably is still too closely related to Euclid, but it is a step in the right direction.

[9/27]

It's time to toss a few more ideas into the pot, stirring vigorously. The strategy seems to be to work both ends, quantity v. quality, against coherence in the middle.

An 'early' state of creation is a growing, neurally networked, psychic **pantheon**. It needs to be shaped into a lattice and then into Newtonian space, along with bodies and their reproductive cycles, *a la* A&O.

We need a sequential circuit of psyches, *a la* the zodiac. This latter is just the metanarrative of the A&O written in the sky. This is the original reproducing cycle, somehow resonating and entraining the rest of the neural net. This is the big Om. In 2-D it would likely start with the circle of six, going to the 12 'pack' in 3-D.

In going from the finite lattice to infinite space we progress through the 17 quasi-exceptional space groups up to the final jump-off point at the sporadic monster. In the process we set up, evolve, the primes and integers by fixing 'e' and pi out of fractional dimensions of space and time(s). Transcendental pi determines translational space. Minimally transcendental 'e' determines directional time. Also, in passing from phi (1.618...) (Fibonacci's rabbit sequence) to 'e' (2.718...) we pass from lattice time to continuous time. ($e/\phi = 1.67999005... (= 2*3*7/5*5)$ for what it's worth.)

There is your basic dog's dinner, all I need now is an industrial strength blender. Where are Black&Decker when we need them? Just about a half-mile up Goucher Blvd, if they haven't moved to Bermuda.

OK. **phi : e = x : pi** -> $x = 1.870006... (= 11*17/(2*5)^2)$. In other words: $3*7*11*17/2*5^4 = 3.1416$. Then what? Somebody wants to square the circle via Fibonacci. A strange game here.

9/28

If any meaning may be attached to this further coincidence relating π to 'e' and ϕ , it indicates a deeper connection between circles and exponentials. We should have already known this from our 'mother' of syzygys: $e^{i\pi} = -1$; a fact which we have yet to understand, but of which there are many reminders. We found this reflected in the 'Ramanujan' constant, $e^{\pi\sqrt{163}}$, which pointed to a connection between the largest finite group, MG, and the largest uniquely factorizable algebraic discriminant, 163, via the j-function, based on the elliptic generalizations of the $e^{i\pi}$ circular function, i.e. the functions of quantum angular momentum. The j-function was discovered in the process of factoring the quintic equation. As the cubic is solved by the trisection of angles, so is the quintic, by a five-section. ϕ , of course, is the pentagonal number. Pentagonal crystals are quasi-periodic, reminiscent of various other objects of mathematical interest.

In the deck of numbers, the five-spot is more than a bit on the wild side. The power of the decimal system may be one result. Otherwise we would have been duo-decimalists, following the Solar cultists. This goes back to our metric related syzygy of $2 \times 31 \times 127^2 = 999998$, and why the inch is *exactly* 2×1.27 cm. And note that $\pi^2 \approx 10$, and $\pi^3 = 31.006\dots$, and while you have your calculator handy, try the windows' one with the 'scientific' view, $2 \times 31 \times 127^2 = 9.999996666663888885 \times 10^6$. Do we think we understand exactly what is going on with these decimals, or are they just playing around? And how could we forget that $e^{\pi} - \pi = 19.99909998\dots$? I wondered about that pattern of 9s, didn't you? It turns out, after some experimenting motivated by the previous pattern, that $99.982^{1/2} = 9.99909996\dots$. Exploiting this fact gives us a recursive formula for $\pi = \ln(\pi + 10 + (100 - .018)^{1/2})$. Starting with, say, $\pi = 3$, this formula rapidly converges on $\pi \approx 3.1415926527\dots$. $\pi = 3.1415926535\dots$. The closest memorable competitor is $113/355 = 3.14159292\dots$. You are invited to comparison shop at [Math World](http://www.mathworld.com). This is the simplest, least arbitrary of the bunch. Furthermore, it seems to beg of a functional meaning, as well as underscoring the decimal essence of π .

But let us wax intuitive. 'e' and ϕ alone are mere exponentials. Those of us who attend to Malthus have often wondered how to tame these exponentials. Long ago it was discovered that the wildness of the 'iota' ($\sqrt{-1}$) would do the trick. Now we see a less imaginary way, using the more subtle wildness of the pentacle. 'e' and ϕ together are able to tame each other. $\phi \sim \sqrt{5}$. The above recursion for π implicitly, but crucially, entails the root of five. Thus does ϕ entice the exponential to chase its own tail in recursive, ouroboric fashion, yielding a circle as perfect as there are souls in the cosmos: $1 : 10^{10}$. And thus will the pentacle help us to complete the A&O 'cycle', right on time. Can't you just see the teachers handing out tarot decks in math class? What is this world coming to? Srinivasa might understand.

[9/30]

I ask myself, what is it with numbers that could cause/allow them to be so amenable to both humans and physics. From whence derived their evident organicity?

The transition from 'classical' to 'quantum' numbers was very significant. Therein we go from just real 'Newtonian' numbers to complex/quaternionic/octonionic matrices with an explosion of potential symmetries, along with all the projective implications associated with measurement. From an 'evolutionary' perspective one might imagine this sequence to have been reversed. These complex, higher dimensional, Hilbert-like spaces, or 'twistor' like networks, may have been the breeding ground for what we naively think of as the God-given integers. The integers, especially the prime ones, were somehow the product of a massive, Big-bang-like, observer coordinated breaking of a high-dimensional primordial symmetry. (see Matthew Watkins' [animation](#) of the evolution of the prime counting function.) First ϕ then 'e' and finally π and would have taken the role of a **quark-triplet** in alchemically forming, through their numerical

coincidences or resonances, the 'periodic' table of the indivisible prime elements.

Admittedly this is a vague and counter-intuitive notion of numbers: the zeros of the Riemann zeta function forming as the discrete spectrum out of an unstructured state. The Monster Group might have formed 'early in the sequence.' The sporadic and exceptional groups, and modular-type generators, could have been the earliest surviving/replicating condensates out of our proto-logical soup, their general structure and functional context preceding the delineation of their individual elements or products. Srinivasa was somehow able to regress his mind to see this evolution and the scribble down some of its fossil remains. The Anthropic principle or observer imperative ensured that the physics had the proper teleological conformation in its co-evolution.

[10/3]

Somewhere on Peter Borwein's organic math [website](#) was a quote to the effect that mathematics is something we never really understand, it's just something we do. The idea of organic math is to restore understanding.

I'm still trying to understand $e^{i\pi} = -1$, the purported mother of all coincidences. The underlying formalism consists of infinite sums of the form $\sum (x^n/n!)$ and $\sum (-1^n x^{2n}/(2n)!)$. The above identity is formally obvious in these terms, but does it make sense? Can it make sense? The Greeks turned away from any such infinite constructions as being unnatural, irrational and reflections of Chaos, like the square root of two.

Elementary geometry is a model of rationality. Algebra, however, pushes us toward the irrational with its 'radicals' and unsolvable equations. Even with algebra, though, there is, at least, a formal containment.

If, however, we go back to the simple geometric circle and attempt to solve it as an algebraic construction, we fail. It is true that a circle is represented algebraically as $x^2 + y^2 = r^2$, but if we attempt to find its circumference, we confront a formula with infinitely many parts. With π we have passed from the algebraic to the 'transcendental' side of mathematics. 'e' shares the same fate, with a similar formula as indicated above. The only known way to rationalize 'e' and π is to combine them with the imaginary 'iota' as shown. No other combination will do. We are left to wonder why the two numbers reflecting growth and circumference respectively end up sharing this particular fate, and why, in that one particular combination they then undergird so much of math and physics. Much of the organicity of math and mathematical physics appears now to already be latent in this unique combination. This simple fact, true though it may be, has not elsewhere been remarked. To the professionals, this would be like a fish noticing the water. And such was gravity until Newton was hit on the head. One might wish that the recursion of $\pi = \ln(\pi + 10 + (100 - .018)^{1/2})$ could play the role of Newton's apple, but it will take more than just another formula to unlock this mystery. We will have to intuit something more substantial about the connection between quantitative and qualitative organicity.

By way of taking up this challenge, there is another item on Peter's website to be noticed. I call your attention to 'Sum 12' in his paper, ['Strange Series and High Precision Fraud'](#). It is an infinite series of the form $\sum (e^{(n^2/10^{10})})$ and it provides an approximation for π that is correct to 42 billion (!) digits before it fails. Surely this should blow mine and every other approximation for π right out of the water. It is a trick, but it is a subtle one, based on the elliptic extension our $e^{i\pi}$ coincidence in a fashion similar to that for the ['Ramanujan' constant](#). As such, it cannot tell us anything more about π than its special role in modular functions, something that we already know. Or do we? Even the 10^{10} that appears in Peter's 'fraudulent' formula is entirely arbitrary. These facts strongly emphasize the extremely robust role of π (along with 'e') in these modular functions which now dominate much of math and physics. The singular robustness of π may even indicate that it is the pivot and 'e' is the lever that moves and structures the quantitative world as seen from an 'evolutionary' perspective. The unreasonable

effectiveness of mathematics is apparently based on just these two numbers. It is this amazing pair that holds the whole shooting match together. From whence did they come?

You know what I am almost reluctantly being forced to verbalize here is the possible sexual character of our **dynamic duo**, the yin and yang of mathematics. The gender of pi seems straight forward, and while e's gender may be more ambiguous, its reproductive nature is not. Consider this as reflected in the [Big Six](#). Perhaps we are just beginning to see the connection between the MG and the reproductive cycle. [Monstrous Moonshine](#) (867 hits) may be just the libidinous lubricant that we need to get Creation rolling. Do 'e' & pi have something to tell us about the birds and the bees, or is it the other way around?

[10/4]

Numbers entered the human psyche via the calendar. The earliest calendars were lunar, although it was the solar days that were being counted. The role of the sun & moon in the formation of our most primitive systems of enumeration is not unlike the role of 'e' & pi in modern math. Elaborate arithmetic was necessary to harness the celestial cycles; numerical coincidences pointed the way. Modern mathematics has developed around the interactive dynamics of 'e' & pi, exploiting their coincidences. This analogy may be a stretch, but we will have to stretch our minds in order to grasp the cosmic coherence.

The gender of sun & moon are virtually universal, even in matriarchal contexts; but can we relate this fact to their numerical cousins? To a degree. Pi, with help from the iota, is the more subtle pivot around which the 'explosive' force of 'e' is entrained. The 'Ramanujan' coincidences of 'e' & pi logically point to the elliptic functions, as the Saros coincidence points to the ecliptic cycles. And, yes, was not the draconic cycle our introduction to the ellipse? As the solar eclipse is the mother of all celestial syzygys, so is $e^{\pi i}$ wrt the mathematical realm, each with their own intimations of fertility. As above, so below.

Might we not also compare the sequential discovery of the sporadic groups to that of the outer planets? Subtle 'gravitational' effects were the tip-off in each case.

With idealism we seek to reverse the roles of epistemology and ontology. The challenges for idealism in the celestial and numerical realms will be similar. We may suppose that lessons learned in one realm will apply to the other.

[10/5]

What we are lacking in the case of numbers is the analog of the evolutionary coordinating role associated with gravity, in the sky. Yes, we do have logic, but I am looking for something beyond that to explain the supra-logical organicity. I am also looking for the numerical analog of the Anthropic principle. It has been suggested that quantum symmetry provides a coordinating link between numbers, physics and observers. But perhaps we need look no further than the coordinating influence of e & pi. Can we tease a telos out of this odd couple?

The Monster Group is the point of 'crystallization', a Jupiter size 'snowflake', for all of the 'exceptional' symmetries, as mediated through the elliptical modularity produced by e & pi. This model might even suggest a pre- or supra-symmetric state out of which our structures of logic and symmetry condense. This crystallization would have been mediated by an anthropic telos. Previously I had thought of this primordial state as one of chaos, but this is not in keeping with the Big Bang analog as now understood through the concept of 'inflation'. It is the quantum principle which helps to sort out the symmetry breaking of the early universe into an orderly sequential process mediated by the quantum based energy-temperature relation of the radiation background. But just because we may choose to exploit the mathematical analogies latent in the Big Bang model of cosmogony, this in no way commits us to

accepting its ontogeny as veridical for any purpose other than the mere 'saving' of the present celestial appearances -- not, of course, to belittle those appearances!

Perhaps the telos of e & π is hiding in plain sight. It may well be, even must be, inherent in the concept of the circle. But is not the circle much too innocent to be carrying so much metaphysical baggage? Is it not our geometrical *ingénue*, if this is not being too gender specific?

Let me attempt to remove some of that sweet innocence. I am reminded of the story of the wealthy prospective patron who demanded proof of an artist's credentials, only to be presented with a **freehand** drawing of a perfect circle. The very idea of the perfect circle and the straight line seem deeply embedded in our psyches, well beyond the explanatory regime of neural dynamics or cultural artifacts. This pair is also the ' π & e ' of geometry, no? In keeping with our gender awareness, note that sunlight, in contrast to moonshine, is the prime source for the rectilinearity of shadows and optics. Recall that the sun is visible as a circle only in the event of a total eclipse! The natural symbol for the Sun is the cross, in its many variations.

Perhaps the psyche and the circle are not accidental associates, as a dualistic reading of Plato might suggest. It is to the emphatic monism of **Pythagoras** that we must turn. Yes, I think we can blame Plato's dualism for the estrangement of mathematics from life, and ultimately, then, for the disenchantment of both. Descartes' version of Plato's dualism further established the dichotomy, only to meet its comeuppance in the Pythagorean revelations of the high energy physicists.

Perhaps the circle is not just an abstraction from some Platonic heaven. It is alive and well at the core of our being, nay, of all being. The living perfection of the circle may well be the living symbol of our Best Possible World which, in turn, is the embodiment of the Alpha-Omega cycle. It is only in Creation that the circle can finally be rectified. She may do more than just represent the telos of that Creation.

In some sense I am identifying the Circle and the Matrix. They cannot ultimately be separated. The solar cults were, in part, a confused attempt to steal the circle from the moon.

In algebra we see the attempt to analyze geometry into 'mere' numbers. But a particular one of those numbers, π , has evidently seen fit to harness algebra to its own higher and very organic purposes. Am I forgetting that poor, dowdy ' e '? Let's just say that ' e ' seems to exist mainly to serve π , in several manners of speaking.

The observer principle is seen to be latent, and all but forgotten, in the circle. In the recursiveness of the circle perfection and normativity play a singular, inseparable role. Nowhere else is symmetry omnipresent. The only perfect circle in nature exists in the atom where it resides in the form of $e^{\wedge}i\pi$, under the aegis of the quantum. Does this mean that every atom has to be observed? Let's be careful here.

Is the quantum normative in any strong sense of that word? Modality enters explicitly into quantum physics, while it remains only implicit elsewhere. It enters into the projective nature of every quantum operator. The complexified, infinite dimensional quantum Hilbert space is nothing if not projective. The projection operation is simply a measurement, and the conundrum of the quantum is precisely the 'measurement problem'. Therein resides its normativity. Measurement is nothing if not normative. Measurement must be more than a mere process. It is irreducibly a procedure. Every quantum operator may be defined only in terms of such a normative procedure. The action of any operator can be understood only in those terms.

We have ventured into normativity before, with respect to: [cycles](#), [quantum](#), [biosemiotics](#), [scientific realism](#), etc. The entire scientific enterprise is replete with norms. For it to then turn around and present us with a normless nature is being entirely, if unwittingly, disingenuous. A normless nature is, in a very strong sense, a formless nature. Does this mean a snowflake cannot exist unobserved?

For the time being, I will avoid answering that question directly. I will be a bit more devious.

So let us consider uncertainty. It shows up in many forms. Certainly it shows up in the positions of particles. The location of a particle may be ascertained only at the cost of imparting to it an unknown momentum. The concept of position, however, implies an absolute background of continuous space that in no way enters into the interactions. This, however, is only an approximation. Quantum gravity forces space to enter into every physical process, and so physicists search for a pre-geometric, relational concept of space that would be logically compatible with quantum physics.

Allow me then to bring up another issue: indeterminacy in mathematics. Unless one is a committed Platonist, the value of π is indeterminate. Would this uncertainty not also come to the fore in the same manner that absolute or continuous space has come to be questioned? This does point to a further logical inconsistency in the quantum formalism, with uncalculated consequences. Because the quantum formalism, so far, produces accurate results, we need not press the issue. Our concern, however, is not with accuracy, but with validity. Scientific pragmatism, i.e. materialism, is the issue.

If mathematics were absolute, and isolated from the rest of reality, then the existence of mathematicians and mathematical physics would be problematic. Of course, both of these should be problematic for the materialist and the Platonist, but we modernists have been willing to cut them a lot of slack in that regard.

There is detectable, however, an ill-formed **anxiety** about such issues. Yes, there is even anxiety about π . It is said that the main reason for the computations of billions of digits of π is a pragmatic one: the testing of computer hardware. I would suggest, though, that there is a specificity and compulsion in this effort that speak to a more inchoate metaphysical anxiety. The notion of a vital mathematics that might, somehow, rise up from its deep slumber, is a ghost which could only haunt the deepest recesses of mathematical consciousness.

In an increasingly uncertain world, is not π the very last vestige of unassailable certainty? Is there no wonder that we desire to grasp it as firmly as possible? Who am I to look askance at such a desire?

Mathematicians may attempt to sidestep Platonism by disavowing the existence of a perfect circle, and instead say modally of π that it would be the circumference of this circle were it, counterfactually, to exist. Or, from an empiricist or constructivist perspective, π could be posited as the (ideal?) limit of a sequence of increasingly accurate constructions and measurements, not to mention calculations. Does this resolve the ontological issue, or does it just shift it? What then would be the actual value of π ? Is it the outcome of the last, most exhaustive calculation, or is it a hypothetical average taken over some 'standard' or normative usage? The first answer is the one that seems to beg no further questions. All such calculations are based on collections of hypotheses which can hardly be placed beyond doubt. And can it be that usage has no ontic significance? Can one simply point to an unused dvd of π 's digits and declare it to be ' π '. The disk might have been scratched or altered unbeknownst to the subject. Try as we might, we are bound to fall back on, at least, a covert Platonism if we do not appeal to norms of some practical kind. Norms invariably change. What will be the value of π when our civilization no longer exists? Do we then appeal to a hypothetical normative civilization? Or will our appeal finally be to Plato? After four thousand years of philosophical debate, the only thing we seem to know for sure is that there are no absolute answers. Computers may compute until the end of time, and still not resolve the basic issue.

Or else? Or else there is the BPW. What, pray tell, would be the best possible value of π ? Is this not a normative question? On its face, yes; but in the BPW, norms may ultimately become ontic. That is the point of it. That is the telos.

In the BPW π is precisely what we most (coherently!) desire it to be. End of story? Not quite. Without fear of immediate contradiction I can simply say, 'See!' Yes, it would be very difficult (impossible?) to imagine a better value than the one it seems to have. The value it seems to have is the one that best holds the world together, teleologically speaking. Where does this leave Plato's perfect circle? I would say that

it brings Plato and his forms down to Earth, where all the best possible action is.

Was not Plato just following the dictum to not store his treasure on Earth where the moth and rust do corrupt? Some folks are thankful that God did not follow this dictum when she sent her greatest treasure to us. We have done our darndest to corrupt it, but apparently we failed.

Given this new found power over pi, should we not be afraid that we will corrupt it? I'm not losing sleep over that. The only thing I lose sleep over is trying to understand and explain how pi can possibly manage to be as wonderful as it seems to be. Yes, there is a note of animism in that remark. We can put our faith in pi to do its very best thing. We can even hold it up, as I surely have tried, as a portent of the potency of the BPW in bringing the light of coherence into all Creation. Not even Plato's farthest heaven can escape that light. Pi can reflect that light better than any other number. I challenge you to find another. It is surely the first among equals. Should we begrudge its singular brilliance? Not when we realize that everything can and will shine with that same light when the coherence is complete. It then was merely a shiny pebble along the path.

Finally then, did God have a choice in creating pi? How can it be the best possible and the only possible?

The same question could be asked of the BPW. If there is a coherent answer, it will be the same for both, and for all. In the BPW, to be is to relate. In that regard, Pi just seems to have more than its fair share of being. And can there be too much of that? Will there not be more than enough being to go around?

We attempt to resolve only the thorniest issues. If you do not feel encouraged and challenged to surpass my feeble effort, I will have failed.

[10/6]

I seek coherence. Coherence is everywhere; it can be found everywhere. To the extent that it can be ascertained, and mainly in relation to the information available on the Internet, my efforts, as demonstrated on this site, remain unique in their scope and depth. That simple fact must then be incorporated into the picture that I present to you. Generally I choose to interpret it in the context of the prophetic tradition.

I claim, with scant fear of reasoned contradiction, that the coherence of the world and our understanding of it will be a growing factor in our survival and well-being. There are, of course, competing claims. I find none of them persuasive, certainly not in comparison to mine. The most recent comparable attempt at coherence goes back to Hegel in the early 1800's. I am not even aware of a comprehensive contemporary critique of his work. There have been a plethora of dissections of it over the years, all in service to much more limited agendas. But no one until here and now has attempted to surpass his effort; and only in that context, the quest for a greater coherence, can any previous efforts be fairly criticized. But not to worry, Hegel is not a significant part of my present concern. Wittingly and unwittingly I have incorporated some of his ideas into my own, those few which I have found truly accessible. Otherwise, I have not been terribly impressed. Perhaps I have missed something important. If such an item from Hegel, or anyone else for that matter, has been overlooked, then please bring it to my attention, ASAP. In the meantime, I unabashedly rely on Google to scour the Internet for relevant ideas. This is where the contest of ideas is increasingly being played out. If there are important ideas from the past which have not yet been recounted in plural contexts accessible to Google, then they may very well pass into oblivion; having to be reinvented if necessary.

Of late, at least since [2/26](#), I have paid considerable attention to numbers in general and Pi in particular. Let me attempt a recapitulation.

I am aware that most people have a positive distaste for numbers. I share their antipathy for the degree to which, in this digital age, we are being distracted and annoyed by the ubiquity of numbers, which

otherwise seem so alien to our personal interests, unless it happens to be the numbers on our paycheck.

And, yet, even at the height of our annoyance, there has been a spate of books, nay, even Hollywood movies, aimed at the general public concerning the affairs of numbers and those who study them. There is ample evidence in history of our ancient fascination with numbers, a fascination which remains not so far below the surface. One has only to look at the probably horrendous number of person-hours devoted to the deliberate choosing of lottery numbers to realize that they cannot be all that alien to us.

In my case, I have come back to numbers, from my long ago academic foray into mathematical physics, with much hesitation and even trepidation. I left that field, for the second time(!), almost thirty years ago feeling burned-out.

Science is an essentially quantitative pursuit. That is what is supposed to distinguish it from all other human endeavors. Any critique of science will also have to be a critique of its quantitative nature. The typical such critique is done from the standpoint of both innumeracy and the antipathy noted above. The result, of course, is superficiality. That is not to be the case here.

I am going to be much more devious. I intend to turn the (multiplication?) tables on my former mathematical colleagues by accusing them of insufficient regard for their own subject matter. Their disregard has two main sources. Either they are jaded by routine overexposure, or they have come to treat their subject as a mere game to be played with symbols.

I am confident, however, that their disregard is ultimately superficial. In the books I mentioned above, there is ample evidence of a high regard for the mysterious potency of numbers, even if it may be a very dim reflection of the outright reverence for numbers evidenced in the constructions we now associate with archaeoastronomy or sacred geometry.

But, no, I am not here to either preach or practice sacred math. I would consider that idolatry. I leave that to the Pythagoreans, a surprising number of whom, I suspect, still roam these precincts.

Rather, I take up numbers as a case study in the coherence of the world. It so happens that I have come to see numbers not as a source of that coherence, but as one manifestation of it. It is even possible that they will provide our most persuasive port of entry into the whole matter of cosmic coherence. This is an important possibility when it comes to addressing a scientifically literate audience as is my intention here.

How do I intend to pursue this possibility? WYSIWYG: long on words and short on formulas. I am neither able nor willing to meet the professionals on their own terms. I intend, rather, to spin a verbal web around their subject, which they may find more difficult to break out of than it might seem at first glance. They are potentially a very important captive audience. I wish to be the captor. My failings in that regard should not put them off their guard. Much greater minds than mine are and will be headed down this path. Consider this a mere whiff of grapeshot. My goal is simply to reawaken their original sense of awe and to then give it a specific spin.

Like everything else with which science comes into contact, numbers have been stripped of all essence. I attempt to restore some of that essence by viewing them in a larger context. The larger context is simply that of being. To exist is to partake of relational being. Numbers ought to be prime examples of this essence, but they have been so stripped down that it will take some effort even to restore a minimal degree of their true identity.

Quite simply, numbers have been reduced to mere quantities. They have lost their individual identity. To make amends I take my cue from some recently popular books on numbers, and pick up from where they tend to leave off.

Clearly Pi is a number already standing out from the rest. What are we to make of this? What do its recent publicists make of it? Not nearly enough, I claim.

Typically they point out the historical fascination with Pi, and the fact that we now spend thousands of computer hours calculating billions of its digits. I don't see any real attempt at this level to explain the interest. One has to scrounge through the Internet to come up with even a few hints as to any underlying continued fascination. I attempt to bring those together here in a coherent fashion, and use them as a point of departure for some informed speculation.

Pi is anyone's exhibit A in proving that not all quantities are equal, in the most qualitative sense of that term. If this be the case, then we have at our disposal a tool of great power to undermine what has become the intellectual fortress of scientific materialism. Indeed, Pi then becomes the perfect Trojan Horse in our anti-materialist armament and assorted bag of tricks. Pi has been sitting quietly at the foundations of that fortress from its very inception. We have only to give it the proper tweak, and the fortress is in extreme jeopardy. But keep in mind, we are in no way inclined to demolish science. We wish only to plant therein the flag of a higher truth, and call it our own.

We are concerned with the truth of all being. If Pi is real, then it must partake of the universal, relational being. If there even exists such a thing as mere quantity, and I would argue to the contrary, then, if any number can, Pi rises above that paltry level of existence. If Pi can do that, then so to can anything and everything we can put our minds to, and that includes especially our own selves.

Yes, Pi has been ground down by that relentless leveler and deconstructor that parades as scientific materialism. And much more tragically, so have you and I. Are we not just meat machines powered with genetic drives? In coming to understand the true identity and power of Pi, we can begin to regain our own true identities, all the while putting the lie to materialism.

The case that Pi is not merely a quantity is excruciatingly simple. I have already made it and I will reiterate. The much more significant question is why have we not already made a 'federal case' of this fact. Why is it not being shouted from the roof tops? Frankly, I'm perplexed. On this simple fact may well rest the fate of humanity. There must be a lot of people out there who should know better, but who, for various reasons, are looking for truth in all the wrong places. I just hope that Google has a better nose for truth than several busloads of Professors. It may just be professional courtesy not to rock the boat and not to piss in each other's soup. In that case, please forgive my French.

Here's the scoop on Pi. No. Stop. Let me quote from one of my favorite professors, in one of his more candid moods: [Ramanujan, modular equations, and approximations to pi](#) (1996) (sec 2: The state of our current ignorance):

In part we perhaps settle for computing digits of pi because there is little else we can currently do.

This from the foremost calculator of those digits! Nowhere have I seen more clearly distinguished the quality vs. the quantity of any number. Emphatically the elusive identity of Pi is seen to transcend any mere quantity, to no matter how many billions of digits we may choose to know its quantity. But is my contention not then trivial? The mere fact that a given number can be calculated indicates that we must possess a generating algorithm that represents that number, quite independently of any digits that it may generate.

OK. Then is any number completely identified by the algorithm which generates it? Yes, but be careful. Identity and identification are not the same thing. I am not my driver's license, now am I?

An algorithm is a mechanism. As such it is necessarily normative. A machine is not a machine unless there is some way to vouch for its proper functioning. Propriety is necessarily teleological, and that is an issue that can be addressed only by an authoritative agent that transcends mechanism. It may be that our goal orientation is illusory, but then so is everything else, and that is then the end of scientific realism, as well as scientific materialism.

Pi is the circumference of an ideal circle, relative to its diameter, as one among many other roles or functions with which it may be identified. An understanding of its functions allows us to agree on various methods for calculating it. We are not terribly surprised when the resulting calculations of the variously derived algorithms are in agreement.

[10/7]

For any given mathematical constant, there exist an indefinite number of ways to calculate it. Each correct algorithm does identify the number, but even all of them taken together cannot exhaust its identity. Thus does the ratio of the circumference to diameter of a circle specify a quantity. But the specification is not bi-directional. The quantity does not specify the entity. No sequence of digits can identify anything besides itself.

Mathematicians use two kinds of equal sign. One stands for equation or equality, usually meaning quantitative identity, as in $1/2 = 2/4$. The second sign is logical identification or simply definition, usually printed as three bars, but let me use # to represent this sign. One may not then say that $1/2 \# 2/4$, because only one of the fractions has been reduced. Thus one could write that $\text{Pi} = \text{algorithm}(k)$, but it would be incorrect to write that $\text{Pi} \# \text{algorithm}(k)$.

In this case, only rational numbers may be quantitatively defined: $R \# n/m$, where the fraction has been properly reduced. $\text{Sqrt}(2)$, however, cannot be identified with anything other than itself.

But is this not a trivialization of my metaphysical or meta-quantitative claim? How might this meta-quantitative distinction be carried over into science?

In science, the distinction I am making is tantamount to scientific realism. That is realism about its theoretical entities. This realism is taken in contrast to empiricism or phenomenalism. Unless they are formalists or constructivists, mathematicians are realists about Pi, as physicists are about atoms or electrons. When confronted about the nature of their realism, scientists take pains to downplay its obvious metaphysical implications. And we cut them that philosophical slack.

Mathematicians are generally much less bashful about their realism. Constructivism seems barely to get off the ground when confronted with the phenomenon that is Pi. Formalism gets hardly any further, and it then has to contend with Godel's overturning of Hilbert's formalistic thesis.

I have to be careful here, myself. I often speak of myself as a relationalist. Radical relationalism posits that only the totality is real. Any attempted subdivision of the totality generates only illusion. I have to admit a degree of sympathy with that view, at least as a last resort against Platonism. Besides, I am an internalist regarding relations, which is the only coherent possibility for the radical version. Pi is real in as much as God resides therein; in as much as God chooses to be manifested in that fashion. This may sound extreme, but there is no other way to make sense of it. Pi may only be understood as a particular rational or teleological projection of cosmic intelligence.

One conclusion to be drawn from the foregoing is the advisability of allowing Pi to stand in for the Monster Group in the [Big Six](#), which then becomes **AORSAP**. Among other things, this tends to place more emphasis on the metaphysical importance of cyclicity, which on the cosmic scale is taken simply as the closure of the A&O. Hereby are we afforded considerable simplification.

A fuller appreciation of the supra-quantitative nature of Pi allows me to emphasize a previous point. Pi is not a quantity. Whatever quantity we choose to assign to it is going to be arbitrary as to its precision. That precision is determined only by the contexts of its best usage, which are various and variable. No other assignment is sensible or even feasible.

What then of the idea of Pi; is that not fixed? No, again. It is certainly not fixed in our minds. Its meaning evolves with its usage and expanding relations to other entities. But is there not some final, teleological form of Pi to which we may refer? In the teleological context, Pi becomes embedded as an actor, or an aspect of cosmic intelligence, in the metanarrative, even as one among the Six. This is not something to which we could presently refer in any mathematical sense.

Numbers have both qualitative and quantitative aspects, and each aspect evolves toward a greater coherence. The fate of every aspect of Creation is increasingly seen as intertwined. Pi must partake of that teleology. Thereby does its normativity and functionality come to the fore. It can hardly be accidental that we come to know Pi in this context. Pi, along with everything else, exists to be known as a significant and integral part of the BPW. It will turn out the the meaning and function of Pi will be the best that we could possibly imagine.

Since Pi is such a key player and so relationally entangled, we can expect that there will not be much slack in its functionality. So although it has an aspect of freedom, that aspect will not be a significant feature, relative to some other entities. However, we can think of Pi as being the primordial *prima donna* of all mathematical entities. From that vantage, its intelligence would have had much wider scope, even freer reign, as it spun the web of mathematics and even physics about itself. I offer this as just a very crude and preliminary vignette. The pi of modern thought is a very pale shadow of its complete metaphysical self. If it still has any substantiality at all, that is its source. Being the measure of circumference may turn out to be an almost incidental aspect of its greater functionality and meaning.

Pi is also turning out to be our tool of choice in taking on the fortress of scientific materialism. It would be ironic if, in the future, we come to think of the function of Pi as more akin to an eschatological Trojan Horse than to mere circumference. It may be the string we have to pull to unravel this piñata that we like to call the world. But, on second thought, if it were our aim to departs the world of scientific materialism, what better item on which to pull, than its belt?

Having made some inroads with regard to Pi, our next item of the Six could be the Atom, but for pedagogical specificity, permit me to temporarily substitute the electron. What does Pi have to tell us about the nature of the electron?

As Pi is hardly just a quantity, the electron is hardly just a hunk of matter. From almost any vantage, it takes on the shape of a formal, ideal, functional entity; very much like its mathematical counterpart. Note carefully that physicists choose to refer to this entity with the definite rather than the indefinite article. Should this not, from the very start, raise a red flag concerning the materiality of **the** Electron? Where does the Electron leave off, and mere electrons take over. That ontological issue remains entirely mute. And according to one, almost mainstream, theory there is only one electron anyway. We are just seeing the same one shuttling back and forth in time.

As with Pi, how can we avoid considering its primordial, anthropically oriented progenitor? What was original with it was simply the sense of metabolic functionality. With metabolism there would have to be some form of chemistry. Energy bearing, interchangeable particles would be required. Stability would require that the energy levels be quantized in some fashion. This is precisely where $e^{i\pi}$ enters the picture. Atomic stability comes from the mathematical symmetry of the electron wave functions. And that statement begs many a metaphysical question. How could electrons wrap themselves in mathematical symmetry, if they were not of the same stuff? And, indeed, they are, according to the super-symmetric theory of elementary particles. Yes, Mam, its mathematical symmetry all the way down. And how better to connote that symmetry than with with our circular Pi? Indeed the lowest energy level of the simplest systems is the shape of a perfect sphere, the only such instance in nature. It is the vast array of Pi's relations which has led us from circular symmetry to elliptic and modular symmetry all the way to the monster group. Plato would roll over in his grave if he knew that his ideal forms inhabited every speck of dirt piled thereon.

The elementary particles might be considered as spin-offs of the multifarious structures latent in the functional promiscuousness of PI. Is there a hint of moral turpitude in the reflected profligacy of our **Matrix**? Well, she is not called Mother for nothing.

[10/8]

OK, it is a bit of a trick to get the whole world out of one number, as seems to be the gist of the last few day's scribbles. But, in a holographic world, no matter where you look, you will see the implications of everything else. My pedagogical strategy for getting a handle on this convoluted situation is to single out a few special pegs on which, hopefully, we will be able to hang the rest of Creation. And, with even more luck, we may thereby hit upon a possible strategy for Creation. In focusing especially on Pi, I am attempting to co-opt the venerable Pythagorean tradition, which remains very much alive in mathematical physics. And replacing the Monster Group with Pi is helpful from both a functional and aesthetic point of view.

In all candor, the power of Pythagoras remains a principle cosmic enigma. I do not expect to be able to slice this world knot with a single stroke, rather I am looking for a strategy to unravel it in piecemeal fashion. The idea of the Millennium is to afford us ample time to complete this task, both theoretically and practically. Thus do we tame the eschaton, to whatever extent that is desirable and feasible. All I'm trying to do here is get this ball rolling. I just hope I'm not trying to roll it up hill.

There is ample evidence this ball is already rolling at a fair clip. In googling on 'world knot' I came across a book of that title by David Ray Griffin, and then discovered that he is a principle contributor to the [Counterbalance Meta-Library](#). This used to be the Meta-Reference Library. It explores the boundary between science and religion by collecting the works and ideas of various intellectuals on the topic. They do hit hard on the Anthropic Principle; this is their strongest suit. Otherwise they are lukewarm, an occupational hazard of academia. CML follows the very moderate line of the [American Scientific Affiliation](#), an organization of mainly Christian oriented scientists, who otherwise choose to remain in the mainstream of their professions. Although the **ASA** takes on board much of the [Intelligent Design](#) philosophy, it eschews their more confrontational tactics. And if you really want to get down and dirty, then just head on over to [Creationism](#). In as much as the ASA has an official philosophy, it would be along the lines of Alvin Plantinga and [Process](#). Process, in its turn, is a lukewarm idealism, which also means it is incoherent. It attempts to combine scientific cosmology with idealism. This is an oxymoronically futile effort, but it is also quite conducive to gaining academic tenure: no small thing, in many circumstances. Unfortunately, I don't have the time to frequently peruse these climes, so if something radical were to pop up, I might have already missed it. I am hoping that someone will keep me current with this potentially important and potentially cultivatable and captivatable audience. Back to the business of immaterialist cosmogony.

When I speak of unraveling, I may sound like a rabid deconstructor. This may be in keeping with my eschatology, but keep in mind that I am primarily a reconstructor of God. That is our telos. The A&O circuit is just the 'recycling' of God. Yes, there is a linkage between the [Gotterdammerung](#) (Ragnarok) and Creation; a linkage which I have not systematically explored, other than in its obvious connection with the Christ event. While on this subject, the following has occurred to me in comparing the Norse and Persian (Zoroastrian) traditions: the Earth is supposed to be the locus of the battle of good and evil, but it is also a struggle between the God that was and the God to be, i.e. the Alpha and Omega aspects of God. Obviously this temporal polarity can be very confusing for the monotheistic sects. Trinitarianism might be seen as a partial resolution, while Unitarianism, and the like, are a deliberate attempt to ignore the problem.

Now with Pi on board with the [Six](#), there is a clearer emphasis on circuits and [cycles](#) (&ff) (more [cycles](#), and [here](#), [here](#), [here](#), [here](#), [Here](#), etc.). Everything fits into that groove, more or less under the tutelage of Pi. Are we

in a position, then, to attempt a serious back-engineering of the Creation? I hope so. We'll have to see.
I am placing a heavy metaphysical and ontogenetic burden on the circuit and cycle. Is it justified?

Bootstrap

[Bootstrap](#) is a term that has appeared frequently on these pages. (In this last link I am using the Google site search, which necessarily includes **all** of comcast.net. I encourage anyone to make liberal use of this feature, but please note that my address is changing from <http://mywebpages.comcast.net/dantsmith/> to <http://home.comcast.net/~dantsmith/>.) [6/18/04 - Please note that I often use [ouroboros](#) ([ext. ref.](#)) or ouroboric circuit as being nearly interchangeable with bootstrap. (Google still references the old address.)]

At the end of the previous page I was about to launch into a discussion of cycles, but upon further reflection I have decided to include the bootstrap in that discussion as an important addition. I would first like to review some other uses of this term, particularly in physics.

It was [Geoffrey Chew](#) who introduced this term to physics in 1968. Geoffrey's interesting anti-materialist attempt to eliminate the notion of elementary particles from physics, quickly ran afoul of the ascendancy of quark theory. From a purely technical perspective the theory attempted to use only the self-consistency and symmetry requirements of the quantum scattering matrix to derive the properties and interactions of all the strongly interacting particles. But from a more philosophical perspective, Geoffrey's vision included a strongly relational cosmology which included consciousness as a fundamental part of the universal bootstrap. Fritjof Capra's *The Tao of Physics* (1976) made liberal use of this idea to support a Zen based model of physics.

John Wheeler's [Participatory Anthropic Principle](#) (1983) carries the bootstrap idea further in the direction of the BPW hypothesis, but it maintains an otherwise physical cosmology in a curious dualism:

The early multiverse can perhaps be thought of as a massively parallel quantum computer which explored all of possibility-space until it was able to generate a living body, which became the habitation of an observing, sentient being. At that moment the multiverse collapsed into the actuality of that one alternative environment.

A more mainstream version of the bootstrap idea in physics refers to the duality of particles and forces in the inherent symmetry of Richard Feynman's diagrammatic formalism. Here the swapping of the space and time coordinates appears to switch the roles of forces and particles, especially if one is not too particular about the fermi-bose distinctions.

In general, [duality principles](#) (3,500 hits) play a very significant role in math and physics. There is an inherent dialectical aspect to them, which in its turn may suggest an underlying bootstrap process as we see with Hegel. It is along these lines that I would like to include the bootstrap idea in a generalized concept of circuits and cycles, especially when they are viewed from an ontogenetic perspective.

[10/11]

While on the subject of circuits and bootstraps, I can hardly avoid mentioning Doug Hofstadter's '[strange loop](#)' (33,400 hits). Here is the Math World [entry](#):

A phenomenon in which, whenever movement is made upwards or downwards through the levels of some hierarchical system, the system unexpectedly arrives back where it started. Hofstadter uses the strange loop as a paradigm in which to interpret paradoxes in logic (such as Grelling's paradox and Russell's paradox) and calls a system in which a strange loop appears a tangled hierarchy.

Douglas Hofstadter, in [Gödel, Escher, Bach](#) (1979) and several later books, uses this esoteric concept

mainly in service to materialism. His intention was to resolve the mind-body problem, in favor of the material side of the dichotomy, using this device. Daniel Dennett, *Consciousness Explained*, collaborated with Hofstadter in *Mind's I* (1981).

The Godelian aspect of the strange loop is a non-starter for Doug's purpose of bootstrapping consciousness. Godel's self-referential arithmetic construction presupposes a self-aware interlocutor, but should not be construed as contributing to that awareness. Also it is strange that Doug discounts the quantum observer loop as having any relevance to his strange loop. His commitment to the classical computing paradigm seems to be a marriage of convenience.

From a more qualitative, less technical perspective, there are aspects of the level shifting, tangled hierarchy which name the larger issues that any systematic cosmology will have to address. There is also a digital version of Pythagoreanism here which warrants our attention. Such a scheme might also be called 'information mechanics', but Doug's version is irreducibly loopy. To this significant extent does Hofstadter depart from materialism and even physicalism.

[10/12]

Those of us on the Microsoft side of the world are all too familiar with rebooting. Recall that the booting being referred to here is not a swift kick to the hard drive, but, rather a bootstrapping process of first loading lower level and then higher level components of the operating system to the active memory. Thus does the computer wake itself up in stages when it starts from scratch. Can any of this simple process be related to the problem of Creation? Probably not, but it's worth keeping in mind.

Probably what most people have in mind with bootstrapping is a spontaneous process of self-organizing emergence. As far as I am aware, the most complex, non-biological system that we know to exhibit this feature is the Belousov-Zhabotinsky oscillating chemical reaction. As long as chemical energy is pumped in, the reaction continues to oscillate around an equilibrium point. This is a long way from even the simplest of Manfred Eigen's [hypercycles](#):

In addition, his name is linked with the theory of the chemical hypercycle, the cyclic linkage of reaction cycles as an explanation for the self-organization of prebiotic systems, which he described 1979.

Living systems are replete with such [autocatalytic networks](#) (5,400 hits), but I see no reference to any that exist *in vitro*. Actually, this is a potentially important piece of evidence against the materialist thesis, and warrants further checking: autocatalytic bootstrapping occurs only *in vivo*. The only exceptions seem to involve computerized systems of 'artificial life': shades of digital Pythagoreanism and information mechanics.

We have covered the related territory of complexity theory and self-organizing systems at considerable length on previous pages: [here](#) and [here](#). The upshot was that what was once thought to be a very promising avenue of research has gotten bogged down while shedding very little new light on the nature of life. Strong emergence and vitalism remain unscathed by the best and brightest of science.

Instead we find that the [proteomists](#) and [biosemioticians](#) are exploring what for them is the brave new world of scientific non-reductionism, or, simply, scientific realism, i.e. realism about the irreducible existence of their theoretical entities.

In examining the idea of the bootstrap I am attempting to locate the essential element of Creation. This has the potential to be deconstructive of our notion of the Creator, but I don't think you need to hold your breath on that score. I am rather trying understand the relation between the numerical and vital aspects of Creation, using the 'bootstrap' as the possible missing link. What I think is mainly missing from our notion of the bootstrap is its necessarily teleological nature.

[Teleology](#) ('mywebpages' url) is frequently mentioned on these pages, but [nowhere](#) is it discussed at length. It is anathema to the scientific establishment. It is a conversation stopper. There is very little to be said about it, other than to opine on its existence. The teleological explanation is widely considered to be simply a non-explanation. Nonetheless, any hint of irreducibility must be considered as a possible manifestation of final causation, if there is to be any cause at all.

A less inflammatory substitute which may be applied to individuals is 'intentional'. Daniel Dennett has made a career out of deconstructing intentions: [The Intentional Stance](#) (1989). Another substitute is 'downward causation', which I have [examined](#) (and [here](#)) at some length.

[10/13]

With this hasty review of bootstraps behind us, we can readdress the original intent. That intent was to focus on cycles and circuits, with the bootstrap concept as a late addendum. The renewed focus on cycles was motivated in part by the replacement of the Monster Group with Pi in the '[Big Six](#)'. The Big Six constitute the main logical hurdles in our attempt to understand Creation. Outside of science, two models of Creation present themselves. The irony is that the 'mystical' model of Creation seems more rational than the theistic version. In fact, the pantheist version is just a bootstrap model.

In some sense, I am attempting a synthesis of the theistic and pantheistic cosmologies, by way of rationalizing the 'mystery' of Creation as it is viewed prophetically. The purpose of the Millennium is to allow us to prepare for the Omega. In that preparation we will be taking advantage of the A&O symmetry to better choreograph our participation in the Omega event of our metanarrative.

I am exploring the possibility that Pi could have played a key role in Creation. We are now simply trying to square the circle of Creation, and to that end we can recall, among other things, our [formula](#).

Previously I have [speculated](#) that the logical origin of numbers might be tied to the symmetry breaking inherent in the 'small group dynamics' of the primordial cosmic intelligence. Thus they would be a part of the creative [logos](#). Thus there is at least a symbolic rationale for equating Pi with the quantitative aspect of the logos.

Pi could even play the role of the Zim-zum: it is the number of the diametrical fission in the primordial symmetry of the cosmic self-potency. This could also be symbolized by the transition from unipolar circle to bipolar ellipse. The only problem then is to upgrade the numbers from a representational to a functional status.

One thing we are lacking is the discrete precursor that we have in the transition from the discrete exponential, phi, to the continuous form of 'e'. There is no particular number to associate with the polygonal approximations to the circle. We will have to make do with the three-way comparisons between e, pi and phi that we have already [introduced](#), and again [here](#) in an attempted transition from network to space, or [here](#) in analogy with quarks. At another point I suggested a [trinitarian](#) analogy for $e^{i\pi}$.

After reviewing these last two pages, I'm inclined to think that our focus on Pi suggests its role as that of a logical bootstrap. It may be the logical key to the coherent substance of our world. But I would have to go further than that. Pi could only have evolved into that role. Its precursor would have been a vital aspect of the cosmic intelligence, indeed, one of the primordial pantheon. I doubt that even science fiction has ever ventured into such a fantasy. Only thus does Pythagoras make sense. We need not let ourselves be forced into numerological extremism. I only want to tentatively put forward the obvious proposition that, even according to Occam, we ought not to make a logical distinction between our notions of a pantheon and the Big Six. Why should these groupings be logically distinct? Animism is not likely to run and hide just because I raise the scepter of rational theism. Why not simply invoke a Solar deity or logos,

along with a Pi logos, as a logically necessary stage of Creation. Extreme monotheism is inherently incoherent, and may be blamed as the logical precursor of analytical materialism. We have gone merely from trinitarianism to sexagenarianism which is precisely where I will be one day next month, perish the thought. In retrospect it is almost amusing how long it took me to make this logical connection. So much for the Protestant abhorrence of the flesh of its Gods, despite the overwhelming evidence of its own tradition. Yes, when we get out our Pi enhanced calculators we may as well be passing around the communion wafers. So let's forget the Tarot deck and send out for the crackers. The gods aren't crazy, they're just fully occupied. They took their work so seriously that you can no longer distinguish them from the product of their labor.

You are witness to my honorable attempt to avoid animism. May we now get on with the program?

This is a large step here. If we want to stick with it we will have to hash it over a bit. Already I was in the process of identifying A&O with the past and future aspects of God. That seems relatively uncontroversial. And surely there might be a god of fertility standing in for our reproductive cycle. That just leaves us with math and physics to account for: SAP, i.e. sun, atom and pi.

Sun and Pi stand out in their respective categories. Not so, for any atom. We can easily, however, revert to the elementary particles, which I believe was the intent all along, and relate these to certain numbers as we have already done. This could be seen as precursor of associating particles with symmetries. Not a great leap.

That leaves us with the Sun as a unique case among the Six. We'll need a solar strategy in our animation scheme. We'll, let's see... haven't we all heard of the person with the sunny disposition? A bit of a stretch, but we have to start somewhere. But now I am reminded of [heliotropism](#). How do we fit that into our animation?

You see that each time we come up with a new aspect of cosmology we have to test, and then adjust it against all our other components, and, hopefully, achieve a more coherent configuration. This is an iterative process which ought to converge on the BPW if we're lucky, darned lucky!

If nothing else, our helios-heliotope causal loop is a bootstrap, *par excellence*. Where resides the 'animus', or animating spirit, more formally speaking? Are we going to have to invent a god of the bootstrap? Already, Occam is looking askance.

But timeout. I am being reminded that even in monotheism, the creative logos need not be singular, and so we have the logoi as the intermediaries between God and Creation. In Christianity, Jesus, as Logos, is just the first among the archangelic logoi. It appears that my attempted paganism may be short-lived.

[10/14]

One might well wonder what one would have to avoid doing if one were not desirous of ending up as an atom. Reincarnating as an atom would have to be about the bottom rung on the hierarchy of being. On the other hand, ending up as every atom might not be such a bad fate. How might one go about arranging this more auspicious outcome? Surely we will face a prodigious cloning.

We wish to combine pantheism and Pythagoreanism in a logical manner so as to produce respectable atoms. In this case it is metabolism that acts as our telos. Helios and heliotrope would be side show, with photons serving as the metabolites, and in both cases we'll have to do some serious bootstrapping.

Numbers seem to have little difficulty with cloning. They are able to rely on logic for their reproductions. It's not a bad trick if you really need to get around. How might atoms follow suit? Words are noted for a similar ability, with much less reliance on logic. Words are characteristically seminal. That is their

charism which we try to capture with the Logos. Is the message in the medium? Is it about currency? How does one set about becoming a medium of exchange?

OK, again. The tack I am pursuing here is simply **personalism**. The logos and logoi are just that: persons, one and all. Reality is of, by and for persons. Recall also that Leibniz, with his monadology, was an early advocate for personalism and panpsychism, and so I will need to review the connection of that with his BPW hypothesis, later.

How are atoms unlike words, with an organism likened to a text? Organisms occupy space-time, while a (spoken) text occupies time. Individual words come to the fore only in the parsing or analysis of the text. There is no Galilean symmetry of spatial translation that leads to a conservation of atomic mass. Nonetheless there is a contextual conservation of the function or meaning of a text, independent of particular verbal content. There is a similar contextual continuity which preserves organisms. In the study of memetics there are further attempts to draw out this analogy in a Darwinian direction.

The point with words is that they exist in the gray area between mind and matter, between subject and object. My intent is to exploit their ambiguous status to create the slippery slope on which atoms will be seen to be capable of sliding, with a little nudge, over into the realm of mind. The ontological status of persons is ambiguous likewise, and it may be possible to exploit that ambiguity in a similar fashion, bringing us back to the usefulness of the concept of the logos. The thesis of personalism is that the substantiality of atoms and everything else is derivative from the substantiality of persons. This simple point warrants emphasis.

There is nothing else in the world with which we can have more direct contact than with our own personal identity. No other identity can be more substantial to us. The closest contender for some of us might be our automobile, which might be thought to be more tangible than anyone's persona. Tangible, perhaps. Identifiable, certainly not.

How about which one is more real, me or my car? Is this just a semantic issue? Yes, indeed. My point is that reality logically has to begin somewhere, and that somewhere has to be at home with the self. Only a few centuries of scientific abstraction might convince us otherwise, but where then does the scientific reality begin? There seems no longer to be agreement on this point, if ever there was. As we have seen, scientific realism has become a very thorny subject.

Reality begins with persons. If we wander too far beyond that simple truth we are liable to get into a whole lot of trouble: witness Descartes. This observation is the beginning and end of personalism. Thus do atoms and numbers become persons? Quantum theory might best be interpreted as a big reminder that we cannot take the observer out of the quantum loop. Does the observer have to be a person? This is more controversial, and certainly remains open. This is just to say that reality is relative to observing persons.

A car in my dream could seem every bit as tangible as in waking. Thus is mere tangibility not a good measure of substantiality. Let's face it, reality is a contextual game, which none of us can avoid playing. No one else can play it for us. Of course, our cultures have a great propensity to school us in 'reality', but you and I would not be here if that were the end of the story. In the prophetic tradition, it is we prophets who must take our cultures to school and then to task.

If reality were not a relational network of, by and for persons, then what could it possibly be? Atoms and numbers show little propensity to escape from this network. This is not to say that I am liable to be reborn as an atom. It is to say that we own the very idea of atoms, and if you try to take our ideas out of the atom, you sure won't have much left over to show for your trouble.

Atoms and numbers are integral to the logical fabric of existence. They behave as they do, because otherwise the fabric would threaten to tear, and that is not logically possible. Paranormal phenomena can occur only on the fringes of that fabric. Yes, this is a social reality, but it goes much deeper than we are

won't to imagine.

There is a mutuality between us and our atoms. There is a mutual habituation. It is not wrong to think of atoms as the teleologically projected idea of a society of atomic physicists. Only in the end will this society own up to its creative role. This is a scary thought because that very same teleology also entails an eschatology. We have only to remind ourselves to fear not.

As a teleological social construct, we should expect that Pi will have much to tell us about ourselves. It is just one of us in a peculiar *extremis*. With patience we may see our own history reflected in its structure and its functional relations.

[10/15]

There must be something holding mathematics together. This something appears to be Pi. This is not the only entity doing so, but it appears to be the preeminent one. If that were the case then it would be fair to say that the role of Pi among other such objects reflects the role of the traditional God in the pantheon that is cosmic intelligence. This pantheon might, in turn, be considered the polyandrous consort of the Matrix. I put this forward merely as a talking point at this time.

The hope of procuring such insights is just the reason that we engage in this multilateral approach to cosmology.

[10/16]

It would be of considerable interest, and not terribly surprising, if mathematical structures reflected cosmological structures. Thus might mathematics work on both the micro and macro levels simultaneously without logical conflict. I'm suggesting an extended structuralism that would mediate the vital primordial processes. One could also imagine a universal grammar at work. Do the structures and grammars have a common source? One suspects that sacred geometry and archeoastronomy point to such a source.

From the Britannica:

[...] Levi-Strauss adopted the so-called distinctive feature method of analysis, which postulates that an unconscious "metastructure" emerges through the human mental process of pairing opposites.

So, we are looking for the metastructure that is the source of the metanarrative. That it would also be the source of logic and math is a more speculative extension. Logic could not be psychologically fundamental, it is much too abstract. We seek the Ur-logic, the pre-geometry, etc. We are hardly alone in that endeavor. In doing so I am running up against the many venerable objections of the positivists and behaviorists to holding mental contents to be real, and not merely abstract. This is the alleged 'fallacy' of psychologism as stated by Frege and many others: [Keeping psychologism in mind](#) -- Anthony Newman (MIT).

[10/17]

It is a far reaching claim that the explicit structures in the world reflect deeper implicit structures. This claim must include mathematics, especially. Otherwise we are saying that the Monster Group comes from nowhere, which is less than credible. Saying that the MG may be derived entirely from a handful of axioms is a statement that, I gather, is widely held, but it is also a statement that has not been critically

examined from any global perspective. This constitutes a curious lack of wonder on the part of, what may be, an overly professional establishment.

Roughly speaking, I am asking if there can be anything new under the sun. I am also asking about the information explosion. Consider then: [conservation of information](#) (1500 hits). The first entry is from that digital mechanic, [Edward Fredkin](#), but his most recent publication deals only with microscopic phenomena. The third entry asks about the source of biological information. There is also the issue of the objectivity of information. The plain fact is that information remains incompletely defined. There is the issue of quantity vs. quality. Can there exist either unobserved or unobservable information? But even these topics do not touch on the information content or source of mathematics.

The discovery of the [Mandelbrot](#) ([demo](#)) set was a big surprise for mathematicians. I am not aware of anyone who has attempted to measure its information content, or speculate as to its source. Does it not remain an object of great mystery? I suspect that it does point to the holographic, holistic nature of all information. As I mentioned before, even a partial understanding of the meaning of the binary set $\{0,1\}$ would require a PhD. in the history of ideas. The Mandelbrot is just one possible manifestation of the information contained in that construct.

Many of the entries indicate that it is only the Intelligent Designers who have the temerity to make an issue of the problem concerning the conservation of information. It is not considered a polite question by the establishment. We hear a lot about the limits to knowledge, but perhaps the more basic question concerns the existence of a limit to our ignorance! Frankly, I wouldn't bet on it.

[10/18]

The generating formula, $z' = z^2 + C$ ($C \rightarrow$ Mandelbrot if z' remains 'small' after many iterations), gives no hint of the complexity contained therein. What is the explanation for this complexity. Let us look at this question from both a theoretical and a sociological perspective. Here is a useful starting point: [Investigating The Mathematics of Complexity](#). The Mandelbrot may serve as a microcosm for the larger issues being raised here.

Karen points to Robert's [Fractal Geometry of the Mandelbrot Set](#). In past years I have spent some hours playing with the Mandelbrot. I had also heard of the Julia sets, but not until a few minutes ago did I realize they were intimately related: [Exploration #3](#). In fact the Julia sets are just an infinite ramification of the underlying Mandelbrot. Go to [Julia Set Applet](#) to see for yourself, and see [Exploration #4](#), and [The Julia Set Computer](#). With the Mandelbrot, I thought I had seen everything, and now I am blown away again. What are we to make of this? Julia published his work in 1918, making a brief sensation, but then it was forgotten until Benoit started his computer explorations of it in the late '70's. Note how the Fibonacci [shows up](#) in the Mandelbrot.

Mandelbrot Mystery

[Note that this discussion of the Mandelbrot began on the [previous](#) page, and it picks up again [here](#).]

If you don't mind, I'd like to do an experiment, as a follow up to yesterday's exercise. Here goes nothing and everything:

[Mandelbrot](#) (217,000 hits). That is a lot of web pages referring to a single mathematical object. A couple of hours ago it occurred to me that I might be able to take possession of this object, that is if no one else chooses to claim it. I will not even have to take it away from Benoit; just hear me out.

[Mandelbrot & mystery](#) (3,600 hits). So far so good. What does this tell us. It tells us that 98% of the websites dealing with this object do not recognize it as a mystery, nor, in fact does Benoit in a lengthy interview on his alleged baby. If he cannot proclaim what it is, then his possession may be in jeopardy, after all.

I will attempt to make the case that the Mandelbrot is the biggest mystery in the world. If that were the case, then it would be very strange that at least 98% of the sites dealing with it neglect to mention its most important feature. In that neglect and its reversal may lie the salvation of the world. Do I exaggerate? Perhaps.

It may be more than a coincidence that my very first foray into a real-time mystery was with the crop circles, and that one of the best examples thereof was the Mandelbrot formation. Was it perpetrated by Cambridge math students? Perhaps. That coincidence, I notice, accounts for several of the first hits. Let's look at the rest.

I have glanced at the first 100 of the 3,600 sites mentioned. I see nothing that is quotable. So now it is my turn.

There is no explanation for the Mandelbrot set. I do not even see the beginning of an explanation. It is surely the most surprising and one of the best known of all mathematical objects. One might suppose that this object would be the very best way to pique the interest of students in mathematics. Yet, my son, a senior in high school, has never seen it before. The websites mentioned yesterday are excellent and are aimed at high schoolers, yet, Robert fails to remark upon the lack of explanation.

Is there a lack of explanation, or should the Mandelbrot be taken to be just one more brute fact? Let us compare Mandelbrot and Darwin. The complexity of the world was claimed by Darwin to be explicable in very simple terms. It was due almost entirely to the process of natural selection or survival of the fittest organisms. This remains today the primary argument against God. Almost one hundred years later we are confronted with a single object which exhibits complexity which almost seems to rival that of nature itself. One might think, naively, that the proponents and opponents of Darwinism would be joining in argumentation as to whether the Mandelbrot set had any relevance to Darwinism, either pro or con.

[Mandelbrot & Darwin](#) (2,800 hits). Of the first 100 sites listed, the most relevant is [Fractal Evolution](#), but I am unable to grasp the author's point. Perhaps someone can help me out.

Here is my point. Should not the Mandelbrot set be used by the evolutionists as a demonstration that complexity can be sourceless. You can generate an infinite amount of complexity by following the simplest of rules. Indeed, the folks at the [Santa Fe Institute](#) are betting their careers on this alleged fact.

There is a problem, however. The Mandelbrot set did not evolve. It sprang into the world fully formed, like Athena from the forehead of Zeus. The Mandelbrot set, like the Monster group, is *prima facie*

evidence for Platonism. Perhaps this explains why complexity theorists and evolutionists are reluctant to use Mandelbrot to support Darwin. It is a sword that could cut both ways.

Fractals abound in nature, reminiscent of the Monster group's ubiquity in physics.

[10/20]

What does this tell us about nature? That nature is random? It tells us that there is self-symmetry and scale invariance. This is something far removed from the simple randomness of, say, a random dot pattern.

There is much more. There is a plethora of patterns. The patterns are not randomly located, but may be seen to be contiguously located so as to appear to 'evolve', one into the other. Symmetry abounds, yet none of it is exact.

Fractals do appear in the inorganic world, but the patterns in the Mandelbrot also exhibit a strongly organic and coherent quality. People can play games based on this quality. One player displays an odd pattern and then the others attempt to find it. One gradually develops an intimate familiarity with the 'logic' of the Mandelbrot, and, yet, there also seems to be no end to the surprises.

The Mandelbrot appears to be a self-organizing system, not unlike biological systems, and, yet, there is no self that need be postulated. There is only the simplest of generating formulas. What could be more impersonal? Self-organizing should then be seen as nothing special, but rather as a ubiquitous aspect of a thoroughly impersonal world. That, at least, is the Santa Fe creed. Is that not also the creed of the pantheist: God without God? It is the creed of the supply side, hidden hand, free marketing capitalist.

I wish to differ. I see something more. I see 'holism' at work. And if I ever wished to use 'scare' quotes, then this is the time to be scared. 'Holism' may just be my biggest stick. Pantheists do attempt to water down God, but do they succeed? That is our question. Just because God is everywhere, it does not logically follow that God is nowhere. Yes, God is now here.

My thesis is that there is intelligence in the Mandelbrot. It is a chip off the block of cosmic intelligence. And so are we.

Here is another way to put it. Here is the lesson of the Mandelbrot. That which is not forbidden is inevitable. And, finally, there is only one thing that is forbidden: the sub-optimal world.

Consider again the ontogenesis of the Mandelbrot. Consider $z' = z^2 + c$. Does that generator **cause** the Mandelbrot? I maintain not. That generator **permits** the Mandelbrot. The awesome beauty that emerges is our latter-day rainbow. We can and should take it as a sign from God that, indeed, this is the one and only BPW. Am I betting the farm on this? We'll see. If I'm correct, it is mine, is it not?

Let me, then, reiterate my claim from above. Besides you and me, the Mandelbrot is the most important demonstrable mystery in the world. It cannot be explained without explaining you and me and God.

There is a creativity, a vitality and even a playfulness in the Mandelbrot that could not be excelled by any human artist working abstractly.

Our ability to aesthetically appreciate the Mandelbrot, its ability to speak to our sensibilities indicates a common ground and source between it and us. It is a direct manifestation of the Matrix. So are we.

Is there any less profound explanation for this object? I sure don't see it. Instead, what I see is a lot of intelligent people, particularly at the SFI, studiously ignoring God's handiwork plastered all over their

walls. They have been left speechless. They may even be afraid. They should be. I am here to loosen their tongues, to assuage their fears.

On a more 'mundane' level, the Mandelbrot should help to explain the Monster. Pray tell.

The axioms of mathematics are like the above mentioned 'non-generator' of the Mandelbrot. They create a special kind of logical vacuum into which Nature or the Matrix is invited to pour itself. And that it does. There is also some filtering that goes on. There are boundary conditions to be met. The quantum arena presents a similar challenge to nature. In both cases, we end up with the Monster Group. Should we be surprised?

[10/21] [a](#)

I am trying to rationalize both the Monster Group and its role in physics. I am comparing the Monster and the Mandelbrot, claiming that neither one is causally explainable in terms of generators or axioms. The source of their complexities is the Matrix. Each is a boundary conditioned snapshot of the unlimited organicity of the Matrix. Each of the non-linear fractal 'generators' acts as a special lens which allows us to peer into the Matrix. Such fractals appear throughout nature. Nature is the outward manifestation of the Matrix, which is the inward toti-potent Being.

The Monster Group is a specialized projection of the Matrix. The Monster is a more highly conditioned form of fractal. Its symmetries are exact. It has a finite and discrete structure.

Ultimately the MG is conditioned by the cosmological anthropic principle. The MG is an important part of that cosmological bootstrap. On the other hand, it seems that the MG is to the cosmos as the Julia set is to the Mandelbrot. The Julia set is not constant the way the MG is, but it is relatively constant over significant parts of the Mandelbrot. It is not yet clear how to combine these two observations. There are probably still several missing links.

Maybe it is time to bring in the big guns: [AORSAP](#). I would further speculate that, probably in some accord with the Kabbalah, the pantheonic, AORSAP, consort of the Matrix creates an asymmetric vacuum, via the Zim-zum, which is filled in some sort of Mandelbrot fashion, with the MG serving as the Julia set in providing local, physical symmetry. Pi serves as the numerical arbitrator, and helps to determine a local Euclidean geometry.

Actually, allowing a virtual MG to vary as Julia does might be useful in a bootstrap situation. There could then be a self-tuning of the MG into an optimal state for the various physical cycles. We don't want to make things too easy for the Creator, but no point in busy work, either.

[10/22]

Permit me, please, to excerpt a recent communication:

There is a big difference between myself and the mathematical physicists. They are Pythagoreans. They put numbers first. You see that Saul-Paul wishes to build mind out of numbers:

> I would even say that Muses's speculation that consciousness should be modeled via hyperdimensional mathematics is on the right track.

Thus would numbers be the 'roots of consciousness' and of all being.

On the other hand, I am putting the Matrix first. This is the vital potency, the womb of Creation, the

fearful symmetry.

The closest I come to numerology, so far, is with the Big Six, AORSAP, which happens to include Pi as one of its members. This is the pantheonic consort, seminal seed, to the ovoid Matrix. It functions in Creation like the Kabalistic Zim-zum which starts the process of breaking the fearful symmetry of the Matrix. Recall that the Zim-zum is also the Logos or Sophia/Christ for the Christians.

The seven-fold spirit is probably a deeper aspect of the Matrix than is the Six, which would form later in the Creation. Thus would the Six be a later, more explicit, version of the Seven. There is obviously nothing very subtle about the Six.

The whole motivation for my excursion into numbers has been to defeat the Pythagorean program of mathematizing reality. My main challenge is to tame the Monster group. Let it be clear that the Monster is the created tool of God and not the other way around. My exhibit A is the Mandelbrot. That provides a relatively unfiltered peek into the Matrix, and the Monster is just a more highly structured and filtered projection of the Matrix.

All of mathematics is just the Anthropically filtered, numerical projection of the Matrix, which, in turn, is the ground and source of all being.

Mathematicians like to think of their subject in Platonic terms. It is a very orderly abstract construction, evolving from clear and simple axioms. The Mandelbrot is then a great embarrassment. They see it only as an aberration. I see it, rather than the axioms, as the source. The axioms are just a latter-day, feeble attempt to rationalize the Matrix.

What we see being practiced by Jack and Saul-Paul is the Patriarchal, sanitized version of mathematics that has come down to us from Pythagoras and Plato. They see mathematics as a way to root out the evil *Apeiron*, which was the Greek term for the fearful symmetry of the Matrix, or *prima materia*. They are simply denying the Mother.

Christianity may be seen as a step toward a balance between the male oriented prophetic tradition, and the feminine mystique of the East. I am attempting to give that balance a more rational, coherent basis. No mean feat.

This by way of providing background information for the present excursus.

[10/23]

I suggest that the Mandelbrot serves as a microcosm with respect to our scientific investigation of the world, with the computer serving in place of our scientific instrumentation and infrastructure. There is complexity, coherence and continuity wherever we investigate. One thing missing is a time dimension, but that need not detract from the analogy. Admittedly this bare analogy needs to be fleshed out. In both cases the Matrix has its work cut out for it.

This analogy pushes us further in the direction of comparing the world to a virtual reality in which fractals would play a major role. The problem would then be to create a virtual reality with distributed intelligence, as with parallel processing and object oriented programming. The time dimension would be largely taken up with cycles operating on all scales.

Our world may then be likened to a Mandelbrot set projected from the Matrix and shaped by the pantheonic AORSAP. The A&O cycle expands to include the reproductive cycles (R) of the 10^{10} distributed human intelligences that participate in the creation and maintenance of the world. The foundational Matrix ensures coherence throughout. The sun, atom and pi (SAP) are the more explicit, pantheonic, sources of coherence.

[10/24]

I have been referring to the Six as a pantheon. A more conventional term would be 'archetypal'. I suggest then that the archetype to be associated with Pi is the [ouroboros](#). In that case, Pi represents the Matrix among the Six. Previously I have associated the ouroboros mainly with the A/O cycle, and it could also be associated with the reproductive cycle (R) in general. Now, however, with Pi in the loop, it may be advantageous to consider the feminine **trinity** of Pi, Matrix and ouroboros, along with our mathematical trinity of $e^{i\pi}$. Pi may be seen as the nexus or distillation of the cyclical character of Creation. Pi, especially in conjunction with 'e' and the iota, may also be viewed as the seminal seed of mathematics, thereby representing the Six in that realm. The Six taken as one, Pi in this case, are also Matrix-like. From a strictly numerical view, $\{0,1\}$ are also seminal to mathematics, but they do not fit this broader context.

Taken by itself, Pi does not seem to manifest the duality or [dialectical](#) property that is usually associated with the ouroboros, as in its Janus or yin-yang guise. I suggest that this duality is to be found in its qualitative vs. quantitative aspect. Thus will Pi serve as the primary bridge between these realms, and become the primary source of psychism in the mathematical domain. The modern equivalent is Godel's transformation of arithmetic syntax into semantics.

[10/30]

I am working on a postmodern Just So story for Creation. In particular I examine the primal personification of the archetypal Six, **AORSAP**. The Six emerge from the relatively undifferentiated Matrix through a process of psychological individuation and projection. This process is only partially spontaneous. The potentiality of the BPW exists in a background state that is gradually materialized or substantiated in the manner I am attempting to describe in metaphorical and quasi-mythic language. Even the notion of temporal sequence must be taken as metaphorical in this pre- or supra-temporal regime. Time comes about in a bootstrap fashion with the metanarrational asymmetry of the **Alpha** and **Omega**. The present attempt to download the metanarrative into real time is one part of the teleological Creation process.

The emergence of **Pi** will be one of the more difficult parts of this story to recreate. Pi might even be the crux of the story: it sits at several significant crossroads. It has to be our main bridge from quality to quantity. In that capacity it is also the foundation for the 'unreasonable effectiveness' of mathematics, which is what keeps our trains running on time, so to speak. It is the warp and woof of our physical infrastructure. Pi may just be the buckle of our bootstrap. We shall see.

As a for instance, the Mandelbrot cardioid is the second order distortion of the complex unit circle defined by $e^{i\pi x}$ ($0 < x < 2\pi$). As we have seen, the Mandelbrot set is a numerical/geometrical projection of the Matrix, noting that Pi is also a bridge from the numerical to the geometrical and spatial systems. Its role in cyclical process indicates that it is instrumental in relating or even generating space and time.

In myths we see the personification of the archetypes. The logical and psychological regime of personification exists in proximity to the Alpha and Omega, which, in turn, have their own archetypal personification.

Pi also sits at the crossroads of the macro and micro cosms: between the **Sun** and the planetary **Atom**. It helps to define the wave-like character of atomic physics. In so doing it lays the foundation for the metabolic cycles that make up the all-important, archetypal **Reproductive** cycle. Thus does Pi quantify and reify the ouroboric nature of the world from the A&O to the Atom. Pi is seen to embody the primary projection of the Matrix. We need to explore the (social) psychology of this projective Creation. This is of more than academic interest. This is our ticket to ride the eschaton. This is where the rubber meets the

road, to once again invoke an aspect of Pi.

Pi is the prime **Logos**, the Zim-zum, the Dialectic, the Om, the seed, the Matrical/metrical mirror of Creation. No mean feat. We are simply asking for the source of the seed. A seminal, Zen-like question, this. In other words, what was Pi before it became Pi?

[10/31]

A recent communiqué: (a)

The Matrix is the relatively undifferentiated ground of being. It is potentiality.

Only by self-limitation can it create. This is spoken of in the Kabbalah, I believe. Pi is and represents the self-limiting, '[mark of distinction](#)' (N.B. the ouroboric logo). Pi yields the unit circle in the complex plane. A projective mapping can either carry the infinite plane into the circle, or the other way around. The [Mandelbrot](#) set is an actual image of the Matrix under the aegis of its self-limitation by Pi.

But Pi does more than this. It is also the self-projection of the Matrix into the realm of quantity and logic. Therein Pi acts as the glue and the seed for the entire system of mathematics. It is the 'fermentation' of this Pi 'yeast' that results in the '[Monstrous Moonshine](#)' for which Richard Borcherds recently won the Fields Medal. The resulting Monster Group contains all the symmetries to be found in particle physics, it is, in fact, the 'M' in M-theory.

I think it is not difficult then to relate the dynamical unfolding of Pi to the dynamics of the **X-event**, i.e. the Incarnation. We see there the same dialectic of self-limitation and self-transcendence, do we not? This dialectic is perhaps best represented in the symbol of the Ouroboros. That same dialectic is present in the self-replicating figuration of the Mandelbrot. Christ stands at the crossroads of the cosmos and microcosm. He is the Alpha and Omega, etc. He is the Six ([AORSAP](#)) in One.

I don't think there is any lack of material here that might beneficially be explored.

Explore it we will.

An important item that comes to light here is the historical misconstrual of the **trinity**. The Catholic church attempted to balance the gender of the trinity by appending its Mariology, yielding a quaternity. This is awkward, and is not even good numerology. The trinity must be mother, son and spirit. Feminists were on to this early on, well B.C. The matriarchy never actually disappeared. Father and son are redundant from a cosmogonic perspective, viz. Oedipus. I have mentioned the $e^{i\pi} = -1$ [trinity](#). Therein I switched the roles of 'e' & pi. All too glibly, I assigned to pi the female role. Euler's natural logarithmic constant 'e' best represents the relatively unformed fecundity and potentiality of the Matrix. Pi is the quintessential form. Pi projects and transforms, in Mandelbrot fashion, the Matrix into mathematical structure. 'i' retains its ghostly, hermetic essence.

Christ/Pi then is the first fruit of the Matrix. Thus we have the Christ/Adam connection. The Anglic homophone, Adam/Atom, may not be an historical accident. I have already alluded to the Pi/Atom connection. Most of chemical physics can be read right off of the spherical symmetries and harmonics latent in $e^{i\pi}$. In that capacity Pi stands to become the buckle of our Anthropic bootstrap, in a manner which I am attempting to grasp. I need to relate the observer principle specifically to Pi. The historical foundation for all our mensuration is to be found in the lunar/solar [syzygys](#). Only now has the atom taken precedence for measuring time as well as space. In every cycle there is a connection drawn between space and time.

A cycle necessarily involves self-similarity, constituting a primitive sort of recurrent self-measurement. If one were to postulate panpsychism, cyclic processes would be of particular interest. Or, from the perspective of immaterialism, cyclic processes might even constitute a suitable ground of being. As much as any quantity can, Pi incorporates this notion self-similarity and total symmetry. This is a significant

aspect of the Matrix. It should not be a surprise that Pi is intimately involved in defining and limiting the complete spectrum of symmetries that comprise group theory, and even the finite groups up to and including the Monster.

Pi represents an ideal form, as no other number can. It is the numerical incarnation of both ideality and of the Matrix.

[11/1]

I have been pressing the case that Pi incorporates ideality, and so perhaps intelligence, in a unique fashion amongst numbers. If this be true, then so also do the important structures of math and physics, quite apart from arguments pertaining to the quantum observer principle. Since Pi is the seed for much mathematical structure, that structure is not mind independent. Does this explain our anthropic bootstrap?

Yes, it does explain the bootstrap, provided that we understand the link between math and physics. The quantum is the obvious link. The quantum does double duty by linking both math and the observer to physics. The quantum and Pi have to compete to be the buckle of our anthropic bootstrap. We have noted the connection between the two in the context of quantum 'wave mechanics' where $e^{i\pi}$ plays a primary role.

Admittedly there has been an immoderate amount of hand-waving leading up to this point. However, the conclusion, if it can subsequently be strengthened, justifies all the hand-waving in the world. We have undertaken nothing less than an explanation of the anthropic principle without resorting either to many worlds or to an omnipotent deity. Simply by ascribing a suitable source to the evident organicity of mathematics, we can gain considerable insight into the logic of Creation. We take Pi to be a principle one of the six archetypes associated with our world. It dominates the quantifiable, measurable aspect of nature. The replicable, replicating patterns of nature must maintain a teleological coherence. Pi is the *de facto*, and allegedly the *de jure*, nexus of that intelligent coherence. Its relational, rational power ensures that the psyche is the alpha and omega of nature. It is the organizing center of mathematics, and thus for much of nature. It supplies the patterns that are the physical and logical basis of life. The Mandelbrot set is an example of its implicit powers. Pi encapsulates the holographic principle within mathematics. We cannot understand math without understanding Pi, and *vice versa*.

Pi is the proxy for the psyche, for the Matrix in the physical domain. It portends the symmetries of the Monster Group, the symmetries that provide the adequate, logical basis for life.

[11/2]

A significant monist thesis is that numbers and nature are not disparate. On a dualist or pluralist view, the evident effectiveness of mathematical physics can only be seen as anomalous or 'unreasonable'. On the one hand, we have Platonic dualism; on the other hand, we have the more monistic views of Pythagoras and Aristotle in which the Platonic forms are actively present in our world. The upshot is that nature is more formal and the forms are more natural than we had once imagined. The increasingly evident organicity of mathematics is just the flip side of the increasing mathematicization of physics. You can't have one without the other, and it is all part of the underlying holistic nature of reality.

The organic, holistic nature of the world can only be the result of its self-organizing ability. This is neither a top-down nor a bottom-up process. It is rather an ouroboric, bootstrap dynamic. We seek to obtain a handle on the bootstrap. That is the purpose of the six archetypes, AORSAP. The archetypes are the primary organizing principles of our world. We have been focusing on the last one of these, Pi. Pi is taken to be the organizing center for the system of numbers, i.e. mathematics. Pi is the ultimate source of

order within mathematics.

I have said very little about the source of the Six, except to point to a psycho-social cosmogonic dynamic. Admittedly this was only intended as a suggestive labeling of what remains a formidable mystery. The strategy herein, in keeping with the cosmic structure itself, is circular. As we repeatedly traverse the cosmic circuit, it is to be hoped that the spiral will gradually tighten up, so as to direct our attention to the key organizing principles, and then to see how they hang together within the ultimate source, or Matrix.

The focus on Pi has been motivated, in part, by the fact that mathematics is the best understood among the fields of knowledge. Understanding the organizing principle of mathematics should be instructive elsewhere. If our Six have been properly selected, then they should be mutually supportive, epistemically as well as ontologically.

Perhaps our best handle on the psycho-social dynamic is to be found in $e^{i\pi}$. Referring to this as a '[trinity](#)' (and [here](#)) was intended to be more than just a figure of speech. Comparing Pi to **Christ** might easily be seen as being grossly sectarian, grossly sacrilegious, or both. In any case, it is not a matter that I take up lightly. Rational theism is indeed a rationalization of God. Theists guard their deity jealously. I am proposing here a postmodern gnosis. While I don't expect to be immolated as were my pre-modern colleagues, neither do I expect to be embraced by my relatively 'agnostic' fellow theists. I can only point out to them that clearly we have not seen the end of God's self-revelation. The only issue then is one of truth. Pity be upon those to whom truth becomes a threat. History has never smiled on such folk.

Christianity is properly considered to be a heresy against monotheism. On that score it is an idolatry. The fact that 18 GI's were killed today in Iraq is not totally unrelated to our being viewed as idolaters in most of the world. My thesis is that Christianity was a very big step from monotheism to monism. The Trinity is essential to monism, not to monotheism. Many lives have already been lost in the confusion between the Father and the Matrix. Many more will be, before this is resolved. I strive to hasten that resolution. If I am correct about the Pi/Christ connection, then we have just made a significant step toward that resolution. On the lighter side, Robert Mapplethorpe came very close to a world shaking revelation, it's just that he mistook pi for pee. I'm glad to be able to set the record straight.

The social psychology, or small-group dynamic, of the trinity is the best handle we are likely to get on our cosmogenesis. The issue before us then is the transformation of the Three into the Six. Our numerical trinity may, hopefully, provide a clue. On the simplest level it is just a case of boxing the compass, if the compass is the complex unit circle implied by $e^{i\pi}$. The zodiacal pantheon does a similar job, as a form of celestial psychology and small-group dynamic.

Time and space are effectively defined by the foursome of AOSA: first/last & big/small, respectively. That leaves with the archetypes of R & P, reproductive cycle and pi.

[11/3]

At this point we bring on the ouroboros and $e^{i\pi}$, with the hope of connecting R & P to each other and to the other four.

The reproductive cycle is the primary bootstrap for nature. The r-cycle is similar to the A/O circuit, and it employs atoms for its metabolic base, with pi as the cyclic number. This leaves out S, the Sun. In mythology the celestial sun is often juxtaposed with the spiritual sun, which may be likened to the trinitarian Son. That is a very roundabout link between S & P, substituting $e^{i\pi}$ for the trinity. Another trinity to consider in this context is earth, sun & moon, in which case the moon would replace the iota as the hermetic link between earth and sun. Using peripheral vision one may barely distinguish yet another trinity by judiciously pairing the Six: A/O, S/A & R/P, taken as matrix, son and Hermes/spirit, respectively; or as time, space and cycle. Any cycle entails both time and space components. Thereby,

however, pi is then linked closer to spirit than to son. Such blatant shape shifting should not be unexpected as we delve back into the Matrix. That is a condition of monism.

Right now, pi is most abstract of the Six. There is an abstraction gap. The atom is the next most abstract. If we made the substitution quantum $\rightarrow$ atom, this would provide more balance, yielding AOSRQP. Writing this as SAORQP would take us from least to most abstract. We have, however, lost the pairing noted in the previous paragraph. If we try to put this into a circular form, there is a discontinuity between S and P.

[11/4]

The circular form of SAORQP may be of some interest. Cycles and circuits are then predominate in the archetypal structure, and so is the son. Previously we have seen the second member of the trinity identified with Sun and Pi, as well as the Alpha and Omega. The Six then manifest a structure similar to the A/O circuit. On this circumstance, Pi would be the new god consuming Sol, the old god, making use of the ouroboric form. What are we to make of this strange figuration?

If we distinguish two threesomes, SAO/RQP, there is a juxtaposition of the macro and microcosms, with the latter somehow representing the new order. There is also the semblance of a contrast between low and high tech. This does not fit with my previous understanding of a Millennial order. Are there shades of transhumanism here? Perhaps we had better check the archetypes again. Or will we have to take [Ray Kurzweil](#) more seriously? Before jumping to conclusions, we might compare this Six with Gurdjieff's Nine, the [enneagram](#). Let us also not forget the [I Ching](#), [Sephiroth](#) and [Zodiac](#).

[11/5]

[Archetypes:](#)

Where do the archetypes come from? In his earlier work, **Jung** tried to link the archetypes to heredity and regarded them as instinctual. We are born with these patterns which structure our imagination and make it distinctly human. Archetypes are thus very closely linked to our bodies. In his later work, Jung was convinced that the archetypes are *psychoïd*, that is, "they shape matter (nature) as well as mind (psyche)". In other words, archetypes are elemental forces which play a vital role in the **creation** of the world and of the human mind itself. The ancients called them *elemental spirits*

For now, I'm not obtaining any new insights from the traditional archetypes. Let us then continue with the trinitarian themes. With the macrocosm, AOS, we might have mother/father, son and lux/spirit. With the microcosm, RPQ, we could have mother, son and spirit; while with $e^i \pi$, it was mother, spirit and son. The archetype of the trinity is our most persistent one. RQP and $e^i \pi$ are closely fitted. ASO does not seem to fit as well. If we were to replace sol with zodiac, however, it might fit better: AZO. This leaves us wondering about the then putative $Q \leftrightarrow Z$ connection. How much of a stretch is this? Is there not a temptation to try another sequence, QRP, then R and Z are more obviously connected. The ambiguities being encountered here are part of the shape-shifting endemic to monism. Q would take on the role of matrix in its threesome. The fact that quantum physics used to be called matrix mechanics is, unfortunately, beside the point.

The quantum is the Pandora's box out of which the microcosm emerges into a definite form, Pi/Atom/Adam/Christ, when mediated by the reproductive cycle, R, within the $A \rightarrow O$ evolutionary circuit; which in its turn is mediated by the celestial cycles and precessions, as we proceed to the telos, O. There seems to be ample flexibility built into this archetypal system to allow for future evolution. We may [recall](#) the evolution of these archetypes: **SAAO** $\rightarrow$ **SAAOM** $\rightarrow$ **AORSAM** $\rightarrow$ **AORSAP** $\rightarrow$ **SAO/RQP** $\rightarrow$ **AZO/QRP**. I had been assuming that the Sun would have been the first created celestial orb. These

modifications suggest otherwise. This does exacerbate the problem of the initial and final celestial appearances. You'll notice that I am not rushing out to tackle this one. The outlook remains hazy.

I should note that biological enzymatic cycles, $\sim R$, function as efficient quantum measuring devices. The juxtaposition of QRP suggests that the telic anthropos, i.e. us, could be the outcome of a prolonged 'delayed-choice' quantum 'measurement', with π serving as our psychic proxy in this case. This suggests that Adam and Eve might better be associated with the Omega than with the Alpha, as given in Genesis. That our mythos might contain such anachronisms is not a surprise. Zodiac-style zoomorphisms might better be associated with the Alpha. The iota, $\sqrt{-1}$, in $e^{i\pi}$, shows a similarly ambiguous identity. Morphogenesis could be substituted for Darwinian evolution. All of this remains most speculative, of course.

[11/6]

The bottom line with the archetypes is phenomenology. Eventually we idealists must produce a coherent phenomenology for the Alpha and Omega regimes. We have inhabited the middle regime for millennia. The Millennium brings us into Owen Barfield's '[final participation](#)' (and [here](#), [here](#)). Using Owen's [terminology](#), 'original participation' or 'alpha thinking' is followed by 'beta thinking', or ordinary ego consciousness, in the middle regime where we are still stuck. In original and final participation the archetypal forms flow and come alive. Panpsychism becomes explicit. In order to participate, we must anticipate the resurrection of the forms. In the Millennium we will, to a degree, be back-engineering the Creation. We must understand the system of archetypes in order to properly modulate the flow of events so as to effect our optimal participation in them.

Of immediate significance is the nature of the initial departures from ordinary physicalism and from the ego consciousness associated with it. It is possible and even likely that aspects of the 'new age' movement portend such developments. Need we mention lucid dreaming? We should make note of any new developments in holistic health. Even the rise of autism could be a negative premonition, and there may be more than a few such negativities. Drug fads may partially mask deeper, spontaneous psychic shifts. The varied phenomenology of 'close encounters' deserves attention in this regard. The reenchantment of the world will be a bumpy road, and it will behoove us to anticipate or quickly recognize the more significant of the bumps.

Science, more or less wittingly, will necessarily participate in the phenomenology. Consider the opening in the heavens rendered by [Hubble](#). It would be quite premature to say that astronomy is not currently involved in finding its way back to some of its archeo-astronomical roots. The Internet and virtual reality are among the modern technologies that seem to be playing into and guiding our shifts in consciousness away from 'beta thinking'.

By the time we awaken to the above developments, we may realize that they are already far advanced. It will be very difficult, even impossible, to effectively distinguish between subjective and objective elements of a shifting phenomenology. That difficulty will only make us more keenly aware of the monistic nature of the world. The shifting norms of epistemology quickly subvert purely ontological schemes.

[11/7]

A notable feature of AZO/QRP is the pervasive duality with respect to linear and circular. A&O mark the end points of our linear time frame, while Z represents cyclical time and a spherical sky/earth. π , of course, is the ratio of line to circle. The quantum, Q, evolves in linear fashion until a measurement, e.g. R, is performed. What I'm lacking at present is a psychological analog for this duality. I would note,

however, that causality is usually taken to be linear unless a specific feedback mechanism is introduced, as in the case of self-organizing systems. Non-linearity is the natural state for most processes. On the other hand, cyclical process are the mark of biological systems.

[11/8]

I'm thinking there is a missing link. We have a micro and macrocosm, but no mesocosm. In esoteric studies the mesocosm is usually identified with the anthropos, or the primordial or universal human. In the prophetic tradition this is Adam/Eve, or Adam Kadmon in the Kabbalah. However, from the pervious discussion ([1](#), [2](#), [3](#)), it might make more sense to take this archetype as the alleged incarnation. We then have the following scheme: **AZO/X/QRP**. The missing element now is the Matrix. It remains as the source of being. The third member of the trinity also remains implicit in this particular representation. We'll have to see if this move from 6 to 7 buys us anything.

[11/9]

I wish to explore the pantheistic, or, more accurately, the pantheonic aspect of AZO/X/QRP. Z is just a pantheonic version of the zoomorphic zodiac. The second person of the trinity is often referred to as the Alpha and Omega. However, the Alpha can also be seen as the Creatrix or Matrix, or as the Father. R may be seen as the microscopic clone of Z. It represents the various biochemical cycles. Both Q and P partake of the dialectic or ratio between linear and non-linear or circular. This renders them more ouroboric. As the most formal or formed element of the Six, Pi may be positively compared with X. Relative to the Q, however, and in the terminology of the Sephiroth, it would be on the pillar of 'severity', along with the father. There is a bit of the paper/rock/scissors type of contextuality here, lending itself to the cosmic ouroboric psycho-dialectic.

The contention is that the Seven may be seen to have spontaneously evolved in a bootstrapped, psychodynamical manner within the Matrix. The teleological constraint is the overall optimization leading to the BPW. Thus do I attempt to rationalize Creation.

Ouroboros:

[...] the infinite circle of its body is a boundary between what is and what isn't. To the Egyptians it represented the end of time when Ouroboros, the creator god, turned back on itself.

Stated explicitly here is the duality of the ouroboros: it is the symbol of both continuity and [discontinuity](#). [also see [12/3](#)]

[11/10]

It is the nature of the psyche to be both inclusive and exclusive. The ability of the ouroboros to express this duality impressed Carl Jung. Also expressed in the same symbol is the self-reflexivity, self-organizing power of the psyche.

The first and last threesomes of what are now our seven archetypes of cosmology, AZO/X/QRP, strongly incorporate the power of the ouroboros. This quality provides an adequate basis for panpsychism and, then, immaterialism. The anthropos, X, and the ouroboros cover the macro, meso and microcosms. The anthropos is necessarily the buckle of the ouroboric bootstrap.

Even the cellular nature of biology should be implicit in QRP. The cell is to the organism as the anthropos

is to the cosmos. R expresses the metabolic imperative of life. Q & P express the symmetric and atomic basis of any metabolic system. The organizational hierarchy of the cosmos then follows, which is to say its microcosmic and holographic structure. Is this to say that the psyche is necessarily embodied? Only in general. The psyche is nothing if not creative. There cannot be a Creator without a Creation. Creatio and Imago are not the same. The Creation is nothing if not creaturely and participatory. It is intensive while the Imago is just extensive.

I cannot claim to comprehend the intensity of creation. It seems to be intensive approximately to the degree that it pushes the envelope of monism. The BPW is as pluralistic as the law of monism possibly allows. The pushing of that envelope may have something to do with the objectifying of pi. Our seemingly endless fascination with that quality/quantity may not be epiphenomenal in this scheme of things. Pi comes as close to mind-independence as one can get. In the context of $e^i \pi$ it is a proxy for the mind-independence of atoms. The logical fact that it cannot fully exercise that proxy is a crucial statement of monism.

It appears, however, that Pi is more than a proxy for the mind. Well, wait. It is the philosopher's stone in the universe of quantity. It provides the organizing principle for most of mathematics. It is, then, equally the proxy for mind in math and for math in mind. In linking math and mind it replicates the function of the anthropos in linking creator and creation, and in linking macro and microcosms. The observational and normative/functional quality of Q & R, respectively, completes the close assimilation of QRP to X. In much the same manner the metanarrational A & O are also assimilated to X, leaving us with Z.

Z manifests the dynamic equilibrium of the psyche. Z is our constant ouroboric link back to the Matrix. It is the necessary proxy (and metronome!) for the still remote A&O archetypes. The dual function of Z in both linking us to, and separating us from, the Matrix is stunning in its extremity, I readily concede. It pushes the same envelope and to the same extent as is pushed by Pi. Our understandings of the organic abstractions of Z & P should be mutually reinforcing. The sky was to be the first frontier of our minds and the final frontier of our materialism. It was long anticipated that our fascination, and then familiarity, with matter in all its forms would finally bring us to glimpse our own reflection in the reflective potency of the material world. We would finally grasp the significance of the Six and then see ourselves as the Seventh. We see through the glass darkly.

Tar Baby

Is Uncle Remus about to go the way of Aunt Jemima? Let's hope that we can preserve the best and move on.

Science and religion, over the centuries, have grown much too comfortable in their mutual neglect. The few lackluster exceptions help only to prove the rule. The same habit of neglect now carries over into their lack of regard for Postmodernism and the New Age movement. Holistic health, in the latter case, however, is a more substantial exception.

How much further to the Millennium, us kids in the back seat would like to know. The foundations of materialism seem as strong as ever. The two main cracks in that facade, mind and the quantum, can continue indefinitely to be treated as mere puzzles, it would seem.

Any cosmology requires its epicycles. Hindsight will show that materialism has acquired far more than its share. Even the truest believing Ptolemaist would have to blush at the sight of it. Will this Rube Goldberg system collapse under its own weight? If it were going to, it already would have, and long ago. It just keeps on trucking.

We can only borrow a page from the book of Copernicus. A little coherence can go a long way, especially if there is no competition. Our minds thrive on patterns and stories. We are witness to a mushrooming plethora of each. There is, however, no meta-pattern, no meta-story. The lack of any such cohering center has led to rampant intellectual and spiritual fragmentation. This fragmentation is no healthier for society than it is for the psyche. The depth of our anomie can hardly be fathomed. There is nothing present to which it may be compared. We have no choice but to slog on.

The only coherent world is the best possible world. There is no coherence in being second best. My own little contest is to remain near the top of Google's [BPW](#) heap. That is my 'tar baby' strategy.

With each long page, coherence comes one page closer. In this age of exploding fragmentation the number of loose ends to gather up is nondenumerable. With sufficient patience, however, a new pattern gradually asserts itself. It takes on a life of its own. The new cosmos emerges out of the miasma of its disintegrating predecessor. If it is anything at all, it will have to become remarkable. And then, one fine day, Brer Fox will no longer be able to ignore it. Well, you know the rest of that story....

Our work on the archetypes is far from finished. It's hard for me to believe that it [began](#) here, in explicit fashion, over six months ago. If there is progress to be made in this endeavor, we have made [some](#). Immaterialism is a very slippery beast, and any handles to be found on it are invaluable. We may have [seven](#) of them. This exercise is as much epistemic as it is ontological. We can judge the archetypes only by the fruit they bear. Their relative consistency, though, is a prime consideration, and we have already explored this to a fair degree. Settling on a stable set of archetypes brings us a long way toward rendering plausible the fact that we do inhabit the BPW.

As with any puzzle, the addition of each piece renders the rest of the pieces that much easier to fit. Of course, there will be misplacements, requiring significant backtracking. But even significant mistakes can be informative.

Something mentioned frequently in these pages is the '[unreasonable effectiveness of mathematics](#)' (UEM) (note the old URL). Its source remains obscure. Let me attempt to shed some more light on it.

A closely related issue is the source of mathematics. I have discussed the Pythagorean vs. Platonic views of the matter. (Hold the phone! I have just discovered Amazon's [new search feature](#), and I'll test it here. Oh dear, it does appear that one can use this feature to read through the book in stepwise fashion. The publishers may decide there will be too much cheating. It's nice while it lasts.)

As with any new gimmick, it is easy to get sidetracked. While looking up UEM on Amazon, I got sidetracked by Michio Kaku's [discussion](#) of reductionism vs. holism in theoretical physics. Remind me to come back to this later.

The unity of math and physics depends largely on symmetry principles, all of which have specific mathematical expressions. That just pushes the question back a step: from whence comes symmetry? In a [recent page](#) on this topic I simply posited an 'initial' state of total symmetry. This is begging the question. Will every possible symmetry be realized? Can there exist unknowable symmetries? This parallels the posit of unobservable worlds.

[11/12]

In the present scheme of things, mathematics is ontologically overprivileged. In too many people's minds mathematics represents the highest level of existence. This is the view of Pythagoras, Spinoza, Einstein, etc. I have been at pains to present a more holistic or integrated picture of mathematics relative to the rest of the world.

Mathematics may be seen as one of many human skills. As such, it is correlated with diverse skills whose origins remain obscure: verbal, artistic, moral, aesthetic, pattern recognizing, game playing, technological, social, etc. It is an integral part of what we call 'natural intelligence', as if there might be any other.

There are many normative and aesthetic aspects of math that cannot be formalized. Even the nature of proof remains informal, not to say, entirely elusive. Above all, mathematicians pride themselves on their consistency, and, yet, that factor seems to have as much to do with aesthetics as it has to do with logic.

Given an immaterial world, are we surprised to find a mathematically describable order? Yes, and no. Let's face it, our world is 'unreasonably' coherent. Mathematics comprises a significant part of that coherence, but that statement can in no way be quantified, or even well qualified.

Atoms and humans are generally law abiding, atoms rather more so. But, with the advent of the quantum, who is to draw any logical distinction. Observation, only ever normatively defined, is not epiphenomenal to any quantum phenomena. And what are these laws of physics? Nature is lawful to a surprising degree. There is no logical way to distinguish the lawfulness of physics from the lawfulness of nature. And are we not all part of nature?

We cannot imagine a world that has no logic, or is not quantifiable. If ours were not so, and to such a considerable degree, then, probably it would not be compatible with any form of intelligence. The non-intelligible world is just a non-world. Is our world minimally intelligible? No. It is optimally intelligible, according to my informed opinion.

Biology and technology (is there a real distinction?) both rely on the quantifiably predictable nature of the world. If the laws of nature were not sufficiently formalizable, there would be no nature to speak of. Yes, nature does stand on formality. Don't we all? Just don't ask me or anyone else to formalize the formality.

The world is a surprising place, and optimally so, I would say. Living without a constantly evocable sense of awe is simply not living. Mathematical effectiveness is awesome, and so should be everything else. (Should we expect anything less from our BPW?) And, by god, we ain't hardly seen nothin' yet.

Fine, but how does it actually work? We are in the process of finding out how the world works. Scientists presently think they know much more about that than they actually do. Their sense of awe has been singularly suppressed, in a manner that would be criminal if it weren't so naive. The only thing that scientists really understand is the formalism of their own formalities. What they like to think of as their success is a pale shadow of where we are all headed. If such a severely straightjacketed mind can be so 'successful', then we know nothing of success.

Math works because it has to? To fully understand why, is also to understand how. That we distinguish the why and the how is just another reflection of our abysmal ignorance. We are merely taking a few faltering steps toward reintegration. The disintegration of the world is 98% in the eyes of its beholders, not to belittle that residual 2%.

The main problem for us immaterialists posed by atoms is the apparent independence of their existence. They seem to do just fine on their own, to the degree that we may wonder why they ever bothered to produce us creatures. The fact, however, that the world has not disintegrated and that we are still here, may indicate that atoms are not as quite independent as the materialists would like us to believe. On the contrary, it is not difficult to get the impression that there is more than a bit of atomic conspiracy taking place behind the scenes.

What's an atom to do? How does an atom come to know what it's supposed to be doing in any given circumstance? Atoms are moved by forces, or course. Every particle is acted upon by every other particle within the visible universe. They do this by exchanging **virtual quanta** of each of the four known force fields. This is a mind boggling mess of interactions to be sorting out for every instant of every particle's existence. I just don't think that Occam would be happy with such an extravagant picture of microscopic existence. There must be a simpler way to run the world.

[11/13]

It's not going to be easy to wean ourselves away from atoms. They have a beguiling simplicity. Unfortunately they are too simple to explain the world. We have then only two choices. We can work from the bottom up, in a step-wise fashion, or we can go the other way.

Science has chosen the former path. It is arduous, a quality recommending itself to our residual puritanical inclinations. It also promises to be minimalistic: to be maximally sparing in our ontological commitments. We remain committed to reductionism, only accepting as irreducible those items that have been forced upon us, and about which we think we have a thorough understanding. That is the way science is supposed to work.

The practice of science is something else. In practice it is only the physicists who are given ontological license. They are relatively free to invent elaborate structures, but only of a mathematical variety, and only in support of their hoped for **Grand Unified Theory**. Everyone else is only granted provisional, *ad hoc* license. All the other sciences proceed phenomenologically. Given any complex system, they apply labels to persistent or recurring phenomena and hope to be able to quantify and formalize them to some degree. There is virtually no attempt to explain or predict these phenomena on first principles, i.e. starting from the basic laws of physics and working back up. Only thus does the spirit reductionism maintain its iron grip on ontology. It must always be given the benefit of the doubt. Reductionism has actually never completely explained anything, not even in physics. But by the same token, it has never been demonstrated that there is any phenomenon that is irreducible in principle.

Reductionism is an all or nothing commitment. There is no such thing as partial reductionism. It is a thumb in the dike situation. If one irreducible property is permitted, then there is no longer a logical defense against an ontological flood. This is a precarious situation. The reductionist status quo is maintained so carefully in science just because it is so precarious. There is no logical middle ground. Non-reductionism necessarily entails downward causation. With downward causation there is no limit in the upward direction. In other words, there must be a finality to final causation, a Telos for teleology. Naturalism is just the attempt to formulate an atheistic non-reductionism. It is simply a new form of panpsychism, pantheism and, inevitably, mysticism. Nothing to recommend itself to the spirit of rational inquiry.

Here you see the only other path. We trade reductionism for coherence. Unfettered coherence necessarily entails cosmic intelligence and the Best Possible World. Easier said than done. It will be a long slog from materialism to immaterialism. As in any long journey the first step is the most difficult. Given the present unstable equilibrium in our postmodern world, the taking of one convincing step toward metaphysical coherence could hardly be anything less than earth shaking. Look, Ma, no atoms....!

The archetypes are nice, but can they do the job? Heretofore, archetypes have been introduced only in an implied dualistic context, as something to be appended to the physics. The singular step to coherence will be to show how the physics may be appended to the archetypes. Physics becomes epiphenomenal.

The primary tool at our disposal will be the principle of sufficient reason: nothing happens without a cause. Most simply, this is just the obverse of mysticism. Here the quantum is on shaky ground. What are we to do with spontaneous events? We may invoke hidden variables, Probability, or a strong observer principle. Beyond this fly in the ointment, the **PSR** is good to go, with all us rational folk. Things get sticky only when one speaks of final cause or downward causation. Speak of it we will.

To cut to the chase, the shaking will come when we can derive [QRP](#) from AZO.

Starting with a totipotent, toti-symmetric Matrix, I posit a symmetry breaking, thereby taking my cue from the physical cosmologists. Here, however, the primordial symmetry breaking is not spontaneous. It is self-sustaining as a deliberate departure toward cosmic self-realization. There is a cosmic schism into a pantheon of 'personalities', a cosmic MPD, if you will. It would involve a daisy-chained, ouroboric, bootstrap dynamic. This is the primal psychic circuit 'emerging' from the Matrix, but beyond all space and time. I label this as the Zodiacal archetype, or just Z.

The metanarrative that we call Creation emerges as the dominant gap between the 'head' and 'tail' of the Ouroboros. This is just our Alpha and Omega. The symmetry breaking discontinuity (spark gap?) between the A&O becomes our historical time frame. So much for AZO. We now have to confront the actual 'mechanics' of this bootstrap process.

[Previously](#) I have speculated about the 'cloning' of the Z cycle. Well, no. The Z already is the potential for every cycle. According to Leibniz' other great principle, the Identity of Indistinguishables, there is ever only one Z. It is tantamount to the Matrix itself. What happens to Z is more akin to spectrum analysis. It is self-analyzed into its logical constituents. It is the mutually compatible and supporting cycles that are sustained. In symbiotic fashion they reintegrate into mutual coherence. Our space-time frame is defined and fleshed out in this manner.

For example, there have been some spectacular solar flares in the last couple of weeks. To grasp this phenomenon we may appeal to atoms or to the PSR. Provisionally assuming a more or less [heliotropically](#) explained sun, we go on to consider its details. First of all, why the details? Why not just place a nice round sunlamp in the sky, and leave well enough alone? There are two reasons for the details. No, make that one reason: aesthetic. God and the Devil are in the details. The fascination of this world is in its details, in its photo-realistic quality. Painters and animators have their work cut out for them, not to mention the scientists.

The aesthetic of nature lies simply in its naturalness. It all hangs together in a self-contained cosmic PSR. It does not appear artifactual. Is not the avoidance of artifice the first and last measure of great art? Surely then, God has outdone herself, just ask your friendly local atheist! It is the bible thumpers who are exercised with God's subtlety. It makes their job so much more difficult.

So did God just say, let the sun be natural; let it have eruptions? Where then, we might wonder, is the model of solar naturalness? Where is the [Jurassic Parc](#)? No, Virginia, there is no model. There is no Garden of Eden. This is it. It's all happening right here, right under our noses, or, perhaps, behind them.

Next to the PSR, holography is our touchstone. If you have seen one physical phenomenon, you have seen them all. If not, then you weren't looking closely enough. Holography is a manifestation of the [GUT](#), and *vice versa*. But does that mean that someone has to calculate the dynamics of a solar flare starting from first GUT principles. I hope not. I'm not volunteering. God is not a workaholic, certainly not in that slide-rulerish fashion. With God, if you have done one calculation, you have done them all, as with the Z-cycle. With all our super-computer calculations and simulations we are only gilding that lily. None of our calculations is wasted, it's just that we may not fully comprehend the reason for them.

With that warm-up, here is my solar narrative. It may not measure up to Rudyard, but it could still suffice. Fluid dynamics is ubiquitous. To chug-a-lug a brew is to get a pretty good feeling for it. The art of imbibing is a fine art. I won't, wouldn't, couldn't, say how God discovered/invented this art, but, obviously, it was much too good to be missed, even hard to be missed, given metabolism and all. And, given the demand, it sure helps to have a goodly supply on hand, and so we quickly get into oceans and atmospheres, you know, the hydro-cycle. With nature it's as below, so above. Storms down here, storms up there there, and, presto, you have your basic solar flare, after figuring in some textbook style magnetohydrodynamics, love that word. If one were to dream up a sun, then chances are pretty good that it would have a few flares, fifteen at least. Now there is just a minor logistics problem. We must arrange for the flares to be where the astronomers can see them. For some folks, the logistic is the whole problem. I can say, *folie a deux*, and you can say, no, pinch me and I'm awake. Admittedly, this is not quite a sequitur, but I'm counting on you to catch my idiomatic drift, nonetheless.

[11/14]

[**Folie a deux**](#): a madness or fantasy shared by two. If I'm correct, ours is a fantasy shared by several billion, not counting our furry and feathered friends.

From [All-Experts](#):

F24 -- Induced Delusional Disorder:

A rare delusional disorder shared by two or occasionally more people with close emotional links. Only one person suffers from a genuine psychotic disorder; the delusions are induced in the other(s) and usually disappear when the people are separated. The psychotic illness in the dominant person is most commonly schizophrenic, but this is not necessarily or invariably so. Both the original delusions in the dominant person and the induced delusions are usually chronic and either persecutory or grandiose in nature. Delusional beliefs are transmitted this way only in uncommon circumstances. Almost invariably, the people concerned have an unusually close relationship and are isolated from others by language, culture, or geography. The individual in whom the delusions are induced is usually dependent or subservient to the person with the genuine psychosis.

This 'rare disorder' is precisely the basis of our reality and all reality. It seems to fit very snugly into our monistic context. Every religion, every cult, and even science also fit this mold to some considerable

degree. So, yes, there can easily be fantasies within fantasies. No one doubts that the mind is fertile, but very few suspect how fertile. I am here to raise our suspicions. God is the great Inductor. We are her unwitting co-conspirators.

The hermetic alchemist mixes together two chemicals that have never been mixed before. Something will have to happen. The PSR will fill in the blank with a teleological turn, it has nowhere else to turn. After that, our collective expectations can be given full power. One may willingly deviate from those expectations only with considerable force of mind. That deviation may be labeled as either madness or magic. It all depends....

Galileo turned his new instrument to the sky. He saw the Mandelbrot we call Nature in greater detail. It was a surprise, but it also fit the larger pattern. The Hubble does the same. But now we see a surprising organicity emerging. Does it not compute? Does it reveal any brush strokes? Not unless you have a scorecard; something which I attempt to provide.

Does the Mandelbrot not compute? Is it truly a mystery? How could it be so precisely replicable if it does not precisely compute?

Here's the deal w/ computers, and everything else. Computers aren't real. Mind is real. Minds are a bit less so. The multiplicity of mind is illusory, but it is a very functional illusion, come Creation time. Bodies are very important appendices to certain kinds of minds, but are still epiphenomenal relative to the latter. Going on down the *scala natura*, mind wanes, illusion waxes. If computers had a mind, they'd be real too, but, alas alak, strong AIers chaseth after the wind.

There is in Plato's heaven something resembling Alan Turing's universal computer. It never crashes. Our pc's down here struggle to emulate her. We test them down here by giving them Riemanns and Mandelbrots to chew on. If they don't chew properly they are casteth upon the junk heap. The Mandelbrot we know and love is the survival of the fittest. The generating function, $z' = z^2 + C$, is a bit like the alchemist's empty retort. The Matrix abhors the vacuum, and pours herself in. You cannot do more than five zooms on the MB without seeing something no one has seen before or ever will again. Yet, there she is in perfect harmony. It is a piece of heaven dropped into just your lap. The perfect detail surpasses any dreamt phantasmagoria. You pinch yourself and you are awake.

Take one pixel on the screen and calculate its iterations by hand. If you are careful you will get just the right color. Where is the magic? As I keep trying to say, it is everywhere, which need not entail that it is also nowhere. It is just that our minds become surfeited if we are not careful.

By the same token, telepathy preempts telephony, but don't tell that to Ma Bell or she will put static on your line. Telephony is a functionally restricted form of telepathy, along with a few extra bells and bills. How else are we to share thoughts in the mental cacophony we call modernity? With the wireless Internet, we are moving toward a less restrictive medium.

One may more easily imagine the Matrix impressing herself upon a quantum computer, but the digital domain should be too restrictive. By the same token there could be a soul hiding in every pc. Determinism, however, is not the issue.

[11/15]

What I may be running into here is the problem of self-similarity. This is the type of symmetry manifested by the Mandelbrot. Self-similarity is ubiquitous in nature. It also relates to the problem I was getting at earlier concerning [virtual quanta](#). Permit me to divert back to that problem and see if we can make any connections.

You may not have heard of the 'ultraviolet catastrophe'. I am not referring to the ozone hole, but rather to a fundamental problem of theoretical physics. It has to do with the self-energy of the electron.

By symmetry, the force field around any point source will vary as the inverse square of the distance from the source. As you approach an electron, its electric field tends toward infinite strength. A static electric field is a form of potential energy. The energy density is proportional to the square of the field strength, so it will vary as the inverse fourth power of the distance. The total energy is proportional to the volume, which, for a sphere, varies as the distance cubed. Within any sphere centered on the electron, the energy of the field inside that sphere will always be greater than the inverse of the distance. Thus the self-energy of any point source would be infinite. From special relativity we know that mass is proportional to energy, and so the electron would have an infinite mass. One way to avoid the infinity is to posit a finite radius for the electron, thereby placing an upper bound on its mass. I have just stated the problem using 'classical' physics, but the same problem occurs in the quantum theory of the electron, but in this case the field energy is quantized into virtual photons. The cut-off then takes the form of an upper bound on the photon energy, which is colloquially referred to as the 'ultraviolet cut-off' thus avoiding the 'ultraviolet catastrophe' for the self-energy of the electron.

The more technical term for the limitation of the self-energy of point particles is 'renormalization'. This was always one of the most contentious areas of physics up until the invention of 'string' theory, which effectively eliminated the problem of point particles by replacing them with strings of finite radius.

[11/17]

Part of my tar baby strategy in these pages is to reawaken our sense of the mystery of the ordinary. The strategy of materialism, in contrast, is just to put us to sleep, as in the 'slumber of materialism'. Materialism accomplishes this death of the spirit by means of a 'thousand cuts', i.e. by its analysis and reductionism. To resist the atomization of the spirit requires an act of deliberate naiveté. In keeping with the present context, let us reconsider Newton.

Newton was astonished and mystified by his own theory of gravity. Gravity, it turns out, is at once the most mundane and most exotic piece of physics. Imagine trying to explain gravity to a premodern. The hardest part would be to convince them that it even existed. How does one do that? We do that by playing ontology. The first move in any ontology game is analysis. It is like cutting the calf out of the herd. Before that time, the calf and herd were inseparable. Only by gross intervention against that natural order do we accomplish our objectification of the calf *vis a vis* the phenomenal herd. Look at this process subjectively and historically. Consider our long hard slog from tribal mind to ego mind.

Imagine trying to explain the concept of self-interest to the primitive tribesperson. Even the concept of self would be utterly alien. There would be virtually no such thing as self-consciousness. There would be no comprehension of abstraction. Even today, we are fascinated by Robinson Crusoe. To the primitive mind, separation from the group is identical to death. There is literally no distinction between death and banishment. Now, to us moderns, self-consciousness is something that we have to struggle to overcome.

Only to those of us immersed in the space age, is gravity truly objectifiable. Newton was simply the first citizen of space. Or perhaps it was Descartes who objectified space with his coordinate analysis of it. Be that as it may, the objectification of gravity, space and time went hand in hand, and together they constituted an enormous, and now almost unimaginable, mental leap. We are trying to look at one part of that leap.

The problem for Newton was the 'action at a distance'. How was it that the earth and moon, separated by thousands of miles, could exert a force on each other? Now we know the answer. It is by means of a force field. We simply put a label on the mystery, and it is no longer mysterious, we think. The fact is, though, that centuries later, the explanation of gravity remains the biggest challenge in physics. Only by

invoking the Monster Group, the biggest mystery in mathematics, do we even hope to 'explain' the biggest mystery in physics. Our attempted objectification and reduction of gravity is actually turning out to be the *reductio ad absurdum* of reductionism itself.

What is a force field? It is what we now call a 'counterfactual', i.e. a sometimes useful conceptual fiction. Let us attempt to analyze 'counterfactual'. In order to do so, we must invoke modal logic, a very controversial metaphysical concept itself. To make sense of modal logic we must invoke the concept of 'possible worlds'. Uh, oh! Now I'm in trouble. Am I not about to deconstruct my precious BPW? I would do that gladly, in order to prove my point.

I wish to reconstruct or reenchant gravity. To do so, I must deconstruct its prior scientific deconstruction or reductive analysis. This is a two-step process. First we return gravity to its Newtonian-style, singular, mysterious objecthood, and then we nudge it back into the holistic phenomenal subjectivity of our one and only BPW, i.e. back into the primal 'dream-time'. I am not thereby turning the clock back, but rather advancing it into our Millenarian act of ['final participation'](#).

If the apple were to become detached from the tree, it would fall, under the influence of the gravitational field, and strike Isaac on the head, thereby propelling him into knighthood. Such is modal logic. How innocuous is it? We analyze modality by the reification of the non-denumerable set of all possible worlds. There are actual forces and possible forces. A force field is just the sum of all possible forces associated with a given source. My charisma is just such an attractive force field. It is the potency or potentiality of my charming presence. It is my magical aura. Is the gravitational aura of a given body any less magical? Certainly it was not to Isaac and his contemporaries. Only now can its familiarity breed our indifference to its mystery.

How do I work my attraction? How does a body work its gravitation? By influence. By sympathy. I vibrate, you resonate. Our spirits are moved to want to come together. If the earth and moon are spiritless, then how are they moved?

In science text books, force fields are reified by drawing in the lines of force, like so many little strings. It is as if the earth had the moon tethered by means of these lines of force. Force may be transmitted by an intervening substance, e.g. a rope. In our case, there is only the intervening emptiness of space. But this can be fixed. We posit the 'ether'. The ether is posited simply as an otherwise undetectable medium with the sole purpose of transmitting gravitational forces and electromagnetic waves. Case closed? Yes, for awhile.

The ether was subsequently deconstructed by Michelson & Morley, and Einstein. Or was it? One explanatory fiction was being replaced by another. Instead of the ether, we now had the space-time 'manifold'. Was that not progress? After all, both space and time are independently and objectively measurable. The deconstruction of the ether, logically, could only be had at a price. The price was the reification of space and time. Prior to Einstein, and going back to Descartes, space and time were independent absolutes. They could be reified only by bringing them into the physics arena where they would logically fall under the sympathetic influence of every other physical entity. And so, notoriously, they did. Instead of two independent abstract entities, we now had a single physical 'manifold' subject to every physical influence.

With Descartes, space and time were the frame of physics, but now the frame had been sucked into the action. The consequence would inevitably be dire. Overnight, our supposedly eternal universe became unstable to self-eradication. There could no longer be a gravitational balance. Now the space-time manifold could and would collapse as if under its own weight. Albert, in a desperate attempt to save the apparent cosmic stability, introduced his 'cosmological constant', and thereby committing, by his own later admission, the 'greatest blunder' of his life. As it turned out, the cosmic appearance would soon be saved by a very much more extravagant device: the notorious Big Bang, in whose shadow we now, oh so, contingently, and, yes, mysteriously, exist. End of story? Not on your life! But I cannot leave Albert

unvindicated. Ironically, even the mind blowing extravagance of the Big Bang, it turns out, is not sufficient to save the celestial appearance. Oh, no! Albert's constant has now officially been exhumed, much to his posthumous, but now embarrassing, vindication.

Now begins the fun. It turns out that the physicists have not been able to leave bad enough alone. Things get worse, much worse. Do I chortle? Only with dramatic license, but I do sincerely admonish. There are lessons yet to be learned, even, and especially, by the most learned amongst us.

Matter bends space and time, but how? How does the space-time manifold know how much it is supposed to bend? That information must be communicated, somehow. **Communication** implies a transmitter and a receiver. Each elementary particle must be able to bend the entire universe, or else none will.

[11/18]

It seems that the choice is yours, and it is obligatory. You will get stuck to a tar baby, and there are only two around. There is the one made of atoms, and the other made of coherence. You pick up on one and let the other ride. All else is mere cacophony.

The materialists are stuck with the atomic baby. The more they struggle to overcome its incoherencies, the stickier it gets. I have spoken of the ultraviolet catastrophe or incoherence. We avoid an infinite mass for the electron by using the topology of supersymmetric non-Abelian gauge theory to turn the electron into a string of finite dimension, all eleven of them! No mean feat!

Next comes the **infrared catastrophe**. This is just the flip side of the UV problem. If I recall my history, the IR catastrophe was invoked prior to the advent of strings in order to explain quark confinement. That was about its only ever useful attribute. Otherwise, it spells nothing but Trouble. Physicists like to brag about how they finally solved the [UV problem](#) (2,500 hits), but they are pretty quiet about the [IR problem](#) (400 hits).

I see from the UV list, however, that I woefully neglected a major point. The cousin, or actually grandfather, to the UV catastrophe is the UV cut-off in the black-body radiation spectrum.

[The Ultraviolet Catastrophe:](#)

The first crack in the edifice of classical physics came with attempts to explain the colour of hot objects using classical physics and electromagnetism. The light from these objects is a mixture of different frequencies (colours). Observations reveal that such objects have a distinctive spectrum (pattern of energy distribution at different frequencies). However attempts to explain this in classical terms failed abjectly - they predicted instead that the amount of energy would tend towards infinity at the high-energy (violet) end of the spectrum - an ultraviolet catastrophe.

It was Max Plank in 1900 who 'solved' this problem by introducing the Quantum of light. Talk about the Big Sticky!

The UV problem turns out to be almost single-handedly responsible for the shape of modern physics. It is not subtle. The IR problem is more subtle. It is still sneaking up on us. The UV problems provoked most of modern physics; the IR problem provokes only hand waving. The UV problem is a photonic energy problem. The IR problem is just a photonic, or, as in the following example, a gravitonic population problem. It is also emblematic of the incoherence of atomism.

Let us return to our [communication problem](#). Consider galactic superclusters. Our Milky Way galaxy belongs to the Virgo supercluster. Our local Andromeda group orbits within it. The superclusters can be hundreds of millions of light years in dimension, and contain upwards of a hundred thousand galaxies, all

moving under a mutual gravitational attraction. Using high-school physics one may easily calculate a typical gravitational force exerted by the supercluster.

Moving on to graduate level physics we would say, following Einstein, that the gravitational force is transmitted by the bending of the space-time manifold, i.e. it is a bulk property of the manifold. Thus we have explained the phenomenon of supercluster gravitation. Should we not leave well enough alone? Perhaps we should have, but it is too late to turn back now. This is the atomic tar-baby in action.

The human mind seeks coherence, and this is true even for atomists. They did achieve an enormous success with the [Grand Unified Theory](#) of Howard Georgi and Sheldon Glashow, based on SU(5) symmetry. There was then, however, an irresistible temptation to quantize gravity. There was no way that the atomists could have walked away from this challenge. Only in retrospect might it be seen as leading to their undoing. The intellectual juggernaut of scientific materialism was not about to stop on a dime. And, besides, mere matter no longer mattered. It was the mathematically besotted Pythagorean physicists who would now lead the materialist parade to the brink, like so many Pied Pipers. Resistance was muted. Could their followers not see the looming Monster? There must have been great ambivalence inside the intellectual fortress of materialism, or was it hubris? The atomic tar-baby was now disguised in a mathematical garment of ravishing elegance.

Should we have been surprised by this turn of events?

[I return to gravitons briefly [below](#).]

[11/19]

Indeed, what might we have expected from science with some educated hindsight?

Certainly the existence of atoms should have been no great surprise, having been anticipated for more than two millennia. Predicting the existence of rudimentary chemical reactions forming molecular compounds from the elemental atoms was equally a no brainer.

But could we have anticipated technology? Certainly not in the first instance, but let us examine the question further. If we had set out as materialists, in the footsteps of Democritus, Epicurus, Lucretius, etc., and not been distracted by Cartesian dualism, then we could have anticipated significant aspects of the Anthropic problem. That is, without being able to appeal to a Creator or to an immaterial mind, there was going to be a lot of explaining to do. There would be placed upon matter a heavy explanatory burden. Without a Creator, there would have to be a gradual evolutionary process providing for the emergence of biological forms. There could then be a partition of the explanatory burden between evolution and its physical base.

Only gradually, over the course of science, has the enormous complexity of the world impressed itself upon our minds. There are two domains of complexity: the physical and the biological. Our understanding of the complexity in each of these domains has grown in an independent but parallel fashion. In the process of attempting to explain one fact, more facts requiring explanation come to light. As our technology evolves, our increasing observational acuity provides us with an ever more detailed picture of nature, with most every one of those details needing to be explained. As the scope of our knowledge expands, there is an exponential increase in the possible correlations in our data, many of which manifest significant patterns.

One of the potentially most significant correlations to be drawn is between biological and physical complexity. To what degree may the biological complexity be taken to be independent of the physical? Logically there must be some dependence, and the preliminary investigations of the anthropic problem indicate there could be a strong dependence. It certainly should not be surprising that there would be.

As our investigative tools become increasingly complex and sophisticated, the measurements they produce will be increasingly removed from and devoid of normal sensory experience. The patterns produced will correspondingly be recalcitrant to verbal description. The abstract nature of the data, and the desire for greater precision, require the quantitative collection and treatment of it. The resulting patterns will then only be amenable to mathematical treatment.

We then have to inquire about the complexity of mathematics, and particularly concerning its correlation with biological and physical complexity. What of our capacity for mathematical cognition? A universal computer or Turing machine is, conceptually, an exceedingly simple device; yet, such devices are able to perform enormously complex feats of calculation and analysis. Their complexity resides almost entirely in the software. Mathematics could be an entirely learned skill. The only issue would be the nature of our learning capacity. The consensus is that our learning capacity is strongly correlated to the complexity of our nervous system.

[11/20]

It occurs to me that I may have been asking improper questions. I have, for instance, asked how it is that mathematics and physics come to be related to each other. That is not a proper question for an immaterialist. The proper question is how did we come to think of them as being somehow separated. Was it merely an accident of our intellectual history that we came to regard mathematics and physics as separate entities?

The impropriety of this question came to light in the above discussion of complexity. In the primal context there would not be separate types of complexity. Ur-complexity, like the ur-cycle or Z-cycle, emerges from the Matrix all of a piece. It is later that we come to see it as existing in diverse contexts. Complexity is the entanglement of diversity. A diverse Creation will necessarily be complex. The complexity will appear in a holographic or holistic fashion. Only as we analyze the holograph does the complexity takes on its analytic guises. It could then appear in the form of the Mandelbrot, the Monster Group, proteomics, string theory, neuroscience, etc. Complexity arises as **we** extract, or abstract the [QRP](#) from the AZO. The emphasis here is on 'we'. 'We' designates the cosmic intelligence of which we humans may represent the greater part.

This shift in emphasis from the part back to the whole may signal a significant shift in, or perhaps a tightening up of, our explanatory and narrational strategy, and that would certainly be the case with regard to the scientific aspect of the story. It simply appears that I was not being sufficiently consistent in my storytelling. I was too easily backsliding into the analytic, atomistic mindset. Does this mean, however, that it will be more difficult to speak to the scientists? That remains to be seen. Inconsistency, though, is seldom beneficial, and especially not when communicating difficult ideas. There will be some reshuffling here as our ducks get a realignment.

It is the math/physics separation that we should be discussing, not the connection. In regard to our strategy, perhaps a Piagetian approach to a developmental cosmic psychology would be appropriate. On [second thought](#), my dialectical, transactional, constructivist, structuralist approach to developmental cosmic psychology may be closer to that of Lev Vygotsky. But let's drop the name dropping for a bit.

The archetypes emerge in constructivist fashion, first AZO, then QRP, with the latter emergence being mediated by X. The separation of Q & P is at issue, with their representation of physics and math, respectively. Together, and along with the bio-cycles, R, they are, 'following' AZO, emerging from the Matrix. It is the zodiacal transactions that do most of the pushing. The incarnational aspect is being mediated by X into R, which then differentiates into physics and math.

[11/21]

I'm getting into even deeper water than usual. I struggle, I flounder, but can I turn back?

The zodiac speaks to phylogeny. A, O & X speak to regeneration. With R we have a reproductive ontogeny on the macro side of the bio-cycle. X & Q speak to incarnation and the bridge between mind and matter. Now we just have to take these, along with Pi, and spin a yarn, but I'm still missing the primal constructs for Q & P.

Q & P are both involved with cycles, projections and symmetries, and let us not forget the quantum 'trinity' of $e^{i\pi}$. But I still don't see a yarn. Z & R are cycles, *simpliciter*. A, O, X, Q and P are crucially and disparately involved in the completion of circuits. P may be a stand-in for X in the mathematical domain. The lack of full symmetry here may be crucial to the dynamic; however, Q & P may be related to A & O, respectively. The Matrix, A and Q express potentiality, and exhibit indefiniteness. They are sources of being. Under the influence of Z, O, X, P and R, Creation is played out on various levels. P operates through Q to enable R. X, P, Q and R are strongly involved with anthropics and incarnation. Pi, particularly in the form of $e^{i\pi}$, and operating on M & Q, generates the symmetries that are subsequently broken. These symmetries include those of atomic and particle physics.

[11/24]

I will be away for a few days, and in the meantime I have been reviewing the role of memory. I am further inclined to discount memory in favor of direct perception of other times. Our singular Creation is forever. Access to it is restricted to various modes. Time asymmetry is subjective.

I was going to say that the substance of atoms was related to memory, but that it too restrictive, by the foregoing atemporal hypothesis. Now I can only reiterate that being is relative, mainly to the cosmic self. This is the omnipresent cosmic self, of which we are the reflective agents. Our participation in that presence has been greatly attenuated, but now it will becoming less so, as we gain in our gnosis. Technology facilitates this change, but only at the behest of the spirit. Our sense of temporality is a measure of the attenuation of our perceptions. The archetypes should remain unscathed by this continued downplaying of the temporality of Creation. The logical role of the Logos is unaffected by this issue. The cyclical or circuitous nature of being is emphasized thereby.

[12/2]

Still struggling to line up my loose ducks. The time away has left me with a desire to return to the basics of mind and matter, leaving alone the archetypes, for the nonce.

Meanwhile, I must note the [recent review](#) of Simon Conway Morris's new book, [Life's Solution: Inevitable Humans in a Lonely Universe](#). It is a surprise to see Morris's explicitly theistic resurrection of a Lamarckian style of teleological convergence, even being neutrally reviewed in the NY Times. He digs up many not previously collated examples of convergent evolution. The Darwinians are accused of treating this evidence with a not so benign neglect. The personal conflict between Darwin and Lamarck has left its scars on the history of biology. Morris points to the 'self-congratulatory atheism' of many modern Darwinians. He takes pains, however, to distance himself from the creationists.

One reviewer takes Morris to task for not giving sufficient credence to the self-organizing ability of matter. We are entitled to wonder anthropically, however, about the extent to which this ability must be based upon the intricacy of the mathematical symmetries which actually comprise what we so glibly refer to as 'matter'. Where would biochemistry be without the Monster as its platform?

A notable link between mind and matter lies in the notion of complexity. The epistemology and ontology of complexity must be closely correlated. Mathematical complexity resides on this divide. Scientific realism pushes us to the side of ontology, even at the expense of forcing us to embrace Pythagoreanism. Why so much complexity in the world? Is there an optimal complexity? How does the value of diversity weigh into this equation? Are our seven archetypes sufficient to account for the complexity?

[12/3]

I find this [abstract](#) (*Complexity International*, 2001) useful, coming from a [pickle maker](#), no less, Russell Standish:

Numerous definitions for *complexity* have been proposed over the last half century, with little consensus achieved on how to use the term. A definition of complexity is supplied here that is closely related to the Kolmogorov Complexity and Shannon Entropy measures widely used as complexity measures, yet addresses a number of concerns raised against these measures. However, the price of doing this is to introduce context dependence into the definition of complexity. It is argued that such context dependence is an inherent property of complexity, and related concepts such as entropy and emergence. Scientists are uncomfortable with such context dependence, which smacks of **subjectivity**, and this is perhaps the reason why little agreement has been found on the meaning of these terms.

And from the same paper:

Emergence is that other area of complex systems study that has experienced controversy and confusion. Its importance stems from the belief that emergence is the key ingredient that makes a system a complex system. Putting things colloquially, emergence is the concept of some new phenomenon arising in a system that wasn't in the system's specification to start with. There is some considerable debate as to how this happens, or whether emergence can truly happen within a formal system such as an agent-based model Rosen, 1999; Funtowicz and Ravetz, 1994.

These references lead me to a Virginia locale ([VCU](#), [VT](#) (N.B. the [ouroboric](#) logo)) for [biosemiotics](#). This might provide us, over here, with a counterweight to [Santa Fe](#). A site search at Santa Fe for [biosemiotics](#) comes up empty handed. This is more than a bit odd, more than just an oversight.

The ouroboros is used above as a symbol of semantic closure. What is the simplest system exhibiting this property? According to Godel, it is just the arithmetic system. This is not quite accurate.

According to [Alexei Sharov](#):

Biologists may ask why to use semiotic terminology in simple population models? In particular, why to talk about semantic closure instead of self-reproduction? "Self-reproduction" seems to be a convenient term that does not have uncertainties associated with signs or semantics. But this simplicity is illusive; self-reproduction includes the word "self" which comes from the field of semiotics rather than physics or biology. In the process of self-reproduction, an organism defines itself; in other words, self is what is preserved in the process of self-reproduction. Self-reproduction is simultaneously a process of self-measurement, self-interpretation, and communication from parents to offspring.

Semantic closure entails the big R, as in AZO/X/QRP. The minimally complex system exhibiting self-referential symmetry in a metabolic context would entail QRP.

But what is communication and what are signs? We are used to these terms because we use signs in our everyday life. But is it possible to define a sign without referencing to **humans**? I am going to show that this is possible using the conception of **semantic closure** (Pattee 1995).

I demur: thus X. The simplest 'autonomous' system would include X/QRP. And why metabolism? The quick answer invoked symmetry. The only way to go much beyond the complexity of Z is to use the

ordering principles of space-time. Relationalism in this context is enforced through metabolic constraints, as in R. The aesthetics of naturalism quickly lead to anthropics and then to MG and so back to Pi. I am just reminding myself of the BPW aspects of complexity. There would be no need for greater complexity unless we wanted to go beyond our allotted 10^{10} souls. There are ample aesthetic reasons to restrain ourselves in this respect.

Back to mind and matter. Does complexity entail mind, or is it spontaneously emergent? As Alexei proposes, might we have semantic closure without X? Even the most radical biosemioticians, at best, seem only to invoke a diluted panpsychism, not unlike the [quantum mind](#) crowd. I must show that panpsychism is incoherent. Of course, I have been arguing this all along.

Let's see what Howard Pattee has to say, [Artificial life needs a real epistemology](#) (1995): :

Life is peculiar, said Jeremy. As compared with what? asked the spider.

When a problem persists, unresolved, for centuries in spite of enormous increases in our knowledge, it is a good bet that the problem entails the nature of knowledge itself. The nature of life is one of these problems. Life depends on matter, but life is not an inherent property of matter. Life is peculiar, obviously, because it is so different from nonliving matter. It is different, not so obviously, because it realizes an intrinsic **epistemic cut** between the genotype and phenotype. Our knowledge of physics, chemistry, molecular biology, genetics, development, and evolution is enormous, but the question persists: Do we really understand how meaning arises from matter? Is it clear why nonliving matter following inexorable universal laws should acquire symbolic genes that construct, control, and evolve new functions and meanings without apparent limit? In spite of all this knowledge, most of us still agree with Jeremy.

A good statement of the problem.

Metaphysical questions, like whether reality is material, formal, or mental, are empirically undecidable, but nevertheless, discussion of these concepts are an important part of scientific discovery. Historically we have seen concepts of reality shifting ground and new horizons discovered, especially with the advent of quantum theory, computation theory, and cosmology. The question is: Can artificial life add some new ideas to the problem of knowledge and the **epistemic cut** or will it only increase the confusion?

Ditto. My quarrel with the biosemioticians is that they do not take relations and holism with sufficient seriousness. My contention is that the minimal semantic (ouroboric) closure is just AZO/X/QRP. Attend to the singularity of the BPW. There can be no lesser worlds than the BPW. Even I had been wondering if God would need to intervene to abort lesser (spontaneous?) creations. I think not. They would be self-abortive. Relationally, they could exist only as appendages to the BPW. Their only identity would be in their functional relevance to the BPW, e.g. certain angelic orders. Otherwise any contingently incorporated selves are welcome to join the big metabolic party. Such subsystems exist mainly in the cosmic imagination, e.g. Jurassic Parc. The BPW is unanalyzable. Our AZO/X/QRP mnemonic is just that, a mnemonic.

Occasionally Pi threatens to detach itself from our metabolic party, in some Platonic fashion. Not to worry, God keeps Pi on a short leash, or, at least, in a [small boat](#). In short, the BPW is its own relational tar baby. You can't live without it. It would be like taking a fish out of water, or a materialist out of a space-time manifold.

It seems as if the world could fall apart at any minute. The more realistic concern is that it might fall together. But neither is truly possible. All things in due course, i.e. according to script. If you wish to see an atomized God, just look in the mirror.

Speaking of atoms, perhaps I should reiterate the graviton problem. How does it differ from the photon problem? What is the difference between seeing stars and being gravitationally attracted to them, from a purely (fictitious!) physical perspective? The retina can do a sum over photons to allow perception of the

dimmest stars. Not too big a deal. Photonic emission and absorption are strictly a surface phenomena, and they involve putatively real photons. Gravity is a volume phenomenon involving putatively virtual gravitons. There is no emission to speak of, or even to think about. The gravitons hang in the air, probabilistically. Who calculates the probabilities? That's my problem. Strictly, this is not different for photons, but it underlines the problem in the most emphatic manner possible.

One can do the mathematical physics of a sand pile, without seemingly having to invoke any notion of micro-computation on the part of the individual grains. They just do their physical stuff. But in speaking of quarks and virtual gravitons, we must appeal to much more abstract symmetries. Each *potential* interaction necessarily invokes the whole of the Monster Group, which, recall, is quite as bulky as Jupiter. The number of potential types of interaction at any instant is then the bulk of Jupiter times the bulk of the Super Cluster emission volume, measured also in quarks. If you think that Times Square is busy, well, think about what is going on in the micro space of every single quark in your body, 24x7. This is panpsychism with a terrible vengeance. Imagine trying to describe this to a child. Would she not think you were pulling her leg? By God, somebody around here is doing a lot of leg pulling, and if you think it's me, well, better check again! Can no one else see that this King is naked? Here endeth the **graviton** story.

But we must go beyond panpsychism. Three centuries of science have been expended in removing the psyche from nature. Its success remains controversial. The psyche is slippery. It keeps slipping back in. It seems to haunt every dark corner, and some corners that aren't so dark. It keeps being swept under the rug, but soon it piles up, for all but the doggedly oblivious.

Nature has been carved into myriad specialized fields. None of the fields logically overlaps. On every boundary accumulate the leavings of the psyche. The apparent messiness of the academic situation is simply an artifact of the analytic process, pushed well beyond its design limits. We proceed to trace the leavings of the psyche, attempting to track it into its lair.

The fact of the matter is that we can define neither complexity nor computation objectively. They are ineluctably functional and normative. Thus the biosemiotic loop must include the subject. Panpsychism does not fit this bill. It is not sufficiently relational or holistic. The Telos may not be deconstructed. It is an all or nothing proposition. We cannot look our gifted, ouroboric Telos in the mouth. All cycles are a spin-off of Z. Every one is functional and contextual; none can exist beyond the orbit of the Big Seven. That is truly beyond the pale.

The biosemioticians would like to take their holism in measured doses. Someone will finally convince them that immaterialism is not a twelve-step program. There is an emphatic gestalt switch here which may not be avoided. You either get it or you don't. When it comes to breaking the habit of materialism, you just have to go cold-turkey.

Why does our millenarian script have to include this quantum jump of the mind? Frankly it makes for a better story, IMO. We have to turn over a new leaf. This was meant to be a dramatic cosmos. And it is. Even the most refined of equilibria must be punctuated on occasion. This is one of those. This will be our paradigmatic asteroid, out of the blue.

Will this trauma be too much for the collective psyche? It will push the envelope of our 'sanity' to its limits. That is just how it was designed from the git go. We are given the opportunity to clear the pipes of our psyches. This is an opportunity we will not wish to refuse. Waking up from the slumber of materialism will require more than a gentle tap. But we must be confident that the only violence will be to our misconceiving egos. There will be no call for, or tolerance of, any other duress.

What about the more colloquial or mundane adjuncts of materialism? I would like to have more to say about the cultural aspects of the Millennium, but I am not feeling disposed to transgress my metaphysical calling, for whatever it may be worth. Once we see the general direction we're headed, the path will be relatively easy to discern.

In the terminology of Howard Pattee, if the [epistemic cut](#) is arbitrary, then we have no business making it at all. The incoherence of the epistemic cut is simply the incoherence of Cartesian dualism. The further we push that cut into matter, the more we must appeal to a unifying cosmic psyche. There is no such thing as half a psyche. Even the dimmest of psyches must partake of that logical whole. Only its access is limited.

Semantic closure must finally be all inclusive. The many sub-loops can convey only partial or tentative meaning and information. The further that any loop becomes detached from the totality, the less becomes its coherence. This all inclusiveness is just the hallmark of natural intelligence as opposed to its artificial interlopers. Accept no substitutes.

[12/4]

Howard Pattee, [Evolving self-reference: matter, symbols, and semantic closure](#) (1993):

A theory of emergent or open-ended evolution that is consistent with the epistemological foundations of physical theory and the logic of self-reference requires complementary descriptions of the material and symbolic aspects of events. The matter-symbol complementarity is explained in terms of the logic of self-replication, and physical distinction of laws and initial conditions. Physical laws and natural selection are complementary models of events. Physical laws describe those invariant events over which organisms have no control. Evolution by natural selection is a theory of how organisms increase their control over events. A necessary **semantic closure** relation is defined relating the material and symbolic aspects of organisms capable of open-ended evolution.

Howard was considered courageous among biologists just for attempting to delve into these murky issues. I now have to refute his bold effort.

[...] self-reference that has open-ended evolutionary potential is an autonomous closure between the dynamics (physical laws) of the material aspects and the constraints (syntactic rules) of the symbolic aspects of a physical organization. I have called this self-referent relation **semantic closure** (Pattee, 1982) because only by virtue of the freely selected symbolic aspects of matter do the law-determined physical aspects of matter become functional (i.e., have survival value, goals, significance, meaning, self-awareness, etc.).

I have emphasized in many papers (e.g., Pattee, 1969, 1972, 1982) that the matter-symbol **distinction** is not only an objective basis for defining life but a necessity condition for open-ended evolution.

Like all dualisms, this must be incoherent. Is not a symbol just about the least objective thing in the world?

Biologists call this matter-symbol **distinction** the phenotype and genotype. Computationalists call this the hardware-software distinction. Philosophers elevate this distinction to the brain-mind problem. What is not as well known is that even in the formulation of physical theories a form of matter-symbol distinction is necessary to separate laws and initial conditions.

Nice try, Howard.

For my argument here, I will mean by matter and energy those aspects of our experience that are normally associated with physical laws. These laws describe those events that are as independent of the observer as possible, i.e., independent of initial conditions. The laws themselves are moot until we provide the initial conditions by a process of measurement. Laws and measurements are necessarily distinct categories. Laws do not make measurements, individuals make measurements. Measurement is an intentional act that has local significance and hence involves symbolic aspects usually in the form of a numerical record. This is the **physical basis** of the matter-symbol distinction.

You have just begged the whole issue, Howard. Since when is a measurement physical? In that sense, initial conditions are not physical, they are normative. Laws are also symbolic and normative. Where is the distinction? Where is the **physics**? If there is any physics, which I doubt, it must be a Kantian noumenon. Everything you speak of is phenomenal. The initial condition for the cosmos must be something like our AZO/X/QRP. Nothing less will ever fly. Nothing less could have semantic closure. There is no epistemic cut. Everything is episteme. The only substance to the world is its relational coherence. That coherence is the present noumenon and then the ultimate phenomenon, as it is finally, eschatologically revealed.

From the origin of life and evolutionary perspective the **most difficult problem** is how material structures following physical laws with no function or significance were gradually harnessed by syntactical rules to provide function and significance as symbols (e.g., Pattee, 1969; 1992). **I will not say much more about the origin problem here.** For several reasons, one of which is its difficulty, the origin of symbols is not considered one of the central problems in any area of philosophy or science. Another reason is that for most scientific models it is not necessary to know the nature or origin of symbols. Natural language, logic, mathematical symbol systems, and computers are most commonly treated simply as well-developed tools, and for most models there is no need to ask how they originated.

Thank you for your honesty, Howard. But is this not throwing in the towel? Are you not then whistling in the dark? How will you know if you are looking at the problem backwards, upside down and inside out? You are ripping out some of the scraps, treating them entirely out of context, all in the name of scientific progress. Why not just give coherence a chance?

[...] Material reductions are certainly one necessary type of model for understanding symbol systems.

However, I am not a reductionist in the sense of those who claim that symbols are "nothing but" matter. "Nothing but" implies that the only model that is required to understand symbols is a complete materialist or physical law model. Reductionists are generally happy when they have discovered the material correlates of higher level behavior. My position is that no complete physical description of these material structures, although correct in all details, will tell us all we need to know about their symbolic function.

[...] I will only elaborate on the well-established value of using complementary models without entering into the **undecidable metaphysical issue** of which model represents reality. Complementary models are well-known in physics. Particle and wave, microscopic and macroscopic, deterministic and stochastic, coarse and fine grained, reversible and irreversible models are necessary for fully understanding any complex system. Rosen (1977) has usefully defined a measure of system complexity by the number of models that we require to adequately understand its behavior.

Well, somebody will eventually have to address the metaphysics. To assume that you can do the physics without the metaphysics is to presuppose a non-contextuality. This is just to prejudge the whole ball game.

Symbols are difficult to define in any simple way because symbols are functional, and function cannot be ascribed to local structures in **isolation**. The concept of symbol, like the more general concept of function, has no intrinsic meaning outside the context of an **entire** symbol system [...]

The concepts of closure and entirety are virtually synonymous. Gnosis and coherence are all or nothing. We are able to survive on scraps of knowledge only because the noumenal coherence acts as our invisible hand, on all levels of our existence. We put up with ignorance only because we can imagine no alternative.

The reason that laws cannot describe symbol function, or any function, is because we specifically restrict physical laws to describe only those properties of matter that are, by principles of invariance and symmetry, as independent of observers and individual measurements as possible, as I stated in Sec. 2. This is necessary to achieve the characteristic universality of laws. Symbols, by contrast, are generated with few physical restrictions but are eventually selected for their contribution to the survival of individual

units in a **local** environment.

Is the contradiction in these two sequential definitions of symbol not perfectly stark? For Howard, contextuality seems entirely fungible. Survival is sometimes a local issue. Evolution, by definition, cannot be. By not paying attention to the metaphysics, Howard loses the thread of any logic. Without a compass, you are bound to walk in circles.

Of course if one believes that everything is a computation, or that by improving simulations they will eventually become realizations then one sees no matter-symbol problem (Pattee, 1988). At the other extreme there are physical reductionists who see symbols only as an illusion, like phlogiston and the ether, that will be unnecessary when an adequate material description of symbolic behavior is found (e.g., Churchland, 1981; Crick, 1993).

[From Complexity to Simplicity: Nature and Symbols](#), Arantza Etxeberria & Alvaro Moreno (1999):

The question is: do control constraints **arise spontaneously**? Many researchers expect that the science of the future will explain the evolutionary transition leading to closed organizations solely by means of physical, dynamical theories, such as self-organization. Although this may seem to be the ideal kind of explanation, Pattee's work, in fact, aims to show that such explanation is not possible, because there are in principle problems to reconstruct the causal sequence leading to the production of a control hierarchy and its typical interactions.

I'd like to see someone pick up on this point. It is not clear from this statement whether the problem is only epistemological or is actually ontological. Is Pattee alleging that the origin of constraints is a case of 'strong emergence'?

Once again I find that biosemioticians are masters in the avoidance of metaphysical commitment. The state of the art of this avoidance may be witnessed in a [collection of essays](#) noted just one year ago. This avoidance is in the venerable tradition of the 'linguistic turn' in philosophy where the strategy is to talk every problem to death. Is this not what semantics is for: Rhetoric?

[12/5]

Organicism, functionalism and biosemiotics are non-reductive in a similar fashion. They take emergent properties seriously, while downplaying their ontological commitments. They must all, however, deal with the problem of closure. It is here that they stumble. Howard Pattee emphasizes closure more than the others, and yet he fails to do it justice. Closure is a more emphatic instance of holism. It embraces coherence.

The bone I must pick is with the notion of partial or local closure. There is the local pluralism of Pattee & Co., or there is the global monism of the BPW sort. When Quine [introduced](#) semantic holism to the philosophical community, it was not of the partial or local variety. Anything less than a complete holism ought to verge on the oxymoronic, one would think. Yet, somehow, the problem of completeness has eluded the biosemioticians. The reason must be that they remain committed to evolution. They see biological holism or organicism as an emergent property. It is something that can reemerge and operate in a local context.

More directly put, the biosemioticians remain anti-teleological. In like manner, they eschew vitalism. To do otherwise would be to invite a confrontation with the biological establishment, a development that this already fringe group could ill-afford. Into their silence, we must venture.

[Naturalism](#) is the defining term here:

Naturalism, as a larger category than materialism, can give a more credible account for moral realism than the narrower thesis of materialism. Naturalists that allow for essences and **teleology** can account

for morality as part of human flourishing and natural properties of the universe, but this requires a pluralist ontology. Naturalism in a classic sense of this word (ala Aristotle) is a "**thick**" naturalism that holds that things have natures and essences. Value is irreducible to physical properties. Value, such as moral properties, can be found in natures; fact and value are linked, and morality flows from this view. It is metaphysically and normatively rich.

The **teleology** (a) mentioned here must be highly restricted: a minimalist teleology. This 'thick' naturalism is what the biosemioticians are attempting to reintroduce, as a pluralistic counter to reductive, monistic materialism, or simply physicalism. That there is a slippery slope from naturalism to supernaturalism is evidenced by the wariness with which the materialists treat these back-sliding neo-naturalists.

Let us reconsider Quine's language model. Natural language is the model of a complete, holistic system, and, yet, supposedly, it did evolve ex nihilo. It is an entirely emergent system. Or is it? Once again, I must demur.

I submit that natural language could have evolved only in the context of a organismic or holistic natural intelligence, only in a society of conscious agents. I apply the same model to the 'emergence' of biology. I do not accept the notion that language and thought are synonymous. There must exist archetypes of the form of AZO/X/QRP well beyond the confines of space and time, as the necessarily anthropic context of Creation.

[Jaegwon Kim](#)'s critique of non-reductive physicalism still stands, but his 1989 'Myth of Non-reductive Materialism' is not available online. Instead, we may examine **William Hasker's** [How Not To Be A Reductivist](#), (2003):

"Non-reductive" accounts of mentality are relatively common these days; it is widely recognized that certain kinds of reductivism should be avoided. However, on closer examination it often turns out that these accounts are reductive after all in a way that undermines the significance of mentality – and, it will be argued, results in a position that is in the end simply untenable. Not being a reductivist requires going further in the other direction than a great many philosophers are willing to go.

Bill has an interesting thesis, but first I must apologize for missing an important book: [The Last Word](#) by Thomas Nagel (1997). Check out the last chapter, "Evolutionary Naturalism and the Fear of Religion," by searching on '[religion](#)':

My guess is that this cosmic authority problem is not a rare condition and that it is responsible for much of the scientism and reductionism of our time. One of the tendencies it supports is the ludicrous overuse of evolutionary biology to explain everything about life, including everything about the human mind. Darwin enabled modern secular culture to heave a great collective sigh of relief, by apparently providing a way to eliminate purpose, meaning, and design as fundamental features of the world. (p. 131)

And this coming from a staunch anti-theist. Then referring to Charles Peirce's fervent naturalism:

The reason I call this view alarming is that it is hard to know what world picture to associate it with, and difficult to avoid the suspicion that the picture will be religious, or quasi-religious. . . . Even without God, the idea of a natural sympathy between the deepest truths of nature and the deepest layers of the human mind, which can be exploited to allow gradual development of a truer and truer conception of reality, makes us more at home in the universe than is secularly comfortable. (pp. 129-30)

[...] I suspect there is a deep seated aversion in the modern "disenchanted" Weltanschauung to any ultimate principles that are not dead -- that is, devoid of any reference to the possibility of life or consciousness. (p. 133)

But as Mark Johnson has said to me, if one asks, 'Why is the natural order such as to make the appearance of rational beings likely?' it is very difficult to imagine any answer to the question that is not **teleological**" (p. 138 n.).

Thomas is not pulling any punches here. Certainly there is a refreshing honesty coming from the

academic heartland, a turn that I had almost discounted.

[12/6]

As effectively as anyone, William Hasker and Thomas Nagel have described the awkwardness of academia's attempt to disentangle itself from the centuries of its deconstructive reductionism. The slipperiness of the reconstructive slope is what makes this incipient back-sliding so problematic for the otherwise thoroughly secular mind. Once you let the teleological genie out of its bottle, God only knows what havoc may be wrought.

In grappling with teleology you are, very simply, grappling with a tar-baby. My entire thesis is just that there can be no teleology without a singular Telos, which, quite logically, is precisely the BPW. It is not particularly controversial to point out that virtually any form of non-reductionism is latently, if not patently, teleological. Thus it is impossible for the materialists to retreat into a 'thick' naturalism without finding themselves falling under the influence of the Great Attractor that is the Telos. Kim and Nagel acknowledge this fact reluctantly, Hasker enthusiastically. The rest of the intelligentsia? They remain stoically silent. Something will break their silence, and not long hence.

We ought to wonder where are William's theological colleagues. The paper to which I have [referred](#) has been published by [ISCID](#) &ff., ironically an organization with which I recently interacted. Perhaps we can trace Bill's theological connections through it. Two of his [books](#) were previously published by [IVP](#), and two others by Cornell. This is hardly a low profile theologian. Here is a [critique](#) of his 'emergent dualism'. Let me examine the [ISCID journal](#) for any other traces of the Great Attractor.

The first paper in the same issue as William's is Timothy O'Connor's [Groundwork for an Emergentist Account of the Mental](#). **He defends an ontological account of emergence in place of the more prevalent epistemological accounts. As for the reason for the disparity:**

(I have the impression in discussing this matter with other philosophers that many think that if there were emergent properties, they would be ubiquitous in nature, appearing at many or all importantly unified levels of natural organization. This strikes me as a groundless judgment.) More generally, the commitment to micro-reducibility, particularly among philosophers, is partly an overreaction to the now **falsified crude** conception of levels of nature propounded by early emergentists, one based in a much simpler picture of higher-level phenomena than we have at present.

Well, pardon my 'false crudeness'. So much for coherence! On the last two pages of the paper, Tim grapples with the emergence of selves:

Taking the phenomena of freedom of choice seriously brings yet further difficulties. It appears to involve the idea of a fundamentally personal causal capacity to initiate behavior for the sake of reasons. If there is such a capacity in normally-functioning, mature **human** beings, one should be able to determine the precise underlying properties on which this distinctive capacity depends. Conversely, what structural transformations in the human nervous system would result in long-standing (or permanent) loss of this capacity?

Is there to be a recognizable personal self in Tim's ontology? If so, is that not a folksy or 'crude' kind of emergence? He seems to waffle on this point. If one admits a unified human self, have not the worst fears of the materialists and secularists very nearly been realized?

In the third paper in this issue, [Functionalism Without Physicalism: Outline of an Emergentist Program](#), Robert Koons defends his own 'neo-functionalism':

There are two critical differences between Functionalism and Neo-Functionalism. First, as I have said above, Neo-Functionalism rejects the causal closure of the domain of first-order physical states. Neo-Functionalism embraces genuine, emergent downward causation, causation that makes an ineliminable

difference to the objective chance of physical events. Second, unlike Functionalism, Neo-Functionalism is not committed to denying that mental states lack any intrinsic character. For Neo-Functionalism, higher-order, mental and other **teleological** states are first-class citizens of the ontology, not an ontological free lunch. These higher-order properties have instances in their own right -- they are not merely instantiated by virtue of the instantiation of other, first-order properties.

It would be hard to be more ontologically committed than this.

In fact, in *Realism Regained*, I gave several arguments for thinking that it is effect-tropes that necessitate their causes, and not vice versa.

Can anyone be more blatantly teleological? Robert goes on to employ the Principle of Least Action (LAP) in physics as a model for mentally mediated teleology. This is his TPE, Teleological Propensity Enhancement, model. Darn, why didn't I think of that? Indeed, our BPW may be viewed as a ramified LAP/TPE on the cosmic level. I had better flesh this out, in due course. I do speak only semi-facetiously of God's laziness, or, more accurately, her minimalist proclivity w.r.t. Creation. This is just the Tom (Becky?) Sawyer model of Creation.

I'm getting a clearer picture now of why my rear end got [canned](#) over at the ISCID forum back when. There is some pretty direct competition going down here. They promote a piecemeal paradigm shift. I'm holding out for a piece of prophetic drama, i.e. millenarian revelation. You takes your choice and you places your bet. Where's [Jimmy](#) the Greek when we need him? Les jeux sont fait?

[Robert](#) may just be my most formidable competition in this moderate crowd. But where does he sit w.r.t. the BPW? His evolutionary ontogeny ('emergent dualism?') is pretty much in the mold of the moderate [ASA](#). When the IDers latch onto this Neo-functionalism and TPE business, they are more likely to make a federal (cosmic, cosmogonic) case out of it. They're not going to like the BPW metaphysics, but it won't be so easy for them to avoid it, especially not if I have anything to say about it. Are they not already out sniffing in these precincts?

[12/7]

The ones who are missing in action are the Christian idealists, i.e. [Jack & Co.](#) at Oxford, not to mention [Owen](#). Have they left no remnant? Even the Christian Science immaterialists have fallen on hard times. The closest to such a remnant, outside of the pantheist tradition, may be the [New Thought Movement](#) of 'religious idealists'. It now seems to include some process theology as well. Actually I'm impressed with this [NTM](#) home page. What's going on here? Has the action picked up since their Bicentennial conference? I notice, however, that Alan's featured [New Thought Alliance](#) links (Clearwater, Scientology??) are inactive. At present, the NTM seems to exist mainly in [Alan's](#) mind. It would take some sleuthing to find another focus. And while on the subject of Christian idealism, consider this [review](#) of a critique of Jacob Böhme. It may be that transcendentalism remains the primary refuge of theistic idealism. My hometown of Concord, MA, was once its radical source on these shores. However, transcendentalism seems to have devolved into a diffuse literary movement whose main successor was theistic existentialism.

Consider, however, [American idealism](#) (3,700 hits). Here is an excellent set of [reviews](#) (August 2003) (mostly from the British perspective) of this Anglo-American tradition. The roster is impressive, and one can catch a sense of excitement in many of the abstracts. Clearly there is a sense of movement and anticipation. Let us not disappoint. We need to get hold of these papers. It almost seems to have been a revival meeting! [Leslie Armour](#) is a contemporary (Canadian) idealist of note. The dearth of U.S. participation here or the lack of an equivalent domestic collection may be significant.

I will need to review McTaggart:

J. M. E. McTaggart would readily qualify as a personalist on the grounds that he held that ultimate reality consists of a society of persons. But his **personalism** is deflationary since he does not recognise the necessity for one controlling Person. He recognises the Absolute, but this Absolute is not a person. It is a unity of persons but not a personal unity. Second, an attempt is made to point out that J. M. E. McTaggart is negative on the idea of a personal, creative God. To affirm the reality of a creative God would mean to affirm the reality of time - and this is something that he rejects.

One can see why evangelicals are wary of idealism. My effort to resolve these potential contradictions remains to be tested. My absolute is the Matrix, a proto-person. Now there's an ugly expression!

In the meantime, and in parallel, I am reexamining [Thoughts on Thinking Matter](#) by James Barham, the self-same paper that got me into trouble on the ISCID [forum](#). Is the gap between biosemiotics and idealism conceptual or just professional in nature?

The Anglo-American version was the last refuge of the continental Idealism that focused on Hegel. This refuge, however, was wasted by the World Wars. It seems that the fates of Idealism and idealism are closely related. Can the former be revived in the midst of our anti-idealist *zeitgeist*. That is the trick. And you must see Thomas Friedman's [American Idol](#) on this latter.

A connection between Robert Koons and the IDers is Robert's lengthy [review](#) of William Dembski's book, [No Free Lunch](#) (2001):

As new data about the specified complexity pours in, especially from computer-driven analyses of the functional regions in the configurational space of proteins, the informational challenge to Darwinism should soon reach a critical level. At that point, even the best efforts by the biological establishment to squash this challenge through name-calling, bullying, and stonewalling (which have already been so much in evidence) will be doomed to failure.

There is no doubt of Robert's creationist sympathies. His espousal of their cause is not reciprocated, however. The IDers and creationists pay scant attention to the more subtle philosophical issues being raised by Koons & Co. The IDers posture themselves as hard-nosed scientists and wish to engage in a direct confrontation with their materialist colleagues. From their perspective, philosophy just muddies the waters. I have noted on previous occasions that the creationists are emphatic Cartesian dualists. Their God is the big Mechanic in the sky. The Matrix is the very last thing they want to hear about. So, no, I don't think we should hold our breath waiting for the creationists to become born again immaterialists or non-dualists. We'll have to look elsewhere for co-conspirators.

[12/8]

We might wonder whether there are any other non-dualistic creationists on the Internet:

[non-dualistic creationist OR non-dualistic theist OR non-dualistic theism OR non-dualistic creationism](#) (0 hits).

Not yet, evidently. What will it take to turn this situation around?

It is one of the great, if not *the* greatest, historical ironies that (Western) rationalism bases itself on the irrationality of dualism, while it is the 'mystics' who have adopted the coherence of non-dualism as the basis of their mysticism. It is as if there were an historical conspiracy to avoid, until the propitious time, the only possible foundation for coherence and rationality: non-dualistic theism. It must be part of the script of our self-concealing, self-revealing, dramaturgical God.

The Hindu creation story comes closest to what I have in mind. Here is a [quote](#) from Joseph Campbell:

Vishnu is pictured as the divine dreamer of the world dream. Vishnu sleeps on a great serpent, whose name is Ananta [ouroboros, no doubt], which means "Endless." The serpent floats on the universal ocean, called the Milky Ocean. But this Milky Ocean and the Serpent and the sleeping God: these are all the same thing. They are three inflections of the same thing, and that thing can be thought of also as the subtle substance that the wind of the mind stirs into action when the universe of all these shifting forms is brought into being. Vishnu, the God, sleeps, and the activity of his mind stuff creates dreams, and we are all his dream: the world is Vishnu's dream. And just as, in your dreams, all the images that you behold and all the people who appear are really manifestations of your own dreaming power, so are we all manifestations of Vishnu's dreaming power. We are no more independent entities than the dream figures in our own dreams.

Howard Abrams then appends his own thoughts:

Do I really think we are nothing more than God's dream? Perhaps. There are plenty of rabbinical and mythological references to God who dreams, thinks, or speaks, and the things come to be. Not much different, I suppose. I know, that is not the unsettling question here— Do I think we are not substantial, like a dream? Perhaps. Would explain a bit, don't you agree?

But I like to put this myth on its sleepy head... is this world just an expression of our own dreams? A figment of our imagination. Clearly, our perception and interpretation is nothing more than cerebral projections on the stimulation of our senses. But this idea doesn't diminish their worth!

I've always been a big fan of science fiction that alters our perception of reality. And it is nice that movies are trying to render those ideas, like that *Truman Show* or *The Matrix*. Does questioning reality, make it any less real? Perhaps. But it certainly makes it richer.

I agree. The only problem with the mystical tradition is that it eschews the obvious logic of the BPW. Only the prophetic tradition posits a unique Creation, which by implication must be the best possible world. The only problem with creationism is that it has become the exclusive domain, simply by intellectual default, of the very literal minded **fundamentalists**. Their literalism forces them into a dualistic, almost mechanistic interpretation of Creation. Theirs is the 'watchmaker' God. It will be a struggle to wrest Creation from their very tight grip. No, it will be a stealth operation, carried out right under their noses, here on the Internet. I know that I cannot be the only one in the world who is willing to gamble everything on coherence. I just keep blogging away here until that someone else shows up. Then I can retire. Right?

[Vishnu & dream & world](#) (17,000 hits). This is hardly an obscure idea on the Internet. So why does no one else in the prophetic tradition see this as the ticket to avoid our three-century-long struggle with the antinomies of Cartesian dualism? Does not everyone agree that the mind-brain problem is the unparalleled conundrum of modernism? There must be some great psychological barrier standing between us and coherence. Is it an unconscious fear of the eschatological implications concerning a final cosmic revelation? Anything less could hardly account for the magnitude of our aversion to what would otherwise be the most obvious of ideas.

[12/9]

I'm thinking further about the historical irony concerning monism, dualism, mysticism and rationalism, and especially about the choreography thereof.

Of all the spiritual luminaries in history, two *personalities* stand out: Buddha and Jesus. Have I not forgotten many other outstanding spiritual leaders: Mohammed, Moses, Lao Tse, Zoroaster, etc., etc.? Yes, and no. I'm just looking at the body count, or, more specifically at the effigy count. After Buddha and Jesus, who has the most effigies? I frankly have no idea. But this is unfair, you say. An Islamic effigy is a sacrilege. We could say that Mohammed was a modest being, but then perhaps, to paraphrase Winston, he had much reason for modesty. What were his reasons? Really just one reason: he was, by

his own repeated admonition, just the messenger. Such was not the case with our dynamic duo. In both instances the medium emphatically was the message.

Reconsider our 'lazy', or least-action principled, optimizing Matrix. The dramaturgical nature of M is manifested in Z, the zodiacal cycle of psyches. We, along with our feathered and furry friends, are the incarnation of Z. Is that not enough drama? No. There has to be a plot line, a story, a metanarrative, a beginning, middle and end, if there is to be coherence. What then is the story, and who has the speaking parts? To a first approximation there is just the Hero. Between X and B, that figure is clearly X. What then of B and Mo, etc.? They have the supporting, conflicting roles. They provide the romantic-gothic twists and turns and flourishes.

What then is our hero? That depends on the optimal story-line. Can there be a better line than the soteriological one? We're still open to suggestions, anyone? Lacking such: hero = savior. This is not brain surgery, now is it?

And where do we place our protagonist: beginning, middle or end? Should X not have been at the end? Admittedly, this does get a bit tricky, but, to make a long story short, X goes in the middle, with the caveat of a another, final appearance. X is then bracketed mainly with B and Mo. To understand the convolutions of history, we had best start with this peculiar seeming bracketing.

The bracketing is mainly in the furtherance of diversity. With only this one BPW, we will need to work overtime to squeeze every last drop of diversity out of it. Does this not contradict the [LAP](#)? Yes, and no. Consider the gothiccity of the [Mandelbrot](#) ($z' = z^2 + C$). Our mandel-braided world optimizes diversity and simplicity at the same time, using the generating formula of AZO/X/QRP. Ma(tricks) does not have to worry her pretty little head with the details, if she just gets the generating formula right. And Ma does give herself a cameo, that is just B, as I propose for the sake of argument. And Mo? Mo, dialectically would be the antithesis of B, in order, at least, not be be the antithesis of X. After that, history can pretty much take care of itself. In fact, that is what you and I are doing right here, just taking care of business, just wrapping things up, or is it just rapping?

I look toward the optimal reappearance of the hero. In the style of dialectics, this would be, finally, the antihero, or the anti-X. Perusers of these pages will know that my rap does not quite end there. I am an observer in the postmodern, quantum tradition. I know that mere observation is impossible. It is with no small relish that I attempt to make that point. The rest will just have to be history, or the end thereof.

Cosmic Dialectics

By now both of us realize that the titles of these longer pages are not meant to be either descriptive or prescriptive, but are more for the benefit of Google than for anything else. This site has become, in this last year, primarily a philosophical diary or 'blog'. Instead of titles, I just use markers. The markers tend to reflect whatever was the last subject on the previous page. Nonetheless, permit me a very brief embellishment.

I owe more to Hegel than I know. What I do know of his work comes third hand, mainly from people with very different agendas from my own. I'll wager that much of my substance will find its precedence therein. My dialectical predilections certainly will.

The [dialectic](#) is the primordial cycle or bootstrap. It is the original breaking of the Matrical symmetry. It is also the Tao, with its yin and yang. Hegel was rather less the personalist than myself. I am more into the I-Thou dialectic of Martin Buber. The I-Thou precedes the I-It. Georg was more the absolutist, but I don't know that his absolute was any more or less objectifiable than my Matrix. Martin's dialectic was more relational than Georg's.

Moses and Mohammed are the antithesis of the Matrix. Jesus (X) is the synthesis. Then there is the Alpha and Omega. History is their dialog. X is the dialectical nexus or cross-roads of the cosmos and of history. The Matrix is the dialectical source.

I attempt to synthesize the prophetic and pantheist traditions. Previous syntheses, e.g. Hegel's, have tended to be weighted toward the pantheist, impersonal side. This leans heavily the other way.

The dialectical juxtaposition of thesis and antithesis will help to maximize diversity. It is our job here to leave no stones unturned. We exercise every option.

Now that was short and sweet.

[This topic is continued below, and is taken up again on [1/3/04](#).]

[12/12]

Not to change the subject or anything, but how 'bout that there [intentionalism](#)? As I scanned the previous topics, this one seemed most in need of a review, and hopefully a brief one.

A mental monist has no perception problem, and, to a first approximation, no problems of any kind. Well, the only problem is to create problems. Somebody must have done a good job of manufacturing problems, since we seem to have no lack in that department. Problems are created by conflict. A conflict is an obstacle between me and my desire. It is a separation of subject and desired object. Or it may be that one desire gets in the way of another. The BPW thesis is that our problems are optimal.

The materialist looks at our limited forms of separation and surmises that atomism is the natural state of affairs, and that relations are epiphenomenal. Holding the world together is the main problem. For the mentalist it is just the reverse.

The materialist is gradually being coaxed into the perspective of the mentalist. Now we are both faced with the problem of explaining symmetry breaking, which is not unrelated to the separation problem.

Dialectical materialism is another example. The thesis creates its antithesis. This is a symmetry breaking

separation. How does this happen? The formation of the thesis, or a distinct idea, would be the hard part. The BPW thesis may be the first and last. God thinks to herself, 'If we are going to do anything at all, let's do it right.' But there must be a prior self to have the thought, then the BPW becomes the antithesis of the primal self. Logically prior to the self is the toti-potentiality of the Matrix. The realizing self is its antithesis. The primal self could be X. 'Why hast thou forsaken me?' This is the primal separation. M & X come 'before' the AZO/QRP. X then is the prototype of Z, and it is X that gets pulled into the spark gap, or head-tail, A/O (history) gap of the ouroboros or primal Zoo-cycle. That is the dynamic of the incarnation. Every time I do genesis, it will be a variation on the theme. Self-realization is the A&O of Creation. X is that. We are the preamble to X. History is its parturition.

All of this is in the one gnostic presence. There is no agnosis, no knowledge problem, until there is absence. Absence is local. Holism is global. All systems are maximally entangled. Freedom derives from the symmetry of 'redundancy'. Metabolism/atomism is the measure of our removal from the boundary conditions of optimality.

[12/17]

I am enjoying the [Music of the Primes](#) by Marcus du Sautoy (2003). It gives a good account of the prime politics, but I must reiterate my objection to Platonism. Plato gives a bad name to idealism. His is a non-relational idealism. His forms just seem to float free in the void, unattached. This is not how it works. Sautoy quotes **Hardy**:

"317 is a prime, not because we think so, or because our minds are shaped in one way rather than another, but because it is so, because mathematical reality is built that way." (G. H. Hardy, A Mathematicians Apology, 1940)

This is just silly. Great minds can and do so easily talk themselves into absurd corners. What is 317? It is scratches on a paper, in the first instance. It also refers to a place in an abstract sequence. The most important point is that no members of that sequence can exist outside of that sequence. A number is the epitome of contextuality. Where does that sequence exist? That sequence exists only in the context of its normative usage.

Objection? A computer may be programmed to test for primality. It will usually print out '317' in the appropriate context. But what is a computer? Yes, I have one sitting in front of me, which could instantiate a universal Turing machine, albeit with finite memory. However, it is still just an artifact existing only in a normative context. If it began to fail, only a teleologically motivated, socially embedded agent could ultimately determine its lack of propriety.

Objection: physical processes instantiate many mathematical forms, including, arguably, primality. We would never have evolved if primality had not previously been physically manifested. But does this not beg the question of Creation? Mathematical physics is just one necessary part of the greater coherence of the world. It is a manifestation of the inherent relationalism of reality. The relationalism may only be grounded in the mind-like ambience of the Matrix. The relations are internal and, as such, may exist only in a larger teleological context.

[12/18]

Marcus draws our attention to two species of cicadas, often found together in the woods, having life cycles of 13 and 17 years, respectively. He points out that the relative primality of their cycles has selective advantages. We are left to infer the usual reductive explanation: numbers & atoms (i.e. selected DNA) are all we need to understand. It does seem rather straight forward, but I must not succumb to such

blandishments. Permit me then to object.

Is this natural phenomenon not reducible to mathematical physics, at least in theory? I'll be the naysayer. I detect teleology. What I see happening in those woods is a microcosm that cannot be isolated from the macrocosm, and I'm not talking ecology. I'm talking ontology.

But here, possibly, is an additional piece of evidence for the Platonists: predator-prey dynamics readily [generates](#) prime numbers. Thus do we have a natural prime number calculator. However, the notion of a 'natural calculator' is illegitimate. To speak of cicadas as calculating would be to anthropomorphize them.

Suppose, instead, that one of our physical constants turned out to be a prime number, for reasons comparable to those given here. Would this not vindicate a Platonic interpretation of mathematics? Or would this attribution be another form of anthropomorphism? I could rather argue for the evident unnaturalness of physics. It might well constitute further evidence for panpsychism.

[12/20]

Neither quantity nor quality may be adequately naturalized. That leaves the very concept of nature without proper reference. Numbers are the individuation of quantity. They are our attempt to anthropomorphize quantity. But where would quantity be without numbers? It would seem that natural intelligence must come before nature. Ironically, physics, imbued as it is with mathematics, is turning out to be the least natural aspect of nature.

The crux of the unnaturalness of physics lies in the centrality of the [e^{i*pi} = -1](#) syzygy. This coincidence remains our exhibit A for panpsychism. The problem of primality is an off-shoot of this. All of this, in turn, lies in the archetype of Pi, which relates significantly to all of the abstract structures and symmetries of the world. It is Pi that holds together the ouroboric dialectic of the cosmos. Pi and X are the seeds of cosmic intelligence and the BPW within the Matrix. We have already considered the [dialectics](#) (and [here](#)) of the Archetypes. Such dualities play a fundamental role in every religious and spiritual tradition. Pi is the ultimately abstract distillation of the Matrical potency. Abstract, yes, but an abstraction that also happens to provide the foundation for physics, in an elegantly holographic fashion.

This brings us back to the [Music of the Primes](#). Is it proper to refer to the primes as the 'atoms of arithmetic'? It is this reductionism which causes us to be surprised at every new manifestation of the organicism of mathematics, the Riemann Hypothesis being the case in point. To understand the primes, we must first understand pi, and to understand Pi, we must understand the Archetypes. One may stare all day at the printed notes without hearing the symphony. Ramanujan could hear the symphony, but could not rationalize it. We attempt the rationalization, in dialectical fashion. Mathematics exists only in a cosmic context. We attempt to describe the context.

[12/21]

I [originally](#) got mixed up with numbers on these pages in an attempt to [rationalize](#) the Monster Group. I counter the alleged Platonic or mind independent nature of the Monster with the organicity of mathematics. The organicity of mathematics is evidenced particularly in the ubiquity of Pi and the centrality of Riemann's Hypothesis concerning his zeta function. It should be noted that Pi, along with 'e' and 'i', plays a critical role in the [zeta function](#).

Previously I have [contrasted](#) (and [here](#)) Platonism and Pythagoreanism. Scientists favor Pythagoras' monism while philosophers favor Plato's dualism. I see Pythagoras as a stepping stone first to

immaterialism and then to the BPW. Plato and Spinoza are obstacles. They both discount the coherence of the world: Plato because of his dualism, Spinoza because of his mystical atheism. Both would probably subscribe to Kant's impenetrable, mind independent Noumenon. In the cosmic Presence of the Eschaton, I would suggest that the residual noumenon is absorbed into the phenomenal, eternal Present. This is gnosis with a vengeance.

Return now to [Hardy's](#) alleged independent reality of '317', but that is not quite what he claims. He says that 317 is a prime, regardless of what anyone else might think. Or, as we noted previously, some cicadas are likely to have prime numbered life cycles, human conventions notwithstanding. Both true. But wait. Wherever 317 exists, it will be a prime, but that does not entail that 317, *per se*, is mind independent. One might even imagine a cicada with a 317 year life cycle. Would that not prove Hardy's point? I will argue no.

We simply return to the notion of a [cycle](#). A cycle is irreducibly normative. The counting of them is necessarily conventional. This is the whole point of positing R & Pi to be Archetypes of Creation. The normativity of logic and math is inescapable. Does this entail that mathematical truth is relative to human convention? No, but it does entail that mathematical and human normativity have the same source. Thus are we unable to avoid the posit of a cosmic normativity, which is logically ascribed to a self-reflecting cosmic intelligence. Morality stands to reason only to the degree that it may reflect this self-same Source. Are we hereby conflating mathematics and morality? Yes and no. They differ only in the type of logic involved, but not in their desired universal teleology.

The 'Pythagorean' scientists pull a cheap shot, even if it is usually unwitting. They are much too quick to justify their mysticism *vis a vis* scientific materialism by a usually gratuitous appeal to a Spinoza style of atheism, thereby departing from the more coherent gnosis of the Pythagorean and neo-Platonic tradition. It would appear that Pythagoras stands to be rescued from these neo-Pythagoreans, but we need not divert to historical *ad hominem*s.

Math and morality are equally grounded in the Matrix. Their full realization is mediated only through the teleology of history. '317's' claim to existence is, along with everything else, relative to that Telos. The telic 317 may only be barely recognizable relative to Hardy's 317. Only time can tell. The personality of every number and every human is subject to teleological revision.

The singular existence of mathematics is just a shadow of the singularity of the BPW.

The Monster Group need be no more or less teleological than a biological cell. As in the case of the cell, I do not have to point to any particular part of the MG in order to argue cogently for its global **functionality**.

The problem for the materialists might now be to point to something that is not normative. I'm not presently aware that they are able to do this. This becomes a big problem. Should we feel sorry for them in their logical predicament? No, I think the rest of us should take this opportunity to move ahead with our lives. We should feel much less restricted by their obsolete absolutism. Our argument then must focus on the incoherence of the postmodern pluralists. We must ask them to justify their incoherence in light of the modern pandemic of alienation and nihilism. Should we not give meaning a chance? For how long must we refuse to ask ultimate questions?

It was **James Barham** who [first impressed](#) upon me the normativity of the reproduction cycle. This is a simple but profound observation. Is there any observation that points more clearly to the logical necessity of panpsychism? Is any other observation more crucial to the inevitable ascendancy of immaterialism? If there be such, then consider the case closed. All we need now is to find an articulate materialist with whom to discuss this point. Are there any left? Where is [Jaegwon](#) (and [here](#), etc.) when we need him? Pragmatically, I doubt that he would want to be entangled in the politics of the BPW, but there don't seem to be any other physicalists of his evident ability.

Fear of the political ascendancy of [fundamentalism](#) (and [here](#), [here](#), [here](#), [here](#), etc.) greatly inhibits the long overdue intellectual debate between materialists and anti-materialists. The fundamentalists have managed to reduce this discussion to its lowest denomination. Vociferous bad thinking and narrow thinking drives out the rest. However, when this inhibition is finally overcome, as someday it must, it is likely then to burst forth in a more dramatic fashion than it would have otherwise. This drama will surely play into the prophetic type of scenario being outlined here. In that case, we need not wax impatient with the historical choreography. A good drama is always worth the wait, even when the wait may be longer than a lifetime.

[12/23]

I have been reading Robert Brandom's [Modality, Normativity, and Intentionality](#) (c. 2000). It is an excellent overview and modern history of these topics going back to **Kant**. From Robert's list of [publications](#), we may surmise more than a passing interest in idealism. Any idealism, however, is well covered here by his attention to linguistic detail. His point is, nonetheless, that M, N & I are inescapable in any type or level of discourse. Early in the last century there were attempts to reduce M, N & I to the purely descriptive and extensional language of logical empiricism. But Kant had already demonstrated the illegitimacy of any such attempt at 'naturalism' even, and especially, in scientific discourse. It seems that if our philosophical colleagues had properly done their Kantian homework we might have been spared a century of analysis. Robert certainly underscores James Barham's [thesis](#). I trust, however, that we managed to learn a thing or two on our analytical junket.

May we then infer idealism from Robert's rendition of Kant, or are we merely reestablishing the rules of our language game? We return, yet again, to the allegation of an [Epistemic-Ontic Divide](#). There is such a divide just in the case of a robust intrusion of Kant's noumenal realm. Only thus did Kant attempt to shield us from what is about to transpire by way of a radical, and probably BPW style of, immaterialism. Well, Manny, you gave it the old college try.

The uncovering of the noumenal is just the task of any final revelation. The physicists were pinning their hopes on a final TOE, but they appear to have succumbed to the non-trivial blandishments of the Monster Group. They have failed to appreciate the esoteric, holistic and intensional potency of Pi. We step into this breach by picking up on Pi along with AZO/X/QRP, and thereby attempt to steal the show from under their noses. All the while we remain in stealth mode, under the academic radar, protected by the Fundamentalist/Creationist cloud of chaff, reinforced, perhaps, by a bit of acronyms (ay) and anonymously generated fog. Never discount the cosmic choreography.

Am I rushing things just a bit? Is my impatience showing? It must be that time of year.

[12/26] [\[a\]](#)

A correspondent picks up on [Mere Words](#):

Your thinking on words caused me to combine your thoughts with some of mine. You may be amused, or perhaps some new thought may occur. Who knows

A word is a sound or a combination of sounds, or its representation in writing, that symbolizes and communicates a meaning.

Words have context, dictionaries list definitions along with examples of actual usage. These definitions and examples demonstrate the external relations or contexts in which a word may be properly used.

But, what about the words content? Words contain information, but where is it? The only information

explicitly contained in a word is in its letters or its sound pattern.

We are subject to the impression that words have an intrinsic individual content or essence or something intrinsic that we refer to as their meaning. But we cannot point to a meaning, the same way that we point to a definition.

What seems intrinsic to words is their ability to refer to or direct our attention to other things.

Referring is not a physical process, referring is an act rather than a process. Action, as opposed to process, requires an acting agent. It is the agent which determines the act of reference.

The agent is our attention or our soul current.

Words meanings are used to associate -- to connect or join together.

The mantra words are used out of context.

Thus the mantras are simply used to associate the disciple's attention with a particular inner region and to the ruler of that region the Master who gave him those words.

Any word would do, provided that it was given by the Master, that is the key.

Thus the process of meditation is one of associating or connecting our attention (our soul current) with that of the Master. Thus we are intrinsically connected to him.

But, by the same reasoning words are used to connect our attention to objects of the world. So going inside is just a matter of letting go of one connection?

This is where the Wing-Walker's Law comes in: Never leave hold of what you've got until you've got hold of something else.

And I respond with my own version of free association:

Master/mantra/disciple is a microcosm. In the macrocosm it would be Matrix/logos/humanity. The [logos](#) is also the primordial set of archetypes, possibly [AZO/X/GRP](#). With John, the logos is identified more specifically with X. X is the anthropos, Adam/Kadmon, or Christ. Christ is the Christian mantra binding us back to the Matrix, which is the Source of being and substance, or the Tao.

The logos is also the [Zim-zum](#), the Om, the ouroboros, and the ten thunders of creation. It is the initiator of the cosmic dialectic of the I-Thou, yin-yang. And it would also, in the end, be closely related to the Telos.

With the Omega, there is a letting go, going to the Christ or cosmic soul within. Immaterialism is the intellectualization of this mainly spiritual process of turning ourselves and the cosmos inside-out. Christ just seems to be the easiest handle for the most people, very convenient, and something very personal, tangible and user friendly.

In such a fashion must we reinitiate the creative dialog. In our analytic sojourn, we have lost all sense of context. That context must now be reestablished in a concerted oracular fashion as we prepare for the Millennium.

Crisis

Several divergent thoughts seem to converge on a singular crisis. First, let me draw your attention to Elaine Pagels' [*Beyond Belief*](#) (2003), and '[Edmund Husserl and the Crisis of Western Science](#)' by Thomas Molnar (1988). I bring these up in connection with my thoughts regarding Sophia. Why can I not do with Jesus what I have done with Sophia: defuse and diffuse the charisma? There is going to be much pressure to ditch the X in AZO/X/QRP. How shall we handle it? This is hardly a sectarian crisis. It is rather a crisis of cosmic proportions. It has everything to do with the crisis of science. It has everything to do with the future of ontology and epistemology.

Here is Tom:

To the question: "What went wrong?" the frequent answer is that it was inscribed in the nature of the Western, Greco-Christian project that it would end in modernity, nihilism, desacralization. The Islamologist **Henry Corbin** is perhaps the most radical exponent of this Muslim view: Christ's incarnation obliged the church to plunge into the vicissitudes of history, with its conflicts and shifts of power, which finally brought the church's own secularization. Today the world is homeless; it is torn by ideologies, all of them intent on remaking history and man.

Yes, are we not in the death throes of a singular personality cult?

The crisis of science has been its failure, for all of its objectification, to find any objects. Its legacy beyond technology is a fragmenting subjectivity. Into that vacuum of meaning flows mysticism and absolutism.

Against the tide of mysticism and absolutism, Elaine proposes gnosticism. We seek to know the universal God, the divine spark within. I subscribe to that. Jesus was our greatest exponent of universal Gnosis. Period? That is the question of the hour.

Well, what then do we make of history? May not God also be found in history? If not, then what is the point of it? Can God be universal and not historical? Elaine avoids this question, as does every other gnostic and mystic. If revelation does not have a social and historical dimension, we fall into a transcendental solipsism.

Hinduism has been blessed with many great teachers down through the ages, but does it not also display a singular lack of coherence? Is that a problem? It is for anyone who seeks universality. Science sought universality. Does its failure mark the end of that quest?

Let it, then, be given that if there is a cosmic intelligence it must have a social and historical dimension. History may have meaning only as a progressive and collective gnosis. This gnosis must include its own historicity. The self-concealment and self-revelation of the transcendental dimension must be played out in the dimension of time. The play must have finality. There must be a final reconciliation of creatures and Creator.

The choice is solipsism or universalism. Universalism directly invokes a redemptive history, a salvation economy.

Let us then consider God in history. Is not the Invisible Hand sufficient? Does it not keep the trains running on time? The Invisible Hand is not sufficient for reconciliation. But what about the Invisible Hand plus a solipsistic Gnosis? Would this not be the proper minimalist version of salvation? There is just a slight logistics problem. There is no provision for finality. For the eschatology to be coordinated it must be public. If one were to imagine public salvation events, surely the X-event would be an extreme of minimalism, of such a degree that its efficacy could remain in grave doubt for at least two millennia. A

key to orchestrating such a minimalist salvific event was to provide it with a proper context. That the social context should be an historically 'chosen' tribe, may seem obvious only in retrospect. That the efficacy of the event could even be rejected by its nominal audience borders on the fantastic, in considering the subtlety of its orchestration. That rejection, however, certainly facilitated its subsequent universalization.

It is entirely within the specification of the event that the perpetrator would have only a vague understanding of the actual mission. The appropriate labeling would be left to the historical redactors and its self-defined recipients.

Who then was this Mr. X, a.k.a. Jesus? Just some bloke who happened to have stumbled onto the scene? It is even possible that there was no such person to begin with. The X-event might have been redacted out of whole cloth. What is the best possible answer? The only logistic requirement is that the person be a member of the given tribe.

The question might be rephrased. If there has to be a public Reconciler, who would we prefer that one to be? Would it not be most reasonable to suppose that the chosen one be especially reconciled with the Creator? Why not, then, just have the person be as closely identifiable with the Creator as is humanly/divinely possible? I see no good reason for skimping on this score. The degree to which this identification is redacted becomes a moot point. This point would matter only to the degree that we posit an epistemic/ontic divide, which is small indeed.

Now, was this either difficult or painful? Was this brain surgery, or was it a simple exercise in common sense? Why then are we having so much difficulty with our reconciliation orchestration?

The difficulty seems to have been built into the history of monotheism. Particularly noteworthy in this regard is the history of Islam. Did Mohammed simply miss the reconciliation boat? Why Islam in the first place? There must have been some mistake.

I sincerely doubt it. We merely have to put on our reconciliation orchestration thinking caps, and then we need to backup a couple of steps.

Reconciliation is essentially eschatological. Its orchestration is tantamount to orchestrating the eschaton. In the BPW there is a Millennium for the public and universal preparation for the eschaton. The inauguration of the Millennium becomes, almost surely, the singularly critical and dramatic event of our salvation history.

We then look for a means to simplify and minimize the logistics of this most portentous inauguration. That there be a reconciliation of believers would be a foregone conclusion. That the believers be partitioned into two principal camps lends itself to all our requirements. This theological reconciliation would provide both the context and pretext for the universally anticipated final messianic event. It would effectively presage the metaphysical reconciliation.

Lots of luck! Right? What then would be an adequate version of a minimalist X2-event? I defer to Big Mo. Big Mo is the touchstone for every political operator: Momentum. I simply point out that before there is Big Mo there must be little mo. Little mo is between you and me and the Internet. If the BPW is, as it seems to be working out here, just a straight forward exercise of common sense, then little mo is just around Google's next corner.

The early Christian communities were millenarian and charismatic. These two ingredients were mutually supportive. This was arguably their first combined appearance in history, but they were to emerge repeatedly in the next two millennia. It took several centuries for the original thrust of this spiritual momentum to exhaust itself. The charisma was routinized, stagnation set in, and the dark ages ensued.

The monotheistic initiative then fell to a militant Islam. It was neither charismatic nor millenarian.

The enthusiasm of the early Church was not conducive to intellectual reflection. Philosophy served only the evangel. Such was not the case with early Islam. Here a much more formal and austere theology cleared away the underbrush of pagan superstitions, while leaving the contemplative mind relatively free to reconstruct a rational order out of the detritus of the preceding cultures. This period of enlightenment eventually encountered the expanding envelope of Islamic orthodoxy, but not before its intellectual drive had spilled back over to the stagnated Christendom in the west. Thus began the second phase of Christianity, gradually blending into modernism.

In this second phase, its millenarian enthusiasm was easily resurrected and harnessed into the singular notion of historical progress. History was afforded meaning by manifesting the progressive stages of God's self-revelation, leading up to the inevitable advent of his Kingdom. Nature was soon pulled into the revelatory dynamic and was cajoled and coerced into yielding up the secrets of Creation, all the better to fathom the mind and spirit of the Creator. How else to fulfill the charismatic covenant of reconciliation than by laboring to comprehend the rationale of Creation? I submit that there was ever only a token resistance on the part of the theocrats. The gnostic impulse was comfortably channeled into the scientific enterprise, which soon took on an economic life of its own.

Yes, science has been an enormous and sustained exercise in cosmic optimism and hubris. I submit that this historical dynamic makes sense only under the aegis of a personally accessible creator, and is that not precisely the import of the X-event? Yes, Virginia, there is a psychosocial linkage. Science was no accident.

Why then do not more of us see the hand of the creator writing on the walls of science? I suspect that many do, but they have not the excuse to brag about it. I would not be here if I did not feel so excused. Being excused is no small thing. It was not that for me. There is no avoiding the concomitant messianic scent. Propriety is a remarkable restraint. Deliberately disregarding it is just another aspect of the Evangel of which we speak.

The Prime Directive is most easily followed within a spiritual vacuum. God seems quite adept at setting such a stage. The aftermath of science leaves just such a void. Indeed, it leaves an audience unprecedentedly receptive to a new and meaningful worldview, given a sufficient rationale. Many ideas rush into this space, but where is there coherence and depth? Is there to be no competition?

Islam? I don't see that it stands a chance in the tsunami that is bearing down on us. It's not what you know, finally, it's who you know.

[1/6]

If I am right about the psychosocial importance of the human avatar, why then did Christianity not prevail from the start? Why was there this Islamic hiatus? Was this an accident of history or was there some internal dynamic that had to be played out? Furthermore, the concept of avatar was not unique to Christianity. The Buddha is an obvious example.

What was unique to Christianity was its millenarian enthusiasm. It was this enthusiasm that had a built-in obsolescence. That it persisted for several centuries despite the lack of historical support is remarkable. That it remained just below the surface through the dark ages, ready to flourish again in the Renaissance and beyond is no less remarkable.

Why then were Islam and Buddhism able to flourish, but not able to incorporate a millenarianism? There had to be a prophetic base, and there had to be a messianic event. Siddhartha (Buddha) lacked the former and never claimed the latter. Mohammed (Muhammad) had the prophetic base, why did he not attempt to

usurp the messianic mantel? He, like John Smith in our own times, was evidently not given that choice. This is no small thing. Are you a messenger, or are you the message? Jesus and Siddhartha were the message; Moses, Mohammed and John Smith were the messengers. Siddhartha was one in a supposed succession of avatars. Jesus was unprecedented.

If the notion of the Millennium is ever to be revived, Jesus will remain its messiah. But will he not have to compete with the Maitreya and the Mahdi, to name but two?

[Shiism As Mahdism- Reflections On A Doctrine of Hope](#) -- Kaveh L. Afrasiabi (11/20/03):

In the vast field of Imamology, as a cornerstone of Shiite theology, Mahdism embodies the central axis of this theology, covering the most important doctrines of Islam: theodicy, eschatology, cosmology, pneumatology, ecclesiology, Creation, and political theology. These doctrines are embodied in the philosophical and theological method (eschatology, apocalyptic motif), epistemological presupposition (resurrection and history), and anthropological implication (hope) of Mahdism . With Mahdism as the center of its system, Shiism assumes a future-oriented eschatology continually speaking the language of hope, expressing God's self-involvement in history. Based on divine intervention, Mahdi's indwelling nature in history, or at least the part of history known as 'Great Occultation', creatively addresses the issue of theodicy from the perspective of divine suffering, for it is suffering in the exile of occultation mixed with hope in close proximity to a process history that defines and re-defines an eschatological community of people in the spirit of renewal and resurrection. [...]

Here, the gap between the Mahdist concept of promise and Christian doctrine of resurrection need to be elaborated upon. In the resurrection of Christ, "the intensification of the promise finds its approach to the eschatological in the negation of death," in other words, even death cannot set limits to the promise of God to human beings (for salvation). This is in contrast to the Jewish concept of promise that "finds its eschaton in the promise of Yahweh's lordship over all people." By comparison, the Mahdist promise presents itself as the epiphany of the eternal present in the world, which can be understood only as part and parcel of a transcendent subjectivity that asserts the self-concealment of Mahdi as a divine matter of "self-revelation."

[...] The Mahdist "event," namely, both the minor and the major occultation, is a single activity of God that orients toward the eschatological consummation of all things. Therefore, the premise of occultation and the promise of reappearance give the Shiite theological form the definitive character – History as eschatology, giving history a progressive nature. The ultimate self-disclosure of Mahdi is the moment of eschaton that overcomes the qualitative difference between time and eternity, i.e., an "eternal now" that addresses the transcendence of humanity, [...]

[...] There is an ontological division here, between the being that is in time and yet outside of it, transported by divine intervention into the temporal vehicle of the eschatological promise, paralleling historical time and conjoining with it only at the climax of history, namely divine eschatology.

This is precisely where one may find **striking resemblance** between the Mahdi "event" and the Christ "event," in the sense that both convey future-embeddedness of the present, where each stage of time points forward to the final completion of time in divine glory, even the apocalyptic moment which envelopes the eschatological promise, as an aeon of a new creation.

I see no problem with this material. Nothing here would prevent a fusion of the Mahdi and christos.

[Jesus of Nazareth and Maitreya the Christ](#) -- Peter Liefhebber (Share International):

In fact, the title Christ does not refer to an individual at all. It is the name of a function in the Hierarchy of Masters of Wisdom, that group of advanced beings who guide the evolution of humanity from behind the scenes. Whoever stands at the head of this Hierarchy automatically becomes the World Teacher, known in the East as the Bodhisattva, during the term of his office.

Maitreya, who embodies the energy we call the Christ Principle, has held that office for over two millennia, and in Palestine he manifested himself as the Christ to inaugurate the Age of Pisces, then beginning

Who is Lord Maitreya -- George Whitten:

The world teacher as he calls himself, lord Maitreya. Lord Maitreya claims to be the one expected of by all major religions. He claims to be the Messiah that the Jews are waiting for. He claims to be the Krishna who the Hindus expect to arrive. He claims to be Maitreya Buddha whom the Buddhists expect. He claims to be Imam Mahdi or the Messiah that the Muslims are looking for. But even more shocking he claims to be the Christ whom Christians are waiting for.

Masters of Wisdom – Who Are They:

Masters of Wisdom are men like us who have gone ahead of us in evolution and have now perfected themselves by the very same steps we are taking today. They have learned the every lesson the earth has to teach Them, have undergone every disappointment, humiliation, and pain, and are now members of the spiritual kingdom or the kingdom of God or Heaven. Therefore the earth has no further to offer them and most of them have moved on to other higher planets within and outside our solar system. [...]

Sixty-three of them are involved with human evolution while others are involved with the evolution of animal, plant and mineral kingdoms. According to Mr Creme fourteen of them have already returned to the everyday world and are currently living in major cities of the world. They will show humanity that every human being can one day be like them.

Maitreya, here, is the Theosophical Master waiting to emerge and bring us into the age of Aquarius. The Theosophical characterization of Maitreya, bearing more than a few traces of theodicy, has evolved significantly from its Buddhist origins. The notion of a collective spiritual evolution of humanity guided by a succession of Avatars or Bodhisattvas is creeping into the New Age versions of Buddhism. But if it is pushed too far this linear evolution runs afoul of the emphatically cyclical Buddhist cosmology.

We quickly run into the great divide between theism and pantheism: Creation. Pantheism need posit no Creator as long as it can explain the world as an endless cycle: no beginning, no ending.

Primitive cultures are replete with creation myths. Modernity is essentially characterized by the discarding of that 'primitive' notion. Pantheism is emphatically modern, then, in its disavowal of a Creator. The historical irony, or perhaps paradox, is that science might never have taken off without the presupposition of a rationally ordered Creation. On the other hand, the idea of progress, which is also essential to modernism, is antithetical to pantheism.

We must wonder why the idea of Creation simply dropped out of such a great portion of the world's religions. What could be the rationale or teleology of so significant a development? It appears that the only sensible answer is that monotheism is not a natural belief. The natural or logical progression seems rather to be from animism to polytheism to pantheism. The only countercurrent in history was the singular Prophetic tradition.

Why singular? If there is a Creator, why was she so **stingy** with her prophets? Why leave so much of the world in the dark for so long? What can possibly justify such pedagogical parsimony? I have spoken several times of the Prime Directive, but isn't this carrying that too far? Think of the horrendous amount of religious strife that could have been averted with just a slightly more efficient dissemination and coordination of prophecy?

Frankly, I think I had best sleep on this one. Anon.

[1/7]

What I am seeing here is a naturalizing of our salvation economy: it's more like a salvation ecology. It is an organic dialectic between cosmic and human intelligence. It is a mutual process where we meet half

way. By this half measure, the Hebrew tribe and Jesus were self-selected. Once selected, however, there was no turning back. The reconciliatory teleology took over. It became preordained.

Such an organic process does not lend itself to duplication. It is like the process of human fertilization: twinning is a rare phenomenon. There could not be two chosen tribes, nor two saviors. We are but one world. Diversity here is priceless. Why squander our precious diversity on mere redundancy? All possible worlds exist in our imaginations. The best of these is the one we live.

There has been ample darkness before this dawning of the Millennium, but cannot and will not the new dawning remove every lingering shadow? Will any of our dear departed ones miss this great awakening? I see no conflict between our historical diversity and our future universal reconciliation. Do you?

Scientific materialism has played a crucial role in laying out the infrastructure of our salvation, but it has also been a great distraction for the spirit. As we begin to see beyond this distraction, as the spirit begins to reorganize itself, the gospel of a permanent reconciliation will be beckoning every soul. What obstacle will remain? How can we shun such an obvious source of meaning for our existence? How can our intellects avoid the snare net of cosmic coherence? Can we possibly imagine a more efficient engine of coherence than the World Wide Web upon which I now type these words of reconciliation?

Ooops! Have I neglected to mention [Krishna](#) (1,300,000 hits)?

[Lord Krishna, Source of Immortal Wisdom](#):

And at last Lord Krishna revealed Himself before Arjuna as the source of everything, the eternal form of the Supreme, the Personality of Godhead.

Krishna was the eighth or ninth avatar of Vishnu. The future avatar is designated as [Kalki](#) (45,000 hits). He would be the tenth avatar if you (syncretically) count Buddha as the ninth. Some allege that he will be the final avatar of this aeon, the Kali Yuga. Each Yuga has four ages: Kali is the last and most depraved. Kalki will defeat this evil and usher us back to the pristine Satya Yuga, to begin the entropic decline all over again. Somehow I fail to get the point of this. But isn't it just the point that there is no point? We are encouraged to escape the wheel of illusion and meaningless rebirth so as to return to Nirvana, Brahma or the Matrix(?).

What is the difference, then, if we all end up in the same place? The most immediate difference will be the Millennium. The Millennium would likely last only a thousand years at the most, while the Satya Yuga should last 1,728,000 years. Should that not be 1,728 times as good as the Millennium?

The answer to this question is very simple. The question is, which is the best possible world? The answer is that in order for there to be a best possible world it would have to be created. If the Brahmanic world is created by Vishnu then it could be the BPW. But if that were the case, why are we admonished to leave it? We either love it or leave it. Are the Hindus claiming that it is impossible to create a lovable world? But could they not retort that we Millennialists will be forced to leave our lovable Millennium anyway; we are not even to be given a choice.

Hold on. A slight correction:

[Vishnu](#) by Alan G. Hefner

Vishnu is regarded as a major god in Hinduism and Indian mythology. He is thought as the preserver of the universe while two other major Hindu gods Brahma and Shiva, are regarded respectively, as the creator and destroyer of the universe.

[...] It is throughout this literature and especially through incarnations that Vishnu is raised to higher

rankings within the Hindu pantheon. He becomes the prominent second god of the Trimurti, the Hindu Triad, while Brahma is first and Shiva is third.

The biggest difference appears to be that Christ is billed as the redeemer while Vishnu is billed as the maintainer of the world. So which would you prefer, a janitor or a savior? To each their own?

I realize that this was a cheap shot, but, really folks, religion does not have to be rocket science. These issues should not be that difficult, given a clear choice.

The great wonder is that in the whole history of religion we encounter but one redeemer. The only sensible response is: How many redeemers does it take to save the world?

You may well object to being 'saved'. Many of us style ourselves as self-made individuals. Besides the parthenogenic difficulties of such a claim, does it not express a legitimate, humane need for dignity and self-respect? The acceptance of charity often comes at the expense of self-respect. Would we wish to marry someone who merely felt sorry for us?

However, a (the?) major aspect of the BPW is its participatory nature. We are the co-creators of the world. By that same token we must also be its co-redeemers. Co-redemption requires coordination. The X&X2-events are simply the logical, preordained foci of this coordination. If you wish not to participate, that is your choice, but could that refusal be viewed as anything other than the epitome of selfishness?

What was the crisis referred to above? There is the crisis of modernity, for one. Then there is the sectarian crisis. If modernity fails to sustain itself, our first alternative is to fall back to a premodern, religious tradition. Unfortunately the religious traditions have experienced little but sectarian fragmentation in the recent centuries.

Modernity held out the promise of a single coherent worldview. This was alleged to be its main advantage over the religious traditions: it would provide a universal basis for problem solving. With that promise fading, is there any hope remaining for an alternative universal worldview?

If there is not that hope, then we face the crisis of increasingly sliding back into sectarian conflict, but now on a truly global scale.

There should be a great incentive to construct a postmodern worldview; indeed, the survival of civilization may depend upon it.

New Age syncretism is a significant step in this direction.

[1/8]

Syncretism, however, fails to provide coherence, depth and vision. The next logical step is synthesis. Pantheism, being syncretic in nature, does not lend itself to this task. Coherence cannot be accidental. There must be a source. The only logical source must be essentially theistic.

India has survived and even prospered for millennia on a cultural diet of pure syncretism. Why cannot this be a model for the postmodern world? The New Age movement is certainly attempting to realize and expand on this model. It is not, however, experiencing much success in penetrating the prophetic tradition. This does not imply that syncretism should be abandoned; it does imply, however, that we should be on the lookout for alternative strategies.

If we wish to elicit the spirit in response to any sort of crisis, then our only appeal is to the Evangel. That is just the agent for the quickening of a communal or global spirit. Any historically significant evangelism, however, is going to have to push the evangelical envelope either up to or beyond the messianic threshold. To fail to push on that envelope would simply be to fail to rise to the occasion of a perceived global crisis.

If these pages do not meet the above requirements, then I fail at my task. If these pages do suffice, then you and I, together, have our work cut out for us. My thesis is on the door. I await the arrival of the Evangel. You know who you are. In the meantime I continue to fill in the details, while searching the web for any like-minded individuals.

If often seems that the primary function of priests and shamans is to **protect** the rest of us from the spirits. A widespread attitude is that spirits and ghosts are needy beings wishing to interfere in human affairs for their own ends. For every benign angel, there is a legion of greedy ghouls. We engage professional mediums to be our intercessors with the other side mostly just to neutralize what might otherwise be its baleful influence.

Even among the more enlightened faithful, the principal motivation is likely to be the avoidance of divine wrath. Fear of the gods is still a major force in our spiritual consciousness. Having intercourse with the gods is considered risky business, if not just plain foolish.

Before my involvement with phenomenology and more recently with the Internet, I spent considerable time discussing metaphysics with scientists and academics. The biggest obstacle, of course, to any such rational dialog was to get past the gut reactions. In most cases this was simply not possible. The main response was almost always one of fear. The exact nature of the fear was usually obscure, if not obscured. Consider the possible objects of fear: of the unknown, of personal doubt and insecurity, of censure and ridicule, of not minding one's own business, of contamination, etc., and all of the above.

Ritual and obsession dominate our behavior around the things we fear and distrust. Religion is just for the purpose of routinizing our intercourse with the other side. This reduces our anxiety level. We could also speak in very similar terms of much of our scientific and technological intercourse with Nature and the Cosmos. Is it not all part of the same bag?

Then there are the mystics, gnostics, fools and geniuses who go where even the angels may fear to tread. Such are the freelancers. I certainly am the latter, but I don't seem to fit amongst the former. I am rather too dogged in my approach to this subject to qualify as any virtuoso. Some twenty-five years ago 'Sophia', in virtually subliminal fashion, indicated that there was a larger truth worthy of pursuit. It was neither an offer nor an instruction. It was more like, 'Look what you'll be doing.' Truth leaves a taste that can scarcely be forgot. Once bitten, always smitten. I would not wish this on everyone. I'm not sure I would have wished it on myself. There only ever seemed to be this one path.

Except possibly for Sophia, and an acronymous agency or two, this is just a case of WYSIWYG. I try to be concise, but I don't hold back. I use this public journal mainly in the struggle to constructively channel my thoughts. I apologize for the endemic disjointedness. If I knew where this was going, both of us would already be there. Hyperlinking stray thoughts is a barely tolerable workaround. If I don't get the chance myself, there is always the hope that an interested party will try to bring order to the chaos. My heart goes out to such a one.

Meanwhile, it does seem on occasion that there is a world out there that might be in need of saving. Someone's attempt to conjoin intellect and spirit might figure in that process. But wouldn't you think that if this were the case that God would intervene at the least just to indicate some sort of preference? Should there not be a sign or two? Well, I'm not sure that salvation would work that way in the BPW. If there is

truth, then we will individually have to be able to recognize it for what it is. This is simply a case of management by objective, as opposed to management by directive. God trusts her creatures; let us do likewise.

The question of **participation** looms large, right about here. So right about now I take a break.

Theism has been consistently hospitable to metaphysical dualism. There are not many instances of theistic immaterialism. Here are a few: [1](#), [2](#), [3](#), [4](#), [5](#). These instances have generally been considered heretical by the maintainers of the orthodoxy. I am not presently aware of a handy explanation for this. There is nothing in the logic of theism which requires a metaphysical separation between Creator and Creation. Permit me, then, to attempt an explanation.

Theism is marked, and many would say marred, by its attention to orthodoxy. Fundamentalism is barely conceivable in the pantheist tradition. Furthermore, while any god could be forgiven for an occasional bout of jealousy, Yahweh turned his jealousy into a commandment, his first. As I have pointed out, monotheism does not seem to be a natural state of mind for us humans. We had to be reminded of it frequently. Theism is also marked by its moral dualism and absolutism. The pantheists entertain a plethora of demons, but the concept of Satan is unique to theism. Heaven and hell are part of this same package, of course.

You must be aware by now that I am no friend of dualism, either in its metaphysical or moral aspects, which is to say that according to the BPW hypothesis, dualism is mistaken. So how come this remarkable and erroneous linkage?

It does, I believe, come back to the problem of concealment ([1](#), [2](#)). The whole point of creation is separation. Creation and separation are the epitome of unnaturalness in a naturally relational, holistic world. Maintaining that separation for the duration is no mean feat. In particular, you have to watch out for those clever creatures who see through the game, and decide they've had enough. Only the person who is 'it' is allowed to shout, 'All ye, all ye come in free!' Otherwise, there would be no game.

Where there is no physical or metaphysical barrier between Creator and creature, the trick is to create a mental barrier, which is the function of religion, as outlined [above](#). But instead of protecting us from God, this mental barrier is actually protecting God from us. God does not wish to be overrun by conscientious objectors.

But then what about all those gnostics, Christian Scientists, [Shaivas](#), etc. who, more or less, figure out the game? Won't they make trouble? Yes, and no.

[1/9]

Even God cannot fool all the people all the time. There are enough of the rest of us, however, to keep the game of Creation going quite smoothly. Mostly we are adept at fooling ourselves. Once we get into a rut, it is hard to get us out of it. Furthermore we are quite adept at fear. Once the notion of fearing God has taken hold of us, we are reluctant to let it go.

The only place that God seems to have outdone herself was with the scientists. She has sure kept a lot of scientists busy and off the streets. It is in this arena that the BPW end game will have to be played out. It is just in the present availability and in the recognition of the crucial significance of this audience that the BPW strategy is unique in the long history of immaterialism. The other versions and the earlier versions of immaterialism either did not have the opportunity or have not had the inclination to tackle science on its own turf, if not quite on its own terms, as I propose here.

Yes, God has afforded herself with an impressive camouflage in the form of scientific materialism. Perhaps she has truly outdone herself. It is a conceptual barrier of formidable proportions. I must be out of my mind if I think I can even begin to make a dent in it. My only weapon is the inexorable logic of coherence. My opportunity is in the increasing awareness of the incoherence of scientific materialism.

My target audience is not the professional scientists in the first instance. It is rather the seekers of meaning who are also cognizant of science, and who are using the Internet to further that pursuit. If just a few of us could cooperate, we would constitute a phenomenon that could not be easily ignored. Then it's up to [Tar Baby](#).

This brings us back finally to the question of [participation](#). Unlike the pantheist world of [Maya](#), neither science nor monotheism presents a worldview that is conducive to participation. According to the latter two, cosmogony is definitely a spectator sport: don't try it at home. It is the task of us coherentists to insinuate some of the logic of pantheist participation into this spectator mindset, without subverting the crucial theistic/coherentist focus in the process. For instance, we could take some of the quantum logic and expand it into a recipe for a participatory Millennium. This would be a first.

[1/10]

I am trying to hold things together here. This started out on the last page as a recap, but I keep returning to the urgency of these times. I am struck again by the Islamic [view](#) of the incarnation:

Christ's incarnation obliged the church to plunge into the vicissitudes of history, with its conflicts and shifts of power, which finally brought the church's own secularization.

[In other words, the faithful felt themselves called upon to participate in what soon came to be thought of as 'progress': facilitating the advent of a Millennial aeon on Earth.]

We should have known! But this is just my point. The believers were being called to make history.

(The 'Right to Life' people take this calling in its narrowest possible (Islamic, legalistic) sense. They see themselves as God's school master with the long stick, keeping the rest of us in line. If that is not about the grossest possible perversion of our incarnational invitation to participate wisely in the world, then heaven help us.)

It has taken us two millennia to come to this threshold of deliberate participation in Creation. [Understanding ourselves, now for the first time, to be the co-creators of the world.] It is not surprising that we hesitate to cross this Rubicon. We do need a signal. We do need to compose our thoughts. My further point is that the correct composition of our thoughts will constitute its own signal. There will be no need for further ceremony. We will recognize the Telos and our path to it. The only real crisis here is our dramatic awakening to our place on the cosmic stage.

God came all the way to be here and participate in our history with us. What are we doing to return the favor? Can we think of nothing better than to go around casting judgments on each other? Can we not, at the very least, discuss our options?

The path to our eschatological Self-realization has been fraught with twists and turns. First there has been the delicate task of producing a 'naturalized' Creation, facilitated by our unwitting participation in the maya-esque 'dream-weaving' of the world, based on a preordained set of archetypes. Then there was the inauguration and maintenance of a prophetic/incarnational/millenarian tradition. Within that tradition was fostered an increasingly secularized notion of progress. The spiritual, intellectual and social 'crisis' of

modernity ensues. As we come to the brink of losing our way and stumbling, we are impelled to reconsider the ground of our being and the Source of our coherence. We re-envision the Metanarrative of history and the Telos. Getting beyond this 'crisis' requires of us only the proverbial 'mustard seed' of faith.

We now have to acquire a deeper understanding of our participation in Creation. This 'gnosis' will prepare us for our participation in the Telos/Omega/eschaton. Within the Metanarrative the gnosis was necessarily [compartmentalized](#). In that manner the keys to Creation could be hidden in plain sight, waiting for us upon the awakening from our 'slumber of materialism'. The formerly seeming antithetical notions of maya and Creation may now be seen to invite a teleological synthesis. The incarnation of the cosmic intelligence may thereby be brought to its natural fulfillment.

[1/11]

I continue to find remarkable the similarities and differences between the [Eastern and Western](#) traditions of philosophy. The crisis of modernism is forcing us to examine its roots in Western philosophy and contrast that with the East.

The theistic idealism/immaterialism proposed here has been much more strongly represented in the East than in the West. What is missing in the East is the rationalism of the BPW. With the immaterialism of the East, the theistic element was optional. Theism in the East was geared mainly to popular consumption, in the form of mystical devotion. Hare Krishna springs to mind. Serious philosophy came mainly with an atheistic flavor. There has been no Eastern tradition of theology, *per se*, despite the popularity of theism.

Western philosophy has been indelibly influenced by two unique sources: Greece and Israel. There is nothing comparable elsewhere. Greece is the source of our rationalism, and Israel the source of our optimism. In the East, optimism was just for the masses. It was not given intellectual expression.

What is not clear to me just now is whether optimism and rationalism are two sides of the same coin, and, if so, what is the coin? Greek rationalism certainly has an optimistic color, but what is its source?

Dualism probably figures here. There is no Plato of the East. Plato's highest form or idea was the Good. From whence did this come? Now that I think about it, must there not have been an historical connection between monotheism and Platonic optimism? I am not aware that this question has been raised. And while we are on the subject of sources, how much of the theistic devotionism in Hinduism is indigenous?

The problem of evil is endemic and unique to the West. So also is the problem of matter. Which came first, dualism or optimism? They seem closely related. How then can I throw out the dualism and keep the optimism? Why has it never happened before?

But is it not obvious that cosmic optimism requires monism? The evil must be subsumed by the good, and matter subsumed by mind. This is just the statement of monotheism. It would appear that the primary source of difference between East and West is Israel: Israel and its insufferably jealous Yahweh.

Western dualism, then, is supervenient on Western personal monism. The monism of the East remains impersonal, abstract and often negative. **Personalism** comes only in the form of polytheism in the East.

If monotheism is true, why is it not commonly indigenous, especially in pre-scientific cultures? Why should paganism and polytheism be globally endemic. Is this just another dimension of concealment? If God exists, she had an incredibly effective anti-publicity agent. Abraham/**Yahweh** got her exclusive global franchise. How was the exclusion clause so effectively enforced? There never was another Yahweh in all of history. Is this not carrying jealousy too far? I'm feeling stumped.

But there is a confusion here. Who is Yahweh? I refer to the matrix and the christos. Yahweh is neither of these. Was Yahweh just local deity who made good? How did he get linked up with M&X, ontologically and epistemologically? Should Yahweh be taken as the eighth archetype? Then there would be an X/Y gender problem. But some could complain that Yang has not been properly represented here.

Yes, Yahweh was a tribal god on steroids. Every other such god ended up in a pantheon, but not our hero. I suspect that M&X made sure that Y got plenty of spinach to eat. They had big plans for this fella. By the same token, all the other tribal gods were left to fend for themselves. They twisted slowly in the wind, until they were either blasted with the gale of monotheism, or they were farmed out in pantheonic service to an impersonal monism.

I am proposing an **M, X & D** [dialectic] trinity, followed by a AZO/QRP sextet. In the trinity, the only real archetype or *persona* is X, so the gender specificity of the christos must be muted. Y may then be subsumed by A (Alpha), whereas X subsumes the Omega, if you will forgive the apparent lack of symmetry. Z figures as a relational nexus and a prototype for the celestial, mental and metabolic cycles.

Yahweh was, and still is, the stalking horse for the christos. The christos is much too subtle to be out in front. Let Yahweh do the warrior stuff. Yahweh starts the deck clearing operation, science finishes the job. That is where we are now. There is virtually a blank slate for the X2-event.

What of the difference between Brahman and the matrix? What of it? Perhaps there is none. More specifically, **Brahman** has both personal and impersonal aspects. The personal part has both a male and female aspects, and each of these can be many deities. But then there is also Brahma, without the 'n', who is the first of the triune godhead along with Vishnu and Shiva, the creator, sustainer and destroyer, respectively. Krishna seems the closest to the Christ figure in Hinduism, but then there is no christos. Krishna is just one of ten incarnations of Vishnu, in this round of creation. We cannot get away from the endless round of creation and destruction. Redemption loses significance every time it is has to be repeated.

[1/12]

From whence comes our finality? Is it something to be embraced? Finality may look good in theory, but how will it be when we must collectively face it?

My advice is that we will need to take this one step at a time. It is still a long way from here to eternity. Yes, we have grown very comfortable with mortality, temporality and biology, but we presume that there is more to existence than this.

On the Eastern view, the eternality of the material world, in no way adds to its value. In fact, while the finite Western world is seen positively, the infinite Eastern (material) world is seen negatively. More is less, evidently. Furthermore, with the finite world, redemption necessarily becomes a corporate or communal enterprise. This then lends a transcendental value to our social relations. In the East, salvation is mainly a solitary affair. It is considered best to remove oneself from society.

There is then a strong linkage between the communal spirit and the finite world. One might have thought that this fact alone would have given the prophetic model a decisive social advantage from the beginning of history. It should have become endemic with or without external influence, but this was not to be.

It does appear that the prophetic model, like the world it purports to represent, is necessarily singular. It is a package deal that is all or nothing. No substitutions are allowed. Thus, we have not only the singularity

of the world to explain, but also the singularity of its representation in history. But is this singularity not just part and parcel of the holistic, relational essence of reality? In such a world there is no interchangeability of the parts, something to which we have become accustomed in our industrial world.

To put this another way, the world and our normally accurate representation of it cannot be distinct. We have noted that immaterialism implies a theory of direct perception for individuals. The prophetic model, by the same token, implies a theory of (stimulated) direct perception on the part the (singular) spiritual community. Gnosis is surely not something merely representational. Gnosis is an immediate acquaintance with the cosmos and the personal intelligence that comprises it. Normal perception is merely more limited in scope. This is just part of the logic of our status as co-creators of this presumably mental world.

The simple fact is that a created world must be quantitatively finite, otherwise it could not be relational or holographic in its essence. Relationalism implies a governing PSR, and this principle can only have a finite scope. This brings us back to Greek rationalism and their abhorrence of the *Apeiron*. There is an immediate linkage between monotheism and rationalism. This places Greece right on the verge of the prophetic community. Beyond the pale of that community there was the inevitable entropic-like slide back into the *Apeiron*. It is only the actual finitude of the world that prevents folk from falling off the edge. Plato's non-organic rationalism is more understandable in this context. His system was a useful abstraction of *agape*.

There are two things to explore at this point. First is my contention that there is a natural slide from a finite to an infinite cosmos, outside of the monotheist order. Second is the theistic antipathy to the positing of a God within.

The time scale of the Hindu cosmos turns out to be much closer to the modern scientific time scale than the traditional time frame of the prophetic cosmos. This has been taken as evidence of the superiority of the Hindu system. Most theists now accept the scientific/Hindu scale. Many of these would agree that this revision takes much of the wind out of the prophetic sails. What is unclear to me is the motivation for this pre-scientific inflation of the time dimension. Could the intent have been other than anti-theistic? Was it targeted specifically against the prophetic tradition? I'm not in a position to research these questions presently. I suspect the answers to be definitely 'no', and probably 'yes', respectively.

It might be more accurate to qualify the intent as anti-millenarian. Utopian eschatology has figured strongly in the many revolutions of the West. In contrast, the Hindu caste system and Chinese Confucianism have been comparatively stable, thanks in no small measure to the lack of a popular eschatological sensibility.

The second item, however, might suggest a different picture. One would think that theism would be naturally sympathetic to the idea of a God within, but this is not true historically. This idea has been a specific target in the prosecution of gnostic and pantheist heresies.

In the East we hear that 'thou art that': Atman, the higher self, may be identified with Brahman. One achieves enlightenment by attuning to that inner sense. This is an individual endeavor, although a teacher may be helpful in the early stages. Here we see a further weakening of the social bond, something not conducive to revolutionary solidarity.

As a non-dualistic theist, I am compelled to take up the cause of Atman, or the God within. We'll need to better understand the antipathy.

The first goal for a society as for an organism is stability or homeostasis. In pre-scientific societies, the realm of the spirits played a significant role. The spiritual realm was not easily controlled, and it could be socially disruptive. Societies evolved various means for taming the spirits, usually involving religious forms. The Latin term *re-Ligio* suggests the binding of the spirit. Many funeral customs seem intended to restrain or divert the spirit of the departed.

Part of the difficulty was to regulate human intercourse with the spiritual realm. This difficulty became acute in the prophetic sphere. Attending to prophets was no small matter. As a rule of thumb, the only good prophet was a dead prophet. The medium of prophecy could best be regulated in scriptural fashion, after the fact. As the scriptural tradition matured, the bar for admission to prophetic status could be continually raised. Despite these precautions, it was not difficult for many individuals to successfully invoke the spirits in times of social crisis. Charisma can never be completely routinized.

Where the role of God has been diffused, as in the pantheist tradition, the concept of the God within, or even identification with God, will be rather less problematic than in a monotheist culture. In the latter case, messianism can be endemic and demanding of vigilance on the part of the powers that be. Ridicule is usually the best antidote, but, at times, messianism becomes no laughing matter.

[1/14]

I will readily admit to being surprised to learn that [Brahman](#) has a personal aspect, as well as an impersonal aspect. I had plain forgotten that Brahma is the Hindu creator god. It is then more difficult to rationalize the Hindu departure from the concept of a monotheist, and presumably singular, act of Creation. First it might be useful to examine how the Buddhists depart from these Hindu teachings. And while we're at it, I am still lacking a clear understanding of why the monotheists embraced metaphysical dualism, while the polytheists embraced monism. It almost seems like a reciprocal compensation.

[Is the Buddha's EMPTINESS the Brahmin's BRAHMAN:](#)

In the high Hindu Vedanta teachings, the goal of the spiritual path is the realization of one's ultimate identity with *Brahman*, the Absolute, which is said to underlie all existence. *Brahman*, the indivisible, eternal, uncreated, is also called "the Deathless" -- that place beyond birth and death, beyond the world.

Gautama the Buddha was acclaimed as a challenger and radical reformer of the decaying Brahminism of his time. One of the revolutionary ideas that he taught was the doctrine of Emptiness, said to be the cornerstone of Buddhist understanding. What he meant by Emptiness has been over the ages a source of much debate. Is Emptiness, as many believe it to be, a radical departure from the concept of the all-pervading eternal Brahman of the Vedas, or is Emptiness the Buddha's description of what is, in essence, none other than the Vedantic Brahman?

[Andrew Cohen:](#)

Shankara, the celebrated eighth century Indian teacher and founder of Vedantic nondualism or Advaita (not two) philosophy, from which many of the main currents of modern Indian thought are derived, referred to that which is absolute as "pure consciousness" or "fullness." Yet Gautama the Buddha is famous for declaring that that which is absolute is "emptiness" or "voidness."

There does seem to be some confusion.

And if two of the most respected authorities in Indian spiritual philosophy seem to disagree on the most fundamental definition of that which is absolute, the experiential discovery of which is supposed to be "enlightenment," then what are we to do? If in fact Shankara and the Vedantic philosophers are correct in their declaration that that which is ultimate, and therefore absolute, is fullness or pure consciousness, then should this lead us to conclude that enlightenment is the experiential discovery of what is referred

to in the West as "God" or "Love" or "Christ-consciousness"? Does that mean that ultimately there is something, the realization of which will set us free? If Gautama the Buddha was truly the Enlightened One, then does that mean that his doctrine of emptiness, stating that the absolute nature of all things is emptiness or voidness, implies that God does not exist? Does the experiential discovery of emptiness reveal to us that there is ultimately nothing, and will that discovery set us free?

Dr. Medagama Vajiragnana:

Then there were the Upanishadic teachers who adopted a different approach. They were metaphysicians who believed not in a Supreme-Godhead but in a universal principle - a highly metaphysical concept. This they called the Brahman, the universal soul, the **matrix** of everything. As a corollary to Brahman, they metaphysically conceived of an individual soul, an Atman, which is a replica of the Brahman, believed to be residing in all beings. These Upanishadic sages believed that the key to solving the human problem lies in the realisation of the undifferentiated Brahman-Atman identity, which has to be attained through the path of knowledge [...]

The Buddha discarding **theology** adopted **psychology** [the best psychology is no psyche!], instead of being **theocentric** He was **anthropocentric**. Through this non-traditional approach He understood the problems of man, how they are caused, how they could be solved and the way leading to their solution in a way never heard of before. His analysis enlightened him with regard to the truth that *dukkha* is not something thrust upon in by some external force, but our own creation and therefore lying within ourselves. From this He concludes that the solution too has to sought within ourselves. [...]

The central philosophy of Buddhism is called *paticca samuppada*. It rejects the view that everything happens either due to a creator, or fate or chance or karma. Everything happens due to causes and conditions and the Buddha explained these causes and conditions. [...]

This is that man has no Soul or Self, he has no lasting permanent entity. This went against the accepted teaching of the time. There is an entity in Indian philosophy called "*Purusha*" which is also known as "*Prkrti*". Some said that this "*Purusha*" or "*Prkrti*" is the source of the world and all in it.

This very same "*Purusha*" or "*Prkrti*" was introduced by some thinkers as "Brahman" or "Paramatman". Everything has originated from the Paramatman with a "Small Atman" in each of them. It is an entity which is eternal, unchanging, omnipresent and indestructible. Through realization of that eternal entity and individual becomes one with it. This is known as "*Moksha*" (freedom).

The Buddha, however, rejected the concept of both Brahman and Atman and put forward His own teaching of No Atman, or **Anatta**. What we call a person or an individual is combination of five aggregates; physical body, feelings, perceptions, mental activity and consciousness. But there is no self existing, ego-entity, soul or atman or any other abiding substance within this physical and mental phenomenon of existence or even outside of them.

The Buddha's teaching also had widespread effects on the structure of society encouraging people to question some of the assumptions on which that society was based, specially with regard to caste and status of women. [...]

The above account clearly shows why Buddhism could be rightly called a teaching that motivated its followers to swim against the current, not to pray and supplicate external forces, but to engage in introspection, strive and bring a total revolution within.

It seems that Siddhartha was putting forward an existential philosophy.

I have referred to the Matrix as pure potentiality, or pure potency, if you will. In this sense it is not something substantial. If our reunion with the Christos is substantial, then our personal identity becomes less so. Our personal identity is relative to the Christos. Only the dialectic of M&X is eternal or primordial, all else is derivative.

Bijoy H. Boruah:

In contemporary philosophical parlance, the Advaita Vedantin would be a realist about the self and the

Buddhist an anti-realist about the same thing. This is surely a radical ontological antinomy. But what is surprising is that despite such an ontological antinomy the two systems of thought have a more or less common "metaphysic of transcendence" or a transformative teleology. They each believe in the possibility of ultimate human liberation or enlightenment. The ultimate liberation (Moksa) of Advaita Vedanta and the ultimate enlightenment (Nirvana) of Buddhism are in essence similar notions of attainment of salvation or final freedom from the quagmire of human bondage. How would one reconcile the fact that the two systems share a basically similar metaphysic of **salvation**[!] with the fact that they are arch opponents on the issue of the ontology of the self?

Me too, w.r.t. salvation!

Apparently, it would be absurd to profess total self-denial while admitting ultimate liberation because the experience of liberation, being enduring as well as unitary, presupposes an experiencer of some sort. We would do well not to short-circuit the Buddhist position into plain absurdity and examine whether there really is no sense of self-affirmation in the overall metaphysical stance of Buddhism. [...]

I think that a reconciliatory philosophical reconsideration of the ancient debate between Buddhism and Vedanta would yield a picture in which the two systems would be seen as being complementary to each other. With this intent I shall start from the Vedantic angle to show that the concept of Atman is compatible with that of Sunyata. [...]

Furthermore, Sunyata is not abhava or non-existence, but held to be the ultimate ground of everything, the utmost original condition of reality prior to all conceptualization and phenomenal distortion. It is characterized as pregnant emptiness, vibrant void. Cast in terms of consciousness, Sunyata is a state of pure consciousness that one would revert to if one were able to empty oneself of any illusory constructions or impressions of an unchanging or permanent reality, whether of things or persons. This reversal to original subjectivity, which also has an ethical import, may be interpreted as one's "becoming" Sunya or empty. But "becoming" Sunya does not mean going out of existence. Rather, one can truly be oneself, or become truly self-aware, only by "becoming" Sunya. Otherwise, one continues to be in an unawakened state---to be under the spell of Avidya.

Can we not say, now, that the Buddhist awakening in "the field of Sunyata" is most akin to the Vedantic realization of the ultimate identity of Atman with Brahman? And is not Brahman---the absolutely indeterminate (Nirguna) Ultimate Reality---itself more like a "field of Sunyata," the original ground of everything?

There does seem to be convergence on the notion of the Matrix.

What is clearly missing is an affirmation of Creation and Creator or Christos. Is it clear why? Was it a positive avoidance, or was it simply a failure to grasp the possibility?

What about the path of bhakti? Is it other than the Christian agape? Pure bhakti is objectless love. Does not the Christos figure in agape?

[Scott David Foutz](#) -- reviewing [Global Philosophy of Religion](#) by Joseph Runzo (2001):

After dispensing with the traditional rationalistic approaches, Runzo sets his sites on what he deems the non-rational or "extra-rational" elements of religious belief, namely love, faith, compassion and devotion. By grounding a philosophical argument in these extra-rational elements, which he demonstrates exist in all the major religious traditions, Runzo believes he has found the means whereby a universal demonstration of the justification of religious belief can be set forth. [...]

For purposes of discussion, Runzo lumps the non-rational elements together under the rubric of 'Love' and then develops a working definition. The term 'seraphic love' is employed to describe "the ultimate love of the Divine, as well as the human love which is modeled in the World Religions on Divine Love". Contrary to the traditional Christian habit of qualitatively distinguishing between Agape and Eros, Runzo argues that these latter are not two different types of love but rather the two poles of Seraphic love. He writes:

For we can ask what motivates agape. And the motive for agape is the passionate, devoted love which is eros. So agape and eros form a dynamic pair... Eros (or bhakti) is the dynamic pole of seraphic love which brings humans also to have agape (or egoless love).

[...] More specifically, Runzo seeks to include in his working definition six characteristics of eros, which are more fully delineated in his earlier *The Meaning of Life in the World Religions*. These are: relationality, surrender, vulnerability, integration, union, and equality. These interpersonal and relational elements will become critical for Runzo's argument that an ultimate religious response of seraphic love implies an Ultimate Other.

Now that we have a working definition of love, Runzo sets forth the argument whereby seraphic love is justified. He does this by introducing the discussion of values, multiple and single, extrinsic and intrinsic. Runzo here adopts Robert Nozick's (*The Examined Life*) definition of intrinsic value as that which is "organically unified". Runzo writes:

The degree to which something is organically unified is determined by how much diversity is being unified as well as the degree of unity that is achieved within that diversity. In short, the greatest intrinsic value results from the greatest integration of the greatest diversity. This is why human life has greater value than works of art or than plant life.

In other words, "the value of a thing is enhanced by meaning. [And] meaning comes from a thing's connectedness to other things". Within this dynamic of value and connectedness Runzo may argue that those love relationships whereby subject and object's interconnectedness increase causes or implies an increase in the individuals' intrinsic and extrinsic value. He then suggests that ultimate meaning can only be derived through connectedness to something outside oneself which is unlimited in value. This, of course, is where the Ultimate Object of justifiable religious belief is introduced. By attaching the notion of an increase of value to the act of loving, Runzo has put forth a rationale or justification for loving. And by introducing the relational aspects of eros into his definition of divine, seraphic love, Runzo finds implicit within such love an argument for God, since "the presence of love in the universe and the obligation to love implies a transcendent love". In the final pages of the book, Runzo delineates a formal "Argument For Love" whereby the causal relation between divine transcendent love and human involvement in seraphic love is laid out. I will leave the full exploration and analysis of Runzo's formulation to those who wish to read the book.

On the christian view, the path of bhakti must have the christos as its Telos. Runzo is inserting the christos into bhakti. Is bhakti thereby incomplete? It is if it neglects the world Telos in favor of the individual telos of union. One cannot escape the logic of the Incarnation. Its singularity is the necessary logical basis for the singularity of the BPW. But is the BPW hypothesis not compatible with monotheism in general? The BPW is necessarily anthropocentric. Monotheism, *per se*, is not. Have I not understood this crucial distinction before? Is it not obvious? But is not this parochialism usually taken to be an embarrassment to christian philosophy?

All or Nothing

We generally try to strike a balance between freedom and commitment. We value our freedom to commit or not to commit. What I am about to suggest, however, goes against that grain. I am making an offer of all or nothing with respect to meaning, truth and, yes, existence. It is an offer which can hardly be refused. It presents an irrevocable choice, which most of us will want to, and are, postponing for as long as possible. The proposition is pretty obvious, but we have become masters at rationalizing away from the obvious.

The fragmentation of meaning, life and existence we have come to accept as part of the modern condition. The virtually unlimited choices placed before us every day represent for us the foundation of our freedom. On the other hand, there is the nagging suspicion that 'freedom' is just another word for nothing left to lose. But what is it that we have lost, amidst all of our freedom?

There is one word for that, too: meaning. Are we going to have to choose between freedom and meaning? Perhaps we just need to find a more meaningful meaning for freedom. For instance, what is the meaning of 'free will'. No one seems to know, but almost everyone has an opinion.

Chaotic and quantum systems are characterized by their unpredictable and ontologically random nature. For the materialist, this is as close to freedom as you can get. Every other 'freedom' is an illusion. Most of us find this response far from satisfactory. That's why we still have philosophers. Well, they were still there the last time I checked.

However, to say that freedom is something more than randomness is, it turns out, having to say a great deal. Very many papers and books have been written on this topic with, apparently, no one feeling that the topic has been exhausted. As you may have anticipated, I am about to add my own two cents, and I'll wager that, despite its brevity, there will be a substantial originality.

My proposition is that freedom and meaning are closely related concepts or problems, depending on your frame of mind. They are both related to the problem of reason. Reason is another word fraught with elusive significance. It has been said that we are the rational animals. We are the only animal purporting to have reasons, and do we ever! We have never been known to lack for them. Do we reason, or do we merely rationalize, more or less, after the fact. Do we just play the obligatory language game that we label as 'reasoning'? Reason, I maintain, is an all or nothing proposition. So will be meaning. Freedom? We'll just have to see about that.

Reasoning is generally teleological in essence. My proposition then is that there is no telos without a Telos, and there is no truth without Truth. Yes, there are facts. But we almost never want to tell just the facts. Just ask Joe Friday. What we almost always want to do is tell a story, and not just any story. We want, above all else, to tell 'Our' story. That is certainly what I am trying to do here. So I am also saying that there is no narrative without a Metanarrative. Now that is a bald statement. Go to the fiction section in any library or bookstore and you will see shelves full of narratives, but I'll warrant that you'll find not a single metanarrative, because right now there is only one BPW story, and we know where it is.

My bald statement becomes less bald when I say of what it is that stories are made. In the first instance, a story is a complex transaction between the teller and listener. Many norms come into play. It can be a very fine art. Perhaps it is even the only art. The most elusive aspect of the transaction is empathy. The listener must be drawn into the story, otherwise it becomes so much hot air, spilled ink or errant electrons.

OK, then, what is empathy? Just another feeling? On the last page we discussed bhakti, agape and love. Is empathy not of these? It is not easy to argue that there are any higher emotions. There are even those

who have equated love with the Telos. I am one of them. And with this one twist of a phrase, I ought to be able to walk smiling into the sunset.

There is, then, only one story: the love story. All meaning, truth and existence derives from that Metanarrative. So are we free to love? Yes, and no. If so, it is our first and last freedom. That is my all or nothing proposition.

I have spoken of the [Trinity](#): M, X & D: matrix, christos, dialectic. The dialectic is the elusive element. It is also the engine of existence. Dialectic is **dialog**. It is sharing in a story. It is, in the first instance, the playing out of the eternal, universal I & Thou. That is simply, then, the dialectic of empathy or love. The holy ghost is the holy spirit. It is the prime mover: Eros & Cupid. It has a thousand masks, but it is finally of one substance. It is the one legal tender in all cosmic intercourse.

Why then is D not an archetype? If it were, there could be none other. Love is jealous. It brooks no rival.

[1/16]

If meaning is reducible or analyzable, it is, at least, reducible to words. Are words reducible? I believe that it was the logical positivists, who, back in the 1920's, claimed they could reduce all meanings to 'sense data'. To some people back then, the idea sounded half-way plausible. Unfortunately, when put into practice, no one could manage even a single reduction. But, no, I believe the situation was worse than that: the logical positivists were never able to produce even a workable definition of 'sense data'. That hope of the Positivists represented the high water mark of materialism and analysis. The Artificial Intelligencers are the last bastion of 'Positivism', but they are no longer willing to engage in philosophical discussion. Daniel Dennett is their most articulate spokesperson, and even he admits that his essays are polemical and evangelical rather than philosophical.

Could any atomic theory of meaning make sense? What would be the minimum number of atoms required to produce a reasonable combinatorics of meaning? A very conservative estimate might be a hundred or so. What then are we to make of those hundred irreducible meanings? From whence did they come? Should they not have universal significance, as is alleged for the elements of math and logic? They could be likened to a finite set of prime numbers, for instance. The ontogeny of the atoms of meaning would present a metaphysical problem of the highest degree, but let us set that aside and look at another problem.

Given our hypothetical atoms of meaning, we still have the problem of context dependency. Even if the atoms themselves were context independent, this would be no guarantee that the 'molecules' of meaning would also be independent. At some level we will have to confront the Text. But can a text have a meaning, *per se*, given our assumption of atomicity? Texts should be epiphenomenal. The text serves no mental function beyond that of its constituent atoms. Does this make sense?

A text is a string of words. The sequence of the words will surely influence the meaning of the text. Where then is the meaning if not in the sequence? Different sequences of words signify different things. Consider the genetic sequences of DNA molecules. One sequence produces a chimp, another, slightly different one, produces a champ. Our reductionist will then argue that chimpness and champness have no significance beyond that of their constituent atoms. But that is missing the point about the function of the DNA. A random sequence of DNA will produce nothing at all. This is nonsense DNA. Even the village reductionist cannot claim that nothing is the same as something.

What I am aiming at here is the so-called 'frame problem'. DNA remains functionless or inert without a proper biological context or frame. The same is true of language. Language requires native speakers. Native speakers require a culture. The psychological or social function of a given text will depend on the

culture in which it is used. The problems of translation can be enormous, and there can be no such thing as an exact translation.

No theoretical limits may be placed on the possible scope of the frame. The more you know about the world, the more meaning you may be able to glean from or read into a text. There is no reason that an astute reader cannot perceive social subtleties unintended by the author. Authors are serving as cultural mediums as well as creators.

Textual considerations demonstrate that subtle shifts in meaning are endemic to any text. If that is true, our hypothetical atomic theory of meaning is simply not tenable. Whatever the ontology of meaning, it is not atomic. The only alternative is something organic. Now we begin to see why we have been so reluctant to give up on reductionism, despite its excruciating shortcomings. The devil we know is better than the one we don't. Better to have no meaning than organic meaning.

This is just what I warned you about: an 'all or nothing' problem with meaning. But there is lurking here a much bigger problem: the all or nothing problem of organicism.

It appears that semantics, among all our fields of knowledge, is the one most obviously susceptible to an organic interpretation. It is the Achilles heel of epistemology relative to organicism. But once that organism gets its foot in the semantic door, how will we keep it out of all the other doors? Reductionism is looking more attractive all the time. Well, lots of luck to us! I have spoken of the crumbling of the foundations of the fortress of materialism, but perhaps that is the wrong analogy. Perhaps those foundations are being eaten away. It was bad enough when we discovered ourselves to be space-farers stranded on a desert island. What will we do if our little island begins to twitch?

But, wait, we are only talking about epistemology, right? So what if our brains are organic? What else is new? Well, sorry, it's not quite that simple. A major tenet of reductionism was just the epistemic/ontic divide. Without its reductionist support, that divide becomes ever so tenuous.

If semantics is organic rather than syntactic or analytic, then our erstwhile computer will not be able to compute it. Something substantial will have to be added to the machine. That something must itself be organic. Now we are talking about the ontology of the computer. The distinction between natural and artificial intelligence is then an ontic distinction. There is no longer a need or motivation to distinguish between the ontic and epistemic aspects of the organism that must exist as the ground of being. At best, this organism would have various microcosmic aspects.

We have long suspected that there was something more to life and mind than atoms swerving in the dark. This suspicion is the basis of our vitalistic, anti-reductive musings over the centuries. That vital something is finally coming home to us. Not, in the end, because we were out searching for it, but rather because we simply had to give up the constant battle of trying to avoid and ignore it.

What then is this subtle thing that has been living with us, presumably since day one? From whence did it come? But are we not thereby asking, from whence do we come? Where is Darwin when we need him? Can't we just say that this organic quality evolved along with life itself?

The point is that Darwinian evolution is just genetic evolution. Clearly we cannot ascribe genes to organicism. By definition it is something extra-genetic. It would then, in fact, be a precondition for evolution. The biggest puzzle of evolution is just the origin of the cellular-genetic processes. This has been considered a prime motivation for vitalism. Whatever this vital potency is, if it is anything at all, it is the source of life and mind.

We have, at the least, an eternal vital potency that is both biological and mental in scope. This sounds like our hypothesized Matrix. It ought to, because that is just what the Matrix was supposed to be. But what then of the dialectic and the archetypes? Here is where the metaphysics begins to get interesting.

Did all of this potency sit idly by just waiting on the off-chance of a Big Bang so that it could then begin to impregnate the otherwise inert matter? But is there not a blatant Cartesian bias to this question? Why posit this dichotomy in juxtaposition to that which is inherently organic? If anything is likely to be all or nothing, would that not especially apply to organicism itself. What is the sense of a cosmos that is half organic?

The Big Bang is the epitome of something inorganic. It is certainly the contingency to end all contingencies. The organically potent Matrix is the mother of all teleologies. If ever there were oil and water, this has got to be it.

This is the big metaphysical crunch. We have been trying to make sense of Cartesian dualism for over three centuries, and look where it has gotten us? Mainly it has brought us to this dead end of materialism. If we wish to move forward, nay, start thinking again, we will have to choose the other branch of that fork. Immaterialism, here we come. You are welcome to keep your head stuck in the materialists' sand box. That is just the 'slumber of materialism'. Otherwise, let's wake up and smell the organic cosmic coffee. Yes, to wake up, that is my final 'all or nothing' offer. Refuse it if you can!

So there we are. We have our immaterial organic potency, our Matrix. Then what? Perhaps now there must logically come the single biggest step in our gestalt switch. We must begin to focus fully on the Matrix. We have to put dualism behind us. We cannot do that without bracketing space, time and matter, and unless you completely missed out on modernism, it would be impossible to imagine a more severe blow to our metaphysical orientation. Are we not simply turning our backs on three centuries of science? Yes and no.

[1/17]

There are several ways to proceed at this point. Several major issues present themselves. But, perhaps, first I need to back up a step. We could use more justification and preparation for the big leap. A bit later I will be attempting to justify the move from Matrix to Creatrix. I don't think this will be terribly difficult, so permit me please to bring on that big gun. Heck, let's go all the way and just postulate an omnipotent creator wishing to create the best possible world, and assume further that we can reason effectively about what might be the basic form of the BPW.

The simple point I then wish to make is that the BPW would not be created by means of a Big Bang. The Big Bang has features that would eliminate it as a candidate for the best possible creation. However, and here is the real twist, those same features, along with some others, make the Big Bang a prime candidate for the best possible phenomenological background for the BPW. With a little help from God, we can have our ontological BPW cake, along with the phenomenological icing of the 'Big Bang', and that this combination, if it were possible, would, indeed, be the best of all worlds.

With the Creatrix in the picture, we can remake the ontology without disturbing the phenomenology, giving us creatures the best deal possible. What is being offered to us is our 'dream' world, in both senses of the word. This is, finally, the very simple point I am trying to make: the obvious, and perhaps only, way to create a 'dream' world is to just dream it up, if possible. Like I say, metaphysics does not have to be 'rocket science'.

So here is our problem now: what would our 'dream' world, i.e. our BPW, be; and would it not be possible, or perhaps even preferable, to create this world by means of dream power?

Consider the last part of the question first. If we wish to entertain the notion of co-creation and of a 'participatory universe', then using 'dream power' is virtually obligatory. Here is another way to look at it.

Materialism tells us that we live in a dumb universe. It came about, more or less, as the result of an accidental collision of dumb atoms. Of course, if there are enough of these dumb universes being created all the time, then every once in while there might be one with the appearance of a masterpiece, like the proverbial monkey typing a Shakespearian sonnet. If God were lazy, you would think she would use the 'monkey method' of creation.

OK, here is the big secret, and don't tell anyone I told you: God IS lazy, but she is smart lazy. Instead of using just the monkey method, she also uses the people method of creation. Remember, we are the smart monkeys.

Evidently, consumers are willing, these days, to pay more for a 'smart house' than for a dumb house. God is just a little ahead of this curve. She figured she would go ahead and create a smart universe. However, to cut down on the costs and the work load, rather than relying on just one central processing unit, i.e. herself, she would use the very latest in computer technology, i.e. distributed/parallel processing, but she calls it 'creature power'.

If bootstrapping is illegal, then that is too bad, but if not, then it would be pretty dumb for the Creatrix not to exploit it in Creation. That we creatures would be the primary participants in any such bootstrap, ought to be a given. But if this were the case, why aren't we aware of it? Well, I believe it was Freud who first pointed out that there must be a great deal more going on under our bonnets than we could ever know. Bootstrapping could well be one of those things. But then why have we been kept out of the loop on this? Maybe the Creatrix just wanted to surprise us. Surprise!

There are many skills we have which are performed better when we don't stop to think about how we do them. This is probably one of those. However, to live is to learn. To fully realize our function of co-creation, we will need, eventually, to give it our full attention, but this is a tricky business. Think of the poor fellow who goes sleep walking out on the window ledge. You're gonna have to wake the guy up, but you had better do it very carefully. This pretty much explains the surprisingly (for many) subdued orchestration of the X2-event. If Gabriel blows his horn too loudly, we might just fall off of our cosmic perch. So, is my horn-blowing not loud enough? Call 1-800-GET-THE-WAX-OUT!

But why didn't the Creatrix even bother to give *me* the time of day? It's all part of the Prime Directive. If you disagree, then prove that it isn't.

Yes, we are all part of the big Dream Machine in the sky. The universe is just our *folie a 10^10*. It must be a heck of job keeping 10^10 sleeping musicians on score. How does she ever manage? Hmmmm, let me get back to you on that one. But if you think it's difficult now, just wait 'til they start waking up!

[1/19]

I think I'm supposed to explain how the dream machine works. This is embarrassing because I don't know. My job is to speculate, to make educated guesses. So here we go.

There are two things that need to be explained: substance and space. If this is a dream that we are having, how does it manage to seem so substantial, so consistent, so realistic, so participatory? We pretty much all agree on the nature of the phenomenon. What is up for grabs is the noumenon. The materialist says it is matter, the immaterialist says it is spirit that is supporting the phenomenal world. The dualist says that it is both.

What is substance? This is a trick question. No, the answer is the trick. Here is the issue: is substance something that is present or absent? The materialist claims that substance is present. I suggest it is

absent. The materialist claims that substance is just what is present(ed) to the senses. No, I say. Substance is present to our 'memory', or more specifically to our collective unconscious. The infant has no conception of substance. The mother's breast may be the first experience or conception of substance.

The concept of substance is tied up in our memories, habits and concept of time. It is something logically derivative, it is not yet immediate. But then is substance in the past or the future? The materialist would say that substance is mainly in the past, I say future. Substance is that to which we awake. Substance now is a shadow of that telic substance.

I fall back in to poesy? No, I fall forward. The ultimate, teleological consistency, substantiality of the world is just poetic. Our collective, telic unconscious is what drives the world forward. That falling is normally just the task of the poet and musician. Here you see me attempting to routinize, systematize the poetic charism.

The materialist has, in fact, lost contact with substance. Matter and substance are no longer to be found in the texts of physics. What has replaced them? Quite candidly, it is the Monster Group. A Platonic conception of mathematics is the closest that physicists can now come to our traditional concept of substance.

These few words may serve just to temporarily bracket the problem of matter and substance. In the meantime we turn to [space](#). Matter is nothing without space. Space is just an organized nothing. Organized by what? By matter? Do we not then have a vicious, or is it a logically vacuous, circle?

A time slice of the phenomenal world is presented to us optically in three dimensions. To explain its optical properties, physicists perform ray tracing; that is, they trace the rectilinear paths of photons. Well, if we can have substance without atoms, can we have vision without photons? And which will be more difficult to rationalize?

Space may be the greatest obstacle to immaterialism. The reason is not because of the coherence of space, but precisely because of its incoherence. Space is substantial because we cannot manipulate it. We cannot manipulate it because we cannot understand it. We cannot understand it because of its logical vacuity. Am I making myself clear? Space is logically vacuous because it is alleged to be elemental. Einstein's General Theory of relativity went some ways toward reducing the substantiality of space by reducing its elementality, by increasing its relationality.

[1/20]

Permit me to back up a step and try a different approach to the problem of space. Let us start with meaning and vision. Meaning derives from narrative which entails a temporal sequence of causes and effects. Vision entails a two-dimensional visual field. Meaning and vision then require at least a two-dimensional dynamics and perhaps even a rudimentary physics. But would this tell us anything about how space comes about?

My thought is that in a teleological system there is no clear distinction between why and how. This is an issue that we now take up.

In a dream environment, the only limit on intent should be logical and narrational consistency. Any further limitations would have to do with optimizing and coordinating that environment. Virtually all dreams have a strong visual content. However, the psychodynamics that we label as zodiacal would be one of the most primitive of dream sequences. Cycles would predominate. Direct perception of essences could predominate over any visual content. Nothing spatial or celestial is entailed in the first instance.

[1/21]

The trick that we seem to accomplish is to have both direct and indirect perception without undue interference. What is the advantage of this? What does spatial or representational perception buy us over direct perception? I would guess that spatial configurations provide combinatorial diversity, not otherwise possible. Without spatial relations and the perception of those distinctions, Leibniz' Identity of Indistinguishables would severely limit our possibilities.

If in the process of Creation it is deemed desirable to partition the cosmic self into some 10^{10} entities, then spatial relations become a bare necessity. Thus do we magnify the creative possibilities with minimal interference or contrivance.

What we get with spatial relations is a parallel processing relative to the cosmic narrative. At least we have a loom in time rather than just a single strand. If our two-and-half dimensional mundane existence is good, why not go for more dimensions? Somewhere I heard it argued that four dimensional topology presented some possibly insurmountable metabolic problems (e.g. difficulty of containment?). 3-D may be biologically optimal. Someone should look into that.

Where there's a will, there's a way. Let us not underestimate the cosmic will. But what exactly is the way to space? How does the Matrix see her way into space? The endlessly cyclical zodiacal narrative may just bore her to death. She lets her potent imagination get off on the combinatorial possibilities, and *voila!* The metabolic cycles pick up on Z, and kick into action. Evidently, space is eminently imaginable and dreamable.

Space and time are a major source of possibility. Matricial potency is ramified thereby. Without time, there is no narrational drama, merely aesthetics. Even the notion of sequence fails without any dimension. Could there be non-dimensional patterns? Cosmos is akin to ornament in Greek. Dimensional arbitrariness seems essential to the ornamental essence. Dimensionality would also be essential to freedom. It is hard to imagine a creation without the allowance of this aesthetic freedom, despite or because of the exigencies of the BPW hypothesis. At this low level of understanding it is not even possible to determine if spatial relations should be deemed internal or external. Temporal relations would be most likely to be internal. We suspect that the answer to this and many other questions will be determined by considering how to enhance the creative bootstrap process. Its space-time structure also enhances the participatory nature of Creation. Aesthetic freedom is readily passed on to the creatures of such a manifold.

Each creature is ensured its own spatial sensorium. The greater problem may be to keep all the sensoria in alignment, without resorting to the physical objectivity of a single manifold. It may be that the zodiac plays a role in the alignment. The global nature of the celestial phenomenon makes it an ideal synchronizing agent. The global megalithic culture was very much attuned to this phenomenon, in what appears to have been a closely coordinated fashion. Materialists use matter to align the sensoria; we use the sky. It is ironic that the material atoms must then be 'aligned' by the sensings of the creatures, according to quantum theory, at least.

Our problem is to explain the 'heavenly' translation of the zodiac from cosmic psyche to starry sky. It is not entirely unanticipated that the collective psyche should find itself projected upon the heavens. Students of the mythos have noted the universality of the translation between sky and spirit. Each of the archetypes has its work cut out for it, but it must also flow along with the phenomenon that it is organizing. The more that the organizing intelligence can be distributed, the more plausible is the model; the more natural will it appear. The zodiac may turn out to be the hardest working of the archetypes. It will require some attention. When it comes down to displacing matter, the zodiac may have to carry most of the water, Aquarian style. It would be helpful if the task could be subdivided, but that may not be possible.

[1/22]

Materialists appeal to the alleged objectivity of the atoms to explain the objectivity of the world. Objectivity projects upward in scale. The higher level forms and patterns are more subjective, lacking as they are in any essential identity.

For immaterialists the objectivity of the world projects downward. This downward projection is facilitated by the microcosmic identity of the creatures. We could also call this the zoocosm. It here that the zodiac comes into play. The zodiac is the original pantheon emanating from the Matrix. It exists originally in ouroboric fashion, being the primordial psychic cycle. The christos element comes to dominate this cycle, partly by preempting, in alpha-omega fashion, the narrative that generates all meaning and history. The christos becomes the organizing principle of the zodiac.

But then we have the ouroboric zodiac projected downward to the gaian zoocosm and outward to ouranos in a prototypical earth-sky duality. Actually the zodiac becomes a quaternary: earth & sky, alpha & omega. I certainly see a reflection here of the traditional four elements of earth, air, fire and water. This identification is underscored by the tradition that identifies the beginning of the world in water and its ending in fire. Like I say, the zodiac will have to work overtime. We do need a rationalization of this subdivision. In this scheme the quintessence is then the christos.

The zodiac starts out as a (dialectical) mind game of the matrix. It then projects itself out to cosmic proportions in a process of continuing symmetry breaking. This sequence is even reminiscent of the big bang. Here is the present sequence: M -> M, D, Z -> A, O, (X), Earth, Sky -> AZ'O/X/QRP. This is still a very sketchy sequence, but it is better than nothing. Keep in mind that this is much more of a logical sequence than a temporal sequence. The linear time dimension grows out of the A/O asymmetry. The time frame for the zodiacal precession of the equinoxes (25,000 yr, see [Hamlet's Mill](#) for the mythic origins) is of the same order as that of the Creation. Also note the distinction now between the primal (psychic) and residual (celestial) zodiacs: Z/Z'.

Here's just a thought: the psychology of Z gradually develops into an ecology. The psychic cycle is replaced by a reproductive and predator-prey cycle. What are the 'evolutionary' steps in this process? The reproductive part will be the toughest to rationalize, that is why there is an archetype just for this.

[1/23]

In the attempt to rationalize Creation, Z is turning out to be the key element. I had not originally anticipated that Z would portend the Earth/Sky duality, but that now seems to be the most natural way to proceed. It is noteworthy that this step has been anticipated by significant versions of the Mythos. For now, the Earthly side of the duality is my focus. The principle obstacle is the transition from Z to **R**. We'll know we're in Kansas when we can make this transformation. Reproduction or bust! This is the buckle of the bootstrap.

The metabolic/reproduction cycle, R, is the most 'materialistic' of the archetypes. This is our biggest hump, so to speak. The ouroboric symbol itself has a strongly metabolic connotation. (In this connection, note also the yin-yang symbol.) It is alimantal as well as elemental, but I don't see how to incorporate that into a narrative.

With these caveats out of the way I can only give it my best shot. The reproductive cycle is a microcosm of our singular cosmic circuit, with the reversal of the head and tail that form our 'buckle'. Now the Telos or Omega becomes the head while the Alpha is the tail. The eschatological resurrection is the final cause of the Creation. Thereby the cosmos becomes self-consuming. The self-sacrificing God comes into her

own, so to speak. There are no loose ends. The microcosmic seedlings are taken back up into the cosmos. As for the mechanics of this spiritual metabolism, I'm drawing a blank; but any good narrative ought to provide spiritual sustenance. Our microcosm would be incomplete if we did not act out and reenact the cosmic circuit. Ontogeny recapitulates phylogeny in more ways than one. Neoteny anticipates evolution. Perhaps this is where the zoocosmic nature of the zodiac is more relevant than its more usual pantheonic, or purely anthropic interpretations. Can we thereby save our Darwinian appearances? Don't ya think? With this rationale we do not have to explain away some arbitrary first appearance of R. It is latent in the essence of almost everything, as is Creation itself.

So much for the Earth, how about the Sky?

[1/24]

Given a 3-dimensional space and a zoocosm, the benefits of differentiating between horizontal and vertical dimensions should not be difficult to either conceive or implement, nor would the idea of a spherical Earth. A remote, evenly distributed metabolic energy source should easily follow suit. The starry version of the zodiac then becomes almost an afterthought. Having done so much work already, the zodiac is seemingly relegated to its happy hunting ground, while helpfully providing chronometric orientation to any wayfaring species. It is, however, our fascination with the heavens that finally empowers us to conquer the atom, transforming the Earth into our terrarium along the way. Perhaps it would be more accurate to say that the starry zodiac empowers us to empower the atom.

The effort now is to see how the individual archetypes can emerge and function in bootstrap fashion. This should go a long way toward establishing the plausibility of the BPW. In this instance, atomic physics is brought about by the refocusing of Z after its branching out. The atom is the ultimate microcosmic reflection of Z. It sits at the confluence of Q, R & P. Q and P have yet to be brought back into this narrative. Originally in these pages the Sun and Atom were both primary archetypes, but later they were given a derivative status.

I submit that Pi 'dropped' out of the sky. This is not hard to explain historically. Q is another matter. It is Q that gives Pi its mundane purchase. Q is the tricky one. It may be allied with R and is the manifestation of panpsychism. It has a bootstrap quality that may be related to the ouroboric Z. Q, along with R, is the buckle of the cosmic bootstrap. The plethora of metabolic cycles are the primary instruments of quantum measurement. Animal consciousness might be viewed as simply an elaboration on this basic theme.

From the Anthropic perspective, Q is practically a no-brainer. It provides for the stability of the micro-world. It accounts for photosynthesis, vision and thermal radiation, among many other functions. But here again we are missing a narrative link to the other archetypes.

Quantum related symmetries provide for micro-level cloning. Thus its relation to R in providing the combinatorics allowed by spatial symmetry. It must also be involved in the organics of mathematics, as part of the anthropic loop implied thereby. In its relation to time it might possibly be sympathetic with the A/O gap in the zodiacal circuit.

[1/25]

I am still trying to break the impasse over Q. Perhaps we can resort to the **trinity** ([1](#), [2](#), etc), i.e. MDX or $e^{i\pi}$. The latter threesome suggest that Q should be [identified](#) with the imaginary unit and then, possibly, with the dialectic. None of these three (Q, i or D) make a solid archetype. Perhaps we can let Q represent the trio, among its more solid cousins. The combination (Q, i, D or **Quid**) might help us gain

insight into each member. There is still the option of dropping Q from the seven primary archetypes. The Quid are bridging elements. They help provide for the relational character of the world, along with M. Such considerations ought to provide additional understanding of the function of the quantum.

[1/26]

Another facet of the Quid is projection. Quantum operators project probability functions into definite observable states. Such projection may underlie the emergence of Z from M. In this case there would be mutual observation and projection. In some fashion, a conscious specificity is wrested from the unconscious potentiality. A Quid for your thoughts.

The necessary mutuality of the primal emergence maintains a cosmic dialectical balance as seen in the yin-yang dynamic. However, the prophetic tradition does look forward to a constructive, teleological synthesis of Creator and Creation, Heaven and Earth.

Yes, there must be a teleological character to the Quid bootstrap. As it helps Z to emerge from M, so does it help R to emerge from the ouroboric structure of Z, and mainly from R we get the materiality of the world.

It is occurring to me just now that the Quid may also be responsible for the singularity of Creation. Consider Richard Feynman's quantum summation over histories formalism. In this case the sub-optimal paths destructively interfere leaving the one path of least action. This would be our BPW. It is the path of least resistance, given the primal Quid impulse. And there can only be one such BPW, just by Leibniz' Identity of Indiscernibles. Can we not play it again, Sam? Really there is no need. The Telos is just a universal Presence. Where there is no absence, there is nothing left to be repeated. It's all right there.

And now there is a bit of snow to be shoveled.

Evidently the Quid is involved in the symmetry breaking of M. In that role it is acting as the precursor of the Logos ([1](#), [2](#), etc). But we also have the Johannine equation of $X = L$, thus we may have to append Quid as QuidX [but see [below](#)]. This is just to emphasize the relational nature of the archetypes, AZO/X/QRP, following from MDZ. QuidX is also involved in the A/O symmetry breaking of Z. In the BPW metanarrative it may be that the Logos has more to do with X2 than X1, but that is a technical detail. Both X and the third person, HG, serve as intermediaries between heaven and earth. This is another indication of the centrality of X.

[1/28]

Pi has also been related to the logos, symmetry breaking and X. This polyvalence of the archetypes is neither unexpected nor dysfunctional. This is how a relational world is supposed to work. It does not imply redundancy. Strictly speaking, M, D & Q are not archetypes. They are, however, essential to the bootstrap. Q also stands in for the atom. Perhaps the Logos as distinct from X should be given a formal status. Also note that X and Z are interchangeable in the trinity of MDX/Z. Z may emerge logically prior to X. X emerges as the self-organizer of Z, for the sake of Creation. Pi appears in the numerical trinity of $e^{i\pi}$, playing the role of the logos.

Four days ago I claimed it would be easy to see how Pi 'dropped' out of the sky, but I am not recalling the point of the allusion. OK, I believe that I was alluding to the chronometric power of the zodiac in particular and of the sky in general. It was astronomy on which we cut our mathematical teeth. The subsequent discovery of the $e^{i\pi}$ trinity led the way to quantum physics and the taming of the atom. This was virtually the second incarnation of the logos as manifested in Pi. As such it would portend the

X2-event that we are struggling to anticipate here.

The dialectic symmetry breaking of the zodiacal circle gives us the ouroboros and the ellipse. History is the result of the former, and I am tempted to say that anthropics is the result of the latter. That is less than obvious. Elliptic functions are the primary manifestation of the organicity of mathematics, which is a major factor in the anthropic telos via the physical symmetries of the Monster Group. Of course, there would be no history without anthropics, and *vice-versa*. Perhaps we are seeing the same breaking process from two different perspectives. There is just one dialectic operation, logos, zim-zum, syzygy, which would help to keep the panpsychism coordinated as in a psyche. The logos is always a dia-logos. Speaking of the zodiac, the number twelve figures prominently in the 'Monstrous Moonshine' that is part of the above organicity.

[1/29]

[Symmetry breaking](#): I'm attempting to get a more coherent take on this topic. I'm also interested in this related [statement](#). We have made some progress in deriving QRP from AZO, and AZO from M via D and L or symmetry breaking. D & L have to do with the mark of [distinction](#). In physics, symmetry breaking is always spontaneous. Not so, here. Here it is always teleological, which is also true of D & L. T(elos) is self-realizing. Perhaps T & L are about the same, now that I think about it. DLT is another trio. These are three aspects of the self. Our non-spontaneous SyBr makes this trio a foursome: DLTS. Then we have the Syzygys to worry about. To what may they be ascribed? Here is some [previous](#) speculation.

The mother of all syzygys is the total solar eclipse. This is the most impressive of all celestial phenomena. It has certainly shaped human culture. Its related numerical coincidences were at the core of our ancient mathematical gnosis. There is a gender specificity on several levels of the phenomenon, providing an added semantic charge. The lunar shadow constituted a veritable stairway to heaven. Outside of anthropics, it is one of the strongest pieces of evidence against the accidental nature of the world. It is a calling card of the Creator.

[1/30]

The next most prominent syzygy is $e^{i\pi} = -1$. This has a 3+1 structure similar to that of the eclipse and of the trinity, MDX, when we include ourselves as the targeted element. Otherwise we have various types of coincidences, synchronicities and synergies to consider. Coincidences may be accidental or not. If not, they indicate an observer oriented and participatory bias in the structure of the world and the events that comprise it. In some cases we confront a possible non-causal semantic linkage between events. This could be the manifestation of an organic or holographic metaphysic. Such a structure is presumed in the postulation of a primordial Matrix, which in turn is a presupposition of immaterialism and the BPW hypothesis. In other words, the coincidences are the residue of the symmetry that preceded the dialectical breaking of it, and are the portent of a Telic synthesis. They both shadow and foreshadow the soon to be completed dialectical process that we call Creation/Resurrection.

The upshot is that we must add the syzygy/synergy to DLTS combination: now DLTSS. This is the third or middle element of our MDX or MDZ trinity. It is the engine of creation. But could this be other than the force or potency of love? Cosmic love + \$3.75 will get you the proverbial cup of coffee in Times Square. Then what? The fact that we often identify X with O, T & L keeps our archetypal pot well stirred.

[1/31]

The logos operates as a symmetry breaker, very often; while the telos, as the omega, is the mother of synchronicities. Then [recall](#) that the dialectic, as a participatory dia-logos, combines L & T, sym/brk & synthesis, thus we may simplify DLTSS as D^3 . Recall that this same dia-logos may have the empathic quality of love, or, at least, agape, to restate yesterday's result. As we identify O and T, we may also identify the Alpha with the logos, and then, following John, the christos with both pairs, and, so with the dia-logos [see [below](#)]. X then would be self-generating wrt M. This would make both Z & X primordial, one circular, the other lineal, with the ratio of pi. The cycle is something quite natural. The line is less so. Their ratio is also the logos, dividing the cycle. Distorting the cycle is the function of the dia-logos, producing the ellipse. This act puts us on the anthropic track via the Monster Group. Recall the [Quid](#). It completes the microcosmic bootstrap. Its projective quality places it in the lineal column. It is the panpsychic version of the logos. The microcosm is the atom and the psyche, the two being logically related. Does this mean there cannot be an immaterial psyche? Both X & Z must live off of borrowed time. That need not render them mortal, but it does render time as virtual. Lineal history is not optional in the big scheme. The circuit collapses without a dia-meter. (I think of the virtual 'tadpole' Feynman diagram, remind me. The photon is lineal, like time but without time, while the electron/positron pair is excursive.) I'm hoping we are on the verge of completing the outline of the metanarrative. There are still some missing links, but the general form is taking shape. The cosmos is often depicted as a doubly or axially connected sphere. Shades of hollow earth! [This structure will have to be related to that of the ouroboros.] In $e^{i\pi}$, the imaginary iota serves as the dialogic element. Along with the logos or pi, it tames the ex-potential matrix. In math, the iota serves both an analytic and synthetic function.

[2/1]

The possibility that Z & X are coeval is a new thought for me. It would be a major factor of the metanarrative. It might help to explain the coevality of East & West. Factored into the equation may be a 'stealth' aspect associated with X, going back to the notion of the self-concealment of the less natural one of this pair. The mystical tradition is naturally diffuse, while the prophetic side is focused around a lineal succession, which is also the central story line of the narrative. We return to the problem of prophetic [stinginess](#).

We see in the history of polytheism the example of the circle collapsing without a structural diameter. This collapse is instructive mainly in its naturalness. The dia-meter comes about as an alignment of the dia-logos. The axial alignment of the dia-logos results in the polar structure referred to yesterday. It may also be viewed as the head/tail symmetry breaking in the context of the ouroboros.

The ouroboros is obviously a case of dog eat dog, or god eat god to be more precise. There is much confusion about the nature of the sacrificial incarnation within the prophetic tradition, particularly between the orthodox and gnostic views. Many lives went up in smoke as a result. It all comes down to who ate whose lunch. In fact, the son ate the dad's lunch, despite the immediate appearance. Two of the pantheonic Z had to work out this deal, rather ignoring the rest, although there could have been a general **conspiracy**, the mother of all such. [2/4 - Please [recall](#) the juxtaposition of X/Y. **Contra John**, we may have to identify Yahweh with the logos. If anything, the christos would have just the last word, which is love. Yahweh is the mono-logos, Jesus is the dia-logos. Y disrupts the Z circuit in favor of X.] This is certainly a case of the telos wagging the dog. The rest of the pantheon may readily be excused for ignoring this shenanigans. It would all work out in the end. But this does seem to make X the derivative of Z. Is there a less biased way of spinning this yarn?

There may have always been a favored son of a matrix, as the partner of a primal dia-logos, but I'm not seeing the necessity. Does it have to be a single-self matrix? Can we invoke Leibniz' I/I? There must be a mythos relative to this problem.

[2/3]

Most of what I said yesterday was unnecessary. The simple fact is that the matrix is nothing if not the mother of creation. The genius of creation is simply its optimizing, teleological agent. This is not the patriarchal Creator of our fathers. That is the source all our confusion. It is our telos/christos that wags that old dog, and us. The telos necessarily operates through us creatures in participatory style. The participation is logically realized in an eschatological resurrection. This is just the bootstrap model of creation. The X1-event was an attempt to explain the bootstrap to a somewhat inept audience. It was never intended to be the final explanation. It was mainly a pump priming exercise: the first fruit of the resurrection, and all that. The final explanation is left for X2. That the messianic kingdom was within us, this message did register, in no uncertain terms, but it registered mainly at the emotion level. All we do now is rationalize that message. That is our X2.

The pantheists picked up on the notion of the God within. This idea was also the mother of all gnostic 'heresy'. Why have we been so slow to demystify that simple concept? Concealment and revelation are just as participatory as the rest of the world. It is only we who have concealed ourselves from ourselves. Our learning curve has been slow, and not always steady. We do, however, necessarily reach a threshold of readiness, when everything goes public. The social dynamics will not be unlike the first time, but the communication factor is several orders of magnitude greater. This is on account of the technology, but that is only the lesser part of it. The greater part is the intellectual content and our greater ability now to absorb it. Our training in scientific thinking over the last few centuries has much to do with our present state of preparation. All we have to do is turn that analytic obsession on its head, and that will be our synthesis. It may be easier said than done, but not by a whole lot. This time around, it will be all or nothing: no child left behind.

But is this X2 event not supposed to be of a minimalist sort? Is the prospective socio-political drama either necessary or desirable? In the first instance, I would say that it is technologically unavoidable, just from a communication perspective. It has to be an all or nothing event. But then won't there be disruptive consequences? The idea here is to minimize these disruptions by emphasizing the rational aspect of this new gnosis. This time around, the head will be leading the heart. The heart will catch up soon enough, but not so soon as to aggravate any disruption. Provided that the disruptions can be minimized, then any good story will benefit from its dramatic episodes. The metanarrative should be no exception. We are destined to live in interesting times.

[2/4]

Each time we go around the horn, there do seem to be fewer loose ends. Yes, for every answer, there are ten new questions, but these questions may be seen as subsidiary. The larger pattern becomes more solid. This is not to say there can be no more quakes in this cosmic scheme, but hopefully the scheme is sufficiently robust to withstand the damage.

What concerns me now is nothing less intractable than the genesis of genesis, or, in particular, the genesis of the logos. Down here it arrives with Abraham via Yahweh. In the BPW scheme, the logos serves as Alpha or the anchor of Creation.

I am taking the zodiacal pantheonic circuit, Z, as mainly internal to the matrix, and not involving the logos initially. The logos is the symmetry breaker of Z, occurring as either Y/X or A/O. Creation is acting as an appendage to the matrix, as if that were possible.

The radial symmetry of Z may be broken in elliptic fashion. This would be less disruptive than a circumferential break, and corresponds to the 'hollow earth' model. The logos then evolves via the syzygys of Pi. Admittedly, it is a long way from Pi to the Ten Commandments, but it is not inconceivable. A

related issue is the origin of the Dialectic associated more with the christos. With ellipsis, the logos and dia-logos would come in tandem. Somewhere along the line we also have to come up with atom/Adam, speaking of anchors.

Previously we have spoken of [Quid](#) as being instrumental here, as the precursor of the logos, along with e/π . But I have to ask if there can be a logos without a self. I'm thinking that the primal Z precedes the self, which is more associated with X. Nor may Pi precede the self. However, is not the dia-logos coeval with X, even to the point of being subsumed thereby? The primordial I/Thou is X/M. This is also the dia-logos which then entrains the Y out of the Z. Yes, the X does have to also belong to the Z. The primal trinity of MDX, is also a triangle of MXY.

Where then do we place the Quid? This will be associated with atom/Adam. The ouroboric Z and [R](#) are instrumental. Adam is the material guy. The Zoocosm, Z, converges on Adam, along with the metabolic atom. The Z becomes stretched out into human and natural history, as logically distinct and parallel elements within a single ecological/metabolic context. It is paleontology that is distinguished from archeology.

I would observe that if the ouroboric cycle is broken and stretched out it becomes a gestational cycle. The phylogenic version of the zodiac could then be applied to an ontogenetic cycle. As this is happening, other metabolic systems are entrained in coherent fashion. Ontogeny is a microcosm of cosmogony. What else would we expect? In cosmogony the logos plays the role of the DNA, yielding mathematical physics, for example. Admittedly it is not easy to conceive the transitional stages. Logical continuity in the 'evolution' of the archetypes is a big step toward naturalizing Creation, at least in the sense of rendering it coherent. That is also to make it plausible.

[2/5]

A natural impulse that is not helpful here is our impulse to inquire after the first instance of something, by way of explanation. This makes sense only when dealing with what Aristotle called 'efficient' causes. Only in such a regime does the origin explain the succession, as with the Big Bang or with the six days of Creation. The regime of the BPW is fundamentally teleological: it is the end that accounts for the means. In this case, 'end' is to be taken in its most general sense, not just as 'ending', although the eschaton may be expected to carry much of the teleological burden. The term Telos is meant to indicate the general sense of 'end'. I am suggesting that atoms and babies can sneak up on us unannounced. Their presence is felt well beyond the confines of history. They are integral to the dia-logos. We see this in the parturition of X. This is both an efficient and final process. Much of atomism is inherent in many fundamental phenomenologies. Genetic coding and photosynthesis are among the most basic of these.

[2/6]

It is eminently logical that a combinatorial diversity in the macrocosm should be supported by a cellular and molecular combinatorics. The habituation of biological cycles will serve to fix the molecular cycles. Biochemistry and biophysics, more or less as we know them, is the only possible outcome. The habituation process should be seen a logical rather than temporal. Linear time is just the result of breaking the cyclical symmetry. Time is the result of breaking the cycle habit.

Atoms are simply the logical accretion of our 'circuitous' memory. Memory is not in the atoms, atoms are in the memory. And memory is simply the temporal asymmetry of a coherence emanating from the Telos. This teleo-logic, organic though it is, also has a combinatoric support that we recognize as mathematical logic. The dialectic regime of the Quantum is the nexus of these two atomisms. In the terminology of the archetypes we might say that $R \& P \rightarrow Q$. The coherence of Q is ultimately derived

only from T/O. There is no logical way to get from Q back to T. The hoped for reversal of this sequence, as held by the logical positivists, has been as thoroughly discounted and discredited as any philosophical thesis ever has been. It is only the heavily fortified wall of Darwinism that is holding back the inevitable rising tide of a demand for coherence. Here you see the first trickle of coherence to breach that wall. The materialist establishment may only watch in silence as the trickle continues. Any response whatsoever will only abet the flow and hasten the deluge.

Individual memory is derivative of the atemporal cosmic mind or memory, which is not distinct from the immaterial cosmos itself. Atomism, as far as it goes, is just the logical result of analyzing that memory. Atoms cannot be more solid or stable than the logic of the coherence from which their quantum processes are extracted.

[2/7]

Let me hasten to point out that there is another aspect of the all or nothing game. This has to do with existence. For the immaterialist, existence is entirely relational, but for the materialist it is all or nothing. I would like to show that the latter position is incoherent. It should not be difficult.

For the materialist, existence must be clear cut, but, unfortunately, existence has been and remains notoriously abstruse. The fall-back position for the materialists is just to say that they will accept as gospel whatever happens to be the current ontological fashion within the physics community. The unacceptability of such an *ad hoc* metaphysical stance is widely remarked and acknowledged, even amongst the materialists. They apologize and ask the forbearance of their philosophical colleagues. The simple fact is that physics and metaphysics are concerned with very different issues. The ultimate responsibility of physicists is just to be pragmatic about their subject matter. Their ultimate metaphysics can only ever be that of pragmatism. The next simple fact is that pragmatism and materialism have a vanishingly small ontological overlap. My case is closed.

But just for the nonce, let us posit the existence of ideal [sic] atoms. The ideal atom would have an entirely independent existence. I maintain that this is incoherent. Said atoms would have to be indestructible in all eternity. More significantly, such entities would be incapable of internal relations. Their only relations could be accidental or spatio-temporal. Such a metaphysic could not support anything resembling chemistry. What could be the ontology of water, for instance? In fact, for our pragmatic scientist, the ontology of a molecule is not distinct from that of an atom; nor, even, is that of a pancreas. There can ever only be differences of degree for any sort of pragmatist. The ultimate ground of existence can ever only be phenomenological.

I maintain that chemistry is possible only in a relational world. No semblance of a molecule could exist without the presence of 'exchange' forces. The exchange force operates only because the different types of atoms share essential mathematical symmetries. These symmetries are only indirectly related to the external shape of a given atom. These internal symmetries are manifested only in the interaction between atoms. The symmetries are of no account other than in such a relational context. These forces are one aspect of the widely touted 'non-local' nature of quantum phenomena. The materialists do not deny chemistry, but they do deny that such purely relational essences exist outside of the quantum-chemical realm. In contrast, I maintain that quantum chemistry is just the tip of the relational iceberg that is our world. The essential properties of the pancreas are just as irreducible as are the molecular properties of water.

Just the fact that atoms are essentially relational does not make them the stuff of dreams, but it is a big step in that direction. What steps remain? There remains to reconsider the entire notion of independent existence. I maintain that the whole idea is incoherent. Let us consider the independent existence of the

stars, just from the viewpoint of an astronomer.

Every day another star blows itself (nearly) out of existence, and we are none the wiser. We could care less. What metaphysical conclusion might be drawn? This says very little about the ontology of the situation.

Here is some ontology. The universe exists in a single unified dynamical space-time manifold. That manifold is what imparts many of the relational and physical properties to its contents. All of those contents once occupied a region vastly smaller than the volume of a single atom. Every star has had a long and complex history. That any star can exist at all is entirely the result of a remarkable balance in an intricate array of forces shared by every particle in the universe. Virtually no stars can exist outside the very complex dynamical systems of galaxies. The vast majority of stars were born in cohorts out of the death throes of a class of giant predecessors. In short, celestial phenomena are less ecological than the biosphere of the Earth, but only by degree.

Let us then consider the independence of existence on the Earth. Consider a baseball. Your typical baseball finds itself stashed somewhere in a locker. What is its ontological status? The materialist would see it as a collection of atoms assembled so as to physically conform, more or less, to an historically derived cultural convention. Despite these facts, its properties are completely reducible to the entirely local properties of its constituent atoms or molecules. We immaterialists beg to differ.

I will cheerfully concede that all of the physical properties of the baseball may be properly explained by physics. The question is whether those properties are the only ones that are essential to the baseball. The only essential qualities for the materialist are just the molecular ones, all other properties may be properly reduced to those. The other relations are external or circumstantial. For the materialist, all questions of ontological import reduce to those of physics. All other questions are epistemological, at best. We have already had reason to question the status of the epistemic/ontic divide. Just for instance, is this division itself to be construed as epistemic or ontic? I next point to mathematics as an obvious counterexample to any unambiguous division. And then where does one draw the line between mathematics and physics?

My attack on the absolutist position concerning existence invokes the problem of identity. I question whether these problems may be properly distinguished. Without alluding to identity, the question of existence becomes abstract, hypothetical and counterfactual. Without reference to a particular individual, the question of existence is nearly vacuous. Identity and individuation can be made as objectively as one might wish, but only according to such a wish. Otherwise, identity erodes with more or less alacrity. Existence without strict identity is necessarily probabilistic.

To say that water exists is about as vacuous as any statement can be. Sure, water absolutely exists, but perhaps not in this universe. Well, thanks for the information! When we inquire as to existence, it almost exclusively concerns particular existence. But even if my concern was with water in general, we would have to agree on the semantic reference of 'water'. I dare say that too many books have been written on the identity of 'twater', i.e. something phenomenologically resembling water, but on a hypothetical 'twin earth'. Ontology cannot logically escape the strictures of epistemology.

Yes, we are all prone to the gut feeling that existence is an all or nothing, independent proposition. My baseball may or may not still exist, independent of almost everything else in the world, and especially independent of the state of my knowledge. It is an understandable feeling, it just doesn't happen to make sense. It does not stand up to scrutiny.

While on the subject of identity, let me point to another aspect of it. Identity is necessarily projective. Identity can only ever be reduced to the act of pointing, referral, or, ritually speaking, to a social act of 'baptism'. The foundation of all identity is in self identity. All identification points back to a particular set of selves. This is an obvious, but often overlooked fact of existence, or simply a very pragmatic fact of

life. A materialist has no basis for positing existence of any kind without positing a particular self. If I am an illusion, then so may be my world and everything in it. Of course, I believe that I am, and that it is, but I may rationally entertain that belief only under the aegis of some greater and more real existence that is necessarily even more 'selfish' than myself, if you'll excuse the turn of phrase.

[2/8]

It does seem that God has not gone out of her way to make us feel like the co-creators of this world. However, if her powers are limited, then we don't have to ascribe malfeasance to her. It is hard for me and a lot of other people to understand why so many people so stubbornly cling to the notion of an omnipotent God, in the face of so much contrary evidence and argument. The fact is, however, in the minds of most believers and non-believers the notions of God and omnipotence are practically synonymous. This is surely the greatest obstacle to any form of rational theism. The irrationalists manage to control the premises of the debates about God.

Rational theism necessarily borrows much from pantheism, and must be considered almost as heretical. The metaphysics behind irrational theism is dualism. The Western mind has fallen very deeply into the trap of dualism. It seems that the theists have gladly granted the pantheists an exclusive franchise wrt monism. To our short list of *ad hoc* synonyms we must add theism and dualism along with pantheism and monism. This historical convention presents a considerable pedagogical barrier to rational theism.

There must be an historical explanation for the nearly ubiquitous juxtaposition of theism and dualism, but it is certainly not being touted. I suspect that the notions of dualism and omnipotence are mutually supportive, but this is not immediately obvious. Dualism is supportive mainly of deism rather than theism. Deism also has to be considered heretical, but apparently less so than pantheism.

What we may be facing here is a politically motivated metaphysic. Pantheism/monism is frankly subversive to almost any established order. Only the most stable of societies could afford to dabble in it. However, theism is subversive relative to deism, but even deism turned out to be conducive to the advent of the scientific revolution. Deism remained the herald of that movement for some time.

Gnosticism is the most common form of theistic monism, only its otherworldliness keeps it in check politically. That otherworldliness is a subdued or modified form of dualism. It is a moral rather than a metaphysical dualism. The constant threat of gnostic subversion has always tended to push established theism far into the deistic corner. Scientific materialism has been the primary beneficiary of this circumstance.

Pantheism is simply the decapitated version of monism. Without recourse to a higher authority, the would-be social reformer is severely handicapped. The caste system of India survived many centuries of Buddhist monism. The linkage between prophecy and social criticism, particularly of the puritanical variety, endemic to the West, was absent in the East. Concerted revolution in the East had to await the dialectical spin-off of scientific materialism. Meanwhile, the polytheistic Hinduism plods along seemingly oblivious to the rest of the world.

Be that as it may, we are stuck with dualism in the West. I am suggesting a this-worldly gnostic heresy to counter the dualism and deism that has become so entrenched in the modern world, not to mention the presence of downright materialism. There is what probably amounts to an unwitting conspiracy between scientific materialists and deists to maintain the present order and disorder of modernism. Postmodernism, pantheism and mysticism are hardly a threat to the established modern order. The deistic tendencies of fundamentalism are, for the most part, silently supportive of this order unless they happen to verge into activism and terrorism, which is atypical and ultimately controllable. Modernism long ago made its pact with dualism, to the point that they are virtually synonymous.

Triumph of Science?

The coherence of scientific materialism is incredibly impressive and powerful. It has transformed the face of the world. Only a fool or a fundamentalist would dare challenge that great edifice of knowledge. Tilting at a windmill would be much more likely to succeed.

What I have come here to tell you is that the coherence of science, great though it is, can only be a pale shadow of what must lie behind it. We have become the masters of our material destiny, thanks to science. But will you believe me if I tell you that the magnitude of any imagined material destiny shrinks to insignificance before the reality of our true destiny? Our romance with science has just been our *aperitif*. Are we ready now for the full course? Trust me, no amount of preparation could ever have prepared us for what comes next.

Scientists have an understandable proclivity to hit us over the head with the incredible quantities that measure the vastness of space and time as well as the minuteness of the atom. Yet, these are window dressing relative to the intricacy of the processes that fill those realms. With the enormous complexity that nature has managed to throw at us, our minds not only cope but positively comprehend to the point of mastery. There is finally only one glaring omission in this story of scientific conquest. It is the instrument that has enabled our victory. Yes, a mere three pounds of gray matter. All the king's men remain baffled as they stand before it. Will we not awaken to tomorrow's headline trumpeting the scientific breakthrough that solves our last puzzle? Who am I to cast doubt on the final triumph of science?

What I am struck by is the disparity in the degree of coherence in the realm of natural science compared to everywhere else. The human sciences, for instance, remain in nearly complete disarray. There is all the appearance of a positive comprehension barrier between the human and natural realms. What could this signify?

It could simply be a minor time-lag or a jog in our path to full understanding. Or there could be a deeper problem. My diagnosis is no secret. I believe that reductionism has run its course. To move forward from here, we will be required to switch horses. I am not suggesting that the scientific juggernaut is about to come to a grinding halt. I am suggesting that a growing number of us will seek a coherent alternative.

The only rational alternative to reductionism entails a formidable gestalt switch. The success of analysis lies in its step by step procedures. As on a long hike, to reach the end, all you have to do is keep putting one foot in front of the other. Not so with synthesis. We will never be able to put Humpty-Dumpty back together without a plan, nay, without a veritable blueprint. Nothing will happen with synthesis until that blueprint arrives.

On these pages I can attempt nothing less than to deliver that blueprint. Anything falling short will be a waste of my time and your time. It is not that I reek with confidence, I have simply found myself with no alternative course. I can do none other. Here you see a former drip under some considerable pressure. As to the ultimate source of this pressure, your guess is as good as mine.

If there is a blueprint to be delivered and it gets delivered, it will have to be an event of biblical proportion. Only a fool could rush into such a spot. All that remains to be seen is whether I am a rational fool, or just a rash fool.

The bad news is that we have been deceived. The good news is that we have only ourselves to blame. It is not God's fault that the world looks so darn natural. That's just how the Best Possible World should look, nay, has to look.

It is only natural to create the best possible world. There is involved in this process just the Principle of Least Action. Even photons know how to do that. In the realm of all possible worlds, one has got to stand out. It could be the worst one, but which one is that? I submit that it is no world at all. The only one that can truly stand out is the best one. The best world necessarily has the best possible creatures. It is all us critters who ultimately make the choice and do the deed in this necessarily co-creative effort. What happens to all the other worlds? In the very best quantum fashion, all the others will destructively interfere, going up in the smoke of our individual dreams and nightmares.

Granted, the best possible God is not your father's God, but that does not mean she is no God at all. She is not lazy either. She is an earnest cheerleader. Heavens, she will even stoop to bare a breast if that will inspire the troops. Some might call it entertainment, others will call it incarnation.

About that gestalt switch? Think of it just as a pill to be swallowed. The bitter taste will not last too long. If you don't care to try it, may I interest you in some valium?

The world is a living organism. Most of it has gone to sleep, that is us creatures. Parts of it has gone numb, that is matter. In our sleep we dream of alternative realities. The dreams gradually coalesce around what will be the best of possible worlds. There is only ever one dream, but we see it through many prisms that we think of as our material brains. The real dreaming is done well beyond space and time. What we experience at night is just the chaff. What we experience in the day is the absence of the Telos. We are gradually pulled, reeled in as on a line, toward our eschatological awakening that is sometimes referred to as the rapture or the *hieros gamos*. It is the final Presence, our final Cause.

While we are asleep, the world runs on an auto-pilot of pure logic. Some call it physics. It is phenomenological cycles within cycles that have long been habituated and optimized. Gradually these cycles have been expanded to include the ouroboric circuit of the whole world and its history. We experience time slices of them. There are growing pains. Some cycles are broken, others collide. We are here to sort it all out and maintain continuity.

Lately we have been passing through the scientific phase of our history. We have been fascinated with atoms and space. We have come to think of these as the substance and container of our world. They are, however, just archetypes that we tend to reify in our systemic and instrumented probing of them. They are, after all, the only logically possible outcome of our analytic compulsion. They can be none other.

If we truly desired, we could send a space probe to Alpha Centauri. But what would that accomplish, other than to possibly extend our slumber of materialism? I don't recommend this stratagem; our appointed hour will not finally be diverted. And would it not be more amusing to persuade the stars to dance in the sky? I not sure I recommend this either, but I don't want to be a party pooper! The auto-pilot of our dreamship Earth conforms to our state of wakefulness. We will know what to do when we need to do it. That is how organicism works. Our dream will only ever become more lucid and pellucid.

Is this so hard to swallow? I doubt that you would be reading this if you were not a prospective pill popper and gestalt switcher. However, if you are already feeling frustrated by the poverty of my gnosis, then your time has come. I'll see you on the other side of the gestalt.

[2/9]

Science has certainly triumphed, well beyond anything anyone could have reasonably expected at the outset. In its chosen arena, science has been unreasonably effective. This remarkable fact raises important

issues:

- Should not science be embarrassed by its own riches? It seems that science can explain almost everything but its own success.
- Science may have to face a revolution of rising expectations that it has engendered but is unable to fulfill.
- There is likely to be a greater demand for the light of reason to be trained upon our ultimate questions. The triumph of our scientific gnosis cannot help but raise our expectations concerning a boarder or higher gnosis. I do not seem to be alone in this regard.

It has been said that man does not live by bread alone. Will the technology of the mass entertainment industry then be able to supply all the requisite circuses? History is quite clear that the motive force behind our scientific quest has always transcended purely materialistic explanation. The record is equally clear that, at the outset of science, it was seen, and even specifically recommended, as a constructive, non-subversive means to channel the all too human and otherwise heretical impulse toward gnosis.

It is widely recognized that, whatever may be the continuing technological fall-out, the gnostic aspect of science, tied as it is to analysis and reduction, has nearly played itself out. There will be many who will be content to rest upon those laurels, but are we then to suppose that gnostic impulse has been quenched? Cannot it not be that for the few, that impulse will merely have been whetted?

Science has been so dramatically successful, almost from the start, that its accomplishments have outpaced our ability to assimilate its larger import, to understand it from the standpoint of any larger historical narrative. It appears quite possible now that our process of assimilating science is finally catching up with the enterprise of it. For the first time we may have the ability and inclination to inquire after its larger context. It has long been the taunting mantra of the obsessively scientifically minded: Catch me if you can! Those days are coming to an end.

It will be increasingly difficult to ignore the gnostic origins of the scientific quest. As we reflect back upon those origins, we can hardly avoid comparing the original impulse with the eventual result. Science will be found wanting in the balance.

That the puzzle of the mind continues fall under the purview of science is strictly contingent upon its ability to meet some rather elevated expectations. Failing these, there will be the devil to pay.

There will be two ways to view science: either as a flash in the pan of history, or as a mission accomplished. There will, of course, continue to be the true believers in science; however, they will be increasingly pressed to explain their unflinching expectations. If all existence is material and accidental, then what could it possibly be that would underwrite their unlimited expectations concerning the future? And perhaps even more to the point, what would be the point? What is the Telos that they so fervently and blindly seek? In attempting to scratch the surface of 'futurism' and 'technosis', one can hardly fail to be impressed by the lack of depth and the almost infantile nature of the desires being expressed. Is technosis anything more than a smoke screen being thrown up against the present mystery of our inevitable gnostic destiny?

The only way to move forward with understanding will be to view science as a mission well accomplished. And if that is the case, reason dictates that it must have been our penultimate mission. How so? Once we turn our minds from analysis to synthesis, there will be no turning back. If there is a Telos to be seen, it will come into view at that turning, or it never will. But should not science now be seen as a false summit of the intellect? What is to prevent science from being followed by yet another false summit? The plain fact is that science never had a patron. Gnosis, if it is anything at all, is a patronage. If we have any further issues, we will know where to take them: to our Matron.

[2/11]

The main difference between materialism and immaterialism is the direction of the arrow of time. Materialists argue that the direction cannot be reversed due to the laws of thermodynamics. That this is a vacuously circular argument in support of materialism seems to bother almost no one, and certainly not the materialists. I am not claiming that we should ignore thermodynamics, any more than we should ignore gravity, I merely point out that they are two parts of the same package. It is only the package in its entirety that is at issue, not its individual parts.

Time is a much bigger mystery than virtually any scientist could either grasp or acknowledge. To the scientist, time is never more than a particular variable in particular dynamical equations. In physics proper, it has no direction. That it appears with directional specificity in the laws of thermodynamics remains unexplained. Time symmetry is broken somewhere in the transition between microscopic and macroscopic regimes. The best guess is that it has something to do with the quantum measurement problem, rendering it a mystery wrapped in an enigma.

In common parlance, the direction of time is usually associated with the notion that cause precedes effect. However, our conventional notions of causality are inextricably tied to our notions of intentionality, neither of which can have any formal role in science.

In short, the concept of time is a potential loose cannon on the scientific deck. Any significant loosening of its perceived tether places the whole ship in peril.

What is easily the most remarkable feature of time is the indescribable nature of its presence to us. The closest thing to such a description is simply the 'shining' present. Science's objectification of time seems impossibly at odds with our singular experience of it. By simply constructing a metaphysics of Presence, the entire scientific enterprise is thereby rendered moot. Immaterialism is necessarily the science of Presence. That is what these pages endeavor. If the Present is to be salvaged, it will be partly at the expense of a cannibalized scientific corpus, but let us eschew necrophagy in this undertaking.

As we focus on sheer presence, the directionality of time becomes open to reinterpretation. The past and future may be subsumed by mere absence. A more teleological view immediately recommends itself. The Telos can simply become an ever fuller Present. Time is thereby robbed of its gravity, or simply disrobed.

Before launching into directionality, let me briefly point to a connection between time and perception that is seldom remarked. Much of our self-alienation from the world is tied up with our peculiar notion of indirect or representational perception. This ubiquitous presupposition is, perhaps, the single most poisonous ingredient in the whole materialist pot. Thus, so deftly, does materialism act to subvert the very possibility of Presence. All that we can ever experience is an *ad hoc* and subjectively reconstituted fabrication of reality. We can ever only be the passive recipients of sensory transductions.

The notion of indirect perception is the result of a totally illicit but perfectly understandable conflation of an informal causal metaphysic with a formal mechanics. It is also parasitic upon the completely gratuitous assumption that experience is only ever by and about the insides of our skulls. Gratuitous because science does not even recognize the existence of consciousness: consciousness doesn't exist, but if it did, you may be sure that it would exist entirely inside your skull! What easy marks we make of ourselves in the life and death game that is science.

It is just the alleged direction of motion of the photon from object to the subject that strongly reinforces the naive notion of object as transmitter and subject as receiver, which underscores the confinement of consciousness to somewhere behind the retina, opening a metaphysical chasm between it and its object. The nerve fibers behind the retina are simply another means of signal transduction. Since neuroscience

does not recognize the existence of consciousness in the first place, there is no basis to relegate it to any particular mode of signal transduction, be it neuronal, optical or by any other means.

[2/12]

Please let me rephrase that last statement: given that consciousness exists, we associate it with the nervous tissue of living systems. However, all that can physically ever happen within that nervous tissue is signal transduction, so there is no reason to physically confine consciousness to any particular segment of that tissue. The pain in my stubbed toe is just a part of my consciousness located in the nerves in my toe. But once consciousness has been vouchsafed, we can, with the same logic, extend it back along the lines of signal transduction which now include the photon paths back to the surfaces of objects. *Voila, **direct perception***. There is no logical or physical reason why we cannot incorporate the photons into our extended sensory signaling system.

It is here that we run into the problem of time delay. The photons could be coming from a distant star that self-destructed before the light reaches our eyes. This, and only this, delay causes a problem for direct physical perception.

But let us now come back to the Present. There is a gigantic metaphysical problem of Presence. The problem is to distinguish it from Absence. Where do we draw the line? This problem, I maintain, is closely related to the problem of attempting to confine consciousness; in fact, I will suggest that the two problems compound each other.

In order to distinguish presence from absence, we would also have to distinguish perception from inference. Simply impossible! Please recall: See Jane. See Jane run. Is Jane present to us? Suppose that Jane had suffered a massive cerebral hemorrhage in mid-stride. When does she stop being present? We can only ever infer the presence of persons. We can only ever infer the presence of oceans. Everything two hundred feet below the surface could have suddenly turned to ice without our being the wiser.

You can see why analytic philosophers despise the notion of Presence. Presence is in no way computable. But may our analysts thereby deny Presence? I would not recommend that course to them. Denying presence is vastly more subversive to a lived world than to merely deny consciousness, which many still do. Without the present, there is no past and future. Without being able to distinguish past and future, one loses contact with the concept of life and living.

Having said that, I will threaten to commit that same error myself. I am also going to deny the past and future, but only in deference to the unbounded potential of the Shining Present/ce. My Present will never lie etherized upon the analytical table.

As a direct perceiver, I have a very hard time with the notion of memory being coded and stored in configurations of atoms. But where else could it possibly be? Our DVDs do an admirable job of storing feature length movies along with the director's cuts. Why not our brain cells? Well, next to consciousness itself, the physical storage and retrieval of memories remains the biggest mystery of neuroscience. To call it an embarrassment to science would be a gross understatement. Over the years, I have ever only seen brief allusions to this problem, never an actual treatise upon it. If I were a rational scientist, would I not want to spell out the full nature and dimension of this puzzle, in all its gory detail, as the first logical step toward its eventual solution? Well, we may then surmise that either there are no rational scientists, or they all subliminally sense that they don't have a snowball's chance in hell of ever solving this little puzzler.

With direct perception: *no problemo*. We directly perceive the past, with just a slightly cloudy crystal ball, or is that supposed to be the future? Or is it the extended Present?

Ev'ry time i see your face,
It reminds me of the places we used to go.
But all i got is a **photograph**
And i realise you're not coming back anymore. ([Ringo Starr](#))

And what about that photo? Is this not a case of indirect, representational perception? How do we explain this, Kimosabe? I'm going to pull a fast one. I equate the photo with a slice of photographic memory. But is it not perfectly clear that the photo is not inside anybody's head? Neither are memories. Furthermore, I would compare a camera with a [telephone](#): both actually operate as psychosocial channelers and facilitators of the psyche; that is, of our still hidden, from ourselves, psychic abilities. This is all part and parcel of immaterialism. If you don't like it, you are perfectly welcome to return to your materialist zombie-hood, atoms swerving in the dark, and all -- or is it nothing?

Should we not then each take innumerable photos of ourselves so as to ensure our immortal presence? Negative. You may, of course; but thereby demonstrate a noticeable lack of regard for unlimited presence. Photos and phones, even especially websites, are stopgaps, perhaps palliatives, wrt presence.

With excruciating crudeness, each of us $\sim 10^{10}$ souls is a 'neuron' of the eternal cosmic mind. That is true presence. What we now call presence is the palest of shadows. Phones and photos? We won't be needing them in heaven. My sincere regrets to AT&T and Kodak. Now it is perfectly possible that somewhere, this side of eternity, we will have implanted phone chips; but, if I'm not mistaken, my teenage son already has one of them. Nevertheless, as we walk naked through those pearly gates, I suspect there will be a full-body scan. Security, you know!

Do you get the picture? The hardest part of materialism is recovering from its hangover. Going cold turkey with immaterialism is just not in the cards. But, trust me, one day we will look back on this awkward transitional phase and chuckle.

What I have ever so awkwardly been leading up to here is a rehash of teleology. Time and causation truly run backward, if they run anywhere at all. The past is constructed from the future, out of our 'memories'. That's how we can have confidence in our future. We couldn't have left home without it. Immaterialism is materialism running backward, kind'a.

Consider the **dreamer** and then the composer. You are going through an elaborate dream about a romance in a clock store, when one of the clocks starts to malfunction, noisily. As you reach over to fix it, you wake up realizing you are reaching for your alarm clock. This sequence raises some problems for efficient causation. More than one philosopher has recommended that, instead of final causation for the dream, we could simply say it all happened in an instant, but was experienced as a sequence. If dream time is illusory, why not 'waking' time.

Similar idea for the composer. It has not infrequently been reported that the idea for an entire symphony has emerged into the composer's consciousness in just a few moments of time. The composer may then spend the next several days turning that palpably memorable instant into a proper sequence. More commonly, when the title of a popular song is mentioned, some holographic nugget of its entirety flashes to mind. And here we are back to the problem of perception. Without that 'holographic' assist, could we ever experience anything besides bits of raw sensory data? Data bits which, you will recall, cannot even be defined.

The Metanarrative has always existed as an eternal moment. We creatures work it out, forwards, backwards and every which way. The seamless, forward experience of it is an artifact of our overlapping

psyches. The director's cuts end up on our pillows at night. Time and space need never exist outside of the eternal moment of the Metanarrative that can only be the best possible one.

This is rough and ready. Crude beyond reason. But without a holographic scorecard, we'll never be able to follow the game. I have to sneak that hologram into both of our psyches, catch as catch can. This is real time for both of us. I remain confident that it will work out. If you want the finished product, just look ahead a few years! If you are already chomping at the bit, well, have at it!

Allow me, please, to distinguish between photos and fossils. In doing so I will also be distinguishing between history and pre-history. Pre-history is an artifact of scientific materialism; or, by the same token, of our naturalistic aesthetic. In either case, it is not something that is ever present to us. Pre-history is a backdrop to history, just as surely as is the starry sky. In fact, one could hardly exist without the other; certainly not with any semblance of coherence.

Yes, the coherence of nature is a false coherence. It is an end to quite another means. It is the most aesthetic, nay, the best possible, countenance which may be put upon our necessary alienation from the Creator, and so, *ipso facto*, from our true selves. Just because this is the BPW does not mean that it will hurt us to imagine all the other possibilities 'out there'. We should always be considering the possibilities, regardless. That is mainly how we earn our co-creaturely keep.

So, where do we draw the line? That's always supposed to be a tricky question. How high is the sky? It all depends on the context. NASA's celestial context is a bit more expansionist (imperialist?) than mine. I would like to distinguish between archeology and paleontology. Come to think of it, dinosaurs are where I draw the line.

I have spoken, however, of [Jurassic Parc](#). And there could as well be a Galactic Alley. This is my hypothetical 'computer' simulator in the sky. It's where we use a bit of cosmic smarts to circumvent those deadly dull 'billions and billions' of materialistic yawns that the scientists are ever so eager to foist upon the Creator. Thanks, but no thanks! Fossils are some of the blueprints that never got off the drawing boards at Jurassic Parc. Walt Disney and the paleontologists have taken care of the rest of it. As for the mechanics of it all, I'll leave that as an exercise to the reader for the time being. Let me know when you have an answer! I have no doubt that, between God and Pixar Studios, we can work out an authentic dinosaur experience for you, if you'll just have a little patience. Heck, you'll have the option of being the dinosaur, if you like. Caesar, on the other hand, frequented these same shores, in real time. If you wish to experience being Caesar or the Second Coming, all in due course. I would submit that we already have, but have merely 'forgotten' it. That's just my own opinion. In dealing with the truly absent, past and future tend to meld together. Notions of reincarnation are part of that melding.

As we begin to accelerate into the shining eschatological presence, many lives and many psyches will begin to overlap. The 'dear departed' will not have to claw their way out of their graves; they need only open up their minds to ours, as if they haven't already. They are us, we will be them.

[2/14]

Have we made any headway against materialism?

We do find that atoms could not serve as the foundation of materialism without the non-local relational properties conferred upon them by the Quantum. Molecular properties are thereby irreducible to atomic properties. Those properties may be predicted mathematically, but the electronic wave functions that are employed are themselves irreducible. They are the irreducible basis functions for a particular representation of the 'matrix mechanics'. Their complexity defies actual computation in all but the

simplest cases. In point of fact, the 'three-body problem' is theoretically unsolvable in either its classical or quantum versions.

Our struggle with materialism then devolves to the question of mind independence. This is tantamount to the objectivity of material objects. I point out that objectification and identification cannot be disentangled. The materialists' position then amounts to the claim that objects may exist without benefit of objectification.

This latter claim technically runs afoul of the measurement problem. The definite location of macroscopic objects is only the result of a yet to be understood, or even formally definable, transition from quantum to classical realms. But I don't want to win this on a mere technicality. It is too important. We need an argument that subverts the admitted gut-level appeal of mind-independence.

The Mars rovers provide a case in point. The rocks they observe on the surface of Mars seem just as real as any rocks back on Earth. Does this not point to the independent existence of material objects in general? How can the rocks on Mars be attributed to our co-creational activity? Will we not have to make a special appeal to the Creator? Is this not similar to the problem of explaining stars and fossils?

Do not these objects exist without benefit of ever having been objectified? My fall-back position is to invoke the problem of Presence. Is it legitimate to distinguish existence and presence (or presentability)? This is possible only if we can distinguish between absence and non-existence. It seems reasonably clear that this latter distinction is untenable. The latter then undermines the tenability of the former. Recall, furthermore, the lack of formal distinction between presence and absence.

We think we have a clear notion of existence. But can we distinguish it from observability, about which we can only have a contingent and dispositional regard? To distinguish between objectivity and objectification is one matter, but to distinguish between objectivity and objectifiability is another matter.

Is it legitimate to posit the existence of anything that is logically unobservable or unknowable? This even goes beyond the problem of the epistemic/ontic divide. It is the counterfactual shadow of that divide.

I am tempted to say that our gut disposition favoring mind independence is, ironically, nothing more than the overworking of our imaginative faculty. Science surely offers not the slightest support for the reification of the unobservable. To posit such entities is to negate the scientific method.

Can we accept this conclusion? Does it subvert our gut instinct? Another test case involves [SETI](#). What is the ontic implication of ETI? Giordano Bruno was burned at the Inquisitional stake for being an early advocate of ETI. Immaterialism rules out ETI, but not UTI (ultra-terrestrial intelligence, e.g. God). In this instance, immaterialism agrees with the orthodox ontology of intelligence. For immaterialism, separate worlds entail separate creations, if not necessarily separate Creators. The Creator(s) hardly have the option of 'physically' linked creations. Therefore, a radio search would be logically futile.

As a footnote, let me just remark that Hindu cosmology, certainly in its theosophical version, invokes the mind-independence of perpetual cosmic rounds, thereby confounding its general proclivity for immaterialism and even for monism. My notion is that Buddhist cosmology is less inconsistent in this regard. I don't see that pantheism could be compatible with mind independence, despite its decapitated monism.

I am claiming to have provided the outline of an argument for the *prima facie* incoherence of mind independence. I am not yet aware of an equivalent argument elsewhere. Is there any life left to be beaten out of materialism? What remains of it? Only the occasionally nagging hangover. The fact is that you cannot kill a zombie, but you can cut its power supply. If it is cut off from all logical discourse and recourse, it can only continue to shrivel.

I remain under the impression that materialism, dualism and pluralism are still being tolerated in academic

circles where such shortcomings should be inexcusable. This plain fact is perhaps the best testimony we have to the radical implications of the one coherent alternative to all of the above.

Materialism is a straw-man for science. It is the ontology of scientism. Science certainly strives *toward* objectivity, but only, legitimately, in the sense of intersubjectivity. If ever it strives *for* objectivity, it surrenders to the facile 'metaphysics' of scientism. To confer a metaphysical status upon materialism is to concede too much. Metaphysics implies a minimal system of logic. Mind independence cannot even pull itself up to that threshold. Virtually by definition, there can be no discourse that could count for independence. At the very most, one might construe a discourse that would end by pointing toward independence, but in that limit all argument must cease. There exists no means for maintaining such a position. The most it could be afforded is the occasional salutation.

Splendid isolation from all discourse, perhaps that is an enviable position. Is it not unassailable?

Let us revisit the logic of the unobservable universe. To avoid the metaphysically radical implications of the Anthropic Principle, materialists posit the existence of an infinite ensemble of universes, virtually all of which could contain no observers in principle. The only implication of their existence would be to vouchsafe the contingent status of the remarkable hospitality of our own universe. The implication is that there might have been no observability whatsoever.

The question is sometimes posed: why is there something rather than nothing? By appealing to the possibility of nothing, do not the materialists only serve to underscore the mystery of existence: a notion that is unsympathetic to any form of absolutism? The objectivity of matter is contingent upon the possibility of there being nothing.

The preclusion of existence is the least coherent of any possible ontic position. Can such a position lend support to any other position? But is it not the logical *reductio* of any reductionist endeavor? I believe that it is. Might there not have been nothing? We can probably say that this is vastly more unlikely than that there be something. Does not potentiality qualify as other than nothing? In order for there to truly be nothing, we would have to preclude all possibility. But is this possible? It is not possible to appeal to the possibility of nothing, without thereby negating all possibility which is impossible. If there were nothing to begin with, this would be no problem, but since there is something, it is impossible to argue back to something that precludes all possibility.

Yes, frequently we romance the notion of non-being. This is a favorite pastime of existentialists. Then have I not gone too far with my counterargument? Could this argument not be construed as an argument against individual mortality? Certainly it is an argument against the cessation of mind. Also it is an argument against the absolute distinction between individual mind and cosmic mind. In that sense it precludes the obliteration of any aspect of mind.

It is just the necessary mind dependence of all existence which affords substantiality to the world and all its aspects. Reductionism can only be self-negating. It can lead only to an absolute nihilism. Nihilism sounds scary, but, as we have seen, it is even less substantial than a paper dragon. Nay, it is impossible, it is even inconceivable. It is, at most, a symptom of the diseased and illegitimate language game that passes as 'reductionism'.

It is possible that contingency is impossible. If one thing is possible, then everything is possible, but that cannot be, because nothingness is not possible. But if anything is possible, then there must be the best possible world. But if contingency is not possible, then the BPW is the only world. It is not possible that there could only exist the second best world.

This sounds incredibly simple minded, but I believe that contingency must be part of the reductionist package. It has no other use. Once you let in one bit of it, it takes over the whole world, and then all the other worlds. It is an all or nothing affair. The only recourse is to opt for none of it.

Coherence and many other things may turn out to be all or nothing propositions. Coherence does not countenance contingency. We will have none of it.

Have we not wasted an incredible amount of time worrying about nothing? Well, it was not possible not to worry! Shoot me if I am being too simple minded. But before you do, you had better check your own logic.

Does this mean that the rocks strewn across the surface of Mars could not have been strewn any other way? Well, it's just WYSIWYG. It will never be any other way. To posit another world may be inconceivably hypothetical. You can't really blame me for that possible fact. Materialists used to be determinists. Perhaps they should have stuck with that thought.

Would not the best possible world allow for free will? It may be that free will need not entail contingency. It may be primarily a subjective reality. No one is in a position to claim to know the true nature of whatever it is that we believe in, when we believe in free will.

[2/15]

It does seem to me that possibility is predicated on the possibility of nothing. So if nothing is not a viable possibility, then neither is possibility itself. Does this make sense?

Another strike against nothingness is the lack of an epistemic/ontic divide. If there can be no epistemology associated with nothingness, then neither can there be an ontology.

[2/16]

In Hilbert space there are infinitely many mutually orthogonal vectors. If we think of each vector as a narrational world, there could be infinitely many non-intersecting, non-overlapping worlds. Actually, each point in Hilbert space constitutes a function, typically a quantum wave function. More likely, each function could represent a life, and then a world would be a mutually consistent linear combination of these life lines. As long as there were only finitely many lives in a world, there could still be infinitely many 'orthogonal' worlds.

I am doing this as an exercise in nothingness: no creation, no worlds, no nothing. With just two (orthogonal?) creations, there are two worlds separated by...nothing? By what are they separated? They could be two ships 'passing' in the night -- no interaction. This might make sense from the view of the creatures, but not in the view of the creators, if there be such. Can there not be orthogonal gods? Perhaps, but not orthogonal creators.

The issue comes back to whether there can be non-relational existence. Even for a non-relational system, such as materialism, we have to ask what would constitute the minimum possible world. Could there exist an atom in isolation? It could not be a physical atom or particle, because these must be embedded in a space-time manifold. The minimal steady-state space-time manifold is infinite. If we invoke Mach's principle, it would also have to contain an infinite dispersion of matter.

Physical cosmology does presently countenance an indefinite number of non-interacting universes, be they finite or not. They may emerge spontaneously from the background quantum potential. This quantum

potential is not unlike our Matrix. As I have noted, almost all of these universes are assumed to be unobservable.

One problem with unobservables would be their possible lack of properties. There are many isolated and temporary features of this world that go unobserved, but we infer by continuity that these features exist. If continuity does not apply, properties are less coherent. If we do not know the physics, we have no basis to infer physical properties. Physicalism provides no basis to infer existence in contexts where hypothetical properties may not accord with knowable physics. How far may we extrapolate from the known to the unknowable? This is turning out to be a largely subjective question. Once again, the epistemic/ontic divide haunts our attempt to invoke mind independence. The possibility of mind independence seems more related to epistemology than ontology. The harder the ontology is pushed, the closer it veers toward epistemology. Yet, it is precisely the hypothesis of mind independence that is the basis for materialism. Does that 'system' not have all the attributes of a house of cards?

The concept of isolated existence is turning out to be highly problematic. Material existence beyond this universe raises many more questions than it could possibly answer. But I still do not have a handle on the possibility of an isolated creator or of an isolated matrix. Previously I have only been able to invoke the Identity of Indiscernibles to limit such possibility. If one Matrix is good, would two not be better? I am wondering if orthogonal potencies are sensible? Without *apriori* restraint, there is no sense in limited potency, but could there be separate omni-potencies, each eventually producing its own version of the BPW? We could end up with innumerable BPWs. What is to prevent such incoherence at the outset?

If there were to be separate matrices, would there not have to be some basis for separation? If relations are the natural basis of existence, as we generally maintain, separation would be unnatural and require explanation. There would have to be an extra-matrical physics to prevent a potential infinity of matrices from 'bumping' into each other. But then the question of source is just pushed back another step. Such redundancy would vitiate any notion of the BPW. In the non-denumerable set of matrices, it seems unlikely that no two could ever interact. But if two could, then they all could and would, and we would suddenly collapse back to our singular Matrix, before the god of matrices could even blink an eye.

The whole notion of redundancy is probably just a residue of the materialist mind set. Eventually it will disappear of its own accord.

Behind redundancy is the notion of non-relational existence. This notion does not stand to scrutiny. It is an illogical extrapolation from an incoherent basis. That it is an endemic presupposition of science does not augur well for the thoughtfulness of that enterprise.

The philosophical depravity of science provides an excellent counter-argument to pantheism. There is, after all, no such thing as distributed intelligence. There is no such thing as isolated intelligence. Mind is all or nothing. The alleged atomicity of our egos should be the most transparent of all illusions.

I am also underscoring the fact that the best possible world is the only possible one. The term 'possible' is retained for mainly pedagogical reasons. Is the notion of Creator rendered otiose? No more than is the notion of creature. Both notions are strictly relational.

The fact that this is the only world, need not limit our freedom, nor the fact that no better world might reasonably be produced, nor the fact that I can know this beforehand. None of this need count against our freedom.

Freedom is precious. It is reserved mainly for the Author's creative freedom. We participate in that freedom only in our alignment with the Creator's creativity. Heretofore that alignment has been largely unconscious. Freedom is not a feature of ego consciousness. Our creaturely freedom is to be realized in the Millennium.

Possibility remains an artifact of creative freedom. It is an artifact of our dreams. But there are no 'possible worlds' out there: WYSIWYG. There is just this one. Possibility down here is no more real than the nothingness from which it would have to be derived. Exploring the possibilities is done on the drawing boards. The Creator is paid to master the possibilities. Has our freedom been stolen? No, only our illusions.

What does this have to say about our political economy? What I see less of in the future is raw competition. What I see more of is management by objective. Society will be more organic. There will be a continuing risk of shortcut reversions to tribalism. Tribalism is not bad in itself, but it will have to be closely managed. I don't have any formulas for that off the top. Such techniques will continue to emerge. It will be more difficult to manage in homogeneous societies. The world will have to reorganize itself around the Telos before our true creative freedom will emerge. In short, I do not see any need for an external radical reform of democratic capitalism. The only meaningful reform will come from within the individual participants. Despotism of all varieties will continue to wither on the vine. I don't feel too sad when the sway of some entrenched despots is deliberately cut short.

[2/18]

I'm going over the last few pages to see where we might head next.

[Naturalism in Question](#), noted [previously](#), is to be released in May. It should be worth the wait.

[John Leslie](#) discusses his book, *Infinite Minds* (2001). I should not have missed this one. [Here](#) is the first chapter. I am perusing it now online. John has almost everything except the BPW. So near yet so far!

[2/19]

John's book is important. I recall having glanced over it at a bookstore. I read with interest John's other book, [The End of the World](#) (1999). In that one he makes the statistical argument that we must be near the end of human history.

John calls himself a Spinoza pantheist. He comes closer to theism than many pantheists. He does attribute morality to the cosmic mind as an argument against the existence of perverse worlds, but like most pantheists he also embraces the *apeiron*. He excludes the possibility of coherence by postulating an infinity of gods, each creating an infinity of non-perverse worlds. Creation is haphazard, at best. There is no metanarrative. Despite his other book on the statistics of eschatology, there is no notion here of teleology or a Telos. However, there is an extended argument for immaterialism. I shall see what we may borrow from it. I am also not seeing any explicit arguments against theism *per se*, only against the dualist versions of it -- a strange but characteristic omission, characteristic, that is, of non-sectarian intellectuals generally. There must be a line in the sand between pantheism and theism. It is as if the theologians are able to maintain a closed shop. I am under the impression that virtually all theologians maintain sectarian identities. This seems to conform to a self-imposed defense against gnosticism. Yes, otherwise gnostic excess would be a real occupational hazard. I ought to know! Now, let me get back to the book.

On p. 22 John misses an opportunity to take up the cause of Presence. He implicitly dismisses it in favor of Einstein's (another Spinozist) non-relational, non-teleological relativity of time. Yes, his immaterialism

is sorely lacking any significant relationalism. He passes up Presence in favor of an infinite ensemble of 'nows'. This is consistent with his embracing the 'many worlds' interpretation of anthropics. Yes, John is consistent, almost obsessively, in maintaining his posture of incoherence. Or is it anti-coherence?

What John Leslie is calling the divine mind, I would call the Matrix. There is no dialectic here and so no X. There is hardly even a Z.

In the next section, starting on p. 23, he takes up the problem of divine incoherence. He is talking about the Matrix. He does not envision the possibility that the Matrix is just the source of being. He is an absolutist in regard to ontology; he does not understand that existence must be relative. If immaterialism is not relational, then it can hardly be distinguished from materialism.

On page 24 things get worse. He refers to David Lewis' modal realism, which is not unlike Meinong's anti-relational, anti-contextual, anti-holistic realism, but observe this [caveat](#) in comparison with Plato. Remind me to follow up on the fact that Ernst Mally of Ontology ([Metaphysics Research](#)) Lab fame was a Meinongian. One does need a scorecard to follow this game. As the card gets bigger, the plot gets thicker. Here is John referring to Lewis, 'He accepts endlessly many gods, despite picturing our universe as entirely godless.' (p. 25). Can't people see that this is a perversion of logic. John seems unable to distinguish between his own and David's ontology. What a shame.

What I see John doing in the next few pages is laying out a detailed argument for the *reductio ad absurdum* of the 'many worlds' interpretation of quantum physics, anthropics, or of modal realism in general. This makes me feel more comfortable with my position contra modality and possibility. He finally, on p. 30, has to revert to aesthetics to defeat modal realism. But is there any logic to limiting aesthetics anywhere short of the BPW? The only reason to arbitrarily limit aesthetics is to avoid the obvious theological consequences of not doing so. Can John not see this? On pp. 33ff, he explicitly borrows from theology to refute modal realism. On p. 35 he assumes that the human mind is based on matter, while the divine mind is not. This is a bizarre form of dualism, particularly for a pantheist. He is rapidly losing it. He has gone off the deep end of the *apeiron*. Omniscience is obviously a hobgoblin. Consistency without coherence is no virtue. This is becoming painful!

It is clear that the only way that John can rescue pantheism from modal realism is by making explicit appeals to theism. Until John started beating on this dead horse of modal realism, I did not realize what a significant skeleton it was in the pantheist closet. Perhaps no one can save pantheism from its most conscientious or obsessive adherents.

On p. 38, he begins what may be a significant appeal to holism. Perhaps John's arguments against modal realism are serving as arguments against atomic or reductive realism. Surely the quantum, at least, should save us from Maxwell's demon. Is holism necessarily anthropocentric, or in the anthropos holi-centric?

Well, I just reached my page limit on Amazon, but it is available at the local Borders. I need to read the chapter 'Best & Infinity', where John discusses the best possible cosmos. I'll report back ASAP.

The book was not at the store. I have to juggle computers to read more. I am not terribly amused by this process. If the academicians, theologians and any others want to participate in discussions that could determine the fate of the world, they will have to take full advantage of the Internet. John is not doing this. If he does not consider his ideas of sufficient gravity to warrant free access, then he need not expect others to take them seriously. I will proceed, nonetheless, as best I can.

There are much worse offenders than John. Almost every theologian is a living indictment of rational discussion, not by their own doing, but because of the restrictive system in which they operate. Not many of us have the good fortune to be able to do freelance theology.

With some judicious skipping of pages using another computer, I think I have gotten the gist of *Infinite Minds*. Yes, he does discuss the BPW hypothesis, and even the Identity of Indiscernibles in regard to multiple Gods. In each case he comes to conclusions that flatly contradict the ones obtained here. We can't both be right.

My biggest problem with *Minds*, however, is the 'so what?' question. He states more than once that there is no phenomenological difference between pantheism and materialism. If so, then what is the point? Is it just an exercise in trying to feel better about the way things are? Is it just an exercise in therapeutic psychology as is sometimes claimed even by the adherents of the traditional pantheist systems? Perhaps I missed where he explains his motivation.

It is painfully obvious that John exhausting his resources in trying to thread the needle between the Scylla of materialism and the Charybdis of theism.

The pantheist God is the Hippocratic God: do no harm. Lets call him Pan. Pan evidently has only sufficient skill to avoid creating morally repugnant cosmoi. We should be grateful for small favors; but how many of us, if we had the choice, would choose such a lame duck?

You and I have a definite advantage over Pan. We have the power of imagination. Pan does not. Imagine that! Recall, please, the curse of Midas' touch. Everything he touched turned to gold. The curse of Pan is infinitely worse. Everything he imagines turns into a reality that some poor creatures like you and me will be forced to sit through, if not suffer through. Are we really expected to pay forty bucks to vicariously suffer through this incoherent collection of creations? Is this what half of the world actually believes? 99% of everybody facing a life and death situation, given the chance, will utter the name of a deity, even if it be as if in vain. Heck, most of us will do so upon stubbing a toe.

John is sincerely trying to do his very best to make sense out of what is patently intended to be nonsensical. Many more of us might have failed to notice the logical death of this particular horse if it weren't for the well intentioned John Leslies of the world who regularly come along to beat on it: a noble service to the rest of us.

Many Gods? If God is good, then two Gods should be wonderful. No? If God is infinite, what is the point of having another? The only point, it seems, is to eschew theism. For all I know, there could be a Creation Committee, but I do know that there can only be one BPW. Anything else is going to never make it off the drawing boards. Stealth Creation? Cheaper by the dozen? Schismatic God? These ideas hardly get off the ground. Correction, I do know there is a Creation Committee, because we are on it!

Pantheism ought to be a non-starter. But, more to the point, it will be an easy act to follow. It survives so long as it can avoid contention. In the age of the Internet, that is not a good bet.

[2/20]

I had forgotten what a pushover pantheism would be for rational theism. There are two things that are propping up pantheism: science and irrational theism, i.e. sectarianism. The irony, or beautiful symmetry, is that science is in a very similar position to pantheism in this regard: it is also being propped up by irrational theism as well as by pantheism.

Thus there is the ungodly *troika* of science, pantheism and sectarian theism. In that triumvirate, pantheism and sectarianism are the weak sisters. Once rational theism is able to rise above the general cacophony of the Internet, thoughtful people will start realizing that, as an alternative to materialism, it will be *nolo contendere* in favor of the BPW. Then materialism will be in big trouble. For the first time in its short life it will have a run for its money.

Rational theism is rather simple, if not quite simple minded. In retrospect, the most amazing thing is how it managed to stay hidden for so long. Let's see about that.

There is also a theistic *troika*: Judaism, Islam and Christianity. Among these, the Christians have long prided themselves on being the least rational; and, superficially, they do seem to have a point. But why the pride? The pride goes back at least to Paul:

1 Cor 1:17-27

17 For Christ did not send me to baptize, but to preach the gospel-- not with words of human wisdom, lest the cross of Christ be emptied of its power.

18 For the message of the cross is foolishness to those who are perishing, but to us who are being saved it is the power of God.

19 For it is written: "I will destroy the wisdom of the wise; the intelligence of the intelligent I will frustrate."

20 Where is the wise man? Where is the scholar? Where is the philosopher of this age? Has not God made foolish the wisdom of the world?

21 For since in the wisdom of God the world through its wisdom did not know him, God was pleased through the foolishness of what was preached to save those who believe.

22 Jews demand miraculous signs and Greeks look for wisdom,

23 but we preach Christ crucified: a stumbling block to Jews and foolishness to Gentiles,

24 but to those whom God has called, both Jews and Greeks, Christ the power of God and the wisdom of God.

25 For the foolishness of God is wiser than man's wisdom, and the weakness of God is stronger than man's strength.

26 Brothers, think of what you were when you were called. Not many of you were wise by human standards; not many were influential; not many were of noble birth.

27 But God chose the foolish things of the world to shame the wise; God chose the weak things of the world to shame the strong.

(NIV)

Paul is not mincing his words. [Ron Ritchie](#) has this to say:

To the Greek world of Paul's day, the word of the gospel seemed to be nothing but foolishness. The same could be said of our own world today. The gospel message is sneered at because it seems foolish. But that did not deter Paul, nor should it deter us. The gospel will always seem foolish unless the Holy Spirit is working in the hearts of those to whom it is being preached. I confess I have often felt foolish myself for preaching it. I have sometimes wondered how it could possibly penetrate hardened hearts. But that is the work of the Holy Spirit. Our job as Christians is to proclaim the good news.

It could well be that Paul is the prototype of the anti-intellectual. Yes, the skeptics hardly have to go digging to discover the 'irrationality' of Christianity. It is positively thrust in their faces: 'Take this, smarty-pants'!

What is going on here? Was Paul already fighting gnosticism? That could only be part of it. Ron has the larger part. Until Constantine came along, Christianity was running purely on fumes. It was the biggest charisma machine in history. Those early Christians followed the simple dictum: don't bother talking or thinking while the flavor lasts. Go with the spirit. Who needs soldiers? But, like death and taxes, the flavor runs out and the charisma gets routinized. Only then do the rationalizations and the apologetics begin; and, in case those fail, the Christian soldiers suit up.

The intellect is poison to the spirit? That certainly remains a popular sentiment. It is also well noted that the intellect is no friend of sectarianism.

And, if I am not mistaken, the number two anti-intellectual in history was Martin Luther. Surely we cannot dispute his anti-gnostic, fundamentalist credentials.

For Christians, 'theo-logy' has always been an oxymoron. I was surprised when I first discovered this in talking to a theologian. The surprise wore off quickly. 'We don't need your dirty mind, we have our Holy

Spirit.' Ouch!

And then along came Sophia, whispering 'sweet nothings' in my ear. The rest of the story you see here. Thanks, girl. 'Theology' is an easy act to follow. It is hardly any act at all.

Part of my thesis is that the anti-intellectualism of christianity became (by design?) a self-fulfilling prophecy. The long pent-up gnosticism, when it finally burst forth into *scientia*, created a monster, scientism/materialism, which quickly turned upon its host, yielding deism and then the modern secular *intelligentsia*. Only under the aegis of postmodernism can we begin to pick up the pieces and reconsider the gnostic roots of modern intellectualism. In effect, we pick up where gnosticism left off, before it was decimated by the teachings of Paul and Luther, and by the fires of the Inquisition.

Permit me to read the Stanford Encyclopedia entries for [panpsychism](#) and [pantheism](#). I will compare them with John's treatment.

[2/21]

I have read the two articles, and I'm not seeing any major disagreements with John. Modern pantheism, by now, is irrevocably committed to scientific cosmology. It is a safe haven for scientists who have become disaffected with materialism. It is also widely identified with 'deep ecology'. I used to call myself a 'transcendental pantheist', which might be closer to Buddhism. In his article, Michael Levine points out that a distinctive feature of pantheism is its denial of personal immortality. This, of course, enhances its compatibility with science.

What is harder to discern are any significant departures from materialism. The alleged unity of the world seems to exist in name only. It could be seen as a language game serving to soften the hard edge of science. How is pantheism to be distinguished from panpsychism? Versions of panpsychism are compatible with emergentism and naturalism. The only real issue between panpsychism proper and emergentism is whether the mental properties exist within quarks or between quarks. It is not clear that there would be any observable consequences.

I imagine one could construct versions of idealism that would also be indistinguishable from materialism. Likewise for deistic versions of theism. Even the BPW is indistinguishable from materialism until we enter the eschatological regime. It is only in its eschatology that theism stands apart phenomenologically from all the other world views, setting aside issues regarding mortality.

Michael takes pains to point out that pantheism does not have a social dimension, aside, perhaps, from its indirect links to ecological concerns. It pertains mainly to the inner life of the individual. Its ethical norms may vary greatly between individual adherents. Pantheism has no practice. The Taoist tradition is the one most closely aligned with pantheism, but even its sparse practices do not follow from any particular pantheist concepts.

We come back to the terribly simple assertion: no telos, no meaning. Only theism offers unconditional meaning. Only theism offers transcendence. Some claim that Buddhism offers this as well. Is it not more accurate to say that Buddhism offers escape? In theism transcendence is often characterized as salvation, but this carries the negative connotation of 'saving from something'. Whatever is the best possible outcome or culmination of existence, this is what is offered. I could not pretend to tell you what this is, but it is not unlike love, and it is quite unlikely that anyone could be disappointed.

Buddhism does not find value in existence. Buddhism does not recognize a telos. Buddhism sees all striving as pointless. Theists don't accept that negative assertion. We claim that life is not in vain. We claim to be privy to the source of life and to that toward which it is drawn. We finally do not and cannot refrain from placing an absolute trust in the vindication and vindicator of all being.

Can we or should we settle for any other? I cannot see how or why. We continue to do so only out of ignorance. We may, instead, anticipate the end of ignorance.

The emptying of the mind can be a valuable exercise. It is a preparation for mindfulness. Mindfulness is of inestimable value.

[2/22]

I continue with Michael Levine's article on pantheism, starting with the section on [divinity](#). Here is the critical passage:

Whatever criteria are decided upon as necessary for attributing divinity to something, one cannot decide *a priori* that the possession of divinity requires **personhood** without ruling out the possibility of the most typical types of pantheism (i.e. non-personal types). After all, theism is what pantheism is most of all trying to distance itself from. I am not sure the reverse is true-but theism does ordinarily strongly oppose itself to pantheism. In any case, Spinoza's God and Lao Tzu's *Tao*, for example, are distinctly non-personal, as are the governing principles of the Presocratics. It seems unwarranted, therefore, to suppose that a necessary condition of something's being divine is that it be personal on the grounds that "Of all the modes of creaturely existence, personality is the highest and so the fittest to serve as an analogy of divine being" (Macquarrie 1984: 42). At least to do so begs the question against Spinoza, some of the Presocratics, Lao Tzu, probably Plotinus, as well as against experiential and socio-scientific accounts of divinity.

I'll reserve comment for now. Let's move on to [creation](#):

In distinguishing between creation *ex nihilo* and emanationism as he does, Macquarrie (1984: 34-5) makes it easy to see why emanationism is often closely associated with pantheism. Emanationism is the view that "creation" is not a "making," but in some sense a "flowing forth" from God or its origin, as Macquarrie puts it. And, what "flows forth" "maintains a closer relation to [its] origin. It participates in the origin, and the origin participates in it." He says, "...emanationism does not necessarily lead to pantheism, but it does imply that in some sense God is in the world and the world is in God."

Amen. I am big on emanationism, but I'm no pantheist. I do not believe in creation *ex nihilo*. That notion is a big mistake. It has everything to do with deism and dualism. The incarnation, X1, should have refuted the idea of creation *ex nihilo*. Oh?

Jesus is God & Jesus is human. Jesus is creature -> Creature = Creator. This is a very big deal, and is very irrefutable. Christianity is undeniably a form of pantheism. It is also undeniably theistic. X'ianity is the best of both worlds. Nay, it is the best of all worlds. Those who hope to best X'ianity can only weep.

Any questions?

Assuming pantheism does require a doctrine or view about creation, what can be said positively about it? Pantheism has a range of options unavailable to theism since the theistic doctrine is **extrapolated** from scripture.

It is so extracted if you are a fundamentalist. I am not that. John is an emanationist. If not, I'll eat my hat. The Logos is all about emanation. Jesus is the Logos.

John 1:1-5

1 In the beginning was the Word, and the Word was with God, and the Word was God.

2 He was with God in the beginning.

3 Through him all things were made; without him nothing was made that has been made.

4 In him was life, and that life was the light of men.

5 The light shines in the darkness, but the darkness has not understood it.

(NIV)

John 1:14

14 The Word became flesh and made his dwelling among us. We have seen his glory, the glory of the One and Only, who came from the Father, full of grace and truth.

(NIV)

You cannot get much more explicit than this, and I did not write this. If this does not take all the wind out of the sails of pantheism, then there has been a big mistake.

True, I do prefer the dia-Logos, but you get the picture. I try to be heretical, but John makes that almost impossible.

So far as Lao Tzu has a doctrine of creation it too is emanationist. "The Tao engenders one, One engenders two, Two engenders three, And three engenders the myriad things"

And this cannot be reconciled with John? *No problemo*. Show me something difficult.

X engenders itself dialectically from the Matrix. X is the dia-Logos. This has got to be the singularly best engenderment. Z & X conspire to create ouroborically. This is also where Q, R & P come into the picture. I do seem to be lacking a scriptural basis for Z, but, hey, I'm just an amateur.

[2/24]

The serpent appears to have been considered the most potent of our mythic symbols. Much of the serpent's potency likely stems from its protean nature and its quality of latency. It is frequently associated with wisdom and gnosis. In Genesis the serpent is of the tree of knowledge, serving as the proxy of Satan. On the Day of the Lord, He shall smite Leviathan, the serpent of the sea, along with the rest of the bad guys. Its forked tongue connotes duplicity, and possibly dialogue.

The serpent is naturally associated with fecundity, abyssal depths and with springs. The magical power of Hermes is seen in his healing caduceus, a winged wand entwined with twin serpents. The serpent is also depicted as coiled about the cosmic egg and the anthropos. In that context it represents time and the aeon. The serpent in the sky may be the zodiac, milky way or rainbow. The ultimate syzygy, the solar eclipse, is the ecliptic serpent devouring the Sun. Serpens and Scorpio sting the fleeing Virgo on the heel.

Let us not forget Quetzalcoatl, feathered serpent, and major deity of meso-America:

Quetzalcoatl was revered as the patron of priests, the inventor of the calendar and of books, and the protector of goldsmiths and other craftsmen; he was also identified with the planet Venus. As the morning and evening star, Quetzalcoatl was the symbol of death and **resurrection**. With his companion Xolotl, a dog-headed god, he was said to have descended to the underground hell of Mictlan to gather the bones of the ancient dead. Those bones he anointed with his own blood, giving birth to the men who inhabit the present universe. (Britannica 2001)

In genealogical contexts the serpent denotes bloodlines. In the ouroboric form it is seen as self-generating. Yes, regarding its erstwhile potency, I don't think you could have beaten it with a stick. Single-handedly the serpent represents nearly every pagan influence that the Yahwist tradition aimed to defeat.

Is Serpens not the archetype of unity? Against this unity the Yahwists cast their logos, and thus they initiated the dia-logos of the christos. Serpens is Z. Thus do we see the tension of AZO/X/QRP. Recall the mathematical ouroboros, $e^{i\pi} = -1$. Here the logos, Pi, restores the unity at a higher level. To get to that higher level the symmetry of the perfect circle is broken into two foci. The syzygys of the elliptic functions generate the Monster group, that mathematical Leviathan, which is finally tamed by the Anthropos. The alchemy of the resulting technosis transmutes matter into information and finally into a cosmic gnosis, facilitating our eschatological resurrection.

This very crude scenario is convoluted, nonetheless. Behind the distractions of their religious strife, X & Z conspire in working through Q, R & P to complete our sojourn from the Alpha to the Omega. Did history have to be complexified to the point of melodrama? It may simply have been a question of stirring the pot: dig deep, God is at the bottom, in this, our new recipe for 'missionary stew'. Yummy! Superimposing X & Z yields a figure '8' or ouroboric symbol of infinity.

[2/26]

On occasion I refer to myself as a 'transcendental pantheist' if I wish to emphasize the participatory and monistic nature of my theism. I would then be able to call myself a panentheist, were it not for the lack of a Telos in both pantheism and panentheism. It seems to me that a Telos ought to be included in anything that is robustly transcendental. The lack of a Telos in the modern 'process' versions of panentheism I would attribute to the attempt to shoehorn theism into a scientific cosmology. Most pantheisms are considered acosmic, in and of themselves. I will have to look further to explain the absence of a Telos in the more traditional versions of panentheism.

In attempting to answer this last question, I have digressed into the history of theism and eschatology. I need to get a better handle on the roots of Zoroastrianism, for example. Clearly there are strong connections between personal and historical eschatology. Devine judgment is often a common factor, but 'judgment' may be too narrow a term. Every group has acceptable norms of behavior. Deviation from those norms brings about corrective responses from the group. In pre-modern times, social norms were rationalized by appeal to a larger context, which typically would be cosmological. Non-conformity would either result in divine censure, or in a disturbance of the natural order that would then have to be restored. Our deviant actions usually would leave a negative trace on the soul, a condition, which, if left uncorrected, could have dire consequences for the individual.

[2/27]

Deviant actions may simply add weight to the human heart or soul, which may then, at the time of death, descend into hell, rather than ascend to heaven. This sequence could be viewed as entirely natural or even mechanical, requiring no divine intervention.

An example of the latter is the [law of karma](#):

In Buddhist teaching, the law of karma, says only this: 'for every event that occurs, there will follow another event whose existence was caused by the first, and this second event will be pleasant or unpleasant according as its cause was skillful or unskillful.' A skillful event is one that is not accompanied by craving, resistance or delusions; an unskillful event is one that is accompanied by any one of those things.

On the one hand there occurs divine judgment, on the other hand there is a natural law. I would like to know if one of these moral systems is derivative of the other. Is there a natural history of morality?

It was pointed out a long time ago that might does not make right, even if the power in question happens

to be godly. We look to super-human authority at least as much for moral inspiration as for specific rules of conduct. To be effective, authority must inspire a sense of allegiance. The first requisite of any religion is to inspire a sense of social solidarity. Theism seems particularly suited to this end. Was there ever a tribe without a tribal god, in its formative stage? We see a dim reflection of this necessity in today's team mascots, but the modern army seems to need only the occasional battle flag.

Let me reemphasize that pantheism, *per se*, is not a religion. It seems rather to be a rationalization of polytheism, pointing back to a putative multiple emergence from the Matrix in Zodiacal fashion. It was not Buddha's intention, but it was inevitable that he would achieve Zodiacal status amongst his followers.

The Telos points to an ultimate future solidarity. We identify with our Source. In pantheism that source may be quite impersonal. I could identify with the Matrix if I had to. It is my ancestral home, after all. Identifying with a deified tribal ancestor might be more inspiring, especially if the ancestor were known to be significantly involved in Creation. Then we just have more spiritual options. Pantheists don't have to give up their pantheism if they choose not to, so no sense in anyone feeling slighted.

[2/28]

Transcendental is virtually synonymous with eternal. It is that which transcends space and time. Pantheism refers to the unity of all things. I cannot conceive how such unity could be entirely immanent. Unity is not an empirical aspect of the world. It is not something that is detectable within the space-time manifold. It is not a construct of science. Pantheism is distinct from materialism. To the degree that it is distinct, to that same degree it must be transcendental. I can only identify the singular source of being with what is here called the Matrix, which may also be called Brahman/atman:

The holy or sacred power that is the source and sustainer of the universe. The single absolute being pervading the universe and found within the individual. The impersonal universal soul or self (*sic*), also found in each person.

Pantheists see that (transcendental?) unity as the ground and source of being. It is the goal of the pantheist to become aligned with the unifying harmony of and beyond the world. This goal is often expressed as the escape from the eternal (*sic*) round of rebirth, the wheel of life.

In the earlier Upanishads, the absolute, impersonal, eternal properties of the divine had been stressed; in the later Upanishads, on the other hand, and in the Bhagavad-Gita, the personal, loving, immanentistic properties became dominant. [...]

On the other hand, Ramanuja, a prominent southern Brahmin who held to a qualified monism, argued strenuously against Sankara's dismissal of the world and of individual selves as being mere products of nescience. In place of this acosmism he substituted the notion of world cycles. In the unmanifest state Brahman has as his body only the very subtle matter of darkness, and he decrees "May I again possess a world-body"; in the manifest state all of the things of the world, including individual selves, are part of his body. The doctrine of Ramanuja approaches panentheism; he has certainly advanced beyond emanationistic pantheism. There are two aspects to the single Brahman, one absolutistic and the other relativistic. As in panentheism, the beings of the world have freedom. The only qualification is that, although it is Brahman's will to support the choices of finite beings, he has the power to prohibit any choice that displeases him. This power to prohibit indicates a preference for the absolute in Ramanuja's thought, which is reflected in many ways: although God is the cause of the world, for example, and includes the world within his being, he is never affected by that world, and his motive in world creation is simply play. In sum, since the absolutistic categories were given the greater emphasis in his thought, Ramanuja is representative of a relativistic monistic pantheism.

The presence in the Hindu tradition of both absolutistic and relativistic descriptions of the divine suggests that genuine panentheism might well emerge from the tradition; and, in fact, in the former president of India, S. Radhakrishnan, also a religious philosopher, that development did occur. Although

Radhakrishnan had been influenced by Western philosophy, including that of A.N. Whitehead, later discussed as a modern panentheist, the sources of his thought lie in Hindu philosophy. He distinguishes between God as the being who contains the world and the Absolute, who is God in only one aspect. He finds that the beings of the world are integral with God, who draws an increase of his being from the constituents of his nature. (Britannica, 2001)

I didn't quite realize the extent to which the Britannica opens itself to ax-grinding! OK, so the issue between pan- and panen- theism is simply one of personal freedom. In as much as personal freedom requires a source, that source must be theistic, i.e. personal.

Pantheism certainly has a personal, i.e. individual, eschatology and telos. It is lacking any notion of cosmic Creation or Telos. The eternal cycles can only be broken by the individual. There is no creator, no redeemer. There is no metanarrative beyond the cycles. No one has power over Karma. It is a law of nature, like gravity.

Pantheism is the natural stance. It is not, however, the rational stance. Why suppose that reason has no source? Why suppose that love has no source? As a point of logic, could reason serve any other Telos than love? It could not and still be coherent. Given the Matrix, and given the possibility of love and reason, X is inevitable. Why has it taken us so long to see the simple logic of it? Why could the pantheists not have come around to this view prior to their encounter with the prophetic tradition? Could we never have come to this understanding without an *ad hoc* divine intervention? Did there have to be an incarnation? Could there have been a metanarrative devoid of, or apart from the 'greatest story'.

Yes, could there be a metanarrative devoid of passion? Nowhere is there a greater dramatic tension between God's self-concealment and her self-revelation. Can you launch a ship without breaking a bottle?

Does there have to be a face in order to launch a thousand ships? If we had gotten too smart, too quickly, we might have ruined the plot. But, still, even God cannot fool all the people all the time. X2 is inevitable. It can be relatively spontaneous, almost natural. The present timing might, however, give one pause. By that same token, the events of 9/11 might seem something less than spontaneous, especially given this possibly larger context.

It may finally come down to a simple aphorism: it's not what you know, it's who you know. If Sophia had not made my acquaintance twenty-five years ago, I would not likely be here today. And twenty five years before that was my encounter with *The Greatest Story*. Yesterday it was *The Passion*. Love and reason are not divisible. Love comes, then reason flows. Only love can be the beginning and end of coherence. Everything else is just analysis. Analysis is reason without love. Love is the great synthesizer. It is the Dia-Logos: I and Thou. Is it true that the Sufis could not find love at home?

The potency of love we drink with our mother's milk. How quickly it is forgotten? How do the pantheists and Islamists manage to so thoroughly abstract love? Patriarchy must be involved, but have there not been matriarchal pantheists?

The original I and Thou are X & M. Out of the zodiacal pantheon, Z, it is X that becomes the center of self-organization. This results in a meta-unity in juxtaposition to the Matricial unity. But then, after Creation, it's almost as if X went and hid behind his mother's skirt, only coming out for his walk-on. Was he simply respecting his elders?

X is all about internalization. All his relations are internal. History is our story of internalizing the Matrix and X. No amount of pedagogy can hasten our matriculation from our school of hard knocks, says the pedagogue. But, rest assured, there will not have been one knock too many. Synchronicity still rules. It's as sure as $e^{\pi i} = 1$. You can set your watches by the coming and going of the spirit, as if we hadn't already.

This here is not pedagogy. This is nostalgia. Someone had to jog our memory. Just hitting ourselves over the head is necessary, but not quite sufficient.

Pantheism still represents a puzzle and a challenge for the theist. What caused the pantheists to disregard the possibility of Creation?

I have expressed the possibility that theism comes only as a package deal. It is a deal that must somehow be mediated in a continuous manner. It is not just an abstract proposition to either be asserted or denied outside of a social context. Furthermore, if prophecy is a necessary part of the theistic package, it is an exclusive element. There cannot be two separately originating lines of prophetic transmission. If redemption is part of the package, there cannot be two redeemers, nor, of course, can there cannot be two eschatons.

A possible exception to the rule of exclusivity is found in Zoroastrianism. It seems to have remained entirely independent of the Yahwist tradition. It retains adherents in India.

[...] his monotheistic concept of God has attracted the attention of modern historians of religion, who have speculated on the connections between his teaching and Judaism and Christianity. Though extreme claims of pan-Iranianism (i.e., that Zoroastrian or Iranian ideas influenced Greek, Roman, and Jewish thought) may be disregarded, the pervasive influence of Zoroaster's religious thought must nevertheless be recognized. (Britannica)

[2/29]

What then had Zoroaster tapped into? Or, for that matter, what did Mohammed tap into? What did the pantheists fail to tap into, and why did they fail?

The alternative scenario of history would have been the unassisted triumph of X1. There would not have been an X2. There would not have been a triumph of science. Jesus may have been under the impression that the Millennial kingdom of God was to have arrived immediately, end of story. We could argue as to the worth of the two thousand year hiatus.

Islam and pantheism each presents a counterpoint to the X1-event, and so does science. Could the world have been complete without these digressions? I, P & S each filled, what are in retrospect, obvious niches in our salvation ecology. There have been many other niches filled more modestly in these last two millennia. If this is the only world, then there is a very high premium here on diversity. Correspondingly, the rent is very high here as well. Speak now, or forever hold your peace. Or have we just about heard it all, already?

Jesus, Mohammed, Buddha, Newton, etc., all filled important niches in the salvational ecology. It is the role of X2 to fit the various pieces together into the most coherent picture. One of us apprentices will suffice in our efforts. If I am biased toward anything other than coherence, I shall certainly not succeed. We may then debate whether X2 came too early or too late. In that process we can hardly fail to consult the calendar.

Look at it this way. In all of history, three cosmic persona stand out: X, Y & Z, as the consort of M. Z is the pantheon. Y is the consummate tribal god. After playing the field, Yahweh 'settles down' with the Israelites. At some level, this has been prearranged with X. X 'steals' that show. It is Mohammed's role to transliterate Y's swan song. Y did himself proud, and thereby, once again conspiring with X toward the inevitable X2. On the subcontinent it is Buddha who incarnates M & Z, thereby earning himself a permanent residence in the pantheon.

It might be said that Abraham was the incarnation of Yahweh. We have, thus, just three historical incarnations: X, Y & Z. Conspiring together, X & Y break the symmetry of the Zodiacal cycle, thereby

causing the A/O space-time gap in that cycle. Y is the Alpha, X(1,2) the Omega. Has Buddha failed to tap into something? I think he had his work already cut out for him. He had to leave something for X2.

Is this just too tidy, or what?

There are a lot of people out there who suppose that Jesus was a wonderful prophet and a nice guy to boot, but, sorry, he wasn't God. Why not?

They would have to maintain that God should never mix and mingle. If I were God I would certainly want to make the acquaintance of my creatures. If we are created in God's image, how better might this be proven. Even most pantheists believe that Buddha was an incarnation. If they can have ten of them, why can't the rest of us just have one, or maybe two counting Abraham? There might be more than that; this would just be the bare minimum.

And then there is the business of the sacrifice. Oh so many people have believed in the sacrificial king. There is a very good reason for that. Why deny that to the rest of us? Too many people have put God and Jesus, etc., on a pedestal. If they choose to get off that pedestal once in a while, then you have no right to deny that to them. Then we could not be in their image. Then we could not fully relate to them. Then we could not be the protagonists of the cosmic drama. It is simply incoherent to deny all of this. If you choose the path of incoherence, you are choosing not to fulfill your human potential. That is not a crime, but it would be wasteful if it were carried any further than sanctioned by the dramaturgy.

If messiahs are OK, why not a savior? And if we are going to be saved, why not by God? If you wish to be self-saved, that is your prerogative, but please don't make things more difficult for the rest of us, unless you really have the need to punish us. If you feel that need, then maybe your salvation needs attention.

[3/1]

In Buddha and Jesus there is a symmetry which remains unfathomed: surely the two great incarnations. Both touched the void in an unmistakable, unforgettable manner. Without either, the world would have been terribly impoverished. Buddha did have to come before Jesus. The sequence could not have been reversed.

From a trinitarian point of view, perhaps Buddha incarnates the dialectic, as well as M & Z. Instead of MDX, or MZX we could have MBX. Buddha has very much to incorporate, and don't we see that manifested in his likenesses? With Buddha there was a metaphysical deck clearing which may be fully appreciated only in the context of X2.

What is left for Jesus to incarnate? There is the teaming up of Y(1,2) & X(1,2) producing the space-time gap in Z. You see that I am sneaking Mohammed into Y2, just for reasons of symmetry. I have no desire to offend Islam by this abstract promotion. We need not neglect the Patriarchy and its crucial role in history. At this point, Buddha remains the disinterested bystander. I suspect, however, given the unmistakable elements of pantheism being resurrected in X2, B & X have a duet in store for us. No stepping on toes, please. There even is a dialectical truth in B that is worthy of the holy spirit, whose advents then fully bracket X1.

In the numerical trinity of $e^{i\pi}$, the dialectical iota adds a whole new dimension to the number line. Only thus do we bring closure to the A/O of history. It is B that holds Y & X, or A & O together. History may be seen in Y & X. The cosmos is seen in B, Y & X. Each of BYX are acosmic, but put them together and *voila*. Without B, Y and X would have been lost to scientific materialism, to technosis. With B, gnosis is restored. Y is the thesis, B is the antithesis and X is the synthesis, as realized in X2.

Virtually every culture started out with a creation story, many of which invoked a recognizable Creator deity. Only the prophetic tradition still retains such an account, but even it has been heavily influenced by scientific cosmology. The pantheist traditions have largely become acosmic, accepting now scientific results for whatever phenomenological value they may have. However, skepticism about creation stories took hold in pantheism well before the scientific era. My hunch is that polytheism is generally conducive to skepticism about the conflicting conduct of its deities. Siddhartha gave this skepticism full rein in his own teachings. It is mainly in monotheism that metaphysical skepticism was kept at bay, even, in many contexts, up to the present. It is interesting that the three main branches of monotheism remain adamant about the shared uniqueness of their historical origin. Zoroastrianism, although prophetic in nature, is not considered monotheistic.

[3/2]

Creationism, despite its early appearances, could only be sustained within the single prophetic legacy. Therein it remained dualistic, in keeping with that tradition.

Within the monotheistic tradition, Judaism has always maintained its tribal and covenantal flavor. It never aspired to evangelism. Islam was able to spread its influence mainly under the aegis of various patriarchal theocracies, and often with a militaristic assist.

Christianity has relied much more on the evangel than have its cousins. This was true certainly up until the time of Constantine. The Inquisition may fairly be seen to have been a tragic anomaly in an otherwise relatively voluntaristic movement. In modern times, it has proven itself much more adaptable to secular, democratic modernism. In fact, it may well have provided the unique social platform for the origination of modern liberalism, and for the launching of the scientific enterprise. It has also shown itself to be somewhat less susceptible to fundamentalist excesses. If any single factor can be held responsible for these characteristics, it would clearly be the incarnational core of its beliefs, as opposed to a primarily scriptural basis for the other two branches.

Meanwhile, pantheism has shown itself to be socially ineffectual. I am sure that many of its adherents would see that as a positive characteristic. But these same folk are also likely to be (ineffectually?) skeptical of 'progress'. There are ample reasons to be skeptical of progress, particularly of its materialistic, anti-spiritual excesses. However, if it turns out that what we have called 'progress' may be seen to have been an integral part of a larger narrative of history, then there will have to be a major reassessment on everyone's part. It is precisely at those who take upon themselves the task of reassessing 'progress' and modernity that these pages are aimed.

From the perspective of postmodernism, most would say that modernism was an historical fluke. The transhumanists and futurists would say that the temporary human participation in the inevitable cosmic triumph of technosis was a biological fluke on one planet. The pantheists will aver that we have been here and done this, many times before, and will again. The orthodox monotheists already see modernism as the last hurrah of the devil prior to Judgment Day.

A few of us will look deeper for reasons. That we even dare to look, could only be by the grace of Sophia. Only one of us will need to get a convincing handle on the truth of our circumstance. The rest will be history, or, may we more accurately say, the end thereof.

I continue to be impressed with *The Passion*. I did not expect to be. Its message is certainly visceral. The

substance of the movie is to be found in the expressions of the Marys. It has only begun to register, the extent to which they were playing the role of the midwife, especially in the mopping up. Was this the clear artistic intent? The entire significance collapses into this one vignette. How achingly certain that we are witnessing a rebirth. A thousand sermons could never have conjured that one scene in my mind. Is this the catholic truth that the protestants failed to retain? From that painful birth, it has taken the church two millennia to reach the threshold of maturity. Materialism has beaten our spirit as did the centurions beat the body. How much we have wanted to climb down from that cross, but we have waited patiently 'til the appointed hour. We have experienced the full measure of forsakenness. Could anything less have sustained us? How do others survive? It is beyond me.

Angelic Doctor

You might have noticed that on these pages I have assiduously avoided Dr. Thom (see, however, [here](#) and [here](#)). [Rumor](#) has it that he is a panentheist. My avoidance has come to an end.

I was searching Google for the philosophy of being, and up comes St. [Thomas Aquinas](#). I lay my burden before the good Doctor. If atoms are not the be-all and end-all of existence, then one must formulate a philosophy of being. It seems that the good Doctor has maintained his lock on Being ever since 1257. His only competition may have been Jean Paul Sartre, but I think Jean Paul was more into non-being. Would one not sell one's soul to have an honorary doctorate in angelology from Harvard?

If something other than atoms exists, what could it possibly be? Don't think I haven't beat my head on this wall. Perhaps I thought I could outsmart the Doctor. I figured he must be a dualist, so imagine my chagrin as once again my professional ignorance is paraded in public.

The pantheists seem generally to agree with Jean-Paul: atoms may not exist and neither does much of anything else. Thomas is adamant that whatever exists besides God, exists through his willing of it. Thomas is not a Matrician. Thomas gets away with his idealism by being an absolutist about God. I am rather more of a relativist or relationalist. In practice, there may not be too great a gap between our positions. For Thom, everything exists in God. For me, everything exists in the Matrix. It is the love of Christ that coordinates existence beyond the level of M & Z. Existence is in the Matrix, coherence is in Christ.

I struggle with being. 'Process' is not a satisfying answer. It is a non-answer. Recall our little [discussion](#) concerning panentheism and the Telos. Clearly, Thom is no Whiteheadian concerning the Telos or lack thereof. So 'panentheism' is setting the bar rather too low for Thom: he certainly is a transcendentalist as well as an eschatologist. But, still, even Spinoza might not feel uncomfortable in a Thomistic, God saturated cosmos. I'm wondering how great is the difference between Hegel and Aquinas. Nor do I know who on the subcontinent came closest to Hegel. I'm guessing no real competition for Georg from back East, although that was the source for some of his inspiration.

[3/5]

I came across chapter [1.54](#) in Thomas' [Of God and His Creatures](#) (c. 1260): 'That the Divine Essence, being One, is the proper Likeness and Type of all things Intelligible.' This title struck my fancy: certainly a delight to monists' ears; if, hopefully, I interpret it correctly, and Thom and I are on the same wavelength. As an idea emerges through the process of compositional(?) thought, it must wind up as something simple to be intelligible, i.e. coherent. In that sense, a coherent idea, like a color or odor, does not have proper parts. Even Beethoven's Fifth does not have proper parts. Its four movements may be separately understood and appreciated, but there is also the being of the Symphony. It can in no way be just an aggregation. The parts must function together organically. If you heard the different movements separately, unknowingly over a period of months, you would not have heard the Symphony.

What then is the being of the Fifth Symphony? Is there only one being that can ever be played, heard or understood? Suppose something were added or omitted. Some have claimed that, besides atoms, only living organisms may be said to exist unitarily. What then of the mind or self?

Consider a person. Persons are usually supposed to be the prime candidates for the status of 'being', if such there be. There is no doubt that persons change. Often personal identification is vouchsafed by the posit of an individually created, immaterial, indestructible soul. This is pure Platonism. Thomas and I are

more monistic. In Thomas' case, he was more inclined to the Aristotelian polarity of form and substance, with whatever was the pre-scientific meaning of substance. This was less idealistic than Plato, but only by degree.

For me, being may only be understood in the context of [M, D, X & Z](#). For Thomas, the only context was his absolute God by whom all polarities are subsumed. I am more inclined to the bootstrap, as mediated by the relational dialectic, D.

We are social animals. We exist in the context of the Metanarrative. B5th is a *bona fide* part of the narrative. Neither we nor it exist or may be understood outside of that context. We and it are necessary components of the BPW. Beethoven may not be known independent of his symphony. As a child, Ludwig was still a potential being. So are you and I. The Metanarrative short of the resurrection is also a potential being. Creator and creature are also not independent. Thomas might disagree. I would say that God, or rather Christ (X), is fully absorbed in Creation. We exist only because all creatures are co-creators. Everything exists *sub specie aeternitas*. That we can have even the smallest of thoughts is due to our participation in the cosmic hologram. Participation is a Whiteheadian Process, but it is a process with a Telos. Plato did not understand process. Neither do physicists when they think of an isolated atom.

Rather than Forms, there are Norms. Our deviation from the norm constitutes our individual identity. Jesus is just the supreme deviant relative to the Matrix and most everything else. Jesus pushed the envelope of the dialectic. We strive to hear the deviation of the Fifth from the symphonic norm. The Fifth may also substantiate that norm by no small measure. Before the Fifth, our symphonic comprehension was correspondingly impoverished. Each being is a piece of the puzzle toward whose comprehension we strive. For Plato there was the Good, a kind of telos; but I think it was understood passively.

[3/6]

I have been remiss in not previously engaging with the good Doctor, but it is never too late. I will now be in a position to make a detailed comparison between my cosmology and that of the pre-modern philosophers. Of the modern philosophers, only Hegel and possibly Whitehead presently seem relevant.

Thomas can be my stalking horse from the past. His historical fortune should shed some light on the present situation. Thomas' posthumous career was nothing short of meteoric; and, considering the primitive state of communication and publishing, it would almost have to be considered miraculous. He was canonized in 1323, only fifty years after his death. His philosophy became canonical forthwith. Beginning in the next century with the Renaissance, however, there gradually developed a distinction between theology and natural philosophy, with Thomas stuck in the middle. The split was not formalized until the Seventeenth century by Descartes' dualism of mind and matter. From that point forward it has just been the case of religion v. science: the tale of two dogmas. The fortunes of theology and philosophy have been in decline ever since. It is sad to think that 1323 was the high-water mark of philosophy. Seven centuries of decline presents to me both a challenge and an opportunity. The deck has certainly been cleared.

There was a Thomist revival in the latter part of the Nineteenth century, probably in conjunction with the brief ascendancy of idealism following Hegel. But the much more steady ascendancy of scientific materialism could not be turned back. Since the turn of the last century, it is just the acosmic philosophies of existentialism, phenomenology and the 'process philosophy' of Whitehead that have had any impact on what little remains of theology.

The struggle for premodern dominance in philosophy was mainly between Plato and Aristotle. This division was reflected in the contrast between Thomas and the Church Fathers, notably Augustine, who

followed Plato. Aristotle may simply have been too subtle for them. It was the Spanish-Islamic philosopher, Averroes, whose Twelfth century commentaries reintroduced Aristotle to the West, thereby stimulating Thomas Aquinas and ultimately the European Renaissance. Averroes was virtually the last flower of the earlier Islamic revival of classical learning. The dark age of Islam has reigned since, or at least until the advent of the Internet. Islam may not be able to survive its liberation from eight centuries of fundamentalism. At the least, though, its collapse would produce a spiritual vacuum of unprecedented proportions. This might present an opportunity for the BPW hypothesis, an opportunity unavailable elsewhere.

My best guess at this point is that it was Thomas' lingering dalliance with a Platonic dualism between Creator and Creation that anticipated Cartesian dualism and the ultimate eclipse of Thomism. It is hard to see how Thomas could have embraced monism and not been disbarred from the *ecclesia*. Pantheists were being used as tinder in those days and right into the Renaissance. It may be those smoldering ashes which continue to dampen monist enthusiasm in the West. A teleological panentheism is what now awaits us. Its summit rises only dimly out of the mists of history. Perhaps in bio/semiotics we see the hint of a revival of a purer, monistic version of Aristotle. Plotinus' (AD 205-270) neo-Platonism may be another horse to watch, if this race is ever to be restarted.

In his 28th year--he seems to have been rather a late developer--Plotinus felt an impulse to study philosophy and thus went to Alexandria. He attended the lectures of the most eminent professors in Alexandria at the time, which reduced him to a state of complete depression. In the end, a friend who understood what he wanted took him to hear the self-taught philosopher Ammonius "Saccas." When he had heard Ammonius speak, Plotinus said, "This is the man I was looking for," and stayed with him for 11 years.

Ammonius is the most mysterious figure in the history of ancient philosophy. He was, it seems, a lapsed Christian (yet even this is not quite certain), and the one or two extant remarks about his thought suggest a fairly commonplace sort of traditional Platonism. A man who could attract such devotion from Plotinus and who may also have been the philosophical master of the great Christian theologian Origen, must have had something more to offer his pupils, but what it was is not known. That Plotinus stayed with him for 11 years is in no way surprising. One did not enter an ancient philosophical school to take courses and obtain a degree, but rather to join in what might well be a lifelong cooperative following of the way to truth, goodness, and the ultimate liberation of the spirit. (Britannica 2001)

Interesting.

[...] That a Greek philosopher, especially at this period, should be interested in Oriental thought is not extraordinary. Plotinus' own thought shows some striking similarities to Indian religious philosophy, but he never actually made contact with Eastern sages because of the failure of the expedition. Though direct or indirect contact with Indians educated in their own religious-philosophical traditions may not have been impossible in 3rd-century Alexandria, the resemblances of the philosophy of Plotinus to Indian thought were more likely a natural development of the Greek tradition that he inherited.

[...] Some members of his circle of friends were **Gnostics** (heretical Christian dualists who emphasized esoteric salvatory knowledge), and they provoked him not only to write a vigorous attack on their beliefs but to organize a polemic campaign against them through the activities of Porphyry and Amelius. Plotinus' reasons for detesting Gnosticism also would have applied, to some extent, to orthodox Christianity--though there is no evidence that he knew anything about it or that he had any contact with the church in Rome. Gnosticism appeared to him to be a barbarous, melodramatic, irrational, immoral, un-Greek, and insanely arrogant superstition. Plotinus' own religion, which he practiced and taught with calm intensity, was the quest for mystical union with the Good through the exercise of pure intelligence.

Well, excuse us, but it does seem that fortune has lately been smiling more on the Gnostics than on Plotinus. I'm not clear about the dualism attributed to them, but imagine that it must be similar to Plato's. Reportedly, though, it was a value laden version of Cartesian dualism: spirit - good, matter - bad. Perhaps I have been a bit liberal in my use of the term 'gnosticism'. I am more concerned with gnosis than with gnosticism, *per se*. However, if we recast the gnostic 'evil' world as that posited by materialism, then the dualism can still be instructional.

Let me just note here that Plotinus' redactor, Porphyry (AD 234-305), also wrote an influential commentary on Aristotle.

According to the Britannica, neo-Platonists posit a quasi-spontaneous emanation from the One. Their One is not my Matrix, although they may be usefully compared and contrasted. The sensory, and possibly atomic, world is the final emanation, and it may be seen as a positive reflection of the One. The body, viewed in more negative terms, is a drag on the soul. Through moral and intellectual effort the soul may reascend to the contemplation of the One. Its original descent into a body may have been necessary, or simply a fall. The material world is eternal, and possibly infinite. There is only an individual eschatology.

What saves the BPW from the excesses of neo-Platonic hierarchialism, is its insistence on relationalism for all its elements. There is not a chain of being. There is a network of being. This relationalism is very amenable to the strongly social aspect of the entire prophetic tradition. The words of the prophet almost always concern social action or lack thereof. Is this just a residue of tribalism, or is it a reflection of the unfolding of the Metanarrative? It is ultimately the dia-logos that is stressed.

Neo-Platonists hold to a cosmology that is only somewhat more positive than that of pantheism generally. Aquinas, however, stumbles on the dualism of both Plato and the Prophets. He failed to fully grasp that the medium was the message in the X-event. The Incarnation of God is the most radical act of monism that could be perpetrated. That this message must await the X2-event for its full explication is the hypothesis being explored here.

[6/7]

With a little help from the angelic doctor, I think we have a pretty good handle on the metaphysical triumvirate of theism, pantheism and materialism. All of our intellectual and spiritual history is the story of how we have mixed and matched these three primary colors into every combination except the right one. Saint Thomas Aquinas came about as close as anyone to getting the right combination. He was just about a dollar short and eight hundred years too early.

Thomas had a lot of help from Plato, Plotinus and Aristotle. Plotinus created the optimal blend of Platonism and pantheism, with his Chain of Being. Thomas came close to panentheism, but could not quite close the gap between Creator and Creation. He had everything else just about right. So near, yet so far. His should be an easy act to follow.

There was a very big historical and intellectual disconnect between theism and pantheism. There was a blind spot here, that I would have to say was deliberate. This no-man's-land was God's own little preserve, set aside for the appropriate time. If the appropriate time is not now, then I'll just have to eat my hat.

The Incarnation should have given away the whole show, but it was such a big deal that it has taken us fully two millennia to digest it, so to speak. How many of those crackers do we have to eat before we get the picture? Plato must still be spinning in his grave at the very thought that billions of people every week are eating his Good. This was not how he had envisioned it. Plato was four hundred years too early. What was Thomas' excuse? Some of the neo-Platonist gnostics must have gotten the picture about monism, but then they either got burned or they forgot the resurrection or both. Yes, that was the problem with monism back then. They got too impatient to wait for the resurrection. They wanted to have their cracker and eat it too.

Can we be more patient now? I truly believe so. This time we will be just a bit wiser. We have had a two thousand year education, we ought to be a little bit smarter. And, lest we forget, we also have the

Internet. It was almost worth the wait. We have eaten our spinach and now it's time to get on with the show. It's time for us to put away our toys and take up the Kingdom. This is not intended to be a new burden. It is simply a matriculation.

Yes, even the polytheists were right about a lot of things, but they missed the idea of Creation. How could they? It has proven all too easy to take the world for granted. It has taken us three centuries of science to begin to appreciate the mystery of matter. Everybody except some of the Incarnationists saw matter as something dirty, if not downright evil. They just didn't take the time to look closely enough.

There were exceptions. Nay, evidently there was ever only one exception the filth theory of matter. It was the Greek exception. Gosh, is that true? We had better check. Were there no oriental elements? No Chinese atoms? [Wu Xing](#):

Most traditional cosmologies speak of four or five fundamental Elements. [...]

Whereas Western thought developed the idea of elements as substances, and Indian thought as emanations, Chinese philosophy conceived of the five elements, or Wu Xing, as dynamic states of change.

It was Plato, allegedly, who took the critical [next step](#). He associated each of the five elements with one of the regular polyhedra. This, however, was done in the spirit of Pythagoras who had lived nearly a hundred years before Plato. This hypothesis of perfectly formed atoms was also in line with the Aristotelian view of the immanence of the the forms, and, ironically, quite contrary to Plato's own dualist view in which the forms did not inhabit the phenomenal realm. Atomism was not a view that ever gained currency in pre-modern China. Atomistic speculation arose in India at about the same time as in Greece, but there were no other renditions of Plato or Pythagoras.

Scientific gnosis, if it came from anywhere, came from a melding of the Greek and prophetic traditions. With his hypothesis of the immanence of the forms in this world, it was almost as if Aristotle, possibly following Pythagoras, anticipated the Incarnation. If we could eat the mathematical forms, why should we not also eat the incarnation of the Platonic Good? The Athens-Jerusalem axis became the fulcrum of the future. It was a double singularity in world history.

Greek style cosmological speculation could never gain currency in the pantheist East. Yes, there were elaborate, even numerically based cosmologies arising in India; but there simply did not exist the Good. The most basic premise of the BPW was never formed or even framed under pantheism or polytheism. The Good could be nothing other than the universal Telos. The notion of universals and archetypes could not arise under pantheism. All was illusion.

It would seem, however, that I am threatening to take some dangerous steps back toward pantheism. This reversal makes sense, and is practicable, only in a postmodern context. I am simply going to put the logical finishing touches on Thomism. I intend only to render the good Doctor coherent. We can have immanence and transcendence without resorting to dualism. Is this not the best of all worlds? As we finally come under the aegis of the Telos, it will be management by objective, rather than management by prophetic directive. The dia-Logos will be fully realized.

The Telos is seen now not as an abstraction but as the Hierogamos. The ideal of **romantic**, chivalric love, as first embraced by the Cathari Troubadours, can hardly be, nor truly has been conceived in any lesser context. The Incarnation was unquestionably a package deal, the dimensions of which we have only begun to comprehend.

Back to those Platonic/Pythagorean atoms. No, not the formless abstractions of Democritus or Kanaada, but rather the specific geometrical solids proposed by Plato. But now I notice that the Britannica gives a more generous interpretation to Democritian atomism, while nowhere mentioning geometrical atoms.

Democritus had declared quantitative differences to be intelligible, because they were subject to mathematical reasoning. Precisely this relationship between quantitative differences and mathematics made it impossible for Descartes (17th century) to think along the atomistic lines of Democritus. If the only thing that is clearly understandable in matter is mathematical proportions, then matter and spatial extension are the same--a conclusion that Descartes did not hesitate to draw. Consequently, he rejected not only the idea of indivisible atoms but also that of the void. In his eyes the concept "void" is a contradiction in terms. Where there is space, there is by definition extension and, therefore, matter. (Britannica)

I'm amazed that the Britannica fails to mention Plato's '[Theory of Everything](#)' as expounded in his *Timaeus*. Admittedly this falls outside the context of his usual dualism, but perhaps it manifests a later reconciliation with a Pythagorean style of teleological panentheism. Only much later would this development be codified into neo-Platonism. History might have been profoundly altered if this monistic side of Plato had been his dominant legacy.

What was still missing back then was the idea of progress. The irony is that when the idea of progress first became accepted it was seen mainly as an antidote to gnostic and millenarian enthusiasm. As the idea of progress devolved into amillennialism and was then confounded with Darwinism, it became the handmaiden of materialism; and, now without a Telos, it has simply become incoherent. Only with X2 may we recover the Telos. And only in a postmodern context can the notion of a participatory progress be compounded with a transcendental Telos, finally bringing the Telos within our grasp, if not yet within our comprehension. First, we now are given to comprehend the Incarnation. We could not have believed any earlier that the proffered salvation was intended to be participatory.

The choreography of the Metanarrative has not been easy. Our spiritual and intellectual guidance has, until now, been placed on separate tracks. The joining of these tracks in the context of X2 constitutes our dramatic inauguration of the Millennium. Only now are the separate revelations of Athens and Jerusalem fully joined. Only now can intellect and spirit finally be aligned. The coming together of these elements might well be compared with the mixing of the elements of a binary explosive. Only the Internet is designed to handle such a charge. The 'irrational exuberance' of the Internet 'bubble' will now be rationalized and realized. Forget 'new economy', we are now talking 'new world'. Y2K becomes **Y2C**, i.e. **X2**. Is this the dreaded New World Order, complete with Antichrist? It may well be dreaded by those ensnared in the old dualistic paradigm. This 'experiment' in spiritual alchemy will seem apocalyptic to those who fail to rise to the occasion. The irony is that the Christian fundamentalists whose beliefs incorporate more of the BPW than anyone else's, may receive the greatest shock and offer the most resistance, simply because they are so close to ground zero.

I champion the view that history is no accident in either a cosmological or local sense. There is a real history of ideas. Ideas matter. One idea leads to another in some rational sequence that remains largely enigmatic, but is ultimately teleological. Within this teleological frame, science and religion have interacted on many levels. Their superficial antagonism belies a much deeper symbiosis.

Fundamentalists can view science only with the darkest suspicion, if not in a outright conspiratorial light. Liberal theologians hew to the dictum that good fences make good neighbors. They leave the history of science to their secular colleagues who do not always return the favor. We are left with anecdotal accounts of the connections, of which this is just one.

We are left to compare and contrast the two poles of revelation: Athens and Jerusalem. The singularity of the later may be more readily rationalized than the former. One can almost sense the choreographic

challenge being presented along this particular geographic and spiritual axis. It is also a fault line into which many good intentions have disappeared. I cannot fail to cast in my own lot.

Although thoroughly pantheist in nature, Greece did not follow the pantheism of the rest of the world. The term 'rational' is applied to ancient Greece as to no other culture. I try to pin this down. Plato stands out, of course, but there had to be many supporting actors. What is the source here? Delphi is practically synonymous with 'oracle', but what could those besotted priestesses have to do with reason? Nonetheless, no oracular site compares. Could the juxtaposition of Athens, Delphi and Jerusalem have been random? Were Apollo and Yahweh conspiring? Nowhere else in the world did the gnostic bug bite so effectively.

The Greeks had a unique grasp of the universals. Their tenacity distinguished them from all other pantheists. They had the Logos in everything but the flesh. Others might well point to Egypt with their hieroglyphs as the ultimate source of the Logos. Perhaps it was the Socratic dia-Logos which finally sets the Greeks apart. It was just the dia-Logos which gave the Greek logos its legs and its almost universal legacy. Was Delphi not the global center for divine interrogation?

And then there was the Good. My goodness? No, my Best, Plato's [Good](#). This is the ultimate gnosis. It is only the Good which we dare to throw in the face of God. Do You measure up? We've got Your number. We interrogate You, then we measure You. On a stake? How better? ==>>> Delphi, Athens, Jerusalem. [6/18 - An 800 mile geodesic arc plotted from the Delphic Oracle to the Temple Mount falls 1.6 miles south of the Parthenon.]

Do we get the picture? Pantheism has its flavors: active and passive. Passivity now rules that roost. Evidently the Greeks caught the gnostic bug. By now the virus has spread though the world, despite all pantheism and despite all orthodoxy. We pose a question, we expect an answer. The Greeks posed many questions. Their answer finally arrived, just about eight hundred miles away, across the sea. Later the Good Doctor put two and two together and came up with three. We'll strive for four, at least.

[3/9]

Speaking of Athens and Jerusalem, two questions come to mind. What is Truth? What is Good? We can, of course, answer these questions by providing particular examples, but does this suffice? Hardly. Lately I have been at pains to distinguish theism from pantheism, but the Greeks seem to fall into that divide. Or, perhaps they attempt to bridge it with their Logos. If Plato could, dialectically, achieve a gnosis of the Good, then what need would he have of the God hypothesis? I am in a similar situation wrt the BPW hypothesis. God can hardly fail to serve the Logos. God cannot fail to create the best possible world. In fact, we are here to do most of that for her, using our Logos gnosis. So much for Athens. So much for the Good.

What is Truth? Pontius did not get an answer, but we know what it is. 'I am the way, the truth and the light.' Hold the phone. We've just crossed wires with Athens on the other line. This does not compute. This is where the Good Doctor adds two and two and comes up a dollar short. Plato could never have said or even imagined such a thing. Who does this guy think he is? Clearly we have come to a fork in the road. Now, two millennia after the fact, it may be time to recompute. Better place a call to Delphi.

I think the problem has to do with the dia-Logos. Did Hegel have the answer? He must have come pretty darn close. But right off the top, how can we get off with objectifying the Good, if that's what Plato was trying to do? For one thing, we come back to the problem of universals, which has bedeviled philosophy from the start.

The problem has a lot to do with Creation. The Greeks, in keeping with pantheism, were not creationists. The world was eternal, whether cyclically so or not. Plato's Good was quite apart from the world. It was never intended to incarnate. It would ever only be occasionally and ineffably glimpsed by the

philosopher.

Then Thomas was confronted with an alleged incarnation. Using Plato and Aristotle he took its measure and came to virtually the same conclusion. The Good and God are ineffable. We were left with the Logos suspended in mid air. Yes, there was a Creation, but it too was suspended in air: it was *ex nihilo*.

Next it was Hegel's turn. He employed his own dialectic.

I'm going to have to be even more cursory than my usual. I'll be out of town for for ten days starting Thursday.

Hegel: so near yet so far. He became obsessive with his dialectic. There was a madness in his method. It became his own *reductio*. Besides, he was 200 years too early. With all his metaphysical expertise, it seems that he totally failed to grasp the significance of the X-event. Poor guy, Georg, without McLuhan how could he know that the medium was the message. I don't think he even understood the Resurrection. For Georg, the X-event was simply Ethics 101. That Jesus got crucified was just a spot of bad luck.

It becomes all too clear that Georg was a pantheist. Instead of the Christos, we are given the Dialectic. I have spoken of the triad of M, D and X, but D exists only in service to X and Creation. It is a means to an end, hardly an end in itself.

Speaking of ends, I have not seen an eschaton yet. Heck, I'm not even sure he has a creation. Except for the fact that his cosmos is anthropocentric, we don't see a cosmology. He is concerned only with the anthropology.

With the above considerations, should anyone have been surprised when Hegel's system was hijacked by the dialectical materialists? Was it not inevitable? That it also may have influenced the National Socialists is a whole other matter.

It just seems that Georg managed to mechanize the Spirit. In that sense his cosmos is deterministic in the manner of the Karma Machine we see in the East. For me, the Telos is the anti-mechanism. It is ultimately a spirit attractor. It is the big charism in the sky. Inevitability, yes. Determinism, no. And did God have a choice in creating the BPW? Yes, and we're it.

My whole style here could almost be characterized as anti-Hegelian. There need be nothing ponderous about the Rapture. The Spirit will never be routinized. There is nothing routine about the BPW. It is pure singularity.

[3/10]

The basic issue between theism and pantheism concerns the nature and provenance of the self. I am on the theistic side of the issue, but leaning toward pantheism with my invocation of the matrix and my radical relationalism.

X dialectically emerges from the Matrix. It is a proactive bootstrap process of which Creation is the prime component. In other words, X is not merely an emanation of M. X is latent in M, but must realize itself through the proactive process of Creation. The creatures more or less reflect X, with X being Creator and Anthropos. The individuality of the human souls is vouchsafed by their participation in the Metanarrative. The Metanarrative is co-authored. The process is also somewhat like a symphony with X as the conductor and principle composer. The individual souls are fully amalgamated into the Christos/Telos at the end of history. This is the Hierogamos. This is a far cry from pantheism and Hegelianism.

Where Hegel primarily departs from pantheism is in his progressive view of history. But this is mainly an anthropology and not totally a cosmology. The eschaton is muted. There is no Creator, and certainly not a personal deity. His absolute One is comparable to Brahman and the Matrix. Cosmic intelligence resides entirely in the collective intelligence of humanity. The role of teleology here is minimized. The dialectic of history may be seen as more of an efficient than final cause. There is virtually no sense of dramaturgy or even aesthetics of history itself. Both of these are stressed in the Metanarrative.

In pantheism the individuality of the souls is stressed. This is particularly true in the doctrine of karma and reincarnation. In orthodox theism, the locus of individuality is in the personal eschatology of heaven versus hell. As a universalist, I am not restricted in that regard. The goal of the pantheist is ultimately to be reabsorbed into the impersonal Brahman. In theism it is more like an 'amalgamation', a term that I using here for the first time. Of course, Brahman is frequently personified in the form of Vishnu, Shiva, etc., but that is strictly optional, as in the way I could refer to the Matrix, somewhat generically, as 'mother'.

The question of the soul arises mainly, if not entirely, for Humans. It has to do with personal identity, which is necessarily correlated with the possession of a personal long-term eidetic memory. It is the latter which distinguishes us from the rest of the creatures. Other creatures have mainly skill type memories that could be 'explained' organically, but not so eidetic memory. The easiest way to shoot down the whole BPW hypothesis would be to produce a material explanation for eidetic memory. Why am I not holding my breath?

The most pressing concern for many folks will be the canine soul. 'Will Rover greet me in heaven?' Yes, Virginia. However, the caveat is that the individuality of particular canine souls is strictly dependent on their particular relation with a particular person. It is a 'parasitic' existence. But by the same token, is not our existence parasitic upon the Christos? It's not what you know, it's who you know. The Christos is ultimately unavoidable. So let us not cast aspersions on our furry friends, but do take note that the issue of the feline soul is hardly ever so pressing. I'm only slightly biased here.

For a minute there I thought that Hegel might give the BPW a run for its money, but that is not to be, evidently. It is the Good Doctor who has come closest to this precinct. Thomism, however, was unable to sufficiently extricate itself from the ecclesiastical orthodoxy of dualism. It was never given the freedom to flirt with pantheism. Yes, it is a dangerous liaison, but ultimately it only requires the courage of one's convictions. Of course, not having the Inquisitor or the Monsignor at one's doorstep does wonders for one's courage. I only ever had that acronymous agency to play with.

Modern flirtation with pantheism occurs exclusively under the aegis of the scientific cosmos. Extricating ourselves from that orthodoxy is evidently more difficult than from its ecclesiastical cousin. This is not a measure of the relative degree of enforcement, but more a measure of the magnitude of the gestalt switch from materialism to immaterialism. Such is the price of coherence. Pantheism is oh so tolerant of incoherence. Is it not the Big Easy? Then we had better enjoy this *Mardi Gras* that some call postmodernism.

Although pantheism is usually regarded as a metaphysics of immanence, the monism that it offers is, certainly in practice, strictly transcendental. The monism of the BPW, by contrast, is immanent in the coherence and comprehensibility of the world. This is part of everyone's daily experience. That the coherence is not always obvious to us, however, does not argue for its absence. Coherence is to be finally and fully realized in a total eschatological Presence. Nothing is left out of the eschaton. There is no remainder. This is just an aspect of universal redemption. Every bit of coherence is a portent of our resurrection.

Solving the World's Problems

That the world has problems is hardly disputable, but that is just about as far as the consensus goes.

That the world has problems and that they might be solvable is a relatively modern idea, but it does predate modernism, *per se*. Historically, the twin notions of a human predicament and of human transgression are among our earliest attempts to grapple with our pervasive sense of dysfunction. Is this not the well-spring of the religious impulse: there is something about existence which ought to be overcome. Perhaps, more basically, this is simply the result of our seemingly unlimited propensity to distinguish 'is' from 'ought'.

Virtually all mythologies point to a primordial state of equilibrium or grace. Then there is some sort of transgression, human, divine or natural, that has inevitably led to the present state of depravity and suffering. The natural solution to such a pervasive problem is just for the world to come to an end, at which point it might or might not be renewed or recycled in some fashion.

This pretty much describes our pre-modern understanding. With modernism came the notion of progress. This was quite contrary to the idea of a primordial state of grace. The more liberally inclined theists were, however, willing to envision material and political progress in the context of a progressive spiritual history of divine revelation. Hegel epitomizes this worldview. The eschatology, herein, is only obscurely implied.

Then along came Darwin and evolution. We struggle to make any cosmological sense of it. The scientific consensus is that there is no sense to be made of it: WYSIWYG. There is nothing normal about evolution. The past has no particular bearing on the future of evolution. Evolution here has no particular bearing on evolution anywhere else in the universe. The rest of us can only wonder. In general, the notion of progress has suffered in our post-Darwinian world. Postmodernism is just the measure of the failure of the idea of progress. What little remains of the secular idea of progress has been taken over by the transhumanists. Without progress, humanism is left without a rudder. This is the meaning of the 'end of history'. Without a clear and consensual vision, humanists are left in the mode of problem solving, usually of the most piecemeal sort, and which is often accompanied by the fervent hope that things won't get too much worse, too quickly. Yes, postmodernism is underscored by a pervasive secular/sectarian apocalypticism. Utopianism is the orphan of modernism. Thus, today, outside of transhumanist circles, the phrase that is the title of this page may only be uttered with the utmost irony. Can we hope to see beyond the irony? In a word, yes. Short of an apocalypse, postmodernism ought to be an easy act to follow.

From a purely secular perspective, religion is very widely perceived to be high on the list of world problems. There are many polarizing issues in the world, but surely religion ought to be counted as among the most divisive and gratuitous of these. Religious passions are often seen to divide region, nation and family. Secular and sectarian interests are often at variance. My own introduction to the practical significance of religious beliefs came with my concerns relative to the detrimental consequences of population growth. It was clear that religion played a crucial role in decisions effecting fertility.

What secularists persistently fail to see is the other side of this coin. Can our human potential be realized without evoking those passions which seem so amenable to religious arousal? If the world's problems are simply amenable to solution by market forces, then perhaps the only human emotion required will be that of material greed. That unbridled greed could be the answer to our problems seems oxymoronic. Reducing humanity to its lowest common denominator might be preferable to constant religious strife, but even that trade-off seems highly questionable.

What seems perfectly clear is that materialism fails to engage the human psyche in anything but the most

superficial manner. Scientific materialism has attempted to reduce every problem to technologically manageable proportions. Specialists in every field of expertise stand ready to tackle each specifiable portion of our predicament. Every special interest marshals its own experts. That the resulting mishmash of conflicting interests is totally lacking in coherence is the problem of no one. The result can hardly fail to exacerbate the underlying condition of alienation or anomie, which most observers would place high on the list of human problems.

If then, in our search for answers to the human predicament, we were finally forced to confront the spiritual dimension of it, how might we possibly proceed? It would seem that the historical solution to the religious problem has already been well established. It is just pantheism. Is not pantheism the religion that could have been designed by a committee of relatively disinterested observers? It is certainly the most tolerant and most inclusive of all the traditions. Has not pantheism already made remarkable inroads amongst those secularists who have become disillusioned with modernism and scientific materialism?

My concern with pantheism is that it seems too much to be a watered-down theism. By definition it has no solid core. Most of its adherents have historically continued to embrace a devotional practice that takes the form of a limited theism. Only the most austere of its intellectuals ever seem able to 'embrace' the impersonal Brahman. Furthermore, the popularity of pantheism among our moderns seems to rest just on its refusal to place demands on their lives. Pantheism is the solace of the private individual. Its social dimension appears deliberately muted.

Indeed, pantheism may well suffice in its newfound role as the spiritual complement to scientific materialism. But that seems to be the extent of it. It provides no greater vision or coherence. In as much as our problems manifest a crucial social dimension, pantheism brings only the most limited resources to the table. Pantheism has never been known for the reshaping of communities. That has never been its function. Pantheism seems deliberately designed not to engage the human spirit. In contrast with the crusading excesses of monotheism, that may be a positive feature.

Playing with spiritual fire is bound to entail risks. Are these risks that we can afford not to take? Perhaps yes, perhaps no. Let me just say that if we are indeed creatures, then by continuing to ignore that fact we cannot possibly expect to address our creaturely predicament. These pages on this site are intended just to explore our putative creaturely status and its possible entailments.

[3/24]

Long before science came on the scene, our creaturely status was left in doubt under the aegis of pantheism. This I find curious. It is difficult now to reconstruct the primordial myths of creation. We cannot ascertain the degree to which the pantheist downplaying of creation was a departure from the primordial base line.

I review Britannica's (2001) very concise summary of the basic creation themes. I notice that I have, wittingly or not, borrowed significant elements from each of the basic themes. In each of these elements I depart from the absolutist, *ex nihilo* view of the monotheist, prophetic tradition. But, in upholding the coherence of Creation, I yield nothing to any tradition or myth. I continue to be perplexed by the fundamental incoherence of traditional monotheism, and this incoherence is most emphatic in the dualism between the Creator and Creation. We need to get to the bottom of that dualism in order to meliorate it. The Incarnation event should have severely undermined that dualism. That it did not is the greatest of historical puzzles.

When it is stated that the supreme being created the world and that there was no primordial matter prior to his being, then the determination of the world is in the mind and will of the deity. This leads to distinctive conclusions regarding the destiny of the world and man. The end (and meaning) of the world is thus not determined by the primordial matter but by the deity who created the world. It is he alone

who determines the preservation, maintenance, and end of the world. (Britannica 2001)

This is the distinctive element of theism that I wholeheartedly endorse, with the caveat that our full participation in this scheme does nothing to detract from the value of the Creator. Also, please note that the Matrix, while primordial, is in no way material. Mind over matter is the core idea of the BPW hypothesis. The only way to ensure this outcome is to give free-rein to coherence. God is self-limiting only in respect to coherence. Incoherence is of no benefit either to Creator or Creation, as if they could ever be truly distinguished.

God emerges from the Matrix just in the act of Creation. To deny the Matrix is actually to deny the power and being of God. It is to deny the very possibility of the Incarnation. My point is that God is self-created out of the Matrix. To deny to God the power of self-creation is to deny almost everything. The Matrix is not that. Does God share the glory of the Matrix? Does God become a demi-urge relative to it? These are issues that do not need to be swept aside by anyone's fiat. The Matrix underwrites the possibility that makes possible the best possible world. Perhaps even God cannot fathom the end of that possibility.

[3/25]

If the X1-event could not persuade the monotheists of monism, what chance does X2 have? Obviously science will have to play a role. The Matrix is the logical ramification of the Quantum. Monism is the ramification of the Matrix as it is informed by neo-Platonism in the context of a Pythagorean inspired mathematical physics.

Was the Incarnation not, then, premature by two millennia? Did it not fall on deaf ears? No. The Gnostics did get the message. They paved the way for our gnostic detour through science. The Alchemists saw divinity in matter. The 'Al' in alchemy speaks even to the Islamic detour of this gnosis. I do not claim to understand the ins and outs of the complex historical transduction of gnosticism. The impetus it received from a Hellenically informed monotheism was, however, not to be duplicated. This was the singular, oracular axis of **Delphi** and Jerusalem. Monism was the perennial philosophy, which only now is set to show its colors. Monism and the Millennium are virtually synonymous. Monism is all about God's inevitable kingdom. With the final and teleological advent of the Internet, the cosmic coherence of monism is no longer to be denied. We have here the electrified Logos. It comes upon the world in a veritable flash.

The exclusionary dualism of the fundamentalists, in all of its unthinking obduracy, will be the greatest obstacle to our inevitable, teleological, universal gnosis. Surely it will be their Antichrist. It will also be their tar-baby, once they can no longer pretend to ignore it.

Such is the inevitable solution to the otherwise intractable problem of religion. The irresistible force of gnosis meets the immovable object of religion. The dramatic potential could not have been lost on our dramaturgical Metanarrator. If the problem of religion can be solved in a single stroke, can our other problems long remain problematic? Will they not also have to give up the ghost?

Fundamentalism, literalism and bibliolatry are the scourge of the prophetic tradition. The Incarnation is what saved Christianity from the worst excesses of fundamentalism that have, for too many centuries, stultified the mind and spirit of Islam. Christian fundamentalism is, in large measure, the inevitable reaction to an equally intransigent scientism.

The strict monotheists see Christianity as only christolatry. This is just their charge against us. Our excessively overworked trinitarian formulations do little to dispel this notion; nor, even, does the empty

CROSS.

On these pages, rather than its trinitarianism, I stress the monism of the Advent. Yes, the cross, empty or not, is the stumbling block of the trinitarians. It seems that their formulaics is meant only to put a distance between their absolute God and the messiness of the Christ event. The cross is a scandal, even or especially, for the trinitarians. One thing that we learn from the mythos is that Creation is just the self-sacrifice of God. Trinitarians see Jesus as the substitute for God. Substitutional atonement convicts us of christolatry.

Not the monotheists, not the pantheists, not the Platonists could ever comprehend the 'mystery' of the Advent. The meaning, however, is plainly stated in the mythos. Creation is necessarily and deliberately a sacrificial act which can only be atoned in the Telos of the resurrection. The resurrection is no gratuitous reward for good behavior. It is the heart of the cosmic logos. It is universal or it is nothing.

Christolatry is a confusion perpetrated mainly by Christians who, ironically, downplay the full measure of the Advent. No one fears monism to the extent of the monotheists. We can bear to take our truth only in portions. Are we finally prepared to bear the burden of Creation? Only now is there no logical choice. We are left with no way out.

What then of the pantheist/polytheist avatars? What of Krishna and Buddha, etc.? Thus are so many of us instructed in our divinity. Thus is monism comprehended. The only thing missing is the oracular Telos: the axis or omphalos of Delphi and Jerusalem. The avatars then are actors. They are not the Metanarrator. The truth was duly apportioned between East and West. The alchemical recombination is just the final, universal advent.

[3/27]

I started off today with the NY Times review '[Is Terrorists' Hatred of the West the West's Own Bastard Child](#)' of [Occidentalism: The West in the Eyes of Its Enemies](#). This then led me to:

- [save the world, or your soul](#),
- [The Enlightenment- The Rise of Modern Paganism](#),
- [Enemies of the Enlightenment- The French Counter-Enlightenment and the Making of Modernity](#),
- [Civilization and Its Enemies - The Next Stage of History](#).

Some useful ideas, these. Are we the 'bastards' of the Enlightenment? The Enlightenment was the deracination of the Western mind. It was rationalism without coherence; surely one of the deadliest toxins ever. It made the world safe for nihilism, fundamentalism, communism and fascism. Democracy is nothing without the 'Created Equal' presupposition of the Constitution. We were left with the bull-dozer of modernism, and now the cacophony of postmodernism. Remind me to contrast paganism and pantheism.

Here is a useful comparison: [paganism and pantheism](#). This leads to [Creation Spirituality](#) (1991) of [Matthew Fox](#). I have not given Matthew a hearing, yet. Yet, are we to revere Creation without understanding the Creator and our role as co-creators? The BPW is of scant value outside of the spirit that gave rise to it and with which it is imbued. It seems that pantheism cannot escape its compulsive depersonalization. Is pantheism a glorification of reductionism?

[3/28]

I think I'm still having a little problem with the intrinsic value of Creation. It is still possible to be

pessimistic about the world. Both theism and pantheism traditionally support the negative view. There is a human predicament which can only be overcome with either an individual or historical eschatology. Does this not deprive the world of intrinsic value? Would we not have been better off without Creation? Could we not just have basked in nirvana, and skipped all the pain in the world? Who would need samsara and salvation? Only when we are on the brink of self-annihilation do we seem to harbor doubts about the negativity of existence.

Now I could point out that without Creation, the world remains a figment of the imagination, but would that discretion not have been the better part of divine valor? What was the compulsion to go through this exercise? Why did Eve have to eat that apple? What did all her gnosis accomplish? Wasn't the real temptation just to have avoided the taste treat? We can see the culpa, but where is the felicity? Is the passion not masochism?

Does it not finally come down to the fact that without creation the cosmos would be radically incomplete? There is a higher aesthetic of the pleroma which overrides pain, regardless. To say that this is the best possible world is not to say that it must be intrinsically pleasurable. It is something that can best be appreciated in retrospect. Is it only fear of death that prevents suicide? There remains that vital impulse which is simply not to be denied. Since it cannot be denied, we can only hope to minimize its often deleterious consequences. The half empty cup, is still vastly superior to no cup at all. Why do the traditions fail to make this point? The point, I think is always implicit in theism, but not necessarily in pantheism. But then in pantheism, is there not also the pagan impulse of a deep ecology, a valorization of nature that is much too often absent in theism. Why can we not do Matthew's creation spirituality and embrace both the immanence and transcendence of life? We do this instinctively, but then we argue about which is better. We let ourselves into the logic trap of either/or. The world cannot possibly be big enough for both immanence and transcendence. Or can it be? Does our salvation just consist of relinquishing our obduracy? We cling to our agnosis just as we cling to life. In some sense they are synonymous. There is also an impulse to coherence that finally cannot be denied. Matriculation is not always easy. We have to give ourselves permission. The salutation of God is almost always simply: fear not.

The worst thing that we might say about this world is that it is a work in progress. Does that place too great a burden upon ourselves? Do we not measure up to the task? Can we not rise to the occasion? God's stick is pretty obvious. The carrot may be less so.

[3/29]

I still struggle with trying to explain the dualism that is endemic to the monotheist tradition. Several issues arise.

Science might not have been possible without the Cartesian dualism that seems to have followed from the earlier dualism. Is it the *ex nihilo* Creation that is responsible for the original dualism? Why then *ex nihilo*? Is it coincidental that the Big Bang hypothesis epitomizes this form of Creation.

Strict monotheism implies that God must exist *ex nihilo*. There can be no other being that is coeternal. Creation then must be an act of pure will, but is this fact not more compatible with a mentalistic rather than a materialistic world. It must exist as a mental construct, in line with the similar pantheist view.

The traditional gnostics and pantheists generally agreed that the material world in general and the body in particular is a trap or cage for the spirit. But both traditions also posit a pristine state of the world that runs down and/or is corrupted by human malfeasance. It is human evil or karma that is set apart from Brahmin or deity. Is matter then the corruptor or the corrupted? There seems to be ambiguity. Eve's partaking of the apple is the most concise statement of this conundrum. The Garden of Eden was a pantheist's paradise up to that point. God walked with us in the garden. The ouroboric serpent had to be put asunder. Procreation came into the picture. It is almost as if the original sin was just our own act of

self-identity. That was our false gnosis that we would spend the rest of creation trying to overcome. Objectification is the original sin, but how could that act be distinguished from the act of creation itself? Being created in the image of God, we would necessarily recapitulate that act. Analytical reductionism must play itself out to its logical nihilist conclusion, which somehow reflects the original *ex nihilo* act.

How did the pantheists manage to overcome this metaphysical dualism, while the theists did not? They did so only by neglecting creation and salvation. Atomism seems unavoidable. It must apply either to matter or to the soul. The anthropocentrism of theism may also be a factor missing from pantheism.

What I am struggling with here is the historical limitation of gnosis. Is the limitation internal or external? Either supposition is problematic. Another factor here may be the dismemberment myth of Creation as seen in the Egyptian myth of Osiris, for instance. This is part of the equation of creation and sacrifice, also seen in the Incarnation and in communion. There is a semiotic nexus here that resists analysis, but which is the source of the analytic imperative. It almost rises to the status of world knot. Pantheism glosses over this knot, while theism practically smothers it.

This knot may also refer back to the Freudian discontent of civilization that is acted out in the iconoclasm of the terrorist/nihilist. Jesus was the ultimate iconoclast. There is that irrational, anti-Hobbesian core of civilization which the rational theist must resolve. The resolution is necessarily eschatological. It has to do with the finitude of the BPW. One wonders that there is not a mathematical analogy. The Monster Group is perhaps an expression of it. Was Girard the anthropologist who dealt with this? Something about violence and the sacred....here is a [website](#), here is the [book](#), here an [exposition](#).

[3/30]

Many years ago I read **Rene Girard's** *Violence and the Sacred*. I note that its influence has hardly diminished. It seems to have maintained a nearly cultic status in academic circles. If anything, I am more disappointed now than I was then. There are, however, some useful points. Between Girard's mimetics and Dawkins' memetics, there is bound to be an interesting connection. Furthermore, Rene's thesis certainly adds to my thesis concerning theism vs. pantheism. However, as an 'explanation' of religion, could there be a more grotesque trivialization? It may well be this gothic twist that provides the cultic cachet.

With Rene & Co., does materialism not parody itself? *Chercher la corpse*. Where are the CSI boys and girls when we need them? Did Rene miss the whole point of the non-extant *corpus delicti*? What is the point?

My point is: as above, so below. This is a phrase that does not roll off the tongue of the materialist. It all goes back to [AZO/X/QRP](#), along with [M & D](#), and now with the [conspiracy](#) theory, I have one-upped Rene as the plot thickens.

It is strange how the pantheists even manage to ignore the pantheon or Z(odiac), that pillar of paganism. I like these expositions of [Chronos](#) or [Saturn](#). Zeus (Jupiter, Thor, Thursday) usurps Chronos (Saturn, Saturday). Perhaps I should stop here, but, heck, what is there to lose? What about [Friday](#)? Venus/Freya intervenes between Zeus and Chronos. Is it too great a stretch to assign X to Venus? X breaks the Zodiacal cycle by conspiring with and/or tricking his neighbors, Zeus and Chronos, and history is created over his dead body. They did not appreciate the trick, perhaps. Eve eats the apple, and then tramples on the head of the zodiacal serpent/ouroboros. It loses its grip on its tail. Eve usurps its implied procreativity to fill the gap. Mind the gap. The whole story is in the mythos, the pieces just have to be rearranged. Monotheism has to be a conspiracy, no way around it. The violence and the sacred, the concealing and revealing are all bound up in this one gnosis or one apple, if you will. The hermaphroditic ouroboros must await the hierogamos. This is not rocket science, is it?

Is it then the case that theism has attempted to conceal the conspiracy by adopting dualism? Why should the concealment be worth that cost? The pantheists also conceal the conspiracy and the sacrifice. There is still something I'm missing here. Is there still a part of mimetics that is missing? Was X the zodiacal scapegoat? The problem must have been cosmic. What was it? Why was it? Creation was just scapegoat-ism carried to an extreme?

On my previous website I spoke on occasion about the 'inversion' of the cosmos, by way of its 'recycling'. This was, mind you, only meant to be a one time event. Here is a more recent [reference](#). To avoid discontinuity, the major portion of the inversion was done in the microcosms of our minds. Thus could we avoid a 'naked' singularity, the bane of physical cosmology. I'm not sure how this inversion would play out in the context of the Matrix (first mentioned [here](#)), which is more recent emendation. I'm speculating there could be a link here to the concealment of sacrificial violence. I recall various diagrams of circles being replaced by figure-eights. X was the center of the 8. The central intersection could be elaborated into a horizontal '8', with the two additional intersections being the Alpha and Omega. The entire figure was composed of one continuous line. The '8' was like the elliptical symmetry breaking of the circle that ultimately produces the Monster Group.

[3/31]

I start out with Britannica's exposition of sacrifice. And until I read about it just now, I had been under the impression that sacrifices were meant mainly as food offerings to the gods. Now, be honest, how many of you are laboring under this same impression? Wrong! Thus the true offering would be a cremation, with the food being delivered to heaven as holy smoke. Not always wrong. But here's the real deal. It is the life that is being offered. Thus does the primordial ritual of sacrifice almost always involve animals, with the animal's life generally seen as a substitute for a human life.

For an eschatologist, this is an awkward admission of ignorance. Is the eschaton not the harvest of souls? Are we not the ultimate soul food? No, the gods are not crazy, they're just hungry. All of our sacrifices are micro-eschatons. They are simply our feeble attempt to postpone our personal and historical eschatons.

When did sacrifices stop? At some point sacrifices became identified with paganism. In the prophetic tradition, the transition probably coincided with the fall of Jerusalem in 70 AD. This marked the transition from the priestly to the rabbinical form of Judaism. This was also when monotheism took on its universalist, absolutist ambitions. Creator and Creation were separated, the latter becoming entirely gratuitous. The eschaton was no longer a harvest, but simply a reward or punishment. In the nascent Christian communities there was even a reversal of the sacrifice as seen in the communion rite.

What has been thoroughly concealed by theists and pantheists is any semblance of mutuality between Creator and Creation. The pantheists fall back on subjective idealism or illusionism. The theists fall back on absolutism and either a Cartesian or sectarian dualism.

Only the gnostics knew better, but they were ahead of their time. How have they been contained? It must have been more than just the Inquisition. What was the cosmic censorship? A good deal of their charism was diverted into the magical monism of technosis. There was also the diversion of Millenarianism and utopianism. The latter-day merging of technosis and utopianism is no small matter. This combination is now the primary buffer between us and the eschaton.

Hegel was the last of the gnostics. As we saw, he followed Thomism, but with a considerable gap. Following Thomas came the agnostic academic split between theology and (pagan/secular) philosophy. This split remains unaccounted. The Renaissance was very much a pagan phenomenon. The pagans but

not the gnostics avoided the Inquisitors. Catholicism had long learned to accommodate pagans as beyond the pale. The gnostics, however, were too close to home. Paganism was another outlet for gnosticism in the interregnum between Thomism and technosis. With the outpourings of Millenarianism, paganism, scientism, and finally pantheism, gnosticism remained, with the possible and significant exception of Hegel, an underground stream, biding its time. It took every bit of Marx and Darwin to derail the Hegelians. The fact that Hegel was an impersonalist (transhumanist?) constrained his attempt at coherence.

That synopsis brings us back to the present. The revival of the gnostic impulse is what is now at stake. We could do worse than to try [gnosis](#) (241,000 hits). Not too promising. The Catholic encyclopedia is down again, so I fall back on Britannica. A significant belief of the gnostics was the demiurge. What is not clear is the precedence for my identification of that one with X. Should that be any big stretch? Consistent with the demiurge is that 'evil' (demiurge/Creation??) resulted from a break within the Godhead. We are certainly barking up the same tree. Sacrifice is both a reenactment and repair of this break.

Eastern Gnosticism took a somewhat different course. Under the influence of traditional Iranian religion, the semi-Gnostic Manichaeism developed an absolute cosmic dualism between soul and matter. Moreover, it showed the enormous influence of Syrian asceticism, but it was equally rooted in popular Gnosticism and preserved its essential doctrines. (Brit.)

Too many people equate this quasi-Cartesian dualism with gnosticism generally. We will have to fix that. The deontic result is similar to that of traditional pantheism: get off the wheel! The neo-pagan, naturalistic pantheists should have already made a big dent in this dualism. Was the Eastern gnosticism non-eschatological?

The world, produced from evil matter and possessed by evil demons, cannot be a creation of a good God; it is mostly conceived of as an illusion, or an abortion, dominated by Yahweh, the Jewish demiurge, whose creation and history are depreciated. This world is therefore alien to God, who is for the Gnostics depth and silence, beyond any name or predicate, the absolute, the source of good spirits who together form the pleroma, or realm of light. (Ibid.)

This sounds like pure pantheism to me. So gnosticism gets diverted into pantheistic dualism. How is this? Were there no monistic gnostics? Was it just ecclesiastical politics which maneuvered the gnostics into the dead end of dualism and mysticism? It was Aquinas who took up the much more positive neo-platonic emanationism: the chain of being. This was also taken up by the alchemists. The Church maintained its nearly exclusive hold on the redeemability of the world. The alchemists were the only gnostics true to the BPW hypothesis, and we know what happened to them. They were smothered by their mundane success. Their future was not quite golden, but certainly plastic.

The development of Christian doctrine was to a large extent a reaction against Gnosticism. The formulation of creedal symbols, the canonization of the New Testament Scriptures, and the emphasis on episcopal authority all were made necessary by the Gnostics' claims. Moreover, in some measure the Gnostics were the first theologians, and their systems prompted the systemization of early Christian thought. In addition, they kept alive the great issues of freedom, redemption, and grace, which for a time lost their emphasis among Christian writers. In a later period, the theology of Augustine owed a great deal to his early experience as a Manichaean. (Ibid.)

Are all the loose ends and loose canons accounted for?

According to the Catholic Encyclopedia (1914), [Gnostics](#)....

held matter to be a deterioration of spirit, and the whole universe a depravation of the Deity, and taught the ultimate end of all being to be the overcoming of the grossness of matter and the return to the Parent-Spirit, which return they held to be inaugurated and facilitated by the appearance of some God-sent Saviour.

[...] The Gnostics, it is true, borrowed their terminology almost entirely from existing religions, but they only used it to illustrate their great idea of the essential evil of this present existence and the duty to escape it by the help of magic spells and a superhuman Saviour. Whatever they borrowed, this pessimism they did not borrow...

[...] This utter pessimism, bemoaning the existence of the whole universe as a corruption and a calamity, with a feverish craving to be freed from the body of this death and a mad hope that, if we only knew, we could by some mystic words undo the cursed spell of this existence -- this is the foundation of all Gnostic thought. It has the same parent-soil as Buddhism; but Buddhism is ethical, it endeavours to obtain its end by the extinction of all desire; Gnosticism is pseudo-intellectual, and trusts exclusively to magical knowledge.

There is in orthodox Christianity the core idea of a magical savior come to break the evil spell cast on the world. The gnostics pushed this idea to a more radical conclusion. With rational theism, the incarnation is reinterpreted.

[4/1]

Theodicy:

(from Greek theos, "god"; dike, "justice"), the justification of God, which is concerned with reconciling the goodness and justice of God with the observable facts of evil and suffering in the world.

Gottfried Wilhelm Leibniz, in his Theodicy (1710), defended the justice of God in spite of the existence of evil. For him, God is almighty only in that he is able to do that which is logically possible. Certain factors may each be independently possible but mutually incompatible, and, because God created the world under these limitations, the created world is indeed "the **best of all possible worlds**." (Brit.)

Gottfried, he's my boy! He was only a few centuries ahead of his time; and, yes, those monads have got to go! I never could understand them, anyway. Other than that, he was on the money. Why has this simple answer been so difficult for us to swallow? Leibniz missed two key points: progress and participation. Hegel (c.1830) added progress, along with the dialectic. Participation? That is implicit in the idea of progress. No? The pantheists had, for at least a millennia, fingered ourselves as the demiurges.

The only thing I can really add to all this brilliance, besides the eschaton, is a slight reinterpretation of the X factor. The logical God is the best possible God, and is not going to be omnipotent, especially not as long as we are the demiurgic, best possible co-creators. This renders the omnipotent God otiose. An omnipotent God renders Creation otiose. Jesus was the best possible God making the best possible sojourn. X2? The minimalist, coherent recapitulation.

Why is this so difficult to swallow? I don't think it will be. We just have to permit ourselves to sit down and think about it for five minutes. Then get up and discuss it calmly.

Evil, problem of:

a theological problem that arises for any philosophical or religious view that affirms the following three propositions: (1) God is almighty, (2) God is perfectly good, and (3) evil exists. If evil exists, it seems either that God wants to obliterate evil and is not able to--and thus his almightiness is denied--or that God is able to obliterate evil but does not want to--and thus his goodness is denied.

The theological problem of evil can be solved logically by denying any one of these three propositions. Vedanta Hinduism, Christian Science, and Stoicism have sought to solve the problem by denying the existence of evil. They affirm that evil is mere appearance or is imaginary. The U.S. philosopher William James attempted to solve the problem by denying the almightiness of God. He regarded God as having great but limited power and as being perfectly good. Orthodox Christianity, however, has generally chosen to live with the tension involved in affirming all three propositions. Some, instead of denying the

proposition that God is almighty, have defined the proposition to mean that God can do anything that is logically possible. The 17th-century German philosopher Gottfried Wilhelm Leibniz, for example, stated that, because God is limited to that which is logically possible, the existence of evil is necessary in this "best of all possible worlds." (Brit.)

They are, all of them, correct, of course. But how were we so fortunate to get the best possible God? We can chalk it up to teleology and a participatory, democratic cosmos. OK, then, what about teleology? I am tempted to say that it is teleology all the way down. Another way to say it is that without teleology there would be virtually nothing, and teleology appears to be a problem mainly for us time-bound creatures.

A curious historical footnote is that gnosticism is rampant amongst ufologists. To put it another way, ufology is just a latter-day rendition of gnosticism. The 'aliens' are the demiurges. We are their victims. I suspect they have the right conspirators, but the wrong conspiracy. The powers-that-be are naturally wont to meddle where they shouldn't. The angels provide a tad of prior restraint. The rest is up to Google and the IAEC. The [Sarfattians](#) amongst the ufologists search diligently for the magic salvific formula, after the fashion of technosis and the alchemists, but usually without the spiritual depth of the latter.

Since the proposed solution to the religious problem is so straight forward and so easily accessible, one has to wonder at the seeming paucity of current exemplars. We desperately clutch at our problems out of a natural conservatism based on maintaining our identities, and on our hesitation to revision the world.

The present disturbances in the Middle East are surely playing a role, both positive and negative. Yes, there is a clash of cultures. This much is unavoidable. It is mainly a materialist West against a fundamentalist East, or secularism vs. sectarianism. Intransigence abounds. The clash plays into the hands of extremists.

The impending Millennium will surely be less secular and less materialist, but neither will it be theocratic. There will be a big carrot and a small stick to move us off our duffs. The Islamic militants are generously providing the stick. As to what will constitute the best possible stick, I hesitate to speculate. The ratio of psychological impact over actual suffering should be maximized. The 9/11 incident seems to conform to that stipulation. Will this cause more people to reconsider materialism and sectarianism? Not directly, but 90% of the action will be below the surface. We can afford to put some trust in the choreography and teleology. Keep an eye on the radar screen for novel emergence. I wait patiently for my first correspondent. Is that asking for too much? In the larger scheme, I trust that it is not.

From the 'Philosophy of Religion' comes the following conclusion:

Solutions to contemporary problems, social and intellectual, demand a multiple consideration by scholars from many disciplines of all the issues involved in the problem, a consideration set within a framework of faith and morality in which man is interpreted as distinctively human, characteristically a person. From such inter-professional, interdisciplinary groups may emerge a new metaphysics and a new theology linked with, but by no means prescriptive of, assertions in other subjects. In this way there may be created a new culture--scientific, moral, religious, and technological at the same time. To be involved in such groups would seem to be the main task of the philosopher of religion, as of the metaphysician, today. If he is successful and if these interdisciplinary groups are creative, the modern period will then take its place among those that have marked crucial turning points in the history of mankind and its culture. (Brit.)

Well, any day now, folks.

I have not spoken recently of [Teilhard](#) de Chardin nor at all, on these pages, of Sri Aurobindo. They speak of the divinization of humanity. I agree with them on that, but only in an eschatological, rather than in the evolutionary context they used. Their acosmic divinization is incoherent. Their attempt to abscond with Darwinism was never taken seriously by scientists. Instead it is the transhumanists who have absconded with Chardin and Aurobindo. In the proximity of the truth, there are many slippery slopes.

The footing can be treacherous.

I almost forgot about [Rene](#). It may be that the original (zodiacal) pantheon was less than paradisiacal. Besides the general sense of incompleteness, there may have been some interpersonal friction, perhaps related to the absent plenitude or fully realized network of being. Thus there developed a 'fault' that could be tolerated internally only after the fashion of the oyster and the pearl. We, of course, being the pearl of great price. That X (Jesus/Freya) may have allowed him/herself, conspiratorially, to be scapegoated in the process, is a further possibility. If this better reconciles me with the Girardists, so much the better. As below, so above.

Can we get the Monster Group out of the same pearl? That would be convenient. If we can get the [Mandelbrot](#) out of $z' = z^2 + c$, then we ought to be able to obtain the MG with a relatively simple teleological generation scheme. What needs determining is the applicable aspect of the Telos. It might simply be the 10^{10} souls, or it could be something more subtle.

[4/14]

I am inclined at this point to attempt a return to basics. Knowing the basis of the BPW, if any, would be significant. My previous attempt involved the archetypes. The archetypes were based on M, D & Z. Then Q, P, R, A, O & X were thrown into the pot without too much ceremony.

The dialectic, D, arrived somewhat late in the game. It remains relatively undefined. It is the basis of the vital force. The zoo-psycho-morphic cycle, Z, is its primordial manifestation, along, possibly, with X. For the time being, I wish to focus on Z. My particular concern is the transition from Z -> R, the bio-cycle. This transition presently constitutes the biggest conceptual leap in the cosmogenesis of the BPW. It stands in need of 'analysis'.

Without Q & R, i.e. atoms, we must contend with disembodied spirits. Our Zoo is a ghost city. I have nothing against ghosts, but I'm not sure I would want my sister to marry one. This statement is loaded in the sense that I'm trying to understand the interface between efficient and final causation. There can be only one vital cause.

From the gnostic and pantheist perspective, bodies are a real drag, something that we would not want to drag to heaven. Why must the BPW be weighed down with them? The answer to this question would necessarily speak to the nature of our reality. Why this massive incarnation? Just because it will feel so good when we stop beating our heads against this wall?

Can we do any of this without a clear view of heaven? I doubt it, but I don't. We are rebuilding this cosmic ship at sea. We start with a raft. Our raft is just Z. M is the ocean.

Z is a network of being. It has its cyclical phenomenology. There are centers of activity. There is interaction. The only frame is the Matrix. Any notions of space and time are vague and even decentralized, at best. There is mainly a relational and relatively incoherent presence mandated by the Matrix. This is not the best possible world, but somewhere within that flux the BPW concept takes hold.

[4/15]

Our participation in Creation is not gratuitous. It is essential to its integrity. We creatures could not participate without the benefit of biological cycles. Through these same cycles we also participate in the

life and death of the Creator, that is in the incarnation and resurrection. Every tradition has either denigrated or denied this participation. This misapprehension is the great paradox of history. This nescience has only very gradually been overcome through the outworking of our positive gnosis. Our technosis finally culminates in the messianic spiritual breakthrough as we overturn materialism.

Our immaterialist breakthrough is predicated upon our grasping the true provenance of atoms. The atom embodies the unity of the cosmos. It is the gear or fulcrum of our participation. The Pythagorean gnosis implicitly understood this fact. We have only to make it explicit.

The simple fact is that the substantiality of atoms is not and cannot be mind independent. This fact remains obscured by its attendant mathematical formalism. It is obscured by our proclivity for a Platonic, dualistic, mind-independent interpretation of mathematics. We fail to grasp the organicity of mathematics. The numerical syzygys are the tell-tale signs of this organicity, and so is our occasional mathematical genius. If Srinivasa were alive today, we could better appreciate this fact. I am no Srinivasa, I must use other means. I must appeal to a more general gnosis.

[4/16]

The best that I seem to be able to do with atoms right now is to relate their ontology to numbers. Numbers are conserved while unobserved. Numbers have spatial properties only indirectly, but then the Mandelbrot has its own spectacular spatiality. Does this dissolve or compound the mystery? It more evenly distributes the mystery. Mystery loves company. I do a similar distribution with God and Creation, *a la* pantheism. The BPW is pretty heavily into the distribution of logic, *a la* Leibniz. The least action principle in physics is a good example of this tactic. We don't spend too much time worrying about how it works.

The conceptual problem with these tactics is Descartes' simplistic dualism, following from Plato. We need to better assimilate Plato's Pythagorean turn. It was very Leibnizian. By that token we may also benefit by better appreciating the bone that Newton and Leibniz were picking. It was not just a question of priority, it was something deeper. Was it not related to the ontology of [infinitesimals](#)? Do we not have a similar problem concerning the ontology of atoms and numbers? Will I have won this ballgame if I can prove capable of sustaining this filibuster indefinitely? I have noted that we all share the burden of Scheherazade. When we run out of words, we run out of reality, *a la* Wittgenstein. My only contention is that the materialists run out sooner.

The archetypes are just the manner of distributing intelligence. It all starts with Z, this problem of chunking the intel. The Matrix must entertain itself somehow, otherwise things would get boring. So what does it do after Creation? That is just the problem of heaven. Whatever it does it will not repeat itself, thanks to Leibniz' I. of I. About eternity? Surprise me.

But, yes, the numbers are a big part of Creation. If we could just understand 0, we would be know-it-alls. What we don't know about numbers has a lot to do with their organicity. It has to do with the personality of Pi, one of our favorites of the pantheon. Pi rules over the syzygous chemistry of her sistren. Srinivasa must have incarnated the Telos that is Pi. Numbers cannot fail to participate in Agape. There is no other excuse, no other ontos. How's my driving? Call 1-800-SHAHRYAR.

0 has something to do with non-standard analysis. Is that not what the Matrix is about? The BPW is the Millennium of the Metanarrative minus one. The Big Bang requires dark energy to sustain itself. Is that not an egregious cheat? Shahryar would never have stood for that. Hot air is vastly superior. Come to think of it, Shahryar, Pi and Scheherazade must have quite the little *menage a trois*. It's about the logos and agape. It is about X, Freya and Saturn.

The pieces of our narrationally monistic cosmos are scattered about. Descartes schism was just the final

straw. Numbers help to lead us back to coherence. We are struggling with the numerology. The Pythagorean proclivity of the physicists flies in the face of dichotomy. We just need to give them an assist. We don't understand the ontology of numbers.

As Marvin Minsky once said, there is a '[society of mind](#)'. We just don't know the etiquette of it. Agape rules the cosmic society, but we need to flesh that out. Numbers are part of that incarnation. Behind the internal relational symmetries of biochemistry lies the monster group, but we have had to dig very deeply. You know, it may have been the MG that forced the hand of the Matrix. That may be putting the cart before the horse, but it is a partial truth. It is the pebble that was used to slay the Matrix, in a major role reversal. The infinite virtual sporadics were like pebbles on a very special beach. They come from the combinatorial symmetries of special sets. For the Matrix it was just like counting sheep, until one got hung up on the fence. But this is a shade too Platonic, is it not? Even for the hypothetical virtual members.

Proof theory is something organic, simply because there is no theory. A proof is one of those things like a chair: you'll know it when you see it. There is a functionality that defies formality. Who could have anticipated Godel's proof? But, yet, we knew it when we saw it. Godel opened up a new branch of logical foundations. How many other branches are there? If math is organic then there must be a means of avoiding the Apeiron. There must be self-containment. Or does it meld back into the matrix when we push it far enough, like everything else?

Creation was the Matrix' way of solving the Monster. It is the monster pearl. That's what the Pythagoreans sensed. I just need to know how. The MG is part of the conspiracy. When we look at it too closely it looks inorganic, like the molecules in a cell. We have to stand back to see its vital, semiotic functionality. Locally, space is always Euclidean. The general-relativistic self-containing, self-referring nature of the logic can only be seen from a hyper-Godelian distance. We need to square the circle. The metanarrative is coded in the digits of pi, if we know where to look.

Can we not suppose that the size and complexity of the monster is related to the size and complexity of the world? The problem is to explain the optimality of it all. The geometric, as opposed to the algebraic, simplicity of pi signals the closure of the complexity. There is only one robust way to break the symmetry of the circle. We can have a two-dimensional periodicity, but not three. The resulting theta functions provide the internal symmetry of atoms. In a similar fashion there are spinors, quaternions and octonions, and nothing beyond.

[4/17]

Just now I contemplate the possibility of a systematic oversight. Immaterialism is predicated on downward causation. My tendency has then been to banish upward, efficient, or emergent causation in order to avoid the slippery slope back into materialism. However, any participatory version of Creation will entail our navigation of this slope [see [Jurassic Parc](#)]. If creatures engage in upward causation, what about atoms? How might we exploit atoms without succumbing to atomism? I have spoken frequently about the distribution of intelligence. Why should atoms not be on the distribution list? Can this be done without objectifying them? I want atoms to retain the insubstantiality of numbers. This raises the issue of causation within mathematics.

It is generally supposed that mathematics is devoid of causation. This is certainly the view of the formalists and constructivists. But what is the Pythagorean view? Does not mathematical physics tell us that there is no way to compartmentalize causation. Formal causes are necessarily extant and inseparable from efficient causes.

The image of the 'society of mind' and of the efficacy of the unconscious also speak to upward causation. Does mathematical genius not imply a passive or observational role for the mind. Why would self-

organization not apply to mathematical objects? The notion of numerical coincidences, numerology, and the organicity of math, does demand a self-organizational capacity.

I am suggesting that biological organization is similarly realized. Thus do our archetypes of Q, R & P participate in Creation. Atoms and numbers cooperate in attaining biological coherence. Cooperation is too mild a term. Atoms and numbers are ontologically indistinct.

Is this atomism? It is not, because atoms, like numbers, are not mind independent. They are phantasmagoric, but only to a limited, contextual or relational degree, as is everything else. The quantum speaks to this issue. But there is no quantum for numbers. Well, not unless we consider Diophantine equations and other rational constructions. Perhaps it is the quantum of math which will finally allow us to square the circle. It is the quantum of math which allows mathematical physics to instantiate the Anthropic Principle, which is another form of circle squaring, or, perhaps, circle/circuit closing.

It is the task of the archetypes to distribute intelligence optimally regarding the telos of the BPW. The telos of mind over matter must be constrained until the eschaton is materialized. Q, P & R serve that end. It is then that the nexus of causation will shift from Atom to Anthropos. It is time for us to consider this eventuality.

[4/18]

My latest atomic gambit remains tentative. I am trying to get a metaphysical grip on the little suckers, without their dragging me back into atomism, perish the thought. They do have more in common with numbers than we generally suspect, but they also have their own *modus operandi*.

They do, of course, have a much more intimate, dependency relation with space. But, by the same token, quantum entanglement gives lie to the absolutist pretensions of space. The quantum also manages to drag the numbers into the spatial arena. This occurrence is mediated by the linear and circular versions of $e^{i\pi}$.

Atoms exist at the behest of cells, and cells at the behest of organisms. Functionality is the key. We should expect there to be a semiotics of atoms. Atoms provide the link between the organic and inorganic worlds, between the biosphere and the geo-sphere.

We easily forget how great was the surprise when Ernest Rutherford, in 1911, discovered the nucleus. Until then, it had been supposed that atoms were something substantial. The nucleus was easily compared to a fly in a cathedral, but, unfortunately, this cathedral had no walls. How could those newly liberated electrons possibly support Westminster Abbey? Well, there has certainly been a lot of earnest hand waving ever since, but permit me to suggest that we still don't know the answer.

Whenever someone sits in a chair, every electron in the chair has to reposition its orbit in order to support the added weight. It seems like a lot of busy-work. And recall that the weight of the person sitting in the chair is partially the result of the individual virtual gravitons emanating from each electron of a hypothetical person residing in the [Coma Cluster](#) of galaxies. How many virtual gravitons can dance on the head of a pin? The [infrared catastrophe](#) remains catastrophic, but, nonetheless, this is how my erstwhile physics colleagues attempt to save the phenomenon of chair sitting. I'm just a tad skeptical. What is really going on here?

Too many angels and too many gravitons spoil our phenomenal soup. Ten billion is enough angels for me. We do the heavy phenomenal lifting, and all those other angels and gravitons simply have cameo roles. Yes, I'm just an occasionalist when it comes to physics. And ditto for mathematics. Finding an atomic nucleus is a bit like pulling a rabbit out of a hat. The rabbit is real, alright, but it is mainly there for the show. Who does the trick and why do they do it?

It is sometimes said that consistency is the hobgoblin of small minds. Well, our minds must be really small, because there is a heck of a lot of consistency out there. Or is it in here? This is just the coherence theory of truth. This is just the BPW. Rabbits don't just materialize: they have to participate in the metabolic game like the rest of us. We're just trying to see how the game works, which is about the same as understanding why it is the best possible game for here and now. This is about gravitonic presence, or, more to the point, absence.

Atoms are just the logical pump primers of our metabolic reality. A given atom exists more or less like the number 3749263. It's there when we need it. When God is not watching the tree on the Quad, the tree does not pick itself up by its roots and walk away. The tree and the number are functionally related to very many other things going on around the Quad, and in the mathematics building. If the tree or number disappeared, we would have no choice but to fill in for it as we fill in for our **blind spot**. Mathematicians and physicists happen to work overtime at that sort of thing, much to the entertainment and entrainment of the rest of us. Let's face it, they each have their own charism. It can be downright mesmerizing.

Am I giving short shrift to the plight of the eighty thousand souls [4/19 - upwards of 400,000 including Nagasaki and the aftermath] who were caught short at the wrong end of $E = MC^2$? How 'bout them angels? Whose game is this, anyway? And, for crying out loud, what is the point?

[4/19]

The way that I often push the envelope of immaterialism is to talk myself into a corner and then see if I can talk my way out again. Each instance affords a learning experience. This is my first foray, on this site, into thermonucleonics. This raises several issues. Did God have to create U235, and to what end? In the BPW, should we not have avoided U235? And speaking of thermonucleonics: is it physics or metaphysics, as asked by an occasional physicist?

It could be instructive to compare a thermonuclear event with Krakatoa, from a phenomenological, immaterialist perspective. These are events that fall well outside of anything that could be construed as cyclical. Only the phenomenology of the Sun could come close.

With Krakatoa, I believe that we are compelled to take a Gaian perspective. It is part of a natural cyclical process for Earth. In our distribution of spirit or intelligence, the Earth, along with atoms, is due her share. That the phenomenology of Gaia should dwarf that of humans is a given. We see it everytime there is severe weather. Krakatoa should fit into that mold. And by the way, volcanoes are the logical/natural result of U235's subterranean presence.

Do we then blame Eniwetok on Gaia? Yes, in part. It was a joint operation of Sol, Gaia, and Anthropos. The alchemy of mixing intelligences is a risky business. It is a business that we will have to master. It is exactly the business of eschatology. Hiroshima was a premature piece of the eschaton puzzle dropped on our heads for instructional purposes. We are still struggling with its catechism. Pakistan's nuclear entrepreneur, Abdul Khan, is just our latest reprise.

Even these 400,000 souls were a small fraction of the holocaust that was World War II. The suffering of that World War is very likely going to be dwarfed by the fall-out of the single AIDS virus. Our molecular threat overwhelms the atomic threat. U235 + HIV is a chemical cocktail made in Hell. And let us not forget that seemingly innocuous CO2. The integrity and coherence of our world are being sorely challenged by these forms of atomism that appear to have run amok.

If there is an atomic intelligence, it certainly has its dark side. And so does all intelligence, all spirit. The deepest shadows point to the brightest light. I just don't think that pantheism can account for the depth of the shadows obviously present in the world. The presence of superhuman evil is forcing us to realize our

superhuman potential. But are we so benighted that we can only be instructed by holocausts? Whose creatures are we, anyway?

We are the seeds placed in the Gaian soil. God's plow furrows deeply. The magnitude and quality of the harvest is thereby determined. Who are we to second guess God's green thumb? Besides being the harvest, we are also God's ultimate plowshares. God has done the heavy lifting, it is time now for us to begin to pay attention to detail, to pick up every lost soul.

Yes, our blood is on God's hands. It is also on our own hands.

It is at the **X2** event that the reins are finally handed over to us. And, ready or not, here it comes.

[4/21]

What I am struggling to say is that although a particular chair may be wooden, it is not accurate to say that the same chair is composed of wood. I'm just cribbing from Aristotle. The given chair is the product of material, efficient and final causes. It is not simply a physical object, and ultimately we cannot separate these causes. Chairs, like everything else, can exist only in the most robust possible relational context. The final context can be nothing less than the BPW. No other context is coherent. No other context coheres.

In a similar vein, it is not accurate to say that a block of wood is composed of atoms. The atoms actually disappear into the wood. The growing of the tree was a complex biological process which entailed atomic intelligence or logic. The atoms exist only as abstracted from that logic. There is no individuality to be ascribed to them, or to be had by them. The wood is strictly a herd phenomenon, and in this case the herd has ontological priority over the animals that are supposed to comprise it.

We, too, comprise a herd, of sorts. Although we may value our individual identity above all else, that identity is primarily an abstraction, like the identity of the atoms in the piece of wood. In our analytic passion we have come to fear our loss of individual identity above all else. It is with this very same passion and fear that we cling to the alleged reality of atoms, as tokens of our own reality. It is just this misguided passion that you and I must begin to overcome.

Am I simply suggesting a 'quantum' theory of society? Am I not then inflating the quantum beyond all reasonable bounds? Rather I am suggesting that the quantum of physics is the *reductio ad absurdum* of the coherence of the world. It is not the coherence that is absurd, but rather our reduction of it. Obviously I have some explaining to do.

[4/21]

It is not fair to say that the quantum is absurd. It does, however, remain a metaphysical enigma. Most scientists and philosophers are content to live with this enigma. Quantum physics is responsible for much of our modern technology. Others of us suspect that the quantum enigma is symptomatic of a deeper problem with scientific materialism. You'll just have to bear with me. The struggle continues.

Atoms *per se* are relatively unreal. What is more real is an atomic intelligence that is invoked mainly in metabolic processes. One might also think of it as a form of instinct. This instinct or intelligence goes well beyond the limits of physics in as much as it is robustly contextual, functional and teleological. It is a conspiracy between our Q, R & P archetypes, each of which are intelligences in their own right. What is difficult to comprehend is that this atomic intelligence does not reside in the atoms, rather the atoms reside in it. The same is true of us with respect to the Creative Intelligence. Intelligence is not bounded by space

and time. With regard to true intelligence, the universe is [Unobstructed](#). That the quantum easily defies spatio-temporal restrictions is a reflection of the derivative nature of space and time. Locality is just a figment of the Metanarrative. Non-locality rules. The eschaton is the breakdown of the illusory obstruction of space and time. Atoms disappear into the wood. We disappear into the high road of Creative Intelligence. From then on, our reappearances, like those of atoms, are strictly optional.

From the perspective of immaterialism, upward causation is not localizable. It is strongly contextual. Out of that context, it is possible to abstract or extract atoms, but only on a strongly *ad hoc* basis. Individual Xenon atoms may be cut out of the herd for an 'IBM' [photo-op](#), but understand that this is all by way of contrivance. It is merely tautologous to say that technology is a contrivance. But I am saying more than that. I am saying that atomic ontology is derived from that contrivance. What is more natural is the atomic intelligence which provides the logic of metabolism. We must look at the world as a network of being and phenomena. My acquaintance with computer programming motivates me too see an analogy here with [object-oriented](#) programming. Lower level functions are derived from and more specialized than the more general or inclusive levels of abstraction. Atomic intelligence is an off-shoot of biological intelligence, which is a spin-off of cosmic intelligence.

What the Pythagorean physicists have brought to this table is their 'Theory of Everything'. There is a functional unity that ties together the atomic intelligences. This is the intelligence that we label as Q and P. In a similar and related manner, there is a creative cosmic unity which ties together the various species' intelligences. That the anthropic mind plays a special, or even central, role in this regard is a possibility that is not to be ignored. The unity at the bottom strongly suggests a unity at the top, and this is a suggestion with which pantheism is inherently unable to cope. The only thing saving pantheism at this point is the view that mathematics is something inorganic and mind independent, i.e. Platonism without the Goodness factor.

Another way to grapple with atomic ontology is to compare atoms with photons. A distinction is sometimes made between real and virtual photons. This, however, is purely a semantic distinction. I simply point out that the only real photon is a 'dead' photon, i.e. one that has been observed or absorbed and, so, no longer exists. Extant or 'live' photons, are, by definition, just virtual or potential beings. The same ontology may be applied to the reification of atoms in a cell. The atoms of a cell are pinned down only in the process of 'fixing' the cell, i.e. killing it. Yes, chemical processes may be studied *in vivo*, but that concerns only the functionality of the process. The teleological aspect and even identity of such processes is inescapable.

The same ontology can be applied to the cells in an organism, and then to organisms in an ecosystem, etc. 'But wait,' you say, 'aren't I real?' All knowledge is based on the *Cogito*: I think, therefore I am. But I am not the only one who begs to differ with Rene Descartes on this crucial point. Show me the aboriginal mind that has ever entertained such a thought, and I will show you a heavily redacted modern contrivance. I am not being an eliminativist when I point to the essential social dimension of mind. My response to Rene is to point to the [frame problem](#). My claim is simply that any frame less comprehensive than the Metanarrative will ultimately prove incoherent. Language is ineluctably cosmological. In as much as cosmologies differ, communication breaks down. Just read the headlines of the morning paper. To believe in a coherent cosmology is tantamount to believing in our own survival. That the only coherent cosmology is eschatological, is ironic only in a superficial sense.

Next up is to give some account of the genesis of atomic intelligence. I don't expect there to be any single or simple answer. Atoms are part of the network of being, and so their existence and function will be determined by various aspects of the larger context. On the one hand, there are metabolic considerations, on the other hand there are logical and mathematical considerations. The relevant archetypes are Q, R & P. We may presume that the genesis of atoms is closely related to our own genesis. Without completely solving either problem, we may still progress in our understanding by letting one problem shed light on the other. Any aspect of the cosmic network that can be discerned will help in a holographic fashion with all the other aspects. We have to mind the whole picture while we investigate any part of it.

[4/22]

Permit me now to shift focus from atomic to species intelligence. In doing so, I revisit [Jurassic Parc](#). Remind me to get a season pass. Admittedly, this ersatz Garden of Eden is a weak link in the cosmogonic scheme of the BPW. I would prefer a less ad hoc stratagem, and I will certainly be on the look out for one, but in the meantime JPC serves as a convenient half-way station for some still half-baked ideas. Hopefully the final Metanarrative will not have to resort to such clumsy devices.

Jurassic Parc is the playground or think-tank of the cosmic intelligences. This is especially true for the species intelligences. It is in this virtual world that the plant and animal intelligences thrash out and optimize their ecological strategies. It is our device for short-circuiting biological and geological evolution. It is a price that immaterialists should be more than willing to pay in order to forego Darwin and the Big Bang.

Atomic intelligence plays a crucial role in the optimizing of the various metabolic strategies. It is here that the reproductive strategies must be fine tuned. Darwin may be short-circuited, but Darwinism is very useful when it comes to maintaining biological coherence. The time dimension, however, is much more elastic than it is in our experience. In some sense we are dealing with a four-dimensional playing field. The genetic codings and linkages are worked out on-the-fly. The metabolic, cellular and organismic evolutions may be run in parallel fashion, facilitated with strong doses of teleology. The anthropic intelligence is crucial in this latter regard.

The point is that ecological and metabolic coherence can be achieved in a very efficient manner by exploiting the distributed intelligence and final causation that is naturally associated with the Matrix and the BPW schemes. The original zoomorphic/zodiacal network of intelligences is greatly ramified and differentiated in this virtual evolutionary process. This differentiation of the cosmic intelligence may usefully be compared with the embryonic cellular differentiation studied in developmental biology. In this context the Matrix acts as the stem cell. There is then a gradual process of differentiation mediated by the Telos or the X factor. This is then the blueprint of Creation. This map becomes the territory as it is stretched to its optimal limit which entails the greatest coherent phenomenological diversity.

Both theism and pantheism were developed back in the 'good ol' days' when life was nasty, brutish and short. There was plenty of blame to go around. The universal mythos was of a once pristinely bucolic world that had suffered mishaps as it had aged. Not unlike you and I. Besides, there were quarrels and treachery on Mt. Olympus, and, down below, human wickedness did nothing to improve the situation.

We could deal with this problem either individually or collectively, depending on how we viewed the nature of the problem. If the sorry state of the world was mainly the natural result of senescence, there was little to be done except to wait for its natural rebirth, or, more permanently, to simply remove ourselves back to the cosmic womb, the Matrix or nirvana.

On the other hand, if it was evil that was responsible for the degradation of the world, then there was the possibility of a collective intervention. The idea was to participate with the divine force of goodness in vanquishing the forces of evil.

Once the concept of good and evil comes to the fore, monotheism becomes logically inevitable. If not, pantheism is the result. The BPW follows neither path. Rather we follow Leibniz in his positing of metaphysical evil: evil is a necessary part of the best possible world. Evil is not natural as in pantheism, but it is logical and rationalizable. Evil is something to be overcome in the eschatological context. We become the primary instruments in the vanquishing of both moral and natural evil. It is this end that

justifies our full participation in Creation. This is the hope that logically attaches to theism. Perhaps it is the moral dualism of monotheism that leads to the metaphysical dualism between the Creator and Creation.

On the pantheist view of the natural senescence of the world, there is no intrinsic value to our participation in that inevitable decline. We are part of the problem. There is no solution other than our opting out.

[4/23]

If we may presume the operation of a (downward) dialectic within the Matrix, then we may expect to see the natural differentiation and symmetry breaking of the primordial psyche or intelligence. To maintain coherence, there must be a Telos for this process. X, with help from Q & P, provides the Telos. The elements provide for the completion of the ouroboric circuit. Agape, or X factor, is the upward dialectic or synthesis of Creation. The resurrected X is the great attractor in the sky. It is the object of the Hierogamos.

Q & P both relate to the completion of the cosmic/anthropic circuit. There is the quantum projective logic on the one hand, and the elliptical 'squaring' or rationalization of the circle facilitated by pi and its attendant monster group. This completes the self-organizing, self-excited circuit that is our metanarrative.

The monster group is the limit of the possible symmetry breaking. It defines the structure of the micro and macro-cosms. It provides the grand unified theory of physics. Atoms are the phenomenal manifestation of the MG. What is still missing is the metanarrational biography of Q & P. As it stands, these archetypes drop out of the sky, fully formed. Their role is not unlike that of the genetic material of a stem cell, but there must be some logical precursor that connects them back to MDZXR, otherwise there will be a glaring gap in our story. The other intelligences have to mind their P's&Q's if they are to properly communicate on the microcosmic level. On the other hand, it is likely that Pi relates to the megalithic culture with its archeo-astronomical and geodesic inclinations.

Several times here Pi has been related to the logos, while Q may be related to the dialectic, yielding a variant on the trinity of MPQ. It may not be too great a stretch to say that we may end up having to derive atoms from the trinity. Certainly atoms have a lot to do with incarnation, i.e. the fleshing out of Pi, and that has to do with rationalizing the circle: removing it from the apeiron.

[4/24]

It would be nice to be able to pin atoms on the dia-logos. That need not be such a terribly big stretch. The MD-L trinity may be represented mathematically, as previously [noted](#), by the ouroboric style coincidence of $e^{i\pi} = -1$. This coincidence is just the basis for quantum wave mechanics. We then have two cycles delimiting Creation: the zodiacal and atomic cycles. All the metabolic cycles operate between these limits. Also the analytical thrust of the dia-logos has to have a logical limit. That is just the traditional conception of the role of the atom. That limit must also serve as the medium of exchange for all the various metabolic processes.

[4/26]

When considering the provenance of atoms, it is assumed that a space-time background already exists. Such an assumption is highly problematic for the quantum gravity theorists who have come up with

various schemes for implementing a 'pre-geometry'. From our more phenomenological perspective, there is much less need for such mathematical niceties. The space-time background for our metanarrative is just a concomitant of its basic phenomenology. What is of greater concern is the introduction of physics into that phenomenology.

The mechanical properties of atoms is based on their mass and solidity. These properties may be thought of as being inherited from the macroscopic forms of matter that may be gas, liquid or solid. Accounting for solidity is a problem for materialists and immaterialists alike. Materialists must resort to a microscopic explanation. I'm suggesting another route for the immaterialists.

Consider mechanical causality: Ben Johnson kicks a stone in his path. This alleged incident remains the paradigmatic refutation of immaterialism; however, the quantum physical explanation of this incident is highly convoluted and even problematic. I suggest that the only rational explanation is a relational explanation.

There mere kicking of a stone has virtually nothing to say about the nature of reality. What might be more revealing would be the disposition of the stone after the fact. A materialist could confidently expect to retrieve said stone afterwards. An immaterialist might have less confidence without, at least, some further reflection. How might this reflection proceed?

The immaterialist could easily imagine the stone to dematerialize in midair, a fate often suffered by castles in the air. What is to prevent a similar fate for most ordinary stones? Is it merely by social convention that stones do not usually behave in such manner?

We could simply say that stones are not in the habit of dematerializing. Admittedly, this is a quasi-animistic explanation, but animism is a logical concomitant of immaterialism. There is a distribution of intelligence. Such a distribution is implicit in the positing of internal relations. But then how are the relations distributed? Also involved here is a tension between the competing logics of upward and downward causation.

Most of the stone's properties and relations are dispositional, contingent or modal in nature. Modality is endemic to both materialism and immaterialism. Its problems that are implicit in materialism are being made explicit here. For the materialist, the modal properties inhere mainly to the atoms. The bulk properties of materials are less easily explained. Materials science remains largely phenomenological, as do chemistry and biology. Quantum physics is just the science of dispositions. This is where reductionism comes to a grinding halt. Dispositions are entirely relational and contextual. Where do the laws of physics and mathematics reside? Where do social norms reside? Merely in our heads? What about in the events that instantiate them? And what sort of reality do we ascribe to events?

One place that intelligence appears to be is in cycles, both organic and inorganic. Does it reside equally in the individual cycles? More likely is the prospect of identifying the relatively indistinguishable cycles. Instances need not always be individualized. We might profitably explore the consequences of a more general lack of individuality among phenomena.

[4/27]

We have previously posited the zodiacal archetype, Z, as the mother of all cycles. We may suppose that Z is self-exciting and self-differentiating. In 'object oriented' fashion, all its progeny inherit its most general characteristics. The problem we then have is to account for the interaction between cycles. Can this be explained in anything other than a mechanical fashion? We don't want to rule out mechanics, but we do want to be able to transcend it. Can we have the best of both worlds? We have not finished with Ben's stone. Previously I was a bit hasty. Consider where the shoe leather meets the wayward rock.

Walking down a path does not seem problematic for an immaterialist. This is an oft repeated cyclical motion. There is the habitual balance between the force of gravity and the solidity of the path. If the unwary pedestrian were to encounter a patch of quick-sand, the phenomenology would quickly change. How may we salvage this new appearance? Had there been a puddle in the path, there would be less of an issue. The water is disposed to splash. Can we identify the disparate splashes? Is the materialist demon not in the details? How may we exorcise this demon?

One problem with splashes is their chaotic nature. Perhaps we could make a direct appeal to a generically fractal solution without having to resort to atomic physics in each instance. If you've seen one splash, you've seen them all. Imagine dropping a glass of water on the floor. There might only ever be a single instance. The phenomenon would be grossly underdetermined. Is that not also a fact of quantum life? Think of all the wave functions that have to be collapsed, 24x7. We surely don't know how that happens?

Consider the plight of the animator. Yet, each year the end product seems a bit more 'realistic'. Could this trend have any bearing on the credibility of materialism? Where do we draw the line between creation and animation, or between animation and animism? How difficult would it be to program Ben Johnson splashing through a puddle? Would this effort have influenced our erstwhile materialist? Could the programming be done at the dispositional level?

[4/28]

Comparing the universe to a computer is hardly a novel idea (see 'information mechanics' and [digital philosophy](#)). Furthermore, it is an idea which immaterialists need to entertain. We are happy to make use of the canned routines, but spare us all the hardware. Objects then are coherent collections of dispositions which may be deployed in contextual fashion. The core dispositions are 'canned routines' from which particular phenomenal instances may be spun-off in an *ad hoc* manner. But ultimately we need to wean ourselves away from conceptual dependence on objects. Objects instantiate functionality in a teleological context. The Anthropic Principle can play a large role. Given incarnate psyches, the metabolic necessities and strategies will determine the environment, as much as the other way around.

Jurassic Parc may include a Garden of Eden. One advantage that Walt Disney has over us is that he does not have to feed his characters. It is not clear how best to jump start that process. The incarnation will require a concentrated use of imagination, until the individual psyches are gradually able to pick up the slack. There will be pump priming, but then habit and the Telos take over. The world will certainly start out in a dream-like state relative to both the Creator and creatures. The canned routines may be very coarse-grained at first. As the number of creatures multiplies and the survival instincts take over, the phenomenal resolution will naturally increase. This increase occurs as part of the ego-centralization. Also, at first, the sense of presence is quite diffuse, generally encompassing whole phenomenal cycles. Memory is cycle-bound. Creation then tends toward the holographic and analog, rather than the digital.

In this immaterial creation process, incarnation tends to work mainly from the inside out. It could even start out as a role playing game among our zodiacal set. As the players become more involved, their imagination becomes more proficient. The game takes over their psyches. The storyline may then evolve simultaneously on many levels and scales. Creation is simply a [MUD](#) with the rules made up on the fly. The time dimension, however, is mainly a construct that is internal to the game, unlike the MUDs hereabouts. So Creation is a MUD that took on a life of its own, as often happens down here. X is the MUD master. I apologize if I have been slow on this uptake. This is not rocket science, nor am I. It seems that I must have been blocking here. It would not be the first, nor likely the last.

[4/29]

That's nice, but next let me try to establish a context. We're dealing with a relational system. The relations are presumed to be of a mental variety. The relations may be conscious or not. The ones that are conscious would presumably be associated with proto-selves. These selves would primarily be conscious of their relations with other such selves. This would constitute the prototype of **direct perception**. The selves would necessarily be social in nature. Co-dependency is the name of the game. It is in this context that our primordial 'MUD' would arise. Could I fail to point out that X would then be the Wizard of Ooze? There need, however, be no single omniscience.

We then have the problem of separating fact and fiction. The zodiacal proto-selves are a mutual fiction supported by the matrix. To paraphrase Anton Wilson, reality is whatever the zodiacal entities can get away with. What is of particular interest here is the emergence of 'public spaces'. At what point does there exist something recognizable as an *agora*? Among the zodiac there would be the agoraphiles and the agoraphobes. One might imagine the *Star Wars* bar scene. Is there a deployment of 'avatars'? This is one recourse for a meeting of the minds. Would the avatars facilitate or inhibit the mind reading?

Yet another angle here is that of Multiple Personality Disorder or Dissociative Identity Disorder (**MPD/DID**). This disorder typically arises in connection with childhood psychological trauma. In this case the personalities arise mainly to compartmentalize the painful memories. In such a system, mind reading may be possible only after lengthy therapy. We might wonder whether MPD would be conceivable, absent a larger social context.

Omniscience might be the most natural state of affairs. Concentration is unnatural. We think of omniscience as a passive state. An active state would involve concentration and communication. Communication would arise only in situations of relative ignorance. We're delving now into the origins of semiosis. Semiosis arises as direct perception breaks down, but signaling could also be used to attract or distract attention. Then we might ask how the distinction of self and non-self could arise. There don't seem to be any easy questions at this level. All of this to ascertain the provenance of atoms.

If one self can arise spontaneously, then others would as well. They could fall outside of any mutual purview. Or one could inhabit the unconscious of the other, as in MPD. In that case the hypothetical MUD master could take the role of therapist and attempt a meeting of the minds. Without such intervention would there have been multiple Creations? Is this disorder a reversion to a more primitive state? In some sense these MPD selves must be mutually orthogonal, and then we might wonder as to the relevant dimensionality of the mental space. It is not clear how the mechanics of codependency functions for the MPD experiencer. Relative to human existence, the dimensionality of the Matrix must be high. It is not clear if there are any intrinsic limitations of the Matrix in this regard, outside the limitations of the BPW.

Communication requires representation. Representation implies indirect perception. In a system of direct perception, there can be no communication. I'll have to think about that. How do I communicate with a mind reader? I would have to be able to point to particular thoughts, but pointing is a form of representation. Would there be any reason for mind readers to communicate? If I attend to my desire for water, would that not communicate my desire to my gifted interlocutor? That is a form of pointing.

Suppose I wish to read a book. Could I not just tap into the author's mind at the time of the creation of the story? How do I construct the correct sequence? This could be cumbersome. Can there be abstraction without language? Is language compatible with direct perception. Philosophers have often asked whether there must be or could be a private mental language. The issue remains controversial. Could a direct perceiver hope to do mathematics? Can we combine direct and indirect perception without incoherence? Is it possible that direct perception is impossible in any form? How then do we perceive our own thoughts? If there is a mental language, what does it represent? On the materialist view, there are no thoughts, only words. But how might our sensations of odors be cast into words? Then there is the question of the degree to which our sensation of odor is subjective or objective.

[4/30]

I can directly perceive my own thoughts but not yours. Yours have to be represented to me. I may then recreate your thoughts in my head to some degree. But recall that for the immaterialist there cannot be a strong distinction between telephony and telepathy. Information is a peculiar thing. Immaterialists have to be skeptical about it. As presented by the materialists, information is something magical, quite alchemical, even chimerical. The problem has to do with content, or lack thereof. If there is no content, there is no problem, but does that not leave us empty headed? When the materialists set out to prove that we are empty headed, they are p*ssing into a strong wind, otherwise known as the stream of consciousness. They might start out by explaining odor, but they just don't seem to have the heart for it. Mind is a gaping hole in the materialist enterprise. It shows no signs of being filled in, only being papered over, again and again. The rest of us grow weary just watching their Sisyphean labors.

In light of their abstracted nature, I have compared atoms with numbers. But in terms of their chemical properties we ought to compare them with words. A cell is a paragraph. An animal is a story. Atoms point to content and substance. They are abstracted essences. They connote as well as denote. They have intension as well as extension. If we could understand words, we could understand the *agora* or the plaza, if you will. As goes the plaza, so goes the world.

When offered a penny for our thoughts, we are seldom at a loss to coin a phrase. When the molecular biologist examines a cell, she is able to coin molecules. Atoms are a bit like cash relative to the monetary supply, which is the true economic substance. It may be convenient to have some in the pocket, but we immaterialists prefer plastic, thank you very much. Some writers are adept at cashing out their thoughts, just ask J.K. Rowling.

Our plaza and our world are constructed of atoms and words, so say the materialists. We immaterialists are hankering for a return to the gold standard, if only we could put our finger on it. The gold standard is telepathy over telephony. It is direct perception. It is the cure for the multiple personality disorder that we call the world. To get there we need only to recreate the primordial plaza. That is tantamount to recreating the first word. Was it the [OM](#), the Zim-zum or maybe Pi? My hunch is the lattermost. It covers the territory. The plaza is the territorial imperative. It is the omphalos, the pyramid. The pyramid allegedly encoded pi and phi, and many other syzygys, zodiacal and otherwise. We grasp for the [Cipher of Genesis](#). Somehow the content was trans-*formed*. There evidently needed to be some sort of anchor for this process, a stationary point, as the mathematicians would say, where the content is the form and the form is the content. Is Pi not the transcendental pi-vot between algebra and geometry? The Cipher has been right under our noses the whole time. Pi might conceivably serve as the tribal peace pipe for the primal zodiac. Our world is their pi~pe dream. Knowing Pi, it should be possible to derive the mass of the electron, don't you think? This is in the spirit of $e^{\pi i}$. Monstrous moonshine has more or less demonstrated that. I would like to think that we are about over the hump. It would be nice to be able to start coasting. We have come a long way to find the path home. Perhaps we will be seeing it for the first time.

[5/1]

Today, weather permitting, will be what has become my annual meeting with Ron. He has had some interesting connections in the government, and has, in the past, shown some interest in my activities and ideas. Also he has, on occasion, arranged meetings for me with people who might be sympathetic with some of the ideas expressed here. I'm thinking it would be neglectful for me not to request another such a meeting. There has not been one since I began working on this website. Permit me then to use this space to collect my thoughts regarding this possible request.

As I understand it, Ron's professional responsibilities at one time, anyway, included what he once referred to as 'phenomenology'. This label was apparently being used more in its scientific rather than in its philosophical sense, i.e. he was dealing with 'uncorrelated' phenomena. I realize that I am raising more questions than answering, but please bear with me. This is a murky area, at best. Let's explore a putative rationale.

The bottom line rationale is presumed to be national security. This is an open ended area of concern, and, to put it very succinctly, it would be Ron's responsibility to make sure that the concerns do, indeed, remain open ended. How so?

National security concerns itself with any threats not covered by domestic law enforcement. It might even be construed to cover natural threats such as global warming, for instance. Indeed, eschatology might well constitute an area of such concern, and if it does not already, perhaps it ought to. But right away, you may appreciate the problem of trying to be open ended relative to questions of security.

Here's a for instance. My first contact with Ron was in connection with my personal interest in the 'crop circle' phenomenon back in the early fall of 1991. It occurred to me that there ought to be some governmental concern about this peculiar phenomenon. It took very few phone calls for me to get through to our erstwhile phenomenologist. Part of his responsibility was to be open to outside information and ideas. I made known my eschatological interests from the start. He maintains that I was the first to use that word in his presence. What followed was a considerable amount of communication up to and including 9/11/01. Since then, contact has devolved to this annual custom. Those communications covered a wide spectrum of interests and activities, and have undoubtedly exerted a subsequent influence on me. Also I was not averse to broadcasting this connection, as you see here in retrospect, to the point that I was the *de facto* PR person for 'phenomenology'. My first weblog was more liberal in its discussion of this 'liaison', if you will.

With that background, it ought to be quite appropriate for me to press for a review of the BPW rubric, under the aegis of whatever might remain of the 'phenomenology network'. Of course, and as always, the mixing of eschatology and national security is likely to be a ticklish endeavor, from any PR perspective. My philosophy has been to grab this bull by the horns, and not worry too much about the bric-a-brac, but I am sure there are plenty of potential correspondents who would not be comfortable with such an MO.

At this point, though, I am not intent on making waves. My first concern is to find whoever might be the best person to critique the BPW hypothesis. I would hope to avail myself of that input for some reasonable period, before attempting to generate any wider interest. In that time frame, the web log would be focused on sharpening these idea and whipping them into a more presentable format. I might draw the line, however, at undertaking anything as potentially distracting as publishing a book, for instance. I would be happy to leave that chore to whomever, while I continue to keep my radar screen clear for all sundry of incoming, relevant thoughts. Disrupting that established MO might be counter productive. It is hard for me to imagine that in my not so many remaining years that the BPW hypothesis is likely to be other than a continuing work in progress. In as much as I attempt to synthesize these disparate ideas, and, yes, make them more coherent, it would probably have to be in close collaboration with a critic such as mentioned above. Well, wish me luck.

The first step in this new 'Aquarium' initiative would be for me to write up a two-page proposal, under Ron's implied *imprimatur*, that would be sent out to some specific individuals in his general orbit. It would be a request for suggested names of potential critics. Any such could remain anonymous to the rest of the world, but at least portions of our correspondence should be available for posting here, following past protocol. I would be happy to provide any *ad hoc* synopsis of these ideas as would facilitate this critique. These synopses should easily benefit the on-going presentation here. There could well be a sequence of BPW critics, with each new one having some responsibility toward a continuity of effort, up until a wider dissemination could either be effectively pursued or dismissed.

[5/2]

There is the old Aviary story of Ocelot & Co, periodically traveling to Los Alamos, perhaps to consult with a visitor, to determine if the time was right for whatever. Well, the sense I got yesterday was that we may be getting a green light. Many of us have been impatient for some action, but, once things start moving, most of us will be wishing it would slow down. We'll be pining for the good ol' days. We humans are hard to please.

[2/6/05 - Here are some **Aviary** sources: [1](#), [2](#), [3](#), [4](#).]

Timing is a big issue, and mostly outside of our purview. The Gregorian calendar was probably no accident. It does mark millennia for those of us who are into millennialism. And neither was 9/11 an accident. The aquarium was maintained in a ready response mode until about 1999. At that point things began to slack off. It was as if there were growing confidence in Plan A, including the WTC. Now that the dust has settled a bit, it seems timely to recommence where we left off. That is my interpretation. The aquarium agenda is to be readdressed. Yes, the R & D show may have to go back on the road. I spontaneously volunteered to make a proposal to pelican, humor us, concerning the above critiquing process. It would be duly considered. Permit me to elaborate on that. In the meantime I hope that we can maintain this open channel, but that will be possible only if it is not abused, and that means YOU, dear reader. Let us put aside our childish ways as we prepare to reenter the home stretch, only as the true children that we are. Once again, excuse my prose, and keep in mind that minimalism is supposed to be the order of the day. Obviously cryptography was never meant to be my strong suit.

I recognize that the BPW is not ready for prime time, but perhaps this is good enough for government work. My job is to be a pump primer. There may be just enough juice here to prime somebody's pump. Our real task is to locate that somebody. I'm asking pelican to assist in that task. Google and I cannot do it alone. Frankly we need some muscle. More than that we need a context, and lacking a context we need a pretext. If R cannot generate an adequate pretext, then I am sorely mistaken.

All I need is a final pitch. [\[a\]](#) [5/8 -- I'm still struggling to put together my 'two page synopsis' of the BPW hypothesis. I will be in the process of [reworking](#) this material on the following page.]

There are many who are reluctant to admit it, but it may well be that with respect to the mind, materialism has run into a brick wall. What then are our options? Whither modernity? The only thing for sure is that we cannot turn back the clock.

The Aquarium contingency is just to explore the possibility of immaterialism. To most people, particularly scientists, this might seem to be one of the least likely or least practical responses to the mind-body problem. Be that as it may, that is no excuse for all of us to ignore it. Every significant contingency must and will have its day in court. I maintain that this one has not. Not now and not up to now. Its time will come. I'm urging that there is no time like the present.

Yes, there are plenty of pantheistic immaterialists out there. There are even a few theistic ones. All that I am doing here is to take the best parts of both of those worlds in order to construct the Best Possible World. And then I maintain that this BPW is also, quite obviously, the only coherent world. This is the only place on Google that you will find a coherent cosmology that includes the mind. If you can find anything even approximating it, please let me know.

Have I carried coherence too far? That is the only relevant question. I have carried it to its logical conclusion. If someone thinks that coherence should be limited, they'll have to figure out how to do that in a way that is not totally arbitrary. Good luck! I have found no such way, and I have been working this territory for at least 25 years. But don't take my word for it. Appealing to coherence puts the ball back in the skeptic's court. To what context or authority can they appeal? Their final recourse is to appeal to our

conservative instincts, hoping that coherence will just go away.

I am bookmarking this section of my weblog to send to R. We then have to figure who to approach and how. I will now start working up a longer summary, following this, that could later be tailored to the given individual's situation.

In the story of coherence there is an arch villain: Rene Descartes. He tried to put asunder that which God had joined, namely the mind and body. This is the Cartesian dichotomy that made scientific materialism conceptually possible. Now, three centuries later, we seem to be stuck with this legacy. The more we struggle with the mind-body problem the more insoluble it appears to be. I am not saying that we should stop struggling, but I am saying, that after three centuries, it is time for at least some of us to consider our alternatives. What are they?

I maintain that there is only one rational alternative to Descartes. Science has only ever had one strategy for dealing with the mind: eliminate it. Consciousness is just a subjective illusion. It is our final self-centered illusion that science must overcome, the way Copernicus overcame our geo-centric illusion. Unfortunately it is more than just consciousness that is to be put on the chopping block. Reason itself is up for grabs. How can science eliminate reason? Isn't science supposed to be based on reason? Well, that was yesterday, evidently tomorrow is going to be a brave new world.

Some of us are not convinced. Some of us are willing to wager that science has finally met its match. There is even a general agreement amongst those of us on this other side of the philosophical fence that defending the mind against the predatory attentions of science will have to be more than piecemeal. Anything piecemeal could only be a rearguard action. The only logical or coherent way to defend the mind is to turn its defense into a cosmic issue. If mind is not an accident of nature, if it is not a contingent fact about a material world, then it is scientific materialism that will have to be upset, even upended.

It is one thing to come to this conclusion, it is another thing to act upon it. At this juncture our ranks rapidly thin out, seemingly to the point of oblivion. Instead we have the spectacle of postmodernism. Rather than correcting Descartes, we ape him. We just proceed to carve the world into ever smaller, incommensurable sub-domains of self-limiting methodologies and discourse. Is this not the way the world is? Or is incoherence becoming a self-fulfilling prophecy? Coherence, if it ever existed, has taken a great fall. How do we put it back together? Certainly not one piece at a time.

Before Descartes there was just theism and pantheism. With theism, there was a more or less rational Creation. With pantheism, there was no rationale for the world. The lack of rationale was due mainly to our unwitting responsibility for its creation and recreation. In clinging to the world we were actually just clinging to our own illusions. As they say, East is East and West is West. Or are they? Is there really a disconnect here?

Why can't we have the best of both these worlds? We can and we do. That is the rationale for the Best Possible World. Should this have to be rocket science or brain surgery? I say not. With all the distractions of science and now of postmodernism, not to mention the acrimonious posturing by every brand of fundamentalism, we're left with nobody tending the cosmological store. There's nobody here but us chickens, and they don't call me Chicken Little for naught.

What is right with pantheism is the fundamental unity it ascribes to the world. It is all the manifestation of a single underlying reality. We are an intimate, integral part of all that is. With theism there is a rationale, but we are here only as the invited guests. Apart from our individual moral struggles, we are mere spectators when it comes to Creation. Separately, neither of these views is coherent. On the one hand we exist only by some unfathomable necessity, on the other hand we exist only by the mysterious grace of God. May these two separate mysteries be rendered mutually coherent? Yes.

Theists do admit that we are created in the image of God, but this is much too weak. Identifying with God, however, is quite another matter. You are welcome to attend your local cinema to witness what happened to one such heretic. The pantheists don't mind if we identify with God, as long as we realize that God is an illusion. How have we managed to take one simple idea and create two incoherent distortions of it?

Can we not have our cake and eat it, too? Isn't that what the Christians are supposed to be doing on any given Sunday? Why should communion be treated as such a mystery? Isn't it the most obvious statement in the world? Why can't we all be chips off the old block? We are, so we'd better get used to it.

Why in heaven's name would God not want to create the best possible world? No reason whatsoever. She did and it is. So, are the theists then saying that in the best possible world the creatures will never be allowed to reunite with their Creator? Show me the scripture which proscribes that most basic of all creaturely desires. How did we arrive at this incoherent notion of a metaphysical dichotomy? That is the only real mystery anywhere in this environs. Perhaps Descartes knows the answer.

But don't get me wrong. I am not complaining about our state of ignorance. Technosis could not have arisen were it not for our metaphysical agnosis. Without our extended sojourn into materialism, nay, into 'matter', would there have been any history at all? History is just the story of our emergence from ignorance. That there might be this final twist in the plot should only help us to better appreciate the dramaturgic skill behind Creation. If you think you could come up with a better story, please leave your idea in the suggestion box on the way out.

This is a nice story, but how could it ever be proven? That is not my job. My job is only to render it sufficiently plausible so that some small but adequate number of early adopters would feel empowered to move the story forward from the point at which I am able to turn it over to them. The proof will ultimately be in that pudding.

[5/3]

I was off-line for most of the day with a power outage. A small twister touched down at my in-laws last evening. They have the adjoining property. It traveled for about a mile uprooting trees but leaving no structural damage. We were watching '10.5' at the time.

[5/4]

OK, here is where things get a little sticky. In the best of all worlds, one might have thought that Google by itself could have led enough people to this BPW website so as to get the ball rolling toward this greater coherence for which the world seems to have so great a need. Well, when the website first showed up on Google a few months ago there were a few nibbles, and then nothing. It appears that I am being forced back into the Aquarium mode, a mode which seemed to have been foreclosed several years ago. So here I am, coming back to Pelican with hat in hand. Beggars can't be choosy.

This puts P back in a difficult spot. If he were to act upon my request, he would call up someone in his phenomenology network with academic connections and set up a meeting for me. So far, so good. This person would know the ropes and some of the Aviary history, but then what? What is this person going to say to one of his naive academic colleagues who has not had this exposure? There would be a lot of explaining to do. Perhaps too much. Most sane people would throw their hands in the air and walk away.

OK, Plan B2: P talks to Jack S., fringe physics type, and suggest that he get me plugged back into that network. Jack might balk, but would relent. That fringe network could then serve as a buffer between P and the real world: academic, religious or otherwise. This would probably be a more effective buffer than anything as serious or as official as the phenomenology network. It should make things easier for P. Hopefully this would be sufficient to prime the Internet pump. Should I be confident that this is not too much to ask? It depends on how much arm twisting would be necessary to get Jack & Co to take notice. Too much twisting might set off someone's alarm. Some of these folks might start overreacting. Well, better sooner than later. These folks have set themselves up to be guinea pigs for just this kind of eventuality. Were they not asking for it? Would this not be the best possible teapot for experimenting with tempest control? [5/7 - I would hold off on this scenario until there has been at least one preliminary critique. Jack tends to be a loose cannon.]

And even if Google alone had been sufficient, this ball would very quickly have come back to P's court anyway, just based on my public [record](#). One might then ask, why the Aquarium in the first place? It was either a bureaucratic fluke, or it was something more serious and more cosmic. Maybe we'll begin to find out.

Like I say, the ball is in your court, Mr. P. Now where did he go?

[5/5]

Yes, we still have no response. Later today I go back to DC to see about arranging for a second picnic. I am reluctant to let this matter drop completely, once having had my chain pulled. It may be that this is all just another distraction, or it is a door that is meant to be difficult to open. In either case I have to be prepared to move on. It is not as if I do not have my work cut out for me here in this metaphysical salt mine. It would be nice to have a coworker or two, but that may not be in the cards. It is a very slow slog through this uncharted territory. It is about the cosmic psyche bootstrapping itself into the BPW. What is the path of least metaphysical resistance?

I remain convinced that there is potentially an issue here of global security. Most any thoughtful person would have to admit that there is a great uncertainty with regard to the universal validity of scientific materialism. There are very few who devote themselves to its global defense, and those few recognize they continue to have a decidedly uphill battle. Still, this would not be a crucial problem if we could be confident that some form of spirit-matter dualism prevailed. Modern secularism is well conditioned to continue to put the best face on that cosmic schism, on that otherwise disturbing piece of cosmic incoherence.

However, and this is a big however, reality may not necessarily respect the cultural preferences or conveniences of modern secularism. If modernity is vulnerable to being blindsided by a non-conforming reality, then we moderns are vulnerable indeed. If modernity is built upon a false premise, and that is the whole issue here, then we could be in for some nasty surprises.

It could well be that 9/11 is just one of those surprises. I'm not accusing our camel-driving Al Qaeda brothers and sisters of metaphysical sophistication, but I'm also not confident that 9/11 was just a cosmic accident. Certainly brother Ron, not to mention sister D., did his darndest to disabuse me of that comforting notion. Modernism is all about the avoidance of cosmic paranoia. The avoidance of paranoia is the prime component of our slumber of materialism. If 9/11 was not our millennial wake-up call, then let's just roll over and hit the ol' snooze button. Or not.

A democratic society will be compatible with a theocratic cosmos, only if the electorate is much better informed about the facts of life. If my hunch is correct, we are playing with very much less than a full deck in this game of life.

The Aquarium has been doing its best to represent our one and only metaphysically coherent alternative, namely the BPW hypothesis. This is the only hypothesis that stands a chance of appealing to humanity's sense of reason. Our powers of reason may not be all that we could desire, but they are the only thing standing between us and totalitarianism. There is a window of opportunity for exercising these powers in the service of something more than materialism. Once this window shuts, we could be in for a very long, very dark spell. Let us not render ourselves spell-bound.

Materialism alone, and faith alone are not going to extricate us from the predicaments of modernity. There is very good evidence that our mental powers transcend the material dimension. If we continue to keep our mental powers chained to the Procrustean bed that is scientific materialism, we will have no chance of coping with what is almost certainly a larger reality.

Perhaps the world is only partly coherent. Even if that were the case, that would not relieve us from the burden of pushing that envelope as far as our human powers allow. To not be true to ourselves cannot be acceptable on any premise. But as we better understand the nature of coherence, we will likely come to realize that being partially coherent is rather like being partially pregnant. It is simply not in the nature of that beast.

End Times & Apokatastasis

I have been doing a hasty review of the Christian take on this subject. Needless to say, it is diverse.

I continue to rethink my Millennialist position. The traditional Christian Millennium had become the capstone of the BPW. It does seem logical to have a Golden Age be the final chapter of history. But is it coherent? Perhaps not. This is what we must investigate.

In the big picture, the Earth is a means to an end. Creation was never meant to be an end unto itself. Even the right to lifers would agree that life is not an end unto itself. Creation is good, not by itself, but in the eyes of the Creator. As co-creators we share in that vision.

The goodness of Creation lies in its realization. Its realization is in eternity. All is well that ends well, stands, obviously, *sub specie aeternitas*. History is the completion of the ouroboric circuit. The Matricial Ouroboros is the realization of our Selves.
