National Investigations Committee on Aerial Phenomena

A Privately-Supported Fact-Finding Body Serving The Public Interest

"Is there supporting evidence for the existence of advanced aerial technology in our atmosphere which exhibits characteristics beyond those of which we humans (Military, Scientists, et al) were capable of at the time of the incidents' occurrence?" (Michael Swords)

Glossary of Acronyms

A2 - Air Force Intelligence
ADC - Aerospace Defense Command
ADLA - Assistant Director For Legal And Legislative Affairs (NSA)
ADPL - Assistant Director For Policy And Liaison (NSA)
ADPR - Assistant Director For Plans/Resources (NSA)
ADT - Assistant Director For Training
ADVA - Advanced Soviet-(One of the 4 major operational divisions of the NSA's production organization; combined with GENS into a group)
AEC - Atomic Energy Commission
AFB - Air Force Base
AFESC - Air Force Electronic Security Command
AFGWC - Air Force Global Weather Control
AFIS - Air Force Intelligence Service
AFM - Air Force Manual
AFOC - Air Force Operations Center
AFOSI - Air Force Office Of Special Invetigations (Headquarters - Bolling, AFB, Washington, D.C.)
AFR - Air Force Regulation
AFSA - Armed Forces Security Agency
AFASC - Armed Forces Security Agency Council
AFSS - Air Force Security Service
ALLO - All Others-(One of the major operational divisions of NSA's production organization now known as G Group)
AMB - Ambassador
AMC - Air Materiel Command
ANCIB - Army-Navy Communications Intelligence Board
ANNCICC - Army-Navy Communications Intelligence Board Committee
ANG - Air National Guard
APRA - Advanced Research Projects Agency
AR - Army Regulation
ARC - Ad Hoc Requirements Committee
ARDF - Airborne Radio Direction-Finding
APRO - Aerial Phenomena Research Organization
ATC - Air Traffic Control
ARTC - Air Route Traffic Control
ARTCC - Air Route Traffic Control Center
ASA - Army Security Agency

Conclusion UFOs Are Space Ships Given SAC in 1952

A 1952 evaluation of "flying saucers" as interplanetary devices, sent to Strategic Air Command Headquarters from MacDill AFB, has been disclosed to NICAP by former information Specialist Don Widener, one of the AF men concurring in this opinion.

The spaceship conclusion was based on numerous AF sighting reports, especially those in the MacDill area. It was drawn up by the MacDill UFO project officer, an AF intelligence captain with whom Widener served. As a member of the project, Widener had access to official AF sighting reports, some of which have never been released.

"Captain ---------- and I drafted a report to SAC Headquarters," Widener has told NICAP. "It stated that in our opinion the unknown objects were of extraterrestrial origin. I imagine that his report is still gathering dust!" (The preceding ***UFO Investigator*** listed one case evaluated by the MacDill project, "hidden" sighting recently given NICAP by Widener. It described the MacDill radar tracking of a UFO at 40,OOO feet and visual reports by a B-29 bomber crew ordered to chase it. The UFO, a glowing oval-shaped device, reversed course and raced off. The sighting was never explained.

The ETH and the Likelihood of Interstellar Travel

by Jean van Gemert

If we at once admit the foolishness of these perennially suggested "impediments" to star flight, we will be on our way to understanding that interstellar space does not need a bridge too far. Interstellar travel may still be in its infancy, but adulthood is fast approaching, and our descendants will someday see childhood's end - Dr. Eugene Mallove and Dr. Gregory Matloff, The Starflight Handbook, 1989.

The (un)likelihood of extraterrestrial visitation is probably one of the most debated aspects of the Extraterrestrial Hypothesis, the answer being an essential component to the validity of the ETH. After all, the assumed unlikeliness of interstellar travel has become the cornerstone of those who resist the ETH as an explanation for UFOs. So, does extraterrestrial visitation necessarily require all sorts of "unlikely" science, or is it possible to accomplish interstellar travel using conventional wisdom?

Can they get here?

Opinions on the practicality of interstellar travel diverge, but the negative and positive opinions are seen to stem primarily from the differences in background of those people doing the studies. SETI researchers think that the degree of dispersion of stars throughout the galaxy, combined with the limitations of interstellar travel as we understand general relativity, effectively preclude the feasibility of extraterrestrial visitation, thus believing that any extraterrestrial intelligence would only be transmitting their love and good wishes to us. The other group, largely composed of physicists and engineers involved in propulsion research, tends to believe that interstellar travel is difficult, but not a barrier, or not difficult at all once technology progresses [Mallove and Matloff, 1989; Forward, 1986; Crawford, 1990]. Not surprisingly, the latter choice appears to be the most defensible.

Quite a number of clever designs have appeared in print, describing various methods of getting mankind to the stars. These include such projects as the star probe Daedalus, a robot interstellar vehicle designed by members of the British Interplanetary Society which uses nuclear fusion power, or interstellar ramjets which scoop up their fuel between the stars. Physicist Robert Forward, one of the leading experts on space travel, has also proposed an entirely different method of interstellar propulsion, using photon pressure to accelerate a vehicle to a significant fraction of the speed of light in a few years [Forward, 1984]. Such ships would appear as huge sails, using the output of space-based orbital power platforms (Beamed Power Propulsion) for acceleration, which would also eliminate the need for an on board energy supply [Mallove and Matloff, 1989; Crawford, 1990]. Hence, much less mass would need to be accelerated. The important point here, as astronomer Ian Crawford notes, is that we "can already identify technological solutions to the problem of interstellar travel that are consistent with the laws of physics as we currently understand them. We *do not need* new physics" [Crawford op. cit., 1990].

Another factor relevant to interstellar flight is that of relativistic time dilation. Any object traveling close to the speed of light will be subjected to effects predicted by Einstein's Special Theory of Relativity. That is, an observer on board a spaceship traveling close to C, would observe that the passage of time on earth has speeded up, and the passage of time on the spaceship relative to an observer on earth would appear to have slowed down. For example, a one-way trip to Alpha Centauri would take, assuming a constant acceleration of 1g up to a high relativistic speed during the first half of the flight and a constant deceleration of 1g during the second half, only 3 years spaceship time, while 6 years will have passed outside the spaceship.

Moreover, recent ideas on speculative space propulsion may just bring us the breakthrough we've all

been waiting for, making use of yet undiscovered "loopholes" in physical laws, that would allow fast transit between widely separated points in space-time [Alcubierre, 1994; Visser, 1989; Crawford, 1995]. It might even be possible to extract large quantities of energy from the zero point field (the vacuum) itself. If this can be done in a practical way, then the energy available to a space traveler could be essentially unlimited, eliminating the need for an on board fuel supply [Froning, 1986].

Too Expensive?

Although it simply is impossible to precisely now how expensive interstellar travel would be for a civilization about which no pertinent data is available to make an estimate, we can still make some educated predictions. Interstellar travel appears not to be expensive for an advanced economy whose productivity has grown steadily for millennia. Therefore, alien contact by visitation is likely once these advanced economies implement interstellar propulsion technologies at insignificant costs relative to their wealth and capital stocks which have grown steadily for millennia. Similarly, an interstellar transportation system may seem expensive from our perspective, but, then, so would a 747 to the Wright brothers [Jones op. cit., 1995].

So what is to be concluded from all of this? Is interstellar flight indeed as "improbable" as the naysayers claim? Indeed, *only if* we grant them their negative and self-defeating assumptions. And with that in mind, we quote Ian Crawford from the October 1996 issue of the New Scientist, in which he neatly outlined the current situation with regard to the feasibility of interstellar travel:

> **"It seems unlikely that interstellar spaceflight is impossible. Even today, we can envisage propulsion strategies which might make it possible to reach between 10 and 20 per cent of the speed of light, permitting travel between nearby stars in a few decades. Any civilization with this technology would be able to colonize every planetary system in the Galaxy in about 10 million years, which is only one-thousandth of the age of the Galaxy" [Crawford, 1996].**

Where are they?

Computer simulation and mathematical modeling of attempts to colonize the galaxy show that this could be accomplished in no more than a few million years [Hart, 1975; Jones, 1976; Papagiannis, 1978]. But the galaxy is ten billion years old, with second-generation (metal-rich) stars up to nine billion years old. Thus, the time needed to colonize the galaxy is much shorter than the age of the galaxy [1]. Moreover, in 1974, physicist O'Neill published his research on space settlements, describing large artificial structures capable of holding vast numbers of people [O'Neill, 1974]. O'Neill argued, with good reason, that such concepts could be realized with current technology in just a few decades. Frank Tipler, Hart, and quite a number of other scientists noted the relevancy of O'Neill's designs with regard to the Fermi debate, suggesting that these habitats, equipped with propulsion, could also be used to colonize other star systems.

The consequences should be clear. There is no need to invent fantastic propulsion systems such as "warp" or "hyper drives." Current available technology would make it possible, in principle, to colonize the galaxy. And this, coupled with earlier calculations on expansion rates, suggested that if any extraterrestrial civilizations exist at all, they should have visited our solar system by now. But there is no evidence of such visitation to Earth. Enrico Fermi called this the "Where are they?" question - which is now known as the Fermi Paradox.

Hart and other human-centrists as physicist Frank Tipler believe it proves us to be the only intelligent civilization in the galaxy, while SETI researchers tend to see the Fermi Paradox as "proof" that interstellar flight is entirely impossible. Other possibilities that have been advanced are:

- Extraterrestrial civilizations are short-lived. If the lifetime of an extraterrestrial civilization is only 50,000 years on average, nobody would live long enough to colonize the whole galaxy.

- Most advanced civilizations are concerned with "more important" matters and have not developed any interest in space exploration.
- Earth *is* a colony because the the entire galaxy was colonized by one civilization long ago. Only they now have a sense of benign paternalism to any developing civilization. This is also known as the "Zoo Hypothesis," [Ball, 1973].

The problem with the first and second hypothesis, is that one would have to assume it to be true for *every* extraterrestrial civilization. It may very well be true in some cases, but hardly, without any exception at all, in a million (which is a modest estimate of the number of advanced extraterrestrial civilizations in our galaxy). Remember, only one civilization is needed to colonize the entire galaxy!

It has also been suggested that extraterrestrial civilizations simply haven't had enough time to find us yet. However, this appears unlikely since it is quite possible to narrow down considerably the number of stellar systems one would have to search to find life-bearing planets, by making use of methodical search techniques based on known remote sensing capabilities such as interferometry. Moreover, as Hart argued, "the consideration that ETs have not yet had time to find earth is discounted by calculations that show that another intelligent species in the Galaxy would have found earth if their space exploration efforts began at least two million years ago" [Hart, 1975].

This author favors hypothesis three, that there is a "galactic club," an established network of old advanced civilizations, and that Earth is under a certain "quarantine." Thus, in my opinion there simply *is no* Fermi Paradox. And the only reason Fermi's paradox has remained a paradox to most scientists is because they have failed to recognize the evidence that there may be extraterrestrials in our own solar system.

Conclusions

Assessment of the feasibility of interstellar travel indicates that it should be easily accomplished by an advanced society. Arguments, such as that they would not have had enough time to find us yet because of the number of stars to visit, are seen to be implausible [Hart, 1975; Jones 1976, 1995; Hoerner, 1995]. Neither technical feasibility, nor energetics, economics, and social factors are likely to prevent interstellar travel or slow the colonization of the galaxy [Papagiannis op. cit., 1980]. The probabilities appear to be heavily in favor of aliens turning up on our doorstep, which I suspect they may already have.

References and Footnotes: It appears reasonable that within about 1 to 2 million years of attaining space technology, a civilization could have spread throughout the galaxy. Given a practical average speed of about 0.2 c, one can cross the galaxy in less than half a million years. It is a fairly serious problem that if species evolve to a technological level and are around for any considerable length of time, then where are they? The galaxy should be a fairly busy place by now. Likewise, if we suppose a race sent out only one expedition every 100,000 years from a given stellar system to colonize another stellar system, in another 100,000 years, each of these would send out another expedition. Therefore, the number of space colonies would double every 100,000 years. At this rate, in only million years, 1000 stellar systems would be colonized. In 2 million years, a million systems would be colonized. In 3 million years, a billion systems. And in less than 4 million years, they could theoretically fill the entire galaxy.

Formulation and Predictions of the ETH

By Brian Zeiler

The extraterrestrial hypothesis, or ETH, is formulated consistent with the accepted scientific framework for hypothesis induction. The null hypothesis to explain UFOs is that they are random, disparate misidentifications of atmospheric or artificial terrestrial phenomena. This is called the misidentification hypothesis. If rejected on sufficient grounds -- and due to the subjectivity we are probably facing a more Bayesian type of inference than an objective test approach -- then we accept the alternative hypothesis, which is that disk-shaped vehicles are in fact flying in our atmosphere.

Note that at this point, we are not concerned with the origin, since the alternative hypothesis is simply that the objects exist without regard to the origin of the objects. Put simply, we don't need to know the origin of the objects in order to determine their existence. In fact, nowhere in science is it necessary to establish the origin of a phenomenon prior to determining the very existence of the phenomenon. Yet skeptics contend that the objects cannot exist due to interstellar travel considerations, which is fallacious on two counts: first, for blending the two hypotheses into one by using the possible origin to debunk the very existence, and second, for establishing a rigid a priori probability of nearly zero for interstellar travel despite a lack of sufficient information to make such a determination.

After rejecting the null in favor of the alternative, which is that the objects exist, a rank-order series of hypotheses are formulated to hypothesize the origin of the objects. When guessing the origin, we see three elements that are observed in the majority of radar-visual cases:

- Physical substance
- Intelligent control
- Propulsion technology beyond human grasp

This is why radar-visual case are so unique in their evidential value. Those three conditions are necessary *and* sufficient conditions to defend inducing the ETH; the question is the degree of corroboration for each of the conditions. When ranking possible origin hypotheses, Occam's Razor is the guiding principle here:

- American or foreign government craft
- Extraterrestrial craft
- "Interdimensional craft"

Once one replaces the null with the alternative and looks for a hypothesis of origin, it is feasible to reject the first origin hypothesis. It is absurd to think these are government craft, since the so-called "conspiracy" widens by a huge magnitude: the behavior of the flights are at variance with accepted flight-test procedures (e.g. chasing civilians), and the requisite physics for the observed propulsion would require enormous leaps in 1947 in all sorts of technology that the civilian community still has not grasped 50 years later.

The second hypothesis, that they are extraterrestrial craft, is the "Extra-Terrestrial Hypothesis", or ETH. Note that this is a specialized sub-hypothesis within the broader, original "alternative hypothesis", which is simply that the "saucers" do in fact exist. Some researchers, like Vallee, reject this and move to the third hypothesis, though that is beyond the scope of this article.

Falsifiability is a difficult area because the very approach to the subject is more subjective and inferential (hence the Bayesian approach -- see Sturrock, "Applied Scientific Inference", Journal of Scientific Exploration, vol. 8, no. 4). The very nature of the problem -- the vagueness, the lack of replicability on demand, and the elusiveness -- does not lend itself with ease to direct and irrefutable

falsifiability.

However, there are certain "proxies" for falsifiability. It seems reasonable to suggest that if there are extraterrestrial vehicles buzzing through our atmosphere, the organization with the means and motive to determine this, above all other organizations, would have determined this by now. This organization is, of course, the US military. If there are flying saucers, our military should show a high level of interest and conviction that this is the case. Indeed, they do, at both the individual level and at the organizational level, from 1947 through the present day, as revealed through Freedom of Information Act documents and summarized in our government pages.

Then there are certain other testable predictions based on the corollary that the military and intelligence would conceal this knowledge. And they have found sufficient cause to conceal it, as their early documents alluded with references to "public panic" and "policies of public information to minimize mass panic". So, do we see signs of official secrecy? What would those signs be? One is leaks. We do, in fact, see quite a few highly compelling leaks from such scientists as Dr. Robert Sarbacher, Dr. Eric Walker, and other military and intelligence personnel on the military quotes page.

Another means of indirect falsification would be the discovery of one or more new terrestrial phenomena that are merely atmospheric in nature, but can adequately explain the body of UFO evidence, from radar-visual to ground-trace cases to machine-like disk-shaped vehicle mirages.

The very nature and structure of this phenomenon renders our typical approach somewhat impotent, and we are mostly left with a Bayesian approach that questions whether the body of evidence we do have is more consistent with the objects existing or with the objects not existing. Looking at the aggregate body of anomalous radar-visual cases, ground trace cases, scientifically tested photos and films from the military and civilian communities, credentialed leaks, and evidence of military and intelligence duplicity, it is more likely that something is indeed going on rather than not -- no matter how falsifiable this hypothesis may be, it doesn't change the aggregate body of evidence. The evidence is far more consistent with the objects existing than not existing.

Our approach must accommodate the phenomenon -- not vice versa. If the phenomenon cannot accommodate our approach, there is no sense in convincing ourselves that the phenomenon must not exist. We must accommodate this elusive, sporadic, and unreplicable but nonetheless existent phenomenon by blending our approach between objective hypothesis falsification and Bayesian inference.

As for the inductive reasoning, the approach is identical in process and in validity to the Big Bang hypothesis which also has no physical proof. Both induce a hypothesis to explain a set of observations without violating known laws of physics according to our existing body of knowledge. Both also make predictions that have been corroborated, and both explain the observations superior to any alternatives. The misidentification hypothesis is an utter failure in both logical process and in explanatory appeal, as detailed in the page on skeptical logical trickery and as judged by the inability to explain the most challenging cases, but the ETH is scientifically valid and superior to the alternative. The problem with the misidentification hypothesis is that the cases it fails to explain, according to USAF's Project Bluebook Special Report #14, happen to be the types of cases that the best observers were most likely to report and that do *not* suffer from insufficient information, but rather appear to be from a wholly different distribution than the the eventually identified UFO reports, based on a chi square analysis.

The misidentification hypothesis has a gaping flaw in its ability to explain the observations, and the ETH is a scientifically valid hypothesis that is the simplest available to explain globally repeating, highly reliable observations by eminently qualified observers of solid objects under intelligent control with propulsion technology irreproducible by human knowledge. All possible predictions of

the ETH have been corroborated, and the inductive process is every bit as valid as the process that led to the Big Bang hypothesis.

Illogical skeptics will complain that any hypothesis can be induced in this framework, such as a giant purple unicorns or flying cats. But the problem is that our current physics predicts that aliens exist, and we know that interstellar travel is *possible*; it may be difficult, but it certainly is possible, and many scientists like Tipler feel that it is almost inevitable. This is why the ETH is the simplest hypothesis after the misidentification hypothesis is discarded. Hypotheses in between, such as an "unknown atmospheric phenomenon", are too vague and specious to be of any value, since they are the logical equivalent of postulating an "undetected flaw" in the analysis of a radar-visual case; but most of all, such a hypothesis fails to explain daylight sightings, and only relies on nocturnal luminosity reports, which is a selective filtration of the observations. Therefore, only the ETH can be of value after rejection of the misidentification hypothesis.

GETTING TO LEVEL 2

Date: Mon, 11 May 1998 11:10:27 -0500
From: Mark Cashman <mcashman@IX.NETCOM.COM>
Subject: On Phil Klass
To: CURRENT-ENCOUNTERS@LISTSERV.AOL.COM

On Mon, 11 May 1998 11:55:59, Mark Cashman <mcashman@IX.NETCOM.COM> wrote:

Rob wrote:

"I will easily concede that Phil stretches it on occassion - sometimes invoking explanations of puzzling UFO reports that strike us as "cheesy," or to be more academic, "inelegant." Of course, that's par for the course across the UFOlogical spectrum, from time to time, so I fail to see how this somehow invalidates him as a member of the UFOlogical community. I will as easily concede him a good point when made - and he's made a lot of them . I should think that this facet of his work would bring him closer to the UFO community."

The problem with Klass, as opposed to the position of the properly skeptical ufologist, is that he won't accept the contention that there are unexplained UFO reports which are challenging and interesting; while our properly skeptical UFOlogist has no problem with accepting both that many reports can be explained and that there are challenging and interesting UFO reports which cannot be explained prosaically.

A further problem with Klass and the attitude he promulgates is that it treats every UFO report as an isolated concrete and denies the possibility of patterns, or of the reinforcement of the validity of a report based on conformance to a pattern. As Hynek put it, if you first, a priori, assume that all UFO reports are explainable as misperceptions, hallucinations or hoaxes, and secondly take every UFO report as if it were the only UFO report in the world, and thirdly allow for any combination of circumstances, no matter how improbable each circumstance may be, to occur at the same time, you can probably come up with an "acceptable" explanation for any UFO report. However, that is not scientific.

The final problem is his willingness to throw away or deny any portion of the witness testimony which may be inconvenient for his desired explanation. That is very firmly not scientific. After all, if I throw away all of the evidence for the atomic structure of matter which I find inconvenient, I can probably prove that the universe is made of the four elements of Fire, Earth, Air and Water - but it won't be science when I do so.

"I see accusations that he "lacks integrity" quite frequently. Lacks integrity?"

I believe it would not necessarily be invalid to say that any theorist lacks intellectual integrity, who is unwilling to accept the complete testimony of the witness(es) be accounted for by his theory.

"In my recent interview with him, his first and foremost position seemed to be that he has not seen a case which is clearly indicative of extraterrestrial visitation. This seems a pretty valid stance, to me - probably more valid than wholesale endorsement of ETH."

There are many UFOlogists who accept UFOs as a scientific problem without endorsing the ETH. Furthermore, we cannot evaluate Klass position without an answer to the question - what would constitute a case indicative of extraterrestrial visitation? Then we would have to analyse such an

answer and filter out a priori assumptions about the nature of extraterrestrial life and technological capabilities (any of which can be no more than the rankest speculation).

Klass would not be alone in making such assumptions part of his "standard". Vallee, whatever his other virtues, made many such a priori assumptions part of his "critique" of the ETH. Many, if not all, of his assumptions can be clearly shown to be irrelevant or sheer prejudice.

It is further an act of intellectual abdication to claim to rely on the content of a single case to validate the ETH, the PNH or any other hypothesis. Was the theory of relativity considered valid after a single experiment? Was the theory of the aether abandoned immediately upon the publication of Michaelson-Morely? Of course not. Multiple repeated experiments or observations which form a pattern supporting or denying a hypothesis are essential for scientific work. Again, Klass' "method" of taking each UFO case in isolation predetermines that it will be impossible for the data to accumulate any convincing weight in his mind.

"Let's consider the Mansfield, Ohio case, which Ronald Story included on his "not suitably explained" list."

To allow his explanation Klass must ignore or discount the witness testimony that:

1) A red light paced the helicopter for a short period, since meteors don't do that.
2) The red light turned and headed toward the helicopter. Meteors don't do that.
3) The pilot enters into a power dive and observes simultaneously the collective in the full down position and the rate of climb indicator showing 1000 fpm rise. Meteors don't affect the flight of aircraft.
4) The final altitude is 1000 feet above the oriiginal flight altitude despite the dive from 2500 feet to 1700 feet.
5) The object is observed to continue slowly toward Mansfield airport and then turn and then accelerate. Meteors don't turn or accelerate.

Heck, what's left? "We saw a bright light that flew over the helicopter."? Now _that's_ easily explained.

Oh, and I forgot -

6) The light was initially red; meteors are not typically "red".
7) The light is red and green when the object seems to be pacing the the helicopter.

(Since the light is red, and both red and green lights are supposedly seen from the helicopter, and the object is traveling perpendicular to the helicopter, how can the windshield affect one light and not the other? If the object is red, and seen through a green glass, the result is not green, it is brown.)

Now, let's be generous, and even allow points 1 and 2 are actually an autokinetic illusion fostered by the fact that the object is headed directly toward the helicopter, and even allow 5 to be some sort of autokinetic illusion based on the helicopter entering a turn.

How can we explain the rest without calling two experienced airmen liars? The answer - we can't. Does the meteor explain the case? No, it does not. Will Klass admit it? No he does not. Does that show integrity? No, it does not.

"IMHO, he doesn't have to back down from all the others, because, as far as I can see it, anyone who accuses him of false explanation probably needs the real explanation at hand, with unimpeachable evidence to back it (else, it's just a war of conflicting hypotheses)."

No, this is a misunderstanding of the rules of scientific evidence. Anyone, including Phil Klass, who

proposes to explain a case, that is to support or refute a hypothesis, is under the same obligation to provide evidence for their position. In any war of hypotheses, the hypothesis which explains the most features of the report wins. Not the hypothesis which is the least offensive to Phil Klass. On this score, Klass does not seem to do a very good job, and yes, he does have to back down when he can't explain 70% or so of the events in a report.

And, on the other hand, declaring that a report is unidentified simply states that the cause of the report cannot be determined. This is not really a hypothesis, since it does not propose an explanation or a cause for the report. The burden of proof is on the explainer.

In another paper, I discuss the methodology required for examining UFO reports. Essentially however, it goes like this:

1) Form hypotheses for a prosaic cause to the report and do everything possible to support them. If a meteor is conjectured, obtain other sightings of the same meteor and determine that all of the aspects of the report can be accounted for by a conventional meteor. If an aircraft is conjectured, then determine the flight plan and ID number of the aircraft. If all attempts at explanation fail, categorize the report as unidentified and proceed to step 2. If the testimony is dubious, rate the report at a low probability or reject it as a hoax.

2) Take the reports which are unidentified by step 1 and analyse them for patterns. Form hypotheses as to the types of patterns that will be observed and their causes / consequences. Search for said patterns in order to refute or support the hypothesis.

Since Klass allows nothing to pass step 1, no matter how much the data must be distorted to prevent it, he never reaches step 2. Because of people like Klass, relatively few UFOlogists have reached step 2 - they are too busy defending their cases against ludicrous and fluid hypotheses which ignore or distort the case data.

Incidentally, step 2 can also be performed on IFOs. To the best of my knowledge, no "debunker" has ever attempted such a step.

"I think the only accusation I would ever level at Phil is that he sometimes formulates bad hypotheses. Here, we return to the idea of peer review. So, his explanation is bunk. He can hold it, even in the face of peer review, until such time as someone can conclusively prove that he is wrong."

No, he will be ignored until he conclusively proves he is right. And he cannot be a peer any more than someone who denies the atomic nature of matter is a peer of the nuclear physicist.

"It's easy to portray Phil as the "Oil Can Harry" of UFOlogy, but I believe he is really sincere about what he does. Maybe misguided or stubborn from time to time, but undoubtedly sincere. Which means he has integrity, in that he is true to what he believes in."

Integrity is not a synonym for stubbornness or sincerity. It is based on "integration", which means having the results of one's thinking be as seamless and integrated a whole as possible. Klass' thinking is a pastiche of denying the data and casting aspersions on the witnesses. It is not recognizable as scientific integrity, which requires willingness to admit of failure and acceptance of the whole of the data as the thing to be explained.

Rod:

Re some of the other comments in this, please see the e-mail I just dispatched. I think I have covered them.

But I do want to address this comment of yours in more detail:

"But, all manner of debate on matters of integrity, philosophical orientation, etc., etc. aside, if it were up to me, I would allow the wolf (Phil Klass) into the fold (serious UFOlogists). Why? Because, if he is as nefarious as you indicate, and possessing of some degree of influence upon his audience, is it not the responsibility of the UFOlogist to take him on? In the interest that truth shall prevail? Otherwise, I see a disturbing similarity between the proclamation that he be ignored and what mainstream science has done with the UFOlogical community - not so much related to the quality of evidence or a lack thereof , but in the sheer ivory tower loftiness of it all."

There is some virtue in this, but I will point out that the intellectual and temporal capital of UFOlogy is limited. Every hour spent battling back yet another ludicrous "Kenneth Arnold saw geese" and "Bertrand, Hunt and Muscarello saw a hoax kite" is an hour not spent on the kind of serious work I think we agree is needed in UFOlogy.

Some people are attracted to the debate against the debunker. I spent a good chunk of a year on a "skeptic" list and a few times attempted to engage in such a debate. The times I attempted this I found the participants preferred to engage in ad hominem attacks on witnesses and investigators if the data could not be squeezed to fit into a natural phenomenon category. They engaged in the same sort of logical errors of which they accused UFO proponents, but would not recognize or admit to it except in the rarest of cases. I decided that such debates accomplished nothing except to raise my blood pressure, and that they were certainly doing nothing to advance knowledge in UFOlogy. And, frankly, I found the level of debate and critique among serious researchers who considered UFOs a real problem to be at a level that was far superior to that brought forward by "skeptics". In general one finds more constructive skepticism in this room than in any of those. Look at the recent debates on Linke, on Rendlesham, on radar cases...

There is no question that debate is important. And I enjoy debates or discussions with and among people who take their work seriously enough to try to refine it through their own contributions, positive or negative. I think many other researchers would agree that this is very productive.

On the other hand, there are many areas of profitless debate. One is - do UFOs exist as an objective phenomenon? The only way to resolve that is to go into the field and investigate and to spend time in analysis. Another are cases like Roswell, where the evidence pro and con is so evenly balanced, and where the information content is so low in any event, that nothing useful can come from it.

So, in short, others may tilt at the debunker's windmill. I'd rather work on the neglected areas in level 2.

History 101

A compilation of UFO facts and quotes

Professor Hermann Oberth:
The German rocket expert considered one of the three fathers of the space age. In 1955, Dr. Werner Von Braun invited him to the U.S. where he worked on rockets with the Army Ballistic Missile Agency and later NASA: "It is my thesis that flying saucers are real and that they are space ships from another solar system. I think that they possibly are manned by intelligent observers who are members of a race that may have been investigating our Earth for centuries." (Oberth, H., "Flying Saucers Come From A Distant World", The American Weekly, Oct 24, 1954)

Admiral Roscoe Hillenkoetter, first Director of the CIA (1947-1950):
"Unknown objects are operating under intelligent control...It is imperative that we learn where UFOs come from and what their purpose is." (Source: Maccabee, Bruce, "What The Admiral Knew: UFO, MJ-12 and R. Hillenkoetter," International UFO Reporter, Nov/Dec., 1986.)

General Lionel M. Chassin, Commanding General of the French Air Forces, and General Air Defense Coordinator, Allied Air Forces, Central Europe (NATO):
"The number of thoughtful, intelligent, educated people in full possession of their faculties who have 'seen something' and described it grows every day...We can...say categorically that mysterious objects have indeed appeared and continue to appear in the sky that surrounds us... (they) unmistakably suggest a systematic aerial exploration and cannot be the result of chance. It indicates purpose and intelligent action."

Rear Adm. D.S. Fahrney, Ret., former Navy missile chief (circa 1956):
"Reliable reports indicate there are objects coming into our atmosphere at very high speeds. They way they change position would indicate their motion is directed."

Captain Ed Ruppelt (1956):
After the Fort Monmouth, NJ, radar sightings (which started on Sept 10, 1951), the Air Force held a meeting at the Pentagon. General Cabell presided over the meeting, and it was attended by his entire staff plus Lieutenant Cummings, Lieutenant Colonel Rosengarten, and a special representative from Republic Aircraft Corporation. The man from Republic supposedly represented a group of top U.S. industrialists and scientists who thought that there should be a lot more sensible answers coming from the Air Force regarding UFOs.

"Every word of the two-hour meeting was recorded on a wire recorder. The recording was so hot that it was later destroyed, but not before I had heard it several times.....it didn't exactly follow the tone of the official Air Force releases--many of the people present at the meeting weren't as convinced that the 'hoax, hallucination, and misidentification' answer was quite as positive as the Grudge Report and subsequent press releases made out."

(1956) Capt. Edward J. Ruppelt (1956):
"The one thing about these briefings that never failed to amaze me, although it happened time and time again, was the interest in UFOs within scientific circles. As soon as the word spread that Project Blue Book was giving official briefings to groups with the proper security clearances, we had no trouble in getting scientists to swap free advice for a briefing. I might add that we briefed only groups who were engaged in government work and who had the proper security clearances solely because we could discuss any government project that might be of help to us in pinning down the UFO. Our briefings weren't just squeezed in either; in many instances we would arrive at a place to find that a whole day had been set aside to talk about UFOs. And never once did I meet anyone who laughed off the whole subject of flying saucers even though publicly these same people had jovially

sloughed off the press with answers of 'hallucinations,' 'absurd', or 'a waste of time and money.' They weren't wild-eyed fans but they were certainly interested."

General Lionel M. Chassin, Commanding General of the French Air Forces, and General Air Defense Coordinator, Allied Air Forces, Central Europe (NATO):
"The number of thoughtful, intelligent, educated people in full possession of their faculties who have 'seen something' and described it grows every day...We can...say categorically that mysterious objects have indeed appeared and continue to appear in the sky that surrounds us... (they) unmistakably suggest a systematic aerial exploration and cannot be the result of chance. It indicates purpose and intelligent action."

U.S. President Harry S. Truman:
"I can assure you that flying saucers, given that they exist, are not constructed by any power on earth." (Press Conference, April 4, 1950)-

NASA Information Sheet, 2/1/78:.
U.S. Department of Defense: "REPORTS OF UNIDENTIFIED OBJECTS ENTERING UNITED STATES AIR SPACE ARE OF INTEREST TO THE MILITARY AS A REGULAR PART OF DEFENSE SURVEILLANCE."

Francis Ridge:
The UFO situation got so serious in 1952 that a meeting was convened with Air Force officials and the CIA (Robertson Panel).

Captain Ed Ruppelt:
"...and it was up to them to tell us if they (UFOs) were real---some type of vehicle flying through our atmosphere. If they were real, then they would have to spacecraft because no one at the meeting gave a second thought to the possibility that the UFOs might be a super secret U.S. aircraft or a Soviet development. The scientists knew everything that was going on in the U.S. and they knew that no country in the world had developed their technology far enough to build such a craft that would perform as the UFOs were reported to do."

(Ridge: What the records showed and what the Air Force knew, was rejected by the panel).

I remember Blue Book

by Jennie Zeidman

■■ **Jennie Zeidman, author of *A Helicopter-UFO Encounter Over Ohio* (1979), is a CUFOS board member and a contributing editor to *IUR*.**

The dark recesses of the CUFOS archives have yielded up a paper titled *Report to Stork on Blue Book Henry*. The by-line is my own; the date is August 1953.

The document is a compendium of 148 "FLYOBRPTS" (flying object reports) and their cursory analyses as they passed from the Air Technical Intelligence Center (ATIC) through the hands of J. Allen Hynek (and me) between January and July 1953. (See illustrations 1 and 2 for examples.) The report also summarizes correspondence with the 35 amateur astronomical societies, 19 Ground Observer Corps Filter Centers, and 48 CAA (now FAA) Control Towers which were contacted with the objective that they would or could provide corroborating (or disconfirming) information for the official reports, specifically with regard to phenomena such as bright meteors/fireballs, normal aircraft, or meteorological phenomena.

The report itself is of little import. The Air Force favored astronomical answers, and Hynek was able to provide many from the selected raw reports presented for his analysis. (See bar graph.) The extremely high number of unknowns (22 percent) and cases of insufficient data (another 10.8 percent) reflect not so much the high strangeness of the information presented as the inadequacy of the reporting mechanism. One paragraph of teletyped tidbits was supposed to provide enough information for a justified, probable, or at least possible identification. Of course it couldn't be done. I don't recall our criteria for differentiation between "unknowns" and "insufficient data." The only certainty I can see in perusing this report is that Venus was in eastern elongation during that time period and that lots of people, even those from college physics departments, couldn't identify it.

Of greater interest than the report may be some associated memories of those heady times: the convolutions of funding of UFO research, the desperate emphasis on hush-hush amid an environment of ludicrously slipshod security, and the unfolding mystery of where Hynek's consultancy to the Air Force on Project Blue Book really fit into the larger scheme of the UFO hierarchy. Enlightening discussions of these matters appear in Hynek's *The Hynek UFO Report* (1977) and David M. Jacobs' *The UFO Controversy in America* (1975). The remarks that follow reflect my personal involvement and interpretations as Hynek's assistant between 1953 and 1956.

Project Stork

Let us start with Project Stork. I doubt, 38 years later, that I'll ruffle any feathers with that name. Heaven knows, it's been mentioned in print, and from time to time I've come across persons (there must have been thousands of us, worldwide) who worked on various phases of it. The fact is that the mission of Stork was to ascertain the capability of the Soviet Union to engage in technological warfare. The specific interest for our purpose is that the group at Battelle Memorial Institute which produced the (in)famous *Project Blue Book Special Report 14* was associated with Project Stork. Okay, let's not beat around the bush. *Special Report 14* was a product of Project Stork.

Does that mean that the government thought UFOs might be Soviet technology? Or does it mean that the government already knew (five years after the Roswell incident) what UFOs represented, wanted to see what the Stork statisticians came up with, and then made sure that the "analysis" met with government "standards"? (Shades of the Condon Committee 15 years later.)

The answer is: probably not. The Condon Committee's blatant objective was to pacify the public, whereas *Special Report 14*, within Battelle/Stork, was Top Secret. It didn't *need* to be created (for public consumption) if the answer was already known—in other words, that the empirical characteristics of UFO reports were statistically different from those of reports that were ultimately resolved into mundane phenomena. Or was Stork perhaps merely a convenient funding vehicle for *14*, a legitimately asked question, a relatively small effort that could be justified (or hidden) under the scope of the Stork mission? Regardless, Battelle *was* the right place for the work to be done. It is a superb group of scientists and engineers scrupulously devoted to excellence.

Battelle's involvement with the fringe subject of UFOs was therefore a source of great embarrassment to it —a family secret, a skeleton in the closet equivalent to

Grandpa's alcoholism or Uncle Ray's penchant for little boys. One absolutely did not mention Battelle in connection with UFOs. And since I had no need to know, the fact of this involvement (in spite of my Secret clearance) was kept from me for over a year.

In the spring of 1987 I found myself at a dinner party seated next to a Battelle executive—an old timer who I knew had worked on *14* as a member of Project Stork. I asked him if after 34 years he had anything he wanted to say about it.

My question made him uneasy. "We were concerned," he said. He was referring to the data and to the Battelle scientists' interpretation of those data. He was referring to the thoughts of his fellow scientists on the question of "What are UFOs?" "We were concerned," he said, and he would say no more.

Project Henry

During the first month (January 1953) I worked for him, Hynek went to Washington to attend the meeting of the Robertson Panel. He was an associate member, a second stringer, which was odd because he had been working directly with the data for about five years. I remember his return on a cold, wintry day. I expected him to announce there would be a major scientific undertaking on the subject. Instead, he told me, "They're not going to have a scientific investigation. For some strange reason they voted it down. They didn't even take a decent look at the data, and they decided to discredit them."

Perhaps he needed some levity that day when he looked up from his coffee and crackers and suggested that we should have a name for his consultancy project, "something that captures the idea that these things flit around the sky." An old-time popular insecticide was called Flit, and its trademark showed a hand-pumped sprayer and, I believe, a harried woman who had just been scared by a bug. "Quick, Henry, the Flit!" she is shouting. Hynek latched on to the word Flit, and thus Project Henry was named (Flit being too obvious and Project Insecticide somewhat cumbersome). Readers familiar with Hynek's sense of humor know I couldn't possibly have made this up.

This is the way Henry worked:

About once a week a courier from Wright-Patterson Air Force Base (I *assumed* he was from Wright-Patterson) would arrive at Hynek's office at Ohio State University with a manila envelope stuffed with TWXs—teletype UFO-sighting reports received from military facilities around the world.

Were they all of the reports Blue Book received—the total number it took in? Surely not. (Hynek often said he knew the best cases were withheld.) I usually looked them over before Hynek did. I had a Secret clearance by then (mid-1953), but only a few were ever classified beyond Restricted, and the sensitive material usually had to do with the installation or facility of report origin, not with the contents of the report per se. If Venus was in western elongation, there would be a whole slew of reports of a bright white light in the predawn east, and Hynek would chuckle and mutter about how darned uneducated the public was. When we would get a report of high strangeness, he would scratch his chin—beardless until the fall of 1953—and say this might bear looking into. We would outline the information we wanted to have, and we would pass that on to Blue Book. But it hardly ever followed up for us. If we really wanted some information, we would have to go out and try to get it ourselves.

Hynek was paid to investigate only reports allocated to him by Blue Book. That meant that if we heard of a case in some other way—if someone called the observatory, say, or there was a newspaper story—we could not count it as an official case, and any expenses incurred by Hynek or me were not reimbursable. Many times we asked people to send a report in to Wright-Patterson so that a case we were already working on (privately) and had spent money investigating could become "official." Sometimes it worked; sometimes it didn't.

Hynek went to Wright-Patterson two or three times a month, and about once a month I went along. The Blue Book facility—building 263, not Hangar 18—consisted of three cramped, crummy little offices. The paint was peeling, and the file cabinets were warped. There were a United States map with pins stuck in it, a sergeant gofer, a gum-cracking, beehive-hairdoed secretary (a civilian), and a dried-out coffee pot on the window sill. This was before computers, of course, so the cases were filed chronologically. If you knew the date, fine. If you knew only the location, try the card index, and lotsa luck. No wonder I never saw Capt. Ed Ruppelt, the Blue Book head, smile. (I remember him as a by-the-book sobersides. I don't recall a human side of him, even when we were having an informal lunch. But I seem to remember intense blue-gray eyes.)

In the early days of my association with Hynek, my title was research assistant, OSU department of physics and astronomy. I worked a few hours a day, spending about half my time on UFO matters and the rest as teaching assistant for Hynek's undergraduate astronomy course and general Girl Friday for OSU's McMillin Observatory. (I was also carrying 15 hours in my second-to-last undergrad quarter.) As the year progressed I graduated, my Secret clearance came through, I worked full time, and my UFO work increased proportionately.

The 1954 flap was underway, and one day I asked Hynek how it was that OSU was willing to keep me on as research assistant when most of my work was for ATIC.

"You're not working for ATIC," Hynek said. "You're working for a contractor."

I had no idea what he meant. "A contractor," he repeated. "A contractor who doesn't want to be known. But don't worry about it. I've already told you too much."

But I did worry about it. My paychecks said Ohio State University. The phrase "laundered money" was not in common usage in those days.

I stewed over this for a few days—not more than a week or two—and then the courier came with the weekly reports. Same man, same car—a Chevy that bilious shade of GI green. For some reason I walked him back out to his car, and did an incredible double-take as he drove away. It wasn't a government car. It was his own car, with Ohio plates. This man's initials were V.E., and the car license plate was VE-29. What a stroke of luck: a spook with vanity plates!

Furthermore, he was from Columbus. The local Chevy dealer's name was on the license-plate holder.

Within five minutes I had raced over to the main OSU library, pulled down the Columbus city directory, and found the man's name and his place of employment: Battelle. Confronting Hynek with my intelligence coup resulted in a few days of negotiations with Stork followed by an increased work load.

I went on a number of field trips for Henry, and the security situation was almost invariably deplorable.

Hynek arranged for me to visit astronomer Clyde Tombaugh at White Sands Proving Ground, New Mexico, during a trip I had previously planned for winter break 1952. (This was a private trip; I paid for it myself.) Tombaugh, who in 1930 discovered the planet Pluto, had himself experienced an extraordinary UFO sighting in 1949. A large, transparent fuselage with lighted windows had sailed across his view as he enjoyed the evening in his backyard.

I arrived at White Sands after a cold and miserable pre-dawn bus ride from El Paso, and Tombaugh sent someone out to the gate to escort me to his office. We walked through hangars and offices and laboratories. "Oooh, what's *that*?" I asked. There were rockets and fancy instruments and equipment lying all over the place. "That's the new Nike," my escort said, "and that one over there's the Honest John." I was carrying no documents to identify myself as affiliated with ATIC. No one asked what kind of clearance I had. And at that time, December 1952, I had none.

The fifth horseman

Hynek also arranged for me to meet with Lincoln LaPaz, the eminent meteoriticist at the University of New Mexico. LaPaz had been consulted by the Air Force during the spate of green-fireball sightings over the Southwest. It was common knowledge that he was

INTEL 3-35. Unidentified object sighted at 0202Z, 8 March, 1953 near Kent Hill, Maine. It was described as a big red ball of fire going west-north-west and was observed for about 12 minutes until it disappeared beyond the horizon. A similar object was observed at 0400Z, 1 Mar, 1953. High speed, no maneuvers, no exhaust. It was a visual observation from the ground with no electronic equipment used. The observer, Mr. Van Ethen, Physics Department, Kents Hill Academy, was located at 70-degrees west and 44 degrees 24 minutes north. He estimated that the object was 40 to 60 miles away and low in the sky. The object was observed by three faculty members and ten students of the academy. The weather was cold and clear with no wind. No physical evidence available, no interception action taken and no known air traffic in the area.

P Probable

interested in UFOs. (LaPaz is mentioned prominently in Ruppelt's *The Report on Unidentified Flying Objects* [1956].)

I found LaPaz in his office at the university. I remember the formality of the room, he behind a large wooden desk, I in a straight chair at right angles. In contrast to the easy-going Tombaugh (and his family, who treated me to a Mexican lunch), LaPaz was a formidable presence, and I felt a bit uncomfortable. We discussed UFOs in general terms. He chose his words carefully, suggesting that the U.S. government knew *plenty* about UFOs. I brought him up to date on Hynek's work and the general skepticism that I felt pervaded Hynek's philosophy (and mine, too).

LaPaz listened to what must have been my naive jabberings. Then he pinned me with a solemn stare. "UFOs are the Fifth Horseman of the Apocalypse," he said, and I was soon dismissed.

Pestilence, War, Famine, Death, and. . . ? As the years have passed, LaPaz's chilling pronouncement has caused me growing concern. His name is not listed on the controversial MJ-12 document. But if such a group, or its equivalent, existed, he would have been a logical candidate for membership.

Back in Ohio the summer of 1953 produced a changing of the guard. For a few months Ruppelt was away, and Lt. Bob Olsson was in charge of Blue Book. At some time in that interval Hynek was going out of town, and he told me to expect a visit from some people from Wright-Patterson. Olsson (whom I already knew) came in, with the sergeant gofer and another man, probably also a lieutenant, to whom I was not even introduced.

It was a hot, stuffy day sans air conditioning. The soldiers took me into Hynek's inner office at the observatory, and the lieutenant arranged the chairs: a straight chair in the center of the room—for me—and three other chairs at 10, two, and six o'clock positions. The anonymous lieutenant and Olsson faced me, and the sergeant sat out of my vision with a clip board and pencil.

They asked me how things were going with the project. What was Hynek's attitude? What was my attitude? How did I like the work? What did I think of this case or that? My utter disingenuousness carried me through this ordeal. In my naivete I was probably even flattered to be the object of so much attention. In retrospect the third man reminds me of that nutty CIA man in the *M.A.S.H.* television series—the ludicrous paranoid who was forever finding devious plots in the most innocent situation.

I liked Bob Olsson. He often included his own evaluations and a friendly note on the reports sent to us, and I felt he was genuinely interested and conscientious in his work. Perhaps that's why he lasted only a few months at Blue Book.

By mid-1956 Hynek had moved to Harvard for his worked on the International Geophysical Year, and I had moved to the main Battelle campus (about a mile from OSU) where my work for Stork also involved the IGY. The subject of UFOs was never mentioned.

Blue Book and beyond

Though I was officially removed from Blue Book business, Hynek and I continued to communicate regularly about UFO matters.

At midnight on March 26, 1966, my husband got me out of a shower for a call from Hillsdale, Michigan. It was Hynek, pleading with me not to get upset when I saw the morning papers. The Air Force had backed him into a corner. *Say something*, he was told. So he had said something. He had said that swamp gas was a possibility as a natural explanation for some lights over a marshy area, and the press jumped on it. The swamp-gas incident distressed him terribly because in effect the Air Force had forced him to compromise his scientific integrity.

Blue Book folded the end of 1969 following the publication of the Condon Report. Within a few months of the *start* of the Colorado project, Hynek had told me he knew it had been decided that the findings would be negative. For years he had understood that he was being kept out of the inner circle, that even with his high security clearances it was judged that he had no need to know what was really going on. He knew he had been used. He seemed actually relieved, then, when his Blue Book work was over. Now he was free to pursue UFO research from a purely scientific viewpoint without the restrictions imposed by his government contract.

But was Hynek's government UFO work *really* over?

In October 1973 he called me to pick him up at Wright-Patterson and bring him to Columbus. It was the height of the Yom Kippur war, and Wright-Patterson was on highest security status because supplies for Israel were being flown from there. I took a wrong turn near the Air Force museum entrance and wound up driving out onto the perimeter of the field. I drove half a mile out on a taxi strip before I could turn around. No challenge. No one came after me.

I finally got reoriented and drove up to where I was supposed to pick up Hynek. It was a small one-storey building, and Hynek was standing in the doorway as I drove up. Another man appeared from the building. He was in dress uniform and may have been a major. I got out of the car, and Hynek made it a point to introduce me. Of course Hynek was always polite, but he easily could have just gotten into the car with no introductions. It seemed to me that the introduction was a purposeful act which I assumed had something to do with the fact that I was a UFO associate.

On our way to Columbus I asked Hynek in general terms what was going on. He would not tell me anything about what he was doing at Wright-Patterson. In face of his reluctance to explain, I felt I could not pursue the subject. But he was agitated on that trip and seemed

The Logical Trickery of the UFO Skeptic

By Brian Zeiler

Skeptics in the scientific community resist the evidence for extraterrestrial visitation because of the implications it raises and because of the questions it begs. But should the integrity of the determination rely on the implications of a positive classification? Or should the classification of true or false be assessed in isolation of the implications? Which is worse -- a false positive, meaning ruling in favor of the UFO as a unique phenomenon when in fact it does not exist, or a false negative, meaning ruling against it and missing out on its true existence?

The answer, of course, lies in the incentive structure of the analyst. An equally intelligent non-scientist has no incentive nor predisposition to favor one type of error over the other, but scientists do. For scientists, it would open a whole new confounding problem domain, and it would make them look incompetent in the public's eyes for missing out on this fact for 50 years. That's why the incentive structure of contemporary scientists is such that they will not accept alien visitation unless they must, which would be when they get irrefutable physical proof. Their incentive structure prohibits them from making any such inference unless it is unavoidable, and they will strain the boundaries of logic and reason to no end to dismiss all evidence other than physical proof, no matter how powerful it may be. This scientific predisposition toward disbelief, rooted not in science and logic but rather in dogma and paradigm, brings us to the logical trickery of the scientific UFO debunker.

What Exactly is "Extraordinary"?

First, the scientific debunker will say that because alien visitation is an extraordinary claim, it thus demands extraordinary proof. Therefore, no evidence is suggestive of alien visitation unless it is accompanied by irrefutable physical proof -- even if the observations directly indicate, within normal scientific evidential standards, the presence of a solid object under intelligent control with propulsion technology beyond human understanding. No matter how directly the observations indicate an anomalous vehicle of nonhuman origin, skeptics maintain that a prosaic explanation must be adopted unless physical proof is obtained. But such a stance, rigid beyond the normal standards of scientific methodology, is a direct product of the incentive structure, not of logic, as indicated above. Normal standards of science would require meeting the evidential threshold for each of the above conditions necessary to establish extraterrestrial origin; yet the same degree of evidence for physical substance is rejected for anomalous vehicles when it would otherwise be accepted for observations of more conventional vehicles.

Thus, the debunkers have failed to define the boundary of extraordinariness, which renders the declaration logically specious due to its wholly arbitrary implementation that is easily contaminated by individual and collective incentives. They exploit the arbitrary classification of "extraordinary" by applying absurdly rigid evidential boundaries to cases that clearly feature anomalous, physical vehicles that humans could not have built. Instead of assessing the case for physical substance on its own merits with the radar-visual observations, they merely apply a priori probabilities of nearly zero to the detection of anomalous vehicles, with no logical defensibility in the face of insufficient information to estimate the a priori probability, and therefore give themselves license to reject all evidence of any quality unless a physical specimen is obtained.

For instance, if SETI receives an anomalous repeating signal with intelligent content such as a mathematical constant, and rules out all known causes of terrestrial and deep-space interference, do they need a chunk of the alien radio dish or a dead alien to attribute it to alien origin? It would be just as easy to apply UFO-skeptic logic and insist that the signal is nothing more than anomalous until we obtain physical proof of aliens; after all, why ascribe a radio signal to alien

origin before we have physical proof of the existence of aliens? After all, we cannot rule out malfunction, fraud, or human error with 100% certainty, so the simplest explanation is an undetected flaw, not an alien message. Right?

Or is it really just the case that the a priori probability assumed by scientists of alien radio detection is higher than that assumed for atmospheric detection? Is this a priori probability differential between radio versus atmospheric detection logically defensible? Or do we lack sufficient information to make anything but a wild guess, a guess contaminated by incentive, dogma, and mere habit? Why do so many scientists, including Tipler and Fermi, argue that interstellar travel would be feasible for advanced civilizations whose productivity growth has created such vast wealth that journeys are less expensive than they would be for us humans? Do we know what alien energy resource stocks are? Even right now, we have the technology to mount a journey at 10% of the speed of light and arrive at the nearest star in 40 years. How "extraordinary" is it to consider that, several billion years ago, one culture might have mounted a gradual expedition that took them to our solar system and many others? We sure don't know whether this is "extraordinary" or the natural outcome of technological advancement, but many scientists wish to believe, simply due to heavily entrenched ideologies with absolutely no basis in logic nor fact, that such interstellar expansions are far less likely than the human interception of alien radio signals.

So just what is "extraordinary", aside from a word referring to a claim for which extremely low a priori probabilities of truth are applied? I consider extraordinary a claim which undermines fundamental precepts of physics. Alien visitation does not do this. And no matter the difficulty as we perceive it, interstellar travel does not violate the laws of physics. Neither do aliens. Therefore, alien visitation does not violate the laws of physics, and nor does it require a straining of credible probabilistic expectations. We simply don't know how likely it is. And that is hardly a strong case for considering alien visitation an "extraordinary claim."

Nevertheless, skeptics will insist on applying to alien visitation an a priori probability of nearly zero for some strange reason. Interestingly, many scientists such as Fermi and Tipler were skeptical of both UFOs and of alien life in general; they contended that interstellar travel would be easy for advanced civilizations, so the lack of overt contact disproved alien existence. Yet most UFO skeptics do believe alien life exists out in the universe -- just not here. So they defend the near impossibility of interstellar travel, which contradicts a considerable portion of the scientific community.

This a priori probability allows them to reject evidence arbitrarily that would otherwise confirm the presence of a solid object under intelligent control with propulsion irreproducible by human technology. For instance, when a certain degree of corroboration of physical substance for an airplane is obtained for an unconventional disk-shaped vehicle, this degree of evidence is accepted for the airplane but rejected for the anomalous vehicle. The only way to do this is to apply a priori probabilities of nearly zero to the detection of such an anomalous object. The problem, of course, is that first of all, we don't have enough information to defend a low a priori probability, and second of all, this approach guarantees automatic rejection of normal avenues of evidence. Effectively, what the skeptics are saying is that radar evidence is too "ordinary" to suffice for an "extraordinary" claim. They succeed in eliminating from review all types of indirect and direct evidence, except for physical proof.

This type of logic can be successfully applied to any claim. For instance, let's declare that dinosaurs are an extraordinary claim. This declaration requires no logical substantiation, just the way skeptics use their nearly zero a priori probability of extraterrestrial visitation to declare the claim extraordinary with no logical defense whatsoever, given the insufficient information to determine this probability. So, we have declared dinosaurs to be an extraordinary claim. The next step is to reject all fossil evidence for dinosaurs, since fossils are only acceptable for

ordinary claims such as woolly mammoths; for extraordinary dinosaur claims, fossils are worthless. What we need, as dinosaur skeptics, is physical proof of an intact dinosaur. And, to make it even more similar to the skeptic approach, we don't need to defend the rationale of the demand for physical proof of dinosaurs; the fact that it is an extraordinary claim allows us to demand the very upper boundary of conceptually feasible modes of proof -- but conceptual feasibility does not translate into practical feasibility. Sure, I can demand physical proof, but will I get it? Is it worth ignoring fossil evidence in my wait for physical proof?

We could extend the analogy further by applying more skeptic logical tricks. For instance, dinosaur articles are published in journals which already believe in dinosaurs; therefore, it is biased and one-sided, and hardly representative of truly critical peer review. We could assert that all fossils are best explained as hoaxes, misidentifications of known and unknown geological processes, and hallucinations and/or misinterpretations by overzealous paleontologists imposing their belief system on an anomalous rock. This, I can contend, is the "simplest explanation", and I don't have to worry about using over strenuous logic because, in an absence of physical proof of dinosaurs, any explanation is simpler, no matter how contrived and convoluted! This is the essence of the scientific rejection of the UFO evidence: an overwhelming need to disbelieve coupled with a shameful lack of research into the actual evidence.

The Demand for Physical Proof

If aliens were visiting, I find the expectation of physical proof quite illogical, since it's going to be hard to obtain. In fact, it may even be impossible. But the skeptics don't mind, since they have already decided to disbelieve until they obtain the highest conceivable level of proof. In the above discussion, it was noted that anybody can apply this logic by insisting that dinosaurs should not be accepted until we find an intact, frozen, preserved dinosaur with the flesh still on the bones, and if that's impossible -- well, too bad. Is it rational to reject fossils the way skeptics reject radar-visual cases and ground-trace cases and then demand a preserved dinosaur specimen the way skeptics demand an alien and/or vehicle specimen? I contend that physical proof is an unattainable evidential boundary which guarantees rejection of the hypothesis of extraterrestrial origin.

Despite the table-pounding insistence by skeptics on physical proof, they have simply not been able to defend this demand, one which is far beyond the scientific rigor that standard scientific methodology would require. The UFO evidence has satisfied the evidential threshold of normal scientific protocols; unfortunately, the evidence has been rejected by the dogmatic, specious demands for physical proof. For all these demands for physical proof, the skeptics have not been able to meet any of the following logical criteria necessary to defend the imposition of this arbitrary evidential threshold:

How can one declare a claim to be extraordinary without sufficient information to defend a low a priori probability?
Are there degrees of extraordinariness?
How does one relate a degree of extraordinariness to a fair and reasonable evidential threshold?
What is it about extraterrestrial visitation that implies the availability of physical proof?
How can we obtain physical proof?
How can an evidential threshold be imposed with no logical defensibility nor any rational expectation of actually meeting such a stringent threshold?

Occam's Razor and the Skeptics

The UFO skeptics don't understand Occam's Razor, and they abuse it regularly. They think they understand it, but they don't. What it means is that when several hypotheses of varying

complexity can explain a set of observations with equal ability, the first one to be tested should be the one that invokes the fewest number of uncorroborated assumptions. If this simplest hypothesis is proven incorrect, the next simplest is chosen, and so forth.

But the skeptics forget two parts: the part regarding the test of the simpler hypotheses, and the part regarding explaining all of the observations. What a debunker will do is mutilate and butcher the observations until it can be "explained" by one of the simpler hypotheses, which is the inverse of the proper approach. The proper approach is to alter the hypothesis to accommodate the observations. One should never alter the observations to conform with a hypothesis by saying "if we assume the object was not physical, despite the level of evidence that would imply the solidity of a conventional aircraft with near-certainty, then we can also assume the object was not moving, was not exhibiting the color orange, was not 50 feet in diameter as described, and then declare that it was really Venus."

But that's okay for the skeptics to do because it's an "extraordinary claim" being made that deserves to be explained away in a Machiavellian fashion as rapidly as possible with the urgent zeal of a religious missionary. Now, to alter observations to force conformance with the preferred hypothesis -- is that science? Or is that dogma? The answer, of course, is dogma. This practice is extremely poor science, and the approach undermines the very spirit of scientific inquiry. It is simply unacceptable to alter the observations that refuse to conform with the predetermined, favored explanation.

The ETH and Falsifiability

While a more thorough discussion of the formulation and potential falsification of the ETH can be found on the ETH page, one particular aspect is worthy of note as another logical trick. The skeptics complain that the ETH is not falsifiable, which is a condition that violates a necessary component of hypothesis formulation. This is not true, as explained on the ETH page. However, even if it were true, the skeptics fail to realize that their beloved SETI hypothesis of alien radio signal detection can be said to be nonfalsifiable! Does a lack of detection disprove the hypothesis that aliens are beaming mathematical constants at us? Certainly not, since our equipment may not be strong enough to detect them. It's been 30 years since SETI's beginnings, with absolutely no positive results whatsoever, yet the nonfalsifiability allows preservation of the project with hopes as high as ever.

Science versus Skepticism

Skeptics are skilled propagandists who appeal to base emotions just like a seasoned politician. Skeptics like to wrap themselves in the robe of science, declaring that their approach and conclusions are "scientific", in just the same way that a politician will cloak himself in the mantle of "family values" and "doing what's right for America." But is skepticism really as scientific as the skeptics want people to believe?

As has been explained throughout this essay, the clear answer is no. Their logical reasoning is rife with fallacies, from their arbitrary declaration of a claim as being extraordinary to their specious demand for physical proof to their abuse of Occam's Razor to their erroneous complaints about hypothesis falsification. So why do they claim that they are the real scientific side?

Skeptics are mostly scientists, but that certainly doesn't mean they behave scientifically, as has been explained. Their behavior stems partially from their distaste for public opinions that contradict the consensus of the scientific community. When a public consensus does contradict the scientific opinion, the scientists will mount a public campaign to discredit this opinion, because such an opinion undermines the role of the scientist in society as the appointed knowledge-seeker and truth-gatherer. What good are scientists if mankind will only insist on believing in warm, fuzzy superstitions anyway? So, these scientists who are guilty of the logical

infractions exposed in this essay are so consumed with the presumed validity of their opinions that, like a zealous religious fanatic, they must convert the masses to the side of truth in order to salvage their own self-image.

The second stimulus of pseudoscientific skepticism is that these scientists, who do not represent all scientists but rather a rogue band of propagandists, feel that science is about the mastery of nature. When nature introduces an anomaly -- a violation of expectation -- to science, the anomaly must be crushed. How dare nature violate science's laws and principles! The anomaly is supposed to indicate an incomplete framework or incorrect a priori assumptions, yet to the skeptical propagandists, it indicates misbehavior by nature that cannot be allowed to undermine their role in society. The anomaly is a threat to the validity of their work, so they must wish it away, convince themselves through wild logical fallacies that the anomaly does not exist, and return the public back toward the truths of nature that are approved by the scientific community. This tendency only changes when it becomes more work to deny the anomaly then to accept it; sadly, with UFOs, this is not likely to occur, because the scientific community will never deal with UFO reports.

Conclusion

The scientific community has vociferously resisted the acceptance of anomalies for centuries, with the Copernican Revolution being the most notable historical example. They threaten the paradigm and disturb the equilibrium. They undermine the community's self-perception of usefulness and value to society by threatening to destroy the assumptions behind their work. For the purposes of emotional well-being, they will be protested and debunked until they can no longer be denied; with UFOs, the breaking point will be physical proof. Yet as this essay demonstrated, the criterion of physical proof is a product of anomaly resistance, rather than a rational assessment of a priori probabilities or a rational interpretation of evidence. Instead of applying fallacious reasoning to the evidence, applying normal scientific standards to the UFO evidence would long ago have enabled the scientific community to embrace the ETH.

5. CONCLUSION
APPENDIX
A1. Summary of the reports

A2. Overview on some of the films
A3. Registrations on seismograph
A4. Registrations on radar
A5. Registration on spectrum analyser
A6. Registrations on magnetograph
- The temperature and the sightings
- An aeromagnetical map
- The geology
- The pictures

FOREWORD

The report first give an introduction to the project. Telling about the history of the lights and the running of the project. Then it lists all the instruments, and the arguments for using these instruments. Then it presents the results. All the details about the measured data are in the appendix. The fourth chapter discusses what we learned during the project

part 1, and what we should have done differently. At last, there is a conclusion.

1. INTRODUCTION.

Hessdalen is a valley in the middle part of Norway, south-east of Trondheim, about 30 km northwest of the town Røros. The valley is about 12 km long, and about 150 people live there.

In December 1981, unknown lights suddenly started to show up. The lights could stand still for more than an hour, they could move around slowly, and sometimes they could stop. They could also show a large speed: at one time a speed of about 8500 m/s was tracked by radar.

These lights could be anywhere. Sometimes they were reported to be just above the roof of the houses, or just above the ground. Sometimes they could be high up in the air. Mostly the lights were reported to be below the tops of the mountains nearby. No one could give explanations for these lights.

The lights appeared to have different specific forms. This showed up on the photos. It could have a form of a bullet, with the sharp end down. It could be round as a football. It could be as a "Christmas-tree" upside down. The colours were mostly white, or yellow-white. Sometimes it could have a small red light, usually on the top or bottom of the white. A few times it seemed to have all the colours; red, green, blue, yellow, at the same time. And sometimes, on the photos, we can see a blue light.

The lights were occuring several times a day, but mostly during the evening or nighttime. At the most, it could be seen about four times a day. All of these were actually in the valley. If we had counted those lights that showed up higher in the sky also, it could have been a higher number. There were more lights in wintertime. In summertime, lights were seldom seen at all. One reason for that might be that there is daylight almost whole night in summertime in Hessdalen.

The lights could be split in three group

- 1. Small and strong white or blue flashes, which could show up everywhere in the sky.

- 2. Yellow or yellow-white lights. These lights have very often been seen in the valley, just over the roof of the houses, or even down on the ground. They could be stationary for more than an hour, move slowly around in the valley, and sometimes show large accelerations and speeds. They could also be higher up in the sky. Mostly they moved on a north/south course.

- 3. Several lights together with a fixed distance from each other. Mostly it was two yellow or white lights with a red in front. Many people talked about "The object", when they saw this type of light. These lights could move slowly around the top of the mountains. The direction of "traveling" was mostly on a north/south course.

Suddenly, in the spring of 1983, the lights seemed to be much more seldom. In the summer of 1983 we got no reports. However, in the autumn and winter reports started coming in again, but much fewer than the years before. However, in this autumn (1984), we have got more reports than last autumn.

As no official institutes with governmental support seemed to care about these unknown lights, five persons started their own project. The aim of the project was to find out what this phenomenon in Hessdalen and nearby areas was. Even if we didn't succeed in that, we hoped to find out a little bit more about the phenomenon than what we knew before. This is the report on part 1 of this project. If founding is available, we will go on for another year.

The project consists of a "working committee", which has the responsibility for running the project, and an "advisory committee", which should help the working committee in the theoretical part. It should act as an expert group and answer questions from us; the working committee. (The fact is that the advisory committee got very little work from us, because we managed to build up a local expert group, consisting of people from Norwegian Defence Research Establishment (NDRE), the University of Oslo and the University of Bergen. In these days, the University of Trondheim also joins the group.)

The project was born on 3 June 1983. On 27 August it was presented on BUFORA's 3. international UFO-congress in England. During the autumn a research program was established. On 19 November the project was presented to the people in the valley. During the first part of January 1984, an information bulletin, explaining about the project, together with a simple report form, which people should return to us, were sent out to 3300 households in the district. The work in the field, with all the instruments, started on 21 January 1984, and ended on 26 February.

The work in the field started with a "test weekend". This weekend should be a training session for the main part, which should go on from 11 February to 26 February. During the test weekend about 22 persons were present. Some of these people could be on duty between the test weekend and the main part. Therefore, we decided that the project should go on, all the time from 21 January to 26 February. During the time between the test weekend and the main part there were few observers present. From Monday 23 January to Friday 27 there were 5 people. After that, only one or two people were on duty. That is perhaps the main reason why there are few reports during that period. In the main part, from 10 February to 27 February, the number of observers was as shown in fig. 1.1.

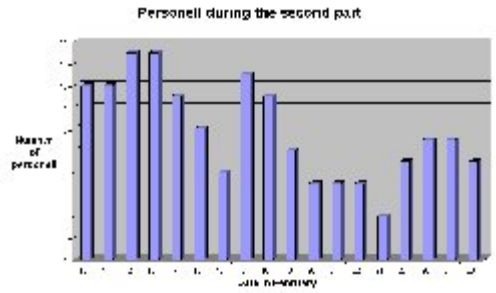

Fig. 1.1. - The number of observers during the main period.

The people in the field were divided in three groups during the test weekend. Some on the headquarter on Aspåskjølen, some on Finnsåhøgda, and some on Fjellbekkhøgda. For a short period, some people were at Heggset, too.

During the main period, from 11 February to 26 February, people were divided in three groups, but now the field-stations were at Hersjøen and Litlfjellet. The headquarter was still at Aspåskjølen. The headquarter was a caravan, with most of the instruments in it.

Some of the photos that were taken of the Hessdals-phenomenon prior to the project period, are in the appendix.

- Acknowledgements. -

I wish to express our thanks to:
Norwegian Defence Research Establishment (NDRE), especially Dr. E. Thrane and T. Blix for all help in planning the field investigation, getting instruments, and discussion of the results. O. Andreassen at the "Institute for theoretical astrophysics", for all discussion, planning and analysing the spectral photos. J. Havskov at the Institute of Solid Earth Physics, for all help in planning, installation and analysing the results from the seismograph. H. Bungum at NORSAR, for supporting us with seismological data and useful discussions. Professor Egeland and several of his men at the Physical Institute at the University of Oslo, for useful discussions.

Professor J.A. Hynek, Prof. J.A. Tellefsen, Dr. H. Rutledge and P. Devereux for being in the "Advisory Committee".

The people in the valley for providing us with living quarters, transportation, power to the instruments, and supporting us with positive attitude.

All those who performed excellent fieldwork, free of charge: L.G. B„rling, L. Berggren, L.S. Berlin, J.W. Bjordammen, D. Ekenhage, U. Ekstedt, C. Flemk, H. Gullberg, P.E. Gullberg, M. Heim, J. Hjelvik, J. Karlsson, S.E. Knutsen, M. Kaarbø, B. Lagesson, A. Lindholm, I. Lindstrøm, O. Lövgren, K. Malvik, D. Mattson, K.A. Mattsson, K. Melander, M. Nielsen, M. Nilsson, C. Nordin, S. Ohlsson, M.B. Pellving, K. Persson, K.O. Petterson, H. Svaerd, U. Tellander, A.P.

Thomassen, T. Thomassen, B. Tyselius, J.K. Quam, K. Aakerlund and others that helped in the project.

The three organisations: "UFO-Norway", "UFO-Sweden" and "Föreningen för psykobiofysik", which supported this project. Per Solerud for developing most of the films. Knut Aasheim, Hans Kristian Moe and Rønnaug Hansen for discussion and correction of this report.

The working committee has consisted of:
L. Havik, O.G. Røed, H. Ekstrand, J. Fjellander and myself, Erling Strand. Together we acted as a project leader-team, which had the responsibility for each part of the project.

[Map of Hessdalen will come]

2. THE INSTRUMENTS

We were facing something unknown, mostly reported as light sources. We wanted to find out what this could be. What should we do?

We focused upon the lights, mainly because most of the reports were dealing with them, and because they were most likely to give results. To find out what kind of instruments we needed, we first studied some of the reports, then we studied what people had proposed as solutions for these unknown lights. That led us to the following instruments:

- Camera with gratings
This is the best way of getting information of what kind of light source we are dealing with. Is it a continuous spectrum, or is it not? That is: Is it a light due to a thermal process, or is it not. If not, what gas-combination can it be? If it is, the big question is: What is the energy source?

This is probably one of the most important measurements to be done. If we get an answer to this, then we can choose the further procedure. It will also eliminate the wrong hypothesis. Plasma phenomena may give a line spectra, as for instance the aurora.

We obtained totally 6 gratings, 3 especially designed for spectral analysis: Paton Hawksley TE.216E. We also got one Paton Hawksley TE.218C and TE.215.

- Seismograph
Is this light due to movements in the ground? This is a hypothesis widely discussed these days. The hypothesis was proposed by P. Devereux in his book: "Earth Lights". There could either be a direct connection with movements in the ground, or it could be a connection with the tension in the ground just before or after a movement in the ground.

That hypothesis was the background for the seismological and geological investigation. We installed a seismograph; "MEQ-800 Portable Seismic System", in Hessdalen in October 1983.

We have also got detailed stereoscopic pictures from Hessdalen and the nearby areas. We could then find out more about the geology. This work is done by Dr.Sc.nat. M. Heim.

- Radar

Do these lights reflect radar waves, and if they do, what is the distance and speed of these lights?
This leads us to the radar: "Atlas 2000". This radar has a wavelength of 3 cm, with a maximum distance of 33 km.

- Spectrum analyser

Many reports from other parts of the world indicate that there has been electrical interference when an unknown aerial phenomenon is nearby. Radio communication has been affected. Even though, nothing of this has been reported from Hessdalen, we decided to monitor the spectrum. We coupled a broadband antenna to a spectrum analyser, which swept

from from 150 KHz to 1250 MHz continuously. This was a Hewlett-Packard, with a 8554L-RF Section, 8552A-IF Section and 141S Display Section.

We also got a radio interference and field intensity meter; Singer NM-25T. This instrument cover the band from 150 KHz to 32 MHz. The purpose of this instrument was to measure the strength of any unknown source detected by the spectrum analyser.

- Magnetometer

There is an hypothesis claiming that this phenomenon may be associated with a magnetic field.

We wanted to test this hypothesis as well. We also wanted to see if there were any connection with magnetical fluctuations (which occur frequently). We got a Fluxgate Magnetometer; Model FM100, Serial 73. This device had a high sensitivity: 1000 gamma gave a reading of 1 Volt. It had three outputs: X (towards north); Y (towards east) and Z (vertical). We connected this to a two-channel recorder: TOA Electronic Polyrecorder Model EPR-200A. Then we could record two (of the three) dimensions. This recorder was available only for a small period of the project. Whenever it was not available, we used an Esterline-Angus Graphic Ampmeter.

The magnetometer was mainly designed to measure slowly varying magnetic fluctuations, as for instance magnetic storms. It was not a pulsationmeter. It had a frequency response within 3 dB from DC to 0.5 Hz. Some of the pulsations were recorded when we used the TOA Polyrecorder. Sometimes they could be hard to read.

- Laser

A couple of reports from Hessdalen state that the light disappeared when a strong light-source was directed towards it. We wanted to test if this was correct. Therefore, we got a 633 nm laser from Spectra-Physics Inc. Model 155. This had a power of 0.4 to 0.76 mW in the TEM (00) mode. The divergence was 1 mrad.

- Geigercounter

Some people have claimed that there have been radioactive radiation from such uknown phenomena. Therefore, we got three geigercounters, which continously measured the background radiation. We had two Radiation Alert Mini, and one home-made with digital read-out.

- IR-Viewer

If there is any strong IR-radiation from these lights, it might be seen with an IR-viewer. We got two of these, from FJW, model 80045.

3. THE RESULTS

3.1 The lights.

During the project period in the field, from 21 January to 26 February, we obtained 188 reports on different lights. These reports have been characterized by two indices:

- One describes the quality of the report, and is given values from G1 to G10. If the report has very few details, it will probably get a G1. If the report is well documented with many details, it will get a G9 or G10.

- One index indicates the probability of finding a natural, or a "known-light" - explanation. If one can decide, with absolute certainty, that the light the report refers to, is a known light, i.e. an airplane, the report will get an F1. If no explanation is found, it will get an F10.

How can we decide if the report shall get for instance an F5 or an F6? This is of course very difficult, and we have not

any specific rules that make the decision clear to us. It is therefore a subjective decision, but it is made by two persons. Even if one report has got a G5 and should have got a G6, the result of giving quality marks is good enough to get an overview of the reports. The same arguments applies to the F-category.

If you study table 3.1, you notice there are few reports which both have a high F-score and high G-score. There are 6 reports with F9 and higher. 4 of them have got G7 or higher. That is too little to draw any conclusion about the nature of the light, or to find anything in common. You will find the details about the lights with high F-numbers in chapter 3.10, and in the appendix.

After studying the reports, I will set a threshold between F4 and F5. A report which has got an F5 or higher might be the Hessdals-phenomenon. If we study all reports which have got an F5 or higher, we see that about 68% moved along a north-south axis. If it was exactly on the axis is hard to say. 12% had other moving directions. Three lights (two of them have got an F10) changed moving-direction during the observation. Two moved up and down (one F9), and 6 reports have not indicated anything on how the lights moved.

Among these 53 reports, three indicate a special kind of movement. One of these was photographed (picture RW1/3). In the picture, you see the start of an oscillation. The frequency of this oscillation is 7 Hz +/- 2 Hz. The report tells that this oscillation was growing in amplitude until the light disappeared. Another report indicates that a flickering light stopped flickering, made a big jump, and started flickering again. All the time was it moving towards north. A third report tells about a "waving movement" when it was moving towards north.

39% of the reports (F5 and higher) indicate some kind of flickering. Two F10 lights were among these. 57% do not mention flickering at all or they say it is a stable light.

Table 3.1 - Categories of the reports. G=good (G10=best; many details in the report) F=strange (F10=very strange phenomenon)

	G1	G2	G3	G4	G5	G6	G7	G8	G9	Sum	
F1	0	8	6	4	1	13	2	47	5	**86**	**Total 135 reports about "A known light"**
F2	2	8	0	2	3	1	1	1	0	**18**	
F3	0	3	1	1	2	1	0	0	0	**8**	
F4	0	1	7	1	4	3	7	0	0	**23**	
F5	0	0	3	2	2	0	4	5	0	**16**	**Total 53 reports about "The Hessdalen Phenomenon"**
F6	0	4	1	1	1	3	4	3	0	**17**	
F7	1	1	0	1	0	2	1	0	0	**9**	
F8	0	0	0	0	0	2	3	0	0	**5**	
F9	0	2	0	0	0	0	0	0	0	**2**

Sum	**3**	**27**	**18**	**12**	**13**	**25**	**24**	**59**	**7**	**188**	

3.2 The spectral-analysis.

Out of seven films that were taken with a grating in the front, only four pictures are good enough to see some kind of spectrum. Two strong ones and two weak ones. None of these pictures were taken of a light that have got an F10-G9.

The two strong ones are taken of a light which have got an F5. With other words; it might be a known light. They are taken by Bj›rn Lagesson, Sunday 26 February at 03.08 am. The light was in the mountainside, northwest (azimuth 366 degrees out of 400) of the field-station at the lake Hersjøen. First there was a strong flash, then after 20 seconds, a strong "spotlight" was pointing at the observers for a couple of seconds. Then the spotlight was directed straight down for a couple of seconds. Thereafter the direction of the spotlight moved upwards and round in a half-circle, and back to the observers once more. Then it suddenly "turned off". The time from the first flash to the "turning off", was about 3 minutes. There were three observers observing this light. One of them thought it might be the spotlight from a snowscooter. But he was not sure, because the light seemed to be "too strong for that", and it had a little bit "strange movement". Anyway - this made it only an F5-light, even if it is strange that anyone should be out in the mountains at that time of the day. You find the pictures in appendix. Fig. A8.

One of the weak ones, with G7-G6, is analysed in a computer at the University of Oslo. The conclusion of this work is that it is too weak to say what kind of spectrum it is. It seemed to be some kind of spectrum from 560 nm to 630 nm. The maximum wavelength the film (Kodak Tri-X) can tolerate, is about 630 nm. We chose to analyse this picture, because it was best documented, and had the highest F-score. The picture was taken by Arne P. Thomassen on 25 January at 7.10 pm. He and his wife, Tone, was at the southern part of the mountain Finnsåhøgda. They saw a bright "planet" low in southwest. It was as bright as Venus at the strongest. It didn't move for a couple of minutes. Then it started to move towards north, on their western side. Arne shot three pictures. Just after Arne had shot the pictures, the light suddenly speeded up and disappeared. You will find a copy of the picture Arne took in the appendix, together with the data analysis.

We have also one picture taken by me, on 21 January at 7.30 pm. This is also too weak to say what kind of spectrum it is. The picture have also a lot of low and high orders of star spectra.

As I have mentioned earlier, I will set the criterion between F4 and F5: any light that has got a "score" of F5 or higher, should be treated as if it was the Hessdals-phenomenon. Because the pictures you see in the appendix, taken on 26 February, lie just at the limit, these pictures cannot be used as a proof that the Hessdals-phenomenon has a continuous spectrum.

3.3 The seismograph.

The seismograph was installed on 24 October 1983. We have not recorded any local seismic activity. All recordings on the seismograph was from earthquakes, or movements in the ground, with epicenters long away from Hessdalen.

The sensitivity we obtained with this installation was 1.5 on the Richter scale.

The Hessdalen area is not well covered from other seismological stations. In Norway, the nearest station to the south is Hamar, to the west Florø, to the north Tromsø. There has to be a quake with greater amplitude than 2.5 on the Richter scale in the Hessdalen area, to be detected on one of the nearest stations.

Inside a radius of 70 km from Hessdalen, there have been detected four quakes, all small in amplitude, during the last 6 years. Inside a radius of 50 km, there have been 15 recordings, during the last 100 years. Even though the area hasn't got any good cover, one can say that there is very little seismological activity, compared to other areas in Norway.

Until now, we have not found any connection between the phenomenon and movements in the ground.

Details of the recordings on the seismograph (from quakes in other parts of the world), and a list of seismological activity from 1887, within 50 km from Hessdalen, will be found in the appendix.

3.4 The radar recordings

Totally, we have 36 radar recordings. Three of those were probably also seen as lights. All the others were not observed

visually. Nine times we could follow this reflection on the radar screen, traveling on a nearly straight line. We have taken pictures out in the air, where the radar screen said there was something. But the pictures didn't show anything unusual.

Most recordings were done on 2, 3 and 4 February. More details in the appendix.

Two times we managed to take a picture of such a reflection. As you can see in the picture (figs. A9 and A10 in the appendix), this reflection is as strong as the reflections from the mountains. Such a strong reflection can be caused by a solid object, a strong gradient of for instance temperature, humidity or pressure. The picture is analysed by a radar expert at NDRE, and he said: *"If this isn't a reflection of a solid object, but only gas in the air, the gas has to be locally and strongly ionised. Otherwise, it wouldn't give such a strong reflection"*.

We did not get reflections from all lights. The reason for that might be the following: Mostly, we had the radar adjusted to show only 5.5 km. Those three times we did get anything on radar together with light, happened when the screen was adjusted on a longer distance. The reason might be that the lights were out of distance when the radar was adjusted to 5.5 km.

Why didn't we have the radar adjusted to maximum range; 33 km, all the time? The reason for that is that we waited for the light that used to travel in front of Finns†h›gda. Then we had to have it adjusted for a shorter distance. It is about 2 km to the mountain Finnsåhøgda.

One of the three times the light was followed with the eyes and was seen as a reflection on the radar screen at the same time and direction, there were reflections every second sweep. But the light was seen all the time. Could it be that the light does not reflect radar waves all the time? Only sometimes? The same thing happened a couple of times when we didn't see the light: Reflection every second sweep. Is it possible that it might "react" to radar waves? Was it because of the radar that it didn't reflect the second time? The technical data on the radar, and a copy of some of the recordings will be found in the appendix.

- The first time we saw a reflection on radar in the same direction as we saw the light, was on Saturday 21 January at 5.50 pm. It was a light which traveled towards north- northeast over Finns†h›gda. When it was in the north, it nearly stopped traveling and suddenly went right down and disappeared. We got one reflection on the radar in the same direction (+/- 5 degrees), when it went straight down.

- The second time was on Wednesday 25 January at 5.32 pm. The observers said: "A big object came from the south, moving towards north over the mountain Finnsåhøgda". When the light was just over Finnsåhøgda, there was a reflection on the radar, in the same direction (+/- 5 degrees) as the observers saw the light. The light was traveling slowly towards the north, all the time. On the next radarsweep, no reflection was seen. On the sweep after that, it was seen again. No more reflections were seen as it traveled further towards north.

- The third time was on Friday 27 January at 10.58 pm. A light was traveling from south to north. The speed seemed to be very large. There were two echoes on the screen. The time between them was 2.4 seconds, and the distance between them was about 20 km to 21 km. Just after (3 seconds) it was seen on the radar, the radar observer went outside. The observers outside told what they had seen. Both the direction of motion and the speed they indicated, seemed to be the same as the radar observer saw. The distance is hard to decide for the observers. The accuracy of the time of observing visually and on the radar is within about 3 seconds.

3.5 The Spectrum Analyser

We did not see anything on the spectrum analyser at the same time we saw the lights, but we did get some unknown recordings at other times.

The analyser was adjusted to show the whole frequency band in one sweep. That is from 100 kHz to 1250 MHz. These unknown recordings showed up as "spikes" with about 80 MHz between them. They went up and down with nearly

equal amplitude on the whole band.

These recordings were done from 29 January to 3 February, with a maximum on 3 february.

A natural explanation of these recordings, is noise from the radar. An argument against that explanation is the fact that we saw no noise on the radar screen when we got the spikes on the spectrum analyser.

3.6 Magnetometer

We have not found any simple correlation with the phenomenon and the "slowly-varying" magnetical fluctuations. But there is a correlation of about 40% with the pulsation-registrations: 4 of 10 registrations with an F5 or higher, from 11 to 14 February, came almost exactly at the same time as a pulsation. But during those days, there were many recordings of pulsations. So there is a possibility that there was a coincidence that the light showed up the same time when there was a pulsation. More observations are needed.

The reason why we had recordings of pulsations only from 11 to 14 February, is because that was the time we had a recorder that was fast enough to record the pulsations; TOA Electronic Polyrecorder. The other times, we had the Esterline-Angus Graphic Ampmeter, which only recorded the slowly-varying magnetical fluctuations.

If we go on for another period, we should have a pulsation magnetometer. Even though the Fluxgate magnetometer did record pulsations, it could sometimes be difficult to read the pulsations. Especially when there were magnetical storms.

In the appendix, you will find the collected data from the magnetometer. In the tables below, you find the times and approximate amplitude of the of pulsations, and the F-number of the lights.

3.7 Laser

We used the laser, and pointed it towards a flashing light, in two different cases, totally 9 times. 8 of these times, there was a reaction.

In the first case, there was a regular flashing light, slowly moving towards north, on Sunday 12 February at 7.35 pm. The flashing had been regular all the time we had seen the light. The light moved slowly. From the first time we saw it in the south, until it disappeared in the north, it took about 15 minutes. When this light was in the northern part of

Finns†h›gda, we pointed the laser towards it for the first time. At once, it changed the flashing sequence: From a regular flashing light, it became a regular double-flashing light: **Flash.Flash.....Flash.Flash.....Flash.Flash.....** After about 10 seconds, we put the laser down, at once it became a regular single-flashing light again: **Flash.....Flash.....Flash.....** After about 10 seconds we repeated this again. It was repeated totally 4 times before it went out of sight. All the times, we got this double-flashing, when the laser was pointing at it.

The second case, the same type of light came from the north and moved towards south. It was the same day, Sunday 12 February at 8.41 pm. When the light was in the west, we pointed the laser towards it. The same thing happened now; it changed to a double-flashing light when the laser pointed towards it. This time we did it 5 times. Only the last of these times did we not get any double-flashing. But 4 of these 5 times, we got it.

The test was done like this: Kurt Persson used binoculars looking at the light. He told what he was seeing all the time; he said: *"flash...flash...flash..."*. I (Erling Strand) used the laser. He could not see where I was pointing with the laser. When I raised the laser, pointing at the light, he said: *"flash.flash.....flash.flash.....flash.flash....."*. May Britt Pellving was a witness to what we were doing. There were also other persons out at that moment, but they were concentrating on their work.

3.8 Geigercounter

The geigercounters we used made a beeping sound every time they made a measurement. They were functioning all the time, but we could not hear any change in the counting rate during a light observation. I have to point out that we never had these lights close (less than 1 km) to the counters.

3.9 IR-Viwer

The two times we used the IR-viewers, we saw no strong IR- radiation.

But we used it only on lights far away. The power from the lights could have been too weak to be detected on our IR-viewer. And since we used it only two times, it should be clear that there is not enough material to draw any conclusion.

3.10 F10-lights

I will now go through the reports which have got a score of F10.

Monday 20 February at 6.12 pm: Red light
Maybe the most "unexplainable" happening was the red light on the ground. It happened on Monday 20 February. Leif Havik was alone in the caravan. He was dressing. Åge Moe (a farmer from Hessdalen) and Edvin Kværnes (also from Hessdalen), had just arrived. They waited outside the caravan. Moe at the north side, beside the door into the caravan, and Kv‘rnes at the south side. They should all go into Øyungneset, to see the lights from that place. Just when Leif went out of the caravan, a red light moved around his feet and disappeared. The duration was a few seconds. Moe said: *"Look at the reflection"*. That was the only explanation he could figure out at that time. Leif saw at once that it was the same type of light as from our laser. The laser we had used was at that time in Oslo.

To check if it really was the same type of light, as from our laser, we brought the laser back on 25 February. Moe had never seen a laser before. We brought him to the caravan. It was about the same time of day when we did this checking. When I put the light onto the snow, just beside our feet, Moe said: "That's exactly what I saw! But it was a little bit weaker". Then I put the light on the floor in the caravan, and he said: *"It was a little bit stronger than that"*.

What could make such a light on the snow. It was very strong. What could it be? All the lights in the caravan had been switched off before this happened. There were no lights outside. It could not have been light from the houses. The nearest house is about 500 meters away, and it is below a hill. The nearest house you can see is 2 km away, in the south.

The light showed up on the northern side of the caravan. All the houses you can see is on the southern side. And if any of the inhabitants should have a laser (very doubtful), probably the only place that person could have been, was in an airplane with no engine and with no lights. - We have not found any explanation on this light, and I don't believe we will either. In the discussion, Leif said: *"If I only had put my hand above it, then I could have found out where it came from. But I didn't think of that when I saw it"*. A second after the light had been "switched off", they looked up in the air, but nothing was seen. It was cloudy, but just over the caravan, there was a little opening in the clouds, and there did they see the stars.

Friday 17 February at 6.05 to 7.30 pm: Yellow light.
The report written by Ove Lövgren, from Hersjøen says: *"At 6.05 pm Ove Joakim Karlsson and Dick Ekenhage went up to the observing place. They came from the cottage. When they were 150 meters from the cottage, they saw a light on the west side of Hersj›en. At 6.15 pm they made some filming and took some pictures. At 6.25 pm they thought it was a cottage, because it hadn't moved. Joakim thought he saw two flashes from the light, but they went on up to the observing place. At 7.30 pm came a yellow light, which was two lights close together, from the western part of Hersj›en. It went to the northeast, but changed direction, and went right towards us. We took photos. When Joakim called on the walkie-talkie, it took a couple of seconds and the light burned out. The light was about 600 to 1000 meters from us, when this happened. Nothing more was seen, and no sounds could be heard, even when it was close to us"*.

- When we study the local map, we see that there is 3 to 4 km from the observing place to the mountain on the western part of the lake Hersjøen. If they used that distance as a reference, it might be correct the distance they indicated where the light burned out. - It was the same light as Joakim and Dick saw between 6.05 and 6.25 pm that moved at 7.30 pm. The report was not clear on that point. They looked at this light often during the time from 6.05 to 7.30 pm. - The film they took show only a moving light. No other reference is in the movie. Then we can't be sure if the movement is caused by the light movement or movement of the camera.

All this together made it an F10-light.

Thursday 2 February at 8.11 pm: A bright "object".
This was the same type of light which has been photographed earlier (see fig. A7). It was three separate lights moving towards north, just above the mountain Finnsåhøgda. It seemed to be quite near. The distance to Finnsåh&slash;gda from the observing place is about 1500 meters. The distance to the light was about 2 - 2.5 km. The observers could see these three bright lights. They indicated also that they could see a darker area in between the bright lights, and also smaller and weaker white light. The movement of the three bright lights was so that it seemed to be fixed onto one "object". Two of them was yellow-white lights and they seemed to be in the back, and a red one seemed to be in the front.

These lights were moving over the mountain Finnsåhøgda towards the eastern part of Litlfjellet. They seemed to be near and just over the mountain. When they were over Litlfjellet, they seemed to be in the same height as the top of Litlfjellet. They had, what the observers called; a waving movement.

At this time, there were none at the headquarter. That is why no instrumentation reading could be done. The lights were observed from Jon Aspås' house at Aspås. Leif havik had a coffeebreak at Jon Aspås, when Åge Moe phoned and told about the light which was coming. He called at 8.11 pm. Just after that, Lars Lillevold called and said the same thing. Åsmund Aspås and Johannes Lyngstad were also at Jon's house. Edvind Kværnes was at Åge Moe. They all went out, and Leif took a camera equipped with a 400 mm telephoto lens. He took some pictures. These pictures were not successfull, because there was no tripod. You can only see a light moving all over the pictures. This movement or smearing is due to the camera movement. The time from Leif Havik saw the light over Finns†h›gda and until it went out of sight at Litlfjellet, was between 1.5 and 2.5 minutes. Jon A. Aspås and his children had also seen it from Heggset.

Friday 27 February at 10.58 pm: A bright light.
Just after a plane was observed, moving towards north, a bright light was seen through binoculars over Brattbekken on the mountain Finnsåhøgda. Jon Aspås and Ruth Marry Moe were observers. Leif Havik was looking at the radar screen. The observers saw the light move at a great speed to the northwest. At that moment, Leif Havik saw two following echoes on the radar. The distance between the two echoes was about 20370 +/- 1000 meters. The time between them

was 2.4 seconds. That give a mean speed of about 8000 to 9000 m/s.

Just after Leif had seen the echoes, he went outside. Then the observers told that they had just seen a light moving at a great speed from south to northwest over Finnsåhøgda.

Their indication of the speed, direction of motion and time seemed to coincide with what Leif Havik observed on the screen. The accuracy of time was about 2-3 seconds.

4. DISCUSSION

- What have we learned and what should we have done differently?

4.1 The sightings

Totally we have reports on about 188 sightings. That includes the reports that were written on planes too; 86. There were of course more planes totally during the project period, but none had written any report on the others.

If you study the summary of the reports, in the appendix, and study the timetable of the planes, you might say that more reports should have a higher "F-score". This is probably right, but the reason why they haven't got any higher score, is that many of them did not look as anything unknown.

If we had got a direct line to the radar station that covers the district, we could perhaps have picked out the planes easily. That means that we would have got few reports with a score between F2 and F8. And then we would have got a more correct picture of the unknown light: When and where. The line to the radar station will probably be "connected" in a future project period. All recordings on planes moving to V‘rnes airport (200 km to the north) can then be noted. And if we together with this could register all planes that we can see, we could easily pick out the planes afterwards.

It is also important that we take measurements of all lights that we are not 100% sure is a known light. We once had a very good opportunity to make measurements; take spectral pictures of an F10-light; the one at 6.05 pm on Friday 17 February. But the reporters "thought" it was a cottage. After it started to move, they became sure that it was no cottage light, but it was too late to make any good measurements.

We must be more clever with the documentation of the photos. Some of the best pictures did not agree completely with the report. The observers should have taken reference pictures that couldn't have been mistaken. Even though this can be made better, and it will this winter, we have many documented pictures of the lights.

We did not have a continuous watch on all stations. So the fact that we have less reports before 11 February and in the last time of the period, is mainly because of lack of personnel.

4.2 The spectral analysis

Many of the spectral films had too much noise; higher order spectra from known lights. If we had built a special screen on the cameras, this type of noise could have been avoided. That is, we could have had more spectral pictures. We have learned from this mistake, and I hope that we will succeed in taking a spectral picture of an F10-light next time.

We only got four spectral pictures out of seven films, mainly because we didn't use this screen, and because the exposure time on the cameras sometimes was too short, and because the light sometimes moved too fast.

Next time we will have this screen. If we also could have a light amplifier on some cameras, the probability of taking a good spectral photo will increase.

4.3 The radar and spectrum analyser

We did not manage to watch the radar and spectrum analyser screens all the time. That means that it might have been more registrations on these than we have noticed. That's mainly due to lack of personnel.

Next time we should have instruments that could record every change on the screen. This should be possible with a spectrum analyser. But radar equipment with this possibility is difficult to obtain. If we don't get this, we should stress that more people should be at the main station.

4.4 The magnetometer

When we analyse the recordings afterwards, and find that probably no connection exists with the slowly varying magnetical fluctuations, only the pulsations, we can say that it is a pity that we didn't have a pulsation magnetometer, and that we didn't have the TOA-recorder all the time. Next time, we know that this is the main issue to stress on the magnetical part.

4.5 The laser

The results from the laser test are very surprising. Even though we have heard that one person have done a light test before and succeeded, I personally thought that this test was only a coincidence. But we did also get a result, 8 out of 9 times. We could have done this test more times. And I think we will another time. Maybe even a stronger laser?

4.6 The geigercounter and the IR-viewer

Even if we didn't register anything on these instruments, I think we should have them with us another time.

We didn't have any lights close to the station. If we have had that, maybe there had been a recording? The IR-viewer we only used twice, and I have already mentioned that this is not enough to draw any conclusion.

4.7 The "nonworking" instruments

Many times during the project period, the cameras failed. This happened mostly when we needed them most. Such happenings should also have been registered. Even some of the other instruments failed when we needed them most, mainly because of bad power connection. All such events should be recorded.

5. CONCLUSION

What is this phenomenon? What do we know about it?

We have not found out what this phenomenon is. That could hardly be expected either. But we know that the phenomenon, whatever it is, can be measured.

Beside the light measurements, it can be "measured" by radar and laser. Perhaps the measurements we did on the magnetograph and spectrum analyser are due to this phenomenon as well. We have to do more measurements with these instruments, before we can be sure of that.

We got no measurements with the geigercounter, seismograph or IR-viewer. But I will prefer to bring these instruments as well in the next period. And it might be useful to also record events that seem to be unimportant. We stand in front of

something unknown, and we must collect everything that might lead us to an answer on what this is.

Some hypotheses of what this phenomenon is, might be weakened or strengthened after analysing the measurements in this report. However, the different hypotheses will not be discussed here. The report is more intended to set a basis for further discussion on what it can be, and what should be used in the nest period.

Erling Strand (sign.)

A P P E N D I X

A1. Summary of the reports

The reports are either a separately written report, notes on tape, or notes on paper. If there is no space between two reports in this list, is it the same light that is reported in two or three reports.

The summary of the reports will be written as following: Hour.Minutes: Place; Category; Story..... Film name, no. ; .....Story.

The place is:
- (1): Aspåskjølen
- (2): Hersjøen
- (3): Litlfjellet
- (4): Finnsåhøgda (south)

- (5): Kjerrengvoll
- (6): Heggset
- (7): The intersection where the road from the headquarter
leads out to the main road
- (8): Øyungen

The category is:
F: Indicate how difficult it will be to find an explanation for the light. F1 marks with a hundred percent certainty that the light is known; i.e. an aeroplane. F10 marks that no explanation is found.

G: Indicate how good the report is. If the report contains many details, or if it contains details enough to get a satisfactory explanation, it will get a G9 or G10. If the report contains very few details, it will get a G1.

Saturday 21 January.
17.33: (5); *G6,F1*; A plane towards north.

17.45: (5); *G7,F6;* A yellow-white light showed up in the direction of the mountain Rødhovde. Sometimes it flickered with uneven frequency and uneven amplitude. It had an irregular movement. It moved towards the north over Finnsåhøgda and disappeared from sight at 17.48 pm.
17.50: (1); *G7,F8;* A red light to the north. Recording on radar. ES1/1-3
18.03: (5); *G7,F6;* A light showed up over Finnsåhøgda. It moved towards southwest. It was flickering. When it was over Fjellbekkhøgda, we saw that there were two lights. They were about 10 degrees apart. The last one was a little bit weaker. They moved in this way some minutes. Then, the last one moved up 10 degrees, and disappeared a short time after. The flickering was uneven. In between the strong flickering, there were several (weak) flickerings. The bright one continued towards southwest, and became weaker (longer distance). Just before it went out of sight, it stopped flickering, made a big jump, and started to flicker again. It went out of sight at 18.17. OGR/1
18.10: (1); *G4,F4;* Flashing light in southwest. ES/4
19.20: (1); *G6,F7;* Light with strange "jumps" in southwest. This jumping stopped suddenly, and it moved towards north. Sometimes there were strange movements, but not with any big amplitude. While it was seen in the north, it first slowly started to oscillate and suddenly made a big movement, like an "S", up in the air and disappeared. This happened at 19.30. RW/2,3 ES1/11,12,13,14 OGR/2-10
19.26: (1); *G3,F1;* Plane towards south. RW1/5
19.40: (1); *G5,F4;* Light in the southwest, moving towards north. Duration about two minutes. ES1/18
21.20: (1); G2,F3; Flickering light in southwest. OGR/11

Sunday 22 January.
01.50: (1); *G2,F3;* Flickering light over Finnsåhøgda. OGR/12,13
17.45: (1); *G2,F2;* Bright light moving towards north. (Plane?)
19.20: (1); G2,F3; Flickering light just above Litlfjellet. It moved towards north. It disappeared at 19.25. OGR/14
19.45: (1); G2,F2; Light moving towards north. Strange movement. OGR/17-19

Tuesday 24 January.
19.15: (4); G6,F4; Light in the east, with unregular flickering. It moved towards south. APT/3
19.20: (4); G6,F7; Many white lights with a big flashing red light, came from the north, turned around "Fjellbekktoppen", and moved towards north. APT1/4-12
19.40: (4); G6,F1; Plane towards north. APT1/13-15

Wednesday 25 January. 17.32: (1); G6,F8; Big "object" from south. Unregular white and red lights. Radar contact. Two echoes. (See separate radar report.)
17.41: (1); G6,F1; A plane over the station, moving towards north.
18.24: (1); G6,F1; A plane moving towards south.
18.40: (1); G6,F1; A plane moving towards north-northeast.
19.05: (1); G6,F1; A plane moving towards north-northeast.
19.10: (4); G7,F6; A yellow light, as bright as Venus, stood motionless a couple of minutes in southwest, 20 degrees

over the horizon. Suddenly it started to move towards north, in the west. "Just after I had taken three photos with the camera (with grating), it suddenly speeded up and disappeared behind Fjellbekkhøgda". APT1/22-24
19.16: (1); G5,F4; A yellow-red light moved towards north over Finnsåhøgda. LH1/
19.35: (1); G6,F1; A plane moving towards south.
20.12: (1); G6,F1; A plane moving towards south.
20.12: (1); G4,F6; A red flickering light moving towards the north, in the west. It moves down, when it is in the north.
20.54: (1); G6,F1; A plane moving towards south.
21.53: (1); G6,F1; A plane moving towards south.
22.00: (1); G6,F1; A plane moving towards north.
22.43: (1); G6,F2; A plane? moving towards north. No sound.
23.21: (1); G7,F1; A plane moving towards south.

Thursday 26 January.
22.47: (1); G4,F5; A bright light with a red light in front, moving towards north.

Friday 27 January.
22.53: (4); G2,F1; Plane.
22.56: (4); G5,F6; The big light (as a jumbojet) moved in the same course as the plane, but a little bit slower and lower.
22.58: (1); G9,F10; A bright light moving from south to north. It showed a large speed. This light was also registered on radar. The radar measured a minimum speed of about 8000 to 9000 m/s. See separate radar report.

Sunday 29 January.
17.31: (1); G3,F4; A light moving towards north.

Tuesday 31 January.
22.48: (1); G3,F4; A light mowing towards north.

Wednesday 1 February.
13.59: (1); G9,F1; Two small planes coming from Rognefjell, moving north. They were seen on the radar.

Thursday 2 February.
20.11: (1); G7,F10; A bright "object" moving towards north. It has two yellow-white lights, and it is darker in the middle. It has a red light in the front. The movement was "waving". It was near and low, just over Finns†h›gda, and it moved towards the eastern part of Litlfjellet.

Friday 3 February.
23.02: (7); G2,F6; A light just over the headquarter, moving up and down.

Sunday 5 February.
23.00: (1); G3,F4; A light moved straight down in the southern part of Finnsåhøgda.

Tuesday 7 February.
20.11: (1); G3,F4; A bright yellow light with a flickering red light, moving towards north.
22.47: (1); G3,F3; A light moving towards north.

Wednesday 8 February.
19.53: (1); G2,F4; A yellow light moved straight down, west of Litlfjellet.

Saturday 11 February.
18.44: (1); G6,F3; A light moved straight down between the two lowest stars in Big Dipper.
19.20: (2); G7,F5; A yellow light moving towards north. It was seen in the west. H001/1,2
19.21: (1); G8,F5; A yellow light with a flickering red light, moving from southwest to northeast. It went out of sight at 19.25. LH1/12-18
21.04: (2); G8,F1; A big light in the sky. Probably a reflection. It disappeared at 21.17. DM001/3
21.20: (2); G5,F2; A big weak light on the mountain. Probably reflection? It disappears at 22.40.

23.10: (2); G5,F2; Light in the sky. Reflection?
23.27: (1); G2,F9; A yellow-orange light in the east. The mountain is seen behind the light. It moves up and down.

Sunday 12 February.
18.18: (1); G2,F2; Plane (?) towards south.
18.29: (1); G2,F2; Plane (?) towards south.
18.35: (2); G5,F4; A yellow-orange light moving towards south. H001/4-8
18.39: (1); G2,F2; Plane (?) towards south.
18.41: (1); G1,F2; Two planes (?)
19.02: (2); G7,F5; A red light in the north, just over the horizon, moving towards west. Duration 1 minute. H001/9,10
19.13: (1); G2,F1; A plane.
19.20: (1); G7,F8; A red flickering light in the south, moving towards the north.
19.22: (2); G7,F8; The light meets a plane (G3,F2), that travels towards south.
19.25: (2); G7,F8; Bright light in the west, moving towards north.
19.35: (1); G7,F8; A red flickering light just over Finnsåhøgda. The first test with laser. Reaction! Four out of four tests.

19.52: (1); G2,F2; Plane moving from north towards south. ES2/10
19.55: (2); G5,F3; Light in the west, moving towards south.
19.55: (1); G3,F4; A red "double-light" in southwest.
20.40: (1); G4,F1; A plane moving towards south.
20.41: (1); G6,F8; A flickering light moved from the mountain Litlfjellet to the mountain Finnsåhøgda. It moves down in the southern part of Finnsåhøond test with laser. Reaction! Three out of four tests.
21.53: (1); G8,F5; Plane towards north. LH1/19-23
22.48: (1); G8,F5; A light moving towards north. LH1/24-28
22.50: (2); G5,F5; A yellow light moving towards north. Duration two minutes. H001/15,16
22.52: (1); G5,F5; Light moving towards north.
23.39: (2); G6,F6; Yellow light moving towards south. Duration 30 seconds.

Monday 13 February.
00.30: (5); G1,F7; A big light over Hersj›en. It stood still for a couple of minutes. Then it moved fast towards northwest, and stopped over yungen.
17.58: (1); G8,F1; A plane moving towards south.
18.02: (1); G4,F2; A satellite moving towards northeast.
18.19: (1); G8,F1; A plane moving towards south.
19.18: (1); G8,F1; A plane moving towards south.
19.39: (1); G4,F3; A light moving fast down on the mountainside. Reflection?
19.55: (2); G7,F4; An orange light "lay" on the edge of the mountain in northwest, for 40 minutes.
20.56: (1); G8,F1; A plane moving towards south.
21.05: (1); G8,F1; A plane moving towards north.
22.35: (2); G8,F6; An orange light in the south, 10 degrees over the mountain. It turned out after 10 seconds.
22.42: (1); G3,F1; A plane.

Tuesday 14 February.
06.07: (2); G8,F2; A white light moving upwards, in the west. Duration 4 seconds.
13.40: (1); G2,F1; A plane.
16.54: (1); G8,F1; A plane moving towards north.
18.08: (2); G7,F1; A flickering light in southeast, 10 degrees over the mountain. - A star. H002/3,4
19.22: (1); G4,F1; A plane moving towards north.
19.29: (1); G3,F1; A plane moving towards north.
19.32: (1); G2,F7; Three flashes in the southeast. First weak, then stronger and the last one very strong.
20.06: (1); G2,F9; Some flickering, in a short time, just by Hammerkneppen (?), in the north. It seemed to be very close to the headquarter.
20.12: (1); G8,F1; A plane moving towards north.
21.24: (1); G6,F1; A plane moving towards south.

Wednesday 15 February.
13.30: (1); G9,F1; A private plane moving towards south, on the east side of the station. Also registered on radar.
16.44: (1); G8,F1; A private plane moving towards south, on the east side of the station.
18.49: (1); G2,F6; A red flickering light moving towards north.
18.55: (1); G2,F6; A red flickering light moving towards north.
19.12: (1); G8,F1; A plane moving towards north.
19.28: (1); G3,F6; Red flickering light moving towards west, in the northern part of Litlfjellet.
19.30: (2); G6,F4; A yellow light moving towards north, in the west. It went out of sight at 19.38.
19.46: (2); G6,F6; A red unregular flickering light, moving towards north, in the west. 25 to 30 degrees over the mountain. It ended/went out of sight at 19.52. H002/5
19.54: (2); G6,F6; A red unregular flickering light, moving towards north. 20 degrees over the mountain. It ended/went out of sight at 20.06. H002/7
20.21: (2); G7,F7; A red flickering light, moving from the north to the south. It met a yellow light, which went over the red one. The red light was seen for 8 minutes, the yellow for 4 minutes.
21.00: (2); G8,F5; A yellow light, moving from the northwest to the southeast. 25 degrees over the mountain. It went out of sight at 21.12. H002/19
21.05: (1); G8,F5; A yellow-white-red light moving from northeast to southwest. It went out of sight at 21.08. LH1/31,32
22.00: (1); G8,F1; A plane moving towards south.
22.06: (1); G8,F1; A plane moving towards north.
22.46: (1); G8,F6; A big oval light, with a darker area in the middle, moving from the south to the north, over Finns†h›gda and west of Litlfjellet. It moved very low. LH2/00-1
23.15: (1); G8,F1; A plane moving towards north.

Thursday 16 February.
18.26: (2); G8,F1; A yellow light in the west, moving towards south. H002/21,22,23
18.26: (1); G8,F1; A plane.
19.33: (2); G7,F4; A yellow light in the west, moving towards north. H002/24-27
19.34: (1); G7,F4; A light moving towards north.
19.45: (2); G4,F7; 5 or 6 red flashes in the west, moving towards south. 5 seconds.
19.46: (1); G4,F7; 5 red flashes in the south.
20.10: (1); G7,F4; A light moving from the south to the north. It was seen until 20.14. LH2/3-7
20.12: (2); G7,F4; A yellow light in the west, moving towards north. H002/28,29
20.35: (1); G8,F1; A plane moving towards south.
21.00: (1); G8,F1; A plane moving towards south. LH2/8
21.01: (2); G8,F1; A yellow light in the west, moving towards south. H004/2-5
21.24: (2); G7,F6; A red light in the west, moving towards south. 40 degrees over the mountain. Duration 3 minutes. H003/3,4
21.53: (1); G8,F1; A plane moving towards south.
21.59: (2); G7,F4; A yellow light in the west, moving towards north. 10 degrees high. Duration 3 minutes. H003/3,4
22.21: (1); G2,F6; A light moving towards south.
22.42: (1); G8,F1; A plane moving towards north.
22.58: (1); G8,F6; A big light moving towards north in the west. It went out of sight at 23.01. LH2/9-15
23.12: (1); G8,F1; A plane moving towards north.
23.26: (2); G6,F4; A strong white light moving upwards, from north to south. Duration 2 seconds.

Friday 17 February.
17.15: (1); G2,F1; A plane
17.33: (1); G4,F1; A plane moving from north to south.
17.47: (1); G4,F1; A plane moving from south to north.
18.04: (1); G2,F1; A plane.
18.05: (2); G9,F10; A yellow light was observed in the mountainside, on the western part of Hersj›en. We took some pictures. But as it hadn't moved until 18.25, we thought it was a light from a cottage. A couple of times it seemed as if it

was flickering, otherwise it was stable. At 19.30 the light suddenly started to move out in the valley, direction northeast. Then we could see that there were two lights, placed very close to each other. Shortly afterwards, it changed direction, and moved straight towards us (in the south). One of us tried to call up the headquarter on a walkie-talkie (27 MHz). Just a few seconds after that, the lights "burned out". The distance to the lights when this happened, was about 600 to 1000 m. The time elapsed from it started to move until it "burned out", was about 1 minute 30 seconds.
18.44: (1); G2,F1; A plane.
19.13: (1); G2,F1; A plane.
19.37: (1); G8,F1; A plane moving from north to south.
20.23: (1); G8,F1; A plane moving towards south.
23.02: (1); G8,F1; A plane moving towards north.
23.37: (1); G8,F1; A plane moving towards north.

Saturday 18 February.
18.29: (2); G7,F2; Light in the mountain. Cottage (?).
18.36: (1); G8,F1; A plane moving towards north.
19.18: (1); G7,F5; A yellow-white light with a flash, moving towards north. Duration 2 minutes.
19.21: (1); G7,F5; White flickering light moving towards north.
20.18: (1); G8,F7; A strong light, just over the horizon in the east. Slowly moving horizontally to the south. It was slowly "flickering": It gradually became very strong, and when it gradually became very weak. Again it became strong and weak and strong... This happened about five to six times. Each time we managed to take a picture. These pictures have a very good quality, compared to what we could expect under such circumstances. It ended at about 20.20. RW1/13-17
22.01: (1); G3,F4; A flash at the top of Finns†h›gda.
23.21: (3); G8,F1; A plane moving towards south.
23.22: (1); G8,F1; A plane moving towards south.

Sunday 19 February.
17.38: (1); G4,F2; A plane (?) moving towards north, east side of the headquarter. LH3/4
19.18: (3); G5,F1; A plane moving towards north.
19.22: (1); G5,F2; A red-yellow light on the western part of Litlfjellet. LH3/5
19.25: (1); G8,F5; A light moving towards north, over Finnsåhøgda and west of Litlfjellet. It went out of sight at 19.28. LH3/6-10
19.27: (2); G8,F1; A plane moving towards north.
19.42: (1); G8,F1; A plane moving towards south.
20.05: (2); G3,F5; A small yellow-white light in the north- northwest. It stood motionless for 1 minute.
20.05: (2); G3;F5; First a light in north. Just afterwards; a flickering light towards north.
20.09: (1); G5,F3; A light moving towards north. A bright white flickering. It went out of sight at 20.16. LH003/11,12,15,16
20.11: (1); G5,F4; Red and green light moving towards north. LH003/13,14
20.13: (3); G8,F1; A plane moving towards north, in the west.
20.20: (1); G8,F1; A plane moving towards south.
20.20: (3); G8,F1; A plane moving towards south.
20.24: (1); G8,F7; A light just over the horizon in the east. It behaved just like the light the day before; the one at 20.18. LH3/17,18
21.25: (2); G3,F1; A plane moving towards south.
21.26: (1); G4,F5; A red light with a white flickering light, moving towards south.
22.09: (3); G3,F1; A plane moving towards north, in the west.
22.45: (2); G8,F7; A strong white light, with a red light in front, moving towards north. 35 degrees over the mountain. It went out of sight after 3 minutes.
22.48: (3); G8,F7; A red light and a strong white light moving towards north, in the west. Low over the horizon.
22.49: (1); G8,F7; A strong light with a red flickering light, moving towards north. LH3/21
22.51: (3); G8,F1; A plane moving towards south.
22.53: (1); G8,F1; A plane moving towards south.

Monday 20 February.
05.17: (1); G8,F1; A plane with a white flickering light, moving towards south.
18.12: (1); G7,F10; A strong red point moving around on the ground.
18.25: (2); G3,F1; A plane moving towards south.
18.30: (2); G7,F4; Two small red lights moving up the mountainside on Skarvan. They were three centimetres apart (relative dimensions, viewed at an arm's length), moving exactly parallel. It took the lights 30 seconds to "climb up" the mountainside.
18.41: (2); G2,F2; A small white light in the mountainside, in the direction of Fjellbekkh›gda.
18.45: (2); G2,F2; A white light moving down the mountainside, in the direction of R›dhovde.
19.22: (2); G5,F5; A yellow-orange light in the west, moving towards north.
19.24: (8); G5,F5; A light moving towards north, just above Øyungen.
19.58: (8); G8,F1; A plane moving towards south.
20.07: (2); G7,F4; A light moving very fast towards north. 35 degrees over the mountain, in the west. Duration 3 minutes.
20.08: (8); G7,F4; A light moving towards north. 60 degrees over the mountain, in the west.
20.09: (8); G7,F4; Three flashes very high up, in the east.
20.09: (2); G7,F4; Some flashes in the zenith (elevation 90 degrees).
21.54: (8); G8,F1; A plane moving towards south.
22.21: (8); G8,F1; A plane moving towards south.
22.48: (8); G8,F1; A plane moving towards north.

Tuesday 21 February.
19.41: (3); G1,F2; A plane (?).

Wednesday 22 February.
18.38: (3); G6,F1; A plane moving towards north.
19.13: (3); G2,F1; A plane moving towards north.
20.13: (1); G3,F5; A red light moving towards north.
20.14: (1); G8,F1; A plane moving towards south.
20.15: (3); G8,F1; A plane moving towards south.
22.23: (1); G8,F1; A plane moving towards south.

Thursday 23 February.
09.43: (1); G9,F1; A military plane moving towards northeast.
09.50: (1); G8,F1; A mil. plane moving towards north.
10.04: (1); G9,F1; A mil. plane moving towards northwest.
10.08: (1); G8,F1; A plane moving towards south.
11.54: (1); G8,F1; A plane moving towards north.
12.11: (1); G8,F1; A plane moving towards north.
14.46: (1); G8,F1; A mil. plane moving towards north.
22.15: (1); G8,F1; A plane moving towards north.
22.19: (1); G8,F1; A plane moving towards south.
23.37: (1); G9,F1; A mil. plane moving towards north.

Saturday 25 February.
18.37: (1); G8,F1; A plane moving towards north.
20.06: (1); G3,F4; A flash just over V†rhuskj›len.

Sunday 26 February.
03.08: (2); G7,F5; First a flash, then a strong "spotlight" pointing at the observers. Then the spotlight was directed straight down. Thereafter the direction of the spotlight moved upwards, and moved back to the observers once more.

A2. Overview on some of the films

In the summary of the reports, I have written down the corresponding films. Not all of these were successful. In this list, I will shortly mention what you can see on the films.

Lightst = A light that have made a line on the picture, due to a long time exposure.

Fi = Finnsåhøgda
FiN = Finnsåhøgda north
Li = Litlfjellet
LiW = Litlfjellet west
LiE = Litlfjellet east
VaW = Vårhuskjølen west

Film: LH1. Type: Tri-X. Time: 8 February to 15 February
7 : A snowscooter by the cottage at Litlfjellet. 8 February.
8 : Leif sitting in a sledge, 8 Feb. at 14.00 o'clock.
9 : A spectral-picture of the moon (half-moon).
10: A spectral-picture of the moon.
11: Only two lights, that might be noise (?). Otherwise nothing.
12: A lightst over FiN.
13: A lightst over FiN, further north.
14: A lightst over Øggdalen.
15: A lightst over LiW.
16: A lightst over Li.
17: A lightst over LiE.
18: A picture of LiE, no lights are seen.
19: A lightst over VaW, with some weak flickering.
20: A lightst over FiS, with uneven (?) flickering.
21: A lightst over FiS, with flickering with uneven amplitude.
22: A lightst over Fi, with two strong flickerings, and some weak.
23: A lightst over Fi, with flickering with even frequency and uneven amplitude.
24: A lightst over FiN, weak and no flashing.
25: A lightst over FiN, further north, now strong and now flashing.
26: A lightst over FiN, weaker towards the end (north).
27: A weak lightst over FiN/Øggdalen.
28: A weak lightst (or noise) over Øggdalen, and Aurora.
29: No picture.
30: Aurora with no reference.
31: Two weak lights over Va, or is it noise?
32: A weak light over Va. The picture is probably taken at dawn.

Film: LH2. Type: Tri-X. Time: 15 February to 17 February.
00: A light over FiN. There seem to be something black in the picture. Is it noise?
0 : Light over Øggdalen. There seem to be two black "things" in the picture. Is this also noise?
1 : Øggdalen. No lights.
2 : Picture of Fi.
3 : Picture of FiN.
4 : A weak lightst over FiN.
5 : A weak lightst over FiN.
6 : A lightst over Øggdalen.
7 : A lights over Li.
8 : A strong flickering light over VaW.
9 : A light just over the horizon of Fi. Noise?
10: A double-flash high over Fi. Noise?
11: A weak lightst over FiN.

12: Øggdalen. No light is seen.
13: Litlfjellet. No light is seen.
14: Litlfjellet, and something which is long and black. Noise?
15: A lightst over LiE.
16: The station seem towards Rognefjell.
17: A dark "U" over Li. Noise?
18: A light without reference.
19: Nothing.
20: The moon.
21: The moon.
22: ---: Nothing.

Film: LH3. Type: Tri-X. Time: 19 February to 19 February.
0 : A snowscooter outside the cottage at Hersjøen.
1,2: Four people inside the cottage at Hersjøen.
4 : A daylight-picture towards northeast of the station.
5 : A lightst over FiN.
6 : A strong lightst over Fi. Weak reference.
7 : A strong lightst over FiN. Weak reference.
8 : A strong lightst further north.
9 : A strong lightst over Øggdalen.
10: A strong lightst over Li. A strange movement in the middle.
11: A flickering light over FiS. Weak reference.
12: A double-flashing light over Fi. Weak reference.
13: A double-flashing light over FiN. Flash-Doubleflash- flash...
14: The same type of light further north.
15: Uneven flickering light far away.
16: Nothing.
17: Two strong lights in the north.
18: One strong light in the north, and two weak ones, which might be noise?
19,20: A spectral-picture of the moon, in the east just above the horizon.
21: A strong lightst over Fi. Uneven movement and flickering.

Film: APT1. Type: Tri-X. Time: 24 January to 27 January.
0,1,2: Pictures of the nature in Hessdalen.
3 : Nothing.
4-16: Nothing.
17: A small lightst. It should be Sirius.
18: A strong light. Sirius.
19-21: Nothing.
22: A lightst. See a part of the spectrum. F=1.7, t=4 seconds.
23: A lightst. See a part of the spectrum. F=1.7, t=4 seconds.
24: A lightst. See a part of the spectrum. F=1.7, t=4 seconds.
25: A light with a strong spectrum: Sirius. F=1.7, t=8 seconds.
26: A light with a little bit weaker spectrum. T=4 seconds.
27: A light with a weak spectrum. T=2 seconds.
28: Only Sirius is seen. T=1 seconds.
29-33: Nothing.
34-37: Daylight-pictures of the nature.

Film: ES1. Type: Tri-X Time: 21 January to 22 January.
0 : A daylight picture of the nature.
1 : A short lightst over FiN. Good star-spectrum.
2 : A weak lightst over Li. Good star-spectrum.

3 : A weak lightst over LiE. Good star-spectrum.
4 : A lightst with flashing over FiS. Weak star-spectrum.
5,6: Nothing.
7 : A lightst with a strange movement over Va. The lights from the houses in Hessdalen and their spectras are also seen.
8 : A lightst with a strange movement and two flashes in the lightst. The lights from the houses and their spectras are also seen.
9 : Nothing.
10: A lightst with a flash. Good star-spectrum.
11: A double-lightst over Fi. First (in the south) weak with flashes, then strong. Good star-spectrum.
12: A double-lightst over FiN.
13: A double-lightst over Øggdalen. Strong with flashing.
14: A double-lightst over Li. The frequency of the flashing suddenly became higher.
15: Nothing.
16: Spectrum of the lights in Hessdalen.
17: Spectrum of the moon.
18: A strong light over Va.
19: A lightst over Li. Much more noise from the other spectras.
20,21: Daylight picture of the nature and the station.

Film: ES3. Type: Neopan 400.
1 : A weak light over Fi.
2 : A weak lightst over Fi.
3 : A weak lightst with uneven amplitude. No reference.
4-6: A weak lightst. No reference.
7 : Grey; nothing.
8 : Nothing.
9 : Two weak lightst over FiN.
10,11: Grey with some star spectras.
12--- Grey and nothing.

Film: RW1. Type: 2484.
3 : A lightst with a slowly growing oscillation in one end.
5 : A lightst.
13-17: A light moving horisontally in the northeast. Good pictures.
18: Only nature. A ref. to picture 17.

Film: X. Type: Tri-X.
1 : A picture of Øggdalen. Unclear in the front.
2 : A picture of Øggdalen. Unclear in the front. Two lights over Fi?
3 : A picture of Øggdalen. Unclear in the background.
4 : Two strong lightst with a strange movement over Fi.
5 : A strong lightst with a strange movement over Fi. Taken from Hammarkneppen?
6 : A lightst over Fi. Strange movement.
7 : A lightst over Øggdalen. Strange movement. One slight movement of the camera (?).
8 : A lightst over Li. Strange movement.
9 : A lightst over LiE. Strange movement.
10: A lightst over Hammarkneppen in north. Strange movement.
11: A weak lightst in the northeast.
12: A weak lightst in the northeast. Far away.
13: A weak lightst in the northeast. Far away.
14: A long lightst in the northeast. Strange movement.
15: A lightst over FiN.
16: A lightst over Øggdalen.
17: Nothing.

18,19: A lightst without reference.
20: Higher order mode of the spectrum from the moon (?), over Va. The spectrum is horizontal.
21: A daylight-picture of the station, seen towards FiS.

Film: H001. Type: Tri-X. Time: 11 February to 12 February.
1 : A light just on top of the mountain.
2 : A lightst with strange movements over the mountain.
3 : A big area in the sky which is lighter.
4 : Nothing.
5,6,7: A lightst with strange movement. No reference.
8 : A lightst over a tree.
9 : A picture of the mountain.
10-21: Pictures of some of the people in the project.

A3. Registrations on seismograph

During the project period, there were some recordings on the seismograph. These recordings were sent to the University of Bergen for analysis. They found out that all recordings came from seismological activity far from Hessdalen, even from other parts of the world.

We also took an overview of the recordings, and we could clearly read visuable recordings at these times: (No recordings from other times than during the project period, are in this list)

01 Feb. at 08.00 - a small recording
01 Feb. at 15.42 - a small recording
12 Feb. at 06.01 - a small recording
15 Feb. at 11.57 to 12.00 - a small recording
16 Feb. at 18.26 to 18.42 - a big recording
18 Feb. at 00.14 - a very small recording
18 Feb. at 00.15 - a very small recording
18 Feb. at 00.34 to 00.37 - a small recording
18 Feb. at 06.31 - a very small recording
22 Feb. at 06.30 - a very small recording
23 Feb. at 16.31 - a small recording
24 Feb. at 13.59 to 14.03 - a medium recording

Recordings within a radius of 50 km from Hessdalen:

Mn=Month, **D**=Date, **Hr**=Hour, **Mi**=Minute, **Se**=Second, **T**= Type of registration *(L=Local earth quaked,LE=Local explosion, LP= Not shure what it is)* **km**= Depth in kilometer, **No**= Number of stations som that have made the record. **Q**=Quality on the record. *Small number is good quality.*
Lm = Local magnitude *(Richters skala)*, **Cm**= Coda magnitude

Recordings within a radius of 50 km from Hessdalen

Year	Mn	D	Hr	Mi	Se	T	Long.	Lat.	km	No	Q	Lm	Cm

A4. Registrations on radar

The radar we used, Atlas 2000, has the following specifications:

- Frequency: 9450 MHz, +/- 20 MHz.

- Pulse peak: 3 kW.
- Pulse frequency: 1 kHz, - duration: 0.1 µs, 0,5 µs.
- Rotation frequency of the antenna: 25 rpm.
- Horisontal beam width: 3 dB-point: 2.4 degrees.
- Sidelobe attenuation at 10 degrees: < 25 dB.
- Vertical beam width: 18 degrees.
- Sidelobe attenuation: < 28 dB.
- Gain: 26 dB.

We registered all reflections that gave a strong point on the radarscreen, those times we watched the screen. No weak refelctions were recorded. As you see in the list, we did many recordings that were only detected by radar. All this is discussed in the report.

First I list all the recordings, then I plot some of the reflections in some drawings. There are three recordings on a light together with radar reflection. These are written with bold letters.

Sat. 21 Jan. at 17.50: One reflection in the Haltdalen valley in the north. Also seen as a light. We followed this light from south towards north. When it was in the north, it suddenly moved straight down. Then it was detected by the radar.

Sun. 22 Jan. at 04.27: Three reflections on three sweeps, east of the mountain Rognefjell.

Mon. 23 Jan. at 17.42: One reflection in the north.

Tue. 24 Jan. at 19.18: Two reflections over Finnsåhøgda.

Wed. 25 Jan. at 17.32: Two reflections over Finnsåhøgda. This was also seen by witnesses outside. This light had a waving movement.

Fri. 27 Jan. at 22.58: Two reflections over Finnsåhøgda. This was also seen by witnesses outside. The light moved from south north. It moved very fast. On the radar we measured a minimum speed of about 8488 m/s.

Sat. 28 Jan. at 15.49: Five reflections on four sweeps, very near the station in a southwesterly direction. The three first ones on three sweeps were big. The two last ones came on one sweep. It seemed as if the reflection had split into two smaller. They all seemed to follow a course.

Sun. 29 Jan. at 16.10: Four reflections on four sweeps, very near the station in the northeast. First a very big one, then smaller and smaller. They seemed to follow a straight course.

Tue. 31 Jan. at 19.01: Three reflections on three sweeps, moving on a course from Rognefjell to Vårhuskjølen.

Wed. 1 Feb. at 15.49: Three reflections on three sweeps, following a course from V†rhuskjølen towards Aspåskjølen.

Thu. 2 Feb.
at 14.05: Three reflections on three sweeps, east of the station.
at 14.35: Five reflections on seven sweeps, in the north. First two reflections on two sweeps, then three reflections on every second sweep.

at 15.46: Two on two sweeps, south and near the station.
at 15.49: One west and near the station.
at 15.51: One southwest and near the station.
at 16.03: Two on two sweeps, north and near the station.

Fri. 3 Feb. at 15.12, 16.09, 16.13, 16.41, 16.42, 16.43, 16.43, 16.51, 16.52 and 17.04.

Sat. 4 Feb. at 13.42, 13.44, 14.03, 14.21, 14.27, 14.29, 18.06 and 19.41.

Sun. 5 Feb. at 13.09: Six on six sweeps, following a course from Rognefjell towards the southwest of the station.

Mon. 6 Feb.
at 14.13: Eight reflections on eight sweeps, moving in a southeasterly direction, east of the station.
at 21.41: One near and to the southeast of the station.

Fri. 17 Feb. at 19.18: One near Finnsåhøgda.

On the following pages, you will find drawings of the radarscreen showing some of the reflections mentioned in the list.

Radar recordings between 21 January and 25 January. [s. 53]

Radar recordings Friday 27 January. [s. 53]

Radar recordings Saturday 4 February. [s. 54]

Radar recordings Saturday 28 January and Sunday 29 January. [s. 54]

Radar recordings Sunday 5 February and Monday 6 February. [s. 55]

Radar recordings Friday 3 February. [s. 55]

A5. Registrations on spectrum analyser

We had some registrations on the spectrum analyser. They can be split into two main categories. One of these can easily be explained as a radio transmitter in the valley. It was a single-frequency component. I include these registrations in the list, because we have not localized this transmitter. The source is therefore unknown. The frequencies were always different. This type of registration is called (1).

The second type of registration is called (2). This one was more strange. It was "spikes" with almost equal amplitude, with 80 MHz between each, all over the frequency-band, from 100 kHz to 1250 MHz. The amplitude of these moved up and down. When they were down, they were about 5 dB over the noise, and when they were at the top, they were about 25-30 dB over the noise.

Sun. 29 January from 19.25 to 19.33: A type (2) registration. It moved up and down all the time.
Sun. 29 January at 21.38: A type (2) registration. Only for a short time.

Tue. 31 January from 15.42 to 15.44: A type (2) registration. Now periodic. It lasted a few seconds, then it stopped for a short time, started again and lasted for a few seconds.. and so on
Tue. 31 January at 16.42: A type (2) registration. Again periodic, but now the total time was almost one minute.

Fri. 3 February at 16.44: A type (2) registration. Only a short time.

18.08: --- " ---
19.51: --- " ---
19.52: --- " ---
19.55: --- " ---
20.01: --- " ---

Thu. 9 February at 19.36: A type (1) registration at 145 MHz. A "spike" moved up and down twice.
Thu. 9 February at 20.04: A type (1) registration at 130 MHz. A "spike" showed up twice. 3 seconds between each.

Fri. 17 February at 17.49: A type (1) registration at 1070 MHz. A "spike" showed up two times. The amplitude was 22.5 dB over the noise level.

Sun. 19 February at 20.59: A type (1) registration at 1115 MHz. The amplitude was 12.5 dB over the noise level.

A6. Registrations on magnetograph

The magnetograph we used, Fluxgate magnetometer model FM100, has an upper frequency of 0.5 Hz. Any magnetical fluctuation with a frequency higher than 0.5 Hz will be suppressed. The instrument is built to register slow-varying magnetical fluctuations. The pulsations might have a higher frequency than 0.5 Hz, typically 2 Hz.

They are usually recorded with a special instrument, a pulsation magnetometer. We didn't have this instrument, therefore we cannot be sure to have recorded all pulsations. The pulsations included in this list are those that could clearly be read out of the recordings.

We have not found any simple correlation with the slow-varying magnetical fluctuations, that is why no copy of the recordings (which is several meters long) is included in the report.

In the list, there is first the approximate time, then on which coordinate it is recorded. At the end it indicates the approximate amplitude of the pulsation. This have to be approximate, because we don't know the exact frequency of the pulsation. If the frequency is 2 Hz, and the suppression is 20 dB/decade in the instrument, this pulsation will be suppressed about 14 dB.

The readings are divided in three types: Strong, medium and weak.
- Strong is a reading of about 10 gamma.
- Medium is a reading of about 2 gamma.
- Weak is a reading of about 0.5 gamma.

The actual amplitude might be higher than this, because of the suppressing in the instrument. The instrument could record the magnetical field in all three coordinates. We had a printer that had only two channels. We chosed channel X (towards north) and Y (towards east).

From Saturday 11 February at 16.12 to Sunday 12 February at 12.20.
16.16-16.17
17.51-17.54 on X and Y - strong
18.00-18.03 X - weak
18.40-18.42 on X and Y - medium
18.45-18.46 X - weak
19.23-19.25 Y - strong
19.55-19.57 Y - strong
20.45-20.48 Y - weak
21.04-21.06 X (and Y?) - very strong
21.09- a few seconds, X and Y - both strong, X stronger
21.10-21.11 X and Y - both strong, X stronger
21.14 and 21.15 both times a few seconds, X and Y - both strong
21.18-21.20 X - weak
21.28-21.30 X - medium
21.56-22.00 X - weak
22.20 - a few seconds, X and Y - strong
22.32 - some seconds (30), X and Y - strong
22.48 - some seconds, X and Y - strong
00.08-00.10 Y - weak
00.27-00.30 X - weak
01.35-01.42 X - weak

After this quite a few ones were observed. Some of them were hard to notice, while four were a little stronger than the others.

From Sunday 12 February at 15.32 to Monday 13 February at 10.07.
17.51-17.53 X - medium
18.17-18.20 X - medium
18.50-18.51 X - weak
19.36-19.39 X - medium
19.55-20.07 Y - weak
20.41-20.44 X - weak

21.41-21.49 Y - weak
22.48-22.50 Y - weak
After that a magnetical storm came up, and it was therefore difficult to read the pulsations. Besides, during a storm there will usually be many pulsations. The storm vanished at 6 o'clock on Monday 13. After that we can see pulsations at:
08.53-09.00 X - weak
09.37-09.48 Y - weak

From Monday 13 February at 10.07 to Tuesday 14 February at 03.02.
11.02-11.05 X and Y - weak
11.27-11.31 Y - weak
12.14-12.17 Y - medium
12.36-12.38 Y - weak
15.45-15.47 X - weak
17.05-17.07 Y - weak
18.13-18.14 Y - weak
After that a magnetical storm came up. It ended at 19.50.
20.12-20.13 X - weak
20.21-20.24 Y - weak
No more pulsations until a second storm started at 01.00.

From Tuesday 14 February at 03.07 to Wednesday 15 February at 11.31.
The storm ended at 11.00 o'clock.
14.52-14.54 X - medium
15.38-15.39 X - weak
16.49-16.55 Y - medium
17.14-17.16 X - medium
18.36-18.39 Y - weak
19.15-19.17 X - medium
20.18-20.21 X - medium
20.24-20.34 Y - weak
22.24-22.29 Y - weak
A storm between 23.55 and 00.53.
01.32-01.33 Y - weak
03.03-03.06 Y - weak
04.11-04.13 Y - weak
06.21-06.30 Y - weak
10.32-10.48 X - medium

During the period from 15 February to 26 February, the recordings were made by the Esterline-Angus graphic Ampmeter. That means that no fluctuations could be measured. A few times during that period, the needle made a fast movement. This happened also a couple of times when a light was seen. Whether this fast movement was caused by a pulsation or not, is difficult to say.

From Saturday 25 February at 17.30 to Sunday 26 February at 11.31.
17.54-17.58 X - medium
19.10-19.30 X - medium
23.06-23.07 X and Y - weak
23.20-23.24 X - weak
01.28-01.32 X - medium
02.34-02.48 Y - medium
03.32-04.02 X - medium
04.20-05.02 X - medium
04.30-04.34 Y - medium

08.14-08.26 Y - medium
08.34-09.26 Y - medium

[Div. temperaturoversikter Hessdalen/Berkåk/Røros 21.01- 23.02.84 ss. 60-61]

[Aeromagnetic map of Hessdalen s. 62]

[Geologic map of Hessdalen s. 63]

[Div. bilder med bildetekst ss. 64-73]

Fig. A1 -Photo taken by Arne P. Thomassen 25 October 1982. It is taken from Fjellbekkhøgda towards east.

Fig. A2 - Photo taken by Arne P. Thomassen 25 September 1982, between 19.00 and 20.30. It is taken with a 400 mm lens in front, from Fjellbekkhøgda towards east.

Fig. A3 - Photo taken by Arne P. Thomassen in October 1982. It is taken from Fjellbekkhøgda towards east.

Fig. A4, A5 - These two pictures are taken by Leif Havik 12 February at 17.53. They are taken from Litlfjellet towards Hessdalen. In the upper picture you can see the northern part of Aspåskjølen. The light moved towards Litlfjellet, followed the valley to the left. The lower picture is taken just before the light disappears behind the mountain in the eastern part of Litlfjellet. He used a Nikon FG with a 50 mm lens.

Fig. A6 - Photo taken by Arne P. Thomassen on 25 September at 19.00. It is taken from Fjellbekkh›gda towards east.

Fig. A7 - Photo showing the third category: Three lights together. The light at the right is red, and the two others are yellow-white. Leif Havik shot the picture on 18 March 1982, at 19.33. He used a Practica LTL-3 camera with a 135 mm lens equipped with a 2x teleconverter.

Fig. A8 - Two photos taken by Bj›rn Lagesson on Sunday 26 February at 03.08. They are taken with a grating in front. The lightstreak you see over the "lightpoint" is the spectrum of the light. The shortest wavelength is nearest the light. The picture at left is taken a few seconds before the picture at right. The report was rated at F5.

Fig. A9, A10 - Two photos showing a reflection on the radarscreen. The reflection is marked. It is 1 nautical mile between the circles.

Fig. A11 - Picture taken from the headquarter towards Vårhuskjølen at 28 January at 15.49. The picture is taken when a strong reflection is seen on the radarscreen. As you see, nothing special is seen in the picture.

Fig. A12- Photo taken by Roar Wister (RW1/3) Saturday 21 February at 19.23. Exposure time is 10 seconds. The aperture is f/5.6. It is taken with a Pentax ME Super with a Vivitar zoom lens with a range 75-205 mm, adjusted to 75 mm. Just after the picture was taken, an oscillation could be seen by the eyes. Probably the same oscillation which you see the start of in the picture. The frequency is 7 Hz.

Fig. A14- The headquarter at Aspåskjølen, seen from southeast.

Fig. A15 to A19 - Photos taken by Roar Wister on Saturday 18 February at 20.18 (RW1/13-17). Pictures taken in east- northeasterly direction. Duration 2 minutes.

Fig. A20- Photo showing two moving lights over Finnsåhøgda (X/4). The picture above is enlarged. The picture below is grossly enlarged.

Fig. A21 - Photo taken by Erling Strand (ES1/13) on Saturday 21 January between 19.20 and 19.30.

Fig. A22 - Photos taken by Arne P. Thomassen on Wednesday 25 January at 19.10 (APT1/22,23). It is possible to

see some kind of spectrum from 560 to 630 nm.

* Note: The title "Dr." was an error by the original congressional/GPO editors, not repeated elsewhere in the record.

The committee met, pursuant to notice, at 10:05 a.m., in room 2318, Rayburn House Office Building, Hon. J. Edward Roush (chairman of the symposium) presiding.

Mr. Roush. The committee will be in order.

Today the House Committee on Science and Astronautics conducts a very special session, a symposium on the subject of unidentified flying objects; the name of which is a reminder to us of our ignorance on this subject and a challenge to acquire more knowledge thereof. We approach the question of unidentified flying objects as purely a scientific problem, one of unanswered questions. Certainly the rigid and exacting discipline of science should be marshaled to explore the nature of phenomena which reliable citizens continue to report. A significant part of the problem has been that the sightings reported have not been accompanied by so-called hardware or materials that could be investigated and analyzed. So we are left with hypotheses about the nature of UFO's. These hypotheses range from the conclusion that they are purely psychological phenomena, that is, some kind of hallucinatory phenomena; to that of some kind of natural physical phenomena; to that of advanced technological machinery manned by some kind of intelligence, that is, the extraterrestrial hypotheses.

With the range in mind, then, we have invited six outstanding scientists to address us today, men who deal with the physical, the psychological, the sociological, and the technological data relevant to the issues involved. We welcome them and look forward to their remarks. Additionally we have requested several other scientists to make their presentations in the form of papers to be added to these when published by the committee.

We take no stand on these matters. Indeed, we are here today to listen to their assessment of the nature of the problem; to any tentative conclusions or suggestions they might offer, so that our judgments and our actions might be based on reliable and expert information. We are here to listen and to learn.

Events of the last half century certainly verify the American philosopher, John Dewey's conclusion that "Every great advance in science has issued from a new audacity of imagination." With an open and inquiring attitude, then, we now turn to our speakers for the day.

They will include:

Dr. J. Allen Hynek, head of the Department of Astronomy, Northwestern University;

Dr. James E. McDonald, senior physicist, the Institute of Atmospheric Physics, the University of Arizona;

Dr. Carl Sagan, Department of Astronomy and Center for Radiophysics and Space Research, Cornell University;

Dr. Robert L. Hall, head of the Department of Sociology, University of Illinois at Chicago;

Dr. James A. Harder, associate professor of civil engineering, University of California at Berkeley, and;

Dr. Robert M. L. Baker, Jr., Computer Sciences Corp. and Department of Engineering, UCLA.
Gentlemen, we welcome your presentations. We ask you to speak first, Dr. Hynek, followed by Dr. McDonald, and then Dr. Sagan. This afternoon Dr. Hall will commence our session, followed by Dr. Harder and then Dr. Baker. The subject matter of the presentations determines the order in which you speak. We hope at the end of the day to allow the six of you to discuss the material presented among yourselves and with the committee in a kind of roundtable discussion.

Mr. Chairman -- the chairman of our full committee, Mr. George Miller.

Chairman Miller. I want to join in welcoming you here. I want to point out that your presence here is not a challenge to the work that is being done by the Air Force, a particular agency that has to deal with this subject.

Unfortunately there are those who are highly critical of the Air Force, saying that the Air Force has not approached this problem properly. I want you to know that we are in no way trying to go into the field that is theirs by law, and thus we are not critical of what the Air Force is doing.

We should look at the problem from every angle, and we are here in that respect. I just want to point out we are not here to criticize the actions of the Air Force.

Thank you.

Mr. Roush. I think it is only appropriate that Dr. Hynek be introduced by our colleague, Mr. Rumsfeld.

Mr. Rumsfeld.

Mr. Rumsfeld. Thank you, Mr. Chairman. It is a pleasure to welcome all the members of this distinguished panel, and particularly to welcome Dr. Allen Hynek, who is a son of Illinois, and presently serves in the Department of Astronomy and Director of the Lindheimer Astronomical Research Center. Dr. Hynek is a member of a number of scientific societies, and has served in the Government service as well as in the academic community. As his Congressman I am delighted he has been invited to appear on this panel, and we certainly look forward to his comments.

Thank you, Mr. Chairman.

Mr. Roush. Dr. Hynek, the floor is yours.

DR. J. ALLEN HYNEK

Born in Chicago, Ill., 1910. B.S. University of Chicago, 1931; Ph.D. (astrophysics) 1935.

Professor Astronomy, Chairman of the Department and Director of Dearborn Observatory, Northwestern University, 1960 to present.

Chief of the Section, Upper Atmosphere Studies and Satellite Tracking and Associate Director, Smithsonian Astrophysical Observatory, 1956-60.

[[2]]

Professor, Astronomy, 1950-56, Ohio State University.

Instructor, Physics and Astronomy, Ohio State University, 1935-41; Asst. Prof. 1941-45; Associate Professor 1946-50.

Asst. Yerkes Observatory, University of Chicago, 1934.

Astronomer, Perkins Observatory, Ohio State, 1935-56.

Assistant Dean of the Graduate School 1950-53.

Supervisor of Technical Reports, Applied Physical Laboratory, Johns Hopkins University, 1942-46.

Visiting Lecturer, Harvard University, 1956-60.

Civilian with U.S. Navy 1944.

Scientific Societies: American Association for the Advancement of Science; Astronomy Society (secretary).

Specialty: Astrophysics.

Fields of Interest: Stellar spectroscopy; F type stars; stellar scintillation.

STATEMENT OF DR. J. ALLEN HYNEK, HEAD, DEPARTMENT OF ASTRONOMY, NORTHWESTERN UNIVERSITY, EVANSTON, ILL.

Dr. Hynek. Thank you.

My name is J. Allen Hynek. I am professor of astronomy at Northwestern University, Evanston, Ill., where I serve as chairman of the department of astronomy and director of the Lindheimer Astronomical Research Center. I have also served for many years, and still do, as scientific consultant to the U..S. Air Force on Unidentified Flying Objects, or UFO's. Today, however, I am speaking as a private citizen and scientist and not as a representative of the Air Force.

We are here today, I gather, to examine whether the UFO phenomenon is worthy of serious scientific attention. I hope my comments may contribute to your understanding of the problem and help lead to its eventual solution.

The UFO problem has been with us now for many years. It would be difficult to find another subject which has claimed as much attention in the world press, in the conversation of people of all walks of life, and which has captured the imagination of so many, over so long a period of time. The word UFO, or flying saucer, can be found in the languages and dictionaries of all civilized peoples, and if one were to collect all the words that have been printed in newspapers, magazines, and books in the past two decades, it would be a staggering assemblage. The bibliography of the subject recently compiled at the Library of Congress is a most impressive document, and illustrates that the UFO became a problem for the librarian even before it did for the scientist.

As we all know, the scientific world is a world of exact calculations, of quantitative data, of controlled laboratory experiments, and of seemingly well-understood laws and principles. The UFO phenomenon does not seem to fit into that world; it seems to flaunt itself before our present-day science.

The subject of UFO's has engendered an inordinate emotional reaction in certain quarters and has far more often called forth heated controversy rather than calm consideration. Most scientists have preferred to remain aloof from the fray entirely, thereby running the risk of "being down on what they were not up on," as the old adage goes.

It is unlikely that I would have become involved in the study of the UFO phenomenon had I not been officially asked to do so. I probably would have -- and in fact did for a time -- regarded the whole

subject as rank nonsense, the product of silly seasons, and a peculiarly American craze that would run its course as all popular crazes do.

I was asked by the Air Force 20 years ago to assist them, as an astronomer, in weeding out those reports arising from misidentification of planets, stars, meteors, and other celestial objects and events. In the course of doing my "homework" I found that some 30 percent of the then current cases very probably had astronomical causes, but my curiosity was aroused by some of the patently nonastronomical reports.

These were ostensibly being explained by the consultant psychologist, but I frequently had the same feeling about the explanations offered for some of these cases that I have had when I have seen a magician saw a woman in half. How he did it was beyond my own field of competence, but I did not question his competence. Yes, I was quite sure that he did not actually saw the woman in half!

My curiosity thus once aroused led me to look into reports other than those of a purely astronomical nature, and in the course of years I have continued to do so. I have pondered over the continuing flow of strange reports from this and a great many other countries, for it is a gross mistake to think that the United States has any exclusive claim to the UFO phenomenon.

Those reports which interested me the most -- and still do -- were those which, apparently written in all seriousness by articulate individuals, nonetheless seemed so preposterous as to invite derisive dismissal by any scientist casually introduced to the subject. Such baffling reports, however, represent a relatively small subset of reports. I did not -- and still do not -- concern myself with reports which arise from obvious misidentifications by witnesses who are not aware of the many things in the sky today which have a simple, natural explanation. These have little scientific value, except perhaps to a sociologist or an ophthalmologist; it matters not whether 100 or 100,000 people fail to identify an artificial satellite or a high-altitude balloon.

The UFO reports which in my opinion have potential scientific value are those -- and this may serve us as a working definition of UFO's -- are those reports of aerial phenomena which continue to defy explanation in conventional scientific terms. Many scientists, not familiar with the really challenging UFO data, will not accept the necessity for a high order of scientific inquiry and effort to establish the validity of the data -- and therefore such detailed, conscientious, and systematic inquiry has yet to be undertaken.

We cannot expect the world of science to take seriously the fare offered at airport newsstands and paperback shelves.

I have been asked by some why, as consultant to the Air Force for so many years, I did not alert the scientific world to the possible seriousness of the UFO problem years ago. The answer is simple; a scientist must try to be sure of his facts. He must not cry "wolf" unless he is reasonably sure there is a wolf.

I was painfully aware, and still am, of the amorphous nature of the UFO data, of the anecdotal nature of UFO reports, of the lack of followup and serious inquiry into reports (which would have required a large scientific staff and adequate funding), of the lack of hardware, of the lack of unimpeachable photographic evidence, and

[[4]]

of the almost total lack of quantitative data -- of all those things which are part and parcel of the working environment of the scientist.

I was aware that in order to interest scientists, hard-core data were needed, and, while the store of unquestionably puzzling reports from competent witnesses continued to grow the wherewithal to obtain such hard-core data which would, once and for all, clinch the matter, was not forthcoming. Thus my scientific reticence was based on a carefully weighed decision.

In attempting analysis of the UFO problem today, I pay particular attention to reports containing large amounts of information which are made by several witnesses, if possible, who as far as I can ascertain, have unimpeachable reputations and are competent. For example, I might cite a detailed report I received from the associate director of one of the Nation's most important scientific laboratories, and his family.

Reports such as these are obviously in a different category from reports which, say, identify Venus as a hovering spaceship, and thus add to the frustrating confusion.

On the other hand, when one or more obviously reliable persons reports -- as has happened many times -- that a brightly illuminated object hovered a few hundred feet above their automobile, and that during the incident their car motor stopped, the headlights dimmed or went out, and the radio stopped playing, only to have these functions return to normal after the disappearance of the UFO, it is clearly another matter.

By what right can we summarily ignore their testimony and imply that they are deluded or just plain liars? Would we so treat these same people if they were testifying in court, under oath, on more mundane matters?

Or, if it is reported, as it has been in many instances over the world by reputable and competent persons, that while they were sitting quietly at home they heard the barnyard animals behaving in a greatly disturbed and atypical manner and when, upon investigating, found not only the animals in a state of panic but reported a noiseless -- or sometimes humming -- brightly illuminated object hovering nearby, beaming a bright red light down onto the surroundings, then clearly we should pay attention. Something very important may be going on.

Now, when in any recognized field of science an outstanding event takes place, or a new phenomenon is discovered, an account of it is quickly presented at a scientific meeting or is published in a respected appropriate journal. But this is certainly not the case with unusual UFO reports made by competent witnesses.

There appears to be a scientific taboo on even the passive tabulation of UFO reports. Clearly no serious work can be undertaken until such taboos are removed. There should be a respectable mechanism for the publication, for instance, of a paper on reported occurrences of electromagnetic phenomena in UFO encounters.

It would be foolhardy to attempt to present such a paper on UFO's to the American Physical Society or to the American Astronomical Society. The paper would be laughed down, if all that could be presented as scientific data were the anecdotal, incomplete, and nonquantitative reports available. Consequently reports of unexplainable UFO cases are' likely to be found, if at all, in pulp magazines and paperbacks,

[[5]]

of which the sole purpose of many seems to be, apart from making a fast buck for the authors, to titillate the fancy of the credulous.

Indeed, in such newsstand publications three or four UFO reports are frequently sensationalized on one page with gross disregard for accuracy and documentation; the result is that a scientist if he reads them at all is very likely to suffer mental nausea and to relegate the whole subject to the trash heap.

This is the first problem a scientist encounters when he takes a look at the UFO phenomenon. His publicly available source material is almost certain to consist of sensational, undocumented accounts of what may have been an actual event. Such accounts are much akin, perhaps, to the account we might expect from an aborigine encountering a helicopter for the first

time, or seeing a total eclipse of the sun. There is nowhere a serious scientist can turn for what he would consider meaningful, hard-core data as hard core and quantitative as the phenomenon itself permits at present.

Here we come to the crux of the problem of the scientist and the UFO. The ultimate problem is, of course, what are UFO's; but the immediate and crucial problem is, How do we get data for proper scientific study? The problem has been made immensely more difficult by the supposition held by most scientists, on the basis of the poor data available to them, that there couldn't possibly be anything substantial to UFO reports in the first place, and hence that there is no point to wasting time or money investigating.

This strange, but under the circumstances understandable attitude, would be akin to saying, for instance, let us not build observatories and telescopes for the study of the stars because it is obvious that those twinkling points of light up there are just illusions in the upper atmosphere and do not represent physical things.

Fortunately, centuries ago there were a few curious men who did not easily accept the notion that stars were illusory lights on a crystalline celestial sphere and judged that the study of the stars might be worthwhile though, to many, a seemingly impractical and nonsensical venture. The pursuit of that seemingly impractical and possibly unrewarding study of astronomy and related sciences, however, has given us the highly technological world we live in and the high standard of living we enjoy -- a standard which would have been totally impossible in a peasant society whose eyes were never turned toward the skies.

Can we afford not to look toward the UFO skies; can we afford to overlook a potential breakthrough of great significance? And even apart from that, the public is growing impatient. The public does not want another 20 years of UFO confusion. They want to know whether there really is something to this whole UFO business and I can tell you definitely that they are not satisfied with the answers they have been getting. The public in general maybe unsophisticated in scientific matters, but they have an uncanny way of distinguishing between an honest scientific approach and the method of ridicule and persiflage.

As scientists, we may honestly wish to see whether there is any scientific paydirt in this international UFO phenomenon. But to discover this paydirt we must devote serious study to UFO's. To make

serious study possible, however, requires recruiting competent scientists, engineers, and technical people, as well as psychologists and sociologists.

This in turn requires not only funds but a receptive scientific climate. Many scientists have expressed to me privately their interest in the problem and their desire to actively pursue UFO research as soon as the scientific stigma is removed. But as long as the unverified presumption is strongly entrenched that every UFO has a simple, rational everyday explanation, the required climate for a proper and definitive study will never develop.

I recall an encounter I had sometime ago with the then chief scientist at the Pentagon. He asked me just how much longer we were "going to look at this stuff." I reminded him that we hadn't really looked at it yet that is, in the sense, say, that the FBI looks at a kidnapping, a bank robbery, or a narcotics ring.

Up to this point I have not discussed another major impediment to the acceptance of the UFO phenomenon as legitimate material for scientific study. I refer to the adoption of the UFO phenomenon by certain segments of the public for their own peculiar uses. From the very start there have been psychically unbalanced individuals and pseudoreligious cultist groups -- and they persist in force today -- who found in the UFO picture an opportunity to further their own fanciful cosmic and religious beliefs and who find solace and hope in the pious belief that UFO's carry kindly space brothers whose sole aim is a mission of salvation.

Such people "couldn't care less" about documentation, scientific study, and careful critical consideration. The conventions and meetings these people hold, and the literature they purvey, can only be the subject of derisive laughter and, I must stress, it is a most serious mistake for anyone to confuse this unfortunate aspect of the total UFO phenomenon with the articulate reports made by people who are unmistakably serious and make their reports out of a sense of civic duty and an abiding desire to know the cause of their experience.

It may not be amiss here to remark in passing that the "true believers" I have just referred to are rarely that ones who make UFO reports. Their beliefs do not need factual support. The reporters of the truly baffling UFO's, on the other hand, are most frequently disinterested or even skeptical people who are taken by surprise by an experience they cannot understand.

Hopefully the time is not far off when the UFO phenomenon can have an adequate and definitive hearing, and when a scholarly paper on the nature of UFO reports can be presented before scientific bodies without prejudice. Despite the scientific attitude to this subject in the past, I nevertheless decided to present a short paper on UFO's to a scientific body in 1952, following a scientific hunch that in the UFO phenomenon we were dealing with a subject of great possible importance.

In my paper (JOSA 43, pp. 311-314, 1963), which I should like to have read into the record, I made reference to the many cases in 1952 and earlier which were nonastronomical in nature and did not seem to have a logical, ready explanation.

[[7]]

(The document referred to is as follows :)

[From Journal of the Optical Society of America, April 1953]

UNUSUAL AERIAL PHENOMENA

J. A. HYNEK, *Ohio State University, Columbus, Ohio*

(Received December 22, 1952)

Over a period of years, diverse aerial sightings of an unusual character have been reported. On the assumption that the majority of these reports, often made in concert, come from reputable persons, and in the absence of any universal hypotheses for the phenomena which stimulated these reports, it becomes a matter of scientific obligation and responsibility to examine the reported phenomena seriously, despite their seemingly fanciful character. Accordingly, several hundred serious reports of "unidentified aerial objects" have been studied in detail in an attempt to get a pattern classification. It appears that those reported phenomena which do not admit of a ready and obvious explanation exhibit fairly well-defined patterns and that these are worthy of further study. One pattern in particular, that of a hovering nocturnal light, does not appear to be readily explainable on an astronomical basis or by mirages, balloons, or by conventional aircraft.

Perhaps the most bizarre phenomenon of our times is the continued popular interest in flying saucers. The term flying saucer, of course, dates back to the treatment by the press of the now famous triggering incident of June 24, 1947, another date which might well be said to live in infamy, when a lone pilot, Mr. Arnold, reported "nine peculiar-looking aircraft" without tails, which flew in a chain-like line and "swerved in and out of the high mountain peaks." The unfortunate newspaper term, flying saucer, as you well know, captured both the press and the public imagination. One can speculate as to the turn of events, and the amount of newsprint that might have been conserved, had Mr. Arnold decided to stay on the ground that day!

Nevertheless, in the past five years, flying saucer has become a standard term in our language, with about as broad a definition as it has been the lot of any term to carry. We can define a flying saucer as *any aerial phenomenon or sighting that remains unexplained to the viewer at least long enough for him to write a report about it*. Lest anyone misunderstand what shall be meant by "flying saucers" in this paper, this definition must be emphasized. Each flying saucer, so defined, has associated with it a probable lifetime. It wanders in the field of public inspection like an electron in a field of ions, until "captured" by an explanation which puts an end to its existence as a flying saucer.

Thus flying saucers spawned by the planet Venus have generally a short lifetime. In almost no time an astronomer comes along and makes a positive identification, and another flying saucer is shattered. We can expect a host of Venus-inspired flying saucers when this planet is low in the western sky after sunset. It reaches greatest eastern elongation this year on January 31, 1953, and on March 8 attains its greatest brilliance. We can confidently predict a swarm of flying saucers from Venus!

The lifetime of a balloon-sponsored flying saucer is often longer, but before long someone like Dr. Liddell comes along and shoots it down. And Dr. Menzel has as his flying saucer ammunition a large variety of optical effects, the lethalness of which requires separate field tests.

My concern is with flying saucers of long lifetime -- those which have not, as yet, been "captured" or demolished by an explanation. Let us further limit them to those that have been observed by two or more people, at least one of whom is practiced in the making of observations of some kind, that is, to pilots, control tower operators, weather observers, scientific workers, etc. Also, let us limit cases to sightings lasting a minute or more, again for obvious reasons.

The Wright-Patterson Air Force Base, where the responsibility for the Investigation of unidentified aerial objects has rested for the past several years, asked me in 1948 to help identify reports that had an astronomical basis. It was a relatively simple task to go through about 200 reports and pick out probable astronomical causes. Indeed, some of the most weird reports could be dismissed with clear conscience by the statement that no astronomical explanation is possible for this incident, thus leaving these unsolved cases to the psychologists.

[[8]]

I did wonder of course, as to how they were disposing of the nonastronomical cases. How did they explain the incident in which a pilot, co-pilot, and stewardess followed some rapidly moving dark objects which were silhouetted against the sunset sky and which disappeared presumably because of their superior speed? But my faith in the psychologists was unshaken and when the Air Forces announced that Project Grudge had been dissolved, I assumed that my colleagues had been successful and had even solved the case in which several observers watched an object, hollow in the middle, travel at a constant slow rate, taking 15 minutes to make the journey across the sky from north to south.

After the project dissolved, Wright Field continued to take care of the slow but steady flow of reports as a part of their regular intelligence function. This spring I became curious and requested permission, through official channels, to look through the crop of reports that had accumulated since my official connection with Project Grudge had terminated. As I looked through the welter of fanciful tales, inaccurate reporting, of misobservation of natural objects, I could not help, as an astronomer, recalling another wave of stories of stones that fell from heaven. Because of poor reporting and poor imagery, scientific progress in meteorites had been held back for a good century. What a difference in imagery there is between "a stone falling from the sky" and "the interception by the earth of a particle pursuing an orbit around the sun." The use of improper and inaccurate description of what actually happened kept meteorites in the category of old wives' tales and out of the niche that celestial mechanics had made ready for them a century before! In 1801, Thomas Jefferson said that he would sooner believe that two Yankee professors had lied than that stones had fallen from heaven. And the French Academy of Sciences branded stories of meteorite falls as fanciful and absurd and dismissed a bona fide meteorite whose fall had been sworn to -- as an ordinary stone that had been struck by lightning. Perhaps the moral of this is: Beware the ready explanation!

Now, it is clear that stories of real flying saucers, visitors from space, and strange aircraft violating the laws of physics are as reprehensible to the scientist of today as stones that fell from heaven were to the scientist of yesteryear. But, of course, stones did not fall from heaven that was poor reporting and a wrong slant on a perfectly natural phenomenon. And we don't have space ships that disregard physical laws. But, do we have a natural phenomenon?

The steady flow of reports, often made in concert by reliable observers, raises questions of scientific obligation and responsibility. Is there, when the welter of varied reports are shorn of, in the words of Pooh Bah, all "Corroborative detail to lend artistic verisimilitude to an otherwise bald and unconvincing narrative" -- any residue that is worthy of scientific attention?

Or, if there isn't, does not obligation still exist to say so to the public -- not in words of open ridicule, but seriously, to keep faith with the trust the public places in science and scientists?

The Air Forces are attempting to give all reports a fair hearing, in view of the above. They are having all reported data reduced to punch cards so that in a month or so it will be possible to compare quickly reports made by people facing west on clear Tuesday afternoons with those made on non-inversion Friday nights by pilots going south. In any event, if significant correlations between various sets of sightings exist, this method should bring them out.

In coming down to cases, to illustrate what constitutes at present the best evidence for unusual aerial phenomena, the examples submitted for examination are presented without an all-embracing explanation for them. These are presented in conformance with the school that believes that good observations and discussion of observations come before theory. It is hoped, however, that out of this discussion there may come a positive approach and, if these sightings do represent heretofore inadequately studied natural phenomena, that these examples will stimulate their serious study; if, on the other hand, no natural phenomena are involved, then an obligation exists to demonstrate explicitly how the following specific reports can be explained in terms of balloons, mirages, or conventional aircraft.

The chosen recent examples represent a definite pattern, and for each of the following there are many other similar examples in the flies.

One of these patterns might be called "Nocturnal Meandering Lights." Reports falling into this category are characterized by the sighting of a bright star-like light, perhaps of -2 or -3 stellar magnitude which floats along without sound, frequently hovers, reverses its field without appearing to turn, and often abruptly speeds up. The light is most frequently described as a yellow amber or orange,

changing to blue or red occasionally, and changing in brightness markedly. Sometimes the description states that the light went out as if someone had pushed a button; at other times the light is reported only as variable. A very characteristic statement by those making the reports is: "I have never seen anything like this in my whole life." The desire to identify these sightings as balloons is thwarted by the tactics observed.

As an example of a report of this kind, let us take one that came in from Florida this past July. On one night several airmen independently observed a light approach at a very slow speed, come to a *halt nearly overhead*, then *reverse direction* with no apparent turn. On two other nights, three other lights appeared in other sections of the sky, of similar appearance, but maneuvering more rapidly. They were observed for some 10 minutes by 9 airmen, including a control tower operator, an aircraft dispatcher, and two pilots from Wright Field.

In the words of one of the men, "For the next fifteen minutes we watched this light and speculated on what it might be. It was not a sharp light like a bare bulb but more like a light shining through frosted glass. No shape of any kind was discernible. It appeared to blink, but with no regularity whatever."

Also this past July at an air base in New Mexico, a similar sighting was made. Paraphrasing from sworn statements made by observers, "Our station was notified that an unconventional aircraft had been picked up with both electronic and visual contact. Our station made electronic contact with the object and two of our men and I had gone outside the building and saw it hovering under a cloud layer to the east of us. It appeared as a large light, at an uncertain distance, and was hovering at the time. A minute or so later, it moved rapidly toward the north for a short distance and stopped as suddenly as it had begun to move."

And from another statement, "Our scope operator at that time reported a strange target about thirty miles east of our station. Two of us went outside and sighted a very bright light traveling at what we estimated to be around 200 miles an hour. The light went out at least two times but did not stay out more than two or three minutes. The light seemed to have a floating effect and made no sound. At one time around seven or eight smaller lights could be seen. The object seemed to drop to about 10 or 12 thousand feet and then climbed to about 25,000 taking a northern course."

Radar observations as well as visual observations are involved in this problem. Early last month shortly before dawn colored lights were observed in the sky southeast of the radar station. At the same time and the same azimuth, unidentified targets appeared on the scope. Only a very slight temperature inversion was present, 1° at 25,000 feet. No more than two lights appeared at one time. They were observed to be moving in a rather erratic pattern and changing colors occasionally. The last thirty minutes of observation revealed the lights remaining yellow prior to that they were red, green, and blue. They moved in no apparent formation but mostly appeared in one area and disappeared in another, when either the light went out or the objects dived behind clouds. They were starlike objects and appeared to develop long, white vapor trails, when they dived. They were motionless at times and moved rapidly at other times. This corresponded to similar movements observed on the radar scope.

One white light went out as it changed direction and continued as a *black silhouette* against the dawn sky. Observation was for a period of about an hour and was made by two airmen and a radar operator -- all three observers were experienced aircraft control and warning operators. Objects were observed 20 to 40° above horizon. Radar gave distances of 50 to 80 miles. This implies a height of about 40 miles. There was no air traffic on radar within 100 miles.

Quoting from the observer's statement, "receiving a call concerning a strange light in the sky, I went out and scanned the sky in several directions before I saw a light. My first glimpse was a very bright blue light, but it lasted only about a minute, then it faded into a light green. It moved in a slow orbit.

I was startled at first so I closed my eyes and opened them again. The light was still there. I stared at it a few minutes and now the light seemed more yellow than before.

I did not think anyone would believe me, so I went inside the building and relieved the radar scope operator. I found a target at 123°, 53 miles. After that it appeared as a permanent echo. In about two minutes, it disappeared and almost immediately another pip appeared, at 134°, 73 miles. It also seemed

like a permanent echo. It stayed on the scope for 1½ minutes. These pips were at no time caused by malfunction of the radar set.

It was daylight when it (the object) seemed to fade both visually outdoors and electronically indoors."

And another sighting -- in Northern Michigan -- on July 29 of last year, a pilot chased a brilliant multicolored object close to the horizon, and due north. He flew at 21,000 feet, followed the object for over a half-hour but could not gain on it. Radar operator reported contact with the object for about thirty seconds. And ground control interceptor station reported blips too. In this case, it seems certain that our harried pilot was pursuing Capella! Reference to a star map will show that at his latitude, at the time of his sighting, Capella was at lower culmination, that is, at the lowest point of its swing around the pole just skirting the horizon. I have seen it at that position myself in Canada, and, can vouch for the fact that its blue, yellow, and red twinkling can be spectacular.

Unfortunately, neither Capella nor any other star can explain many other nocturnal meandering lights. But there is no question in my mind, just to make this point exceedingly clear, that there exists a relatively simple, natural explanation for them, perhaps even ordinary aircraft under special test conditions. The chief point here, is to suggest that nothing constructive is accomplished for the public at large -- and therefore for science in the long run by mere ridicule and the implication that sightings are the products of "bird-brains" and "intellectual flyweights." In short, it would appear that the flying saucer situation has always been a problem in science-public-relations, and that fine chance has consistently been missed to demonstrate on a national scale how scientists can go about analyzing a problem. A lot is said about the proper interpretation of science to the public, but the only answer they receive to a question about which they are more widely concerned than perhaps any other in this century, is ridicule. Ridicule is not a part of the scientific method and the public should not be taught that it is.

Let me quote an additional report, to show that the original flying disks, as distinct from wandering lights, are still with us.

On the day that our pilot chased Capella, a radio from Seattle announced that flying saucers were seen heading toward Montana. At an airport in Montana several pilots gathered outside the hangars to wait and watch. A perfect set-up for suggestibility and yet, quoting from one of the many signed statements, "Objects were seen that resembled flat disks reflecting sun's rays. One of the objects hovered from

three to four minutes, while the other three circled around it like satellites. Then the stationary object moved southeast to disappear, while the three satellites moved due west and disappeared at very high speeds!"

And from another observer: "After watching for approximately five minutes I was able to see what appeared to be a disk, white or metal in color approaching from the west. As it moved directly overhead it turned generally north at a 90° turn, then slowing down and then making several more 90° turns and proceeding east. After seeing this I knew what I was looking for and was able to pick up at least five more of these objects. *Being skeptical, I did my best to see them as either dandelion seeds or other small particles close to the surface of the earth rather than large objects at extreme distance.* However, after keeping them in sight long enough to study their appearance they definitely seemed to be very high. *I won't make an estimate of the height since I did not know their size*. All of these appeared in the west and proceeded east at what appeared to be an extremely high rate of speed."

I submit that this Air Force lieutenant was not incompetent, but rather that his manner of reporting -- as far as it went -- was commendable and that his report, made in good faith, is therefore entitled to a hearing without prejudice or ridicule, but also, without fanfare, hysteria, and fantastic newspaper publicity.

I cautioned against the then prevalent attitude of ridicule, pointing out that the UFO phenomenon, which had generated vast public interest, represented an unparalleled opportunity to demonstrate to the public the operation of the scientific method in attacking a problem, and that "ridicule is not a part of the scientific method and the public should not be taught that it is."

In those years and the following ones I repeatedly asked for the upgrading of the method of reporting UFO's to the Air Force. In

[[11]]

1960, in a hearing before Congressman Smart and his committee I urged "immediate reaction capabilities" in the investigation of UFO reports. The recommendation was applauded but not funded.

As the scientific climate grew more receptive in giving the UFO phenomenon a scientific hearing, I published a letter in "Science" (Oct. 21, 1966), not without difficulty, in which I pointed out the following general misconceptions regarding UFOs. I should like to have that letter made a part of the record.

(The letter referred to is as follows :)

UFO'S MERIT SCIENTIFIC STUDY

Twenty years after the first public furor over UFO's (called "flying saucers" then) reports of UFO's continue to accumulate. The Air Force has now decided to give increased scientific attention to the UFO phenomenon. Thus I feel under some obligation to report to my scientific colleagues, who could not be expected to keep up with so seemingly bizarre a field, the gist of my experience in "monitoring the noise level" over the years in my capacity as scientific consultant to the Air Force. In doing so, I feel somewhat like a traveler to exotic lands and far. away places, who discharges his obligation to those who stayed at home by telling them of the strange ways of the natives.

During my long period of association with the reports of strange things in the sky, I expected that each lull in the receipt of reports signaled the end of the episode, only to see the activity renew; in just the past two years It has risen to a new high. Despite the fact that the great majority of reports resulted from misidentifications of otherwise familiar things, my own concern and sense of personal responsibility have increased and caused me to urge the initiation of a meaningful scientific investigation of the residue of puzzling UFO cases by physical and social scientists. I have guardedly raised this suggestion in the literature [1] and at various official hearings, but with little success. UFO was a term that called forth buffoonery and caustic banter; this was both a cause and an effect of the lack of scientific attention. I speak here only of the puzzling reports; there is little point to concern ourselves with reports that can be easily traced to balloons, satellites, and meteors. Neither is there any point to take account of vague oral or written reports which contain few information bits. We need only be concerned with "hard data," defined here as reports, made by several responsible witnesses, of sightings which lasted a reasonable length of time and which were reported in a coherent manner.

I have strongly urged the Air Force to ask physical and social scientists of stature to make a respectable, scholarly study of the UFO phenomenon. Now that the first firm steps have been taken toward such a study, I can set forth something of what I have learned, particularly as it relates to frequently made misstatements about UFO's. Some of these statements which lead to misconceptions are:

1. *Only UFO "buffs" report UFO's*. The exact opposite is much nearer the truth. Only a negligible handful of reports submitted to the Air Force are from the "true believers," the same who attend UFO conventions and who are members of "gee-whiz" groups. It has been my experience that quite generally the truly puzzling reports come from people who have not given much or any thought to UFO's.

2. *UFO's are reported by unreliable, unstable, and uneducated people.* This is, of course, true. But UFO's are reported in even greater numbers by reliable, stable, and educated people. The most articulate reports come from obviously intelligent observers; dullards rarely overcome their inherent inertia toward making written reports.

3. *UFO's are never reported by scientifically trained people.* This is unequivocally false. Some of the very best, most coherent reports have come from scientifically trained people. It is true that scientists are reluctant to make a public report. They also usually request anonymity which is always granted.

4. *UFO's are never seen at close range and are always reported vaguely*. When we speak of the body of puzzling reports, we exclude all those which fit the above description. I have in my files several hundred reports which are fine brain teasers and could easily be made the subject of profitable discussion among physical and social scientists alike.

[1] *J. Opt. Soc. Amer.* 43, 311 (1953).

5. *The Air Force has no evidence that UFO's are extraterrestrial or represent advanced technology of any kind.* This is a true statement but is widely interpreted to mean that there is evidence against the two hypotheses. As long as there are "unidentifieds," the question must obviously remain open. If we knew what they were, they would no longer be UFO's -- they would be IFO's. Identified Flying Objects! If you know the answer beforehand, it isn't research. No truly scientific investigation of the UFO phenomenon has ever been undertaken. Are we making the same mistake the French Academy Sciences made when they dismissed stories of "stones that fell from the sky"? Finally, however, meteorites were made respectable in the eyes of science.

6. *UFO reports are generated by publicity.* One cannot deny that there is a positive feedback, a stimulated emission of reports, when sightings are widely publicized, but it is unwarranted to assert that this is the whole cause of high incidence of UFO reports.

7. *UFO's have never been sighted on radar or photographed by meteor or satellite tracking cameras*. This statement is not equivalent to saying that radar, meteor cameras, and satellite tracking stations have not picked up "oddities" on their scopes or films that have remained unidentified. It has been lightly assumed that although unidentified, the oddities were not unidentifiable as conventional objects.

For these reasons I cannot dismiss the UFO phenomenon with a shrug. The "hard data" cases contain frequent allusions to recurrent kinematic, geometric, and luminescent characteristics. I have begun to feel that there is a tendency in 20th-century science to forget that there will be a 21st-century science, and indeed, a 30th-century science, from which vantage points our knowledge of the universe may appear quite different. We suffer perhaps, from temporal provincialism, a form of arrogance that has always irritated posterity.

J. ALLEN HYNEK,
Dearborn Observatory, Northwestern University, Evanston, Ill.

One great misconception is that only UFO buffs report UFO's; quite the opposite is the case, as is the misconception that the most baffling reports come from unreliable, unstable, and uneducated people. Most reports of this baffling sort which I at least receive in my mail, are remarkably articulate.

Other misconceptions are that UFO's are never reported by scientifically trained people, are never seen at close range, have never been detected on radars, and have never been recorded by scientific cameras.

It is well to remind ourselves at this point of the definition of an UFO: those aerial phenomena reports which continue to defy explanation in conventional scientific terms, even after appropriate study. There is no point to be interested in anything else; lights at night which might be aircraft, balloons, meteors, or satellite re-entries all these fit more readily into the category of IFO's or identified flying objects.

In other words, only truly unidentified cases should be of interest. The Air Force has its own definition of an unidentified case, and it has many hundreds in its files. The Air Force calls a sighting unidentified when a report apparently contains all pertinent data necessary to suggest a valid hypothesis concerning the cause or explanation of the report but the description of the object or its motion cannot be correlated with any known object or phenomena. .

It is most logical to ask why do not the unidentified in the Air Force files call forth investigative efforts in depth and of wide scope. The answer is compound: the Air Force position is that there is no evidence that UFO's represent a threat to the national security: consequently it follows that it is not their mission to be scientifically curious about the hundreds of unidentified cases in their own files.

It may be that, properly investigated, many of the Air Force unidentifieds would turn out to be IFO's after all, but it is illogical to conclude that this would be true of all unidentified reports. As long as unidentified cases exist, thus bona fide UFO's according to definition, we don't know what they are, and these should represent a remarkable challenge to science and an open invitation to inquiry.

But so powerful and all-encompassing have the misconceptions among scientists been about the nature of UFO information that an amazing lethargy and apathy to investigation has prevailed. This apathy is unbecoming to the ideals of science and undermines public confidence.

Now it is of interest to report that in just the past few years, probably because of the persistent flow of UFO reports from this and many other countries (one could base his whole plea for a major investigative effort solely on the reports of the years 1966 and 1967) there has been a growing but unheralded interest on the part of more and more scientists, engineers, and technicians in doing something positive about the UFO problem. To this growing body of qualified people it seems increasingly preposterous to allow another two decades of confusion to exist.

The feeling is definitely on the increase that we should either fish or cut bait, that we should mobilize in earnest adequate groups of scientists and investigators, properly funded, adopt a "we mean business" attitude, or drop the whole thing. My recommendation is to fish.

As a scientist I can form conclusions from and act upon only reliable scientific data. Such data are extremely scarce in the UFO field for reasons already pointed out: it has never been considered worthwhile to improve the data-gathering process because the whole subject has been prejudged. Even as a scientist, however, I am permitted a scientific hunch, and that hunch has told me for some time, despite the tremendous muddiness of the scientific waters in this area, the continued reporting from various parts of the world of unidentified flying objects, reports frequently made by people of high repute who would stand nothing whatever to gain from making such reports, that there is scientific paydirt in the UFO phenomenon -- possibly extremely valuable paydirt -- and that therefore a scientific effort on a much larger scale than any heretofore should be mounted for a frontal attack on this problem.

In saying this I do not feel that I can be labeled a flying saucer "believer" -- my swamp gas record in the Michigan UFO melee should suffice to quash any such ideas -- but I do feel that even though this may be an area of scientific quicksand, signals continue to point to a mystery that needs to be solved. Can we afford to overlook something that might be of great potential value to the Nation?

I am reminded of the old story of the member of Parliament who visited Faraday's laboratory where he was at work on early experiments on electrical induction. When asked of what possible value all this might have, Faraday replied, "Sir, someday you may be able to tax it."

Apart from such inducements, I have the following recommendations to make: first, that a mechanism be set up whereby the problem posed by the reports from all over the world, but especially by those in the United States, from people of high credibility, can be adequately

studied, using all methods available to modern science, and that the investigation be accorded a proper degree of scientific respectability and an absence of ridicule so that proper investigations can be carried out unhampered by matters not worthy of the ideals of scientific endeavor. I might suggest that this could be accomplished by the establishment, by the Congress, of a UFO Scientific Board of Inquiry, properly funded, for the specific purpose of an investigation in depth of the UFO phenomenon.

Secondly, I recommend that the United States seek the cooperation of the United Nations in establishing a means for the impartial and free interchange among nations of information about, and reports of, unidentified flying objects -- a sort of international clearinghouse for the exchange of information on this subject. For, since the UFO phenomenon is global, it would be as inefficient to study it without enlisting the aid of other nations as it would be to study world meteorology by using weather reports from one country alone.

Now, it may be well to remind ourselves at this point, that the UFO problem may not lend itself to an immediate solution in our time. The problem may be far more complex than we imagine. Attempts to solve it may be no more productive than attempts to solve the problem of the Aurora Borealis would have been 100 years ago.

The cause of northern lights could not have been determined in the framework of the science of 1868. Scientific knowledge in those days was not sufficient to encompass the phenomenon.

Similarly, our scientific knowledge today may be grossly insufficient to encompass the problem posed by UFO's. A profound scientific obligation exists, nonetheless, to gather the best data possible for scientific posterity.

To summarize: in the course of 20 years of study of UFO reports and of the interviewing of witnesses, I have been led to a conclusion quite different from the one I reached in the very first years of my work. At first I was negatively impressed with the low scientific content of UFO reports, with the lack of quantitative data, with the anecdotal nature of the reports, and especially with the lack of hardware, of unimpeachable photographs, and with the lack of instrumental recordings.

I am still aware of the paucity of truly hard-core data -- but then, no effort has really been made to gather it. Nonetheless, the cumulative weight of continued reports from groups of people around the world whose competence and sanity I have no reason to doubt, reports involving close encounters with unexplainable craft, with physical effects on animals, motor vehicles, growing plants, and on the ground, has led me reluctantly to the conclusion that either there is a scientifically valuable subset of reports in the UFO phenomenon or .that we have a world society containing people who are articulate, sane, and reputable in all matters save UFO reports.

Either way, I feel that there exists a phenomenon eminently worthy of study. If one asks, for what purpose, I can only answer -- how does one ever know where scientific inquiry will lead. If the sole purpose of such a study is to satisfy human curiosity, to probe the unknown, and to provide intellectual adventure, then it is in line with what science has always stood for.

[[15]]

Scientific inquiry has paid off, even though pioneers like Faraday, Curie, Hahn, Pasteur, Goddard, and many others little realized where the paths they blazed would lead. As far as UFO's are concerned, I believe we should investigate them for the simple reason that we want to know what lies behind this utterly baffling phenomenon even more simply, we want to find out what it's all about.

Thank you.

Mr. Roush. Thank you, Dr. Hynek.

Although we have reserved the latter part of the afternoon for our roundtable discussion, the Chair is well aware the Members of Congress, because of other duties, may not find it possible to be here during that time.

If any of my colleagues do have questions and can keep them brief, which I realize is impossible, I will entertain those questions at this time. But keep in mind that we have two more papers this morning, and three this afternoon.

Mr. Hechler. Mr. Chairman.

Mr. Roush. Mr. Hechler.

Mr. Hechler. First I would like to commend you, Mr. Roush, for your initiative in setting up this symposium.

I would like to ask you, Dr. Hynek, whether you consider this scientific board of inquiry which you outlined as a sort of a one-shot thing which would make its report, or do you consider this to be a continuing body that could examine, as the Air Force has, reports and analyze them? And with this question, I would like to ask if your assumption is that the Air Force, because of its emphasis on national security, has really not measured up to a thorough scientific analysis of UFO's?

Dr. Hynek. Well, in answer to the first part of that question, sir, I would say I don't believe in a problem as complex as this the one-shot approach would be sufficient. I think there should be this board of inquiry which should be a continuing board in the same sense that we have, I presume, boards of study for world population problems, of pollution problems, of world health, and so forth.

The letter that came with the invitation to speak here, strongly stated that we would not discuss the Air Force participation in these matters, and I would like to therefore not speak to that point.

Mr. Roush. Mr. Rumsfeld.

Mr. Rumsfeld. Because of the fact it does look as though we will have a busy afternoon on the floor, I very likely will not be present for the remainder of the discussion. I would like to express the hope the other members of the panel might at some point comment on the two recommendations that Dr. Hynek has set forth in his paper. Further, I would hope that each member of the panel, during the afternoon session, might address himself to the questions of priorities.

Assuming that there is some agreement with Dr. Hynek's conclusion that this is an area worthy of additional study, then the question for Congress, of course, becomes what is the priority? This is a rather unique situation in that it is a scientific question that has reached the public prior to the time that anything beneficial can even be imagined. In many instances a scientific effort is not widely known to the public until it is successful.

[[16]]

Each of you are experts in one or more disciplines. I am sure there are a number of things on your shopping lists for additional funding. I would be interested to know how this effort that is proposed here might fit into your lists of priorities.

Thank you, Mr. Chairman.

Mr. Roush. Thank you, Mr. Rumsfeld.

Mr. Miller.

Chairman Miller. Doctor, you mentioned a number of things -- population studies at least. A great many of these are carried out not by Government directly, but in the National Science Foundation or through the National Academy of Sciences or scientific bodies themselves.

Do you think, I merely offer this as a suggestion, perhaps the scientific community try to encourage NSF or the scientific societies dealing in this field to take the initiative in doing this, rather than to wait for Government to take the initiative?

Dr. Hynek. I know, of course, most of the bodies you have mentioned are funded by the Government anyway. Most or a great part of our scientific research today has to be so funded. Private sources are certainly not sufficient. And, therefore, I think it is rather academic, really, to worry too much about who does it. It is more a question of who is going to pay for it.

We have a rather interesting situation here, as Congressman Rumsfeld has already pointed out. This is one of those strange situations in which the cart is sort of before the horse. Generally this results in the scientific laboratories and the results of the studies of scientists finally come to the public attention, but here we have the other situation. it is the public pressure, the public wants to know actually, more than the scientists, at the moment. So you are facing public pressures, even, definitely more than scientific pressures at the moment.

Chairman Miller. Unfortunately in some of our problems, for example the NASA problems, where the public is indifferent, the matter of waste disposal, pollution, health, and these things. They are quite indifferent to them, and it takes a lot of effort to get them interested in them sometimes.

The committee has studied this on several occasions, but we have generally had a group of the scientific community behind us to give pressure, to bring pressure, to get some of these things done.

Dr. Hynek. I think we will see, sir, in this testimony today that you will find a corps of scientists stand ready to do this. In fact, as I mentioned in my testimony, I have private information from a very large number of scientists who are interested.

Chairman Miller. I think this one of the values of the symposium.

Mr. Roush. Are there other questions or comments ?

(No response.)

Our next participant is Dr. James E. McDonald. Dr. McDonald is presently with the University of Arizona. He is a senior physicist, Institute of Atmospheric Physics, the University of Arizona, and has had a long and distinguished career as a scientist.

Dr. McDonald, we are pleased to have you as one of our participants. You may proceed.

STATEMENT BY DR. JAMES E. MCDONALD

1. Biography
2. Oral Statement
3. Questions from Committee Members
4. Prepared Statement

(The biography of Dr. McDonald follows:)

Dr. JAMES E. MCDONALD

Born: Duluth, Minn., May 7. 1920.

Home Address: 3461 East Third St., Tucson, Ariz.

Education:

University of Omaha, Omaha, Nebraska, B.A. (Chemistry) 1942.

Massachusetts Institute of Technology, Cambridge, Mass. (Meteorology) 1945.

Iowa State University, Ames, Ia., Ph.D. (Physics) 1951.

Professional Career:

Instructor, Dept. of Physics, Iowa State University, 1946-49.

Assistant Professor, Dept. of Physics, Iowa State University, 1950-53.

Research physicist. Cloud Physics Project, University of Chicago, 1953-54.

Associate Professor, Dept. of Physics, University of Arizona, 1954-56, Professor, 1956-57.

Associate director. Institute of Atmospheric Physics, University of Arizona, 1954-57.

Professor, Dept. of Meteorology, and Senior Physicist, Institute of Atmospheric Physics, 1958 to present.

Other activities:

U.S. Navy, 1942-45, naval intelligence and aerology.

Member, Panel on Weather and Climate Modification, National Academy of Sciences, 1965-present

Member, ESSA-Navy Project Stormfury Advisory Panel, 1966-present.

Member, American Meteorological Society Commission on Publications, 1966- present.

Member, Advisory panel for weather modification. National Science Foundation, 1967-present.

Professional memberships:

American Association for Advancement of Science, American Meteorological Society, Sigma Xi, American Geophysical Union, Royal Meteorological Society, Arizona Academy of Science, American Association of University Professors.

Personal: Married, 1945, Betsy Hunt: six children.

Fields of special interest:

Atmospheric physics, physics of clouds and precipitation, meteorological optics, atmospheric electricity, weather modification, unidentified aerial phenomena.

STATEMENT OF DR. JAMES E. MCDONALD, SENIOR PHYSICIST, INSTITUTE OF ATMOSPHERIC PHYSICS, AND PROFESSOR, DEPARTMENT OF METEOROLOGY, THE UNIVERSITY OF ARIZONA, TUCSON, ARIZ.

Dr. McDonald. Thank you, Mr. Roush.

I am very pleased to have this chance to make some comments and suggestions based on my own experience to the committee, and I do wish to commend the Committee on Science and Astronautics for taking this first, and I hope very significant step, to look at the problem that has puzzled many for 20 years.

As Dr. Hynek has emphasized in his remarks, it is one of the difficulties of the problem we are talking about today that the scientific community, not just in the United States but on a world basis, has tended to discount and to regard as nonsense the UFO problem. The fact that so much anecdotal data is involved has understandably discouraged many scientists from taking seriously what, in fact, I believe is a matter of extraordinary scientific importance.

I have been studying now for about 2 years, on a rather intensive basis, the UFO problem. I have interviewed several hundred witnesses in selected cases, and I am astonished at what I have found.

[[18]]

I had no idea that the actual UFO situation is anything like what it really appears to be.

There is a certain parallel between Dr. Hynek's slow recognition of the problem and my slow recognition of the problem. I have been curious about UFO's in a casual way for 10 or 20 years and have even checked cases in the southern Arizona area off and on rather casually, mainly encountering sincere laymen who do not recognize an aircraft strobe light, or Venus, or a bright fireball, when they see them. It is quite true that many persons misidentify natural phenomena; and my experience was mainly but not entirely limited to that sort of case.

About 2 years ago I became more than casually curious for several reasons that are not too relevant here, and began to spend much more time and very quickly changed my notions about the problem. I visited Wright-Patterson Air Force Base, saw their very impressive and surprising UFO files, the pattern of which is entirely different from what I had imagined.

At the same time, I contacted a number of private investigating UFO groups, one of the best and most constructive located here in Washington, the National Investigations Committee on Aerial Phenomena; contacted another one of the large national groups, the Aerial Phenomenon Research Organization, and found again somewhat to my surprise, that these amateur groups operating on a shoestring basis, and frequently scorned by us scientists, were, in fact, doing really a rather good investigative job within their resources, and had compiled in their files, for instance in NICAP, on the order of 10,000 or 12,000 cases, many of which I have subsequently checked, and all of which imply a problem that has been lost from sight, swept under the rug, ignored, and now needs to be very rapidly brought out into the open as a problem demanding very serious and very high-caliber scientific attention.

I wish to emphasize that. We must very quickly have very good people looking into this problem, because it appears to be one of very serious concern. We are dealing here with inexplicable phenomena, baffling phenomena, that will not be clarified by any but the best scientists.

The scope of my remarks this morning, and the scope of my more detailed remarks in my prepared statement which has been submitted, deal with two broad areas:

I have been asked to summarize the results of my interviewing of witnesses in the last 2 years, what I found, the problems I have encountered and so on; and, secondly to address myself to the categories of past explanations of UFO sightings, that hinge on my own field of atmospheric physics.

Let me turn very briefly to my experience. In the past 2 years I have been able to devote a substantial part of my time to this problem. I have mainly concentrated on witnesses in UFO sightings that have already been checked by some of the independent groups; that is, I was no longer, in the last 2 years, dealing with original raw data where it was primarily misidentified phenomena, but rather, I was dealing with presifted, presorted data, leaning very heavily on groups like NICAP and APRO, and other groups in this country and other groups abroad for my leads and background material.

[[19]]

I have also had a chance to interview 75 or 80 witnesses in Australia, New Zealand, and Tasmania, when I was down in that area last summer. There were various kinds of atmospheric explanations that bad been invoked in Australian cases. I must say that many of them are just as reasonable from the scientific point of view as many that we have heard in this country. But primarily I found in Australia that the nature of the sightings is similar to those in the United States, disk-like objects, cigar-shaped objects, objects without wings, without evident means of propulsion, frequently hovering without any sound, sometimes making sounds, hovering over cars, stopping cars, as Dr. Hynek has pointed out, causing interference with the ignition system, and the same kind of public reluctance to report was very evident.

I want to emphasize, as one of the very important misconceptions that has been fostered, that instead of dealing with witnesses who are primarily looking for notoriety, who want to tell a good story, who are all out to gain attention, it is generally quite the opposite. And this is true in Australia, too. People are quite unwilling to tell you about a UFO sighting, afraid acquaintances would think they nave "gone around the bend," as Australians put it. Over and over you encounter that. People are reluctant to report what they are seeing. There is a real ridicule lid that has not been contrived by any group, it just has evolved in the way the whole problem has unfolded. This is not entirely new in science. It has occurred before.

I am sure a number here at the speakers' table are familiar with an interesting chapter in science years ago when meteorites, out of which NASA and many scientists around the world now get a very large amount of useful scientific information, were scorned and scoffed as unreal. It was regarded as nonsense that peasants were telling stories about stones falling out of the sky. The efforts of a few scientists to take a look at the problem and to get some initial data simply were ignored until a very unusual but very real event occurred in northern France, a meteorite shower. So they sent an eminent academician out to have a look at what these people were talking about, and by golly, the peasants appeared to be right. Everybody in the village, the prefect of police, the local administrators, all the peasants, had seen stones fall out of the sky, and for the first time the French Academy deigned to take a look at the problem. Meteoritics was born.

Here we now face a very similar situation in science. We have tended to ignore it because we didn't think it made sense. It definitely defies any explanation, and hence the situation has evolved where we can't get going because we aren't already going.

The scientific community as a whole won't take this problem seriously because it doesn't have scientific data. They want instrumental data.

Why don't they have instrumental data ? Because the scientists don't take it seriously enough to get the scientific data. It is like the 20-year-old who can't get a job because he lacks experience, and he lacks experience because he hasn't had a job. In the same way you find the scientist wishing you would give him good hard meter readings and magnetometer traces, and so on: but we don't have it yet because the collective body of scientists, including myself, have ignored UFO's.

[[20]]

Turning to some of the highlights of my interviewing experience, I first mention the "ridicule lid." We are not dealing with publicity seekers. We are not, and I here concur with Dr. Hynek's remarks, we are not dealing with religiosity and cultism. Those persons aren't really the least bit interested in observations. They have firm convictions entirely independent of observations. They do not cause noise that disturbs the real signal at all.

General Samford of the Air Force put it well, 16 years ago. General Samford, then Director of Intelligence, said, and I would concur 100 percent, "Credible observers are observing relatively incredible objects." That was said 16 years ago, and it is still occurring.

I will touch in a moment or two on a sighting in Mr. Pettis' district that very well illustrates that, a sighting this year in Redlands, Calif., which I think Dr. Harder may be able to tell still more about.

Another characteristic in interviewing the witnesses is the tendency for the UFO witness to turn first not to the hypothesis that he is looking at a spaceship, but rather it must be an ambulance out there with a blinking red light or that it is a helicopter up there. There is a conventional interpretation considered first; only then does the witness get out of the car or patrol car and realize the thing is stopped in midair and is going backwards and has six bright lights, or something like that. Only after an economical first hypothesis does the witness, in these impressive cases, go further in his hypotheses, and finally realize he is looking at something he has never seen before.

I like Dr. Hynek's phrase for this, "escalation of hypotheses." This tendency to take a simple guess first and then upgrade it is so characteristic that I emphasize it as a very important point.

Then, looking at the negative side, all of us who have checked cases are sometimes in near anguish at the typical inability of the scientifically untrained person to estimate angles, to even understand what you are asking for when you ask for an angular estimation. We are all aware of the gross errors in distances, heights, and speeds so estimated.

And I would emphasize to those who cite jury trial experience that the tendency for a group of witnesses to an accident to come in with quite different accounts, must not be overstressed here. Those witnesses don't come in from, say, a street corner accident and claim they saw a giraffe killed by a tiger. They talk about an accident. They are confused about details. There is legally confusing difference of timing and distance, and so on; but all are in agreement that it was an auto accident.

So also when you deal with multiple-witness cases in UFO sightings. There is an impressive core of consistency; everybody is talking about an object that has no wings, all of 10 people may say it was dome shaped or something like that, and then there are minor differences as to how big they thought it was, how far away, and so on. Those latter variations do pose a very real problem. It stands as a negative factor with respect to the anecdotal data, but it does not mean we are not dealing with real sightings of real objects.

Then there's the very real but not terribly serious problem of the hoaxers, fabricators, liars, and so on. You do encounter cases from time to time where you end up thinking, well, this person has some

reason to have invented the whole story. Sometimes it is fairly apparent. Sometimes it takes a lot of digging to prove it.

I might say here that the independent investigative groups have done an excellent job. It takes a knowledge of human characteristics, not scientific expertise to detect lies and hoaxes.

Then there is the problem that you always have to be sure in talking with witnesses that you are not dealing with somebody already very enthusiastic about UFO's. You have to try to establish, and this is not always easy, whether he has prior knowledge of the whole UFO literature. Are you dealing with somebody who is just telling you again what he has read in a recent magazine in the barber chair?

I emphasize that my experience is that again and again you find people who were not really interested in UFO's until they saw one themselves. Then they suddenly became very, very concerned, as one more member of the public who has become a UFO witness; and in this body of citizens there are some very distressed persons who wish that the scientific community, or the Government, were doing something about this problem.

The types of objects that are being seen, and I state the word "objects" not "hazy lights," are spread over quite a range of types, a baffling range.

I want to use that word many times, because it speaks for my experience. The UFO problem is baffling. But there is a predominance of disc-shaped objects and elongated cigar-shaped objects, objects without wings, appendages, tails, and that sort of thing. Typically, wingless objects, disc- and cigar-shaped.

The same type of observations have been coming from all parts of the world, and have been for a number of years. My direct interviews with a witness in Australia speak for that global pattern.

Another characteristic that emerges is a quite fluctuatory frequency of sightings. Right now, in the past few months, there have not been very many really impressive cases that have come up; but last fall, for example, England had a wave of sightings which was unprecedented in the English experience, that led, for example, to a BBC documentary that has just been produced. It led also to a recently published study, that I got only a couple of weeks ago from the Stoke-on-Trent area in Staffordshire, 70 sightings in about a 2½ month period in this area. It happens that one of my colleagues is an English physicist from that very area. As he points out, these are no-nonsense people who are not airy-fairy types that would be on LSD), or seeing ghosts in the sky.

He is puzzled, and I am puzzled.

Well, there are many questions that are asked by skeptical scientists, skeptical members of the public; and skepticism, as Mark Twain said, is what gets you an education.

There are questions like. "Why aren't UFO's seen abroad?" "Why aren't UFO's seen by airline pilots?" "Why aren't UFO'S seen by crowds of people rather than by lone individuals?" "Why aren't they tracked by radar?" "Why don't weather observers and meteorologists see UFO's?"

"Why aren't there sonic booms, or why aren't there crashed UFO's?"

Finally, a very frequently raised question, "If the UFO's are from somewhere else,' if they are really devices that represent some high

[[22]]

civilization, why no contact?" This is a question that comes up again and again, since most persons who know enough about the UFO problem to realize there must be something there, cannot, in their first view of the problem, visualize a visitation from elsewhere, surveillance, or what have you, without contact.

I want to return to that point later, but I wish to emphasize that that is a fallacious question. If we were under surveillance from some advanced technology sufficiently advanced to do what we cannot do in the sense of interstellar travel, then, as Arthur Clarke has put it quite well, quoted in Time magazine the last week, we have an odd situation. Arthur Clarke points out that any sufficiently advanced technology would be indistinguishable from magic. How well that applies to UFO sightings. You have a feeling you are dealing with some very high technology, devices of an entirely real nature which defy explanation in terms of present-day science. To say that we could anticipate the values, reasons, motivations, and so on, of any such system that has the capability of getting here from somewhere else is fallacious.

That is a homocentric fallacy of the most obvious nature, yet it is asked over and over again.

In my prepared statement I will be able to cover more of these points, of course.

The heart of the problem lies in citing cases, and I have investigated, personally, on the order of 300 cases dealing with key witnesses. I have looked as carefully as I can for all reasonable explanations.

There are many cases that fall apart when you investigate them. Then there are far too many that resist the best analysis that many of us have been able to subject them to.

Let me just cite briefly, to take a recent case rather than an old one, the instance at Redlands, and perhaps Dr. Harder can fill you in in more detail.

On February 4 of this year, at 7:20 in the evening, over a residential area in that city of population 30,000, a disc was seen. Twenty witnesses interviewed by University of Redlands' investigators, described it as having "windows" or "ports" or something of that sort. They interviewed a little over half a dozen of them and all saw something on the bottom that they described as "looking like jets."

This object was hovering at an estimated height of about 300 feet. The estimates vary, but it came out about 300 feet. The citizens had gone out in the street because dogs were barking and, because they had heard an unusual noise, and pretty soon there were people all up and down the street. It was estimated that more than 100 witnesses were involved, and 20 were directly interviewed.

Here was an object seen by many persons. It hovered, then shot up to about double the height, hovered again, and moved down across Redlands a short distance, hovered once again, and then took off rapidly to the northwest.

This case has not received any scientific attention beyond this investigation by Dr. Philip Seff and his colleagues. It has not received public notoriety. This was, in fact, only reported in a short column in the local paper and not on the wires anywhere. That happens over and over again.

Here, for example, are the reports for one month of last fall, clipping-service coverage on the things that get local coverage, but

[[23]]

don't get on the wires, because in the present climate of the opinion, wire editors, like scientists, Congressmen, and the public at large, feel sure there is nothing to all this, and they don't put them on the wires. You have to go right to the local town to get press coverage in most cases.

The Redlands, February 1968, case illustrates that very well. Once in a while a case will get on the wires and receive national attention, but by and large, one just doesn't read about these cases in other parts of the country, because wire services don't carry them.

Let me tell you another case that answers the questions: "Why aren't there multiple witnesses?" "Why aren't they seen in cities?" "Why aren't these ever seen in the daytime?"

It is true that there is a preponderance of nighttime sights. Maybe this is merely a matter of luminosity.

It is also true that there seem to be more reports from rather remote areas, say desert areas or swampy areas, than in the middle of cities. But there are city observations. And it is also true there are more individual witness cases than sightings by large crowds. But in every instance there are striking exceptions to this.

In New York City, on November 22, 1966, a total of eight witnesses, members of the staff of the American Newspaper Publishers Association, were the witnesses in a good case. I interviewed William Leick, of that staff, the manager of the office there. I heard about it through a NICAP report. It did not appear in the papers, as I will mention. William Leick had been looking out the window, saw an object over the U.N. building. It was hovering, and as he talked to a colleague he realized there was something odd about it, so they walked out on the terrace. Soon they had six others out on the terrace. This was at 4:30 in the afternoon. It was kind of a cushion-shaped object, as he described it, and had no wings. It was rocking a little from time to time, blinked in the afternoon sun a little bit, had kind of an orange glow. All eight were watching, and after it hovered for several moments it rose vertically and then took off at high speed. There is an example of midtown sighting in New York where the witnesses are staff members of a responsible organization. Leick, himself, had been trained in intelligence, in World War II. There is no reason at all to think he and his colleagues would invent this.

They did call a New York paper, but to say they weren't the least bit interested. There was no report published in a New York paper. Next they called a local Air Force office but no one came to investigate it. It came to my attention because one of the members of the staff knew of NICAP and sent NICAP a report.

This sort of thing has happened over and over again. The ridicule lid keeps these out of sight; too many of them are occurring to delay any longer in getting at this problem with all possible scientific assistance.

A famous multiple-witness instance occurred in Farmington, N. Mex., on March 17, 1950. I interviewed seven witnesses there. A very large number of objects were involved. There were several different groups of objects, all described as disc-shaped objects. They were explained as Skyhook balloons, officially, so I checked into that.

I finally established that there was no Skyhook balloon released anywhere in the United States on or near that day. The witnesses included

some of the leading citizens in the town. It was reported nationally at that time but was soon forgotten.

I have interviewed one of the witnesses in a Washington State sighting, at Longview, Wash., July 3, 1949. An air show was being held and someone spotted the UFO because there was a sky-writing aircraft overhead that some people were watching. They spotted the first of three disc-like objects that came over Longview that morning. The person whom I interviewed is a former Navy commander, Moulton B. Taylor. He was the manager of the air show, so he got on the public address system and got everybody to look at this object before it crossed the skies. It was fluttering as it went across the sky. There were pilots, engineers, police officers, and Longview residents in the audience. Many had binoculars. Taylor estimated it to be about 10 minutes of arc in diameter. Because the aircraft was still skywriting people continued to watch the sky. Two successive objects of the same type flew over in the next 20 minutes. A total of three objects came over, and they were from three different directions: one from the north, one from the northwest, and one almost from the west, quite clearly ruling out an explanation like balloons, which became the official explanation. There were no balloon stations anywhere near Longview, Wash., as a matter of fact, and the balloon explanation is quite inadequate.

Here we have a case of over a hundred witnesses to the passage of a wingless object moving at relatively high velocity. When the second and third objects went over, someone had the presence of mind to time the fluttering rate -- it was 48 per minute.

Here again we have a multiple-witness case, a daytime sighting case, and one which you can't quickly write off.

If time permitted I would talk about a number of radar cases. One of the most famous is the Washington National Airport sighting. On July 19, 1952, CAA radars and Andrews Air Force radars tracked unknowns moving at variable speeds from 100 miles an hour to over 800 miles an hour, and a number of airline pilots in the air saw these, and were in some instances vectored in by the CAA radar people, and then saw luminous objects in the same area that they showed on radar up near Herndon and Martinsburg.

I talked to five of these CAA people. One can still go back and check these old cases, I emphasize. I also talked to four of the airline pilots who were in the air at the time. I have gone over the quantitative aspects of the official explanation that this was ducting or trapping of the radar beams. That is quite untenable. I have gone over the radiosonde, computed the radar refractive index gradient, and it is nowhere near the ducting gradient.

Also, it is very important that at one time three different radars, two CAA and one Andrews Air Force Base radar, all got compatible echoes. That is extremely significant.

And finally from a radar-propagation point of view, the angles of propagation, radar and visual, were far above any values that would permit trapping, which makes this a case which is not an explained case. It was an instance of unidentified aerial objects over our Capital, I believe.

One could go on with many cases. I want to just briefly touch two categories of atmospheric explanations that have been rather widely discussed, and close with that.

[[25]]

Meteorological optics is a subject, that I enjoy and have looked into over the years rather carefully, and I must express for the record my very strong disagreement with Dr. Donald H. Menzel, former director of Harvard Observatory, whose two books on the subject of UFO's lean primarily on meteorological explanations. I have checked case after case of his, and his explanations are very, very far removed from what are well-known principles and quantitative aspects of meteorological optic objects. He has made statements that simply do not fit what is known about meteorological objects.

I would be prepared to talk all day on specific illustrations but time will not permit more.

Secondly, there has more recently been a suggestion made by "Aviation Week" Senior Editor Philip J. Klass, that the really interesting UFO's are atmospheric-electrical plasmas of some type similar to ball lightning, but perhaps something different, something we don't yet understand but are generated by atmospheric processes.

The first time anyone tried the ball lightning hypothesis was in Air Force Project Grudge, back in 1949. The Weather Bureau was asked to do a special study of ball lightning. I recently got a declassified copy of that, and the Air Force position at that time, and since then was that ball lightning doesn't come near to explaining these sightings. I concur in that. When you deal with multiple-witness cases involving discs with metallic luster, definite outline, seen in the daytime, completely removed from a thunderstorm, perhaps seen over center Manhattan, or perhaps in Redlands, Calif., they are not ball lightning or plasmas.

In weather completely unrelated to anything that could provide a source of energy, the continuous power source required to maintain a plasma in the face of recombination and decay of a plasma, Klass' views just do not make good sense.

It is just not reasonable to suggest that, say the BOAC Stratocruiser that was followed by six UFO's for 90 miles up in the St. Lawrence Valley in 1954 was followed by a plasma, or that these people in Redlands were looking at a plasma, or that the 20 or so objects that went over Farmington were plasmas.

One of the most characteristic features of a plasma is its very short lifetime and exceedingly great instability, as some of your members will know from your contact with fusion research problems. The difficulty of sustaining a plasma for more than microseconds is a very great difficulty. To suggest that clear weather conditions can somehow create and maintain plasmas that persist for many minutes, and fool pilots with 18,000 flight hours into thinking that they are white- and red-

domed discs, to take a very famous case over Philadelphia where the pilot thought he was about 100 yards from this dome-disc, is unreasonable. It is not a scientifically well-defended viewpoint.

To conclude, then, my position is that UFO's are entirely real and we do not know what they are, because we have laughed them out of court. The possibility that these are extraterrestrial devices, that we are dealing with surveillance from some advanced technology, is a possibility I take very seriously.

I reach that hypothesis, as my preferred hypothesis, not by hard fact, hardware, tailfins, or reading license plates, but by having examined

[[26]]

hundreds of cases and rejected the alternative hypothesis as capable of accounting for them.

I am afraid that this possibility has sufficiently good backing for it, despite its low a priori ability, that we must examine it. I think your committee, with its many concerns for the entire aerospace program, as well as our whole national scientific program, has a very special reason for examining that possibility. Should that possibility be correct, if there is even a chance of its being correct, we ought to get our best people looking at it. Instead, we are collectively laughing at this possibility.

To meet Mr. Rumsfeld's request, let me remark on Dr. Hynek's two recommendations. I strongly concur in the need for some new approach. I am sure Dr. Hynek was not suggesting there be one single UFO committee. In fact, he said, "not a one-shot approach." A pluralistic approach to the problem is needed here.

The Defense Department is already supporting some work on it. NASA definitely has a need to look at this problem. We have to pay very serious attention to the problem and get a variety of new approaches.

The other point Dr. Hynek mentioned was that we try to look at this on a worldwide basis. This is crucially important. We are dealing with a real problem here, and I insist it is a global problem. We can study it in the United States, but if we ignore what is happening in France and England -- one of the greatest UFO waves that ever occurred was in France -- would be a serious mistake. I strongly urge that your committee consider holding rather more extensive Hearings in which a larger segment of the scientific community is given the opportunity to talk pro and con on the issue, hearings aimed at getting a new measure of scientific attention to this important problem.

Thank you.

Mr. Roush. Thank you, Dr. McDonald, for your presentation. As we explained awhile ago, we are pressed for time. We are entertaining questions from members of the committee.

Mr. Bell. Dr. McDonald, I want to compliment you on your interesting statement. But what leads you to believe that whatever these phenomena are, they are extraterrestrial?

What facts do you have?

Dr. McDonald. May I say I wouldn't use the word "believe." I would say the "hypothesis" that these are extraterrestrial surveillance, is the hypothesis I presently regard as most likely.

As I mentioned, it is not hard facts in the sense of irrefutable proof, but dealing with case after case wherein the witnesses showed credibility I can't impugn. That impresses me. These are not at all like geophysical or astronomical phenomena; they appear to be craft-like machine-like devices. I would have to answer you in terms of case after case that I and others have investigated, to make all this clear. It is this very large body of impressive witnesses' testimony, radar-tracking data on ultra-high-speed objects sometimes moving at over 5,000 miles an hour, UFO's, combined radar-visual sightings, and just too much other consistent evidence that suggests we are dealing with machine-like devices from somewhere else.

[[27]]

Mr. Bell. Have there been pictures taken ?

Dr. McDonald. Yes; there nave been pictures taken.

For instance, a photograph taken in Ohio, by an Air Force photo reconnaissance plane May 24, 1954. I recently have looked a little more closely at the data. This was explained as an undersun, but that idea is subject to quantitative observation. The angles just do not fit. There is a very important case at Edwards Air Force base with two witnesses, where they got photographs of the object. Unfortunately, in this case I have not seen the photo, but I have talked with the persons who took it. There are photographs, but not nearly as many as we would like. We would like to have lots of them. In a case in Corning, Calif., a police officer, one of five witnesses, had a loaded camera in his patrol car, 20 paces from where he watched the object, didn't even think of getting his camera. He said he was too flabbergasted to think of it. That is a part of the problem.

Mr. Roush. Mr. Hechler.

Mr. Hechler. Have you examined any reports of communication by these objects ?

Dr. McDonald. Yes; the problem of contact is very important. There is one category of contact, not in the sense of shaking hands, but rather light response. I have a file on several of these, and I'm looking for more. For instance, in Shamokin, Pa., Kerstetter is the name of the witness, he works for a bank in Shamokin. I talked to the president of the bank as to his reliability and got very good recommendations. Last year, he and his wife and family were in a car near a mountain ridge in Shamokin, saw a thing hovering over the mountain, like the flashing lights of a theater marquee. He had a flashlight. He didn't know Morse code, but it really didn't matter. He sent light flashes in various orders and he got lights back from the thing. That same thing happened in Newton, N.H., in August of last year, where several persons saw an object coming overhead. The same thought occurred to them and they signaled with a flashlight. It wasn't Morse, it was dot dash dot, then dash dash dash, and it came back with no failure, replicated light signals. The same thing happened in West Virginia, where a pharmacist, named Sommers, did it with his headlights. When I was in Australia, I talked about some hunters out hunting kangaroo. A disk came over, one said "give them Morse"; the flash came back faithfully, and they left in a hurry. Is that contact? I don't know. Nobody got any intelligence out of it either way, if you will pardon the whimsy. It would be terrible if in fact this was surveillance and our technology was represented by the Eveready flashlight. [Laughter.]

We may be flunking our exam.

Mr. Roush. Mr. Downing.

Mr. Downing. I'm interested in your testimony. On page 10 of your written statement, you say it is unfortunate no acceptable version of Reference 6 exists, though it has managed to get it into the status of limited acceptability.

Why is this not available?

Dr. McDonald. Well, that was an Air Force document. This was completed in 1949. These were classified until just a few years back. No one could get access to them, because they were under DOD classification. But the 12-year rule expired, and Dr. Leon Davidson managed to get a copy.

[[28]]

It is accessible in the sense that if I want to pay $90 for Xeroxes I can now get it. It is not published in the sense of being available to every library in the country. My Reference 7, which NICAP just published, is available to scientists all over the country. It is a matter of the Air Force having a policy of not publishing such items, and they were classified. I think the Moss committee and NICAP are to be highly praised to get out in the open Reference 7.

Mr. Downing. Is there a reason why this is classified?

Dr. McDonald. There is an understandable reason why the Air Force has had to classify this. An unidentified aerial object, on presumption, is hostile until proved otherwise. So there has been this unfortunate, but entirely understandable measuring of these two areas. The national defense mission of the Air Force has necessitated they have some part of the UFO problem inevitably, and they got it in the first instance. They have long since told us there is no hostility here, hence the scientific curiosities going unattended because it doesn't fall under the defense mission, in other words to be transferred into NASA, NSF, or something like that. That does not mean the Air Force won't continue to watch unidentified objects on the millisecond basis. But they not need worry about this other part of the problem. I think it is understandable, but needs changing.

Mr. Roush. Mr. Pettis.

Mr. Pettis. Mr. Chairman, Doctor.

I was a little bit interested in your observations about this UFO sighting in my hometown of Redlands.

I might observe that Redlands is a rather conservative community, when people in Redlands say they saw something, they saw something. I did not happen to be in Redlands that particular date, so I did not see this.

But I would like to observe this, that having spent a great deal of my life in the air, as a pilot, professional and private pilot, I know that many pilots and professional pilots have seen phenomena that they could not explain.

These men, most of whom have talked to me, have been very reticent to talk about this publicly, because of the ridicule that they were afraid would be heaped upon them, and I'm sure that if this committee were ever to investigate this, or bring them in here, there probably would have to be a closed hearing, Mr. Chairman.

However, there is a phenomena here that isn't explained.

I think probably we ought to do a little looking into this, is my personal opinion.

Mr. Roush. Mr. Ryan.

Mr. Ryan. Yes, thank you, Mr. Chairman.

First I should like to commend you, Mr. Roush, for your interest in the subject matter, and the chairman of the full committee for having arranged for hearings into this problem.

I think it is important that this committee not waive its jurisdiction, but that it explore very carefully the proposals that have been made by the witnesses here, and that it have a continuing field of exploration into this whole question. I want to commend Dr. McDonald for having been persistent in presenting his views to the various members of the committee, helping to bring about these hearings.

[[29]]

I wondered, Dr. McDonald, if you would care to evaluate the research project at the University of Colorado, and comment on that?

Mr. Roush. Mr. Ryan, may I just say we had agreed that this was not the place to discuss that particular project, and that the purpose of the symposium was not to go into the activities of another branch of government, but rather to explore that as a scientific phenomena.

I'm sure that Dr. McDonald would be very happy to confer with you privately on this, but if you could show some restraint here, the Chair would be real grateful to you.

Mr. Ryan. Well, let me rephrase my question.

In view of the fact that there has been a study conducted by a project in the Air Force, and the University of Colorado, do you believe there is anything further that should be done by any branch of the Government?

Dr. McDonald. Emphatically, yes.

Mr. Ryan. What would you recommend?

Dr. McDonald. I think that we need to get a much broader basis of investigation of UFO's, as I did say, a few moments ago, it would be very salutary to have a group in NASA looking at this problem, and to have some NASA support of independent studies. It would be very good for the National Science Foundation to support, say, some university people interested in it. It would be good to have the Office of Naval Research et cetera involved.

We don't deal with many other important problems, space, or molecular biology or health without a pluralistic approach, a multiplicity of research programs. I don't want to touch a frayed nerve here. This problem of duplication is sometimes lamented. But by and large I think you will agree we would gain from having a lot of different people with slightly different points of view going at every problem. At the moment everything is focused through one agency, and everything

now hinges on that one particular program you have asked me about, and my answer was, we very definitely need some independent programs.

I am on record elsewhere than here in my specific views on that project.

Mr. Ryan. Looking back at page 14, you wrote a letter to the National Academy of Sciences, concerning this project. Have you had any reaction from the National Academy of Sciences?

Dr. McDonald. Yes, I received a letter from Dr. Seitz, saying for the time being we must let the Colorado project run its course. That was the gist of the answer.

Mr. Roush. I would appreciate it, if we dispensed with that. Let me say that the National Academy is undertaking an evaluation of the University of Colorado project, and this will be published.

Mr. Ryan. I'm suggesting maybe this committee should make an investigation of the University of Colorado project.

Chairman Miller. That is something we don't have authority to do here.

Mr. Ryan. To what extent, Dr. McDonald, have sightings been picked up by radar, and what extent of those that have been picked up been explored?

Dr. McDonald. Well, there are many such sightings, I dare say there are thousands of military radar sightings that were for the short

[[30]]

period unidentified. Then they identify them. But here is an impressive number of both military and civilian radar sightings that defy radar explanation in terms of unknown phenomena. Most of these deficiencies are well understood, so one can be fairly sure that many of these unidentified radar cases have no conventional explanation.

In a case where a P-61 flew over Japan, back some years ago, made six passes at an unidentified object it was getting radar returns on, and the pilot saw it visually. Here you are dealing with an unknown. Then there was a case in Michigan where a ground radar detected an object at 600 miles an hour coming in over Saginaw Bay. The pilot got a radar return, and also saw a vast luminous object; the object turned in a very sharp 180 degree turn and went back, and eluded the F-94. Here you are dealing with a case where radar propagation anomalies will not explain it. There was one radar in the airplane at 20,000 feet and one radar on the ground, both showing the object. There are many cases like that which I could enlarge on.

Mr. Ryan. Let me ask a further question: In the course of your investigation and your study of UFO sightings, have you found any cases where contemporaneously with the sighting of UFOs allegedly, there were any other events which took place, which might or might not be related to the UFO's ?

Dr. McDonald. Yes. Certainly there are many physical effects. For instance, in Mr. Pettis' district, several people found the fillings in their mouth hurting while this object was nearby, but there are many cases probably on record of car ignition failure. One famous case, was at Levelland, Tex., in 1967. Ten vehicles were stopped within a short area, all independently in a 2-hour period, near Levelland, Tex. There was no lightning or thunder storm, and only a trace of rain. There is another which I don't know whether to bring to the committee's attention or not. The evidence is not as conclusive as the car stopping phenomenon, but there are too many instances for me to ignore. UFO's have often been seen hovering near power facilities. There are a small number but still a little too many to seem pure fortuitous chance, of system outages, coincident with the UFO sighting. One of the cases was Tamaroa, Ill. Another was a case in Shelbyville, Ky., early last year. Even the famous one, the New York blackout, involved UFO sightings. Dr. Hynek probably would be the most appropriate man to describe the Manhattan sighting, since he interviewed several witnesses involved. I interviewed a woman in Seacliff, N.Y. She saw a disk hovering and going up and down. And then shooting away from New York just after the power failure. I went to the FPC for data, they didn't take them seriously although they had many dozens of sighting reports for that famous evening. There were reports all over new England in the midst of that blackout, and five witnesses near Syracuse, N.Y., saw a glowing object ascending within about a minute of the blackout. First they thought it was a dump burning right at the moment the lights went out. It is rather puzzling that the pulse of current that tripped the relay at the Ontario Hydro Commission plant has never been identified, but initially the tentative suspicion was centered on the Clay Substation of the Niagara Mohawk network right there in the Syracuse area, where unidentified aerial phenomenon has been seen by some of the witnesses.

This extends down to the limit of single houses losing their power when a UFO is near. The hypothesis in the case of car stopping is that there might be high magnetic fields, d.c. fields, which saturate the core and thus prevent the pulses going through the system to the other side. Just how a UFO could trigger an outage on a large power network is however not yet clear. But this is a disturbing series of coincidences that I think warrant much more attention than they have so far received.

Mr. Ryan. As far as you know, has any agency investigated the New York blackout in relation to UFO?

Dr. McDonald. None at all. When I spoke to the FPC people, I was dissatisfied with the amount of information I could gain. I am saying there is a puzzling and slightly disturbing coincidence here. I'm not going on record as saying, yes, these are clear-cut cause and effect relations. I'm saying it ought to be looked at. There is no one looking at this relation between UFO's and outages.

Mr. Roush. Our time is really running short, Mr. Ryan.

Mr. Ryan. One final question. Do you think it is imperative that the Federal Power Commission, or Federal Communications Commission, investigate the relation if any between the sightings and the blackout?

Dr. McDonald. My position would call for a somewhat weaker adjective. I'd say extremely desirable.

Mr. Roush. Thank you.

Thank you, Dr. McDonald.

INTRODUCTION

I should like first to commend the House Committee on Science and Astronautics for recognizing the need for a closer look at scientific aspects of the long-standing puzzle of the Unidentified Flying Objects (UFOs). From time to time in the history of science, situations have arisen in which a problem of ultimately enormous importance went begging for adequate attention simply because that problem appeared to involve phenomena so far outside the current bounds of scientific knowledge that it was not even regarded as a legitimate subject of serious scientific concern. That is precisely the situation in which the UFO problem now lies. One of the principal results of my own recent intensive study of the UFO enigma is this: I have become convinced that the scientific community, not only in this country but throughout the world, has been casually ignoring as nonsense a matter of extraordinary scientific importance. The attention of your Committee can, and I hope will, aid greatly in correcting this situation. As you will note in the following, my own present opinion, based on two years of careful study, is that UFOs are probably extraterrestrial devices engaged in something that might very tentatively be termed "surveillance."

If the extraterrestrial hypothesis is proved correct (and I emphasize that the present evidence only points in that direction but cannot be said to constitute irrefutable proof), then clearly UFOs will become a top-priority scientific problem. I believe you might agree that, even if there were a slight chance of the correctness of that hypothesis, the UFOs would demand the most careful attention. In fact, that chance seems to some of us a long way from trivial. We share the view of Vice Adm. R. H. Hillenkoetter, former CIA Director, who said eight years ago, "It is imperative that we learn where the UFOs come from and what their purpose is (Ref. 1)" Since your committee is concerned not only with broad aspects of our national scientific program but also with the prosecution of our entire space program, and since that space program has been tied in for some

years now with the dramatic goal of a search for life in the universe, I submit that the topic of today's Symposium is eminently deserving of your attention. Indeed, I have to state, for the record, that I believe no other problem within your jurisdiction is of comparable scientific and national importance. Those are strong words, and I intend them to be.

In addition to your Committee responsibilities with respect to science and the aerospace programs, there is another still broader basis upon which it is highly appropriate that you now take up the UFO problem: Twenty years of public interest, public puzzlement, and even some public disquiet demand that we all push toward early clarification of this unparalleled scientific mystery. I hope that our session here today will prove a significant turning point, orienting new scientific efforts towards illumination of this scientific problem that has been with us for over 20 years.

SCOPE AND BACKGROUND OF PRESENT COMMENTS

It has been suggested that I review for you my experiences in interviewing UFO witnesses here and abroad and that I discuss ways in which my professional experience in the field of atmospheric physics and meteorology illuminates past and

present attempts at accounting for UFO phenomena. To understand the basis of my comments, it may be helpful to note briefly the nature of my own studies on UFOs.

I have had a moderate interest in the UFO problem for twenty years, much as have a scattering of other scientists. In southern Arizona, during the period 1956-66, I interviewed, on a generally rather random basis, witness in such local sightings as happened to come to my attention via press or personal communications. This experience taught me much about lay misinterpretations of observations of aircraft, planets, meteors, balloons, flares, and the like. The frequency with which laymen misconstrue phenomena associated with fireballs (meteors brighter than magnitude 5), led me to devote special study to meteor physics; other topics in my own field of atmospheric physics also drew my closer attention as a result of their bearing on various categories of UFO reports. This period of rather casual UFO-witness interviewing on a local basis proved mainly educational; yet on a few occasions I encountered witnesses of seemingly high credibility whose reports lay well outside any evident meteorological, astronomical, or other conventional bounds. Because I was quite unaware, before 1966, that those cases were, in fact, paralleled by astonishing numbers of comparable cases elsewhere in the U.S. and the rest of the world, they left me only moderately puzzled and mildly bothered, since I came upon relatively few impressive cases within the environs of Tucson in those dozen years of discursive study. I was aware of the work of non-official national investigative groups like NICAP (National Investigations Committee on Aerial Phenomena) and APRO (Aerial Phenomena Research Organization) ; but lacking basis for detailed personal evaluation of their investigative methods, I simply did not take their publications very seriously. I was under other misimpressions, I found later, as to the nature of the official UFO program, but I shall not enlarge on this before this Committee. (I cite all of this here because I regard it relevant to an appreciation, by the Committee, of the way in which at least one scientist has developed his present strong concern for the UFO problem, after a prior period of some years of only mild interest.) Despite having interviewed a total of perhaps 150-200 Tucson-area witnesses prior to 1966 (75 of them in a single inconclusive case in 1958), I was far from overwhelmed with the importance of the UFO problem.

A particular sighting incident in Tucson in early 1966, followed by the widely-publicized March, 1966, Michigan sightings (I, too, felt that the "swamp gas" explanation was quite absurd once I checked a few relevant points), led me finally to take certain steps to devote the coming summer vacation months to a much closer look at the UFO problem. Within only a few weeks in May and June of 1966, after taking a close look at the files and modes of operation of both private and official (i.e., Project Bluebook) UFO investigative programs, after seeing for the first time press-clipping files of (to me) astonishing bulk, covering innumerable intriguing cases I had never before heard of, and (above all) after the beginning of what became a long period of personal interviewing of key witnesses in important UFO cases, I rapidly altered my conception of the scientific importance of the UFO question. By mid-1966, I had already begun what became months of effort to arouse new interest and to generate new UFO investigative programs in various science agencies of the Federal government

and in various scientific organizations. Now, two years later, with very much more background upon which to base an opinion, I find myself increasingly more concerned with what has happened during the past twenty years' neglect, by almost the entire scientific community, of a problem that appears to be one of extremely high order of scientific importance.

THE UNCONVENTIONAL NATURE OF THE UFO PROBLEM

To both laymen and scientists, the impressive progress that science has made towards understanding our total environment prompts doubt that there could be machine-like objects of entirely unconventional nature moving through our atmosphere, hovering over automobiles, power installations, cities, and the like, yet all the while going unnoticed by our body scientific. Such suggestions are hard to take seriously, and I assure you that, until I had taken a close look at the evidence. I did not take them seriously. We have managed to so let our preconceptions block serious consideration of the possibility that some form of alien technology is operating within our midst that we have succeeded in simply ignoring the facts. And we scientists have ignored the pleas of groups like NICAP and APRO, who have for years been stressing the remarkable nature of the UFO evidence. Abroad, science has reacted in precisely this same manner, ignoring as nonsensical the report-material gathered by private groups operating outside the main channels of science. I understand this neglect all too well; I was just one more of those scientists who almost ignored those facts, just one more of those scientists who was rather sure that such a situation really could not exist, one more citizen rather sure that official statements must be basically meaningful on the non-existence of any substantial evidence for the reality of UFOs.

The UFO problem is so unconventional, involves such improbable events, such inexplicable phenomenology, so defies ready explanation in terms of present-day scientific knowledge, has such a curiously elusive quality in many respects, that it is not surprising (given certain features in the past twenty years' handling of the problem) that scientists have not taken it very seriously. We scientists are, as a group, not too well-oriented towards taking up problems that lie, not just on the frontiers of our scientific knowledge, but far across some gulf whose very breadth cannot be properly estimated. These parenthetical remarks are made here to convey, in introductory manner, viewpoints that will probably prove to be correct when many more scientists begin to scrutinize this unprecedented and neglected problem. The UFO problem is, if anything, a highly unconventional problem. Hence, before reviewing my own investigations in detail, and before examining various proposed explanations lying within atmospheric physics, it may be well to take note of some of the principal hypotheses that have been proposed. at one time or another, to account for UFOs.

SOME ALTERNATIVE HYPOTHESES

In seeking explanations for UFO reports, I like to weigh witness-accounts in terms of eight principal UFO hypotheses:

1. Hoaxes, fabrications, and frauds.
2. Hallucination, mass hysteria, rumor phenomena.
3. Lay misinterpretations of well-know physical phenomena (meteorological, astronomical, optical, aeronautical, etc.).
4. Semi-secret advanced technology (new test vehicles, satellites, novel weapons, flares, re-entry phenomena, etc.).
5. Poorly understood physical phenomena (rare atmospheric-electrical or atmospheric-electrical effects, unusual meteoric phenomena, natural or artificial plasmoids, etc.).
6. Poorly understood psychological phenomena.
7. Extraterrestrial devices of some surveillance nature.
8. Spaceships bringing messengers of terrestrial salvation and occult truth.

Because I have discussed elsewhere all of these hypotheses in some detail (Ref. 2), I shall here only very briefly comment on certain points. Hoaxes and fabrications do crop up, though in percentually [sic] far smaller numbers than many UFO scoffers seem to think. Some of the independent groups like APRO and NICAP have done good work in exposing certain of these. Although there has been a good deal of armchair-psychologizing about unstable UFO witnesses, with easy charges of hallucination and hysteria, such charges seem to have almost no

bearing in the hundreds of cases I have now personally investigated. Misinterpreted natural phenomena (Hypothesis 3) do explain many sincerely-submitted UFO reports; but, as I shall elaborate below, efforts to explain away almost the entirety of all UFO incidents in such terms have been based on quite unacceptable reasoning. Almost no one any longer seriously proposes that the truly puzzling UFO reports of close-range sighting of what appear to be machines of some sort are chance sightings of secret test devices (ours or theirs) ; the reasons weighing against Hypothesis 4 are both obvious and numerous. That some still-not-understood physical phenomena of perhaps astronomical or meteorological nature can account for the UFO observations that have prompted some to speak in terms of extraterrestrial devices would hold some weight if it were true that we dealt therein only with reports of hazy, glowing masses comparable to, say, ball lightning or if we dealt only with fast-moving luminous bodies racing across the sky in meteoric fashion. Not so, as I shall enlarge upon below. Jumping to Hypothesis 6, it seems to receive little support from the many psychologists with whom I have managed to have discussions on this possibility; I do not omit it from consideration, but, as my own witness-interviewing has proceeded, I regard it with decreasing favor. As for Hypothesis 8, it can only be remarked that, in all of the extensive literature published in support thereof, practically none of it has enough ring of authenticity to warrant serious attention. A bizarre "literature" of pseudo-scientific discussion of communications between benign extraterrestrials bent on saving the better elements of humanity from some dire fate implicit in nuclear-weapons testing or other forms of environmental contamination is certainly obtrusive on any paperback stand. That "literature" has been one of the prime factors in discouraging serious scientists from looking into the UFO matter to the extent that might have led them to recognize quickly enough that cultism and wishful thinking have essentially nothing to do with the core of the UFO problem. Again, one must here criticize a good deal of armchair researching (done chiefly via the daily newspapers that enjoy feature-writing the antics of the more extreme of such groups). A disturbing number of prominent scientists have jumped all too easily, to the conclusion that only the nuts see UFOs.

The seventh hypothesis, that UFOs may be some form of extraterrestrial devices, origin and objective still unknown, is a hypothesis that has been seriously proposed by many investigators of the UFO problem. Although there seems to be some

evidence that this hypothesis was first seriously considered within official investigative channels in 1948 (a year after the June 24,1947 sighting over Mt. Rainier that brought the UFO problem before the general public), the first open defense of that Hypothesis 7 to be based on any substantial volume of evidence was made by Keyhoe (Ref. 3) in about 1950. His subsequent writings, based on far more evidence than was available to him in 1950, have presented further arguments favoring an extraterrestrial origin of UFOs. Before I began an intensive examination of the UFO problem in 1966, I was disposed to strong doubt that the numerous cases discussed at length in Keyhoe's rather dramatically-written and dramatically-titled books (Ref. 4) could be real cases from real witnesses of any appreciable credibility. I had the same reaction to a 1956 book (Ref. 5) written by Ruppelt, an engineer in charge of the official investigations in the important 1951-3 period. Ruppelt did not go as far as Keyhoe in suggesting the extraterrestrial UFO hypothesis, but he left his readers little room for doubt that he leaned toward that hypothesis. I elaborate these two writers' viewpoints because, within the past month, I have had an opportunity to examine in detail a large amount of formerly classified official file material which substantiates to an almost alarming degree the authenticity and hence the scientific import of the case-material upon which Keyhoe and Ruppelt drew for much of their discussions of UFO history in the 1947-53 period (Refs. 6 and 7). One of these sources has just been published by NICAP (Ref. 7), and constitutes, in my opinion, an exceedingly valuable addition to the growing UFO literature. The defense of the extraterrestrial hypothesis by Keyhoe, and later many others (still not within what are conventionally regarded as scientific circles), has had little impact on the scientific community, which based its write-off of the UFO problem on press accounts and official assurances that careful investigations were turning up nothing that suggested phenomena beyond present scientific explanation. Hypothesis No. 7 has thus received short shrift from science to date. As one scientist who has gone to some effort to try to examine the facts, I say that this has been an egregious, if basically unwitting, scientific error -- an error that must be rectified with minimum further delay. On the basis of the evidence I

have examined, and on the basis of my own weighing of alternative hypotheses (including some not listed above), I now regard Hypothesis 7 as the one most likely to prove correct. My scientific instincts lead me to hedge that prediction just to the extent of suggesting that if the UFOs are not of extramundane origin, then I suspect that they will prove to be something very much more bizarre, something of perhaps even greater scientific interest than extraterrestrial devices.

SOME REMARKS ON INTERVIEWING EXPERIENCE AND TYPES OF UFO CASES ENCOUNTERED

1. Sources of cases dealt with

Prior to 1966, I had interviewed about 150-200 persons reporting UFOs; since 1966, I have interviewed about 200-250 more. The basis of my post-1966 interviewing has been quite different from the earlier period of interviewing of local witnesses, whose sightings I heard about essentially by chance. Almost all of my post-1966 interviews have been with witnesses in cases already investigated by one or more of the private UFO investigatory groups such as NICAP or APRO, or by the official investigative agency (Project Bluebook). Thus, after 1966, I was not dealing with a body of witnesses reporting Venus, fireballs, and aircraft strobe lights, because such cases are so easily recognizable that the groups whose prior checks I was taking advantage of had already culled out and rejected most of such irrelevant material. Many of the cases I checked were older cases, some over 20 years old. It was primarily the background work of the many independent investigatory groups here and in other parts of the world (especially the Australian area where I had an opportunity to interview about 80 witnesses) that made possible my dealing with that type of once-sifted data that yields up scientifically interesting information so quickly. I wish to put on record my indebtedness to these "dedicated amateurs", to use the astronomer's genial term; their contribution to the ultimate clarification of the UFO problem will become recognized as having been of basic importance, notwithstanding the scorn with which scientists have, on more than one occasion, dismissed their efforts. Although I cite only the larger of these groups (NICAP about 12,000 members, APRO about 8,000), there are many smaller groups here and abroad that have done a most commendable job on almost no resources. (Needless to add, there are other small groups whose concern is only with sensational and speculative aspects.)

2. Some relevant witness-characteristics

By frequently discussing my own interviewing experience with members of those non-official UFO groups whose past work has been so indispensable to my own studies, I have learned that most of my own reactions to the UFO witness-interview problem are shared by those investigators. The recurrent problem of securing unequivocal descriptions, the almost excruciating difficulty in securing meaningful estimates of angular size, angular elevation, and angular displacements from laymen, the inevitable variance of witness-descriptions of a shared observation, and other difficulties of non-instrumental observing are familiar to all who have investigated UFO reports. But so also are the impressions of

widespread concern among UFO witnesses to avoid (rather than to seek) publicity over their sightings. The strong disinclination to make an open report of an observation of something the witness realizes is far outside the bounds of accepted experience crops up again and again. In my interviewing in 1947 sightings, done as a crosscheck on case material used in a very valuable recent publication by Bloecher (Ref. 8), I came to realize clearly for the first time that this reluctance was not something instilled by post-1947 scoffing at UFOs, but is part of a broadly disseminated attitude to discount the anomalous and the inexplicable, to be unwilling even to report what one has seen with his own eyes if it is well outside normal experience as currently accepted. I have heard fellow-scientists express dismay at the unscientific credulity with which the general public jumps to the conclusion that UFOs are spaceships. Those scientists have certainly not interviewed many UFO witnesses; for almost precisely the opposite attitude is overwhelmingly the characteristic response. In my Australian interviewing, I found the same uneasy feeling about openly reporting an observation of a well-defined UFO sighting, lest acquaintances think one "has gone round the bend." Investigators in still other parts of the world where modern scientific values dominate world-views have told me of encountering just this same witness-reluctance. The charge that UFO witnesses, as a group, are hyperexcitable types is entirely incorrect I would agree with the way Maj. Gen. John A. Samford, then Director of

Air Force Intelligence, put it in a 1952 Pentagon press conference: "Credible observers have sighted relatively incredible objects."

Not only is the charge of notoriety-seeking wrong, not only is the charge of hyperexcitability quite inappropriate to the witnesses I have interviewed, but so also is the easy charge that they see an unusual aerial phenomenon and directly leap to some kind of "spaceship hypothesis." My experience in interviewing witnesses in the selected sample I have examined since 1966 is that the witness first attempts to fit the anomalous observation into some entirely conventional category. "I thought it must be an airplane." Or, "At first, I thought it was an auto-wrecker with its red light blinking." Or, "I thought it was a meteor -- until it stopped dead in midair," etc. Hynek has a very happy phrase for this very typical pattern of witness-response: he terms it "escalation of explanation", to denote the often rapid succession of increasingly more involved attempts to account for and to assimilate what is passing before the witness' eyes, almost invariably starting with an everyday interpretation, *not* with a spaceship hypothesis. Indeed, I probably react in a way characteristic of all UFO investigators; in those comparatively rare cases where the witness discloses that he immediately interpreted what he sighted as an extraterrestrial device, I back away from what is likely to be a most unprofitable interview. I repeat: such instances are really quite rare; most of the general population has soaked up a degree of scientific conventionalism that reflects the net result of decades, if not centuries of scientific shaping of our views. I might interject that the segment of the population drawn to Hypothesis 8 above might be quick to jump to a spaceship interpretation on seeing something unusual in the sky, but, on the whole, those persons convinced of Hypothesis 8 are quite uninterested in observations, per se. Their conviction is firm without bothering about such things as observational matters. At least that is what I have sensed from such exposure as I have had to those who support Hypothesis 8 fervently.

3. *Credibility of witnesses*

Evaluating credibility of witnesses is, of course, an ever-present problem at the present stage of UFO studies. Again, from discussions with other investigators, I have concluded that common sense and previous everyday experience with prevaricators and unreliable persons lead. each serious UFO investigator to evolve a set of criteria that do not differ much from those used in jury instructions in our courts (e.g. Federal Jury Instructions). It seems tedious to enlarge here on those obvious matters. One can be fooled, of course; but it would be rash indeed to suggest that the thousands of UFO reports now on record are simply a testimony to confabulation, as will be better argued by some of the cases to be recounted below.

4. *Observational reliability of witnesses*

Separate from credibility in the sense of trustworthiness and honesty is the question of the human being as a sensing system. Clearly, it is indispensable to be aware of psychophysical factors limiting visual discrimination, time estimation, distance estimation, angular estimation, etc. In dealing with the total sample of all observations which laymen *initially* label as UFOs, such factors play a large role in sorting out dubious cases. In the type of UFO reports that are of primary significance at present, close-range sightings of objects of large size moving at low velocities, or at rest, and in sight for many seconds rather than fractions of a second, all of these perceptual problems diminish in significance, though they can never be overlooked.

A frequent objection to serious consideration of UFO reports, made by skeptics who have done no first-hand case investigations, is based on the widely discrepant accounts known to be presented by trial-witnesses who have all been present at some incident. To be sure, the same kind of discrepancies emerge in multiple-witness UFO incidents. People differ as to directions, relative times, sizes, etc. But I believe it is not unfair to remark, as the basic rebuttal to this attack on UFO accounts, that a group of witnesses who see a street-corner automobile collision do not come to court and proceed, in turn, to describe the event as a rhinoceros ramming a baby carriage, or as an airplane exploding on impact with a nearby building. There are, it needs to be soberly remembered, quite reasonable bounds upon the variance of witness testimonies in such cases. Thus, when one finds a half-dozen persons all saying that they were a few hundred feet from a domed disk with no resemblance to any known aircraft, that it took off without a sound, and was gone from sight in five seconds, the almost inevitable variations in descriptions of distances, shape, secondary features, noises, and times

cannot be allowed to discount, per se, the basically significant nature of their collective account. I have talked with a few scientists, especially some psychologists, whose puristic insistence on the miserable observing equipment with which the human species is cursed almost makes me wonder how they dare cross a busy traffic intersection. Some balance in evaluating witness perceptual limitations is surely called for in all of these situations. With that balance must go a healthy skepticism as to most of the finer details, unless agreed upon by several independent witnesses. There is no blinking that anecdotal data are less than ideal; but sometimes you have to go with what you've got. To make a beginning at UFO study has required scrutiny of such anecdotal data; the urgent need is to get on to something much better.

5. *Problem of witness' prior knowledge of UFO phenomena*

In interviewing UFO witnesses, it is important to try to ascertain whether the witness was, prior to his reported sighting, familiar or unfamiliar with books and writings on UFOs. Although a strong degree of familiarity with the literature of UFOs does not negate witness testimony, it dictates caution. Anyone who has done a lot of interviewing at the local level, involving previously unsifted cases, will be familiar with occasional instances where the witness exhibited such an obvious enthusiasm for the UFO problem that prudence demanded rejection of his account.

However, in my own experience, a much more common reaction to questions concerning pre-sighting interest in UFO matters is some comment to the effect that the witness not only knew little about UFOs beyond what he'd happened to read in newspapers, but he was strongly disinclined to take the whole business seriously. The repetitiveness and yet the spontaneity with which witnesses of seeming high credibility make statements similar to, "I didn't believe there was anything to all the talk about UFOs until I actually saw this thing," is a notable feature of the interview-experience of all of the investigators with whom I have talked. Obviously, an intending prevaricator might seek to deceive his interrogator by inventing such an assertion ; but I can only say that suspicion of being so duped has not been aroused more than once or twice in all of the hundreds of witnesses I have interviewed. On the other hand, I suppose that. In several dozen instances, I have lost interest in a case because of a witness openly stressing his own prior and subsequent interest in the extraterrestrial hypothesis.

Occasionally one encounters witnesses for whom the chance of prior knowledge is so low as to be almost amusing. An Anglican missionary in New Guinea, Rev. N. E. G. Cruttwell (Ref. 9), who has done much interviewing of UFO witnesses in his area, has described testimony of natives who come down into the mission area from their highland home territory only when they are wallaby-hunting, natives who could not read UFO reports in any language of the world, yet who come around, in their descriptions of what they have seen, to the communications-shortcut of picking up a bowl or dish from a nearby table to suggest the shape they are seeking to describe in native tongue. Little chance of bias gained from reading magazines in a barber-chair in such instances.

6. *Types of UFO accounts of present interest*

The scope of the present statement precludes anything approaching an exhaustive listing of categories of UFO phenomena: much of what might be made clear at great length will have to be compressed into my remark that the scientific world at large is in for a shock when it becomes aware of the astonishing nature of the UFO phenomenon and its bewildering complexity. I make that terse comment well aware that it invites easy ridicule; but intellectual honesty demands that I make clear that my two years' study convinces me that in the UFO problem lie scientific and technological questions that will challenge the ability of the world's outstanding scientists to explain as soon as they start examining the facts.

(a) *Lights in the night sky*. -- ("DLs" As they are called by the NICAP staff, on the basis that the profusion of reports of "damnable lights" meandering or hovering or racing across the night sky in unexplainable manner are one of the most common, yet one of the least useful and significant categories of UFO reports.) Ultimately, I think their significance could become scientifically very substantial when instrumental observing techniques are in wide use to monitor UFO movements. But there are many ways that observers can be misled by lights in the night sky, so I shall discuss below only such few cases as are of extremely unconventional nature and where the protocols of the observations are unusually strong.

[[38]]

(b) *Close-range sighting's of wingless discs and cigar-shaped objects*. -- This category is far more interesting. Many are daytime sightings, many have been made by witnesses of quite high credibility. Structural details such as "ports" and "legs" (to use the terms the witnesses have adopted to suggest most closely what they think they have seen) are described in many instances. Lack of wings and lack of evident means of propulsion clearly rule out conventional aircraft and helicopters. Many are soundless, many move at such speeds and with such accelerations that they defy understanding in terms of present technology. It is to be understood that I speak here only of reports from what I regard as credible observers.

(c) *Close-range nighttime sightings of glowing, hovering objects, often with blinking or pulsating discrete lights*. -- In these instances, distinct shape is not seen, evidently in many cases because of the brilliance of the lights. Less significant than those of the preceding category, these nonetheless cannot be accounted for in terms of any known vehicles. Frequently they are reported hovering over vehicles on the ground or following them. Sometimes they are reported hovering over structures, factories, power installations, and the like. Soundlessness is typical. Estimated sizes vary widely, over a range that I do not believe can be accounted for simply in terms of the known unreliability of distance and size estimates when one views an unknown object.

(d) *Radar-tracked objects, sometimes seen visually simultaneously by observers on the ground or in the air*. -- In many of these cases, the clues to the non-conventional nature of the radar target is high speed (estimated at thousands of miles per hour in certain instances); in others, it is alternate motion and hovering; in still others, it has been the unconventional vertical motions that make the radar observations significant. Clearly, most important are those instances in which there was close agreement between the visual and the radar unknown. There are far more such cases than either scientists or public would guess.

Those four categories do not exhaust the list by any means. But they constitute four commonly encountered categories that are of interest here. Examples will be found below.

7. Commonly encountered questions

As Mark Twain said, "Faith is a great thing, but it's doubt that gets you an education."

There are many questions that one encounters again and again from persons who have done no personal case-checking and who maintain a healthy skepticism about UFOs. Why don't pilots report these things if they are buzzing around in our skies? Why aren't they tracked on radar? Why don't our satellite and astronomical tracking systems get photos of UFOs? Why are they always seen in out-of-the way rural areas but never over large cities? Why don't large groups of people ever simultaneously see UFOs, instead of lone individuals? Why don't astronomers see them? Shouldn't UFOs occasionally crash and leave clear-cut physical evidence of their reality? Or shouldn't they at least leave some residual physical evidence in those alleged instances where the objects have landed? Shouldn't they affect radios and produce other electromagnetic effects at times? If UFOs are a product of some high civilization, wouldn't one expect something of the nature of inquisitive behavior, since innate curiosity must be a common denominator of anything we would call "Intelligence"? Why haven't they contacted us if they're from somewhere else in the universe and have been here for at least two decades? Is there any evidence of hostility or hazard? Are UFOs seen only in this country? Why didn't we see them before 1947, if they come from remote sources? And so on.

In the following sections, I shall show how some of these questions do have quite satisfactory answers, and how some of them still defy adequate rebuttal. I shall use mostly cases that I have personally investigated, but, in a few instances (clearly indicated), I shall draw upon cases which I have not directly checked but for which I regard the case-credentials as very strong.

8. Useful source materials on UFO's

Hoping that Committee staff personnel will be pursuing these matters further, I remark next on some of the more significant items in the UFO literature. All of these have been helpful in my own studies.

One of the outstanding UFO references (though little-known in scientific circles) is *The UFO Evidence*, edited by R. H. Hall and published by NICAP (Ref. 10). It summarizes about 750 UFO cases in the NICAP flies up to about

[[39]]

1964. I have cross-checked a sufficiently large sample of cases from this reference to have confidence in its generally very high reliability. A sequel volume, now in editorial preparation at NICAP, will cover the 1964-68 period. Reference 8, by Bloecher, is one of the few sources of extensive documentation (here primarily from national newspaper sources) of the large cluster of sightings in a period of just a few weeks in the summer of 1947; its study is essential to appreciation of the opening phases of the publicly recognized UFO problem. Reference 7 is another now-accessible source of extremely significant UFO documentation; it is unfortunate that no generally accessible version of Reference 6 exists, though the Moss Subcommittee, through pleas of Dr. Leon Davidson, has managed to get it into a status of at least limited accessibility. I am indebted to Davidson for a recent opportunity to study it for details I missed when I saw it two years ago at Bluebook headquarters.

The 1956 book by Ruppelt (Ref. 8) is a source whose authenticity I have learned, through much personal cross-checking, is far higher than I surmised when I first read it a dozen years ago. It was for years difficult for me to believe that the case-material which he summarized could come from real cases. References 5 and 6, plus other sources, do, however, now attest to Ruppelt's generally high reliability. Similarly Keyhoe's books (Refs. 3 and 4) emerge as sources of UFO case material whose reliability far exceeds my own first estimates thereof. As a scientist, I would have been much more comfortable about Keyhoe's books had they been shorn of extensive direct quotes and suspenseful dramatizations; but I must stress that much checking on my part has convinced me that Keyhoe's reportorial accuracy was almost uniformly high. Scientists will tend to be put off by some of his scientific commentary, as well as by his style; but on UFO case material, his reliability must be recognized as impressive. (Perhaps it is well to insert here the general proviso that none of these sources, including myself, can be expected to be characterized by 100 per cent accuracy in a problem as intrinsically messy as the UFO problem; here I am trying to draw attention to sources whose reliability appears to be in the 90+% range.)

A useful collection of 160 UFO cases drawn from a wide variety of sources has been published by Olsen (Ref. 11), 32 of which he obtained directly from the official files of Project Bluebook, a feature of particular interest. A book devoted to a single short period of numerous UFO observations within a small geographic area, centering around an important sighting near Exeter, N.H., is Fuller's *Incident at Exeter* (Ref. 12). Having checked personally on a number of features of the main Sept. 3, 1965, sighting, and having checked indirectly on other aspects, I would describe Reference 12 as one of the significant source-items on UFOs.

Several books by the Lorenzens, organizers of APRO, the oldest continuing UFO investigating group in this country, contain valuable UFO reference material (Ref. 13). Through their writing, and especially through the APRO Bulletin, they have transmitted from South American sources numerous unusual sightings from that country. I have had almost no opportunity to cross-check those sightings, but am satisfied that some quite reliable sources are being drawn upon. An extremely unusual category of cases, those involving reports of humanoid occupants of landed UFOs, has been explored to a greater extent by APRO than by NICAP. Like NICAP, I have tended to skirt such cases on tactical grounds; the reports are bizarre, and the circumstances of all such sightings are automatically charged in a psychological sense not found in other types of close-range sightings of mere machine-like devices. Since I shall not take up below this occupant problem, let me add the comment that I do regard the total number of such seemingly reliable reports (well over a hundred came just from central France in the outstanding 1954 sighting wave in that country), far too great to brush aside. Expert psychological opinion is badly needed in assessing such reports (expert but not close-minded opinion). For the record, I should have to state that my interviewing results dispose me toward acceptance of the existence of humanoid occupants in some UFOs. I would not argue with those who say that this might be the single most important element of the entire UFO puzzle; I would only say that most of my efforts over the past two years, being aimed at arousing a new degree of scientific interest among my colleagues in the physical sciences, have led me to play down even the little that I do know about occupant sightings. One or two early attempts to touch upon that point within the time-limits of a one-hour colloquium taught me that one loses more than he gains in speaking briefly about UFO occupants. (Occupant sightings must be carefully distinguished from elaborate "contact-claims" with the Space Brothers;

[[40]]

I hold no brief at all for the latter in terms of my present knowledge and interviewing experience. But occupants there *seem* to be, and contact of a limited sort may well have occurred, according to certain of the reports. I do not regard myself as very well-informed on this point, and will say little more on this below.)

It is, of course, somewhat more difficult to assess the reliability of foreign UFO references. Michel (Ref. 13) has assembled a day-by-day account of the remarkable French UFO wave of the fall of 1954, translated into English by the staff of CSI (Civilian Saucer Intelligence) of New York City, a now-inactive but once very productive independent group. I have spoken with persons having first-hand knowledge of the French 1954 episode, and they attest to its astonishing nature. *Life* and *The New Yorker* published full contemporary accounts at the time of the 1954 European wave. An earlier book by Michel (Ref. 14), also available in English, deals with a broader temporal and geographic range of European UFO sightings. A just-published account of about 70 UFO sightings that occurred within a relatively small area around Stoke-on-Trent, England, in the summer and fall of 1967 (Ref. 15) presents an unusual cross-section of sightings that appear to be well-documented. A number of foreign UFO journals are helpful sources of the steady flow of UFO reports from other parts of the world, but a cataloging will not be attempted here. Information on some of these, as well as on smaller American groups, can be found in the two important books by Vallee (Refs. 16 and 17).

Information on pre-1947 UFO-type sightings form the subject of a recent study by Lore and Denault (Ref. 18). I shall return to this phase of the UFO problem below; I regard it as being of potentially very great significance, though there is need for far more scholarly and scientific research before much of it can be safely interpreted. Another source of sightings of which many may ultimately be found to fall within the presently understood category of UFO sightings is the writings of Charles Fort (Ref. 19). His curious books are often drawn upon for material on old sightings, but not often duly acknowledged for the mine of information they comprise. I am afraid that it has not been fashionable to take Fort seriously; it certainly took me some time to recognize that, mixed into his voluminous writings, is much that remains untapped for its scientific import. I cannot imagine any escalated program of research on the UFO program that would not have a subgroup studying Fortean reports documented from 19th century sources.

To close this brief compilation of useful UFO references, two recent commentaries (not primarily source-references) of merit may be cited, books by Stanton (Ref. 20) and by Young (Ref. 21).

Next, I examine a number of specific UFO cases that shed light on many of the recurrent questions of skeptical slant often raised against serious consideration of the UFO problem.

WHY DON'T PILOTS SEE UFO'S?

This question may come in just that form from persons with essentially no knowledge of UFO history. From others who do know that there have been "a few" pilot-sightings, it comes in some altered form, such as, "Why don't airline and military pilots see UFO's all the time if they are in our atmosphere?" By way of partial answer, consider the following cases. (To facilitate internal reference, I shall number sequentially all cases hereafter treated in detail.)

1. ***Case 1. Boise, Idaho, July 4, 1947***

Only about a week after the now-famous Mt. Rainier sighting by private pilot Kenneth Arnold, a United Air Lines DC-3 crew sighted two separate formations of wingless discs, shortly after takeoff from Boise (Refs. 8, 10, 22, 28). I located and interviewed the pilot, Capt. Emil J. Smith, now with United's New York office. He confirmed the reliability of previously published accounts. United Flight 105 had left Boise at 9:04 p.m. About eight minutes out, en route to Seattle, roughly over Emmet, Idaho, Co-pilot Stevens, who spotted the first of two groups of objects, turned on his landing lights under the initial impression the objects were aircraft. But, studying them against the twilight sky, Smith and Stevens soon realized that neither wings nor tails were visible on the five objects ahead. After calling a stewardess, in order to get a third confirming witness, they watched the formation a bit longer, called Ontario, Oregon CAA to try to get ground-confirmation, and then saw the formation spurt ahead and disappear at high speed off to the west.

Smith emphasized to me that there were no cloud phenomena to confuse them here and that they observed these objects long enough to be quite certain that they were no conventional aircraft. They appeared "flat on the bottom, rounded on top", he told me, and he added that there seemed to be perceptible "roughness" of some sort on top, though he could not refine that description. Almost immediately after they lost sight of the first five, a second formation of four (three in line and a fourth off to the side) moved in ahead of their position, again traveling westward but at a somewhat higher altitude

than the DC-3's 8000 ft. These passed quickly out of sight to the west at speeds which they felt were far beyond then-known speeds. Smith emphasized that they were never certain of sizes and distances, but that they had the general impression that these disc-like craft were appreciably larger than ordinary aircraft. Smith emphasized that he had not taken seriously the previous week's news accounts that coined the since-persistent term, "flying saucer." But, after seeing this total of nine unconventional, high-speed wingless craft on the evening of 7/4/47, he became much more interested in the matter. Nevertheless, in talking with me, he stressed that he would not speculate on their real nature or origin. I have spoken with United Air Lines personnel who have known Smith for years and vouch for his complete reliability.

Discussion. -- The 7/4/47 United Air Lines sighting is of historic interest because it was obviously given much more credence than any of the other 85 UFO reports published in press accounts on July 4, 1947 (see Ref. 8). By no means the most impressive UFO sighting by an airliner crew, nevertheless, it is a significant one. It occurred in clear weather, spanned a total time estimated at 10-12 minutes, was a multiple-witness case including two experienced observers familiar with airborne devices, and was made over a 1000-ft. altitude range (climb-out) that, taken together with the fact that the nine objects were seen well above the horizon, entirely rules out optical phenomena as a ready explanation. It is officially listed as a Unidentified.

2. ***Case 2. Montgomery, Alabama, July 24, 1948***

Another one of the famous airline sightings of earlier years is the Chiles-Whitted Eastern Airlines case (Refs. 3, 5, 6 , 10, 23, 24, 25, 26). An Eastern DC-3, en route from Houston to Atlanta, was flying at an altitude of about 5000 ft., near Montgomery at 2:45 a.m. The pilot, Capt. Clarence S. Chiles, and the co-pilot, John B. Whitted, both of whom now fly jets for Eastern, were experienced fliers (for example, Chiles then had 8500 hours in the air, and both had wartime military flying duty behind them). I interviewed both Chiles and Whitted earlier this year to cross-check the many points of interests in this case. Space precludes a full account of all relevant details.

Chiles pointed out to me that they first saw the object coming out of a distant squall-line area which they were just reconnoitering. At first, they thought it was a jet, whose exhaust was somehow accounting for the advancing glow that had first caught their eyes. Coming almost directly at them at nearly their flight altitude, it passed off their starboard wing at a distance on which the two men could not closely agree: one felt it was under 1000 ft, the other put it at several times that. But both agreed, then and in my 1968 interview, that the object was some kind of vehicle. They saw no wings or empennage, but both were struck by a pair of rows of windows or some apparent openings from which there came a bright glow "like burning magnesium." The object had a pointed "nose", and from the nose to the rear along its underside there was a bluish glow. Out of the rear end came an orange-red exhaust or wake that extended back by about the same distance as the object's length. The two men agreed that its size approximated that of a B-29, though perhaps twice as thick. Their uncertainty as to true distance, of course, renders this only a rough impression. There is uncertainty in the record, and in their respective recollections, as to whether their DC-3 was rocked by something like a wake. Perception of such an effect would have been masked by Chiles' spontaneous reaction of turning the DC-3 off to the left as the object came in on their right Both saw it pass aft of them and do an *abrupt pull-up*, but only Whitted, on the right side, saw the terminal phase in which the object disappeared after a short but fast vertical ascent By "disappeared", Whitted made clear to me that he meant just that; earlier interrogations evidently construed this to mean "disappeared aloft" or into the broken cloud deck that lay above them. Whitted said that was not so; the object vanished instantaneously after its sharp pull-up. (This is not an isolated instance of abrupt disappearance. Obviously I cannot account for such cases.)

Discussion. -- This case has been the subject of much comment over the years, and rightly so. Menzel (Ref. 24) first .proposed that this was a "mirage", but gave no basis for such an unreasonable interpretation. The large azimuth-change of the pilots' line of sight, the lack of any obvious light source to provide a basis for the rather detailed structure of what was seen, the sharp pull-up, and the high flight altitude involved all argue quite strongly against such a casual disposition of the case. In his second book, Menzel (Ref. 25) shifts to the explanation that they had obviously seen a meteor. A horizontally-moving fireball under a cloud-deck, at 5000 ft., exhibiting two rows of lights construed by experienced pilots as ports, and finally executing a most non-ballistic 90-degree sharp pull-up, is a strange fireball indeed. Menzel's 1963 explanation is even more objectionable, in that he implies, via a page of side-discussion, that the Eastern pilots had seen a fireball from the Delta Aquarid meteor stream. As I have pointed out elsewhere (Ref. 2), the radiant of that stream was well over 90 away from the origin point of the unknown object. Also, bright fireballs are, with only rare exceptions, not typical of meteor streams. The official explanation was shifted recently from "Unidentified" to "Meteor", following publication of Menzel's 1963 discussion (see Ref. 20, p. 88).

Wingless, cigar-shaped or "rocket-shaped" objects, some emitting glowing wakes, have been reported by other witnesses. Thus, Air Force Capt. Jack Puckett, flying near 4000 ft. over Tampa in a C-47 on August 1, 1946 (Ref. 10, p. 23), described seeing "a long, cylindrical shape approximately twice the size of a B-29 with luminous portholes", from the aft end of which there came a stream of fire as it flew near his aircraft. Puckett states that he, his copilot, Lt. H. F. Glass, and the flight engineer also saw it as it came into within an estimated 1000 yards before veering off. Another somewhat similar airborne sighting, made on January 22, 1956 by TWA Flight Engineer Robert Mueller at night over New Orleans, is on record (Ref. 27). Still another similar sighting is the AAL case cited below (Sperry case). Again, over Truk Is., in the Pacific, a Feb. 6, 1953, mid-day sighting by a weather officer involved a bullet-shaped object without wings or tail (Ref. 7, Rept. No. 10). Finally, within an hour's time of the Chiles-Whitted sighting. Air Force ground personnel at Robins AFB, Georgia, saw a rocket-like object shoot overhead in a westerly direction (Refs. 3, 5, 10, 6). In none of these instances does a meteorological or astronomical explanation suffice to explain the sightings.

3. ***Case 3. Sioux City, Iowa, January 20, 1951.***

Another of the many airline-crew sightings of highly unconventional aerial devices that I have personally checked was, like Cases 1 and 2, widely reported in the national press (for a day or two, and then forgotten like the rest). A check of weather data confirms that the night of 1/20/51 was clear and cold at Sioux City at the time that a Mid-Continent Airlines DC-3, piloted by Lawrence W. Vinther, was about to take off for Omaha and Kansas City, at 8:20 p.m. CST. In the CAA control tower, John M. Williams had been noting an oddly manenvering light high in a westerly direction. Suddently the light abruptly accelerated, in a manner clearly precluding either meteoric or aircraft origin, so Williams alerted Vinther and his co-pilot, James F. Bachmeier. The incident has been discussed many times (Ref. 4,5, 10, and 28), but to check details of these reports, I searched for and finally located all three of the above-named men. Vinther and Bachmeier are now Braniff pilots, Williams is with the FAA in Sacramento. From them I confirmed the principal features of previous accounts and learned additional information too lengthy to recapitulate in full here.

The essential point to be emphasized is that, shortly after Vinther got his DC-3 airborne, under Williams' instructions to investigate the oddly-behaving light, the object executed a sudden dive and flew over the DC-3 at an estimated 200 ft. vertical clearance, passing aft and downward. Then a surprising maneuver unfolded. As Vinther described it to me, and as described in contemporary accounts, the object suddenly reversed course almost 180°, without slowing down or slewing, and was momentarily flying formation with their DC-3, off its port wing. (Vinther's dry comment to me was: "This is something we don't see airplanes do.") Vinther and Bachmeier agreed that the object was very big, perhaps somewhat larger than a B-29, they suggested to newspapermen who interviewed them the following day. Moonlight gave them a good silhouetted view of the object, which they described as having the form of a fuselage and unswept wing, but not a sign of any empennage, nor any sign of engine-pods, propellers, or jets. Prior to its dive, it had been seen only as a light; while pacing their DC-3, the men saw no luminosity, though during the dive they saw a light on its underside. After about five seconds, the unknown object

began to descend below them and flew under their plane. They put the DC-3 into a steep bank to try to keep it in view as it began this maneuver; and as it crossed under them, they lost it, not to regain sight of it subsequently.

There is much more detail, not all mutually consistent as to maneuvers and directions, in the full accounts I obtained from Vinther, Bachmeier, and Williams. The dive, pacing, and fly-under maneuvers were made quickly and at such a distance from the field that Williams did not see them clearly, though he did see the object leave the vicinity of the DC-3. An Air Force colonel and his aide were among the passengers, and the aide caught a glimpse of the unknown object, but I have been unable to locate him for further cross-check.

Discussion. -- The erratic maneuvers exhibited by the unknown object while under observation from the control tower would, by themselves, make this a better-than-average case. But the fact that those maneuvers prompted a tower operator to alert a departing aircrew to investigate, only to have the object dive upon and pace the aircraft after a non-inertial course-reversal, makes this an unusually interesting UFO. Its configuration, about which Vinther and Bachmeier were quite positive in their remarks to me (they repeatedly emphasized the bright moonlight, which checks with the near-full moon on 1/20/51 and the sky-cover data I obtained from the Sioux City Weather Bureau), combines with other features of the sighting to make it a most significant case. The reported shape (tailless, engineless, unswept aircraft of large size) does not match that of any other UFO that I am aware of; but my exposure to the bewildering range of reported configurations now on record makes this point less difficult to assimilate. This case is officially carried as Unidentified, and, in a 1958 publication (Ref. 29), was one of 12 Unidentifieds singled out for special comment. A contemporary account (Ref. 28),

taking note of a then recent pronouncement that virtually all UFOs are explainable in terms of misidentified Skyhook balloons, carried a lead-caption. "The Office of Naval Research claims that cosmic ray balloons explain all saucer reports. If so, what did this pilot see?" Certainly it would not be readily explained away as a balloon, a meteor, a sundog, or ball lighting. Rather, it seems to be just one more of thousands of Unidentified Flying Objects for which we have no present explanations because we have laughed such reports out of scientific court. Bachmeier stated to me that, at the time, he felt it had to be some kind of secret device, but, in the ensuing 17 years, we have not heard of any aircraft that can execute instantaneous course-reversal. Vinther's comment to me on a final question I asked as to what he thinks, in general, about the many airline-pilot sightings of unidentified objects over the past 20 years, was: "We're not all having hallucinations."

4. ***Case 4. Minneapolis, Minn., October 11, 1951***

There are far more private pilots than airline pilots, so it is not surprising that there are more UFO sightings from the former than the latter. An engineer and former Air Force P-38 pilot, Joseph J. Kaliszewski, flying for the General Mills Skyhook balloon program on balloon-tracking missions, saw highly unconventional objects on two successive days in October, 1951 (Refs. 5, 7, 10). Both were reported through company channels to the official investigative agency (Bluebook), whose report (Ref. 7) describes the witnesses as "very reliable" and as "experienced high altitude balloon observers." On October 10, at about 10:10 a.m., Kaliszewski and Jack Donaghue were at 6000 ft in their light plane, climbing toward their target balloon, when Kaliszewski spotted "a strange object crossing the skies from East to West, a great deal higher and behind our balloon (which was near 20,000 ft. at that time)." When I interviewed Kaliszewski, he confirmed that this object "had a peculiar glow to it, crossing behind and above our balloon from east to west very rapidly, first coming in at a slight dive, leveling off for about a minute and slowing down, then into a sharp left turn and climbing at an angle of 50° to 60° into the southeast with a terrific acceleration." The two observers had the object in view for an estimated two minutes, during which it crossed a span of some 45 of the sky. No vapor trail was seen, and Kaliszewski was emphatic in asserting that it was not a balloon, jet, or conventional aircraft.

The following morning, near 0630, Kaliszewski was flying on another balloon mission with Richard Reilly and, while airborne north of Minneapolis, the two of them noticed an odd object. Quoting from the account submitted to the official agency (Ref. 7, Rept. No. 2) :

"The object was moving from east to west at a high rate and very high. We tried keeping the ship on a constant course and using the reinforcing member

of the windshield as a point. The object moved past this member at about 50 degrees per second. This object was peculiar in that it had what can be described as a halo around it with a dark undersurface. It crossed rapidly and then slowed down and started to climb in lazy circles slowly. The pattern it made was like a falling oak leaf inverted. It went through these gyrations for a couple minutes and then with a very rapid acceleration disappeared to the east. This object Dick and I watched for approximately five minutes."

Shortly after, still another unknown object shot straight across the sky from west to east, but not before Kaliszewski succeeded in radioing theodolite observers at the University of Minnesota Airport. Two observers there (Douglas Smith, Richard Dorian) got fleeting glimpses of what appeared to them to be a cigar-shaped object viewed through the theodolite, but could not keep it in view due to its fast angular motion. In my conversations with Kaliszewski about these sightings, I gained the impression of talking with a careful observer, in full accord with impressions held by three other independent sources, including Air Force investigators.

Discussion. -- The October 10 sighting is officially categorized as "Aircraft," the October 11 main sighting as "Unidentified." When I mentioned this to Kaliszewski, he was unable to understand how any distinction could be so drawn between the two sightings, both of which he felt matched no known aeronautical device. Clearly, objects performing such intricate maneuvers are not meteors, nor can they be fitted to any known meteorological explanations of which I am aware. Instead, these objects seem best described as devices well beyond the state of 1951 (or 1968) technology.

5. ***Case 5. Willow Grove, Pa., May 21, 1966***

Skipping over many other pilot observations to a more recent one which I have personally checked, I call attention to a close-range airborne sighting of a domed-disc, seen under midday conditions by two observers. One of them, William O. Powell, of Radnor, Pa., is a pilot with 18,000 logged flight hours. He and a passenger. Miss Muriel McClave, were flying

in Powell's Luscombe in the Philadelphia area on the afternoon of 5/21/66 when an object that had been first spotted as it apparently followed an outbound flight of Navy jets from Willow Grove NAS made a sharp (non-banking) turn and headed for Powell's plane on a near-collision course. As the object passed close by, at a distance that Powell put at roughly 100 yards, they both got a good look at the object. It was circular in planform and had no wings or visible means of propulsion, both witnesses emphasized to me in interviews. The upper domed portion they described as "porcelain-white", while the lower discoid portion was bright red ("dayglow red" Powell put it). It was slightly below their altitude as it passed on their right, and Powell pointed out that it was entirely solid, for it obscured the distant horizon areas. His brief comment about its solidity and reality was, "It was just like looking at a Cadillac." He estimated its airspeed as perhaps 200 mph, and it moved in a steady, non-fluttering manner. He estimated its diameter at perhaps 20 feet. Miss McClave thought it might have been nearer 40 feet across. Each put the thickness-to-diameter ratio as about one-half. After it passed their starboard wing, Powell could see it only by looking back over his shoulder through a small aft window, but Miss McClave had it in full view when suddenly, she stated to me, it disappeared instantaneously, and they saw no more of it.

Discussion. -- Powell flies executive transports for a large Eastern firm, after years of military and airline duty. I have discussed the case with one of his superiors, who speaks without qualification for Powell's trustworthiness. At a UFO panel discussion held on April 22, 1967 at the annual meeting of the American Society of Newspaper Editors, Powell was asked to summarize his sighting. His account is in the proceedings of that session (Ref. 30). I know of no natural phenomenon that could come close to explaining this sighting. The visibility was about 15 miles, they were flying in the clear at 4500 ft., and the object passed nearby. A pilot with 18,000 hours flight experience is not capable of precise midair distance and speed estimates, but his survival has probably hinged on not commonly making errors of much over a factor or two. Given the account and accepting its reliability, it seems necessary to say that here was one more case of what Gen. Samford described as "credible observers seeing relatively incredible objects". I felt that Powell's summary of his sighting at the ASNE meeting was particularly relevant because, in addition to my being on the panel there. Dr. D. H. Menzel and Mr. Philip J. Klass, both strong exponents of meteorological-type UFO theories, were present to hear his account. I cannot see how one could explain this incident in terms of meteorological optics nor in terms of ball

lighting plasmoids. Here again, we appear to be dealing with a meaningful observation of some vehicle or craft of non-terrestrial origin. Its reported instantaneous disappearance defies (as does the same phenomenon reported by J. B. Whitted and numerous other UFO witnesses) ready explanation in terms of present-day scientific knowledge. Powell reported his sighting at Willow Grove NAS, but it engendered no interest.

6. ***Case 6. Eastern Quebec, June 29, 1954.***

A case in which I have not been able to directly interview any witnesses, but about which a great deal is on record, through contemporary press accounts, through the pilot's subsequent report, and through recent interviews by BBC staff members, occurred near Seven Islands, Quebec, just after sunset on 6/29/54. A BOAC Stratocruiser, bound from New York to London with 51 passengers, was followed for 18 minutes (about 80 miles of airpath) by one large object and six smaller objects that flew curious "formations" about it. The pilot of the Stratocruiser was Capt. James Howard, a highly respected BOAC flight officer still flying with BOAC. At the time, he had had 7500 flight hours. About 20 witnesses, including both passengers and crew, gave statements as to the unprecedented nature of these objects (Refs. 4, 10, and Associated Press wire stories datelined June 30, 1954).

Discussion. -- The flight was at 19,000 ft in an area of generally fair weather, with good visibility, attested by Howard and by weather maps for that day. No obvious optical or electrical explanation seems capable of accounting for this long-duration sighting. The objects were dark, not glowing, and their position relative to the sunset point precludes sundogs as an explanation. Mirage phenomena could not account for the eighty-mile persistence, nor for the type of systematic shape-changes described by the witnesses, nor for the geometrically regular formations taken up by the satellite objects as they shifted positions from time to time. Just before an F-86 arrived from Goose AFB at Howard's request, First Officer Boyd and Navigator George Allen, who were watching the objects at that moment, said the small objects seemed to merge into the larger object. Then the large object receded rapidly towards the northwest and was out of sight in a matter of seconds. Such a maneuver of a number of satellite objects seeming to merge with or to enter a larger object has been reported in other UFO incidents around the world.

7. ***Case 7. Goshen, Ind., April 21, 1950***

Another early airline sighting that seemed worth personally cross-checking involved the crew and passengers of a TWA DC-3 on the evening of 4/27/50 (Refs. 4, 5, 10, 23). I have interviewed both the pilot, Capt. Robert Adickes, and the copilot, Capt. Robert F. Manning, and confirmed all of the principal features first reported in detail in a magazine account by Keyhoe (Ref. 31). The DC-3 was at about 2000 ft, headed for Chicago, when, at about 8:25 p.m.. Manning spotted a glowing red object aft of the starboard wing, well to their rear. Manning sent to me a copy of notes that he had made later that night at his Chicago hotel. Quoting from the notes:

"It was similar in appearance to a rising blood red moon, and appeared to be closing with us at a relatively slow rate of convergence. I watched its approach for about two minutes, trying to determine what it might be. I then attracted Adickes' attention to the object asking what he thought it was. He rang for our hostess, Gloria Henshaw, and pointed it out to her. At that time the object was at a relative bearing of about 100 degrees and slightly lower than we were. It was seemingly holding its position relative to us, about one-half mile away."

Manning's account then notes that Capt. Adickes sent the stewardess back to alert the passengers (see Keyhoe's account, Ref. 31), and then banked the DC-3 to starboard to try to close on the unknown object. Manning continues in his 4/27/50 notes:

"As we turned, the object seemed to veer away from us in a direction just west of north, toward the airport area of South Bend. It seemed to descend as it increased its velocity, and within a few minutes was lost to our sight ..."

Discussion. -- Although, in my interview, I found some differences in the recollected shape of the object, as remembered by the two TWA pilots, both were positive it was no aircraft, both emphasized its red glow, and both were impressed by its high speed departure. Manning remarked to me that he'd never seen anything else like it before or since; and he conceded, in response to my query, that the decreased number of airline reports on UFOs in recent years

probably stems chiefly from pilot reluctance to report. Both be and Adickes, like most other pilots I have asked, indicated they were unaware of any airline regulations precluding reporting, however. I mentioned to Adickes that there is indirect indication in one reference (Ref. 5) that the official explanation for this sighting was "blast-furnace reflections off clouds." He indicated this was absolutely out of the question. It is to be noted that here, as in many other pilot sightings, an upper bound, even if rough, is imposed on the range to the unknown by virtue of a downward-slanting line of sight. In such instances, meteor-explanations are almost automatically excluded. The Goshen case has no evident meteorological, astronomical, or optical explanation.

8. ***Case 8, Newport News, Va., July 14, 1952***

Another case in which experienced pilots viewed UFOs below them, and hence had helpful background-cues to distance and size, occurred near 8:12 p.m. BST, July 14, 1952. A Pan American DC-4, en route from New York to Miami, was at 8000 ft over Chesapeake Bay, northeast of Newport News, when its cockpit crew witnessed glowing, disc-shaped objects approaching them at a lower altitude (estimated at perhaps 2000 ft). First Officer Wm. B. Nash, at the controls for Capt. Koepke (who was not on the flight deck during the sighting) and Second Officer Wm. H. Fortenberry saw six amber-glowing objects come in at high velocity and execute a peculiar flipping maneuver during an acute-angle direction-change. Almost immediately after the first six reversed course, two other apparently identical discs shot in under the DC-4, joining the other six. I am omitting here certain other maneuver details of significance, since these are on record in many accounts (4, 5, 10, 11, 25). Although I have not interviewed Nash (now in Germany with PAA, and Fortenberry is deceased), I believe that there has never been any dispute as to the observed facts. Nash has stated to T. M. Olsen (author of Ref. 11) that one of the most accurate accounts of the facts has been given by Menzel (Ref. 25), adding that Menzel's explanation seems entirely out of the question to him. A half-dozen witnesses on the ground also saw unknowns at that time, according to official investigators.

The objects had definite edges, and glowed "like hot coals", except when they blinked out, as they did in unison just after the first six were joined by the latter two. When the lights came back on, Nash and Fortenberry saw them climbing westward, eight in line, north of Newport News. The objects climbed above the altitude of the DC-4 and then blinked out in random order and were seen no more.

Discussion. -- Menzel explains this famous sighting as resulting from a searchlight playing on thin haze layers, an almost entirely ad hoc assumption, and one that will not account for the amber color, nor for the distinct edges, nor for the final

climb-out of the objects. The rapid motion, abrupt course-reversal, and the change from negative to positive angles of elevation of the line of sight to the unknowns seem to preclude any meteorological-optical explanation, and there is, of course, no possibility of explaining cases like this in terms of bail lightning, meteors, balloons, or many of the other frequently adduced phenomena. Nash has stated that he feels these were "intelligently operated craft" This case is officially "Unidentified."

9. Many other pilot sightings, both recent and old, could readily be cited. Not only civilian pilots but dozens of military pilots have sighted wholly unconventional objects defying ready explanation (see esp. Ref. 10 and Ref. 7 for many such instances). Thus, the answer to the question, "Why don't pilots see UFOs?" is: "They do."

WHY ARE UFO'S ONLY SEEN BY LONE INDIVIDUALS? WHY NO MULTIPLE-WITNESS SIGHTINGS?

It is true that there are more single-witness UFO reports than multiple-witness cases. But, to indicate that by no means all interesting UFO reports entail lone witnesses, consider the following examples:

1. ***Case 9. Farmington, N.M., March 17, 1950***

In the course of checking this famous case that made short-lived press headlines in 1950, I interviewed seven Farmington witnesses out of a total that was contemporarily estimated at "hundreds" to "over a thousand." (Refs. 5, 25) It became clear from my interviewing that the streets were full of residents looking up at the strange aerial display that day. It was not only a multiple-witness case, but also a multiple-object case. My checking was done seventeen years after

the fact, so the somewhat confused recollective impressions I gained are not surprising. But that unidentified aerial objects moved in numbers over Farmington on 8/17/50 seems clear. One witness with whom I spoke, Clayton J. Boddy, estimated that he had observed a total of 20 to 30 disc-shaped objects, including one red one substantially larger than the others, moving at high velocity across the Farmington sky on the late morning of 8/17/50. John Baton, a Farmington realtor, described being called out of a barber shop when the excitement began and seeing a high, fast object suddenly joined by many objects that darted after it. Baton sent me a copy of an account he had jotted down shortly after the incident A former Navy pilot. Baton put their height at perhaps 15,000 ft. "The object that has me puzzled was the one we saw that was definitely red. It was seen by several and stated by all to be red and traveling northeast at a terrific speed." Baton also spoke of the way the smaller objects would "turn and appear to be flat, then turn and appear to be round," a description matching an oscillating disc-shaped object. No one described seeing any wings or tails, and the emphasis upon the darting, "bee-like" motion was in several of the accounts I obtained from witnesses. I obtained more details, but the above must suffice here for a brief summary.

Discussion. -- This once-headlined, but now almost forgotten multiple-witness case has been explained as resulting from the breakup of a Skyhook balloon (Ref. 25). Skyhooks do shatter at the very low temperatures of the upper troposphere, and occasionally break into a number of smaller pieces. But to suggest that such fragments of transparent plastic at altitudes of the order of 40-50,000 ft. could be detected by the naked eye, and to intimate that these distant objects of low angular velocity could confuse dozens of persons into describing fast-moving disc-shaped objects (including a large red object) is simply not reasonable. However, to check further on this, I contacted first Holloman AFB and then the Office of Naval Research, who jointly hold records on all Alamogordo Skyhook releases. No Skyhooks or other experimental balloons had been released from the Holloman area or any other part of the country on or near the date of this incident. A suggestion that the witnesses were seeing only cotton-wisps was not only unreasonable, given the witness accounts, but was in fact tracked down by a local journalist to comments casually made by a law enforcement officer and overheard by another reporter. From my examination of this case, I see no ready explanation for the numerous disc-shaped objects moving in unconventional manner and seen by large numbers of Farmington residents on 3/17/50.

2. ***Case 10. Longview, Wash., July 3, 1949***

Many of the UFO cases I am citing are drawn intentionally from earlier years, in order to illustrate that the evidence for the existence of a quite real and scientifically significant phenomenon has been with us for a disturbing number of years. I discuss next a case on which I hold copies of material from the official investigative flies, copies that state that this incident was "observed by 150 other people at an Air Show", in addition to the reporting witness, Moulton B. Taylor. I have interviewed Mr. Taylor and have obtained strong recommendations of his reliability from a former superior officer, Adm. D. S. Fahrney, under whom Taylor served in Navy guided missiles work prior to the incident. Taylor is an aeronautical

engineer, and was airport manager at Longview, in charge of an air show that was to be held on the afternoon of 7/3/49, the day of the incident in question. A skywriting Stearman was at 10,000 ft. at 10:40 a.m., laying down "Air Show Today", and hence holding the attention of a number of the personnel already at the airport, when the first of three unidentified objects flew over at high altitude. Alerted by one of the persons who first spotted the object coining from the northwest, Taylor got on the public address system and announced to all persons at hand that they should look up to see the odd object. Many had binoculars, and among the over 150 persons present were police officers, city officials and a number of Longview's leading citizens, Taylor emphasized. The object was observed by a number of experienced pilots; and, according to official file summaries, all agreed that the object was shaped much like a discus. It seemed to have metallic luster and oscillated periodically as it crossed the sky from northwest to southeast until lost in mill-smoke. Taylor described the motion as a "sculling or falling-leaf motion rather than a movement through the axis of the disc." Its angular size he estimated as about that of a pinhead at arm's length, or about that of a DC-3 at 30,000 ft., both of which come out to be near 10 minutes of arc (one-third of moon's diameter).

The crowd's attention to events in the sky did not lapse when the first object was lost from view, and, about nine minutes later, someone spotted a second object, whereupon the event was again announced via the public address system. Still a third object was brought to the attention of the crowd in the same manner at 11:25. The second object came out of the north, the third came from almost due west. In the third case, someone thought of timing the oscillation frequency (all three exhibited the same unconventional oscillation, with sun-glint perceptible in certain of the instances of tipping, Taylor mentioned). The oscillation frequency was clocked at 48 per minute. In the official report are height estimates and some disparate comments on color, etc., from several other witnesses, as well as remarks on other sightings in the same area on the same day. Full details cannot be recounted here, for reasons of space limitation. Taylor, in his statement submitted to official investigators, said:

*"My experience in radio control of pilotless aircraft and guided missiles for the Navy at NAMU during the war, and over 20 years of aircraft study, does not permit my identification of the objects which were seen. They definitely were not balloons, birds, common aircraft, parachutes, stars, meteors, paper, clouds, or other common objects. They moved in a regular motion either straight or in curved lines. They were all at approximately the same altitude, but moved on different courses as indicated on the sketch. The oscillations were clearly visible and timed on the 3rd sighting ***."*

Discussion. -- The official explanation for this case is "Balloons". I obtained information on upper winds over that part of Washington on that day (700 and 500 mb charts), and the flow aloft between 10,000 and 20,000 ft was from the southwest. The objects, all reported as about the same angular size, came from three distinctly different directions, all within a period of less than an hour. This immediately casts very strong doubt on the balloon hypothesis, as does the flipping motion, the sunglint, and, above all, the fact that no pilot balloon stations were located close upwind of Longview. Furthermore, a typical pilot balloon of about 1 meter diameter could be no higher than about 2500 ft altitude to subtend as large an angle as 10 minutes of arc. Taylor's report (official flies) gave transit times of 2-3 minutes for the unknowns to cross the Longview sky, and, during such a time interval, the normal ascent rate of a pilot balloon would carry it up by 1200-1800 ft. To then fit the angular-size requirements would clearly require that the balloons have been released at some nearby location, which fails to match known pibal-station locations at that time. Furthermore, surface winds were from the west, and winds a short distance above the ground were southwesterly, as indicated by pulp mill smoke-drift described in Taylor's report. This, plus the previously cited upper-flow directions, contradict the balloon hypothesis for all three directions of arrival, particularly those coming from north and northwest. To hypothesize that these were, say, Skyhook balloons coming from three different (unknown) sites, at three different high altitudes, but all so arranged that the apparent balloon diameter came out at about the same 10 minutes of arc each time is scarcely reasonable. In all, I can only regard the balloon explanation as untenable.

Disc-shaped objects have been sighted in dozens of instances, including Arnold's 6/24/47 Mt Rainier sighting. In many, though not all, the odd flipping or fluttering motion has been described by witnesses (Refs. 8, 10). What the dynamical significance of this might be is unclear. We know no more about this in 1968 than we knew in 1947, because such observations have been ignored as nonsense or misidentified balloons.

3. ***Case 11. Salt Lake City, Utah, Oct. 3, 1961***

A midday sighting of a lens-shaped object involving one airborne witness and seven witnesses on the ground became headline news in Salt Lake City (Ref. 32). Accounts of the incident have been summarized elsewhere (Refs. 2, 10, 13, 25). A private pilot, Mr. Waldo J. Harris, was taking off on Runway 160 at Utah Central Airport at almost exactly noon on

10/2/61 when he noted what he at first idly viewed as a distant airplane. He noted it again in the same area just after becoming airborne, once more after gaining some altitude, and then became somewhat puzzled that it had not exhibited any appreciable change of position. About then it seemed to tilt, glinting in the noonday sun, and exhibiting a shape unlike any aircraft. To get a better view, Harris climbed towards the southeast and found himself at its altitude when he was somewhat above 6000 ft. By then it appeared as a biconvex metallic gray object, decidedly different from conventional aircraft, so he radioed back to the airport, where eventually seven persons were taking turns viewing it with binoculars. I have interviewed not only Harris,

but also Jay W. Galbraith, operator of the airport, who, with his wife, watched the object, and Robert G. Butler, another of those at the airport. As Harris attempted to close in, he got to a minimal distance that he thought might have been approximately two or three miles from the object, when it abruptly rose vertically by about 1000 ft, a maneuver confirmed by the ground witnesses. They indicated to me that it took only a second or perhaps less to ascend. Just before the abrupt rise, Harris had been viewing the object on an essentially dead-level line of sight, with distant Mt. Nebo behind it, a significant feature of the case, as will be brought out in a moment.

Before Harris could close his distance much more, the object began moving off to the southeast at a speed well above his light-plane top speed. It was soon an estimated ten miles or so away, but Harris continued his attempt to close. However, after seeming to hover a short time in its new location, it began rising and moving westward, at an extremely rapid speed, and passed out of sight aloft to the southwest in only a few seconds. Some, but not all of the ground witnesses, observed this final fast climb-out, I was told. Military jets were called, but the object had gone before they arrived.

Both Harris and the ground observers using binoculars attested to lack of wings or tail, and to the biconvex side view. Harris said he had the impression its surface resembled "sand-blasted aluminum," but his closest view was about 2-3 miles away, and its estimated size was put at about 50-60 ft diameter (and only a tenth as thick), so the impression of surface texture must be regarded as uncertain. All witnesses confirmed that the object "wobbled" during its hovering. Jay Galbraith said that, when Harris' Mooney Mark 20A was only a speck, they could see the disc rather easily by naked eye, suggesting that its size may have been substantially larger than Harris' estimated 50 ft. Galbraith's recollection of its final departure was that it climbed at a very steep angle, perhaps within about 20 of the vertical, he thought. Butler also recalled the final departure and stressed that it was a surprisingly steep climb-out, quite beyond any known jet speed. All remarked on 10/2/61 being a beautifully clear day.

Discussion. -- Once again we deal with observed performance characteristics far beyond anything of which we have present knowledge: a wingless device that can hover, shoot straight up, and move fast enough to pass out of sight in a matter of a few seconds does not correspond to any known terrestrial craft. The official explanation was originally that Harris saw Venus. From astronomical data, one finds that Venus was in the Utah sky at noon in early October, but lay in the southwest, whereas everyone's line of sight to the object lay to the southeast. Furthermore, Harris' statement that at one stage he viewed the disc against a distant mountain would contradict such an explanation. Finally, it is well known to astronomers that Venus, even at peak brilliance, is not very easily spotted in daytime, whereas he had no difficulty relocating it repeatedly as he flew. Menzel (Ref. 25) proposed that it was merely a sundog that Harris and the others were observing, and this was subsequently adopted as the official explanation. But sundogs (parhelia), for well-known reasons, occur at elevation angles equal to or slightly greater than the sun, which lay about 40° above the southern horizon at noon in Salt Lake that day. Such a solar position would imply that a sundog might have lain to the southeast (22° to the left of the sun), but at an elevation angle that completely fails to match Harris' dead-level viewing (against a distant mountain, to further embarrass the sundog hypothesis).

Finally, to check the witness' statements about cloud-free skies. I checked with the Salt Lake City Weather Bureau office, and their logs showed completely clear skies and 40 miles visibility. Sundogs cannot occur without ice crystal clouds present. The only weather balloon released that morning was sent up at 10:00 a.m.; but in any event, one would have to write off almost all of the observed details to propose that this incident was a misinterpretation of a weather balloon. As I see it the 10/2/61 Salt Lake City sighting is just one more of the hundreds of very well-observed cases of machine-like craft exhibiting "flight performance" far beyond the state and present-day technology.

4. ***Case 12. Larson AFB, Moses Lake, Washington, January 8, 1953***

NICAP's recent publication of long-inaccessible official report-summaries (Ref. 7) makes readily available to interested scientists a large number of fascinating UFO reports. Many are in the multiple-witness category. For example, the dawn

(0715 PST) sighting at Larson AFB where *"over sixty varied military and civilian sources observed one green disc-shaped object. The observations continued for fifteen minutes during which time the object moved in a southwesterly direction while bobbing vertically and going sideways. There was no*

sound. An F-84 aircraft was scrambled but a thirty minute search of the area produced negative intercept results."

The official summary also notes that the "winds were generally from 240° below an overcast at 13,000 ft. Thus the object would appear to move against the wind since it must have been below the clouds. There was no air traffic reported in the area."

No radar sites in the area had unusual returns or activity, according to the same report.

Discussion. -- This green disc, moving against the wind below an overcast and seen by over sixty witnesses, is an official Unidentified.

5. ***Case 13. Savannah River A.E.C Plant, Summer, 1952***

A rather illuminating multiple-witness case was called to my attention by John A. Anderson, now at Sandia Base, New Mexico, but in 1952 working as a young engineer in the Savannah River AEC facility near Aiken, S.C. After a considerable amount of cross-checking on the part of both Anderson and myself, the date was inferred to be late July, 1952, probably 7/19/52. The circumstance giving a clue to the date was that, at about 10:00 a.m. on the day in question, Anderson, along with what he estimated at perhaps a hundred other engineers, scientists and technicians from his group were outside watching a "required attendance" skit presented from a truck-trailer and commemorating the 150th anniversary of the founding of the DuPont company, July 18, 1802. Anderson indicated that some less than absorbed in the skit first spotted the unidentified object in the clear skies overhead, and soon most eyes had left the skit to watch more technically intriguing events overhead. A greenish glowing object of no discernible shape, and of angular size estimated by Anderson to be not over a fifth of full-moon diameter, was darting back and forth erratically at very high speed. Anderson had the impression it was at great altitude, but conceded that perhaps nothing but the complete lack of sound yielded that impression. It was in view for about two minutes, moving at all times. He stressed its "phenomenal maneuverability"; it repeatedly changed direction abruptly in sharp-angle manner, he stressed. The observation was terminated when the object disappeared over the horizon "at apparently tremendous velocity."

Discussion. -- Anderson said that the event was discussed among his group afterwards, and all agreed it could not possibly have been a conventional aircraft. He remarked that no one even thought of suggesting the unreasonable notion that it was an hallucination or illusion. Despite searching local papers for some days thereafter, not a word of this sighting was published, and no further information or comment on it came from within the very security-conscious AEC plant. He was unaware of any official report.

Months after hearing of this from Anderson, in one of my numerous rereadings of Ruppelt's book (Ref. 5), I came across a single sentence in which Ruppelt, referring to the high concentration of reports in the Southeast around September of 1952, states that: "Many of the reports came from people in the vicinity of the then new super-hush-hush AEC facility at Savannah River, Georgia." Whether one of those reports to the official investigative agency came from within Anderson's group or other Savannah River personnel on the 7/52 incident is unknown. If not, then we may have here a case where dozens of technically-trained personnel witnessed an entirely unexplainable aerial performance, yet reported nothing. Anderson knew of no report, and was unaware of any assembling of witness-information within his group, so the evidence points in the direction that this event may have gone unreported. If, as Anderson is inclined to think, this event was on July 19, 1952, it occurred only about twelve hours before the famous Washington National Airport radar-visual sightings; but this date remains uncertain.

6. ***Case 14. Trinidad, Colo., March 23, 1966***

A daytime sighting by at least a dozen persons, in several parts of town, occurred near 5:00 p.m. on 3/23/66 in Trinidad, Colo. Following up a report in the APRO Bulletin on this interesting case, I eventually interviewed ten witnesses (seven children of average age near 12, and five adults). This case came just a few days after the famous "swamp gas" UFO incidents in southern Michigan, which made headline news all over the country. As APRO noted in its account, the

Trinidad case seems in several respects a distinctly better case, yet went essentially unnoted outside of Trinidad. (Press reporting of UFO sightings leaves very much to be desired; I concur in the cited APRO comment. However,

[[51]]

press shortcomings in the UFO area are only secondary factors in the long failure to get this matter out into the open.)

The witness-variance that skeptics like to cite is fairly well illustrated in the results of my ten interviews. I wish space permitted a full exposition of what each witness told me, for it would not only attest to that well-known variance but would also illustrate the point made earlier, namely, that despite those bothersome differences in details, there nevertheless comes through a consistent core of information on observations of something that was of scientific interest.

Mrs. Frank R. Hoch paid no attention when her son first tried to call her out to see something in the sky. Knowing it was kite season, dinner preparations took precedence, and she told the 10-year-old boy to go ride his bike. The second time he was more insistent, and she went outside to look. Two objects, domed on the top but nearly flat on the bottom, shaped like a cup upside down, having no rim or "sombrero brim", she said, were moving slowly westward from Fisher's Peak, which lies just south of Trinidad. Her son, Dean, told her he had seen three such objects when he tried to get her to come out earlier. (Mr. Louis DiPaolo, a Trinidad postman whom I interviewed, had also seen three objects.)

Interestingly, when Mrs. Hoch saw the objects, one was between her and the ridge, the other just above the low ridgeline. The ridge is about a half-mile from the Hoch residence. A photo of the ridge, with roughly-scaled objects sketched on it, suggests an angular diameter of perhaps a degree (object size of order 100 ft), in disagreement with her earlier angular estimates. It was clear that Mrs. Hoch was, as are most, unfamiliar with angular-size estimating. The objects, Mrs. Hoch said, moved up and down in a bobbing manner as they progressed slowly westward along the ridgeline. Occasionally they tilted, glinting in the late afternoon sun as if metallic. No sound was mentioned by any witness except one young boy whose attention was drawn to the object by a "ricocheting sound", as he put it. DiPaolo's observations were made with 7x35 binoculars; he also described the objects as metallic in appearance and shaped like a saucer upside down. His attention had been called to it by neighborhood boys playing outside. Mrs. Amelia Berry, in another part of Trinidad, evidently saw the objects somewhat earlier, when they were farther east, circling near Fisher's Peak, but she was uncertain of the precise time. She saw only two, and remarked that they seemed to "glitter", and she described them as "saucer shaped", "oblong and narrow". Mrs. J. R. Duran, horseback-riding with a 12-year-old son on the opposite (north) side of town also saw two objects, "flat on the bottom, and domed on top, silvery", when her son called them to her attention. She described them as "floating along slowly, bobbing up and down, somewhat to the west of Fisher's Peak." She, like the other witnesses, was positive that these were not airplanes. No one described anything like wings or tail. A number of witnesses were so close that, had this been an unconventional helicopter, its engine-noise would have been unmistakable.

Discussion. -- Notwithstanding differences in the witness accounts (more of which would emerge from a more complete recounting), the common features of the observers' descriptions would seem to rule out known types of aircraft, astronomical, meteorological, and other explanations.

7. ***Case 15, Redlands, Calif., February 4, 1968***

A still more recent multiple-witness case of great interest was well-documented by three University of Redlands professors shortly after it occurred on the evening of 2/4/68. APRO plans a fairly detailed summary-report. Dr. Philip Seff kindly sent me a copy of the witness-testimony he and his colleagues secured in interviewing about twenty out of an estimated hundred-plus witnesses to this low-altitude sighting in a residential area of Redlands. Because I .understand that Dr. Harder will be giving a fairly detailed report of this case to your Committee. I shall give only a much-abbreviated version. At 7:20 p.m.. many persons went outdoors to investigate either (a) the unusual barking of neighborhood dogs. or (b) a disturbing and unusual sound. Soon many persons up and down several streets were observing an object round in planiform, estimated at perhaps 50-60 feet in diameter, moving slowly towards the east-northeast at an altitude put by most witnesses as perhaps 300 feet. Glowing ports or panels lay around its upper perimeter and "jet-like" orange-red flames or something resembling flames emanated from a number of sources on the undersurface. A number of odd psysiological [sic] effects were remarked by various witnesses, and the animal-reactions were a notable feature of this case. The object at one point rose abruptly by some hundreds of feet before continuing its somewhat "jerky" motion to the

[[52]]

east it then hovered a short time and moved off with acceleration to the northwest.

Discussion. -- The Redlands University trio inquired concerning radar detection, but were informed that the nearest radar was at March AFB, Riverside, and the beam clearing intervening ridges could not detect so low a target over Redlands. An interesting aspect of press coverage of UFOs, a very characteristic aspect, is illustrated here. The local Redlands-area papers carried only short pieces on the event; beyond that no press coverage occurred, as far as I have been able to ascertain.

Evidently even the state wires did not carry it. (I think this fact deserves very strong emphasis. One has to see national clipping-service coverage, drawing upon many small-town papers, to gain even a dim glimpse of the astonishing number of UFO reports that occur steadily, but go unreported on state and national wires so that none but very diligent UFO investigators have any appreciation of the true frequency of UFO sightings. This is no "press clampdown", no censorship; wire editors simply "know" that there's nothing to all this nonsense about UFOs. A local story will be run simply for its local interest, but that interest falls off steeply with radial distance from the observation site.) Thus, we must confront a situation, developed over 20 years, in which over a hundred citizens in a city of about 30,000 population can see an utterly unconventional aerial machine just overhead and, almost by the time the dogs have stopped barking, press and officialdom are uninterested.; Dr. Seff told me just last week that he had encountered a Redlands University coed who had seen the object (he hadn't interviewed her previously), and she seemed still terrified by the incident. I believe that your Committee must recognize an unfilled scientific obligation to get to the bottom of such matters.

8. Many other multiple-witness cases could be cited, some from my own interviewing experience, far more from other sources within this country and abroad. An October 28, 1954 sighting in Rome was estimated to have been viewed by thousands of people, one of whom was U.S. Ambassador Clare Booth Luce (Ref. 10) with her embassy staff. Mrs. Luce said it had the shape of a silver dollar and crossed the skies in about 30 seconds. A now-famous group of sightings of June 26/27, 1989, near Boianai, New Guinea, was observed by several dozen witnesses. the principal one of whom I interviewed in Melbourne, in 1967, Rev. Wm. B. Gill. Bloecher (Ref. 8) describes a number of mid-1947 incidents where the witness-totals ranged from dozens up to well over a hundred persons. Hall (Ref. 10) cites more recent instances. Many other sources could be cited to show that the intimation that UFOs are never seen except by lone individuals driving along some remote back road (a frequent setting, to be sure!) does not accord with the actual facts. Multiple-witness UFO cases are impressively numerous.

WHY AREN'T UFO'S EVER SEEN IN CITIES? WHY JUST IN OUT-OF-THE-WAY PLACES?

One cannot study the UFO problem long without being struck by the preponderance of reports that come from somewhat remote areas, non-urban areas. Similarly, one cannot escape the conclusion that more UFOs are reported at night than in day. For the latter, luminosity and its obvious effect on probability of chance visual detection may go far towards explaining the diurnal variation of UFO sightings (though I suspect that moat students of the problem would conclude that there is a real excess of nightttme occurrences for quite unknown reasons). Why, some ask with respect to the geographical distribution, don't the UFOs, if real and if extraterrestrial, spend most of their time looking over our cities? That's what we'd do, if we got to Mars and found huge urban complexes, some skeptics insist.

It is surprising to find scientists who do not see through the transparency of that homocentric fallacy. If it were true that we were under surveillance from some advanced civilization of extraterrestrial origin, the pattern of the observations, the motivation of the surveillance, and the degree of interest in one versus another aspect of our planet could be almost incomprehensible to us. Aboriginal natives under anthropological observation must find almost incomprehensible the motives behind the strange things that the field-teams do, the odd things in which they are interested. But the cultural and the intellectual gulf that would separate us from any intelligent beings commanding a technology so advanced that they could cross interplanetary or interstellar distances to inspect us would be a gulf vastly greater than that which separates a Harvard field-anthropologist from a New Guinea native. And, for this reason, I think one must concede that, within the argumentation carried out under tentative consideration of an extraterrestrial

terrestrial hypothesis for UFOs, incomprehensibility must be expected as almost inevitable. Hence there is more whimsy than good reasoning in queries such as, "Why don't they land on the White House lawn and shake hands with the President?"

Nevertheless, the evidence affords a fairly definite answer to the skeptics' question, "Why aren't they ever seen over or in cities?" They are.

1. ***Case 16. New York City, November 22, 1966***

A report in a 1967 issue of the NICAP UFO Investigator (Ref. 33) reads as follows;

"A UFO over the United Nations in New York City was reportedly seen on November 22, 1966. Witnesses included at least eight employees of the American Newspaper Publishers Association, who watched from their offices on the 11th floor of 750 Third Avenue at 4:20 p.m. on a bright, sunny day. The UFO was a rectangular, cushion-shaped object ...(which) came southward over the East River, then hovered over the UN Building ... It fluttered an bobbed like a ship on agitated water."

Witnesses mentioned were D. B. McVay, assistant general manager of ANPA and Mr. W. H. Leick, manager of the ANPA's Publications Department. I telephoned the ANPA offices and spoke at some length with Mr. Leick about the sighting. He confirmed that eight or nine persons went out on the 17th floor terrace, watching the object hover over the UN Building (as nearly as they could estimate) for a number of minutes as it rocked and reflected the sun's rays with a golden glint before rising and moving off eastward at high speed. I asked Leick if they reported it to any official channels, and he said that A. A. LaSalle called a New York office of the Air Force and was assured that an officer would be in the next day to interview them. But no one ever came. Leick added that they also phoned a New York newspaper "which shall go unnamed," but "they weren't interested." It got to NICAP almost by accident, and NICAP sent up their standard witness-questionnaires which Leick said they all filled out.

Discussion. -- When an incident such as this is cited to the skeptic who asks, "Why no UFOs near cities?", I find that his almost invariable retort is something like: "If that had really happened, why wouldn't hundreds to thousands of persons have reported it?" There are, I believe, two factors that explain the latter situation. First, consider the tiny fraction of persons on any city street whose vision is directed upwards at any given moment. In absence of loud noises aloft, most urbanites don't spend any large amount of time scanning the skies. In addition to infrequency of sky-scanning, another urban obstacle to UFO detection is typically restricted vision of the full dome of the sky; buildings or trees cut down the field of view in a way not so typical of the view afforded the farmer, the forest ranger, or a person driving in open country. Finally. In UFO studies, it is always necessary to draw sharp distinction between a "sighting" and a "report". The first becomes the second only if a witness takes the step of notifying a newspaper, a law-enforcement office, a university, or some official agency. It is abundantly clear, from the experience of UFO investigations in many parts of the world, that psychological factors centering around unwillingness to be ridiculed deter most witnesses from filing any official report on a very unusual event. Again and again one learns of a UFO sighting quite indirectly, from someone who knows someone who once mentioned that he'd seen something rather unusual. On following such leads, one frequently comes upon extremely significant sightings that were withheld from official reporting channels because of the "ridicule lid", as I like to term it, that imposes a filter screening out a large number of good sightings at their source.

Returning to the 11/22/66 New York City report, I must say that. between the information NICAP secured from the witnesses and my own direct conversations with Leick. I accept this as a quite real sighting, made by reliable observers under viewing circumstances that would seem to rule out obvious conventional explanations. When the object left its hovering location, it rose straight upward rapidly, before heading east, Leick said. Although he and his colleagues may well have erred in their slant-range estimate which put it over the UN Building, their description of its shape and its maneuvers would appear to rule out helicopters, aircraft, balloons, etc.

2. ***Case 17. Hollywood, Calif., February 5-6, 1960***

A still more striking instance in which entirely unconventional objects were observed by many city-dwellers, where low-altitude objects hovered and exhibited baffling phenomena, is a central Hollywood case that was rather carefully checked by LANS, the Los Angeles NICAP Subcommittee (Ref. 34). The

two incidents occurred just after 11:00 p.m. on two successive nights, Friday 2/5/60 and Saturday 2/6/60, over or near the intersection of Sunset Blvd. and La Brea Ave., *i.e.*, in the heart of downtown Hollywood. I have gone over the site area with one of the principal investigators of these incidents, Mrs. Idabel Epperson of LANS, have examined press accounts (Ref. 35) that dealt (very superficially) with the event, and have studied correspondence between the LANS investigators and official agencies concerning this case. The phenomenology is far too complex to report in full detail here; even the 21-page single-spaced LANS report was only a digest of results of all the NICAP witness-interviewing carried out to substantiate the events. The LANS report summarizes object-descriptions given by eight witnesses Friday night and eighteen witnesses Saturday night, several of them police officers.

Cars were stopped bumper-to-bumper, according to employees of several businesses on the Sunset-La Brea intersection in the midst of the main events, with people gaping at the object overhead. Persons on hotel and apartment rooftops were out looking at the bright "cherry-red, circular light" that figured in both incidents. On the two successive nights, the red object first appeared at about 11:15 p.m., and on both nights it stopped and hovered motionless for periods of about 10 minutes at a time. The angular estimates of the size of the red light varied, but seemed to suggest a value of one-fourth to one-third of the lunar diameter, say 5-10 minutes of arc. Almost all agreed that the light was sharp-edged rather than hazy or fuzzy. The usual witness-variances are exhibited in the total of about two dozen persons interviewed, e.g., some thought the light pulsated, others recalled it as steady, etc., but the common features, consistent throughout almost all the testimony, bespeak a quite unusual phenomenon.

On Friday night, the red light was first seen directly overhead at Sunset and La Brea. Two service-station attendants at that intersection, Jerry Darr and Charles Walker, described to LANS interviewers how, "... hundreds of people saw it -- everybody was looking" as the light hovered for at least five minutes over a busy drive-in there. Ken Meyer, another service station attendant a third of a mile to the north, estimated it hovered for about 10 minutes. Harold Sherman, his wife, and two others watched it in the later phases (also described by the above-cited witnesses) as it resumed motion very slowly eastward. After proceeding east for a distance that witnesses roughly estimated at a block or two, it veered southeastward and passed out of sight. (It is not clear whether it was occulted by buildings for some witnesses, or diminished in intensity, or actually passed off into the distance.) No sound was heard over street-noise background.

The following night, an object which appeared to be the same, to those several witnesses who saw both events, again showed up overhead, this time first seen about one block farther east than on Friday night. Triangulation based on estimates of angular elevations as seen from various locations was used to approximate the height above ground. LANS concluded that, when first seen, it lay about 500-600 ft. above the intersection of Sunset and Sycamore. A number of witnesses observed it hovering motionless in that position for about 10 minutes. Then a loud explosion and brilliant bluish-white flash was emitted by the object, the noise described by all witnesses as unlike any sonic boom or ordinary explosion they had ever heard. The sound alerted witnesses as far away as Curson and Hollywood Blvd., i.e., Tom Burns and two friends who asked LANS interviewers not to use their names. Condensing very greatly here the descriptions given to the interviewers by independent witnesses who viewed the "explosion" from various locations scattered over a circle of about a 1-mile radius yields a summary-description as follows: What had, just before the explosion, looked much "like a big red Christmas ball hanging there in the sky", was suddenly the source of a flash that extended downward and to the west, lighting up the ground all around one interviewed (Soe Rosi) on La Brea Ave. A "mushroom-shaped cloud", with coloration that impressed all who saw it, emerged upward and soon dissipated. Concurrently, as the red light extinguished, an object described by most, but not all, witnesses as long and tubular shot upwards. Angular estimates implied an object a number of tens of feet long, 70 ft. from Harold Sherman's rough estimates.

Clearly, it is difficult to explain how an object of such size could have materialized from a light at 500 ft. elevation and subtending an angle of only 10 minutes of arc, unless it had been there all along, unseen because of the brilliance of the red light beneath it. Or perhaps the angular-size estimates are in error. Some witnesses followed only the tubular ascending object, others saw

only something that "spiraled downwards" beneath the explosion source. No witness seemed certain of what it was that came down; some spoke of "glowing embers"; no one gave indication of following it to ground.

Glossing over other details bearing on this "explosion" at an estimated 5-600 ft above Sunset and Sycamore, witnesses next became aware that the just-extinguished red light had evidently reappeared in a new location, about a block to the west. Police officers Bay Lopez and Daniel Jaffee, of LAPD, located at the corner of Sunset and LaBrea, heard the explosion and looked up, seeing the light in its new location "directly overhead", as did many others at that intersection who then watched the red light hovering in its new location for about 3 minutes. (Space precludes my giving all pertinent information on time-estimates as set out in the 21-page LANS summary. For example, a good time-fix on the explosion came from the fact that E. W. Cass, a contractor living almost a mile west, was just winding his alarm clock, looking at it, when flare-like illumination "lit up the whole bedroom", just at the indicated time of 11:30. He went out, watched the hovering red light in its new location, and added further details I shall omit here. Others took their time clues from the fact that 11:30 commercials had just come on TV when they heard the peculiar explosion and hastened outside to check, etc.)

The red light, now over Sunset and La Brea, was roughly triangulated at about 1000 ft up, a figure in accord with several witness comments that, when it re-appeared some 4-5 seconds after the "explosion", it lay not only somewhat west of its

first location, but noticeably higher. After hovering there for a time inferred to be eight minutes, it began slowly drifting eastward, much as on the previous night when much less spectacular events had occurred. Larry Moquin, one witness who had taken rather careful alignment fixes using rooflines as an aid, remarked that, at this stage. La Brea and Sunset was filled with watchers: "Everybody was standing outside their cars looking up -- cars were backed up in the streets -- and everyone was asking each other, "What is it?" After moving slowly but steadily (observers mentioned absence of bobbing, weaving, or irregularity in its motion) for about a block east, to its first location it turned sharply towards the north-northeast, accelerated, and climbed steeply, not stopping again until at a very high altitude well to the north. From crude triangulation, LANS investigators inferred a new hovering altitude of over 25,000 ft, but it is clear from the data involved that this estimate is extremely rough.

Discussion. -- Although I have done no personal witness-interviewing to date in the 2/60 Hollywood case, I can vouch for the diligence and reliability with which the LANS group pursues its case-studies. The large number of interviews secured and the degree of consistency found therein seem to argue that some extremely unusual devices maneuvered over Hollywood on the two nights in question. Unless one simply rejects most of the salient features of the reports. it is quite clear that no meteorological or astronomical explanation is at all reasonable. Nor does any conventional aircraft match the reports.

The question that arises almost immediately is that of a practical joke, a hoax. However, the resources required to fabricate some device yielding the complex behavior (stop motionless, move against wind, explosively emit secondary devices, and finally, in the 2/6 event, climb to rather high altitude) would scarcely be available to college pranksters. The phenomena go so far beyond the gas-balloon level of hoaxing that one must have some much more elaborate hoax hypothesis to account for the reported events. Balloons must drift with the winds, and the LANS group secured the local upper-wind data for both nights, and there is no match between the reported motions and the winds in the surface-1000-ft layer. And, in any event, the alternation between hovering and moving, plus the distinct direction-shifts without change of apparent altitude, cannot be squared with balloon-drift. This would mean that some highly controlled device was involved, capable (in the 2/6 incident) of hovering in an almost precisely stationary position relative to the ground (Moquin sighted carefully, using structural objects to secure a fix when the red light lay right over La Brea and Sunset, and perceived no motion for many minutes). Yet the Weather Bureau was reporting 5 mph winds from the southwest at 1000 ft (triangulated altitude when hovering there). Only if one hypothesized that this was an expensively elaborate experiment in psychological warfare could one account for financial resources needed to build a device capable of simulating some of these phenomena. Such a hypothesis seems quite unreasonable in the 100-megaton age where ever-present realities of weaponry pose more psychological strains than Disney-like pyrotechnics.

In fact, UFO sightings with equally peculiar phenomenology are so much a part of the total record that this Hollywood incident is not as unparalleled as it might first seem. In Hobard, Tasmania, I interviewed an electrical engineer who, along with a fellow engineer also employed by the Tasmanian Hydroelectric Commission, observed phenomena occurring in broad daylight over and near the River Derwent at Risdon that have the same "absurd" nature that one meets in the Hollywood case. The wife of a Texas rancher described to me an incident she witnessed in Juarez, Mexico, with about the same absurdity-quotient. We simply do not understand what we are dealing with in these UFO phenomena; my present opinion is that we must simply concede that, in the Hollywood case, we are confronted with decidedly odd UFO phenomena, in a decidedly urban locale.

There appears to have been no official investigation of these striking events (Ref. 35), and local newspapers gave it only the briefest attention. In the New York City case cited above, the particulars were phoned to a large New York paper, but the paper was not interested, and no account was reported. Similarly in the 2/4/68 Redlands case, the local papers felt it warranted only an extremely brief article. This pattern is repeated over and over again; newspapermen have been led to believe that UFOs are really no more than occasional feature-story material. On rare occasions, for reasons not too clear to students of the UFO problem, some one case like the Michigan incident of 1966 will command national headlines for a day or two and then be consigned to journalistic limbo. This, in company with scientific rejection of the problem, plus official positions on the matter have combined to keep the public almost entirely unaware of the real situation with respect to frequency and nature of UFO incidents. For emphasis, let me repeat that I do not see design in that, nothing I construe as any well-planned attempt to keep us all uninformed for some sinister or protective reason. The longer I reflect on the history of the past handling of the UFO problem, the more I can see how one thing led to another until we have reached the intolerable present situation that so urgently calls for change.

3. ***Case 18. Baytown, Texas, July 18, 1966***

Baytown, Texas, on Galveston Bay, has a population near 80,000. Several persons evidently saw an interesting object there at about 9:00 a.m. on 7/18/66. My original source on this case was an article that appeared in the 10/8/66 *Houston Post* from NICAP flies. The article, by Post reporter Jimmie Woods, represents one of those rare UFO feature stories in which fact is well blended with human interest, as I found when I subsequently interviewed one of the principal witnesses, W. T. Jackson, at whose service station he and assistant Kelly Dikeman made the sighting. Both were inside the station when Jackson spotted the object hovering motionless about 100 yards away. (The Post said 1000 yards, but Jackson pointed out that Woods interviewed him while he was waiting on customers at the station and the reporter didn't get allot it correct.)

Jackson explained to me that the object "lay right over the Dairy Queen." He described it as a white object that "looked like two saucers turned together with a row of square windows in between", and he thought it might have been 50 feet in diameter. He called Dikeman over, and they both looked at it for a few seconds and then simultaneously started for the door to get a better look. Almost at that moment it started moving westward. Dikeman was at the door before Jackson and had the last view of it as it passed over a water tower, beyond buildings and a refinery and was gone, "faster than any airplane." Jackson described it as pure white, and definitely not spinning, since he saw clearly the features that he termed "windows" Jackson kept the incident to himself for a time; when it got out, two nurses who were unwilling to give him their names because "they didn't want to be laughed at" stopped at his station and told him they had seen it from another part of Baytown.

Discussion. -- "Swamp gas" explanations were then still featured in press discussions of UFOs, and Jackson volunteered the comment that there are no swamps nearby and that it was "too high for any gas formations" he knew of. "It damned sure wasn't no fireball," Jackson told the *Post* reporter, and also commented, "Feller, when you set there and count the windows it ain't no damn reflection." I received similar salty commentary on various hypotheses when I spoke with Jackson. No sound was heard, yet, as Jackson put it, "if it had been any kind of jet, we'd have been deafened." As in many other cases, a distinctly machine-like configuration, definite outlines, secondary "structural" features here termed "windows", add up to a description that does not suggest any misinterpreted

natural phenomenon. That it hovered within a city of moderate size with only a total of two declared and two other undeclared witnesses is not entirely difficult to understand when one has interviewed large numbers of witnesses for whom the likelihood of ridicule was an almost sufficient deterrent to open reporting.

4. ***Case 19. Portland, Oregon, July 4, 1947***

In the course of cross-checking a sampling of the 1947 cases that went into Bloecher's study (Ref. 8), the numerous daytime sightings in central Portland on 7/4/47 seemed worth checking, especially because many of the reports came from police and harbor patrolmen. Here again, we deal with a case for which there are so many relevant details available that space precludes an adequate summary (see Ref. 8). I spoke with Sheriff's Deputy Fred Krives who, along with several other deputies, had seen some of the many objects over Portland from the Court House across the Columbia River in Vancouver, Wash. Krives recalled that over half a dozen deputies were outside looking at what they estimated to be about 20 disc-shaped objects in several subgroups racing across the sky at an estimated height of perhaps 1000 ft, heading to the southwest.

Both from contemporary press accounts and my own checks, it became evident that more than one formation of discs flew over Portland that day. Harbor Patrol Capt. K. A. Prehn, whom I located by telephone, told me that he had been called outside by another officer who spotted objects moving overhead towards the south. Their speed seemed comparable to that of aircraft, their outlines were quite sharp, and they looked metallic as they flashed in the sun. They occasionally wobbled, and their path seemed to be slightly irregular. Other officers with whom I spoke sighted discs from other parts of the Portland area; one of them, Officer Walter Lissy, emphasized that he recalled them as zig-zagging along at "terrific speed." Another officer, Earl Patterson, told me of seeing a single object that "made sudden 90-degree turns with no difficulty." I also obtained letter accounts from others in the Portland area who saw disc-like objects that day. Here was an early instance of unidentified objects maneuvering in full daylight over a major city.

Discussion. -- The July 4, 1947 sightings (for which Bloecher gathered press accounts for more than 80 from various parts of the U.S.) were made the subject of a good deal of press ridicule, as Bloecher's study makes clear. However, after interviewing a number of the witnesses to the Portland sighting concerning their recollections of what they saw that day, I see no basis at all for rejecting these sightings. The official explanation for the Portland observations is "Radar Chaff," based evidently (Ref. 6) on a report that some aircraft had made a chaff-drop in that area sometime on that day. "Chaff" is

metal-foil cut into short strips, typically a few inches in length, ejected from military aircraft to jam radar. The strips float down through the air, intercepting and returning the radar pulses. To suggest that numerous police officers would confuse strips of foil, so small as to be invisible beyond a few hundred yards, with maneuvering disc-like objects seems unreasonable. I doubt that anyone who had talked directly to these officers could have seriously proposed such an explanation. Herein lies a difficulty: In an overwhelming majority of cases, official explanations have been conceived without any direct witness-interviewing on the part of those responsible for conceiving the explanations.

5. Perhaps, for present purposes, the foregoing cases will suffice to indicate that there have been significant UFO incidents in cities. Many other examples could easily be cited. Elsewhere (Ref. 2) I have discussed my interviews with witnesses in a case at Beverly, Mass., on the evening of April 22, 1966, where three adult women and subsequently a total of more than half a dozen adults (including two police officers) observed three round lighted objects hovering near a school building in the middle of Beverly. At one early stage of the sightings, one of the discs moved rapidly over the three women, hovering above one of them at an altitude of only a few tens of feet and terrifying the hapless women until she bolted. This case was quite thoroughly checked by Mr. Raymond B. Fowler, one of NICAP's most able investigators, who has studied numerous other UFO incidents in the New England area.

I interviewed witnesses in a most interesting sighting in Omaha in January 1966, where a stubby cigar-shaped object had been seen by a number of persons on the northwest side of the city. Urban UFO cases in other parts of the world are also a matter of at least journalistic if not yet scientific record. To sum up, though non-urban reports are definitely more numerous, urban reports do indeed exist.

WHY DON'T ASTRONOMERS EVER SEE UFO'S?

I have had this question put to me by many persons, including a number of astronomers. Once I was speaking to a group from an important laboratory of astronomy when the director asked why astronomers never see them. In the room, among his staff, were two astronomers who had seen unconventional objects while doing observing but who had asked that the information they had given me about their sightings be kept confidential. I understand such strictures, but some of them make things a bit difficult. This phenomenon of professional persons seeing unidentified objects and then being extremely loath to admit it is far more common than one might guess. After hearing of an evidently very significant sighting by a prominent physical scientist who was hiking in some western mountains when he spotted a metallic-looking disc, examined it with binoculars, and saw it shoot up into the air (according to my second-hand report from a professional colleague), I tried for month's to secure a direct report of it from him; he was unwilling to discuss it openly with me. NICAP has had reports from prominent executives in large technical corporations who insisted that, just because of their positions, their names not be used publicly. Similar instances could be cited almost ad infinitum. The very types of witnesses whose testimony would carry greatest credence often prove to be the most reluctant to admit their sightings; they seem to feel they have the most to lose. Within a day of this writing

I spoke to a veteran airlines pilot about a sighting in which he was involved about a decade ago. After the official "explanation" was publicized, he decided he'd never report another one. I predict that social psychologists are going to have a field day, in a few years, studying the "pluralistic ignorance" that led so many persons to conceal so many sightings for so long.

Returning, however, to the question of why astronomers never see UFOs, a relevant quantitative consideration needs to be cited at once. According to a recent count, the membership of the American Astronomical Society is about 1800; by contrast, our country has about 350,000 law-enforcement officers. With almost 200 times as many police, sheriffs' deputies, state troopers, etc., as there are professional astronomers, it is no surprise that many more UFO reports come from the law-enforcement officers than from the astronomers. Furthermore, the notion that astronomers spend most of their time scanning the skies is quite incorrect; the average patrolman almost certainly does more random looking about than the average professional astronomer.

Despite these considerations, there are on record many sightings from astronomers, particularly the amateurs, who far outnumber the professionals. A few examples will be considered.

1. ***Case 20. Las Cruces, N.M., August 20, 1949***

A good account of the sighting by Dr. Clyde Tombaugh, discoverer of the planet Pluto, is given by Menzel (Ref. 25). From my own discussions with Dr. Tombaugh, I confirmed the main outlines of this incident. At about 10:00 p.m. on 8/20/49, he, his wife, and his mother-in-law were in the yard of his Las Cruces home, admiring what Tombaugh described as a sky of rare transparency, when Tombaugh, looking almost directly towards zenith, spotted an array of pale yellow lights moving rapidly across the sky towards the southeast. He called them to the attention of the two others, who saw them just before they disappeared halfway to the horizon. The entire array subtended an angle which Tombaugh put at about one degree, and it took only a few seconds to cross 50 or 60 degrees of sky. The array comprised six "windowlike" rectangles of light, formed into a symmetric pattern; they moved too fast for aircraft, too slowly for a meteor, and made no sound. Menzel quotes Tombaugh as. saying, "I have never seen .anything like it before or since, and I have spent a lot of time where the night sky could be seen well."

Discussion. -- Dr. Menzel explains this phenomenon as resulting from reflection of lights from the ground, possibly "the lighted windows of a house" reflected by an inversion or haze layer aloft. The movement he explains as resulting from a ripple on the haze layer. Such an "explanation" is not merely difficult to understand; it is incredible. For an "inversion layer" to produce such a near-normal reflection of window lights would demand a discontinuity of refractive index so enormously large compared with anything known to occur in our atmosphere as to make it utterly out of the question. However, it has been just such casual *ad hoc* explanations as this by which Menzel has, in his writings, used meteorological optics to rationalize case after ease with no attention to crucial *quantitative* details. It is a simple matter to show that even inversions of intensity many

orders of magnitude larger than have ever been observed yield reflectivities (at the kind of near-normal incidence involved in Tombaugh's sighting) that are only a tiny fraction of one per cent (Ref. 36). In fact, I see no way of accounting for the Tombaugh observation in terms of known meteorological or astronomical phenomena.

2. ***Case 21. Ft. Sumner, New Mexico, July 10, 1947***

A midday sighting by a University of New Mexico meteoriticist, Dr. Lincoln La Paz, and members of his family was summarized by Life magazine years ago (Ref. 87) without identifying La Paz's name. Bloecher (Ref. 8) gives more details and notes that this is officially an Unidentified. (At 4:47 p.m. MST on 7/10/47, four members of the La Paz family nearly simultaneously noted "a curious bright object almost motionless" low on the western horizon, near a cloud bank. The object was described as ellipsoidal, whitish, and having sharply-outlined edges. It wobbled a bit as it hovered stationary just above the horizon, then moved upwards, passed behind clouds and re-emerged farther north in a time interval which La Paz estimated to be so short as to call for speeds in excess of conventional aircraft speeds. It passed in front of dark clouds and seemed self-luminous by contrast. It finally disappeared amongst the clouds. La Paz estimated it to be perhaps 20 miles away, judging from the clouds involved; and he put its length at perhaps 100-200 ft.

Discussion. -- This observation is attributed by Menzel (Ref. 24, p. 29) to "some sort of horizontal mirage, perhaps one of a very brilliant cloud shining like silver in the sunlight -- a cloud that was itself invisible because of the darker clouds in the foreground." As nearly as I am able to understand that explanation, it seems to be based on the notion that mirage-refraction can neatly superimpose the image of some distant object (here his "brilliant cloud") upon some nearer object in the middle distance (here his "darker clouds"). That is a fallacious notion. If any optical distortions did here bring into view some distant bright cloud, it would not be possible to receive along immediately adjacent optical paths an image of the intermediate clouds. Furthermore, the extremely unstable lapse rates typical of the southwestern desert areas under afternoon conditions produce inferior mirages, not superior mirages of the looming type here invoked by Menzel. Rapid displacements, vertically and horizontally, are not typical of mirage phenomena. Hence Menzel's explanations cannot be accepted for this sighting.

3. ***Case 22. Harborside, Me., July 8, 1947***

An observation by an amateur astronomer, John F. Cole, reported to official investigative offices near the beginning of the period of general public awareness of the UFO problem, involves an erratically maneuvering cluster of about 10 objects, seen near 2:30 p.m. EDT on 7/3/47 on the eastern shore of Penobscot Bay. Hearing a roar overhead, Cole looked up to see the objects milling about like a moving swarm of bees as they traveled northwestward at a seemingly high speed, as nearly as he could judge size and distance. The objects were light-colored, and no wings could be discerned on most, although two appeared to have some sort of darker projections somewhat resembling wings. In 10-15 seconds they passed out of sight

Discussion. This is one of several dozen cases admitted to the Unidentified category in one of the earliest official reports on UFOs (Ref. 6). I have tried, unsuccessfully, to locate J. F. Cole. An account of the case is given by Bloecher (Ref. 8). It might be remarked that "swarming bee" UFO observations have cropped up repeatedly over the years, and from all over the world.

4. ***Case 23. Ogra, Latvia, July 26, 1965***

An astronomer whom I know recently toured a number of observatories in the USSR, and brought back the word that a majority of Russian astronomers have paid little attention to Russian UFO reports (details of which are quite similar to American UFO reports, my colleagues established), a frequently-cited reason being that the American astronomer, Menzel, had given adequate optical explanations of all such sightings. I must agree with Dr. Felix Zigel who, writing on the UFO problem in Soviet Life (Ref. 38), remarked that Menzel's explanation in terms of atmospheric optics "does not hold water." It would, for example, be straining meteorological optics to try to account in such terms for a sighting by three Latvian astronomers whose report Zigel cites in his article. At 9:35 p.m. on 7/26/65 while studying noctilucent clouds, R. Vitolniek and two colleagues visually observed a starlike object drifting slowly westward. Under 8-power binocular

magnification, the light exhibited finite angular diameter, so a telescope was used to examine it. In the telescope, it appeared as a composite of four smaller objects. There was a central sphere around which, "at a distance of two diameters, were three spheres resembling the one in the center." The outer spheres slowly rotated around the central sphere as the array gradually moved across the sky, diminishing in size as if leaving the Earth. After about 20 minutes' observation, the astronomers noted the outer spheres moving away from the central object, and by about 10:00 p.m., the entire group had moved so far away that they were no longer visible.

Discussion. -- I have no first-hand information on this report, of course. The group of objects was seen at an angular elevation of about 60 degrees, far too high to invoke any mirage-effects or other familiar refractive anomalies. Furthermore, the composite nature of the array scarcely suggests an optical distortion of the telescope, a possibility also rendered improbable from the observed angular velocity and apparent recessional motion.

5. ***Case 24. Kislovodsk, Caucasus, August 8. 1967***

Zigel, who is affiliated with the Moscow Aviation Institute, reports in the same article (Ref. 38), a sighting at 8:40 p.m., 8/8/07, made by astronomer Anatoli Sazanov and colleagues working at the Mountain Astrophysical Station of the USSR Academy of Sciences, near Kislovodsk. Sazanov and ten other staff members watched an "asymmetric crescent, with its convex side turned in the direction of its movement" moving eastward across the northern sky at an angular elevation of about 20 degrees. Just ahead of it, and moving at the same angular speed was a point of light comparable to a star of the first magnitude. The crescent-like object was reddish-yellow, had an angular breadth of about two-thirds that of the moon, and left vapor-like trails aft of the ends of the crescent horns. As it receded, it diminished in size and thus "instantly disappeared".

Discussion. -- If we may accept as reliable the principal features of the sighting, how might we account for it? The "faintly luminous ribbons" trailing from the horns suggest a high-flying jet, of course; but the asymmetry and the reddish-yellow coloration fail to fit that notion. Also, it was an object of rather large angular size, about 20 minutes of arc, so that an aircraft of wingspan, say, 150 feet would have been only about five miles away whence engine-noise would have been audible under the quiet conditions of a mountain observatory. More significant, if it had been an aircraft at a slant range of five miles, and at 20 degree elevation, its altitude would have been only about 9000 ft above the observatory. For the latitude and date. the sun was about ten degrees below the western horizon, so direct sun-illumination on the aircraft at 9000 ft above observatory level would be out of the question. Hence the luminosity goes unexplain . Clearly, satellites and meteors can-be ruled out. The astronomers' observation cannot be readily explained in any conventional terms. Zigel remarks that the object was also seen in the town of Kislovodsk, and that another reddish crescent was observed in the same area on the evening of July 17, 1967.

6. ***Case 25. Flagstaff, Ariz., May 20, 1950***

Near noon on 5/20/50, Dr. Seymour Hess observed an object from the grounds of the Lowell Observatory. Although Hess' principal field of interest has been meteorology, we may here consider him an astronomer-by-association, since he was at Lowell doing work on planetary atmospheres, on leave from Florida State University. Spotting an unusual small object

moving from SE to NW, he had time to send his son after binoculars, which he used in the later portions of his observation. He said it looked somewhat disc-shaped, or perhaps somewhat like a tipped parachute. It had no wings or visible means of propulsion, Dr. Hess indicated to me that he probably had it in sight a total of about three minutes, during which it passed directly between him and a cloud, before disappearing (into a cloud Hess feels, though this point was not certain). From meteorological data bearing on the cloud-base height, Hess deduced that the cloud bases lay 12,000 ft above terrain (vs. Weather Bureau visual estimate of 6000 ft above terrain). The zenith angle was about 48 degrees, so the slant range would have been 17,000 ft or 8,000 ft, depending on which cloud height is accepted. For its 3 minutes estimated angular diameter (dime at 50 ft Hess estimated), the diameter would then come out of the order of 10 to 15 feet His subjective impression was that it was possibly smaller than that.

Discussion. -- The possibility that this might have been a balloon or some other freely drifting device comes to mind. However, Hess noted carefully that the clouds were drifting from SW to NE, i.e., at right angles to the object's motion.

He estimated its speed to be in the neighborhood of 100 to 200 mph, yet no engine noises of any kind were audible. It appeared dark against the bright cloud background, but bright when it was seen against blue sky. No obvious explanation in conventional terms seems to fit this sighting.

7. Many other sightings by both professional and amateur astronomers could be listed. Vallee (Ref. 17) discusses in detail a November 8, 1957 observation by J. L. Chapuis of Toulouse Observatory in France of what appeared through a small telescope to be a yellowish, elliptical body, with distinct outlines, leaving a short trail behind it. It was seen by other observers in three separate locations, executed maneuvers entirely excluding meteoric origin, and was regarded as an unexplainable phenomenon by all of the witnesses. Hall (Ref. 10) lists nine examples of astronomer sightings of unidentified objects, several of which are quite striking. Ruppelt (Ref. 5) remarks that an astronomer working under contract to the official UFO investigatory program interviewed 45 American astronomers uring the summer of 1952, of whom five (11 per cent) had seen what they regarded to be UFOs. Although the sample is small, that percentage is well above the population percentage who say they have seen UFOs, which suggests that perhaps astronomers may sight more UFOs than they report as such. Indeed, with the recent publication of Ref. 7, further interesting information on that 1952 poll is now at hand. The contract astronomer wrote at that time (Ref. 7, Rept 8), "... certainly another contributing factor to their desire not to talk about these things is their overwhelming fear of publicity. One headline in the nation's papers to the effect that 'Astronomer Sees Flying Saucer' would be enough to brand the astronomer as questionable among his colleagues." Unfortunately, we scientists are by no means as open-minded and fearlessly independent as we are sometimes pictured. It is often quite difficult to persuade a scientist to let his confidential report of a UFO sighting become a fully open UFO report; and my own experience suggests that perhaps astronomers, as a group, are just a bit more sensitive on this score than other scientists. At any event, perhaps the above-cited cases will suggest that some astronomers have seen unidentified flying objects.

METEOROLOGISTS AND WEATHER OBSERVERS LOOK AT THE SKIES FREQUENTLY. WHY DON'T THEY SEE UFOS?

1. ***Case 26. Richmond, Va., April 1947***

To begin an answer to that rhetorical question, we might consider an observation made by a weather observer at the Richmond, Va., U.S. Weather Bureau station, about two months before the first national publicity concerning UFOs. Walter A. Minczewski, whom I located at the same Weather Bureau office where he made the sighting in 1947, was making a pilot balloon observation, when he spotted a silvery object that entered the field of his theodolite (which was trained on the balloon he had released). In the account that Minczewski sent me, he stated that "the bottom was flat and the top was slightly dome-shaped": and when he tried to see it with naked eye, he could not spot it. (Typical pilot balloon theodolites have magnifications of about 20 to 25. and angular fields that are usually about a degree across.) It was a "clear bright morning" when he spotted the object, and it lay to his NNE at an elevation of about 45 degrees. Whether Minczewski really saw the upper surface or formed his mental impressions without realizing that the theodolite may have inverted the image is now unclear, and my questioning did not settle that point.

Discussion. -- A report of this sighting is in the official files, a circumstance which greatly surprised Minczewski, since he had discussed it only with his fellow workers. In the ensuing two decades, he has never again seen anything like it. Clearly, the probability of an object crossing the small angular field of a meteorological theodolite is quite low, if only chance were

involved here. He tried to track it but lost it, due to its high angular velocity, after about five or six seconds, he recalled. No obvious conventional explanation suggests itself for this early sighting.

2. ***Case 27. Yuma, Ariz., February 4, 1953***

Weather Bureau observer S. H. Brown was tracking a pilot balloon at 6000 ft over Yuma at 1:50 p.m. MST on 2/4/53 when first one and then a second unidentified object moved across his theodolite field, somewhat as in the preceding case. I obtained an account of this sighting from V. B. Gotten, Meteorologis in-Charge at the Yuma station. The full account is too long for recapitulation here. Both objects appeared to be of the order of a minute of arc in diameter

and appeared "almost round, a solid dull pure white color, with a thin white mist completely edging each object." The first object moved into the optical field and curved upwards to the west, with the theodolite oriented to about 53 degrees elevation, 107 degrees azimuth. About 20 seconds later, a second object entered the field and moved in and out of the field erratically two times, to rejoin the first object. Brown was able to track the pair thereafter, as they jointly changed both azimuth and elevation. Because he had a stopwatch at hand for the balloon observation (which he did not complete because of following the unknown objects), he was able to determine that he followed the pair of objects for five minutes (1350 to 1355), until he lost sight of them against a cirrus cloud deck to the SSW. At the termination of the observation, his instrument was pointed to 29 degrees elevation, 204 degrees azimuth.

Discussion. -- This case is carried as Unidentified in the official files (see Ref. 7 for official summary). At times these objects lay near the sun's position in the sky, which might suggest forward-angle scattering of sunlight by airborne particles. However, initially, the objects were detected at angular distance of about 40 degrees from the solar position, which would not yield appreciable low-angle scattering. Furthermore, if these were airborne scatterers, they would almost certainly be separated by random turbulence within as long a period as five minutes, yet the observer's report indicates that they maneuvered together within angular separations of the order of the roughly one-degree field of such theodolites. The fact that the second object did go out of the field only to return to the vicinity of the first object strains the airborne-particle hypothesis. Thus the official categorization of Unidentified seems reasonable here.

3. ***Case 28. Upington, Cape Province, December 7, 1954***

R. H. Kleyweg, Officer-in-Charge of the Upington Meteorological Station, had just released a balloon for upper-wind measurement and was shielding his eyes from the sun trying to spot the balloon to get his theodolite on it. Seeing an object east of the sun, moving slowly to the west, he thought it was his balloon and got the theodolite on it, only to find that it was white, whereas he had released a red balloon. An account in the Natal Mercury, January 28, 1950, quoted Kleyweg as saying that it seemed "like a half-circle with the sun reflecting off the sloping top." He had no difficulty following it for about three minutes, but then it began to accelerate and, after another minute, he was unable to track fast enough to keep it in optical view (Ref. 10). Discussion. -- Kleyweg was quoted in the cited press source as saying, "I have followed thousands of meteorological balloons. This object was no balloon. " A South African student doing graduate work in my Department, Petrus DuToit, has confirmed this sighting, having had an account of it directly from Kleyweg. An accelerating airborne half-circular object with sloping top seems best categorized as an unidentified flying object.

4. ***Case 29. Arrey, New Mexico, April 24, 1949***

Charles B. Moore, Jr., was with four enlisted Navy personnel making a pilot balloon observation preparatory to release of a Skyhook balloon at the White Sands Proving Ground in the middle of the morning of 4/24/49. The balloon was airborne and was under observation by one of the men when Moore became aware that a white object which he took to be the balloon was in a part of the sky well away from where the theodolite operator had this instrument trained. As Moore has explained directly to me in discussing this famous case, he thought the operator had lost the balloon. Moore took over, swung the 25-power scope onto the "balloon" he had spotted, and found that it was in fact an ellipsoidal white object moving at a rapid angular velocity towards the NE. With stopwatch and recording forms at hand, it was possible for the team of five men to secure some semi-quantitative data on this sighting; Moore disengaged the vernier drives to track manually, and followed the object as it sped from the southwest into the northeast skies. At its closest approach, it was moving at about 5 degrees/sec. Just before Moore lost it in the distance to the northeast, its angular elevation began to increase, as if it were climbing, a quite significant point. The object had a horizontal length about two to three times greater than its vertical thickness. Moore never got a sufficiently clear view to identify any finer details if any were present. Another balloon was immediately released to check the slim possibility that a high-speed jet from SW to NE might have

carried some airborne object across the sky; but the winds were blowing more or less at right angles to the object's path to the 93,000 ft level, and were rather weak (Ref. 10). The angular diameter of the object was estimated at about a

minute of arc (which in the 25-power theodolite would appear to Moore as about three-fourths the apparent size of the moon).

Discussion. -- Moore's sighting is carried as Unidentified in official files. Menzel (Ref. 24)says of it:

"This incident, kept in the classified files for more than two years, presents no serious difficulty to the person who understands the optics of the earth's atmosphere. The air can, under special conditions, produce formations similar to lenses. And, just as a burning glass can project the sun into a point of light, so can these lenses of air -- imperfect though they are -- form an image. What Moore saw was an out of focus and badly astigmatic image of the balloon above"

It would be interesting to hear Menzel present a quantitative defense of that astonishing disposition of this interesting sighting. Here five witnesses, with aid of a tracking device giving better than rough angular-coordinate information on the movements of an unknown object, observe the object move through an arc of over 90 degrees that took it into a part of the sky about that same large angular distance from the real balloon's location, and Menzel adduces a "lens of air" to explain it away. Astronomers find atmospheric scintillation a very serious observational problem because stellar images are often erratically shifted by tens of *seconds* of arc from their mean position as a result of atmospheric turbulence effects. In the 5/24/49 Moore sighting, Menzel is proposing that the atmosphere carried a refracted image of the balloon northeastward at a steady rate of excursion that finally totaled several thousand times the magnitude of refractive angular image-displacements known to occur with bad seeing. I feel obliged to repeat an observation I have made before: If the transmission properties of the Earth's atmosphere were as anomalous as Menzel assumes in his handling of UFO observations, he and his colleagues would be out of business. The official categorization of Unidentified for the Moore sighting seems inescapable. It might be added that, over the years, there have been very many UFO observations of significant nature from the vicinity of White Sands Proving Ground, many involving instrumental tracking, many made by experienced observers. A long and impressive list of them could easily be compiled, yet all have been slowly lost from official cognizance by a process that is characteristically at the heart of response to the UFO problem.

5. ***Case 30. Admiralty Bay, Antarctica, March 16, 1961.***

This listing of UFO sightings by meteorologists could be extended very considerably by drawing on my file of such cases. To cite just one more that also indicates the global .scale of the UFO phenomena, a very unusual luminous unidentified aerial object seen by a meteorologist and others aboard the U.S.S. Glacier at about 6:15 p.m. on 3/16/61 in the Antarctic will be mentioned. I have quite recently received, through French UFO investigator Rene Fouere, a rather detailed summary of this sighting by Brazilian meteorologist Rubens J. Villela, whose earlier account I had seen but paid little attention to (Ref. 10). The point I had missed, prior to reading Villela'a detailed description of the circumstances of the sighting, was the very important feature of a low cloud overcast present at about 1500 ft above the sea. With three shipmates on the flying bridge, Villela suddenly saw

"a multicolored luminous object crossing the sky,"

an object which for a moment they took to be an unusual meteor.

"It was egg-shaped, colored mainly reddish at first, and traveled slowly from NE to SW at about 50 degrees above the horizon, on a straight horizontal trajectory. From its frontal part, several multicolored, perfectly straight 'rays' extended backwards, diverging outwards at an angle; the colors of these rays changed continually, predominantly green, red, and blue. Most striking of all, it left a long trail of orange color in the form of a perfectly straight tube which gave the distinct impression of being hollow, faintly comparable to a neon light,"

Villela stated in his summary.

"Then, suddenly the object divided in two. It was not an explosion, it was a controlled division in two equal parts, one behind the other, each egg-shaped as before and each radiating outwards its V-shaped lateral rays. Then the object shone

with a slightly stronger light, changing color to blue and white, and disappeared completely. That's it -- just disappeared, abruptly."

[[64]]

His account emphasizes that the boundaries of the object (s) were definite and sharp, not diffuse. Villela's account indicates that a total of six persons were above-decks and saw this striking phenomenon. It is to be emphasized that, in the estimated 10 seconds that this lasted, the object was moving below a cloud deck that lay only about 1500 feet above the sea, so that, for the reported elevation angle of about 50 degrees, the slant range from observers to object was perhaps of the order of 2000 ft. Villela had the subjective impression that the egg-shaped initial form was about as big as a small airplane.

Discussion. -- In a recent book aimed at showing that a majority of the most interesting UFOs are an atmospheric-electrical plasma related to ball lightning, Philip J. Klass (Ref. 39)) cites the preceding case as a good example of the port of observation which he feels he can encompass in his "plasma-UFO" hypothesis. To the extent that he treats only the breakup into two parts, he has some observational basis for trying to interpret this as something akin to ball lightning. But almost at that point the similarity ends as far as meteorologically recognized characteristics of ball lightning go. The highly structured nature of the object and its rays, its size, its horizontal trajectory, its presence in a foggy area with low stratiform clouds free of thunderstorm activity scarcely suggest anything like ball lightning. Nor does this account suggest any meteoric phenomenon at sub-cloud altitudes. I would regard this as just one more of a baffling array of inexplicable aerial phenomena which span so wide a range of characteristics that it is taxing to try to invent any single hypothesis to rationalize them all. The full spectrum of UFO phenomena will, I predict, come as a shock to every scientist who takes the necessary time to look into the wealth of reports accumulated in various archives over the past two decades and more. Official assertions to the effect that UFO reports in no way defy explanation in terms of present scientific and technological knowledge are, in my opinion, entirely unjustified. The Villela sighting seems a case in point. And meteorologists do see UFOs, as the foregoing cases should suggest.

DON'T WEATHER BALLOONS AND RESEARCH BALLOONS ACCOUNT FOR MANY UFOS?

Probably the most categorical statement ever made attributing UFO observations to balloons appeared in a Look magazine article by Richard Wilson in February 1051, entitled, "A Nuclear Physicist Exposes Flying Saucers." Dr. Urner Liddel. then affiliated with the Navy cosmic ray research program using the large Skyhook balloons, was quoted as saying, "There is not a single reliable report of an observation (of a UFO) which is not attributable to the cosmic balloons." When one considers the large number of UFO reports already on record by 1951 in which reliable airlines pilots, military personnel, and other credible witnesses have observed unidentified objects wholly unlike a high-altitude, slowly drifting pear-shaped Skyhook balloon, that assertion appears very curious. Nevertheless, that many persons have misidentified Skyhook balloons and even the smaller weather balloons used in routine meteorological practice is unquestioned. A Skyhook seen against the twilight sky with back-illumination yields a strangely luminous, hovering object which many observers, especially if equipped with binoculars, were unprepared to identify correctly in the 1946-51 period when Skyhook operations were tied up with still-classified programs. To this extent, Liddel's point is reasonable; but his sweeping assertion fails to fit the facts, then or now.

Actually, in official case-evaluations, one finds Skyhook balloons invoked relatively infrequently compared with "weather balloons," But in many of the latter cases, the balloon hypothesis is strained beyond the breaking point. The official criterion used (Ref. 7, p. 185) is extremely loose:

"If an object is reported near a balloon launch site within an hour after the scheduled launch times, it is classed as a balloon."

with no specification of heights, shapes, distances, etc. Using such a criterion, it is easy to see why so many "balloon" explanations figure in the official summaries. There are even "balloon" UFOs whose speed, when inferred from the report, comes out supersonic! The tiny candles or flashlight bulbs hung on pilot balloons for night tracking have been repeatedly made the basis for explanations of what witnesses described as huge luminous objects at close range. Within only days of this writing, I have checked out such a case near Tucson where four adult witnesses saw, on July 2, 1968, a half-moon-shaped orange-red object hovering for several minutes at what they estimated to be a few hundred feet above terrain and perhaps a few miles away over open desert. They watched it tip once, right

[[65]]

itself, then accelerate and rise over a mountain range and pass off into the distance in some ten seconds. Because a weather balloon had been released earlier (actually about an hour and forty-five minutes earlier) from the Tucson airport Weather Bureau station, the official explanation, published in the local press, was that the witnesses had seen a "weather balloon". A pilot balloon of the small type (30-gram) used in this instance rises at about 600 ft/min, the tiny light on it becomes invisible to the naked eye beyond about 10,000 ft slant-range, and the upper-level winds weren't even blowing toward the site in question. Also the angular size estimated for the observed reddish half-moon was about twice the lunar diameter, and some said about four times larger. A pilot balloon light would have to be within about 20-30 feet to appear this large. Yet such a case will enter the files (if even transmitted to higher echelons) as a "balloon", swelling the population of curious balloon-evaluations in official files.

1. ***Case 31. Ft. Monmouth, N.J., September 10, 1951***

It is clear from Ruppelt's discussions (Ref. 5) that a series of radar and visual sightings near Ft. Monmouth on 9/10/51 and the next day were of critical importance in affecting official handling of the UFO problem in the ensuing two-year period. Many details from the official file on these sightings are now available for scientific scrutiny (Ref. 7). Here, a sighting by two military airmen flying in a T-33 near Ft. Monmouth will be selected from that series of events because the sighting was eventually tagged as a weather balloon. As with any really significant UFO case, it would require far more space than can be used here to spell out adequately all relevant details, so a very truncated account must be employed. While flying at 20,000 ft from a Delaware to a Long Island airbase, the two men in the T-33 spotted an object "round and silver in color" which at one stage of the attempted intercept appeared flat. The T-33 was put into a descending turn to try to close on the object but the latter turned tightly (the airmen stated) and passed rapidly eastward towards the coast of New Jersey and out to sea. A pair of weather balloons (probably radiosonde balloons but no information thereon given in the files) had been released from the Evans Signal Laboratory near Ft. Monmouth, and the official evaluation indicates that this is what the airmen saw.

However, it is stated that the balloons were released at 1112 EDST, and the sighting began at about 1130 EDST with the T-33 over Point Pleasant, N.J. In that elapsed time, a radiosonde balloon, inflated to rise at the 800-900 ft/min rate used for such devices, would have attained an altitude of about 17-18,000 ft, the analysis notes. From this point on, the official analysis seems to be built on erroneous inferences. The airmen said that, as they tried to turn on the object, it appeared to execute a 120-degree turn over Freehold, N.J., before speeding out over the Atlantic. But from the upper winds for that day, it is clear that the Ft. Monmouth balloon trajectory would have taken it to the northeast, and by 1130, it would have been about over the coast in the vicinity of Sea Bright. Hence, at no time in the interval involved could the line of sight from T-33 to balloon have intersected Freehold, which lies about 15 miles WSW of the balloon release-point. Instead, had the airmen somehow seen the radiosonde balloon from Pt. Pleasant, it would have lain to about their N or NNE and would have stayed in about that sector until they passed it. Furthermore, the size of the balloon poses a serious difficulty for the official analysis. Assuming that it had expanded to a diameter of about 15 feet as it ascended to about the 18,000-ft level, it would have subtended an arc of only 0.6 min, as seen from the T-33 when the latter passed over Pt. Pleasant. This angular size is, for an unaided eye, much too small to fit the airmen's descriptions of what they tried to intercept. In a press interview (Ref. 40), the pilot, Wilbert S. Rogers of Columbia, Pa., said the object was "perfectly round and flat" and that the center of the disc was raised "about six feet" and that it appeared to be moving at an airspeed of the order of 900 mph. The entire reasoning on which the balloon evaluation is elaborated fails to fit readily established points in the official case-summary.

Discussion. -- The possibility that a pilot can be misled by depth-perception errors and coordinate-reference errors to misconstrue a weather balloon as a fast-maneuvering object must always be kept in mind. But in the Ft. Monmouth instance, as in many others that could be discussed in detail, there is a very large gap between the balloon hypothesis and the facts. The basic sighting-report here is quite similar to many other daytime sightings by airborne observers who have seen unconventional disc-like objects pass near their aircraft.

2. ***Case 32. Odessa, Wash., December 10, 1952***

According to an official case-summary (Ref. 7, Rept 10), two airmen in an F94 "made visual and radar contact with a large, round white object larger than any known type of aircraft" near 1915 PST on 12/10/52 near Odessa. The radar operator in the F-94 had airborne radar contact with the object for 15 minutes, and during that same interval, ground radar was also tracking it. The summary states that "the object appeared to be level with the intercepting F-94 at 26,000 to 27,000 ft," and it is pointed out that "a dim reddish-white light came from the object as it hovered, reversed direction almost

instantaneously and then disappeared." It is stated that the skies were clear above 3000 ft The official evaluation of this incident is "Possible Balloon", although the report notes that no upper-air research balloon was known to be in the area on this date. The principal basis for calling it a balloon was the observers' description of "large, round and white and extremely large", and it was remarked that the instrument package on some balloon flights is capable of yielding a radar return.

Discussion. -- To conclude that this was a "Possible Balloon" just on the basis of the description, "large, round and white and extremely large", and thereby to ignore the instantaneous course reversal and the inability of a 600-mph jet to close with it over a period of 15 minutes seems unreasonable. We may ignore questions of wind speeds at the altitude of the object and the F-94 because both would enjoy the same "tail-wind effect". In 15 minutes, the F-94 would be capable of moving 150 miles relative to any balloon at its altitude. On the other hand, airborne radar sets of that period would scarcely detect a target of cross-section represented by the kinds of instrument packages hung on balloons of the Skyhook type, unless the aircraft were within something like 10 or 15 miles of it Yet it is stated that the F-94 was pursuing it under radar contact for a time interval corresponding to an airpath ten times that distance. Clearly, categorizing this unknown as a "balloon" was incompatible with the reported details of the case.

On the other hand, there seems no reason to take seriously Menzel's evaluation of this Odessa F-94 sighting (Ref. 25, p. 62). Menzel evidently had the full file on this case, for he adds a few details beyond those in Ref. 7, details similar to those in Ruppelt's account of the case (Ref. 5) :

"Dim reddish-white lights seemed to be coming from windows and no trail or exhaust was visible. The pilot attempted to intercept but the object performed amazing feats, did a chandelle in front of the plane, rushed away, stopped, and then made straight for the aircraft on a collision course at incredible speed."

He indicates that after the pilot banked to avoid collision he could not again locate it visually, although another brief radar contact was obtained. Having recounted those and other sighting details, Menzel then offers his interpretations:

"In the east, Sirius was just rising over the horizon at the exact bearing of the unknown object. Atmospheric refraction would have produced exactly the phenomenon described. The same atmospheric conditions that caused the mirage of the star would have caused anomalous radar returns."

Now stars just above the viewer's horizon do scintillate and do undergo turbulent image-displacement, but one must consider quantitative matters. A refractive excursion of a stellar image through even a few minutes of arc would be an extremely large excursion. To suggest that a pilot would report that Sirius did a chandelle is both to forget realities of astronomy and to do injustice to the pilot. In fact, however, Menzel seems to have done his computations incorrectly, for it is easily ascertained that Sirius was not even in the Washington skies at 7:15 p.m. PST on 12/10/52. It lay at about 10 degrees below the eastern horizon. A further quite unreasonable element of Menzel's explanation of the Odessa case is his easy assertion that the radar returns were anomalous results of the "atmospheric conditions". Aircraft flying at altitudes of 26,000 ft do not get ground returns on level flight as a result of propagation anomalies. These extreme forcings of explanations recur throughout Menzel's writings; one of their common denominators is lack of attention to relevant quantitative factors.

3. ***Case 33. Rosalia, Wash.. February 6, 1953***

Another official case-summary of interest here is cited by Menzel (Ref. 25, p. 46). Keyhoe (Ref. 4), who studied the case-file on it much earlier, gives similar information, though in less detail. A B-36, bound for Spokane was over Rosalia, Wash., at 1:13 a.m. when, as Menzel describes it,

*"the pilot *** sighted a round white light below him, circling and rising at a speed estimated at 150 to 200 knots as it proceeded on a southeast course."*

Menzel states that the B-36

"made a sharp descending turn toward the light, which was in view for a period of three to five minutes."

The light was blinking, and Keyhoe mentions that the blink-interval was estimated at about 2 seconds.

Menzel concurs in the official evaluation of this as a "weather balloon", noting that a pilot balloon had been released at Fairchild AFB at 1:00 a.m., and remarking that the

"winds aloft at altitudes of 7,000 to 10,000 ft. were from the northwest with a speed of about fifty knots."

He says that

"computations showed that the existing winds would have carried the balloon to the southeast, and it would have been over Rosalia, which is 12.5 nautical miles southeast of Fairchild, in about fifteen minutes."

In fact, Rosalia lies 33 statute miles SSE of Fairchild, or about twice as far as Menzel indicates. The net drift of the balloon cannot be deduced simply from the winds in the 7-10,000-ft. layer; and, in fact, an examination of the upper-wind data for that area on February 6 indicates that the winds at lower levels were blowing out of the southwest. The trajectory of the balloon would have taken it initially east-northeast, then east, and finally curving back to the southeast as it got up to near the 10,000-ft. levels. By that time, it would have been already east of Spokane, nowhere near Rosalia.

The small light (candle or flashlight bulb) used on night pibal runs is almost invisible to the naked eye beyond a few miles' distance. (A 1-candle source at 3,000 ft. is equivalent to a star of about the first magnitude. At 6 miles, then, one finds that the same source equals the luminosity of a sixth-magnitude star, the limit of human vision under the most favorable conditions. For a pilot, looking out of a cockpit with slight inside glare to spot a 1-candle source against a dark background would require that the source be only a few miles away.) At some 30 miles, the B-36 pilot could not have seen the small light on a balloon east of Spokane.

Menzel states that

"the balloon carried white running lights which accounted for the blinking described, and the circling climb of the UFO is typical of a balloon's course"

Neither inference is supportable. The light used on pilot balloons is a steady source; only if one were right above it, with its random swing causing intermittent occultation, would one ever perceive blinking. But then, flying at B-36 speeds, the pilot would have swept over the sector of perceptible occultation in only a matter of seconds. Yet here the pilot watched it for a reported 3-5 minutes. Furthermore, "circling climb" cannot be called "typical of a balloon's course." The balloon trajectory is controlled by the ambient wind shears and only with unusually strong directional shears would a pilot flying a straight course perceive a pilot balloon to be "circling."

In all, there appear to be so many serious difficulties with the balloon explanation for the Rosalia sighting that it is not possible to accept Menzel's statement:

"Thus all the evidence supports ATIC's conclusion that the UFO was a weather balloon."

4. ***Case 34. Boston, Mass., June 1, 1954***

At 0930 EDST, a Paris-New York TWA Constellation was passing near Boston when the cockpit crew spotted "a large, white-colored disc-like object" overhead (Ref. 41). Capt. Charles J. Kratovil, copilot W. R. Davis, and flight engineer Harold Raney all watched it for a total time of 10 minutes as they flew on their own southwestward course to New York. They would occasionally lose it behind overlying clouds. Knowing that they were flying into headwinds, they concluded that it could not be any kind of balloon, so they radioed the Boston airport control tower, which informed him that jets were scrambled and saw the object, but could not close with it.

After landing in New York, Capt. Kratovil was informed that official spokesmen had attributed the sighting to a "weather balloon" released from Grenier AFB, in New Hampshire.

Discussion. -- I am still in the process of trying to locate Kratovil to confirm sighting details; but the fact that four newspaper accounts for that day give the same information about the major points probably justifies acceptance of those points. From upper-wind data for that area and time, I have confirmed the presence of fairly strong flow from the WSW aloft, whence Kratovil's press comment, "If this was a weather balloon, it's the first time I ever saw one traveling against the wind," seems reasonable. The cruising speed of a Constellation is around 300 mph, so during the reported 10 minutes' duration of the crew's sighting, they moved about 50 miles relative to the air, so it would have been impossible for them to have kept a weather balloon in sight for this long. Furthermore, it was about 1.5 hours after scheduled balloon-release time, so that even a small balloon would have either burst or passed to altitudes too high to be visible. Finally, with flow out of the southwest sector from surface to above 20,000 ft., any balloon from Grenier AFB would have been carried along a trajectory nowhere near where the TWA crew spotted the "large, white-colored, disc-like object" overhead.

5. In my files are many other "balloon" cases from the past twenty years, cases that ought never have been so labeled, had the evaluators kept relevant quantitative points in mind. To ignore most of the salient features of a sighting in order to advance an easy "balloon" explanation is only one more of many different ways in which some very puzzling UFO observations have been shoved out of sight.

WHY AREN'T UFO'S EVER TRACKED BY RADAR?

The skeptic who asks this question, and many do, is asking a very reasonable question. With so much radar equipment deployed all over the world, and especially within the United States, it seems sensible to expect that, if there are any airborne devices maneuvering in our airspace, they ought to show up on radars once in a while. They do indeed, and have been doing so for all of the two decades that radar has been in widespread use. Here, as with so many other general misconceptions about the true state of the UFO problem, we encounter disturbingly large amounts of misinformation. As with other categories of UFO misinformation, the only adequate corrective is detailed discussion of large numbers of individual cases. Only space limitations preclude discussion of dozens of striking radar-tracking incidents involving UFOs, both here and abroad; they do exist.

1. ***Case 35. Fukuoka, Japan, October 15,1948.***

A very early radar-UFO case, still held as an official Unidentified, involved an attempted interception of the unknown object by an F-61 flying near Fukuoka, Japan, at about 11:00 p.m. local time on 10/15/48. The official file on this incident is lengthy (Ref. 42) ; only the highlights can be recounted here. The F-61 (with pilot and radar operator) made six attempts to close with the unknown, from which a radar return was repeatedly obtained with the airborne radar. Each time the radarman would get a contact and the F-61 pilot tried to close, the unknown would accelerate and pass out of range. Although the radar return seemed comparable to that of a conventional aircraft,

"the radar observer estimated that on three of the sightings, the object traveled seven miles in approximately twenty seconds, giving a speed of approximately 1200 mph"

In another passage, the official case-file remarks that

"when the F61 approached within 12,000 feet, the target executed a 180° turn and dived under the F-61"

adding that

"the F-61 attempted to dive with the target but was unable to keep pace"

The report mentions that the unknown

"could go almost straight up or down out of radar elevation limits"

and asserts further that

"this aircraft seemed to be cognizant of the whereabouts of the F-61 at all times ..."

The F-61 airmen, 1st Lt. Oliver Hemphill (pilot) and 2d Lt. Barton Halter (radarman) are described in the report as being

"of excellent character and intelligence and are trained observers."

Hemphill, drawing on his combat experience in the European theater, said that

"the only aircraft I can compare our targets to is the German ME-163."

[[69]]

The airmen felt obliged to consider the possibility that their six attempted intercepts involved more than one unknown. Hemphill mentions that, in the first attempted intercept,

"the target put on a tremendous "burst of speed and dived so fast that we were unable to stay with it."

After this head-on intercept, Hemphill did a chandelle back to his original 6000-ft altitude and tried a stern interception,

"but the aircraft immediately outdistanced us. The third target was spotted visually by myself,"

Hemphill's signed statement in the case-file continues.

"I had an excellent silhouette of the target thrown against a very reflective undercast by a full moon. I realized at this time that it did not look like any type aircraft! was familiar with, so I immediately contacted my Ground Control Station ..."

which informed him there were no other known aircraft in the area. Hemphill's statement adds further that,

"The fourth target passed directly over my ship from stern to "bow at a speed of roughly twice that of my aircraft, 200 mph. I caught just a fleeting glance of the aircraft; just enough to know he had passed on. The fifth and sixth targets were attempted radar interceptions, but their high rate of speed put them immediately out of our range"

(Note the non-committal terminology that treats each intercept target as if it might have been a separate object.) A sketch of what the object looked like when seen in silhouette against the moonlit cloud deck is contained in the file. It was estimated to be about the size of a fighter aircraft, but had neither discernible wings nor tail structures. It was somewhat bullet-shaped, tapered towards the rear, but with a square-cut aft end. It seemed to have "a dark or dull finish".

Discussion. -- Ground radar stations never detected the unknown that was seen visually and contacted by airborne radar. The report indicates that this may have been due to effects of "ground, clutter", though the F-61 was seen intermittently on the ground units. The airmen stated that no exhaust flames or trail were seen from this object with its "stubby, clean lines". The total duration of the six attempted intercepts is given as 10 minutes. We deal here with one of many cases wherein radar detection of an unconventional object was supported by visual observation. That this is carried as Unidentified cannot surprise one; what is surprising is that so many other comparable instances are on record, yet have been ignored as indicators of some scientifically intriguing problem demanding intensive study.

2. ***Case 36. Nowra, Australia, September, 1954***

The first UFO case to command general press attention in the Australian area seems to have been a combined radar-visual sighting wherein the pilot of a Hawker Seafury from Nowra Naval Air Station visually observed two unknown objects near him as he flew from Canberra to Nowra (Ref. 43). Press descriptions revealed only that the pilot said "the two strange aircraft resembling flying saucers" were capable of speeds much beyond his Seafury fighter. He saw them flying nearby and contacted Nowra radar to ask if they had him on their scope; they informed him that they had three separate returns, at which juncture he described the unidentified objects. Under instructions from the Nowra radar operator, he executed certain maneuvers to identify himself on the scope. This confirmed the scope-identity of his aircraft vs. the unknowns. As he executed the test maneuvers, the two unknowns moved away and disappeared. No explanation of this incident was offered by Naval authorities after it was widely reported in Australian and New Zealand papers about three months after it occurred.

Discussion. -- It is mildly amusing that the press accounts indicated that

"the pilot, fearing that he might be ragged in the wardroom on his return if he abruptly reported flying saucers, called Nowra by radio and asked whether the radar screen showed his aircraft."

Only after getting word of three, not one, radar blips in his locality did he radio the information on the unknowns, whose configuration was not publicly released. This is in good accord with my own direct experience in interviewing Australian UFO witnesses in 1967; they are no more willing than Americans to be ridiculed for seeing something that is not supposed to exist.

3. ***Case 37. Capetown South Africa, May 23, 1953***

In November 1958, the South African Air Force released a brief announcement concerning radar-tracking of six successive passes of one or more unknown high-speed

objects over the Cape. On January 1, 1967, in a transoceanic shortwave broadcast from South Africa, the authenticity of this report was confirmed, though no additional data beyond what had been cited earlier were presented. In the six passes, the target's altitude varied between 5,000 and 15,000 ft, and its closest approach varied between 7 and 10 miles. Speeds were estimated at over 1200 mph, well beyond those of any aircraft operating in that area at that time.

Discussion. -- This report, on which the available information is slim, is cited to indicate that not only visual sightings but also radar sightings of seemingly unconventional objects appear to comprise a global phenomenon. By and large, foreign radar sightings are not readily accessible, and not easily cross-checked. Zigel (Ref. 88) briefly mentions a Russian incident in which both airborne and ground-based radar tracked an unidentified in the vicinity of Odessa, on April 4, 1966, the ground-based height-finding radar indicating altitudes of well over 100,000 ft. Such reports, without accessory information, are not readily evaluated, of course.

4. ***Case 38. Washington, D.C., July 19, 1952***

By far the most famous single radar-visual sighting on record is the one which occurred late in the evening of July 19, and early on July 20, 1962, in the vicinity of Washington, D.C. (Refs. 2, 4, 5, 10, 24, 25). A curiously similar incident occurred just one week later. The official explanation centered around atmospheric effects on radar and light-propagation. Just before midnight on July 19/20, CAA radar showed a number of unidentified targets which varied in speed (up to about 800 mph) in a manner inconsistent with conventional aircraft A number of experienced CAA radarmen observed these returns, and, at one juncture, compatible returns were being received not only at the ARTC radar but also on the ARS radar in a separate location at Washington National Airport, and on still a third radar at Andrews AFB. Concurrently, both ground and airborne observers saw unidentifiable lights in locations matching those of the blips on the ground radar.

Discussion. -- I have interviewed five of the CAA personnel involved in this case and four of the commercial airline pilots involved, I have checked the radiosonde data against well-known radar propagation relations, and I have studied the CAA report subsequently published on this event Only an extremely lengthy discussion would suffice to present the serious objections to the official explanation that this complex sighting was a result of anomalous radar propagation and refractive anomalies of the mirage type. The refractive index gradient, even after making allowance for instrument lag, was far too low for "ducting" or "trapping" to occur; and, still more significant, the angular elevations of the visually observed unknowns lay far too high for radar-dueling under even the most extreme conditions that have ever been observed in the atmosphere. Some of the pilots, directed by ground radar to look for any airborne objects, saw them at altitudes well above their own flight altitudes, and these objects were maneuvering in wholly unconventional manner. One crew saw one of the unknown luminous objects shoot straight up, and simultaneously the object's return disappeared from the ARTC scope being watched by the CAA radar operators. The official suggestion that the same weak (1.7° C) low-level "inversion" that was blamed for the radar ducting could produce miraging effects was quantitatively absurd, even if one overlooks the airline-pilot sightings and deals only with the reported ground-visual sightings. From the CAA radar operators I interviewed, as well as from the pilots I talked to about this case, I got the impression that the propagation-anomaly hypothesis struck them as quite out of the question, then and now. In fact, CAA senior controller Harry G. Barnes, who told me that the scope returns from the unknowns.

"were not diffuse, shapeless blobs such as one gets from ground returns under anomalous propagation"

but were strong, bright pips, said that

"anomalous propagation never entered our heads as an explanation."

Howard S. Conklin, who, like Barnes, is still with FAA, was in the control tower that night, operating an entirely independent radar (short-range ARS radar). He told me that what impressed him about the sighting that night was that they were in radio communication with airlines crewmen who saw unidentified lights in the air in the same area as unknowns were showing up on his tower radar, while simultaneously he and Joseph Zacko were viewing the lights themselves from the tower at the D.C. Airport James M. Ritchey, who was at the ARTC radar with

Barnes and others, confirmed the important point that simultaneous radar fixes and pilot-sightings occurred several times that night He shared Barnes' views that the experienced radar controllers on duty that night were not being fooled by ground returns in that July 19 incident. Among the airlines crewmen with whom I spoke about this event was S. C. Pierman, then flying for Capitol Airlines. He was one of the pilots directed by ground radar to search in a specific area for airborne objects. He observed high speed lights moving above his aircraft in directions and locations matching what the CAA radar personnel were describing to him by radio, as seen on their radars. Other airline personnel have given me similar corroborating statements. I am afraid it is difficult to accept the official explanations for the famous Washington National Airport sightings.

5. ***Case 39. Port Huron, Mich., July 29, 1952***

Many of the radar cases for which sighting details are accessible date back to 1953 and preceding years. After 1953, official policies were changed, and it is not easy to secure good information on subsequent cases in most instances. A radar case in which both ground-radar and airborne-radar contact were involved occurred at about 9:40 p.m. CST on 7/29/52 (Refs. 4, 5, 7, 10, 25). From the official case summary (Ref. 7) one finds that the unknown was first detected by GGI radar at an Aircraft Control and Warning station in Michigan, and one of three F-94s doing intercept exercises nearby was vectored over towards it. It was initially coming in out of the north (Ref. 5, 25), at a speed put at over 600 mph. As the F-94 was observed on the GCI scope to approach the unknown, the latter suddenly executed a 180° turn, and headed back north. The F-94 was by then up to 21,000 ft., and the pilot spotted a brilliant multicolored light just as his radarman got a contact. The F-94 followed on a pursuit course for 20 minutes (Ref. 7) but could never close with the unknown as its continued on its northbound course. At the time of first radar lockon, the F-94 was 20 miles west of Pt. Huron, Mich. The GCI scope revealed the unknown to be changing speed erratically, and at one stage it was moving at a speed of over 14000 mph, according to Menzel (Ref. 25), who evidently drew his information from the official files. Ruppelt (Ref. 5) states that when the jet began to run low on fuel and turned back to its .base, GGI observed the unknown blip slow down, and shortly after it was lost from the GGI scope.

Discussion. -- This case is still carried as an official unknown. The case summary (Ref. 7) speculates briefly on whether it could have been

"a series of coincident weather phenomena affecting the radar equipment and sightings of Capella, tut this is stretching probabilities too far."

Menzel, however, asserts that the pilot did see Capella, and that the airborne and ground radar returns

"were merely phantom returns caused by weather conditions"

No suggestion is offered as to how any given meteorological condition could jointly throw off radar at the ground and radar at 21,000 feet, no suggestion is offered to account for 180° course-reversal exhibited by the blip on the GCI scope just as the F-94 came near the unknown, no suggestion of how propagation anomalies could yield the impression of a blip moving systematically northward for 20 minutes (a distance of almost 100 miles, judging from reported F-94 speeds), with the F-94 return following along behind it. With such ad hoc explanations, one could explain away almost any kind of sighting, regardless of its content. I have examined the radiosonde sounding for stations near the site and time of this incident, and see nothing in them that would support Menzels interpretations. I have queried experienced military pilots and radar personnel, and none have heard of anything like "ground returns" from atmospheric conditions with aircraft radar operated in the middle troposphere. If Menzel is not considering ground-returns, in the several cases of this type which he explains

away with a few remarks about "phantom radar returns", then it is not clear what else he might be thinking of. One does have to have some solid target to get a radar return resembling that of an aircraft. Refractive anomalies of the "angel" type have very low radar cross-section and would not mislead experienced operators into confusing them with aircraft echoes.

6. Many other cases might be cited where UFOs have appeared on radar under conditions where no acceptable conventional explanation exists. Ref. 7 has a number of them. Hall (Ref. 10) lias about 60 instances in which both radar and visual sightings were involved. A December 19, 1964 case at Patuxent River NAS is one that I have checked on. It involved three successive passes of

an unknown moving at speeds estimated at about 7000 mph. It is an interesting case, one that came to light for somewhat curious reasons. A low overcast precluded any visual sightings from control tower personnel, so this is not a radar-visual case. I found no conventional explanation to account for it.

It has to be stressed that there are many ways in which false returns can be seen on radarscopes, resulting not only from ducting of ground returns but also from interference from other nearby radars, from internal electronic signals within the radar set, from angels and insects (weak returns), etc. Hence each case has to be examined independently. After studying a number of official evaluations of radar UFO cases, I get the impression that there would probably be more radar Unknowns if there were less tendency to quickly explain them away by qualitative arguments that overlook pertinent quantitative matters. Even at that, there are too many conceded unknowns in official files to be ignored.

A famous case in UFO annals involved a B-29 over the Gulf of Mexico, where several unknowns were tracked on the airborne scopes and were seen simultaneously by crewmen, moving under the aircraft as they passed by (Refs. 4, 10, 25). This one is still carried as Unidentified in official files. Still another famous combined radar-visual case, which Hynek has termed "one of the most puzzling cases I have studied," occurred between Rapid City and Bismarck on August 5, 1953. It involved both ground and airborne radar and ground and airborne visual sightings, but is far too long and complex to recapitulate here.

Perhaps the above suffices to indicate that UFOs are at times seen on radar and have been so seen for many years. The question of why we don't hear a great deal about such sightings, especially with newer and more elaborate surveillance radars, is a reasonable question. Some of the answers to that one are posed by the statement of Dr. Robert M. L. Baker, Jr., in these proceedings. Other parts of the answer must be omitted here.

WHY AREN'T THERE NUMEROUS PHOTOS OF UFO'S IF THEY REALLY EXIST?

Here is a question for which I regard available answers as still unsatisfactory. I concede that it does seem reasonable to expect that there should, over the past 20 years, be substantially more good photos than are known to exist. Although I do not regard that puzzle as satisfactorily answered, neither do I think that it can be safely concluded that the paucity of good photos disproves the reality of the UFOs. Many imponderables enter into consideration of this question.

1. *Some general considerations*

If one had reliable statistics on the fraction of the population that carried loaded cameras with them at any randomly selected moment (I would guess it would be only of the order of one per cent) and had figures bearing on the probability that a UFO witness would think of taking a photo before his observation terminated, then these might be combined with available information on numbers of sightings to attempt crude estimates of the expected number of UFO photos that should have accumulated in 20 years. Then one would need to weight the data for likelihood that any given photo would find its way to someone who would make it known in scientific circles, and then this figure might be compared with the very small number of photos that appear to stand the test of the exceedingly close scrutiny photos demand.

A general rule among serious UFO investigators with whom I have been in touch is that the UFO photo is no better than the photographer (Hall). Many hoax photos have been brought forth. A UFO photo can be sold; this attracts hoax and fraud to an extent not matched in anecdotal accounts. Many photos have been clearly established as fraudulent in nature; far larger numbers seem so suspicious on circumstantial grounds that no serious investigator gives them more than casual attention.

An interesting, even if very crude check on the likelihood of securing photos of UFOs from the general populace is afforded by fireball events. On April 25, 1966, a fireball, rated at about magnitude -10, arced northward across the northeastern U.S. From the total geographic area over which this fireball was visually detected, the population count is about 40 million persons. According to one account (Ref. 43), 200 visual accounts were turned in, and I infer that only 6 photos were submitted. The fireball was visible for a relatively long time as meteors go, about 80 seconds, and was, of course, at a great altitude (25 to 110 km). That 6 photos were submitted (at time of publication of the cited article)

[[73]]

from a potential population of sighters of 40 million might seem to argue that perhaps we really cannot expect to get many photos of UFOs. However, one of the principal reasons for citing the foregoing is to bring out the difficulties in drawing any firm conclusions. A phenomenon lasting 30 seconds scarcely permits the observer time to collect his wits and to swing into photographic action if he does have a loaded camera. UFO sightings have often extended over much longer than 30 seconds, by contrast, affording far better opportunity to think of snapping a photo. But, on the other hand, sighting a UFO in daytime at close range, judging from my own witness-interviewing experience, is a far more disconcerting and astonishing matter than viewing a brilliant meteor. Thus one can go back and forth, with so little assurance of meaningfulness of any of the relevant weight factors that the end result is not satisfactory. I simply do not know what to think about the paucity of good UFO photos, though I do feel uncomfortable about it.

2. ***Case 40. Corning, Calif., July 4, 1967***

A case that may shed at least a bit of light on the paucity of photos involves a multiple-witness sighting near dawn at Corning, Calif., on 7/4/67. I have interviewed four witnesses who sighted the object from two separate locations involving lines of sight at roughly right angles, serving to confirm the location of the object as almost directly over Highway 5 just west of Corning. Jay Munger, proprietor of an all-night bowling alley, was having coffee with two police officers, Frank Rakes and James Overton, when he spotted the object through the front window of his place. All three rushed out to the parking lot to observe what they described as a large flattened sphere or possibly football-shaped object, with a brilliant light shining upward from the top and a dimmer light shining down from the underside. The dawn light was such that the object was visible by reflected light even though the object's beams were discernible. It appeared at first to be hovering almost motionless at a few hundred feet above ground, and all three felt it lay about over Hwy. 5 (which estimate proved correct from sightings made on the highway by the independent witnesses). Their estimates of size varied from a diameter of maybe 50 feet to about 100 ft. It was silent, and the three men all emphasized to me that the quiet morning would have permitted hearing any kind of conventional aircraft engines. All three said they had never before seen anything like it. Munger decided to phone his wife to have her see the thing, and by the time he came back out from phoning, the object had moved southward along the highway by about a quarter of a mile or so. At about that juncture, it began to accelerate, and moved off almost horizontally, passing out of sight to the south in an additional time estimated at about 10-20 seconds.

This case is relevant to the photo question since Officer Overton was on duty and had in his patrol car both binoculars and a loaded camera. When I asked him why he didn't try to get a picture of the object, he admitted that he was so astonished by the object that he never even thought of dashing for the camera. I asked Munger to go through the motions that would yield a time estimate of the period he was inside phoning, to get a rough notion of how long Overton, along with Rakes, looked at it without thinking of the camera. The time was thus estimated by Munger as about a minute and a half, possibly two minutes.

Discussion. -- It may be hazardous to try to draw any conclusions from such a case, but I do think it suggests the uncertainty we face in trying to assess the likelihood of any given witness getting a photo of a UFO he happens to see. A colleague of mine at the University of Arizona was out photographing desert flowers on a day when a most unusual meteorological event occurred nearby - a tornado funnel came down from a cloud. Despite having the loaded camera at hand, despite having just been taking other pictures, and despite the great rarity of Arizona tornadoes, that colleague conceded that it wasn't till much later that the thought of getting a photo rose to consciousness, by which time the funnel was long since dissipated.

In the Trinidad, Colo. case of March 23, 1966 (Case 14 above), Mrs. Frank R. Hoch pointed out to me that she had loaded still and movie cameras inside the house, yet never thought about getting a photo. Again, the reason cited was the fascination with the objects being viewed. I think this "factor of astonishment" would have to be allowed for in any attempt to estimate expected numbers of photos, but I would be quite unsure of just how to evaluate the factor quantitatively.

[[74]]

3. ***Case 41. Edwards AFB, May 3, 1957***

Occasionally, one could argue, UFOs ought to come into areas where there were persons engaged in photographic work, who were trained to react a bit faster, and who would secure some photos. One such instance evidently occurred at Edwards AFB on the morning of 5/3/57. I have managed to locate and interview three persons who saw the resultant photos. The two who observed the UFO and obtained a number of photos of it were James D. Bittick and John R. Gettys, Jr, both of whom I have interviewed. They were at the time Askania cameramen on the test range, and spotted the domed-disc UFO just as they reached Askania #4 site at Edwards, a bit before 8:00 a.m. that day. They immediately got into communication with the range director, Frank E. Baker, whom I have also interviewed, and they asked if anyone else was manning an Askania that could be used to get triangulation shots. Since no other camera operators were on duty at other sites, Baker told them to fire manually, and they got a number of shots before the object moved off into the distance. Bittick estimated that the object lay about a mile away when they got the first shot, though when first seen he put it at no more than 500 yards off. He and Gettys both said it had a golden color, looked somewhat like an inverted plate with a dome on top, and had square holes or panels around the dome. Gettys thought that the holes were circular not square. It was moving away from them, seemed to glow with its own luminosity, and had a hazy, indistinct halo around its rim, both mentioned. The number of shots taken is uncertain; Gettys thought perhaps 30. The object was lost from sight by the time it moved out to about five miles or so, and they did not .see it again. They drove into the base and processed the film immediately. All three of the men I interviewed emphasized that the shots taken at the closer range were very sharp, except for the hazy rim. They said the dome and the markings or openings showed in the photos. The photos were shortly taken by Base military authorities and were never seen again by the men. In a session later that day, Bittick and Carson were informed that they had seen a weather balloon distorted by the desert atmospheric effects, an interpretation that neither of them accepted since, as they stated to me, they saw weather ballons being released frequently there and knew what balloons looked like. Accounts got into local newspapers, as well as on wire services (Ref. 44). An Edwards spokesman was quoted in the *Los Angeles Times* as saying, "This desert air does crazy things," An INS wire-story said, "intelligence officers at Edwards ... would say almost nothing of the incident."

Discussion. -- I have not seen the photos alleged to have been taken in this incident, I have only interviewed the two who say they took them and a third person who states that he inspected the prints in company with the two Askania operators and darkroom personnel. I sent all of the relevant information on this case to the University of Colorado UFO project, but no checks were made as a result of that, unless done very recently. It would be rather interesting to see the prints.

4. Photographic sky-survey cameras might be expected to get photos of UFOs from time to time. However, one finds that, in many sky-photography programs in astronomy, tracks that do not obviously conform to what is being sought, say meteor-tracks, are typically ignored as probable aircraft. Indeed, a very general pattern in all kinds of monitoring programs operates to bias the system against seeing anything but what it was built to see. Nunn-Baker satellite cameras are only operated when specific satellites are computed to be due overhead, and then the long axis of the field is aligned with the computed trajectory. Anything that crosses the field and leaves a record on the film with an orientation markedly different from the predicted trajectory is typically disregarded. Photographic, radar, and visual observing programs have a large degree of selectivity intentionally built into them in order not to be deluged with unwanted "signals". Hence one must be rather carefnl in suggesting that our many tracking systems surely ought to detect UFOs. There's much evidence to suggest that, if they did, the signal would be ignored as part of a systematic rejection of unwanted data. Even in the practices of the GOC (Ground Observer Corps), some units received instructions to report nothing but unidentified aircraft. (But, for examples of some UFOs that did get into the GOC net, see Hall, Ref. 10.)

Although I am aware of a few photos allegedly showing UFOs, for which I have no reason at present to doubt the authenticity (for example a series of snapshots taken by a brother and sister near Melbourne, Australia, showing a somewhat indistinct disc in various positions), I must emphasize that the total

sample is tiny. Compared with that, I have seen dozens of alleged UFO photos which I regard as of dubious origin. Other UFO photos of which I am aware are still in process of being checked in one way or another. To summarize, I do have the impression that we ought to have more valid UFO photos than the small number of which I am aware.

IF UFO'S ARE REAL, SHOULDN'T THEY PRODUCE SOME REAL PHYSICAL EFFECTS?

Again, the answer is that they do. There are rather well-authenticated cases spanning a wide variety of "physical effects." Car-stopping cases are one important class. UFOs have repeatedly been associated with ignition failures and light-failures

of cars and trucks which came near UFOs or near which the UFOs moved. I would estimate that one could assemble a list of four or five dozen such instances from various parts of the world. Interference with radios and TV receptions have been reported many times in connection with UFO sightings. There are instances where UFOs have been reported as landing, and after departure, holes in the ground, or depressions in sod, or disturbed vegetation patterns have been described. In many such instance's, the evident reliability of the witnesses is high, the likelihood of hoax or artifice small. A limited number of instances of residues left behind are on record, but these are not backed up by meaningful laboratory analyses, unfortunately.

A physical effect that does *not* typically occur under conditions where the description of events might seem to call for it, relates to sonic booms. Although there are on record a few cases where fast-moving UFOs were accompanied by explosive sounds that might be associated with sonic booms, there are far more instances in which the reported velocity corresponded to supersonic speeds, yet no booms were reported. A small fraction of these can be rationalized by noting that the reporting witnesses were located back within the "Mach cone" of the departing UFO; but this will not suffice to explain away the difficulty. One feels that if UFOs are solid objects, capable of leaving depressions in soil or railroad ties when they land, and if they can dash out of sight in a few seconds (as has been repeatedly asserted by credible witnesses), they should produce sonic booms. This remains inexplicable; one can only lamely speculate that perhaps there are ways of eliminating sonic booms that we have not yet discovered; perhaps the answer involves some entirely different consideration.

If we include among "physical effects" those that border on the physiological, then there appear to be many odd types. Repeatedly, tingling and numbness have been described by witnesses who were close to UFOs; in many instances outright paralysis of a UFO witness has occurred. These effects might, of course, be purely psychological, engendered by fear; but in some instances the witnesses seem to have noted these effects as the first indication that anything unusual was occurring. A number of instances of skin-reddening, skin-warming, and a few instances of burns of very unusual nature are on record. These physiological effects are sufficiently diverse that caution is required in attempting generalization. Curiously, a peculiar tingling and paralysis seem to be reported more widely than any other physiological effects. A person who is almost unaware of the ramifications of the UFO evidence may think it absurd to assert that people have been paralyzed in proximity to UFOs; the skeptic might find it inconceivable that such cases would go unnoticed in press and medical literature. Far from it, I regret to have to say, on the basis of my own investigations. I have encountered cases where severe bodily damage was done, or where evident hazard of damage was involved, yet the witness and his family found ridicule mounting so much faster than sympathy that it was regarded wiser to quietly forget the whole thing. At an early stage of my investigations I would have regarded that as quite unbelievable; UFO investigators with longer experience than mine will smile at that statement, but probably they will smile with a degree of understanding. I could cite specific illustrations to make all this much clearer, but will omit them for space-limitations, except for a few remarks in the next section.

IS THERE ANY EVIDENCE OF HAZARD OR HOSTILITY IN THE UFO PHENOMENA?

Official statements have emphasized, for the past two decades, that there is no evidence of hostility in the UFO phenomena. To a large degree, this same conclusion seems indicated in the body of evidence gathered by independent investigators. The related question as to potential hazard is perhaps less clear. There are on record a number of cases (I would say something like a few dozen cases) wherein persons whose reliability does not seem to come into serious

question have reported mild, or in a very few instances, substantial injury as the result of some action of an unidentified object. However, I know of only two cases for which I have done adequate personal investigation, in which I would feel obliged to describe the actions as "hostile". That number is so tiny compared with the total number of good UFO reports of which I have knowledge that I would not cite "hostility" as a general characteristic of UFO phenomena.

One may accidentally kick an anthill, killing many ants and destroying the ants' entrance, without any prior "hostility" towards the ants. To walk accidentally into a whirling airplane propeller is fatal, yet the aircraft held no "hostility" to the unfortunate victim. In the UFO phenomena, we seem to confront a very large range of unexplained, unconventional phenomena and if among them we discern occasional instances of hazard, it would be premature to adjudge hostility. Yet, as long as we remain so abysmally ignorant of over-all nature of the UFO problem, it seems prudent to make all such judgments tentative. If UFOs are of extraterrestrial origin, we shall need to know far more than we now know before sound conclusions can be reached as to hazard-and-hostility matters. For-this reason alone, I believe it to be urgently important to accelerate serious studies of UFOs.

In the remainder of this section, I shall briefly cite a number of types of cases that bear on questions of hazard:

1. ***Car-stopping cases***

In a two-hour period near midnight, November 2-3, 1957, nine different vehicles all exhibited ignition failures, and many suffered headlight failures as objects described as about 100-200 ft long, glowing with a general reddish or bluish glow, were encountered on roads in the vicinity of the small community of Levelland, Tex. (Ref. 10, 13, 14). This series of incidents became national headline news until officially explained in terms of ball lightning and wet ignitions. However, on checking weather data, I found that there were no thunderstorms anywhere close to Levelland that night, and there was no rain capable of wetting ignitions. Although I have not located any of the drivers involved, I have interviewed Sheriff Weir Clem of Levelland and a Levelland newspaperman, both of whom investigated the incidents that night. They confirmed the complete absence of rain or lightning activity. The incidents cannot be regarded as explained.

This class of UFO effect is by no means rare. In France in the 1954 wave of UFO sightings, Michel (14) has described many such cases involving ignition-failure in motorbikes, cars, etc. Similar instances were encountered in my checks on Australian UFO cases. There are probably of the order of a hundred cases on record (see Ref. 10 for a list of some dozens). In only a very few cases has there been any permanent damage to the vehicle's electrical system. In the Levelland case, for example, as soon as the luminous object receded from a given disturbed vehicle, its lights came back on automatically (in instances where the switches had been left on), and the engines were immediately restartable. The latter point in itself makes the "wet ignition" explanation unreasonable, of course.

It is unclear how such effects might be produced. One suggestion that has been made as to ignition-failure is that very strong magnetic fields might so saturate the iron core of the coil that it would drive the operating point up onto the knee of the magnetization curve, so that the input magnetic oscillations would produce only very small output effects. Only a few oersteds would have to be produced right at the coil to accomplish this kind of effect, but when one back-calculates, allowing for shielding effects and typical distances, and assumes an inverse-third-power dipole field, the requisite H-values within a few feet of the "UFO dipole" end, to speak here somewhat loosely, come out in the megagauss range. Curiously, a number of other back-calculations of magnetic fields end up in this same range; but obviously terrestrial technologies would not easily yield such intensities. Clear evidence for residual magnetization that might be expected in the foregoing hypothesis does not exist, so far as I know. The actual mechanism may be quite unlike that mentioned.

How lights are extinguished is even less clear, although, in some vehicles, relays in the lighting circuits might be magnetically closed. The lights pose more mystery than the ignition. Such cases do not constitute very disturbing questions of hazard or hostility. One might argue that highway accidents could be caused by lighting and ignition failures; however, more serious highway-accident dangers are implicit in other UFO cases where no electrical disturbance was caused. Many motorists have reported nearly losing control of vehicles when UFOs have swooped down over them; this hazard is distinctly more evident

than hazard from the car-stopping phenomenon. Indeed, the number of instances of what we might term "car-buzzing" instances that have involved road-accident hazards is large enough to be mildly disturbing, yet I know of no official recognition of this facet of the UFO problem either. An incident I learned of in Australia involved such fright on the part of the passengers of the "buzzed"' vehicle that they jumped out of the car before it had come to a stop, and it went into a ditch. A similar instance occurred not long ago in the U.S. For reasons of space-limitations, I shall not cite other such cases, though it would not be difficult to assemble a list that would run to perhaps a few dozen.

2. ***Mild radiation exposure***

By "radiation" here, I do not mean exposure to radioactivity or to other nuclear radiations, but skin irritations comparable to sunburn, etc. I have interviewed a number of persons who have experienced skin-reddening from exposure to (visible) radiations near UFOs. Rene Gilham, of Merom. Indiana, watched a UFO hovering over his home-area on the evening of Nov. 6. 1957, and received mild skin-burns, for example. I found in speaking with him that the symptoms were gone in a matter of days, with no after-effects. The witnesses in a car-stopping incident at Loch Raven Dam, Md., on the night of Oct. 26, 1958, who were close to a brightly luminous, blimp-sized object after getting out of their stopped car, experienced skin-reddening for which they obtained medical attention. Without citing other such instances, I would say that these cases are not suggestive of any serious hazard, but they warrant scientific attention.

3. ***More serious physical injuries***

James Flynn, of Ft. Myers. Fla., in a case that has been rather well checked by both APRO and NICAP investigators, reportedly suffered unusual injuries and physical effects when he sought to check what he had taken to be a malfunctioning test vehicle from Cape Canaveral that had come down in the Everglades, Mar 15, 1965. I have spoken with Flynn and others who know him and believe that his case deserved much more than the superficial official attention it received when he reported it to proper authorities. He was hospitalized for about a week, treated for a deep hemorrhage of one eye (without medical evidence of any blow), and suffered loss of all of the principal deep-tendon reflexes for a number of days, according to his physician's statement, published by APRO (Ref. 45).

An instance of more than mere skin-reddening, associated with direct contact with a landed unidentified object, reportedly occurred in Hamilton, Ontario, March 29, 1966. Charles Cozens, then age 13, stated to police and to reporters (and recounted to me in a telephone interview with him and his father) that he had seen two rather small whitish, luminous objects come down in an open field in Hamilton that evening. He moved towards them out of curiosity, and states that he finally moved right up beside them, and touched the surface of one of them to see what it felt like. It was not hot, and seemed unusually smooth. One of the two small (8 ft by 4 ft plan form, 3-4 feet high) bun-shaped objects had a projection on one end that the boy thought might have been some kind of antenna, so he touched it. only to have his hand flung back as a spark shot out from the end of the projection into the air. He ran, thinking first to go to a nearby police substation. But on looking over his shoulder after getting to the edge of the field and seeing no objects there, he decided the police might not believe him and ran to his home. His parents, after discussing the incident at some length with the frightened boy, notified police, which is how the incident became public knowledge. Two others in Hamilton saw that night seemingly similar objects, but airborne rather than on the ground. Cozens was treated for a burn or sear on the hand that had been in contact with the projection at the moment the spark was emitted. On questioning both the boy and his father, I was left with the impression that, despite the unusual nature of the report, it was described with both straightforwardness and concern and that it must be given serious consideration. Clearly one would prefer a number of adult witnesses to an individual boy; yet I believe the case will stand close scrutiny.

There are a few other such reports of moderate injury reportedly sustained in direct physical contact with landed aerial objects for which I do not set feel satisfied with the available degree of authentication. It would be very desirable to conduct far more thorough investigations of some foreign cases of this type, to check the weight of the evidence involved. That only a very small number of such cases is on record should be emphasized.

4. ***Rare instances suggesting overt hostility***

In my own investigative experience, I know of only two cases of injuries suffered under what might be describable as overt hostility, and for which present evidence argues authenticity. There are other reports on record that might be construed as overt hostility, but I cannot vouch for them in terms of my own personal investigations.

In Beallsville, Ohio, on the evening of March 19, 1968, a boy suffered moderate skin burns in an incident of puzzling nature. Gregory Wells had just stepped out of his grandmother's house to walk a few tens of yards to his parents' trailer when his grandmother and mother heard his screams, ran out and found him rolling on the ground, his jacket burning. After being treated at a nearby hospital, he described to parents, sheriff's deputies, and others what he had seen. Hovering over some trees across the highway from his location, he had seen an oval-shaped object with some lights on it. From a central area of the bottom, a tube-like a endage emerged, rotated around, and emitted a flash that coincided with ignition of his jacket. He had just turned away from it and so the burn was on the back of his upper arm. In the course of checking this case, I interviewed a number of persons in the Beallsville area, some of whom had seen a long cylindrical object moving at very low altitude in the vicinity of the Wells' property that night. There is much more detail than can be recapitulated here. My conversations with persons who know the boy, including his teacher, suggest no reason to discount the story, despite its unusual content.

After checking the Beallsville incident, I checked another report in which burn-injuries of a more serious nature were sustained in a context even more strongly indicative of overt hostility. I prefer not to give names and explicit citation of details here, but I remark that there appears to me, on the basis of my present information and five interviews with persons involved, to be basis for accepting the incident as real. Partly because of its unparalleled nature, and partly because some of the evidence is still conflicting, I shall omit details and state only that the case, taken together with other scattered reports of injuries in UFO encounters, warrants no panic response but does warrant far more thorough investigation than any that has been conducted to date.

5. ***UFOs and other electromagnetic disturbances***

There are so many instances in which close-passage of an unidentifled flying object led to radio and television disturbance that this particular mode of electromagnetic effect of UFOs seems incontrovertible. One would require nothing mor than broad-spectrum electromagnetic noise to account for these instances, of course.

There is a much smaller number of instances, some of which I have checked. in which power has failed only within an individual home coincident with nearby passage of a UFO. Magnetic saturation of the core of a transformer might conceivably account for this phenomenon.

Then there are scattered instances in which substantial power distribution systems have failed at or very near the time of observation of aerial phenomena similar, broadly speaking, to one or another UFO phenomenon. I have personally checked on several such instances and am satisfied that the coincidence of UFO observation and power outage did at least occur. Whether there is a casual connection here, and in which direction it may run, remains quite uncertain. Even during the large Northeast blackout, November 9, 1965, there were many UFO observations, several of which I have personally checked. I have inquired at the Federal Power Commission to secure data that might illuminate the basic question of whether these are merely fortuitous, but the data available are inadequate to permit any definite conclusions. In other parts of the world, there have also been reports of system outages coincident with UFO sightings. Again, the evidence is quite unclear as to casual relations.

There is perhaps enough evidence pointing towards strong magnetic fields around at least some UFOs that one might hypothesize a mechanism whereby a UFO might inadvertently trigger a power outage. Perhaps a UFO, with an accompanying strong magnetic field, might pass at high speed across the conductors of a transmission line, induce asymmetric current surges of high transient intensity, and thereby trip circuit breakers and similar surge-protectors in such a way as to initiate the outage. There are some difficulties with that hypothesis, of course; but it could conceivably bear some relation to what has reportedly occurred in some instances.

I believe that the evidence is uncertain enough that one can only urge that competent scientists and engineers armed both with substantial information on UFO phenomena and with relevant information on power-system electrical engineering, ought to be taking a very close look at this problem. I am unaware of any adequate study of this potentially important problem. Note that a problem, a hazard, could exist in this context without anything warranting the label of hostility.

MISAPPLICATIONS OF ATMOSPHERIC PHYSICS IN PAST UFO EXPLANATIONS

1. ***General comments***

Since the bulk of UFO reports involve objects reportedly seen in the air, it is not surprising that many attempts to account for them have invoked principles of atmospheric physics. Over the past twenty years, many of the official explanations of important UFO sightings have been based on the premise that observers were misidentifying or misinterpreting natural atmospheric phenomena. Dr. D. H. Menzel, former director of Harvard Observatory, in two books on UFOs (Ref. 24, 25), has leaned very heavily on atmospheric physics and particularly meteorological optics in attempting to account for UFO reports. More recently, Mr. Philip J. Klass, Senior Avionics Editor of *Aviation Week,* has written a book (Ref.36) purporting to show that most of the really interesting UFO reports are a result of unusual atmospheric plasmas similar to ball lightning. Over the years, many others have made similar suggestions that the final explanation of the UFOs will involve some still not fully understood phenomenon of atmospheric physics.

As a scientist primarily concerned with the field of atmospheric physics, these suggestions have received a great deal of my attention. It is true that a very small fraction of all of the raw reports involve misidentified atmospheric phenomena. It is also true that many lay observers seriously misconstrue astronomical (especially meteoric) phenomena as UFOs. But, in my opinion, as has been emphasized above and will be elaborated below, we cannot explain-away UFOs on either meteorological or astronomical grounds. To make this point somewhat clearer, I shall, in the following, remark on certain past attempts to base UFO explanations on meteorological optics, atmospheric electricity, and radar propagation anomalies.

2. ***Meteorological optical explanation***

Mirages, sundogs, undersuns, and various reflection and refraction phenomena associated with ice crystals, inversions, haze layers, and clouds have been invoked from time to time in an attempt to account for UFO observations. From my study of the past history of the UFO problem and from an examination of recent "re-evaluations" of official UFO explanations, I have the strong impression that many alterations of explanations for classic UFO cases that have been made in the official files in the last few years reflect the response to the writings of Menzel (especially Ref. 25). I have elsewhere (Ref. 2) discussed a number of specific examples of what I regard as unreasonable applications of meteorological optics in Menzel's writings. Some salient points will be summarized here.

A principal difficulty with Menzel's mirage explanations is that he typically overlooks completely stringent quantitative restrictions on the angle of elevation of the observer's line of sight in mirage effects. Mirage phenomena are quite common on the Arizona desert, but both observation and optical theory are in good accord in showing that mirage effects are confined to lines of sight that do not depart from the horizontal by much more than a few tens of minutes of arc. Under some extremely unusual temperature conditions in the atmosphere (high latitude regions, for example), one may get miraging at elevation angles larger than a degree, but these situations are extremely rare, it must be emphasized. In Menzel's explanations and in certain of the official explanations, however, mirages are invoked to account for UFOs when the observer's line of sight may depart from the horizontal by as much as five to ten degrees or even more. I emphasize that this is entirely unreasonable. If it were the case that all UFOs were reported essentially at the observer's horizon, then one would have to be extremely suspicious that we were dealing with some unusual refraction anomalies. However, as has been shown by many cases cited above and has been long known to serious investigators of UFO phenomena, no fixed correlation exists. Some of the most interesting UFOs have been seen at close range directly overhead, quite obviously ruling out mirage explanations. The 1947 sighting by Arnold near Mt. Rainier is explained officially and by Menzel as a mirage,

yet the objects which he saw (nine fluttering discs) changed angular elevation, moved across his view through an azimuthal range of about 90 degrees, and were seen by him during the period when he was climbing his own plane through an altitude interval that he estimates to be of the order of 500 to 1000 ft. Anyone familiar with mirage optics would find it utterly unreasonable to claim that such an observation was satisfactorily explained as a mirage. Similarly, as has been noted above, the 1948 sighting by Eastern Airlines pilots Chiles and Whitted, once explained by Menzel as a "mirage", involves quantitative and observational factors that are not even approximately similar to known mirage effects. There are some extremely rare and still not well-explained refractive anomalies in the atmosphere, such as those that have been discussed by Minnaert, but good UFO observations are so much more numerous than those types of rare anomalies that it is quite out of the question of explain the former by the latter.

Sundogs, or parhelia, are a quite well-understood phenomenon of meteorological optics. Retractions of the sun's rays on horizontally falling tabular ice crystals produce fuzzy, brownish-colored luminous spots at about 22 degrees to the left and right of the sun when suitable ice-crystal clouds are present. Rarer phenomena, produced by the moon rather than the sun, are termed paraselenae. Sundogs are relatively common, but it is probably true that many laymen are not really conscious of them as a distinct optical phenomenon. For this reason, it might seem sensible to suggest that some observers have been misled by thinking that sundogs were UFOs. However, anyone with the slightest knowledge of meteorological optics talking directly to such a witness would, within only a few moments of questioning, establish what was involved. Instead of dealing with anything like a sharp-edged "object", one would quickly find that the observer was describing a very vague spot of light which he saw to the left or right of the sun, probably very near the horizon. To blandly suggest, as Menzel has done, that Waldo Harris in the 10/2/61 sighting near Salt Lake City was fooled by a sundog is to ignore either all of the main features of the report or to ignore all of what is known about sundogs.

Undersuns, sub-suns, can be seen rather frequently when flying in jet aircraft at high altitudes. They are a reflection phenomenon produced by horizontally floating ice crystals, which reflect an image of the sun (or at night the moon) and can give surprisingly sharp solar images in still air where turbulence does not cause appreciable tilting of the ice crystals. Here again, it is probably true that many laymen may be sufficiently unaware of this optical phenomenon that they could be confused when they see one. But, as with sundogs, the stringent quantitative requirements on the location of this optical effect relative to the sun would permit any experienced investigator to quickly ascertain whether or not an undersun was involved in this specific sighting. The effect involves specular reflection of the sun's rays, whence the undersun is always seen at a negative angle of elevation in which the observer's line of sight to the undersun is just as far below the horizon as the sun momentarily lies above that same observer's horizon. Clearly, many of the UFO cases that have been cited in examples given above do not come anywhere near satisfying the angular requirements for an undersun. In my own experience, I have already come across two or three reports, out of thousands that I have examined, where I was led to suspect that the observer was fooled by an undersun.

"Reflections off clouds" have been referred to repeatedly in Menzel's writings, never with any quantitative discussion of precisely what he means. But the impression is clearly left that many observers have been and are continuing to be fooled by some kind of cloud-reflections. Aside from the above-described undersun, I am unaware of any "cloud-reflection phenomenon" that could produce anything remotely resembling a distinct object. Clouds of droplets or ice crystals do not provide a source of specular reflection (except in the case of horizontally-floating ice crystals observed from above with a bright luminary, such as sun or moon, in the distance, undersun). What Menzel could possibly have in mind when he talks loosely about such cloud reflections (and he does so in many different places in his books), I cannot imagine.

Inversions are invoked by Menzel, and in official evaluations, to account for certain UFO sightings. Inversions produced by radiational cooling or by atmospheric subsidence are relatively common meteorological phenomena. In some cases, quite sharp inversions with marked temperature differences in rather small vertical distances are known to occur. It is such inversion layers that are responsible for some of the most striking desert mirages of the looming type.

[[81]]

To experience a looming mirage, the observer's eye must be located in the atmospheric layer wherein the temperature anomalously increases with height (inversion layer), and the miraged target in the object-field must also lie in or near the inversion layer. Inversion layers are essentially horizontally, and the actually-encountered values of the inversion lapse rates are such that refraction anomalies are confined to very small departures from the horizontal, as noted above under remarks on mirages. All of these points are well-understood principles of meteorological optics. However, Menzel has attempted to account for such UFOs as Dr. Clyde Tombaugh saw overhead at Las Cruces in August 1949 in terms of "inversion" refraction or reflection effects. Since I have discussed the quantitative unreasonableness of this contention elsewhere, I will not here elaborate the point, except to say that if inversions were capable of producing the optical disturbances that Menzel has assumed, astronomers would long since have given up any attempt to study the stars by looking at them through our atmosphere. Other atmospheric-optical anomalies have been adduced by Menzel in his UFO discussions. He has repeatedly suggested that layers of haze or mist cause remarkable enlargement of the apparent images of stars and planets. By enlargement, he makes very clear that he means radial enlargements in all directions such that the eye sees not a vertical streak of the sort well-known to astronomers as resulting from near-horizon refraction effects, but rather a circular image of very large angular size. Menzel even describes a sighting that he himself made, over Arctic regions in an Air Force aircraft, in which the image of Sirius was enlarged to an angular size of over ten minutes of arc (one-third of lunar diameter). I have discussed that sighting with a number of astronomers, and not one is aware of anything that has ever been seen by any astronomer that approximates such an instance. In fact, it would require such a peculiar axially-symmetric distribution of refractive index, which miraculously followed the speeding aircraft along as it moved through the atmosphere, that it seems quite hopeless to explain what Menzel has reported seeing in terms of refraction effects.

Since Dr. Menzel's writings on UFO's have evidently had, in some quarters, a marked effect on attitudes towards UFOs, I regard that effect as deleterious. If I felt that we were dealing here with just a slight difference of opinion about rather controversial scientific matters on the edge of present knowledge. I would withhold strong comment. However, I wish to say for the record, that I reward the majority of Dr. Menzels purported meteorological-optical UFO explanations as simply scientifically incorrect. I could, but shall not here, enlarge upon similar critique of official explanations that have invoked such arguments.

3. ***Atmospheric electricity***

One phenomenon in the area of atmospheric electricity to which appeal has been made from the earliest years of investigations of the UFO phenomena is that of ball lightning. For example, a fairly extensive discussion of ball lightning was prepared by the U.S. Weather Bureau for inclusion in the 1949 Project Grudge report (Ref. 6). It was concluded in that report that ball lightning was most unlikely as an explanation for any of the cases which were considered in that report (about 250). Periodically, in succeeding years, one or another writer has come up with that same idea that maybe people who report UFOs are really seeing ball lightning. No one ever tried to pursue this idea very far, until P. J. Klass began writing on it. Although his ideas have received some attention in magazines, there is little enough scientific backup to his contentions that they are quite unlikely to have the same measure of effect that Menzel's previous writings have had. For that reason, I shall not here elaborate on my strong objections to Klass' arguments. I spelled them out in considerable detail in a talk presented last March at a UFO Symposium in Montreal held by the Canadian Aeronautics and Space Institute. Klass has ignored most of what is known about ball lightning and most of what is known about plasmas and also most of what is known about interesting UFOs in developing his curious thesis. It cannot be regarded as a scientifically significant contribution to illumination of the UFO problem.

4. ***Radar propagation anomalies***

In the past twenty years, there have been many instances in which unidentified objects have been tracked on radar, many of them with concurrent visual observations. Some examples have been cited above. It is always necessary to approach a radar unidentified with full knowledge of the numerous ways in which false returns can be produced on radar sets. The physics of "ducting"

[[82]]

or "trapping" is generally quite well understood. As with mirages, the allowed angle of elevation of the radar beam can only depart from zero by a few tens of minutes of arc for typically occurring inversions and humidity gradients. Ducting with beam angles in excess of a degree or so would require unheard of atmospheric temperature or humidity gradients. Care must be taken in interpreting that statement, since beam-angles have to be distinguished from angles of elevation of the beam axis. For the latter reason, a beam-axis elevation of, say, two degrees still involves emission of some radar energy at angles so low that some may be trapped, yielding "ground returns" despite the higher elevation of the axis. All such points are well described in an extensive literature of radar propagation physics.

In addition to trapping and ground return effects, spurious returns can come from insects, birds, and atmospheric refractive-index anomalies that generate radar echoes termed "angels". These are low-intensity returns that no experienced operator would be likely to confuse with the strong return from an aircraft or ther large metallic object.

Also, other peculiar radar effects such as interference with other nearby sets, forward scatter from weak tropospheric discontinuities (see work of Atlas and others), and odd secondary reflections from ground targets need to be kept in mind.

When one analyzes some of the famous radar-tracking cases in the UFO literature, none of these propagation anomalies seem typical as accounting for the more interesting cases. (Several examples have already been discussed. (cases 32, 35, 36, 37, 38, and 39).)

SUMMARY AND RECOMMENDATIONS

In summary, I wish to emphasize that my own study of the UFO problem has convinced me that we must rapidly escalate serious scientific attention to this extraordinarily intriguing puzzle.

I believe that the scientific community has been seriously misinformed for twenty years about the potential importance of UFOs. I do not wish here to elaborate on my own interpretation of the history behind that long period of misinformation; I only wish to urge the Committee on Science and Astronautics to take whatever steps are within their power to alter this situation without further delay.

The present Symposium is an excellent step in the latter direction. I strongly urge your Committee that further efforts in the same direction be made in the near future. I believe that extensive hearings before your Committee, as well as before other Congressional committees having concern with this problem, are needed.

The possibility that the Earth might be under surveillance by some high civilization in command of a technology far beyond ours must not be overlooked in weighing the UFO problem. I am one of those who lean strongly towards the extraterrestrial hypothesis. I arrived at that point by a process of elimination of other alternative hypotheses, not by arguments based on what I could call "irrefutable proof." I am convinced that the recurrent observations by reliable citizens here and abroad over the past twenty years cannot be brushed aside as nonsense, but rather need to be taken extremely seriously as evidence that some phenomenon is going on which we simply do not understand. Although there is no current basis for concluding that hostility and grave hazard lie behind the UFO phenomenology, we cannot be entirely sure of that. For all of these reasons, greatly expanded scientific and public attention to the UFO problem is urgently needed.

The proposal that serious attention be given to the hypothesis of an extraterrestrial origin of UFOs raises many intriguing questions, only a few of which can be discussed meaningfully. A very standard question of skepticism is "Why no contact?" Here, the best answer is merely a cautionary remark that one would certainly be unjustified in extrapolating all human motives and reasons to any other intelligent civilization. It is conceivable that an avoidance of premature contact would be one of the characteristic features of surveillance of a less advanced civilization; other conceivable rationales can be suggested. All are speculative, however; what is urgently needed is a far more vigorous scientific investigation of the

full spectrum of UFO phenomena, and the House Committee on Science and Astronautics could perform a very significant service by taking steps aimed in that direction.

Our next participant is Dr. Carl Sagan.

Dr. Sagan is associate professor of astronomy in the Department of Astronomy and Center for Radiophysics and Space Research in Cornell University, having just recently left Harvard University. He has written over 100 scientific papers, and several articles for Encyclopedia Britannica, Americana. He is coauthor of several books. Dr. Sagan, we are delighted you are participating with us in this symposium this morning and you may proceed.

STATEMENT BY DR. CARL SAGAN

1. Biography

2. Oral Statement

3. Article Read into the Record

4. Questions from Committee Members

(The biography of Dr. Sagan follows:)

DR. CARL SAGAN

Dr. Carl Sagan is Associate Professor of Astronomy in the Center for Radiophysics and Space Research at Cornell University, Ithaca, New York. He received his A.B. and B.S., an M.S. in Physics and his Ph.D. in Astronomy and Astrophysics, all from the University of Chicago. Since then he has held positions at the University of California, Berkeley; at Stanford University Medical School (as Assistant Professor of Genetics); and at Harvard University and the Smithsonian Astrophysical Observatory.

Dr. Sagan's major research interests are on the physics and chemistry of planetary atmospheres and surfaces, the origin of life on earth, and exobiology. He has played a leading role in establishing, for example, that the surface of Venus is very hot and that major elevation differences exist on Mars, and has been a principal exponent of the view that organic molecules are to be found on Jupiter.

Dr. Sagan has served on many advisory groups to the National Aeronautics and Space Administration and to the National Academy of Sciences, as well as such international organizations as COSPAR and the International Astronomical Union. He was a member of the Committee to review Project Blue Book for the Air Force Scientific Advisory Board.

A winner of the Smith Prize at Harvard in 1964 and Condon Lecturer in the State of Oregon in 1968, Dr. Sagan is shortly to assume additional duties as Editor of the planetary sciences journal, ICARUS. He has been active in educational innovations, regularly teaches in the South, and is a lecturer in the astronaut training program in Houston.

In addition to well over a hundred scientific papers, and several articles written or the Encyclopedias Britannica and Americana, Dr. Sagan is co-author of "The Atmospheres of Mars and Venus" (1961), "Planets" (1966), and "Intelligent Life in the Universe." (1966).

STATEMENT OF DR. CARL SAGAN, DEPARTMENT OF ASTRONOMY, CORNELL UNIVERSITY, ITHACA, N.Y.

Dr. Sagan. Thank you very much, Congressman Roush.

As I understand what the committee would like from me, is a discussion of the likelihood of intelligent extraterrestrial life, and since this estimate is to be made in this symposium, clearly it is the hypothesis that unidentified objects are of extraterrestrial origin which the committee must have in mind.

I'm delighted to tell about contemporary scientific thinking along these lines, but let me begin by saying that I do not think the evidence is at all persuasive, that UFO's are of intelligent extraterrestrial origin, nor do I think the evidence is convincing that no UFO's are of intelligent extraterrestrial origin.

I think as each of the preceding speakers has mentioned, but perhaps not sufficiently emphasized, that the question is very much an open one, and it is certainly too soon to harden attitudes and make any permanent contentions on the subject.

I find that the discussion, like elsewhere, is best evaluated if we consider the question of life on earth. I suppose that if you had all your prejudices removed and were concerned with the question of whether the earth was populated by life of any sort, how would you go about finding out?

If, for example, we were on some other planet, let's say Mars, and looking at the Earth, what would we see? Fortunately we now have meteorological satellite photographs of the earth at various resolutions, so we can answer the question. The first large slide.

This is a photograph of the earth. That is the full earth, which you are looking at which is primarily cloud cover. This is the Pacific Ocean. You can see southern California in the upper right, and, as advertised by the local chamber of commerce, you can see it is cloud free. [Laughter.]

Dr. Sagan. Now, it is clear that very little information about the earth, much less possibility of life on it, is obtained by a picture at this resolution.

The next large slide is a TIROS photograph of the earth at about 1-mile resolution, that is, things smaller than a mile cannot be seen, and very prolonged scrutiny of the entire eastern seaboard of the United States shows no sign of life, intelligent, or otherwise.

We have looked at several thousand photographs of the earth, and you may be interested to see that there is no sign of life, not only in New York or Washington, but also in Peking, Moscow, London, Paris, and so on.

The reason is that human beings have transformed the earth at this kind of scale very little, and therefore the artifacts of human intelligence are just not detectable photographically in the daytime with this sort of resolution.

The next slide shows one of the few successful finds of intelligent life on earth that we made; down toward the lower left you can see

[[86]]

a kind of grid, a kind of crisscross pattern, a rectangular area. This is a photograph taken near Cochran, Ontario, in Canada. What we are looking at are swaths cut by loggers through the forest. They cut many swaths in parallel, then another parallel sequence of swaths at right angles. Then the snow fell, heightening contrast, so that is the reason for the tic-tac-toe pattern. The sequence of straight lines there is anomalous. You would not expect it by geological processes. If you found that on another planet you would begin to expect there is life there. This is a photograph at about a tenth of a mile resolution, and is far better than the best photographs we have of Mars. The photographs we have of Mars are, of course, better than of any other planet. Therefore, to exclude intelligent life on another planet photographically is certainly premature. We could not exclude life on earth with this same sort of resolution.

However, there are other reasons why intelligent life on the other planets of this solar system are moderately unlikely.

To continue this sequence of photographs, I should say there are only about one in a thousand photographs where this resolution of the earth gives any sign of life.

The next photograph, however, shows a resolution about three times better. That is a Gemini capsule in the lower left-hand corner and we are looking at the vicinity of the Imperial Valley in California. You are just on the verge of resolving the contour patterns of fields, for agricultural purposes.

The next slide shows us an area between Sacramento and San Francisco, which has a very clear geometric pattern. It is quite obvious that this is the result of some intelligent activity on the earth.

You can see an airport, a railway, the monotonous pattern of housing developments in the upper right. You can see the patterns of contour fields. And this is such a highly geometrized picture, that it is clearly the result of some intelligence.

However, a photograph taken of this same area, only let's say 100,000 years ago, when there certainly was lots of life on earth, would show none of these features, because these are all the signs of our present technical civilization.

So even though the earth was full of life, and human beings were very much in evidence 100,000 years ago, none of this would be detectable by such photography. To detect individual organisms on earth, we have to have a photographic resolution about 10 times better than this, then we occasionally see things like these in the next slide. All those little dots casting shadows are cows in a field in California.

There are other ways of detecting intelligent life on the earth. From the vantage point of Mars, detecting, say, the lights of cities at night, is extremely marginal, and in fact the only way of doing it would be to point a small radio telescope at the earth, and then as the North American Continent turned toward Mars, there would be this blast of radio emission from domestic television transmission that prolonged scrutiny would indicate some sign of intelligent life on the earth.

In fact, it is radio communications which is the only reasonable method of communications over very large distances. It is a remarkable fact that the largest radio telescope on the earth at the present time, the Arecibo dish in Puerto Rico, is capable of communicating

with another dish, similarly outfitted if one existed at the incredible distance of 1,000 light years away, a light year being about 6.6 trillion miles, and the distance to the nearest star being a little over 4 light years.

Now, let me then go to the question of the cosmic perspective of where we are.

We are, of course, sitting on a planet, the third from the Sun, which is going around the Sun, which is a star-like, and the other stars visible on a clear night to the naked eye.

The first small slide will give an impression of what happens when you point a moderate telescope in the direction of the center of the Milky Way Galaxy.

This is a photograph of a star cloud. You are looking at tens of thousands of suns here. In fact, the number of suns in our galaxy is about 150,000 million.

They are collected into a disk-shaped pattern, shown in the next slide; the next slide will show a photograph of the nearest galaxy like our own. That fuzzy spiral thing in the middle is M-31, that is also known as the Great Galaxy Andromeda, and if that were a photograph of our galaxy, we would be situated extremely far out, in fact, a little far off the slide, very much in the galactic boon docks. The Sun is nowhere near the center of the galaxy. It is a very out-of-the-way rural location we happen to be in.

Now, in [the] collection of 150,000 million stars in the Milky Way Galaxy, our sun is just one, and there are at least billions of other galaxies, and the last slide, will show you what happens if you point a telescope away from the obscuring dust and stars in the galaxy. You then start seeing dozens of other galaxies, everyone of those funny-shaped spiral and irregular-shaped things there, and some of the spherical-shaped ones, are other galaxies, each of which are containing about 100 billion stars as well.

So it is clear that there are in the accessible universe, some hundreds of billions of billions of stars, all more or less like our own.

Now, if we want to assess the likelihood that there are intelligent civilizations somewhere in advance of our own, on planets of other stars in our own galaxy, we have to ask questions which cover a variety of scientific subjects, some of which are fairly well known, some of which are extremely poorly known. For a numerical assessment of whether there is likely intelligence in other parts of the galaxy in a form we do not have at present, let me indicate the kinds of things we know. It depends on the rate of star formation.

It depends on the likelihood that the given star has planets. It depends on the likelihood at least one of those planets is at a position from the essential star which is suitable for the origin of life. It depends on the likelihood that the origin of life actually occurs on that planet. It depends on the probability life once arisen on that planet will evolve to some intelligence. It depends on the likelihood that intelligence, once emerged, will develop a technical civilization. And it depends on the lifetime of the technical civilization, because technical civilization of a very short lifetime, will result in very few technical

civilizations being around at any given time. We know something about some of these. There is some reason to believe that planets are a reasonable

[[88]]

likely accompaniment of star formation, that the solar system in other words is a fairly common event in the galaxy and is not unique. There are laboratory experiments on the origin of life, in which the early conditions on earth have been duplicated in the laboratory. It turns out that at least the molecules fundamental to living systems, are produced relatively easy [sic], physics and chemistry apparently made in such a way that the origin of life may be a likely event.

Beyond that it is difficult to do laboratory experiments, because evolution takes billions of years, and scientists aren't that patient. Therefore, it is just a question of intelligent and knowledgeable estimates.

Here, some scientists believe that the evolution of intelligence and technical civilization is very likely. Others believe it is a very remarkable and unusual event and by the merest fluke did it happen here.

I don't think that this is the place to go into this very difficult question in any great detail. Let me merely say that much more important than these uncertainties is the question of the life of a technical civilization, judging from the events on the earth, one might say the likelihood of our civilization lasting only a few decades more, might be a fairly high probability, and if that is typical of other civilizations, then it is clear there aren't any other humans around.

On the other hand, if civilizations tend to have very long lifetimes, it may be there are large numbers of technical civilizations in the galaxy.

Now, one thing is clear, which is this: If there are other technical civilizations, any random one of them is likely to be vastly in advance of our own technical civilization. For example, we are only 10 or 15 years into having the technology of interstellar communication by radio astronomy. It is unlikely there is any other civilization in the galaxy that is that backward in their technical expertise.

Mr. Miller. Doctor, didn't Sir Bernard Lovell receive electrical pulses he can't explain?

Dr. Sagan. Yes, sir. There are now five objects in the heavens called pulsars, which are objects which are sending out radiation which is modulated with a frequency of about one per second; also there are sub-modulations. There are a variety of hypotheses to explain these things, some of which involve the oscillations of very old stars. There are certain difficulties with each hypothesis. The first suggestion made by the British at Cambridge, when they encountered this phenomenon was perhaps it was a beacon of some extraterrestrial civilization. That is not now their favored hypothesis. It is not clear that that is totally absurd, but in fact the scientific method to be used in that case is rather similar to the one to be used in this case. That is, it is a puzzling phenomenon. One therefore excludes all physical explanations that one possibly can before going to the much more hypothetical possibility of intelligence being involved.

So, that is the present state of work in that field. For data gathering to get better information, and the refinement of the purely physical hypothesis.

Well, I was saying that if there are other civilizations, many of them are likely to be far in advance of our own, and this, therefore, raises the question of how likely it is that they can traverse interstellar space and come from planets or some other star to here.

[[89]]

I should first emphasize that the distances between the stars are absolutely huge. Light, faster than which nothing can travel, takes 4½ years to get from here to the nearest star.

Mr Roush. Excuse me, isn't that a rather arbitrary statement?

Dr. Sagan. I don't think so. Perhaps you can tell me why you think it might be, then I can tell you why I think it isn't.

Mr. Roush. In my opening statement I referred to the new audacity of imagination John Dewey had spoken of. I'm thinking of imaginative terms, not factual terms.

Dr. Sagan. Let me say in a sentence, why most physicists believe no material object can travel faster than light. That takes us into questions of the theory of relativity, which has had previous encounters with congressional committees, and perhaps we don't want to go into that in very great detail.

But the essential point is, that in making a few, very few assumptions, one of which was, the one we are talking about, nothing goes faster, Einstein was able to then derive a whole body of predictions which are confirmed in vast detail. Therefore, if someone says that is not a good idea, that things can travel faster than light, then they have to come up with a physical theory which explains everything we know in a way that is consistent with the idea that you can travel faster than light. No one has succeeded in doing that. Many physicists have tried. Therefore, the present belief is that you can't. But that, of course, is a time-dependent statement. It may be that this isn't the ultimate truth.

In physics, as in much of all science, there are no permanent truths, There is a set of approximations, getting closer and closer, and people must always be ready to revise what has been in the past thought to be the absolute gospel truth. If I might say, to revise opinions, is one which is frequent in science, and less frequent in politics. [Laughter.]

Dr. Sagan. So, in the context of contemporary science, I'm obviously speaking in that context, one cannot travel faster than light.

So the distances between the stars are extremely large. Of course, any contemporary space vehicle would take a ridiculous amount of time to get from here to anywhere else, but we are not talking about contemporary space vehicles. The question, "Is there any conceivable method of traveling from one place to another very close to the speed of light, and therefore get reasonable transit times?" involves extrapolations of technology of a very difficult sort. However, let me merely say at least some people who have looked into the subject have concluded that it is not out of the question, even with contemporary principles of science, to imagine vehicles capable of traveling close to the speed of light, between the stars.

This doesn't mean that it happens. There may in fact be insuperable engineering difficulties we don't know about, but there is nothing in the physics that prohibits interstellar space flight.

So any estimate of how likely it is that we would be visited by an extraterrestrial intelligent civilization, depends not only on how many of them are there, but on what kind of transport they have, and how often they launch their space vehicles, even very optimistic estimates for all these numbers, gives a conclusion that an advance civilization comes here very rarely. But I again emphasize the great uncertainty in any of these numerical estimates, as they involve parts of science we don't know very much about.

So, to conclude what I understand is the main reason why this committee has asked me to testify, it is not beyond any question of doubt that we can be visited. There are great difficulties from our present point of view. They are not insuperable. And if Dr. McDonald, for example, were to present me with extremely convincing evidence of an advanced technology in a UFO, I could not say to him that is impossible, because I know you can't get from there to here, or I can't say to him that is impossible because I know there aren't any other guys up there.

On the other hand, I would of course demand very firm evidence before I would say, well, that seems to be a very likely hypothesis. So I would like to spend Just a few minutes to come more closely to the subject of this symposium.

First of all, I think it is clear to the committee, but this point should be emphasized very strongly, that there are very intense, predisposing, emotional factors in this subject.

There are individuals who very strongly want to believe that UFO's are of intelligent extraterrestrial origin. Essentially to my view, for religious motives; that is, things are so bad down here, maybe somebody from up there will come and save us from ourselves. This takes all sorts of subtle and not so subtle forms. There are also predisposing emotional factors in the other direction; people who very much want to believe UFO's are not of intelligent extraterrestrial origins, because that would be threatening to our conception of us as being the pinnacle of creation. We would find it very upsetting to discover that we are not, that we are just a sort of two-bit civilization.

It is clear that the scientific method says you don't take either of those views, and you simply keep an open mind and pursue whatever facts are at hand with as many diverse hypotheses as possible, and try to eliminate each suggested hypothesis, and see if you are lucky with any one.

I might mention that, on this symposium, there are no individuals who strongly disbelieve in the extraterrestrial origin of UFO's and therefore there is a certain view, not necessarily one I strongly agree with -- but there is a certain view this committee is not hearing today, along those lines.

Finally, let me say something about the question of priorities, which Congressman Rumsfeld asked us for, and the question of significance. Now, the possibility of discovering something about extraterrestrial life, life originated on some other planet, is of the very highest interest for biology and in fact for all science. A bona fide example of extraterrestrial life even in a very simple form, would revolutionize biology. It would have both practical and fundamental scientific benefits, which are very hard to assess, it would truly be immense.

Now, if the answer to this sort of profound scientific question lies right at hand, it would be folly to ignore it. If we are being visited by representatives of extraterrestrial life, just stick our heads in the sand, would be a very bad policy, I think.

On the other hand, to mount a major effort to investigate these things, I think requires some harder evidence than is now at hand.

It is clear that if such an effort were mounted, some information on atmospheric physics would be forthcoming. I think some information on psychology would certainly be forthcoming. I have the impression

that the capability of human populations to self-delusion, has not been accorded appropriate weight in these considerations. There is an interesting book published about a century ago by McKay called "Extraordinary Popular Delusions and the Madness of Crowds" which I commend to the committee. It goes into such things as alchemy, and witchcraft. After all, there have been centuries in which these things were considered to be as obviously true as anything, and yet we now know that this is really nonsense.

So the possibility of these sort of delusions having a kind of contemporary guise as UFO's should not be thrown out altogether. I do not think that explains most or all of the unidentified settings.

Since the funds are so painfully tragically short for science today, the priority question boils down to this: In the search for extraterrestrial life there is a high risk, high possibility, that is the one we are talking about today; namely, UFO's -- there is a high risk that they are not of extraterrestrial origin, but if they are, we are sure going to learn a lot.

Compared to that, there is a moderate risk, significant return possibility, and that is, looking for life even simple forms on nearby planets, and searching for intelligent radio communications by the techniques of radio astronomy. Here it is clear there will be significant paydirt of one sort or another for what I gather is a comparable sort of investment.

So if Congress is interested, and I'm not sure it is, I think it might very well ought to be, but if Congress is interested in a pursuit of the question of extraterrestrial life, I believe it would be much better advised to support the biology, the Mariner, and Voyager programs of NASA, and the radio astronomy programs of the National Science Foundation, than to pour very much money into this study of UFO's.

On the other hand, I think a moderate support of investigations of UFO's might very well have some scientific paydirt in it, but perhaps not the one that we are talking about today.

Mr. Chairman that concludes my statement except that I request that you include for the record a statement entitled "Unidentified Flying Objects" that I prepared for the Encyclopedia Americana.

UNIDENTIFIED FLYING OBJECTS*

(by Carl Sagan)

Unidentified flying objects (UFO*s) is the generic term for moving aerial or celestial phenomena, detected visually or by radar, whose nature is not immediately understood. Interest in these objects stems from speculation that some of them are the products of civilizations beyond the earth, and from the psychological insights into contemporary human problems that this interpretation, provides.

Observations. Unidentified flying objects have been described variously as rapidly moving or hovering; disc-shaped, cigar-shaped, or ball-shaped; moving silently or noisily; with a fiery exhaust, or with no exhaust whatever; accompanied by flashing lights, or uniformly glowing with a silvery cast. The diversity of the observations suggests that UFO's have no common origin and that the use of such terms as UFO's or "flying saucers" serves only to confuse the issue by grouping generically a variety of unrelated phenomena.

In the United States, popular interest in unidentified flying objects began on June 24, 1947, when a group of rapidly moving, glistening objects was observed

*In Encyclopedia Americana (New York: Grolier) and In Bull Atom. Sci, 23, (6), 43, 1967.

from the air in daytime, near Mount Rainier, Washington. The observer, a Seattle resident, dubbed them "flying saucers." The sighting received extensive publicity. Somewhat similar sightings have been reported ever since. The differences among these observations, however, are as striking as the observations themselves.

Investigations. Because of its national defense responsibility, the U.S. Air Force investigates reports of unidentified flying object over the United States. The number of sightings investigated in 1947-65 is shown in the following table.

Reported sightings of UFO's, 1947-65

Year	*Number*	*Year*	*Number*
1947	79	1957	1,178
1948	143	1958	473
1949	186	1959	364
1950	169	1960	557
1951	121	1961	591
1952	1,501	1962	474
1953	425	1963	399
1954	429	1964	572
1955	404	1965	886
1956	778		

Source: Tacker, Lawrence, J., Flying Saucers and the U.S. Air Force (Princeton, N.J. (1960), and Library of Congress, Facts About Unidentified Flying Objects (Washington 1966).

Evaluation of these reports is difficult. Observations frequently are sketchy, and different reports of the same phenomenon are often dissimilar, or even irreconcilable. Observers tend to exaggerate. Deliberate hoaxes, some involving double-exposure photography, have been perpetrated. After allowances are made for these factors, the accepted scientific procedure is to attempt an explanation of the observations in terms of phenomena independently observed and understood. Only if an observation is rigorously inexplicable in terms of known phenomena does the scientist introduces alternative hypotheses for which there is no other evidence. Such hypotheses must still be consistent with all other available scientific information.

The identity of most UFO's has been established as belonging to one of the following categories: unconventional aircraft; aircraft under uncommon weather conditions; aircraft with unusual external light patterns; meteorological and other high-altitude balloons; artificial earth satellites; flocks of birds; reflections of searchlights or headlights off clouds; reflection of sunlight from shiny surfaces; luminescent organisms (including one case of a firefly lodged between two adjacent panes of

glass in an airplane cockpit window); optical mirages and looming; lenticular cloud formations; ball lighting; sun dogs; meteors, including green fireballs; planets, especially Venus; bright stars; and the aurora borealis.

Radar detection of unidentified flying objects has also occurred occasionally. Many of these sightings have been explained as radar reflections from temperature inversion layers in the atmosphere and other sources of radar "angels."

Considering the difficulties involved in tracking down visual and radar sightings, it is remarkable that all but a few percent of the reported UFO's have been identified as naturally occurring -- if sometimes unusual phenomena. It is of some interest that the UFO's which are unidentified do not fall into one uniform category of motion, color, lighting, etc., but rather run through the same range of these variables as the identified UFO's. In October 1957, Sputnik I, the first earth-orbiting artificial satellite, was launched. Of 1,178 UFO sightings in that year, 701 occurred between October and December. The clear implication is that Sputnik and its attendant publicity were responsible for many UFO sightings.

Earlier, in July 1952, a set of visual and radar observations of unidentified flying objects over Washington, D.C., caused substantial public concern. Government concern was reflected in the creation in November of that year of a special panel to evaluate these reports. The panel was established by the Office of Scientific Intelligence of the Central Intelligence Agency, and was headed by the late Professor H. P. Robertson of the California Institute of Technology. The Robertson panel, after a thorough investigation of the UFO reports to that date, concluded that all were probably natural phenomena, wrongly interpreted.

The most reliable testimony is that of the professional astronomer. Professor Jesse L. Greenstein of Mount Wilson and Palomar Observatories (author of the

ASTRONOMY article on pages 90-95) has pointed out that a vehicle 100 feet (30.5 meters) in diameter, at an altitude of 50 miles (80.5 km), would leave a broad track on photographic plates of the sky taken with large telescopes. This track could be distinguished easily from those of ordinary astronomical objects such as stars, meteors, and comets. Nevertheless, it appears that such tracks or unambiguous visual observations of classical UFO's have never been made by professional astronomers.

For example, in the Harvard Meteor Project performed in New Mexico during the period 1954-56, extensive photographic observations were made by Super-Schmidt cameras, with a 60° field of view. In all, a surface area of about 3,000 square miles (7,700 sq km) was observed to a height of about 50 miles (80 km) for a total period of about 3,000 hours. Visual and photographic observations were made which could detect objects almost as faint as the faintest objects visible to the naked eye. These observations by professional astronomers were made in a locale and period characterized by extensive reports of unidentified flying objects. No unexplained objects were detected, despite the fact that rapidly moving objects were being sought in a study of meteors. Similar negative results have been obtained by large numbers of astronomers and help to explain the general skepticism of the astronomical community towards flying saucer reports.

A series of puzzling and well-published flying saucer sightings in the mid-1960's again led to the appointment of a government investigating panel, this time under the aegis of the Air Force Scientific Advisory Board. It is significant that this panel was convened not at the request of the operational or intelligence arms of the Air Force, but in response to a request by the Air Force public relations office. The panel, under the chairmanship of Brian O'Brien, a member of the board, met in February 1966, and restated the general conclusions of the Robertson panel. It was recommended that the Air Force make a more thoroughgoing effort to investigate selected UFO reports of particular interest. although the probability of acquiring significant scientific information (other than psychological) seemed small. The O'Brien panel suggested that the Air Force establish a group of teams at various points within the United States in order to respond rapidly to UFO reports. The panel recommended that each team should consist of a physical scientist familiar with upper atmospheric and astronomical phenomena, a clinical psychologist, and a trained investigator.

In October 1966 the University of Colorado was selected by the Air Force Office of Scientific Research to manage the program, and to prepare a thoroughgoing analysis of the UFO problem. The National Academy of Sciences agreed to appoint a panel to review the report when it is completed in early 1968.

Hypotheses of Extraterrestrial Origin. Repeated sightings of UFO's, and the persistence of the Air Force and the responsible scientific community in explaining away the sightings, have suggested to some that a conspiracy exists to

conceal from the public the true nature of the UFO's. Might not at least a small fraction of the unexplained few percent of the sightings be space vehicles of intelligent extraterrestrial beings observing the earth and its inhabitants?

It now seems probable that the earth is not the only inhabited planet in the universe. There is evidence that many of the stars in the sky have planetary systems. Furthermore, research concerning the origin of life on earth suggests that the physical and chemical processes leading to the origin of life occur rapidly in the early history of the majority of planets. From the point of view of natural selection, the advantages of intelligence and technical civilization are obvious, and some scientists believe that a large number of planets within our Milky Way galaxy -- perhaps as many as a million -- are inhabited by technical civilizations in advance of our own.

Interstellar space flight is far beyond our present technical capabilities, but there seem to be no fundamental physical objections to it. It would be rash to preclude, from our present vantage point, the possibility of its development by other civilizations. But if each of, say, a million advanced technical civilizations in our galaxy launched an interstellar spacecraft each year (and even for an advanced civilization, the launching of an interstellar space vehicle would not be a trivial undertaking), and even if all of them could reach our solar system with equal facility, our system would, on the average, be visited only once every 100,000 years.

UFO enthusiasts have sometimes castigated the skeptic for his anthropocentrism. Actually, the assumption that earth is visited daily by interstellar spacecraft is far more anthropocentric -- attaching as it does some overriding significance to our small planet. If our views on the frequency of intelligence in the

galaxy are correct, there is no reason why the earth should be singled out for interstellar visits. A greater frequency of visits could be expected if there were another planet populated by a technical civilization within our solar system, but at the present time there is no evidence for the existence of one.

Related to the interstellar observer idea are the "contact" tales, contemporary reports of the landing of extraterrestrial space vehicles on earth. Unlike the UFO reports, these tales display a striking uniformity. The extraterrestrials are described as humanoid, differing from man only in some minor characteristic such as teeth, speech, or dress. The aliens -- so the "contactees" report -- have been observing earth and its inhabitants for many years, and express concern at "the present grave political situation." The visitors are fearful that, left to our own devices, we will destroy our civilization. The contactee is then selected as their "chosen intermediary" with the governments and inhabitants of earth, but somehow the promised political or social intervention never materializes.

Psychological Factors. The psychologist Carl Jung pointed out that the frequency and persistence of these contact tales -- not one of which has been confirmed by the slightest sort of objective evidence -- must be of substantial psychological significance. What need is fulfilled by a belief that unidentified flying objects are of extraterrestrial origin? It is noteworthy that in the contact tales, the spacecraft and their crews are almost never pictured as hostile. It would be very satisfying if a race of advanced and benign creatures were devoted to our welfare.

The interest in unidentified flying objects derives, perhaps, not so much from scientific curiosity as from unfulfilled religious needs. Flying saucers serve, for some, to replace the gods that science has deposed. With their distant and exotic worlds and their pseudoscientific overlay, the contact accounts are acceptable to many people who reject the older religious frameworks. But precisely because people desire so intensely that unidentified flying objects be of benign, intelligent, and extraterrestrial origin, honesty requires that, in evaluating the observations, we accept only the most rigorous logic and the most convincing evidence. At the present time, there is no evidence that unambiguously connects the various flying saucer sightings and contact tales with extraterrestrial intelligence.

Thank you.

Mr. Hechler. Dr. Sagan, there have been some recent experiments at Green Bank, W. Va., with its 300-foot telescope, in an attempt to synchronize this with the Arecibo dish, in such a way as you might in effect produce almost a 2,000-mile diameter collecting surface for trying to receive signals from the pulsars.

I wonder if this isn't the type or specific activity in radio astronomy that could utilize some additional support in order to ascertain the truth about terrestrial life and signals therefrom ?

Dr. Sagan. Congressman Hechler, as a member of the faculty at Cornell that runs the observatory, I would find some problem answering that.

Mr. Hechler. But not of West Virginia, however?

Dr. Sagan. That is right. The study of pulsars, as I indicated to Chairman Miller, is relevant. The development of a long base-line parameter of the sort you talked about is of great interest to many areas of radio astronomy, and conceivably to the area we are talking about.

However, there has not been since Project OXMA, which occurred in Green Bank some 7 years or so ago, any systematic effort in this country to look for signals of intelligent extraterrestrial origin.

There is at the present time a fairly major effort under way in the Soviet Union, but at least in this country there are no such efforts directed specifically to this question.

It may be if we ever do detect intelligent signals from elsewhere, it will be an accidental byproduct of some other program. There is at the present time no effort to search for extraterrestrial signals.

Chairman Miller. Are they trying to do things in Australia?

Dr. Sagan. To the best of my knowledge there is no such work being done.

Chairman Miller. The Mills-Cross program is also connected with Cornell, isn't it?

Dr. Sagan. The Cornell-Sydney Astronomy Center, yes, sir.

Chairman Miller. Is that all, Mr. Hechler?

Mr. Hechler. I was hoping you would suggest something more specific, for our future consideration.

Dr. Sagan. Let me say, and again let me emphasize that it is by no means demonstrated that radio astronomical searches for extraterrestrial intelligence have anything whatever to do with UFO's, but if we were interested, as some of us are, in examining the possibility of extraterrestrial intelligence, sending signals to Earth, then relatively modest programs, of say less than a, million dollars, could be organized, using largely existing instruments with only small modifications in the things you hook up to the radio telescope, which would be ideal for this purpose.

There are in fact many radio astronomers who are privately interested in this sort of thing, but it carries something of the same sort of stigma that both the previous speakers mentioned about UFO's. It is unconventional. It is in many senses radical. Many astronomers prefer to have nothing to do with it.

Mr. Pettis. Mr. Chairman.

Mr. Roush. Mr. Pettis.

Mr. Pettis. I would like to ask the doctor, or any other member of the panel. Is there any indication that any other Government, particularly the Russians, are interested in this subject?

Dr. Sagan. I cannot speak about the UFO program. Perhaps Dr. Hynek can say something about that. As far as the question that I just mentioned, the radio search for extraterrestrial intelligence, there is a state commission in the Soviet Union, for the investigation of cosmic-radio intelligence. There is a fairly major effort that has been mustered for the last few years along these lines.

And there is only some information about that; that we have gotten out of the Soviet Union.

I don't know anything about their activities on UFOs. Perhaps Dr. Hynek would like to comment on that.

Dr. Hynek. May I, Mr. Chairman, preface my remark, in answer to that, by pointing out a danger here that we may be putting the cart before the horse in the consideration of extraterrestrial intelligence.

Speaking of horses, suppose someone comes here and tells us, or announces to us there is a report of a horse in the bath tub.

[[96]]

I think that it would be rather pointless to then ask, what is the color of the horse, what does he eat, how could be have gotten there, who installed the bath tub? The question is is there a horse in the bath tub? This is a question I think we should direct ourselves to first. Is there anything to these reports?

Now, coming to the question of the Russian situation, I do know from my visits behind the Iron Curtain, or as they like to speak of it, the Socialist countries, there have been sightings behind the Iron Curtain.

In fact, if you were to have good translations, it would be difficult to distinguish between a UFO report from Russia, from Brazil, from Argentina, from Japan, or from the United States. There is a rather rough pattern.

Now, the Russians, to the best of my knowledge, have given no official recognition to the problem, but I do know, from personal information, that there is sort of a ground-swell interest, or a latent interest, that pops up here and there, but apparently they have as much difficulty in getting official recognition as we do.

Mr. Roush. I would first point out that I realize that a visit to Russia doesn't necessarily make a person an expert or give him all the information. A year ago June I did visit Russia. I had conversations with a few of their people, including, my pronunciation may not be correct, Dr. Millionshchikov and the head of their weather bureau, I believe it is Petrov, and several others, and I repeatedly asked the question, "Do you believe in unidentified flying objects" In each instance they merely laughed. That was the response that I got. Since then, however, I have observed there have been papers published in Russia discussing the phenomena, and discussing it in scientific terms.

It seems to me that any discussion such as ours today raises the question of the existence of extraterrestrial life. That is one reason we asked Dr. Sagan to come here. I'm not real sure, Dr. Sagan, whether you stated whether there is or whether there is not extraterrestrial life. I was watching for that, and I don't believe I heard you say it.

Dr. Sagan. Congressman Roush, I have enough difficulty trying to determine if there is intelligent life on Earth, to be sure if there is intelligent life anywhere else. [Laughter.]

If we knew there was life on other planets, then we would be able to save ourselves a lot of agony finding out. It is just because the problem is so significant, and we don't have the answers at hand we need to pursue the subject. I don't know. It beats me.

Mr. Roush. I believe you coauthored a book with a Russian, is that correct?

Dr. Sagan. That is correct.

Mr. Roush. Does Dr. Shklovsky share your views?

Dr. Sagan. I think he shares my restraint.

I think both of us would say we think this is an extremely important subject, that we are on the frontier of being able to find out, but that neither of us knows whether there is or isn't life out there. Let me say if it turns out there isn't life on Mars, that is almost as interesting as if we find there is life on Mars, because then we have to ask, what happened different on Mars than on the Earth, so that life arose here and not there. That will surely give us a very profound entry into the question of follow-up of evolution and the cosmic context.

[[97]]

Mr. Roush. Suppose we discover there is life on Mars, in some form, wouldn't this almost cinch your case, and you could say there is extra- terrestrial life?

Dr. Sagan. Yes, sir; it certainly would, but not cinch our case about extraterrestrial intelligence. Conceivably, there might be a low form on Mars. If there is Martian life, it is of interest how low it is. If there is intelligence on Mars -- but we don't know there is intelligence on Mars -- then we don't have to grasp that evolution process.

Mr. Roush. I would like to finish this mornings session just by telling of a cartoon I saw which I think Dr. Hynek perhaps saw and enjoyed as much as I did. It showed a flying saucer hovering over the Earth, with little green men looking down, and one turned to the other and said, "Do you suppose it is swamp gas?" [Laughter.]

Dr. Hynek. That is a good statement to close the session on.

Mr. Roush. We shall reconvene at 2 o'clock this afternoon.

(Whereupon, at 12:15 p.m., the hearing was recessed to reconvene at 2 p.m.)

[[98]]

AFTERNOON SESSION

Mr. Roush. The committee will be in order.

This afternoon we are going to hear first from Dr. Robert L. Hall. Dr. Hall is professor and head of the Department of Sociology at the University of Illinois, and has been since 1965.

He too has a distinguished career. Dr. Hall, we are glad to welcome you as a participant in this symposium, and you may proceed.

STATEMENT BY DR. ROBERT. L. HALL

1. Biography
2. Oral Statement
3. Prepared Statement

(The biography of Dr. Hall is as follows:)

DR ROBERT L. HALL

Born February 25, 1924, at Atlanta, Georgia. Married; 3 children.

EDUCATION

Yale University, 1941-42. B.A. 1947.

University of Stockholm, Sweden, 1947-48.

University of Minnesota, 1949-52. M.A., 1950. Ph.D., 1953.

PROFESSIONAL EXPERIENCE

1. Instructor, Extension Division, University of Stockholm, Sweden, 1948.

2. Research Assistant, University of Minnesota, 1950-52.

3. Social Psychologist in the Air Force Personnel & Training Research Center, 1952-1957. Engaged in research on performance of bomber crews, the role of the aircraft commander, and processes of evaluation of small teams.

4. Assistant Professor (1957-1960) and Associate Professor (1960-62) of Sociology. Teaching social psychology, especially the processes of mass communication and opinion change. Conducting research on social psychological aspects of higher education and effects of social interaction on the learning process.

5. Program Director for Sociology and Social Psychology, National Science Foundation, 1962-1965. Administered a program of research grants and related activities to strengthen Sociology and Social Psychology in universities in the United States and to bolster understanding in these fields through basic research.

6. Associate Professor of Sociology and Psychology (1965-66) and Professor of Sociology and Head of the Department of Sociology (since 1966), University of Illinois at Chicago Circle.

PUBLICATIONS

A number of articles in Sociological and Psychological journals and chapters in professional books. A few selected publications are listed below:

Social influence on the Aircraft Commander's role, "American Sociological Review" 1955,20,292-299.

Military Sociology, 1945-1955. "Chapter in Sociology in the United States of America," ed. by Hans Zetterberg, Paris: UNESCO, 1966.

Group performance under feedback that confounds responses of group members. "Sociometry," 1957,20,297-305.

The informal control of everyday behavior. Chapter in "Controlling Human Behavior," ed. by Roy Francis, Social Science Research Center, University of Minnesota; 1959.

Two alternative learning in interdependent dyads. Chapter 12 in "Mathematical Methods in Small Group Processes," ed. by Joan Criswell, H. Solomon, and P. Suppes, Stanford Univ. Press: 1962.

The educational influence of dormitory roommates. "Sociometry," 1963,26,294-318 (with Ben Willerman).

The effects of different social feedback conditions upon performance in dyadic teams. Chapter in "Communication and Culture," ed. by A. G. Smith, 1966, 353-364.

[[99]]

STATEMENT OF DR. ROBERT L. HALL, HEAD, DEPARTMENT OF SOCIOLOGY, UNIVERSITY OF ILLINOIS, CHICAGO, ILL.

Dr. Hall. Thank you, Mr. Roush.

First I should like to state a few of the rather well-established facts as they would be seen by a social psychologist. I find that when I do so, there is a great deal of redundancy. You have heard most of these facts before, so I will make my presentation brief.

Fundamentally what we know that everyone can agree upon is that a great many people all over the world keep reporting some quite puzzling flying objects. In these reports there are certain recurring features, and the people so reporting often have all the characteristics of reliable witnesses.

Second, the next main thing we know is that there are several strongly, often bitterly competing systems of belief about how to explain these observations, and some rational men seem to fall into line supporting each of these positions.

This in itself is of course of great interest to a social psychologist. Inevitably he is interested in how systems of belief grow and are maintained.

The third major factual thing that can be quite well agreed upon is that to a very large extent these alternative explanations, these systems of belief, have become rooted in organizations of people who have become committed to defending their respective positions. This greatly complicates the problem of arriving at a generally accepted explanation. In that sense, in addition to any other problems that have been defined here, clearly we have a social psychological problem also.

These are very briefly the main outlines of the facts as I see them. Now, how are these explained?

There are certain things that everyone seems to agree upon, or nearly everyone, I believe. First that a great many of these observations can be quite clearly identified as mistakes on the part of the observer, misidentifications of familiar objects, hoaxes, and a miscellaneous collection of similar things.

Beyond that point, there comes to be a good deal of divergence in explanations, to say the least. Perhaps the major views now can be classified simply as follows: First, that these are technological devices or vehicles of some sort entering our atmosphere from the outside.

Second, that this is some new, as yet ill-understood natural phenomena, something like a form of plasma, that we do not understand, and so on.

The third major hypothesis to explain the hard-core cases that are not otherwise agreed upon, is that they too are simply a result of mass hysteria, and its resulting misidentifications.

This hypothesis I will address myself to particularly very soon, because obviously a social psychologist has a special interest in this possibility.

The three major topics that I believe I should address myself to are, first, what has brought about this complicated situation of strongly opposed beliefs that seem to resist the factual evidence, and are not responsive to each other?

[[100]]

Second, what are the probable consequences from the point of view of a sociologist or social psychologist of each of the major explanations?

And third, I would like to comment quite explicitly on the hypothesis that mass hysteria and hysterical contagion is common in many of the cases.

I believe I should start with the mass hysteria hypothesis. To begin with, I think there is very strong evidence that some of the cases do result from hysterical contagion in the sense that this has often been used by social psychologists. Once people are sensitized to the existence of some kind of a phenomenon (whether indeed it really exists or not), when there is an ambiguous situation requiring explanation, when there is emotion or anxiety associated with this, resulting from the uncertainty, there are precisely the conditions that have been observed repeatedly as resulting in what I shall call "improvised news." Lacking well-verified facts and explanations, people always seem to generate the news and the explanations that will reduce the ambiguity, thereby reduce the anxiety they have about uncertain situations.

There are many well-documented cases of this kind of mass hysteria and hysterical contagion. I believe it will be out of place for me to go into lengthy discussions of these episodes, but I shall comment on a few ways in which we can examine the observations of unidentified flying objects to assess whether this is a reasonable hypothesis for the hard-core cases.

One of the first of these is one thoroughly familiar to attorneys, social psychologists having no monopoly on an interest in the credibility of testimony, but this is one of the principal means obviously of establishing whether we should reasonably believe certain explanations.

The criteria, as most of you know, involve such things as the established reputation of the witnesses, the quality and details of the report, whether there are apparent motives for distortion or prevarication, whether there was preexisting knowledge of the thing being reported, whether there were multiple witnesses and whether there was contact among these multiple witnesses, whether observation was through more than one medium (for example, direct visual observation confirmed by radar) whether there were verifiable effects that could be observed after the reporting by witnesses, recently of the events being reported, the duration of the period in which the witness was able to observe the phenomenon; how the witnesses reacted, whether they had intense anxiety and emotion themselves, which might interfere with their observation, and so forth.

These are some of the major factors, and a closely related factor in assessing the credibility of the testimony is of course an assessment of the care in gathering the testimony by interviewers themselves.

How does the testimony on hard-core UFO cases look with reference to these criteria? I should say that there is a substantial subset of cases which look very good on these criteria, which make it very difficult to say that the witnesses involved were victims of hysterical contagion, grossly misinterpreting familiar things.

For example, there is the Red Bluff, Calif., case in 1960, where two policemen observed for 2 hours and 15 minutes constantly, apparently

[[101]]

without tremendous anxiety or concern, an object hovering, moving about, going through gyrations. Twice it approached their police car. When they tried to approach it, it would retreat.

They radioed in and requested that this object be confirmed on radar, and it was confirmed by local radar stations at approximately the same location.

Ultimately, after a couple of hours of observation, they watched this object move away, join a second similar object, and then disappear. They then went to the sheriff's office, where two deputies were present who had also seen this phenomenon, and gave similar descriptions.

Now applying the criteria to a case such as this, in most respects it is very convincing. These are police officers of good reputation. Their report was prompt, thorough, careful, and in writing -- and I have read the report in full. There is much detail in it of a sort that could be cross-checked with the other witnesses from the sheriff's office. There are no apparent motives for prevarication or distortion. It was a long period of observation.

I cannot establish very clearly what prior interest or information these witnesses had, but I find no indication that they had any. There was confirmation of the observation from more than one medium of observation -- both visual and radar.

This is the kind of case that leads me to regard the hypothesis of hysterical contagion as being quite inadequate to account for these observations. It is not a lone case; there are many others.

There were trained ground observers near White Plains, N.Y., in 1954, who observed an object which they described as having the apparent size of the moon, while simultaneously they saw the moon, which was not full that night. They watched this for 20 or 30 minutes, then it moved away to the southeast.

Two radar stations established fixes confirming the visually reported location. Jets were scrambled from two bases to intercept. The ground observers were able to see the jet trails approaching. Both the pilots of the jets and the ground observers report that as the jets approached, this object changed color and moved up very rapidly and disappeared, and at that point radar contact was also lost.

Once again this is the kind of report that seems to me to fit the customary criteria of credibility to a very considerable degree. It is very difficult to claim that these multiple observers, trained for the type of observation they were making, confirmed independently through more than one channel, were victims of hysterical contagion.

Dr. McDonald, I believe, referred briefly to the Levelland, Tex. cases in 1958, of interference with automobile ignition, in which there were 10 separate sightings in that one evening, apparently with no opportunity for the citizens involved either to read the news, hear the news of this, nor to talk with one another. They uniformly reported the same general shape. They uniformly reported -- a great many of them reported also interference with automobiles ignition and headlights. This was an effect which at that time had not been observed and publicized a great deal. It subsequently has become publicized.

Now, how do these cases differ from the well-known, documented cases of mass hysteria and hysterical contagion? In general those episodes have not persisted as long as the active interest in unidentified flying objects, it lasted a week or a few weeks, and it had not been too difficult to find reasonably acceptable explanations.

In the second place, they have not generally involved a prolonged observation of a phenomenon by people who were calm, not emotionally upset. A characteristic example of hysterical contagion would be the recent study by Back and Kerckhoff, supported by the National Science Foundation. The book reporting on this study is called "The June Bug." It was a case of hysterical contagion among the employees of a factory in North Carolina.

It is one of the most thoroughly reported and studied incidents of this sort. It resembles the kind of thing we are talking about in almost no respect. I find it very difficult to find elements in common, other than the fact that some people believed something that was difficult to verify.

The employees were convinced that they were being bitten by poisonous insects, resulting in fainting and other symptoms such as rashes. All medical officers, all careful research on this, was unable to turn up any hard evidence that such an insect was present, or that there was any standard medical accounting for these symptoms. But these were people in close constant contact, sharing a particular set of problems and frustrations that raised their level of anxiety.

The epidemic can be interpreted as a convenient way of escaping the problem of coping with very difficult circumstances. I have said that I think in isolated cases you can find a similar thing in observations of unidentified flying objects, but if we look at the hard-core, well-documented cases, I see practically no resemblance.

Another important thing to note about the witnesses in the best sightings of UFO's is that very commonly -- as has been mentioned, I believe, by Dr. McDonald -- they first try to explain their observation in some very familiar terms. This is the

well-known and labeled psychological process of "assimilation." People first try to assimilate their observation into something understood and known and familiar.

This is quite contrary to the kind of argument frequently built into the hypothesis of hysterical contagion, namely, that characteristically witnesses are eager, are motivated, to see strange objects.

Another important thing to notice about the witnesses in these cases is of course their reluctance to report. We have had some mention of that. This, for one thing, counters the argument of publicity seeking as a motive in some of the best cases. It incidentally runs contrary to most experience of social psychologists engaged in public opinion research, in polling, and contrary to the experience of experienced precinct workers in politics. Those people who have not tried this kind of thing expect people not to want to talk to them, but when you start ringing doorbells, the striking thing about the American people is it is often difficult to stop them from telling you what they believe. Yet in instances of unidentified flying objects, there has often been a marked reluctance to talk about them.

I can illustrate this anecdotally simply to make my point. When I was on the faculty at the University of Minnesota, a student came to me, having heard that I had some interest in this question. He informed me that his father, a colonel, an artillery colonel in Korea -- this was at the time of the Korean conflict -- had flown over a hill in Korea in his observer plane, and found (right next to him virtually) a characteristic unidentified flying object with the usual kind of configuration. It had promptly retreated upwards. It had frightened

him, but he was an experienced and trained observer, so he took notes on it; he recorded it. When he returned he was so ridiculed and laughed at for a long period of time that he completely gave up trying to have this taken seriously. He refused to talk about it.

I urged this student to get his father to report this to some of the private organizations that might take it seriously, and he apparently was unable to do so. The ridicule suppressed the opportunity for this information.

I have encountered similar things in academic colleagues from a variety of fields, finding they are very interested and wanting to hear about this, but are afraid to talk about.

In order to support the hysterical contagion hypothesis, it seems to me we need to present some plausible evidence:

First, that there is a very ambiguous situation. This we can all agree upon.

Second, that there is a great deal of anxiety and concern about it. This appears clearly to be the case.

Third, some plausible evidence of contact among the witnesses, either directly by conversing with one another, or indirectly by being exposed to the same information, the same stimuli. In cases that I have studied. I find that this third element is the one that is often lacking, that there are often witnesses who appear not to have had prior knowledge, not to have had contact with one another, not to have been exposed, as far as we can determine, to the same news information.

I might throw in here, in reference to a remark Dr. Hynek made, that the public is indeed very unwilling to accept the kinds of casual and bland explanations that have been offered. This has been my experience also, and is indeed an index of the amount of concern and anxiety about this, it appears to me.

Now I will turn to another subject. I might summarize in one sentence that in my eyes the hypothesis that the hard-core cases of observed UFO's is hysterical contagion is highly improbable. The weight of evidence is strongly against it.

Now I would like to address the question of what has brought about this situation of strongly opposing beliefs that seem not to become reconciled with one another. On this I will have to digress first to explain briefly what I mean by a system of beliefs in social psychology.

Perhaps the best way to explain that is to say that just as nature abhors a vacuum, nature abhors an isolated belief. Neither a belief nor the person who holds it can normally persist very long in isolation. The beliefs become organized in such a way that, for one person, his various beliefs support one another, and people gather together in organizations to lend each other

support in their beliefs. This is the sense in which we have highly developed systems of belief which come to resist change, to resist evidence.

The circumstances under which systems of belief such as this characteristically arise are, as I mentioned in passing before, a situation of ambiguity about a matter of importance on which there is not reliable, verified information in which people have confidence. Clearly the antidote is simple. It is to get good, reliable information which people have confidence in.

This is probably the only way to weaken the irrational elements that are strongly resistant.

[[104]]

Finally, I want to comment to some extent on the probable consequences of each of the most important explanations that has been offered, and what might be done in the public interest in each instance to counter the negative aspect of these consequences.

Let's suppose to start with that these are extraterrestrial devices of some sort visiting our atmosphere. If this is the case, we for one thing have to concern ourselves with the possible consequences of contact with civilizations which are technologically very advanced and whose values we know nothing about. It is very tempting to the anthropomorphic, to attribute human characteristics to any such life form hypothesized, and to imagine, like humans, they might be hostile and might cause us some danger.

I know of no hard evidence of danger, of threat, from the cases reported. But we do not have any inkling, if indeed these are extraterrestrial devices, as to their purpose. We have no hard evidence as to their purpose, their intent, their motives,so to speak.

Consequently, I find it extremely difficult to even speculate in an intelligent way about what might result from contact with them. I can say a very great risk of contact, if this is the case, is the risk of panic, and panic is often very harmful to us mere humans, as in theater fires and so on.

Once again from all knowledge in sociology and social psychology, the best way to counter this risk of panic is not to issue reassuring statements, but to find sound information in which people have confidence which can reduce their anxiety about the situation, and explain it adequately. This to me has been one of the most unfortunate and possibly dangerous aspects of this problem, that the ridicule, the tendency not to take the problem seriously, to issue reassurances rather than good information, has in my opinion only maximized the risk of panic, at least under this hypothesis, and I relieve under the others as well.

Another risk, if these are extraterrestrial devices is clearly the risk of misinterpreting the devices as hostile devices from another country on earth, which might trigger indeed a devastating nuclear war. Once again, the same conclusions follow about the need for good information.

Mr. Roush. Might not another conclusion be that if there should be something to this, again, if there should be perhaps it would bring all the people of the world together for a better understanding, a common purpose, and a common stand, which probably would relieve us of some of our own anxieties'

Dr. Hall. This is indeed within the range of possibility, though I hesitate to speculate on the probability.

Mr. Roush. You don't have to speculate. Go ahead.

Dr. Hall. The final comment about probable effect, if these are indeed extraterrestrial devices, is of course the possibility of learning something of great technological value from them. The possible value of contact for purposes of advancing our knowledge of our technology.

Let's turn then to another hypothesis, which is this is a natural phenomenon which we do not understand, something like plasma. In this case, I think we have precisely the same risk of panic through misinterpretation resulting in precisely the same recommendation for the need for understanding to reduce the risk of panic.

[[105]]

I think we have precisely the same risk of misinterpretation as hostile aircraft, with again the same resulting recommendation.

I think we have again the same possible great value from understanding the phenomenon in order to advance our knowledge. The third major hypothesis, explanation, which I cited above, is that even the most solid and plausible cases reported are results of mass hysteria and hysterical contagion. I simply note that if this is the case, I regard it as prima facie evidence that we badly need to improve our understanding of mass hysteria, of the process of belief formation, of the means by which we might control the kinds of anxiety that produce this problem.

In this situation there is still the dangerous risk of panic, even if there is no physical phenomenon underlying these reports. There is still the risk of misinterpretation of hostile aircraft, and I would submit that there is still the great potential benefit from studying it thoroughly and scientifically, in this case the gain being a gain in sociological and psychological knowledge, which would be of obvious importance if all of this is caused simply by mass hysteria.

I have a few conclusions and recommendations which I have written out. I will try to tie these to what others have said as I go along.

My first conclusion would be that no matter what explanation you accept, we have here a rare opportunity for gaining some useful knowledge by a thorough detached study of UFO reports, and a systematic gathering of new information, hopefully with good instrumentation, and good, well-trained interviewing teams.

My second conclusion would be that hysteria and contagion of belief can account for some of the reports, but there is strong evidence that there is some physical phenomena underlying a portion of the reports.

Third, I would conclude that because of the lack of trustworthy information the systems of conflicting beliefs has been built up to account for a very ambiguous set of circumstances. Each of these positions is sometimes defended beyond the point of rationality.

Fourth, I would repeat my earlier statement as a conclusion, that whether or not there is a physical phenomenon underlying a portion of the reports, we clearly have a social psychological problem of subduing these irrational systems of belief, defense of beliefs, of lowering the anxiety about these reports, and of reducing the ambiguity about their nature.

The recommendations that I had written out were two -- excuse me, were three, and overlap considerably with the comments of my colleagues. I would say that the most important matter is to promote the fullest possible free circulation of all the available information about this phenomena. This should help reduce risks of panic and other dangerous irrational actions. It should help to weaken these systems of belief, the irrational elements in them. Here I would say indifference, or disinterest on the part of national leaders can retard our learning about this phenomenon, and open interest and encouragement can help.

I believe you are performing a fine service in having this kind of open inquiry. This whole matter badly needs to be treated as something deserving serious study.

The second recommendation I have to make concerns some general lines of research that would seem to me called for. One of these seems

to me would be to take the 100 or 200 cases per year that seem to be reliably reported and reasonably well documented, and to study them carefully for recurring patterns' with emphasis on the way they react to their environment, the way they react to light sources, the way they react to presence of humans and so on.

The second form of research would be, I think to study explicitly those portions of the problem that do result from mass hysteria, apparently. These need to be studied intensively, quite apart from the question of the physical phenomena, to improve our understanding of mass hysteria and panic, and its possibly dangerous consequences.

In doing this I think it is terribly important that particular observations be studied by the scientists of a variety of disciplines, that the study of the hysteria hypothesis not be separated from the others. If it is, there is a tendency to make this hypothesis the garbage can for otherwise unexplained sightings.

The third type of study that seems to me terribly important, but my colleagues at the table can speak with more authority than I, is the systematic gathering of new cases with good scientific instrumentation, the kind of work in quantitative evidence that would give us much more to go on.

The third recommendation I had to suggest was that possibly in addition to a careful scientific investigation and study of this phenomenon, it might be fruitful to set up formally an adversary proceeding modeled after our system of jurisprudence. There is a tendency for us academics to sit on fences as long as we possibly can, and I think that if there were several teams of investigators who were assigned the responsibility much the way a prosecuting attorney or defense attorney is, assigned the responsibility to make the strongest possible case for one of the systems of explanation, that this would challenge the others, and force them to find more solid evidence.

It would try to benefit from some of the valuable features we have in our system of jurisprudence.

That concludes my presentation, except to comment briefly on how this relates to the suggestion of my colleagues. I would certainly enthusiastically agree with Dr. Hynek's suggestion of a board of inquiry, or some competent group to study the phenomenon.

I would certainly agree with Dr. McDonald's view that a variety of approaches would be fruitful, that a single study has many disadvantages. I have taken an interest for a number of years in the problems of the support of academic institutions by Government and I think that we are most likely to proceed to some good knowledge rapidly if we don't put all our eggs in one basket.

I certainly agree with Dr. Sagan's view that there are these very intense predisposing emotional factors for each of these beliefs. Somehow we need to weaken those.

Finally, on the idea of UN cooperation, this had not occurred to me, but I think it is an excellent idea. If it is possible to establish some detached international agency that can bring about free, open flow of information, and some cooperation internationally in investigating this, it would be helpful.

Thank you, Mr. Roush.

Mr. Roush. Thank you, Dr. Hall.

Are there questions?

(The prepared statement of Dr. Hall follows:)

PREPARED STATEMENT BY ROBERT L. HALL

From the point of view of a social psychologist, UFO reports present us with a most interesting and challenging situation. To a social psychologist the known facts appear to be facts about people and the things that they are saying and doing. First, many people, all over the world, including reliable and knowledgeable witnesses, keep reporting puzzling flying objects, and the reports have certain recurrent features. Second, several competing systems of belief have grown up to explain these reports, with some rational men supporting each of several different explanations. Third, as any sociologist would predict, the systems of belief have, to a large extent, become rooted in complex organizations of people: some organizations have been created to defend a particular position about UFOs; some organizations whose main purposes are remote from UFOs have been drawn into .the controversy and found themselves committed to defending a position.

Nearly all rational observers appear to be agreed that the great majority of reported sightings of unidentified flying objects (UFOs) can be explained as misidentifications of familiar phenomena, with an occasional hoax contributing to the

confusion. However, there are approximately 100 to 200 cases per year, based upon apparently sound testimony, with recurrent features of appearance, movement, and reaction to the environment. Strong disagreement arises over these cases.

One major area of disagreement is the question whether any novel physical phenomenon underlies these reports or whether they are simply a miscellaneous collection of familiar phenomena, misidentified because of mass hysteria and misperceived as having recurrent features because of a process of hysterical contagion. Among those who believe that there is a physical phenomenon, there are, in turn, several alternative explanations as to what it is. A substantial number argue that there are technological devices or vehicles entering our atmosphere from the outside. A substantial number argue that there is a novel natural phenomenon, as yet ill understood, such as a form of plasma or "ball lightning." There are other explanations supported by some people, such as the belief that "space animals" are swimming around in our atmosphere, or that these objects are secret devices manufactured somewhere on earth. In my judgment these last two explanations fit the available evidence so poorly that I shall not deal with them further. We might, then, label the three major hypotheses: (1) Mass hysteria and contagion; (2) Extraterrestrial devices; (3) New natural phenomenon.

My comments, as a social psychologist, will be organized around three major questions: (1) What has brought about this situation of competing systems of belief, strongly held and often unresponsive to the observed facts, and how can we modify the situation? (2) Is the mass hysteria hypothesis a plausible one, and can it account adequately for the known facts? (3) For each of the major explanations, what would be the probable consequences if the explanation were true, and what actions or precautions might be taken in the public interest?

How did the present situation come about? Much sociological research on rumor and belief systems indicates that ambiguity about an important matter begets improvised news. To the extent that trusted information is not available. systems of belief are generated to fill the gap. A recent scholarly work by Shibutani describes a rumor as a kind of improvised news which "... arises in situations of tension when ordinary communication channels are not operating adequately." (Shibutani, 1966, p. 57). Shibutani further argues that people are always being confronted with new circumstances which are not clearly and adequately treated by trusted channels of information, and therefore rumors are a normal and important part of men's efforts to adapt to their environment (p. 161, 182-183). Alternative explanations of UFO reports have arisen because of a lack of sound, authoritative information in which people have confidence. This is a normal and usual reaction to such situations of ambiguity.

In order to complete my answer about how the present situation came about, I must digress briefly to explain what I mean by a "system of belief." Just as nature abhors a vacuum, nature abhors an isolated belief. Neither a belief nor the person who holds it can normally persist long in isolation. Each person's beliefs tend to become organized into an interdependent system of beliefs which support one another. Also, people who share important beliefs typically become

organized into social groups in which members support one another's beliefs. Hence a particular belief, such as the belief that there is no new physical phenomenon underlying UFO reports, is intricately tied in with two systems -- a system of related beliefs by the same person, and a social system of people who share similar beliefs. Many social psychologists have analyzed and documented this kind of phenomenon (e.g., Festinger, 1957; Simmons. 1964; Smith, Bruner, and White, 1950).

In circumstances such as those described, the ambiguous situation is often associated with widespread anxiety, and the belief systems which arise characteristically contain elements of hysteria which may increase the likelihood of panic or other irrational action (see Smelser, 1963). New beliefs which are improvised to reduce the ambiguity often are assimilated into preexisting belief systems, such as the beliefs of religious cults, so that, in effect, the ambiguous situation is used to manufacture support for preexisting beliefs. Once a situation of competing belief systems is established, probably the only way to modify it very much is by attacking the conditions which brought it about -- that is, the lack of authoritative, trusted information.

My second major question, stated above, was: "Is the mass hysteria hypothesis a plausible one, and can it account adequately for the known facts?" First, let me reiterate the facts which we are trying to explain: numerous reliable reports, and recurrent features in these reports. When a large number of people report observations that share many details of appearance and behavior, one of three things must be the case: either they are observing the same phenomenon, or they have been exposed to the same sources of information which have influenced them to expect to see certain things, or they have been in mutual contact and influenced one another in some fashion. If the mass hysteria, hypothesis is to beheld

plausible, we need to show that separate people reporting the same details have been in touch with each other or with some common source of information. The independence of the separate observers becomes a crucial question.

In determining the plausibility of this hypothesis, a second major concern is the credibility of testimony. Much of our legal system is based upon the assumption that we can, under appropriate conditions, accept human testimony as factual. Social psychologists are certainly not alone in having developed criteria for assessing the credibility of testimony; attorneys are thoroughly familiar with such criteria. In assessing testimony we customarily consider such questions about the witness as his reputation in his community, whether he has any apparent motive for prevarication or distortion, whether he has previous familiarity with the things reported. In addition we consider internal characteristics of his report, such as the recency and duration of the events reported, the number and type of specific observable details reported as apart from reports that are primarily interpretations, the inclusion of details that are independently verifiable (such as physical effects). Also testimony is, of course, more credible if there are multiple witnesses, especially ones who are completely independent of one another; if there have been different means of observation (e.g., both visual and auditory, or unaided observation and observation through instruments); and if the testimony is gathered by qualified, careful interviewers.

In my judgment there are many reports of UFOs that meet the above criteria quite well -- better, indeed, than many court cases which a judge and jury accept. In some of these cases, no familiar explanation can be found that fits the evidence. I shall digress briefly to describe a few cases.

Consider the case of two police officers near Red Bluff, California, on August 13, 1960. They saw a large object descending and at first thought it was an airliner about to crash. They jumped from their patrol car and noticed that the object made no discernible noise. They watched it descend to an estimated 100 or 200 feet, then reverse itself at high speed, and finally stop and hover at an estimated 500 feet. They described details of shape, color, and movement. They radioed the sheriff's office to contact a local radar base and were informed that the radar base reported an unidentified radar return at the same location as their visual observation. They reported details of the object's behavior and their own. They tried to approach the object and it retreated; when they remained stationary, the object approached their car. They reported that the object retreated when they turned on the patrol car's red light. After prolonged observation the object began to move away, and they followed slowly. They saw it join another similar object and finally disappear over the horizon. Altogether they watched the object for about two hours and fifteen minutes. Their report was prompt, thorough and

written, and contained details which are contained in many other UFO reports. Immediately after losing sight of the object, the officers returned to the sheriff's office and met two deputies who reported the same observation. The officers were men of good reputation, and there is no indication of prior interest in UFOs nor prior knowledge of the kinds of details reported (e.g. the red light beam emitted by the object and radio interference each time it came near). These men have subsequently been contacted by people with scientific training and have confirmed various details of their report.

Another case of interest occurred near White Plains, New York, in late summer, 1954, and was reported by James Beatty, an experienced ground observer corps supervisor in an Air Force Filter Center. At about 9:50 p.m. an observer team about 20 miles southeast of Poughkeepsie saw an object similar in apparent size to the moon. At the same time they could see the moon, which was not full. They watched the object for about 20 or 30 minutes and then it moved slowly southeastward. According to the report of the supervisor, two radar stations had fixes corresponding to the visual sighting, and jets were scrambled from two airbases. As the jets approached the object, both the pilots and the ground observers report that the object changed color, moved upward at very high speed, and disappeared. At this point radar contact was lost, too.

In the vicinity of Levelland, Texas, on the night of November 2-3, 1957, there were ten separate sightings by several people, including police officers, over a period of approximately 2 1/2 hours. The descriptions were similar in several important details of visual appearance. Several observers independently reported that their cars' engines and headlights quit working when the object was close. This kind of effect has been frequently reported but had not been publicized prior to this group of reports in Levelland. In most instances it is clear that the witnesses around Levelland were going about their usual business and were surprised by the sighting; they had not been alerted to watch for a strange object.

These are only three cases out of many (see Hall, 1964, and U.S. Air Force, 1968). They are reported only sketchily here, but much more detail is available (see Hall, 1964). I introduce them only to illustrate the kinds of evidence available relevant to the hypothesis of mass hysteria to account for UFO sightings. I am forced to the conclusions that there are many sightings by multiple observers and that many observers are reliable and independently report similar details. In many

instances it appears highly unlikely that they could have been exposed to similar detailed information in advance (e.g., the electrical interference effects at Levelland).

Social psychologists have studied a number of cases of mass hysteria and hysterical contagion (Cantril, 1940; Johnson, 1945; Kerckhoff & Back, 1968; Medalia & Larsen, 1958). In my judgment the "hard-core" reports of UFOs do not resemble those documented cases. Those cases were generally short-lived -- a day, a week, or at most a few weeks; UFO reports have persisted for decades, at least, despite much ridicule and very little recent press coverage of serious cases. The documented cases of mass hysteria have not involved calm, prolonged observations such as the police officers near Red Bluff, California. The documented cases have had some plausible indication that the people involved have been in touch with one another (Kerckhoff & Back, 1968) or previously exposed in common to the information that they incorporate into a report (e.g., Johnson, 1945; Medalia & Larsen, 1958). The documented cases have not been worldwide, as are UFO reports. They have not involved phenomena that were simultaneously observed through such different media as direct visual contact and radar contact. In documented cases of mass hysteria I do not know of evidence of people reluctant to report; in UFO sightings there are numerous such cases. The hypothesis of mass hysteria does not, in my judgment, fit the "hard-core" reports very satisfactorily.

The third, and last, of the three major questions which I raised at the beginning was: For each of the major explanations, what are the likely consequences, and what actions or precautions might we take in the public interest?

First, let us suppose that there are extraterrestrial devices entering our atmosphere from the outside. We must then concern ourselves with the possible consequences of contact with technologically advanced civilizations whose values, or intentions, or motives are totally unknown to us. It appears to me an almost impossible task to predict the probable effects of contact between our earthly civilization and another civilization without making some clearcut assumptions about their values and motives. I have not been able to find any rational basis for defending particular assumptions of this kind, and I shall not attempt

the task. We must also be concerned with the risks of panic resulting in people hurting one another, even if the assumed extraterrestrial visitors mean no harm. This risk could be markedly reduced by preparing the public for the eventuality -- by treating it as a serious possibility that must be discussed. The greatest risk of panic would come from a dramatic confrontation between the assumed "visitors" and a collection of humans who were unprepared and had been told that their leaders did not believe such visitors existed. Another risk is that we might misinterpret such devices as weapons of another country and thereby accidentally trigger nuclear war. If these are extraterrestrial devices, we have, of course, a great opportunity to learn from their technology, which would appear to be very advanced in certain respects by our terrestrial standards.

Second, let us suppose that this is a novel natural phenomenon which we do not understand. Under this assumption we still run the risk of panic if a crowd of people are confronted with a case of the phenomenon without any preparation. We still run the risk of misinterpreting an occurrence as a hostile weapon system. Also, it is a reasonable assumption that we might reap scientific and technological benefit from understanding such a puzzling thing that appears to involve some kind of concentration of energy.

Third, let us suppose that the whole persistent business of UFO reports over the years is strictly a social psychological phenomenon—a new and extreme case of mass hysteria and hysterical contagion. In this event the underlying anxiety must indeed be massive and the risk of panic accordingly very great unless we can introduce trusted information and reduce the ambiguity and anxiety. Under this assumption -- if atmospheric and astronomical observations can be so badly misinterpreted and so badly reported by many people of good reputation and good education -- then I would judge that we run great risk of misinterpreting those same phenomena as hostile weapons, and we must prepare for this risk. Most important, if this whole business is a social psychological phenomenon, then this is prima facie evidence of the urgent need to improve our understanding of the processes of mass hysteria, belief formation, and means of controlling the kinds of anxiety that generate such a problem. In this event the UFO reports present an unsurpassed natural laboratory for research on mass hysteria, human response to ambiguity, standards for assessment of human testimony, and other related matters.

CONCLUSIONS

1. No matter which explanation is correct, we have a rare opportunity for gaining useful knowledge by a thorough, detached study of UFO reports and a more systematic gathering of new evidence.

2. Hysteria and contagion of belief can account for some of the reports of UFOs, but the weight of evidence suggests strongly that there must be some kind of physical phenomenon which underlies a portion of the reports.

3. Because of the lack of trustworthy information about UFO reports, systems of conflicting belief have been built up to account for this ambiguous set of circumstances, and each position is sometimes defended beyond the point of rationality.

4. Whether or not there is a physical phenomenon underlying a portion of the reports, we now have, in addition to any other problem, a social psychological problem of subduing irrational defense of beliefs, lowering anxiety about the reports, and reducing ambiguity about the causes of the reports.

5. Our lack of understanding of UFO reports forces us to run unnecessary risks of panic and of accidental triggering of nuclear war.

RECOMMENDATIONS

1. The most important and urgent matter is to promote the fullest possible circulation of all available information about UFOs and to encourage systematic gathering of new evidence. This should help to reduce the risks of panic and other dangerous irrational actions. This should also help to weaken the irrational elements incorporated into opposing systems of belief. Indifference or disinterest on the part of national leaders can retard our learning about the phenomenon at hand; open interest and encouragement can help. The whole matter needs to be treated as something deserving serious study.

2. At least three lines of serious research should be undertaken: (a) For the 100 to 200 cases per year that are reliably reported and well documented, we need to study carefully reports of recurring patterns of behavior by the phenomenon,

including its apparent reaction to other events in the environment with emphasis upon establishing independence or non-independence of separate witnesses, (b) Those portions of the problem that result from mass hysteria need to be studied intensively to improve our understanding of mass hysteria toward the end of controlling its potentially dangerous consequences, (c) Some systematic means of monitoring and observing should be developed so as to add well documented new cases with specific reports of details obtained independently from different observers.

3. Serious consideration might be given to the idea of setting up a formal adversary proceeding, modeled after our system of justice. Just as courts have attorneys assigned to build the best possible case for the prosecution and others to build the best case for defense, we might have a staff assigned to build the strongest possible case for each of the three major explanations of UFO reports. If each had to confront the others and answer their criticisms, we would probably force a clearer focus on the crucial points that need to be settled.

My closing comment returns to my starting point. The situation that we face in UFO reports is an exciting and challenging one which presents a rare scientific opportunity, no matter whose interpretation and explanation you may accept.

Mr. Roush. Our next participant is Dr. J. A. Harder.

Dr. Harder, we are delighted that you can participate. We are getting into another area here now. Again, as with the other gentlemen. Dr. Harder has a distinguished career behind him and probably an even more distinguished career ahead of him.

Dr. Harder, will you proceed.

STATEMENT BY DR. J. A. HARDER

1. Biography
2. Oral Statement
3. Prepared Statement

(The biography of Dr. Harder is as follows:)

DR. J. A. HARDER

Born: Fullerton, Calif., 1926.

B.S. California Institute of Technology, 1948; Ph.D. (fluid mechanics), 1957;

Associate Professor of Civil Engineering, University .of California, Berkeley, 1962 to present; Assistant Professor, Hydraulic Engineering, 1967-62; Resident Engineer, 1952-57;

Design Engineer, soil conservation service, U.S. Department of Agriculture, 1948-50;

U.S. Navy, 1944-45.

Scientific Societies: Fellow of the American Association for the Advancement of Science, Society of Civil Engineering.

[[112]]

Specialty: Engineering Science

Fields of Interest: Hydraulic systems analysis; surface water hydrology; analog simulation.

STATEMENT OF DR. JAMES A. HARDER, ASSOCIATE PROFESSOR OF CIVIL ENGINEERING, UNIVERSITY OF CALIFORNIA AT BERKELEY, CALIF.

Dr. Harder. Thank you, Mr. Chairman.

Your committee has asked me to comment on the problem of propulsion as raised by some reports, and to whatever potential benefits there might be to the aerospace programs from an intense scrutiny of UFO phenomena.

I am very glad for this opportunity to present to your committee some of my views on the problems of unidentified flying objects and to indicate some of the areas in which I think a closer investigation of this problem might provide us with scientific clues that would give us important impetus to basic and applied research in the United States.

As Dr. Hall has said, there have been strong feelings aroused about UFO's, particularly about the extraterrestrial hypothesis for their origin. This is entirely understandable, in view of man's historic record of considering himself the central figure in the natural scene; the extraterrestrial hypothesis tends inevitably to undermine the collective ego of the human race. These feelings have no place in the scientific assessment of facts, but I confess that they have at times affected me.

Over the past 20 years a vast amount of evidence has been accumulating that bears on the existence of UFO's. Most of this is little known to the general public or to most scientists. But on the basis of the data and ordinary rules of evidence, as would be applied in civil or criminal courts, the physical reality of UFO's has been proved beyond a reasonable doubt. With some effort, we can accept this on an intellectual level but find a difficulty in accepting it on an emotional level, in such a way that the facts give a feeling of reality. In this respect, we might recall the attitude many of us have toward our own deaths: We accept the facts intellectually, but find it difficult to accept them emotionally.

Indeed, there are flying saucer cultists who are as enthusiastic as they are naive about UFO' s -- who see in them some messianic symbols -- they have a counterpart in those individuals who exhibit a morbid preoccupation with death. Most of the rest of us don't like to think or hear about it. This, it seems to me, accurately reflects many of our attitudes toward the reality of UFOs -- natural, and somewhat healthy, but not scientific.

In my remaining statements you will note that I have tacitly assumed the reality of UFO's as a hypothesis underlying my assessment of the importance of this subject for scientific study.

1. THE UFO PROPULSION PROBLEM

By way of introducing the propulsion problem of UFO's, I will review a sighting near the city of Corning, in northern California, during the night of August 13, 1960, by two California highway

patrolmen. During that night, and several succeeding nights, there were many reports of UFO's over northern California, but this particular event is important not only because of the fact that it has been well authenticated but because of the relatively long time and close nature of the observations. My condensed description that follows is from the official report filed the next day by the two officers (see appendix I and II) from a half-hour taped interview conducted 3 days later by myself and Dr. Carl Johannessen, of the University of Oregon; from a letter written by Officer Charles A. Carson to Walter N. Webb, Charles Hayden Planetarium, Boston, Mass., dated November 14, 1960; and from a telephoned interview conducted by Dr. James McDonald with Mr. Carson on October 27, 1966.

APPENDIX I

ADDITIONAL WITNESSES TO THE EVENTS OF AUGUST 13, 1960

When Officer Scott radioed the Tehama County Sheriff's Office, two deputies, Fry and Montgomery, traveled to Los Molinos, somewhat northeast of the first sighting, from which point they observed the UFO simultaneously, though at a greater distance, with Scott and Carson. The night jailer, from a point further north, saw it, and marched his several prisoners out onto the roof of the jail, each of whom saw it. Subsequently, due to newspaper publicity, Carson received a number of letters from motorists who had seen the object while traveling along Highway 99E. After Scott and Carson returned to the Sheriff's Office, they called the radar base again, and talked with the operator while all of them listened in on various extensions. He described to them some of the movements of the object as he had observed it on the radar screen; these corresponded to the movements they had observed.

Several months later, in a personal interview conducted on January 3, 1961, Captain Blohl, Area Commander at Red Bluff, stated that both Scott and Carson had worked for him for three or four years, and that he had the highest regard for their honesty and devotion to duty. They were not publicity minded, he said. Of Scott, he remarked, "Scotty would rather take a knife or a gun away from a man than make a speech." In the unwanted publicity that was forced upon them, Blohl stated that their story stood up unaltered -- that there were no baubles [sic] during question periods.

APPENDIX II

REPORT OF OFFICERS CARSON AND SCOTT TO STATE HIGHWAY PATROL AREA COMMANDER

August 13, 1960.

To: Area Commander, Red Bluff.

From: C. A. Carson, No. 2358, S. B. Scott, No. 1851.

Subject: Unidentified Flying Object.

Sir: Officer Scott and I were eastbound on Hoag Road, east of Corning looking for a speeding motorcycle when we saw what at first appeared to be a huge airliner dropping from the sky. The object was very low and directly in front of us. We

stopped and leaped from the patrol vehicle in order to get a position on what we were sure was going to be an airplane crash. From our position outside the car the first thing we noticed was an absolute silence. Still assuming it to be an aircraft with power off we continued to watch until the object was probably within 100' to 200' of the ground when it suddenly reversed completely, at high speed and gained approx. 500' altitude. There the object stopped. At this time it was clearly visible to both of us, and obviously not an aircraft of any design familiar to us. It was surrounded by a glow making the round or oblong object visible. At each end, or each side of the object, there were definite red lights. At times about 5 white lights were visible between the red lights. As we watched, the object moved again and performed aerial feats that were actually unbelievable. At this time we radioed Tehama County Sheriff's Office requesting they contact the local radar base. The radar base confirmed the U.F.O. -- completely unidentified.

[[114]]

Officer Scott and myself, after our verification, continued to watch the object. On two occasions the object came directly towards the patrol vehicle. Each time it approached the object turned, swept the area with a huge red light. Officer Scott turned the red light on the patrol vehicle towards the object and it immediately went away from us. We observed the object use the red beam approximately 6 or 7 times, sweeping the sky and ground areas. The object began moving slowly in an easterly direction and we followed. We proceeded to the Vina Plains Fire Station where we again were able to locate the object. As we watched it was approached by a similar object from the south. It moved near the first object and both stopped, remaining in that position for some time, occasionally emitting the red beam. Finally both objects disappeared below the eastern horizon. We returned to the Sheriff's Office and met Deputy Fry and Deputy Montgomery, who had gone to Los Molinos after contacting the radar base. Both had seen the U.F.O. clearly and described to us what we saw. The night jailer also was able to see the object for a short time, each described the object and its maneuvers exactly as we saw them. We first saw the object at 2350 hours and observed it for approx. 2 hours and 15 minutes. Each time the object neared us we experienced radio interference.

Sir, we submit this report in confidence, for your information, we were calm after our initial shock and decided to observe and record all we could of the object.

Charles A. Carson, No. 2358.
S. B. Scott, No. 1851.

Officers Scott and Carson were searching for a speeding motorcyclist along Hoag Road, east of Corning, Calif., between U.S. Highway No. 99W and 99E when they saw what at first appeared to be a huge airliner dropping from the sky. This was at 11:50 p.m. They stopped and leaped from the patrol car in order to get a position on what they were sure was going to be an airplane crash. From their position outside the car the first thing they noticed was an absolute silence. Still assuming it to be an aircraft with power off, they continued to watch until the object was probably within 100 to 200 feet off the ground, whereupon it suddenly reversed completely, traveling at high speed back up the 45-degree glide path it had been taking, and gaining about 500-feet altitude.

This observation was from a distance of one-half to 1 mile. They said it was about the size of a DC-6 without wings; Officer Carson later made a sketch which shows an elliptical object 150 feet long and 40 feet high.

It was a very clear night, with no clouds, and as the object hovered for about a minute they got a good look at it. It was obviously not an aircraft of any design familiar to them, they said. It was surrounded by a white glow, making the object visible. At each end there were definite red lights, and at times five white lights were visible between the two red lights. They called the night dispatching office at the county sheriff's office and asked that other cars be sent, and that all other cars in the area be alerted. They also asked the radar base be notified.

The object then drifted westward toward them, losing altitude, and got within some 150 yards of them, easy pistol range, before drifting eastward again. During this time it performed aerial feats that seemed unbelievable. It was capable of moving in any direction -- up, down, back, and forth. At times the movement was very slow, and at times completely motionless. It could move at extremely high speeds, and several times they watched it change direction or reverse itself while moving at unbelievable speeds.

[[115]]

As the object moved away from them toward the east, they followed at a judicial distance, encouraged by the expectation that they were to be joined by other officers. At that time they also radioed the Tehama County Sheriff's Office requesting

that they contact the local radar base. By telephone the radar operator confirmed the UFO and stated that it was unidentified.

The two officers drove the next day to the local radar base, were refused permission to talk to the radar operator that had been on duty, and were given what Carson described as the "ice water treatment" by the commanding officer.

There follow many interesting details of their hide-and-seek chase with the object over the next 2 hours along the back roads of northern California, trying to get close enough to this thing to get a better observation. It seemed always to know they were there and always kept about half a mile away.

However, when we restrict our attention to the propulsion problem, the significant facts are: (1) there was no observable noise, (2) the UFO could hover -- seemed to float as if it were in water -- and move in any direction without altering its orientation, (3) it could sustain very high accelerations and move very rapidly, (4) it was able to hover or to move relatively slowly for at least 2 hours under circumstances that precluded suspension by aerodynamic lift forces.

What can we learn about the propulsion of UFO's from the information provided by the observations of these two police officers? Mainly, it is negative information. From the silence it seems impossible that it could have been supported by a jet or rocket reaction. There are further considerations involving specific impulse, energy, et cetera, that we need not go into here, that provide compelling arguments against any conventional way of counteracting the earth's gravitational field. There remains a slight possibility of developing sufficient reactive force by expelling relativistic neutrinos, for they would not be intercepted by the earth under a UFO and would not be noticed.

Expelling neutrons would have this same advantage, but in the quantities required they would induce far more radioactivity than has ever been measured at sites where UFO's have come close to the ground or have been reported to have landed.

Fortunately, there has been at least one observation that tends to provide a bit of positive information. Mr. Wells Allen Webb, an applied chemist with a master of science degree from the University of California, was 1 mile north of Spain Flying Field, 7 miles east of Yuma, Ariz., just off U.S. Highway No. 80, when his attention was drawn to the sky to the north by some low-flying jet aircraft. Then he noticed a small white cloud-like object in an otherwise cloudless sky.

He watched for about 5 minutes as it traveled eastward; as it reached a spot north-northeast of his location, it abruptly altered shape from being oblong and subtending about half the angle of the full moon -- about 15 minutes of arc -- to be circular and subtending about 5 minutes of arc. Webb was wearing polaroid glasses and noted that there appeared around the object a series of dark rings, the outermost of which was about six times the diameter of the central white or silvery object, or about the diameter of the full moon. The object

or cloud then decreased in apparent diameter, as if it were traveling away from him, and disappeared in another few minutes. During this time Webb repeatedly took off his glasses and then put them back on, noting each time that the rings appeared only when he was wearing the glasses. He did not know what to make of the sighting, but took notes, including the fact that it was about 10 in the morning. The date was May 5,1953.

One of the first things to note about the situation as described in the account is that the dark rings were observed with polaroid glasses, but not without them. The second thing is that, from the orientation of the observer relative to the position of the sun at that time of day, the blue scattered light from the part of the sky that formed the background for the object was polarized.

To this fortunate circumstance we must add the fact that Mr. Webb was curious about clouds, the effect of viewing them with polarized light, and took notes of what he observed. He did not, however, realize that he was observing the rotation of the plane of polarization of the blue light in the vicinity of the object. This was the interpretation I made some 8 years later upon reading his account.

Mr. Wydler. How would you define UFO's as you are using it in this paper before us.

Dr. Harder. I don't know how I could define it without being circular.

Mr. Wydler. That is the conclusion to which I came.

You state on the very first page or you more or less say you are going to tacitly assume the reality of UFO's, merely an "unidentified flying object." I think we can assume their reality without worrying much about it. It is only if they have some particular interplanetary significance that might become a real problem, the way we look at it, isn't that so? We all agree there are unidentified flying objects.

I think you are defining them as interplanetary. I don't see you really come out and say that, but I think you hinted at it.

Dr. Harder. Well, if my interpretation of these rings is correct, it is certainly nothing we have been able to accomplish on earth.

Mr. Wydler. Are you saying, when you use this term, for the purposes of your statement, in your testimony, you are assuming they are of an interplanetary nature?

Dr. Harder. Yes, that is right.

Mr. Wydler. All right.

Dr. Harder. In my statement, which is available to the transcriber, I have gone through a little bit of argument suggesting why the outer of the three rings represents light that had been rotated through 90 degrees, so it would not pass through the polarizer, if it is polarized glasses. The next ring represented light that had been rotated 90 plus 180 degrees. If you have polaroid glasses and look at the right part of the blue sky, any afternoon, you can seen that the light is polarized, and as you rotate your polaroid glasses there is an alternate darkening-lightening, as you go through 180 degrees.

We can assume, to begin with, that the plane of the polarizer in his glasses was parallel to the plane of the undisturbed polarized light from the general direction of the object. If then something affected the light so as to turn its plane of polarization through 90 degrees, the portion that had been originally polarized would not pass through

the glasses. Likewise, for light that had had its plane of polarization turned through 90 plus 180 degrees, 90 plus 360 degrees, and so on, there would be a partial extinction of light.

On this basis, the outer dark ring was due to the rejection by the polarizing filter of the glasses of light which had had its plane of polarization turned through 90 degrees, the next outermost band by light that had been turned through 27O degrees, et cetera.

This interpretation is strengthened by Webb's observation that the dark rings were narrower than the brighter areas between them; this is what should be expected on the basis of the above explanation.

What hypotheses can be constructed that might account for this unusual observation? There are at least two that have interesting implications for the propulsion problem. First by the Faraday effect, a magnetic field parallel to the path of the light could so rotate the plane of polarization. A quick calculation using the properties of the atmosphere shows that a field of 200,000 gauss, operating over a distance of 130 feet -- 40 meters -- could turn the plane 90 degrees; this is indeed a very intense and extensive magnetic field and, of course, would only account for one ring. Three rings would require a million gauss over the same distance.

We have been able to achieve these field strengths in the laboratory for only fractions of seconds over very small distances. However, the principal argument against this hypothesis is the conclusion that were such a field brought at all close to the surface of the earth its effect would be to induce very strong remnant magnetism in nearly every piece of iron within several hundred yards. This has not been found.

We have been able to achieve that kind of field strength for fractions of seconds only over short distances on earth, or at least we, on earth. [sic] [***NCAS Editor's note***: apparent severe garble in the transcription]

However, there has been a suggestion made earlier that a very strong magnetic field might so saturate certain iron cores of electrical machinery as to explain some of the observed phenomena of electrical malfunctioning.

Despite the above-described observation, there is little reason to believe that magnetic fields, of themselves could be of much use in propelling a spacecraft, although there has been much uninformed speculation about this in popular UFO publications. The simple reason is that we cannot produce a north pole without at the same time producing a south pole. Tills is a consequence of fundamental theory. Such a dipole cannot exert a force in conjunction with a uniform magnetic field, such as the earth may be assumed to have in a given locality, though it can produce a force in a nonuniform field.

To go beyond the above discussion would be rather speculative, but it is just here that we find a stimulus and challenge to scientific theory. It is almost circular to say that when we find a phenomenon we understand but vaguely we have also found a means of advancing our understanding; this has been particularly true in astronomy.

Concerning the propulsion of UFO's, a tentative hypothesis would be that it is connected with an application of gravitational fields that we do not understand.

Gravitation remains one of the enigmas of modern science, although there have been some advances in its understanding, beyond general

relativity, in the past decade. There are theoretical grounds for believing there must exist a second gravitational field, corresponding to the magnetic field in electromagnetic theory, and that the interaction between these two fields must be similar to that between the electric and magnetic fields.

This interaction and its exploitation forms the basis for our modern electrical generators and motors. Without the interaction, we would be back to the days of electrostatic attraction and of permanent magnets -- two phenomena that can produce only very weak forces when operating individually. Some day perhaps we will learn enough to apply gravitational forces in the same way we have learned to apply electromagnetic forces. This will depend upon advances in many fields of science. Some of the things required will be enormously increased sources of power from atomic fusion; very intense magnetic fields and current densities, perhaps from superconducting sources; and extremely strong materials to contain mechanical forces. Some of these advances are approaching, or are on the horizon. Others we have yet to see clearly.

May I close this part of our discussion by recalling the statement that the most important secret of the atomic bomb was that it worked. This gave the crucial impetus to other nations in their own efforts to duplicate the research of the United States. In the UFO phenomena we have demonstrations of scientific secrets we do not know ourselves. It would be a mistake, it seems to me, to ignore their existence.

I have further comments on UFO's and high-strength materials, but perhaps the committee would rather interrupt at this point before I go on to that second subject?

Mr. Roush. Any questions?

I think you better go ahead, Dr. Harder, because if we get started questioning it is impossible to stop these people.

Mr. Boone. Mr. Chairman, may I ask one question?

Mr. Roush. Go ahead, Mr. Boone.

Mr. Boone. Have you concluded that what you have just told us is true, we should not ignore their existence?

Dr. Harder. I have no doubt of the veracity of the observer who saw this thing in the sky; I know him personally.

Mr. Boone. I didn't question the observer, I questioned your remark, and the magnetic, if you will, electromagnetic interactions, and so forth, when you said we undoubtedly must admit the existence of these -- I am sorry I can't quote you exactly. But your last sentence there is what I refer to.

It does seem like an obvious conclusion resulting from all the previous remarks you said about some supernatural, if you will --

Dr. Harder. Oh, heavens, I never suggested that, I hope.

Mr. Boone. Well, let me say, science fiction propulsion system, then.

Dr. Harder. Well, sir, what we have been discussing this morning, and this afternoon, is perhaps closer to science fiction than anything. I hope it is more science than fiction, however.

Mr. Roush:. Go ahead, Dr. Harder.

Dr. Harder. The instances in which physical fragments of UFO's have been found are disappointingly few. To my knowledge, there is only one well-authenticated finding, and that was in Brazil, in

1957. The story of its discovery is contained in chapter 9 of the *Great Flying Saucer Hoax*, written by Dr. Olavo T. Fontes.

Briefly, several small metallic fragments were recovered by some fishermen near the coastal town of Ubatuba, Sao Paulo, after they saw what they described as a brilliant explosion of a flying disc. Some of the fiery fragments were extinguished in the water near the shore, where they were recovered.

Fontes acquired three of the fragments that weighed less than a tenth of an ounce each, and had one of them analyzed at the Mineral Production Laboratory in the Brazilian Agriculture Ministry. The results of the first analysis was that the substance was magnesium of an unusually high degree of purity, and that there was an absence of any other metallic element.

On the basis of the first examination a second spectrographic test was conducted, using the utmost care and the most modern instruments. The second report was again marked by references to the "extreme purity" of the sample. Even impurities that are sometimes detected due to contamination from the carbon rod used as an electrode were absent. A further test, using X-ray diffraction, failed to turn up any other metallic component.

One of the pieces was flown to California and was analyzed. I have the report here. They used neutron activation analysis and discovered a total of one-tenth of 1 percent of other metallic elements than magnesium, 500 parts per million zinc, that included zinc, which is interesting, and small amounts of barium and strontium.

Certainly this metal is of extraordinary purity, certainly far beyond the capacity of fishermen at Ubatuba to produce.

What could be the use of such high-purity magnesium in the context of a spacecraft? One clue lies in its crystalline structure. It is close packed hexagonal structure, and is in this regard similar to the high-strength metals beryllium and titanium. Hexagonal crystals have but one slip plane, and this tends to make them brittle but strong.

One of the reasons for slip along crystal planes is that local imperfections in the crystal, or foreign atoms, create lines of stress concentration that move rapidly through the crystal, producing deformation.

If these imperfections, or dislocations, could be eliminated, the theoretical strength of the crystal lattice itself might be approached. This strength is on the order of millions of pounds per square inch for any materials. Carefully prepared 1/4-inch diameter glass rods, etched to remove microscopic surface cracks and then lacquered, have withstood stress of 250,000 psi for i hour. Fused silica fibers have been stressed to 2 million psi.

Thus, foreign atoms within a crystal lattice are focal points for dislocations -- points of stress concentration where the crystal lattice itself tears and slips. We can imagine that a high-purity crystal, free of surface and internal imperfections, would achieve fantastic strengths. Indeed, with the advent of iron whiskers, and boron fiber reinforced composites, we are already approaching some of these strengths, but only for extremely small diameter fibers.

Should, by any good fortune, further samples of UFO material be found, there may be further clues that would spur on research into high-strength materials, and perhaps give us hints of how to achieve

superstrength in materials that are larger than the tiny fibers we have produced so far.

Needless to say, if we persist in denying the reality of UFO s we will not be looking for such samples, and may indeed reject them as having no importance when they are brought to our attention.

That is the conclusion of my prepared statement. I would like to comment on some of the suggestions as asked by Congressman Rumsfeld earlier.

I conclude in some of my colleagues' recommendations that a multiple-faceted exploration be made of this subject, preferably at several institutions simultaneously.

I have some suggestions as to how we could acquire additional scientific data even at the present time.

This is a three-point program which involves first the establishment of an early warning network, which the Colorado project began last February. Then to take advantage of one of the characteristics of UFO sightings: that they, in many instances, are seen on one or two successive nights.

We could have prearranged instrument packages which are arranged for instant transportation to locations where UFO's have been sighted. If the budget for such a program were low, you might be able to borrow such things and have them ready at various universities where the instruments were otherwise occupied for research.

That would be the second point of this investigation.

The third point would be the cooperation of the Air Force for logistics and high-speed transport to crucial areas on a 24-hour basis.

Now, that three-point program may well bring to us physical data that so far has appeared only in anecdotal, still from essential amateurs who happened just accidentally to be at the right place. It was truly a fortunate accident when Mr. Webb was there to make the observation I described earlier.

Mr. Roush. Does that conclude your statement?

Dr. Harder. That concludes my statement.

PREPARED STATEMENT OF DR. JAMES A. HARDER

I am very glad for this opportunity to present to your Committee some of my views on the problem of Unidentified Flying Objects and to indicate some of the areas in which I think a closer investigation of this problem might provide us with scientific clues that would give an important impetus to basic and applied research in the United States.

There have been strong feelings aroused about UFO's, particularly about the extra-terrestrial hypothesis for their origin. This is entirely understandable, in view of man's historic record of considering himself the central figure in the natural scene; the extra-terrestrial hypothesis tends inevitably to undermine the collective ego of the human race. These feelings have no place in the scientific assessment of facts, but I confess that they have at times affected me.

Over the past twenty years a vast amount of evidence has been accumulating that bears on the existence of UFO's. Most of this is little known to the general public or to most scientists. But on the basis of the data and ordinary rules of evidence, as would be applied in civil or criminal courts, the physical reality of UFO's has been proved beyond a reasonable doubt. With some effort, we can accept this on an intellectual level but find a difficulty in accepting it on an emotional level, in such a way that the facts give a feeling of reality. In this respect, we might recall the attitude many of us have towards our own deaths: We accept the facts intellectually, but find it difficult to accept them emotionally.

Indeed, there are flying saucer cultists who are as enthusiastic as they are naive about UFO's -- who see in them some Messianic symbols -- they have a

[[121]]

counterpart in those individuals who exhibit a morbid preoccupation with death. Most of the rest of us don't like to think or hear about it. This, it seems to me, accurately reflects many of our attitudes towards the reality of UFO's -- natural, and somewhat healthy, but not scientific.

In my remaining statements, you will note that I have tacitly assumed the reality of UFO's as a hypothesis underlying my assessment of the importance of this subject for scientific study.

I. THE UFO PROPULSION PROBLEM

By way of introducing the propulsion problem of UFO's, I will review a sighting near the City of Corning in northern California during the night of August 13, 1960, by two California. Highway patrolmen. During that night and several succeeding nights there were many reports of UFO's over northern California, but this particular event is important not only because of the fact that it has been well authenticated (see Appendix I p. 114) but because of the relatively long time and close nature of the observations. My condensed description that follows is from the official report filed the next day by the two officers (see Appendix II p. 114); from a half-hour taped interview conducted three days later by myself and Dr. Carl Johannessen of the University of Oregon; from a letter written by Officer Charles A. Carson to Walter N. Webb (Charles Hayden Planetarium, Boston, Massachusetts) dated November 14, 1960; and from a telephoned interview conducted by Dr. James McDonald with Mr. Carson on October 27, 1966.

Officers Scott (Stanley E. Scott) and Carson (Charles A. Carson) were searching for a speeding motorcyclist along Hoag Road, east of Corning, California, between U.S. Highway 99W and 99E, when they saw what at first appeared to be a huge airliner dropping from the sky. This was at 11:50 p.m. They stopped and leaped from the patrol car in order to get a position on what they were sure was going to be an airplane crash. From their position outside the car the first thing they noticed was an absolute silence. Still assuming it to be an aircraft with power off, they continued to watch until the object was probably within one hundred to two hundred feet off the ground, whereupon it suddenly reversed completely, traveling at high speed back up the 45 degree glide path it had been taking, and gaining about 500 feet altitude. This observation was from a distance of one-half to one mile. They said it was about the size of a DC-6 without wings; Officer Carson later made a sketch which shows an elliptical object 150 feet long and 40 feet high. It was a very clear night, with no clouds, and as the object hovered for about a minute they got a good look at it. It was obviously not an aircraft of any design familiar to them, they said. It was surrounded by a white glow, making the object visible. At each end there were definite red lights, and at times five white lights were visible between the two red lights. They called the night dispatching office at the County Sheriff's Office and asked that other cars be sent, and that all other cars in the area be alerted.

The object then drifted westward towards them, losing altitude, and got within some 150 yards of them ("easy pistol range") before drifting eastward again. During this time it performed "aerial feats" that seemed unbelievable: It was capable of moving in any direction -- up, down, back and forth. At times the movement was very slow, and at times completely motionless. It could move at extremely high speeds, and several times they watched it change directions or reverse itself while moving at unbelievable speeds.

As the object moved away from them towards the east, they followed at a judicial [sic] distance, encouraged by the expectation that they were to be joined by other officers. At that time they also radioed the Tehama County Sheriffs Office requesting that they contact the local radar base. By telephone the radar operator confirmed the UFO and stated that it was unidentified. (Note: The two officers drove the next day to the local radar base, were refused permission to talk to the radar operator that had been on duty, and were given what Carson described as the "ice water treatment" by the commanding officer.)

There follow many interesting details of their hide-and-seek chase with the object over the next two hours. However, when we restrict our attention to the propulsion problem, the significant facts are: (1) there was no observable noise, (2) the UFO could hover ("seemed to float as if it were in water") and move in any direction without altering its orientation, (3) it could sustain very high accelerations and move very rapidly, (4) it was able to hover or to move relatively slowly for at least two hours under circumstances that precluded suspension by aerodynamic lift forces.

[[122]]

What can we learn about the propulsion of UFO's from the information provided by the observations of these two police officers? Mainly, it is negative information: From the silence it seems impossible that it could have been supported by a jet or rocket reaction. There are further considerations involving specific impulse, energy, etc., that we need not go into here, that provide compelling arguments against any conventional way of counteracting the earth's gravitational field. There remains a slight possibility of developing sufficient reactive force by expelling relativistic neutrinos, for they would not be intercepted by the earth under a UFO and would not be noticed. Expelling neutrons would have this same advantage, but in the quantities required they would induce far more radioactivity than has ever been measured at sites where UFO's have come close to the ground or have been reported to have landed.

Fortunately, there has been at least one observation that tends to provide a bit of positive information. Mr. Wells Allen Webb, an applied chemist with a master of science degree from the University of California, was one mile north of Spain Flying Field, seven miles east of Yuma, Arizona, just off U.S. Highway 80, when his attention was drawn to the sky to the north by some low-flying jet aircraft. Then he noticed a small white cloud-like object in an otherwise cloudless sky. He watched for about five minutes as it traveled eastward; as it reached a spot north northeast of his location, it abruptly altered shape from being oblong and subtending about half the angle of the full moon (about 15 minutes of arc) to being circular and subtending about 5 minutes of arc. Webb was wearing polaroid glasses, and noted that there appeared around the object a series of dark rings, the outermost of which was about six times the diameter of the central white or silvery object, or about the diameter of the full moon. The object or cloud then decreased in apparent diameter, as if it were traveling away from him, and disappeared in another few minutes. During this time Webb repeatedly took off his glasses and then put them back on, noting each time that the rings appeared only when he was wearing the glasses. He did not know what to make of the sighting, but took notes, including the fact that it was about 10 in the morning. The date: 5 May 1953.

One of the first things to note about the situation as described in the account is that the dark rings were observed with polaroid glasses, but not without them. The second thing is that from the orientation of the observer relative to the position of the sun at that time of day, the blue scattered light from the part of the sky that formed the background for the object was polarized. To this fortunate circumstance we must add the fact that Mr. Webb was curious about clouds, the effect of viewing them with polarized light, and took notes of what he observed. He did not, however, realize that he was observing the rotation of the plane of polarization of the blue light in the vicinity of the object. This was the interpretation I made some ten years later upon reading his account.

We can assume, to begin with, that the plane of the polarizer in his glasses was parallel to the plane of the undisturbed polarized light from the general direction of the object. If then something affected the light so as to turn its plane of polarization through 90 degrees, the portion that had been originally polarized would not pass through the glasses. Likewise, for light that had had its plane of polarization turned through 90 plus 180 degrees, 90 plus 360 degrees, and so on, there would be a partial extinction of light. On this basis, the outer dark ring was due to the rejection, by the polarizing filter of the glasses, of light which had had its plane of polarization turned through 90 degrees, the next outermost band by light that had been turned through 270 degrees, etc.

This interpretation is strengthened by Webb's observation that the dark rings were narrower than the brighter areas between them; this is what should be expected on the basis of the above explanation.

What hypotheses can be constructed that might account for this unusual observation? There are at least two that have interesting implications for the propulsion problem. First, by the Faraday effect, a magnetic field parallel to the path of the light could so rotate the plane of polarization. A quick calculation using the properties of the atmosphere shows that a field of 200,000 gauss, operating over a distance of 130 feet (40 meters) could turn the plane 90 degrees; this is indeed a very intense and extensive magnetic field, and of course, would only account for one ring. Three rings would require a million gauss over the same distance. We have been able to achieve these field strengths in the laboratory for only fractions of seconds over very small distances. However, the principal argument against this hypothesis is the conclusion that were such a field be brought at all close to the surface of the earth its effect would be to induce very strong

remnant magnetism in nearly every piece of iron within several hundred yards. This has not been found.

Despite the above-described observation, there is little reason to believe that magnetic fields, of themselves, could be of much use in propelling a spacecraft, although there has been much uninformed speculation about this in popular UFO publications. The simple reason is that we cannot produce a north pole without at the same time producing a south pole.

This is a consequence of fundamental theory. Such a dipole cannot exert a force in conjunction with a uniform magnetic field, such as the earth may be assumed to have in a given locality, though it can produce a force in a nonuniform field.

To go beyond the above discussion would be rather speculative, but it is just here that we find a stimulus and challenge to scientific theory. It is almost circular to say that when we find a phenomena we understand but vaguely we have also found a means of advancing our understanding; this has been particularly true in astronomy. Concerning the propulsion of UFO's, a tentative hypothesis would be that it is connected with an application of gravitational fields that we do not understand.

Gravitation remains one of the enigmas of modern science, although there have been some advances in its understanding (beyond general relativity) in the past decade. There are theoretical grounds based on general relativity for believing there must exist a second gravitational field, corresponding to the magnetic field in electromagnetic theory, and that the interaction between these two fields must be similar to that between the electric and magnetic fields. This kind of interaction and its exploitation forms the basis for our modern electrical generators and motors. Without the interaction, we would be back to the days of electrostatic attraction and of permanent magnets -- two phenomena that can produce only very weak forces when operating individually. Someday perhaps, we will learn enough to apply gravitational forces in the same way we have learned to apply electromagnetic forces. This will depend upon advances in many fields of science: Some of the things required will be enormously increased sources of power from atomic fusion; very intense magnetic fields and current densities, perhaps from superconducting sources; and extremely strong materials to contain mechanical forces. Some of these advances are approaching, or are on the horizon. Others we have yet to see clearly.

May I close this part of our discussion by recalling the statement that the most important secret of the atomic bomb was that it worked. This gave the crucial impetus to other nations in their own efforts to duplicate the research of the United States. In the UFO phenomena we have demonstrations of scientific secrets we do not know ourselves. It would be a mistake, it seems to me, to ignore their existence.

II. UFO's AND HIGH-STRENGTH MATERIALS

The instances in which physical fragments of UFO's have been found are disappointingly few. To my knowledge, there is only one well-authenticated finding, and that was in Brazil in 1957. The story of its discovery is contained in Chapter 9 of *The Great Flying Saucer Hoax* (Coral B. Lorenzen, The Willeam-Frederick Press, New York, 1962) written by Dr. Olavo T. Fontes.

Briefly, several small metallic fragments were recovered by some fishermen near the coastal town of Ubatuba, Sao Paulo, after they saw what they described as a brilliant explosion of a flying disc. Some of the fiery fragments were extinguished in the water near the shore, where they were recovered. Fontes acquired three of the fragments that weighed less than a tenth of an ounce each, and had one of them analyzed at the Mineral Production Laboratory in the Brazilian Agricultural Ministry. The results of the first analysis was that the substance was magnesium of an unusually high degree of purity, and that there was an absence of any other metallic element (Lorenzen, *ibid*, p. 99). On the basis of the first examination a second spectrographic test was conducted, using the utmost care and the most modern instruments. The report was again marked by references to the "extreme purity" of the sample. Even impurities that are sometimes detected due to contamination from the carbon rod used as an electrode were absent. A further test, using X-ray diffraction, failed to turn up any other metallic component.

What could be the use of such high-purity magnesium in the context of a spacecraft? One clue lies in its crystalline structure: It is close packed hexagonal, and is in this regard similar to the high-strength metals beryllium and titanium. Hexagonal crystals have but one slip plane, and this tends to make them brittle but strong. One of the reasons for slip along crystal planes is that

local imperfections in the crystal, or foreign atoms, create lines of stress concentration that move rapidly through the crystal, producing deformation. If these imperfections, or dislocations, could be eliminated, the theoretical strength of the crystal lattice itself might be approached. This strength is on the order of millions of pounds per square inch for many materials. Carefully prepared 1/4 inch diameter glass rods, etched to remove microscopic surface cracks and then lacquered, have withstood stresses of 250,000 psi for one hour (C. J. Phillips, *American Scientist*, v. 53, no. 1, p. 32). Fused silica fibers have been stressed to 2,000,000 psi.

Thus, foreign atoms within a crystal lattice are focal points for dislocations -- points of stress concentration where the crystal lattice itself tears and slips. We can imagine that a high-purity crystal, free of surface and internal imperfections, would achieve fantastic strengths. Indeed, with the advent of iron whiskers, and boron fiber reinforced composites, we are already approaching some of these strengths, but only for extremely small diameter fibers.

Should, by any good fortune, further samples of UFO material be found, there may be further clues that would spur our research into high-strength materials, and perhaps give us hints of how to achieve super-strength in materials that are larger than the tiny fibers we have produced so far. Needless to say, if we persist in denying the reality of UFO's, we will not be looking for such samples, and may indeed reject them as having no importance when they are brought to our attention.

Mr. Roush. Are there questions?

Well, if not, let's go to our next participant. Our next participant is Dr. Robert M. L. Baker, Jr.

Dr. Baker, again we recognize your own eminence in your field, and we are very happy to have you here as a participant in this symposium. You may proceed.

STATEMENT BY DR. ROBERT M. L. BAKER, JR.

1. Biography
2. Oral Statement
3. Attachments & Appendices

(The biography of Dr. Baker, Jr., is as follows:)

DR. ROBERT M. L. BAKER, JR.

Dr. Baker is a 36 year old scientist who received his BA with Highest Honors in Physics and Mathematics at UCLA in 1954, and was elected to Phi Beta Kappa. In 1956 he was granted a MA in Physics, and was the recipient of the UCLA Physics Prize. In 1958 Dr. Baker received a PhD in Engineering, which was the first of its kind to be granted in the nation with a specialty in Astronautics.

With respect to his academic background. Dr. Baker was on the Faculty of the Department of Astronomy at UCLA from 1959 to 1963. Since that time he has been on the Faculty of the Department of Engineering at UCLA where he currently offers courses in astronautics, fluid mechanics, and structural mechanics.

Dr. Baker is an internationally recognized expert in various fields of science and engineering. He was a research contributor to .the development of preliminary orbit determination procedures utilizing radar data, astrodynamic constants, near free-molecular flow drag—all utilized in the nation's space programs. He has also developed unique theories in the area of hydrofoil marine craft design.

In private industry Dr. Baker has initiated, supervised, and conducted research programs in astronautics, physics, fluid mechanics, mathematics, and computer program design. He has contributed to problem definition and analysis of scientific and engineering problems in both industrial and military projects.

Dr. Baker's industrial career began in 1954 as a consultant to Douglas Aircraft Company. Between 1957 and 1960 he was a Senior Scientist at Aeronutronic-Philco-Ford. While in the Air Force during 1960 and 1961, he was a project officer on a number of classified Air Force projects. Between 1961 and 1964 he was the head of Lockheed's Astrodynamics Research Center, where he directed the efforts of approximately 25 scientists in various scientific areas. In 1964 Dr. Baker joined the Computer Sciences Corporation (CSC), first as Associate Manager for Research and Analysis, and later as the Senior Scientist of CSC's System Sciences subdivision. In this latter capacity he is currently involved in several Air Force, Navy, and NASA projects.

Dr. Baker represented the United States Air Force at the International Astronautical Federation meeting in Stockholm, Sweden in 1961, represented the United States at the International Union of Theoretical and Applied Mechanics European Conferences in 1962 and in 1965 and was an invitee to the Astronomical Councile [sic] of the Academy of Sciences of USSR in Moscow in 1967. He was voted an Outstanding Young Man of the Year by the Junior Chamber of Commerce in 1965. From 1963 to 1964 he was the National Chairman of the Astrodynamics Technical Committee of the American Institute of Aeronautics and Astronautics and is currently a member of Computer Sciences Technical Committee.

Dr. Baker has been the Editor of the Journal of the Astronautical Sciences since 1968. He was the joint editor of the Proceedings of the 1961 International Astronautical Federation Congress and the senior author of the first textbook on astrodynamics: An Introduction to Astrodynamics published in 1960. Dr. Baker is the author of four books and over 70 technical papers (see Appendix 2).

Dr. Baker's professional society memberships include the American Association for the Advancement of Science, Phi Beta Kappa, Sigma Xi, Sigma Pi Sigma, American Astronautical Society (Fellow), British Interplanetary Society (Fellow), American Institute of Aeronautics and Astronautics (Associate Fellow and member of the Computer Sciences Technical Committee), British Astronomical Society (Fellow), American Astronomical Society, American Physical Society, and Meteoritical Society.

His active security clearance is top secret.

STATEMENT OF DR. ROBERT M. L. BAKER, JR., SENIOR SCIENTIST, COMPUTER SCIENCES CORP., El SEGUNDO, CALIF., AND FACULTY, DEPARTMENT OF ENGINEERING, UCLA

Dr. Baker. Fine, thank you, Mr. Roush.

I should like to preface my remarks by stating my preference for the term "anomalistic observational phenomena," as opposed to the term "unidentified flying objects."

Mr. Roush. I observed you were going to say that and I wonder about some of my Hoosiers back home using those terms.

Dr. Baker. It comes trippingly off the tongue.

Mr. Roush. It might not only cause some Hoosiers but some laymen some problems. It might be easier to say UFO's. You may go ahead.

Dr. Baker. I call it AOP.

From the data that I have reviewed and analyzed since 1954, it is my belief that there does exist substantial evidence to support the claim that an unexplained phenomenon -- or phenomena -- is present in the environs of the earth, but that it may not be "flying," may not always be "unidentified," and, perhaps, may not even be substantive "objects." In the following statement I will --

(1) Present a summary of the analyses that I have accomplished to date -- those that have led me to believe that anomalistic phenomena exist;

(2) Explain the probable inadequacy of our current terrestrial sensors in observing and/or defining the characteristics of the anomalistic phenomena;

(3) Suggest a number of tentative hypothetical sources for the phenomena, and the justification for their scientific study;

(4) And, finally, I will make specific recommendations concerning the necessity for new types of closely related observational and study programs which might be implemented in a fashion that would permit the detection and quantitative analysis of the anomalistic phenomena.

[[126]]

Several appendices accompany this report. The first two are in response to Congressman Roush's invitational letter of July 10, 1968, and consist of my biographical sketch and a listing of my bibliography, respectively. The third appendix relates directly to my specific recommendations, and was included with the kind permission of Dr. Sydney Walker III. The fourth appendix presents three reprints of articles (Baker (1968a) and (1968b) and Walker (1968)) that are pertinent to the subject matter of this report.

PART 1. ANALYSES OF ANOMALISTIC OBSERVATIONAL PHENOMENA

UTAH AND MONTANA FILMS

My initial contact with anomalistic observational phenomena -- AOP -- came in 1954 when I was a consultant to Douglas Aircraft Co. in Santa Monica, Calif., serving as special assistant to Dr. W. B. Klemperer, director of Douglas' research staff. The data consisted of two short film clips: one taken in Montana -- termed by us as the Montana film -- and one taken in Utah -- called by us the Utah film. These films were provided to us by the Air Technical Intelligence Center -- ATIC, now the Foreign Technology Division -- FTD -- at Wright-Patterson Air Force Base; 35-millimeter prints were furnished by Green-Rouse Productions of Samuel Goldwyn Studios.

Both films had been taken by apparently reliable and unbiased men using amateur movie cameras and, in each case, there was a credible, substantiating witness present. The films exhibited the motion of rather fuzzy white dots, but the Montana film was remarkable in that foreground was visible on most of the frames.

Preliminary analysis excluded most natural phenomena. More detailed study indicated that the only remaining natural phenomenon candidate for the Utah film was birds in flight, and for the Montana film it was airplane fuselage reflections of the sun. After about 18 months of rather detailed, albeit not continuous, study using various film-measuring equipments [sic] at Douglas and at UCLA, as well as analysis of a photogrammetric experiment, it appeared that neither of these hypothesized natural phenomena explanations had merit, and a report was published by me (Baker (1956)) and forwarded to Brig. Gen. Harold E. Watson, commander, ATIC. Since the description of the circumstances of the filmings and the analyses of the data provided on the films is rather lengthy, and have since been published in the open literature,[1] it does not seem unreasonable to repeat the analyses here. [***NCAS Editor's note***: This last sentence appears to be a mis-transcription; the two analyses were not presented in Dr. Baker's statement.]

FLORIDA FILM

During the course of this study we also had the opportunity to view some gun-camera photographs taken over Florida. Unfortunately, we could not retain this film, and did not have time available to accomplish a comprehensive analysis. Like the Montana and Utah films, this film also exhibited only white-dot images; however, since a foreground was present, a competent study could have been carried out. Dr. Klemperer and I agreed on the preliminary conclusion -- not supported by detailed analyses -- that, again, no natural phenomenon was a likely source for the images.

[1]For the Utah film, see Baker and Makemson (1967): for the Montana film, see Baker (1968a). This latter reference is included in app. 4 to this paper.

VENEZUELA FILM

In June of 1963 I received a movie film clip from a Mr. Richard Hall that had purportedly been taken from an aircraft (DC-3) near Angel Falls, Venezuela, at about 12:15 p.m. This film clip was 8-millimeter color film, exposed at 16 frames per second and showed a very bright yellow, slightly pear-shaped object that disappeared in a cloud bank after about 60 or 70 frames. At the time I was the head of the Lockheed Aircraft Co.'s Astrodynamics Research Center. We had developed a small group of photogrammetrists consisting of Dr. P. M. Merifeld and Mr. James Rammelkamp, and were able to undertake a study of the film. Initially, Merifeld and Rammelkamp found little of interest on the film. After their preliminary examination, I expended considerable effort in further analysis. Again, I was only able to draw the conclusion that the yellow object was no known natural phenomenon; but [before] we could make a quantitative determination of angular rates and accelerations, and the bounds of distance, linear velocity, and acceleration, the film was lost (except for a microphotograph exhibiting the object on one frame). There was, however, no question in my mind as to the anomalistic character of the images.

CALIFORNIA FILM

In January 1964, Mr. Zan Overall showed me three cinetheodolite films which had been taken simultaneously by three different cameras of a Thor-Able Star launching at Vandenberg AFB (project A4/01019). These films depicted a white object moving vertically (relative to the film frame) against a clear, blue-sky background. The object was about as bright as the booster's second-stage exhaust, and passed the booster at about one-third degree per second. Rough estimates of the direction of the Sun -- based on shadows on early frames -- and the winds aloft -- indicated by the motion of the rocket's exhaust plume) -- were made. These, together with the brightness of the object and its rate of ascent, seemed to rule out balloons, airplanes, lens flare, mirages, et cetera. Since one of the cinetheodolites was at a site some distance from the other two, a parallax determination of the actual distance and speed of the object could be determined rather easily. Because the films were on loan from the Navy, I was unable to carry out the necessary study and a determination of the precise character of the phenomenon (natural or anomalistic) could not be made. In 1967, I discussed the matter with Prof. William K. Hartmann of the University of Arizona, and Prof. Roy Craig of the University of Colorado. At that time, they were involved in the Colorado UFO Study Group, and indicated that they would attempt to obtain the film for further analysis. Although I am confident that they made a conscientious effort to obtain the films, apparently they were unsuccessful (as of 6 months ago, at least).

PROBABLY NONANOMALISTIC FILMS

In addition to the foregoing film clips -- which seemed to involve data that were the result of anomalistic phenomena -- the Montana film in my opinion, certainly was anomalistic and all of the other

[[128]]

films except for the California film, most probably were anomalistic -- I have also had the opportunity to view approximately a half dozen other films, purportedly of "UFO's." The images on these films appeared possibly to be the result of natural phenomena, such as reflections on airplanes, atmospheric mirages, optical flares, birds, balloons, insects, satellites, et cetera. For example, a recent (February 1968) set of two films were taken, using professional motion picture equipment, by a Universal Studio crew on location. Although rather peculiar in appearance, the objects thus photographed could have conceivably been the result of airplane reflections.

To this date my analyses of anomalistic motion picture data have been rather ungratifying. Although I am convinced that many of the films indeed demonstrated the presence of anomalistic phenomena, they all have the characteristic or rather ill-defined blobs of light, and one can actually gain little insight into the real character of the phenomena. For example, linear distance, speed, and acceleration cannot be determined precisely, nor can size and mass. As I will discuss in a moment, this situation is not particularly surprising, since, without a special-purpose sensor system expressly designed to obtain information pertinent to anomalistic observational phenomena, or a general-purpose sensor system operated so as not to disregard such data, the chance for obtaining high-quality hard data is quite small.

PART 2. INADEQUACIES OF EXISTING SENSOR EQUIPMENT AND SYSTEMS

The capabilities of astronomical optical sensors have been dealt with in a thorough fashion by Page in 1968. The Prairie Network for Meteor Observations (McCrosky and Posen (1968)) is a good example of a wide-coverage optical system, but as is so often the case, and as Page (1968) pointed out. "*** K E. McCrosky of the Smithsonian Astrophysical Observatory informed me that no thorough search (for anomalistic data) has been carried out." Even so, some astronomical photographs are bound to exhibit anomalistic data. Again quoting from Page (1968), "*** W. T. Powers of Northwestern University Astronomy Department informed me that 'several' of the Smithsonian-net photographs show anomalous trails." As I have already pointed out (Baker (1968b) to be found in appendix 4), the majority of our astronomical equipment (e.g., conventional photographic telescopes, Baker-Nunn cameras, meteor cameras, Markowitz Dual-Rate Moon Cameras, et cetera) are special purpose in nature, and would probably not detect the anomalous luminous phenomena reported by the casual observer if they were indeed present. Their photographic speed, field of view, et cetera, impose severe restrictions on their ability to collect data on objects other than those they have been specifically designed to detect As already noted in the quotes from Page (1968), even if such data were collected, the recognition of their uniqueness or anomalous character by an experimenter is improbable. Examples abound, in the history of celestial mechanics, of minor planets being detected on old astronomical plates that had been measured for other purposes, and then abandoned.

Our radar and optical space surveillance and tracking systems are even more restrictive and thus, even less likely to provide information on anomalistic phenomena than are astronomical sensors. The Signal Test Processing Facility (STPF) radar at Floyd, N.Y. is a high-performance

[[129]]

performance experimental radar having a one-third degree beam width. For lockon and track, an object would have to be pinpointed to one-sixth degree, and even if the radar did achieve lockon, an erratically moving object could not be followed even in the STPF radar's monopulse mode of operation. For this reason only satellites having rather well-defined paths (i.e., ephemerides), which have been precomputed, can be acquired and tracked.

Our three BMEWS radars propagate fans of electromagnetic energy into space. If a ballistic missile or satellite penetrates two of these fans successively, then it can be identified. Since astrodynamical laws govern the time interval between detection fan penetrations for "normal" space objects, all other anomalistic "hits" by the radar are usually neglected, and even if they are not neglected, they are usually classified as spurious images or misassociated targets, and are stored away on magnetic tape, and forgotten.

One space surveillance site operates a detection radar (FPS-17) and a tracking radar (FPS-79). If a new space object is sensed by the detection radar's fans, then the tracking radar can be oriented to achieve lockon. The orientation is governed by a knowledge of the appropriate "normal" object's astrodynamic laws of motion, or by an assumption as to launch point. Thus, if an unknown is detected, and if it follows an unusual path, it is unlikely that it could, or would, be tracked.

Furthermore, the director of the radar may make a decision that the unknown object detected is not of interest (because of the location of the FPS-17 fan penetration or because of the lack of prior information on a possible new launch). In the absence of detection fan penetration (the fan has a rather limited coverage), the FPS-79 tracking radar is tasked to follow other space objects on a schedule provided by the Space Defense Center, and again there is almost no likelihood that an anomalistic object could, or would, be tracked.

The NASA radars, such as those at Millstone and Goldstone, are not intended to be surveillance radars, and only track known space objects on command. Again the chances of their tracking anomalistic objects are nearly nil. The new phased-array radar at Eglin AFB (FPS-85) has considerable capability for deploying detection fans and tracking space objects in a simultaneous fashion. Such versatility raises certain energy-management problems -- that is, determining how much energy to allocate to detection and how much to tracking -- but this sensor might have a capability (albeit, perhaps, limited) to detect and track anomalistic objects. The problem is that the logic included in the software associated with the FPS-85's control computers is not organized in a fashion to detect and track anomalistic objects (I will indicate in a moment how the logic could be modified). Furthermore, the FPS-85, like the other surveillance radars is usually tasked to track a list of catalogued space objects in the Space Defense Center's data base and the opportunity to "look around" for anomalistic objects is quite limited.

There are a number of other radar surveillance systems such as a detection fence across the United States. In the case of this fence, we have a situation similar to BMEWS, in which the time interval between successive penetrations (in this case separated by an orbital period for satellites) must follow prescribed astrodynamical laws. If they do not, then the fence penetrations are either deleted from

the data base or classified as "unknowns" or "uncorrelated targets," filed, and forgotten.

There is only one surveillance system, known to me, that exhibits sufficient and continuous coverage to have even a slight opportunity of betraying the presence of anomalistic phenomena operating above the Earth's atmosphere. The system is partially classified and, hence, I cannot go into great detail at an unclassified meeting. I can, however, state that yesterday (July 28, 1968) I traveled to Colorado Springs (location of the Air Defense Command) and confirmed that since this particular sensor system has been in operation, there have been a number of anomalistic alarms. Alarms that, as of this date, have not been explained on the basis of natural phenomena interference, equipment malfunction or inadequacy, or manmade space objects.

PART 3. HYPOTHETICAL SOURCES FOR ANOMALISTIC OBSERVATIONS AND JUSTIFICATION FOR THEIR STUDY

In Baker and Makemson (1967), I discussed the usual candidates for the natural sources of anomalistic observations. For example, some scanning radars -- such as airport radars -- pick up anomalistic returns termed "angels." A variety of explanations have been proposed, variously involving ionized air inversion layers, etc. (see Tacker (1960) and even insects (see Glover, et al. (1966)). With respect to human observation of anomalistic luminous phenomena, some rather strong positions have been taken by such authorities as Menzel (1953), who feels that the predominant natural phenomenon is atmospheric mirages; by Klass (1958a), who feels that the predominant natural phenomenon is related to ball lightning triggered by high-tension line coronal discharge, jet aircraft, electrical storms, etc.; by Robey (1960), who feels that the observations are of "cometoids" entering the earth's atmosphere, etc. The list of hypothetical sources for anomalistic observational phenomena is long indeed, but from the photographic data that I have personally analyzed, I am convinced that none of these explanations is valid.

The analyses that I have carried out to date have dealt with observational evidence that I term "hard data" -- that is, permanent photographic data. Although I will not discuss in detail the analyses of eyewitness reports (which I term "soft data"),[1] Powers (1967), McDonald (1967), Hynek (1966), and others have concluded that overwhelming evidence exists that a truly anomalistic phenomenon is present.

Of course, there are numerous others who have come to a completely opposite conclusion; in fact, it becomes almost a matter of personal preference: it is possible for one to identify all of the anomalistic data as very unusual manifestations of natural phenomena. No matter how unlikely it is, anything is possible -- even a jet plane reflecting the sun in direct opposition to the laws of optics. I'm sometimes reminded of the flat earth debates that I organized 10 years ago in my

elementary astronomy courses at UCLA. Some students became so involved in justifying their positions-- either flat or spherical -- that they would grasp at even the most improbable argument in order to rationalize their stand.

[1]Except in app. 3 to this report -- a paper supplied by Dr. Sydney Walker III, concerning a hypothetical case.

[[131]]

Mr. Roush. Dr. Baker, I'm sorry to interrupt, but I'm going to have a brief recess here.

Dr. Baker. Certainly.

Mr. Roush. There is a motion to recommit the military construction bill, and I would like to vote on it. None of my colleagues are here right now, so we will declare a very brief recess, and I shall return as quickly as I can.

(Whereupon a short recess was taken for a floor vote.)

Mr. Roush. The committee will be in order.

Dr Baker, you may proceed.

Dr. Baker. Thank you.

Personally, I feel that it is premature for me to agree that the hard and soft data forces the scientific community to give overriding attention to the hypothesis that the anomalistic observations arise from manifestations of extraterrestrial beings. On the other hand, I strongly advocate the establishment of a research program in the area of anomalistic phenomena -- an interdisciplinary research effort that progresses according to the highest scientific standards; that is well funded; and that is planned to be reliably long term. The potential benefit of such a research project to science should not hinge solely on the detection of intelligent extraterrestrial life; it should be justified by the possibility of gaining new insights into poorly understood phenomena, such as ball lightning, cometoid impact, and spiraling meteorite decay.

There is practical value in such research for the Military Establishment, as well. Let us suppose that something similar to the "Tunguska event" of 1908 occurred today, and that it was Long Island in the United States, rather than the Podkamenaia Tunguska River Basin in Siberia that was devastated by a probable comet impact. Would we misinterpret this catastrophic event as the signal for world war III? What if another "fireball procession," such as occurred over Canada on February 9, 1913, repeated itself today, and the low-flying meteors were on nearly polar orbits that would overfly the continental United States. Would we interpret the resulting surveillance data as indicating that a fractional orbital bombardment system (FOBS) had been initiated in Russia? My knowledge of our Air Force sensors, both current and projected (see Baker and Ford (1968)), indicates that they are sufficiently sophisticated so that they would probably not react prematurely and signal a false alarm -- although a careful study of this point should be made. On the other hand, there may exist other anomalistic sources of data that might give rise to a false alarm and perhaps provoke us either to deploy our countermeasures, or even to counterattack.

Before I enumerate the specific benefits this research might confer upon various scientific disciplines, allow me to digress briefly on the subject of soft data. The primary reason that I have avoided the introduction of soft data into my photographic studies and have not involved myself in the analysis of eyewitness reports (such as the excellent ones given by Fuller (1966)), is that I have been unable to develop a rational basis for determining the credibility level for any given human observer. Although they lie outside the field of my own scientific competence, I feel that credibility evaluations of witnesses

[[132]]

would form an important adjunct to any serious study of anomalistic phenomena (see Walker (1968) included in app. 4 of this report). The soft data must involve some useful information content, and it would be extremely unrealistic to neglect it entirely. For this reason, I have included appendix 3 by Dr. Walker, which presents a logical procedure for establishing a credibility level for observers. Walker's report of a hypothetical case integrates the results of general medical, neuroopthalmologic, neurologic, and psychiatric evaluations, and develops a logical basis for assigning an overall credibility score.

Dr. Robert L. Hall is, of course, eminently qualified to comment on the question of eyewitness testimony at this seminar.

If serious studies can be initiated, with the objectives of detecting, analyzing, and identifying the sources of anomalistic observational phenomena, then I feel that the following scientific benefits can be expected:

(1) *Meteoritics*. -- Although there are a number of excellent meteor observation nets operating today, data collected on erratically moving phenomena (including rapid determination of the location of any "landings" or impacts) would add significantly to the coverage and analyses of meteorites and, possibly, entering comets. Furthermore, the timely recovery of meteoritic debris at the subend point of fireballs would be most valuable.

(2) *Geology*. -- It has been pointed out by Lamar and Baker (1965), that there exist residual effects on desert pavements that may have been produced by entering comets. Furthermore, any geological or material evidence of the impact or "landing" of extraterrestrial objects would be of great interest. As Dr. John O'Keefe (1967), Assistant Chief, Laboratory for Theoretical Studies of NASA GSFC indicated "Would it not be possible to get some scraps of these ("UFO") objects for examination? For instance, a scrap of matter, however small, could be analyzed for the kind of alloys in terrestrial foundries.

A piece of a screw, however small, would be either English, Metric, or Martian. I am impressed by this because I looked at some tens of thousands of pictures of the Moon and found that the very small amount of chemical data has more weight in interpreting the past history of the Moon than the very large amount of optical data. It doesn't seem possible that objects ("flying saucers") of this size can visit the Earth and then depart, leaving nothing, not even a speck, behind. We could analyze a speck no bigger than a pinhead very easily." I concur with O'Keefe's remarks, and if there exist "landings" associated with the anomalistic phenomena, then a prompt and extremely thorough investigation of the landing site must be accomplished before geological/material evidence is dispersed or terrestrialized.

(3) *Atmospheric physics*. -- One of the great mysteries today is the formation, movement, and explosion of ball lightning. As Singer (1968) noted:

The specific properties of ball lightning, which present particular difficulty in experimental duplication, are formations of the sphere in air (at near-atmospheric pressure and at a distance from the source of energy) and its extensive motion. It is evident that additional clarification of both theoretical and experimental aspects is needed.

With respect to "plasma UFO's" Mr. Philip J. Klass(1968b) comments that:

If conditions -- all of the conditions -- needed to create plasma-UFO's near high-tension lines or in the wake of jet aircraft occurred readily we should have millions of UFO reports and the mystery would have been solved long ago. But the comparative rarity of legitimate UFO sightings clearly indicates that the ball-lightning related phenomenon is a very rare one.

Even if ball lightning is not the primary source of anomalistic data (and I am not at present convinced that it is), any program investigating anomalistic observational phenomena would surely shed significant light on the ball-lightning problem.

(4) *Astronomy*. -- I have already noted the possibility of cometary entry, a study of which would be valuable to the astronomer. If as some respected astronomers believe, the anomalistic observational phenomena (including perhaps, "intelligent" radio signals from interstellar space) are the results of an advanced extraterrestrial civilization, then the study of the phenomena would become a primary concern of the entire human race. The implications for astronomy are overwhelming.

(5) *Psychiatry and psychology*. -- Since bizarre events have been reported, the study of eyewitness credibility, under stressful circumstances of visual input, if possible. As I will recommend later: if a competent, mobile task force of professionals could be sent into action as soon as anomalistic events are detected, then reliable evaluation of eyewitness reports (soft data) in relation to the actual hard data obtained, could be accomplished. Even if the event was only a spectacular fireball, or marsh gas, the psychiatric/medical examination of eyewitnesses would still be more informative.

(6) *Social science*. -- Although not classified as a physical science, there appears to be a challenge here for the social sciences. It has been my contention throughout this report that it is not a prerequisite to the study of anomalistic observational phenomena to suppose that they result from extraterrestrial intelligence.

Nevertheless, it still is an open possibility in my mind. It seems reasonable, therefore, to undertake a few contingency planning studies. In order to extract valuable information from an advanced society, it would seem useful to forecast the approximate characteristics of such a superior intelligence—or, if not necessarily superior, an intelligence displayed by an industrial, exploratory culture of substantially greater antiquity. There exist dozens of treatises on technological forecasting; one can key estimates of technological advancement to speed of travel, production of energy, productivity, ubiquity of communications, etc. There have been many debates on the technical capabilities or limits on the capabilities of advanced extraterrestrial societies (for example, see Markowitz (1967) and Rosa, et al. (1967). Often intermixed with these technological capabilities arguments, however, are very dubious comments concerning the psychological motivations, behavioral patterns, and unbased projections of the social motivations of an advanced society. Hypothetical questions are often raised such as, "*** if there are flying saucers around, why don't they contact us directly? *** I would if I were investigating another civilization." Such comments are made on extremely thin ice, for, to my knowledge, no concerted study has been carried out in the

area of forecasting the social characteristics of an advanced extraterrestrial civilization. Philosophers, social scientists, and others usually undertake studies of rather theoretical problems. (See Wooldridge (1968) and Minas and Ackoff (1964). If only a quantitative index or indices of social advancement could be developed that, say, would differentiate us from the Romans in our interpersonal and intersociety relationships (for example, tendencies toward fewer crimes of violence, fewer wars, etc.), then we might be better equipped to make rational extrapolations from our own to an advanced society. In fact, such as index, if it could be developed might even be beneficial in guiding our existing earth-based society.

(7) *Serendipity*. -- In addition to the value of anomalistic phenomena studies to these specific scientific disciplines, there is always serendipity. Any scientific study of this nature is potentially capable of giving substantial dividends in terms of "spin-off." For example: in improved techniques in radar and optical sensor design and control; in giving a reliable quantitative credibility level to witness' statements in court; or in deciphering and/or analyzing anomalistic radio signals from interstellar space.

PART 4. CONCLUSIONS AND RECOMMENDATIONS

For the past 16 years I have seriously (albeit sporadically) followed the analyses of "UFO" or "flying saucer" reports -- both scientific and quasi-scientific. It is my conclusion that there is only so much quantitative data that we can squeeze out of vast amounts of data on anomalistic observational phenomena that has been collected to date. I believe that we will simply frustrate ourselves by endless arguments over past, incomplete data scenarios; what we need is more sophisticated analyses of fresh anomalistic observational data. We must come up with more than just a rehash of old data.

I emphasize that it is very unlikely that existing optical and radar monitoring systems would collect the type of quantitative data that is required to identify and study the phenomena. Moreover, we currently have no quantitative basis upon which to evaluate and rank (according to credibility) the myriad of eyewitness reports. Thus continuing to "massage" past anomalistic events would seem to be a waste of our scientific resources. In balance, then, I conclude that:

(1) We have not now, nor have we been in the past, able to achieve a complete -- or even partially complete -- surveillance of space in the vicinity of the earth, comprehensive enough to betray the presence of, or provide quantitative information on, anomalistic phenomena.

(2) Hard data on anomalistic observational phenomena do, in fact exist, but they are of poor quality, because of the inadequacies of equipment employed in obtaining them.

(3) Soft data on anomalistic phenomena also exist, but we have no quantitative procedure to evaluate their credibility and develop clear-cut conclusions on the characteristics of the anomalistic phenomena.

(4) It follows from the scientific method that an experiment or experiments should be devised, and closely related study programs be initiated expressly to define the anomalistic data better.

(5) In order to justify such an experiment and associated studies, it is not necessary to presuppose the existence of intelligent extraterrestrial life operating in the environs of the earth, or to make dubious speculations either concerning "their" advanced scientific and engineering capabilities or "their" psychological motivations and behavioral patterns.

In the light of these conclusions, I will make the following recommendations:

(1) In order to obtain information-rich hard and soft data on anomalistic phenomena, an interdisciplinary, mobile task force or team of highly qualified scientists should be organized. This team should be established on a long-term basis, well funded, and equipped to swing into action and investigate reports on anomalistic phenomena immediately after such reports are received. Because of the relatively low frequency of substantive reports (see p. 1968), immediate results should not be anticipated, but in the interim periods between their investigations in the field, their time could be productively spent in making thorough analyses of data collected by them previously, and in "sharpening up" their analysis tools.

(2) In concert with the aforementioned task force, a sensor system should be developed expressly for detecting and recording anomalistic observational phenomena for hard-data evaluation. The system might include one or more phased-array radars (certainly not having the cost or capability of the FPS-85, but operating in a limited fashion that would be similar to the FPS-85). A phased-array radar would have the advantage over a conventional "dish" radar in that it could track at high rates and divide its energy in an optimum fashion between detection and tracking. The control system would be unique, and would necessitate the development of a sequential data-processing controller that would increase the state variables describing the object's path from a six-dimensional position and velocity estimation to a 12-dimensional acceleration and jerk estimation (Baker (1967)) in order to follow erratic motion.

In addition, the data base would have to be especially designed, to avoid manmade space objects and (if possible) airplanes, birds, common meteors, etc. It should, however, be designed to detect and track nearby cometoids, macrometeorites (fireballs), ball lightning, and any other erratic or anomalistic object within its range. Optical cameras (including spectrographic equipment) should be slaved to the radar, in order to provide more comprehensive data. Because of the aforementioned low frequency of anomalistic data, alarms from the system should not occur very frequently and could be communicated directly to the recommended task force.

(3) A proposed new-generation, space-based long-wave-length infrared surveillance sensor system should be funded and the associated software should be modified to include provisions for the addition of anomalistic objects in its data base. The specific sensor system cannot be identified for reasons of security, but details can probably be obtained from the Air Force. This sensor system, in particular, could provide some data (perhaps incomplete) on anomalistic, objects which exhibit a slight temperature contrast with the space background, on a basis of noninterference with its military mission. The system represents a promising technological development, and no other novel

technique introduced in recent years offers more promise for space surveillance. In my view, the scientific principles underlying the proposed surveillance system are sound, and a developmental measurements program should be initiated.

(4) The software designed for the FPS-85 phase-array radar at Eglin Air Force Base be extended in order to provide a capability to detect and track anomalistic space objects. The relatively inexpensive modification could include the implementation of tracking techniques such as those outlined in Baker (1967). It should, however, be clearly borne in mind that only a limited amount of tracking time (about 30 percent) could be devoted to this endeavor, because of the overriding importance of the surveillance of manmade space objects which is the basic responsibility of this radar.

(5) Various "listening post" projects should be reestablished (using existing instruments) in order to seek out possible communications from other intelligent life sources in the universe. See, for example, Shklovskii and Sagan (1966), chapters 27, 28, 30, and 34.

(6) Technological and behavioral pattern forecasting studies should be encouraged in order to give at least limited insight into the gross characteristics of an advanced civilization. These studies (probably not Government funded) should include the social-psychological implications of anomalistic observational phenomena, as well as the psychological impact upon

our own culture that could be expected from "contact" with an advanced civilization. (See ch. 33 of Shklovskii and Sagan (1966).)

(7) Studies should be initiated in the psychiatric/medical problems of evaluating the credibility of witness' testimony concerning bizarre or unusual events. (See app. 3 of this report.)

PART 5. AFTERWORD

All of the foregoing recommendations involve the expenditure of funds, and we are all well aware of the severe limitations on the funding of research today. On the other hand, I feel that one of the traps that we have fallen into, so far, is reliance on quick-look, undermanned and underfunded programs to investigate a tremendous quantity of often ambiguous data. I would discourage such programs as being diversionary, in regard to the overall scientific goal.

The goal of understanding anomalistic phenomena, if attained, may be of unprecedented importance to the human race. We must get a positive scientific program off the ground; a program that progresses according to the highest scientific standards, has specific objectives, is well funded, and long term.

Thank you.

PART 1

ABSTRACTS FROM BAKER (1956) RELATED TO THE UTAH FILM -- ANALYSIS OF PHOTOGRAPHIC MATERIAL

PHOTOGRAMMETRIC ANALYSIS OF THE "UTAH" FILM TRACKING UFO'S

Several Unidentified Flying Objects (UFO's) were sighted and photographed at about 11:10 MST on July 2, 1952 by Delbert C. Newhouse at a point on State Highway 30, seven miles north of Tremonton, Utah (latitude 41° 50", longitude

112° 10'). Mr. Newhouse, a Chief Warrant Officer in the U.S. Navy,* was in transit from Washington, D.C. to Portland, Oregon.

He, his wife and their two children were making the trip by car. Shortly after passing through the city of Tremonton, his wife noticed a group of strange shining objects in the air off towards the eastern horizon. She called them to her husband's attention and prevailed upon him to stop the car. When he got out, he observed the objects (twelve to fourteen of them) to be directly overhead and milling about. He described them as "gun metal colored objects shaped like two saucers, one inverted on top of the other." He estimated that they subtended "about the same angle as B-29's at 10,000 feet" (about half a degree -- i.e., about the angular diameter of the moon). (Next, he ran to the trunk of his car, took out his Bell and Howell Automaster 16mm movie camera equipped with a 3" telephoto lens, loaded it, focused it at infinity and began shooting. There was no reference point above the horizon so he was unable to estimate absolute size, speed or distance. He reports that one of the objects reversed its course and proceeded away from the rest of the group; he held the camera still and allowed this single object to pass across the field of view of the camera, picking it up later in its course. He repeated this for three passes.

During the filming, Newhouse changed the iris stop of the camera from f/8 to f/16. The density of the film can be seen to change markedly at a point about 30% through the sequence. The camera was operated at 16 fps.

The color film (Daylight Kodachrome) after processing was submitted to his superiors. The Navy forwarded the film to the USAF-ATIC where the film was studied for several months. According to Al Chop (then with ATlC and presently with DAC) Air Force personnel were convinced that the objects were not airplanes; on the other hand the hypothesis that the camera might have been out of focus and the objects soaring gulls could neither be confirmed nor denied. Mr. Chop's remarks are essentially substantiated by Capt. Edward Ruppelt, reference (1) then head of Project "Blue Book" for ATIC.

A 35mm reprint of the Newhouse "Utah" film was submitted to Douglas Aircraft Company for examination. Visual study of the reprints on the Recordak and astronomical plate measuring engine revealed the following: The film comprises about 1,200 frames; on most of the frames there appear many round white dots, some elliptical. The dots often seem clustered in constellations, or formations which are recognizable for as long as seventeen seconds. A relative motion plot (obtained from an overlay vellum trace on the Recordak) of two typical formations are presented. The objects seem to cluster in groups of two's and three's. On some frames they flare up and then disappear from view in 0.25 seconds or less and sometimes they appear as a randomly scattered "twinkling" of dots. The dot images themselves show no structure; they are white and have no color fringes. *Examination under a microscope shows the camera to be well focused as the edges of the images are sharp and clear on many of the properly exposed frames (of the original print).* Angular diameters range from about 0.001,6 to 0.000,4 radians. Their pattern of motion is essentially a curvilinear milling about. Sometimes the objects appear to circle about each other. There are no other objects in the field of view which might give a clue as to the absolute motion of the cluster.

In the overlay trace, the frame of reference is determined by a certain object whose relative motion during a sequence of frames remains rather constant. This object is used as a reference point and the lower edge of the frame as abscissa. Assuming the camera to have been kept reasonably uncanted, the abscissa would be horizontal and the ordinate vertical. In the overlay trace, the particular frame itself is used as the reference. Assuming the camera was held steady (there is an unconscious tendency to pan with a moving object) the coordinate system is quasi-fixed. It is realized that both of these coordinate systems are in actuality moving, possibly possessing both velocity and acceleration.

No altitude or azimuth determination can be made because of lack of background. The only measurable quantities of interest are therefore the relative angular distances between the objects and their time derivatives. Graphs of two typical time variations of relative angular separation and velocity are included (in Baker and Makemson (1967)). The relative angular velocity is seen to vary from zero to 0.006,5 radians per second. The relative angular acceleration had a maximum value of 0.003,6 radians per second squared. Supposing the

*At the time he had already logged some 2,200 hours as a chief photographer with the Navy.

camera was kept stationary the average angular velocities for the object moving across the field are 0.039 and 0.031 radians per second. The angular velocities in these sequences sometimes vary erratically from 0.07 to 0.01 radians per second. This variation may be attributed in part to camera "jiggling" and in part to the object's motion. The decrease in average angular velocity could be due to the object's having regressed between filmings just as was reported by Newhouse. Also the average image diameter decreases about 30% over the entire film, indicating a possible over-all regression of the objects.

The following tabulation indicates the hypothetical transverse component of relative velocities and accelerations at various distances. It is noted that the transverse velocity may be only a fraction of the total velocity so that the numbers actually indicate minimum values.

If the object's distance was-	Its transverse velocity was-	Its transverse acceleration was-	Velocity of single object was-
100 ft.	0.65 ft./sec. or 0.44 m.p.h.	0.36 ft./sec^2 or 0.011g.	3.8 ft./sec. or 2.7 m.p.h.
1,000 ft.	6.5 ft./sec, or 4.4 m.p.h.	3.6 ft./sec^2 or 0.11 g.	39 ft./sec. or 27 m.p.h.
2,000 ft.	13 ft./sec. or 8.8 m.p.h.	7.2 ft./sec^2 or 0.22g.	78 ft./sec. or 54 m.p.h.
1 mile.	23 m.p.h.	0.56 g	135 m.p.h.
5 miles.	115 m.p.h.	2.8 g	670 m.p.h.
10 miles.	230 m.p.h.	5.6 g	1,300 m.p.h.

The objects in the "Utah" and "Montana" films can only be correlated on the basis of two rather weak points. First, their structure, or rather lack of it, is similar. Thus as shown, in the "blow-ups" there are no recognizable differences between them*. Second, the objects on the "Montana" film are manifestly a single pair; on the "Utah" film perhaps 30% of the frames show clusters of objects seemingly also grouped in pairs.

The weather report was obtained by the author from the Airport Station at Salt Lake City. The nearest station with available data is Corinne which reported a maximum temperature of 84°, a minimum of 47° and no precipitation. A high pressure cell from the Pacific Northwest spread over Northern Utah during July 2, the pressure at Tremonton would have a rising trend, the visibility good, and the winds relatively light. The absence of clouds and the apparently excellent visibility shown on the films would seem to be in agreement with this report. Through use of References (2) and (3), the Sun's azimuth N132°E altitude 65° was computed. No shadows were available to confirm the time of filming.

The image size being roughly that of the Montana film (a few of the objects being perhaps 10% larger than the largest on the Montana) the same remarks as to airplane reflections apply, i.e., they might have been caused by Sun reflections from airplanes within one to three miles to the observer, although at these distances they should have been identified as conventional aircraft by the film or the observer. No specific conclusions as to Sun reflection angles can be drawn since the line of motion of the objects cannot be confirmed. However, the reported E to W motion of the UFO's and their passing overhead coupled with the SE azimuth of the Sun would make the achievement of optimal Sun reflections rather difficult.

That the images could have been produced by aluminum foil "chaff"** seems possible, at least on the basis of the images shown, as very intense specular Sun reflections from ribbons of chaff might flare out to about the size of the UFO's.

Examination of film frames obtained from the photogrammetric experiment -- reference Analysis of Photographic Material, Serial 01, Appendix II -- show that no significant broadening is produced by flat white diffuse reflectors such as birds, bits of paper, etc. at f/16 under the conditions of the filming. Actual measurements show a slight "bleeding" or flaring of about 10% to 20%.

The rectangular flat white cardboards of the aforementioned experiments represented very roughly the configuration of birds. The light reflected by such a surface is probably greater than that from a curved feather surface of a bird.

*The images on the "Utah" film appear to be a little brighter. However, possible variations in development techniques would not allow quantitative analysis in this regard.

**Bits of aluminum foil dumped overboard by planes, often utilized as a countermeasure against antiaircraft radar. This material might possibly be in the form of large ribbons several feet long and several inches across.

One figure shows the appearance of one and two foot birds* as they might appear on a 16 mm frame taken with a 3" telephoto lens f/16 at a distance of 1,200', at 3,000' and at' 3,300'. Many of the images on the "Utah" film have an angular diameter of 0.001,2 radians (some as large as 0.001,16 radians), thus they might be interpreted as one foot (wing span) birds at 600' to 800', two foot (wing span) birds at 1,200' to 1,600' or three foot (wing span) birds at 2,400' to 3,200'. *At these distances, it is doubted if birds would give the appearance of round dots; also they would have been identifiable by the camera if not visually*. However, actual movies of birds in flight would have to be taken to completely confirm this

conclusion. The following type of gulls have been know to fly at times over this locality: California Herring Gull (a common summer resident), Ring-Billed Gull and-the Fork-Tailed Gull, see Reference (4).

The images are probably not those of balloons as their number is too great and the phenomenon of flaring up to a constant brightness for several seconds, and then dying out again cannot well be associated with any known balloon observations.

Certain soaring insects -- notably "ballooning spiders" (References (5) and (6)) produce bright-moving points of light. The author has witnessed such a phenomenon. It is produced by Sun reflections off the streamers of silken threads spun by many types of spiders. Caught by the wind, these streamers serve as a means of locomotion floating the spider high into the air. They occasionally have the appearance of vast numbers of silken flakes which fill the air and in some recorded instances extend over many square miles and to a height of several hundred feet. The reflection, being off silk threads, is not as bright as diffuse reflection from a flat white board. Thus no flaring of the images could be expected. The author noted that the sections of the "web" that reflected measured from ¼" to ½" for the largest specimens. Thus the images might be attributed to ballooning spiders at distances of 50 to 100 feet. However, these web reflections ordinarily show upon only against a rather dark background and it is doubted if their intensity would be great enough to produce the intense UFO images against a bright sky.

Besides the above remarks, pertinent to the actual images, several facts can be gleaned from the motion of objects. The observations are not apt to support the supposition that the objects were conventional aircraft as the maneuvers are too erratic, the relative accelerations probably ruling out aircraft at distances of over five miles. Several observers familiar with the appearance of chaff have seen the film and concluded that the persistence of the nontwinkling constellations, their small quantity, and the reported absence of aircraft overhead makes chaff unlikely. Furthermore, the single object passing across the field of view would be most difficult to explain on the basis of chaff. These same remarks would apply also to bits of paper swept up in thermal updrafts.

The relative angular velocity might be compatible with soaring bird speeds at distances of less than one mile, the angular velocity of the single object could be attributed to a bird within about one thousand feet. There is a tendency to pan with a moving object -- not against it -- so the velocities in the table probably represent a lower bound. *The motion of the objects is not exactly what one would expect from a flock of soaring birds (not the slightest indication of a decrease in brightness due to periodic turning with the wind or flapping) and no cumulus clouds are present which might betray the presence of a strong thermal updraft*. On the other hand the single object might represent a single soaring bird which broke away in search of a new thermal -- quite a common occurrence among gulls -- see Reference (7).

That the air turbulence necessary to account for their movement if they were nearby insects (even the single object's motion!) is possible, can be concluded from examination of Reference (8). However, if the objects were nearby spider webs the lack of observed or photographed streamers is unusual. Furthermore, the fact that they were visible from a moving car for several minutes is hard to reconcile with localized insect activity.

The phenomenon of atmospheric mirages, Reference (9), might conceivably account for the images. Such a hypothesis is hampered by the clear weather conditions and the persistence and clarity of the images. Also no "shimmering" can be detected and the motion is steady. Again the object which breaks away would be difficult to explain.

*The dimensions refer to wing spread. The actual exposed white area of a bird is usually less and depends upon the perspective of the observer. This difference has been roughly accounted for in the data given, however, if the body were the principal reflector the distance given should be reduced by a factor of 2 or 3.

It has been suggested that spurious optical reflections or light leaks in the camera might be responsible. Examples of such effects have been examined and found to be quite different from the UFO's (in the Utah Film).

The evidence remains rather contradictory and *no single hypothesis of a natural phenomenon yet suggested seems to completely account for the UFO involved*. The possibility of multiple hypotheses, i.e. that the Utah UFO's are the result of two simultaneous natural phenomena might possibly yield the answer. However, as in the case of the "Montana" analysis, no definite conclusion (as to a credible natural phenomenon) could be obtained.

THE APPLIED ASSESSMENT OF CENTRAL NERVOUS SYSTEM INTEGRITY; A METHOD FOR ESTABLISHING THE CREDITABILITY OF EYE WITNESSES AND OTHER OBSERVERS

by

Dr. Sydney Walker III

THE APPLIED ASSESSMENT OF CENTRAL NERVOUS SYSTEM INTEGRITY; A METHOD FOR ESTABLISHING THE CREDITABILITY OF EYE WITNESSES AND OTHER OBSERVERS

I. Statement of Reason(s) for Evaluation of the Subject
II. General Medical Evaluation
  A. Past History (medical, family, social)
  B. Review of Systems (i.e. cardiovascular, gastrointestinal, etc.)
  C. Physical Examination
  D. Selected Laboratory Studies (hematologic, urinary, biochemical)
  E. Summary of Positive Findings
  F. Probability (discussion plus creditability score) of Influence of General Medical Status on Observer Creditability
III. Neuro-ophthalmologic Evaluation
  A. "Eye" History
  B. Qualitative Ophthalmologic Examination: detailed, descriptive report
  C. Quantitative Neuro-ophthalmologic Investigation
    1. Photographs (color) of exterior eyes (gross)
    2. Goniometry
    3. Visual Acuity (quantitated)
    4. Color Vision (quantitated)
    5. Photographs (color) of the fundi (retina, optic nerve, etc.)
    6. Visual Fields by perimetry (quantitated)
    7. Ophthalmodynomometry (quantitated)
    8. Opticokinetic examination
  D. Summary of Positive Findings
  E. Probability (discussion plus score) of Influence of Neuro-ophthalmologic Status on Observer Creditability
IV. Neurologic Evaluation
  A. Neurologic History
  B. Neurologic Examination
  C. Pertinent Laboratory Studies (biochemical, toxic metals, etc.)
  D. Summary of Positive Findings
  E. Probability (discussion plus score) of Influence of Neurologic Status on Observer Creditability
V. Psychiatric Evaluation
  A. Anamnesis: Detailed History plus Exploration of Attitudes and Feelings (via interview)
  B. Mental Status Examination
  C. MMPI Testing (for corroboration and additional information about personality)
  D. Summary of Positive Findings: Psychiatric Evaluation and Character Assessment (with supportive data)
  E. Probability (discussion plus score) of Influence of Psychiatric Status on Observer Creditability
VI. Integration of Findings and Composite Assessment of Central Nervous System Functioning

A. Summary of Specific Abnormalities with a Discussion of Their Relation to Each Other and Their Multifactorial Contribution to Observer Creditability (plus an Overall Creditability Score)

[[152]]

I. Statement of Reason(s) for Evaluation of the Subject

The subject, Mr. C. F. McC. (Project #704), is a 37 year-old white Catholic single male who is a Tucson bank official. He was referred to us for screening on 17 November 1967 by the Tucson Police Department, following his 17 November 1967 (AM) report that he had seen a large, luminous disc in the northeastern sky for several minutes at 3 AM, the same date. His evaluation took place on 18 and 19 November 1967 as part of the Research Project on Anomalistic Phenomena.

II. General Medical Evaluation

A. Past History

Medical History: The subject says his general state of health has always been good, that he has no current physical complaints and has not seen a physician in the past five years.

Childhood diseases: Measles, mumps, chicken pox before the age of six. No complications.

Hospitalizations and Operations: a) Tonsillectomy in 1938 with a two day hospitalization, and no complications; b) Appendectomy in 1943 with four day hospitalization, and no complications.

Past illnesses: He denies having had a) tuberculosis b) venereal diseases c) pneumonia d) heart, kidney, and gastrointestinal problems e) neurologic or psychiatric difficulties.

Drugs: Only medication at the present time are non-proprietary sleeping pills ("Sleep Eze"). He has not ever been exposed to any toxic substances has never had to take any medication over a long period, and has never used any of the popular addicting drugs.

Family History: Father died in 1947 at age 58 from a "stroke". Mother died in 1959 at age 70 of unknown causes. She had had "asthma" for a number of years. There are six siblings, ranging in age from 29 to 43 (two older brothers and four sisters). All are alive and in good health. There is no family history of diabetes, hypertension, malignancy, epilepsy, migraine headache, psychosis, or tuberculosis. All of the males in the subject's immediate family (father, brothers, and subject himself) have been heavy drinkers.

Social History: Mr. McC. presently works forty-four hours per week as a junior executive for a local bank where he has been for the past five years. He lives alone in a boarding house. He has never married and presently doesn't date. His present residence in Arizona started approximately twelve years ago following his honorable discharge from the Army. During his two years in the Military Service, he worked in the finance office and achieved the rank of Corporal. The patient has smoked from one to two packs of cigarettes per day for the past twelve years and admits to daily "social drinking" (for clarification, see Section V, Psychiatric Anamnesis).

B. Review of Systems

Head: No history of trauma, loss of consciousness, headaches, or light-headedness.

Eyes: No double vision, blurred vision, flashing lights, spots, or halos around lights. No history of trauma or previous infection or excessive tearing. Recent onset of photophobia so troublesome that he wears sunglasses all the time on bright days.

[[153]]

Ears: No pain or discharge. No previous infections or trauma. No ringing, dizziness, or decrease in acuity.

Mouth: No difficulty with chewing or swallowing; no burning or biting of the tongue. No history of dental problems.

Nose: No nosebleeds, trauma, difficulty with smelling or post-nasal discharge.

Neck: No history of trauma, difficulty swallowing; no limitation of motion, no pain, sense of fullness, uncontrolled movements, or stiffness,

Cardiorespiratory: No difficulty breathing, shortness of breath or chronic cough, no bloody sputum, night sweats, palpitation, or exertional dyspnea. No lightheadedness on getting up, no chest pain.

Gastrointestinal: No nausea, vomiting, constipation, or diarrhea. No abdominal pain, no history of bloody stools or changes in color of stool. No history of hemorrhoids or rectal surgery.

Genitourinary: No dysuria, pyuria, or hematuria. No nocturia, no costovertebral angle tenderness. No penile discharge or sores.

Endocrine System: No polydipsia or polyuria. Recent waning of appetite, however, associated with his depression of the past two months. No history of increase of hat, shoe, or ring size. No excessive sweating, heat intolerance, or loss of hair. Sexual difficulties described in Section V (Psychiatric Anamnesis).

Allergic and Immunologic: The subject denies sensitivity to any foods or drugs. He has had no rashes of a protracted nature. He has been immunized for smallpox, tetanus, diphtheria, and polio (without adverse reactions).

C. General Physical Examination

General Appearance: The subject is of medium build, weighs 149 lbs. and is five feet eleven inches tall. He has dark brown hair, is light-complexioned, appears well-nourished and hydrated.

Vital Signs: Blood pressure; 140/80 right arm, 145/85 left arm. (On standing the pressure in each arm dropped 10 mmHg. immediately and then returned to normal). Temperature: 98.6; Respirations; 20 per minute; Pulse; 90 per minute and regular.

Skin: His face is ruddy with mild malar telangiectasia bilaterally. There is no evidence of jaundice, cyanosis, or pallor. Hair distribution and texture is normal. His nails are of good texture and clean. No scars or other skin lesions are present.

Head: Normocephalic; no exostoses, tenderness, or bruits.

Eyes: No ptosis, exophthalmous, enophthalmous or scleral pigmentation. Mild conjunctival injection bilaterally (for detailed examination and review, see Section III, Neuro-ophthalmology).

Nose: No inflammation or discharge; both nostrils patent; no sinus tenderness.

Ears: Normal external configuration, no tophi discharge or tenderness. Both external canals clear; tympanic membranes are glistening.

Mouth: No fissures, inflammation or ulceration around the lips. Oral mucosa is clear and pink. Teeth are in good repair. Tongue shows moderate degree of cigarette stain. Papillae appear normal.

Throat: No ulceration; moderate injection of posterior pharynx (consistent with heavy smoking). No tonsils present.

Neck: Supple; trachea midline; carotids of good quality bilaterally without thrills or bruits. No venous distension, masses, or tenderness.

Thorax: Symmetrical; breasts normal for male without masses or axillary adenopathy. No increase in A-P diameter; fair diaphragmatic excursion.

Lungs: Few dry, basilar rales which cleared upon coughing. Otherwise, clear. No fremitus, ronchi, or hyperresonance.

Heart and Vessels: Maximum pulse at 5th intercostal space; regular rhythm; no murmurs. There is no evidence of varicosities, stasis, or ischemia.

Abdomen: Moderate protrusion of abdomen with liver edge felt in right upper quadrant, 2 cm. below the costal margin (sharp edge, non-tender, non-nodular). No other organomegaly or masses. No rebound or direct tenderness. Normal bowel sounds. No ascites or costovertebral angle tenderness.

Rectal: No hemorrhoids or masses, or tenderness. Good sphincter tone; stool guaiac negative.

Genitourinary: Normal uncircumcized male phallus; no evidence of scars or chancres Testes are descended bilaterally, of normal consistency and non-tender.

Extremities: No limitation of motion or deformity. No inflammation or ulceration. No clubbing or peripheral edema.

Neurological: See Section IV. (Neurologic Evaluation).

D. Selected Laboratory Studies

	Normal	Subject
Hematology:		
Hematocrit	40 - 54%	42%
Hemoglobin	14 - 18 Gm.%	14.50%
RBC	4.5 - 6.2 mill/cu.mm	5.5 mil/cu.mm
Sed. Rate	less than l0mm/hr.Wintrobe	18 mm/hr.
White blood cell count	5 - 10,000 cu./mm.	12,000 cu/mm
Segmented neutrophiles	40 - 60%	45%
Band neutrophile	0 - 5%	4%
Lymphocytes	20 - 40%	40%
Monocytes	4 - 8%	7%
Eosinophiles	1 - 3%	4%
Basophiles	0 - 1%	0
Myelocytes	0	0
Non-specific Chemistries:		
Sodium	136 - 145 mEq/L.	135 mEq./L.
Potassium	2.5 - 4.5 mEq/L.	3.0 mEq./L.
Chloride	100 - 106 mEq/L.	98 mEq./L.
Carbon Dioxide content	24 - 29 mEq/L.	29 aEq./L.
Liver Function Tests:		
Bilirubin (Van den Bergh)		
Direct	0.1 - 0.4 mg./100 ml.	0.7 mg./l00 ml.
Indirect	0.2 - 0.7 mg./100 ml.	0.9 mg./l00 ml.
Alkaline phosphatase	2 - 4.5 (Bodansky units)	5.8
Albumin/Globulin	3.5 - 5.5Gm%/1.5 - 3Gm%	3.2/3.6Gm.%
Endocrine Studies:		
PBI	4 - 8 microgram/100ml.	6.2
T-3 Uptake	10.3 - 14.3 units	11.9 units
Glucose (Polin)	80 - 120mg./ml.	100mg./ml.
Cholesterol	150 - 280mg./100ml.	205mg./100ml.
Renal:		
Blood Urea Nitrogen	8 - 20 mg./l00ml.	11mg./100ml.

Urinalysis:
Grossly amber and clear. Specific gravity: 1.015. pH: 5.5; albumin: negative; glucose: negative; acetone: negative.

Microscopic:
WBC/HPF - 0-2
RBC/HPF - 0-1
No casts seen. Amorphous urates (moderate amount) present.

[[155]]

E. Summary of Positive Findings

1. History of chronic alcoholism and heavy smoking.
2. Recent photophobia.
3. Hepatomegaly, with ruddy complexion with malar telangiectasia.
4. Effects of smoking: tobaccco-stained teeth, injected posterior pharynx, and basilar rales.
5. Abnormal liver function studies: Bilirubin elevated in both direct and indirect fractions; elevated alkaline phosphatase; decreased albumin and elevated globulin (reversed A/G ratio).

F. Discussion and Creditability Score

The subject has definite changes of early alcoholic cirrhosis. At this point in time the toxic effects of his liver pathology would be expected to be exerting only a mildly adverse influence on overall central nervous system functioning.

Such effects, however, would serve to aggravate any already existing neurological and/or psychological problems.

Creditability Score 75%.

[[156]]

III. Neuro-ophthalmologic Evaluation

A. "Eye" History

Subject denies previous history of transient blindness, blurred vision, double vision, spots or shadows before his eyes or protracted pain in his eyes. His last eye evaluation was 20 years ago. This was during high school and was prompted by headaches when reading. Reading glasses were prescribed at that time and he wore them for approximately eight months and then discarded them. He denies any eye problems since that time. He states that both his parents wore glasses only for reading and that none of his siblings wear glasses. He states also that his father developed glaucoma at age 55 and was required to use eye drops to keep it under control.

There is no history of trauma or infection in the past five years. On questioning, the patient acknowledges a mildly irritating tearing which he has noticed for six to eight weeks, associated with a slight mistiness of his vision. He also has been wearing sunglasses on bright days for the same period because the sunlight hurts his eyes.

B. Qualitative Ophthalmologic Examination

Subject is right eye dominant. There is no evidence of structural abnormality, trauma, or ptosis (see photo in Section III C 1). The palpebral fissure is of normal shape and size. The cornea is clear bilaterally but the conjunctivae show a moderate degree of injection, without discoloration. The sclerae are also clear without abnormal vessels or pigmentation. The iris is bilaterally brown. The pupils are symmetrically round, equal, and both 4mm. in diameter. They reacted to light sluggishly and responded to accommodation directly and consensually (see Fig. #l). The extra-ocular muscles function normally. There is no image separation upon red glass testing. There was no nystagmus either horizontally or vertically.

Funduscopic examination reveals a poor red reflex bilaterally. There are no apparent floaters or other opacities in the vitreous. The disc shows sharp margins bilaterally but the normal physiologic cupping is absent. There is a pale quality to

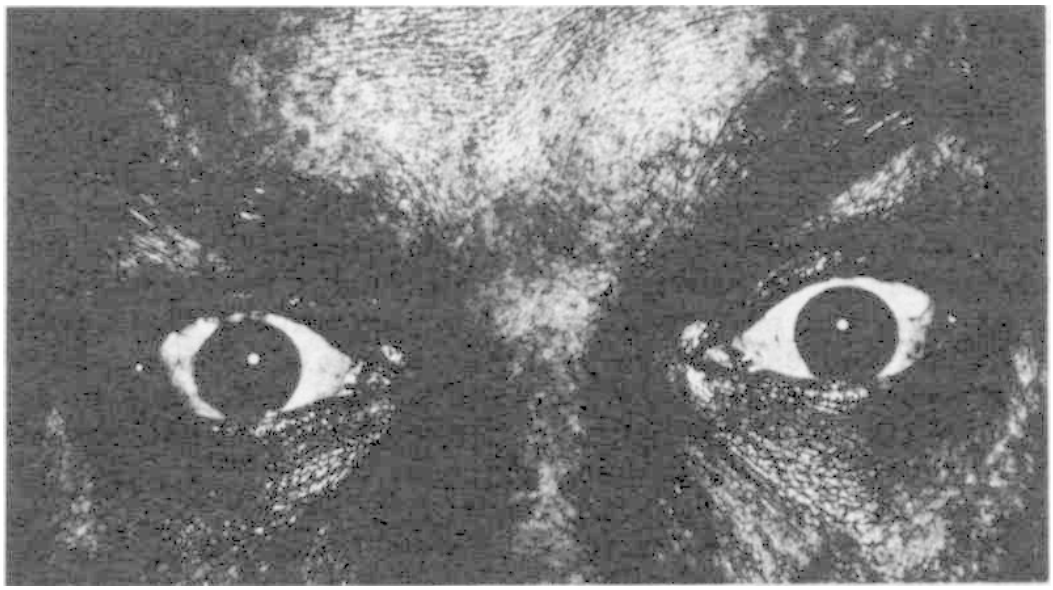
the nerve head. Both retinae show a confluent mottling which completely obscures the macula. There are no hemorrhages or exudates. The arteriovenous ratio is approximately 5 to 1.

Gross confrontation shows no apparent field cuts and no extinction to bimanual visual stimuli.

C. Quantitative Neuro-ophthalmologic Investigation

1. Photographs of exterior eyes (gross):

(Taken with a Zeiss 1.5 F. lens from 15 cm. using stroboscopic lighting). The conjunctival injection is visible; the absence of pigmentation, the state of the pupils, and the axis of the eyes are clearly visible.

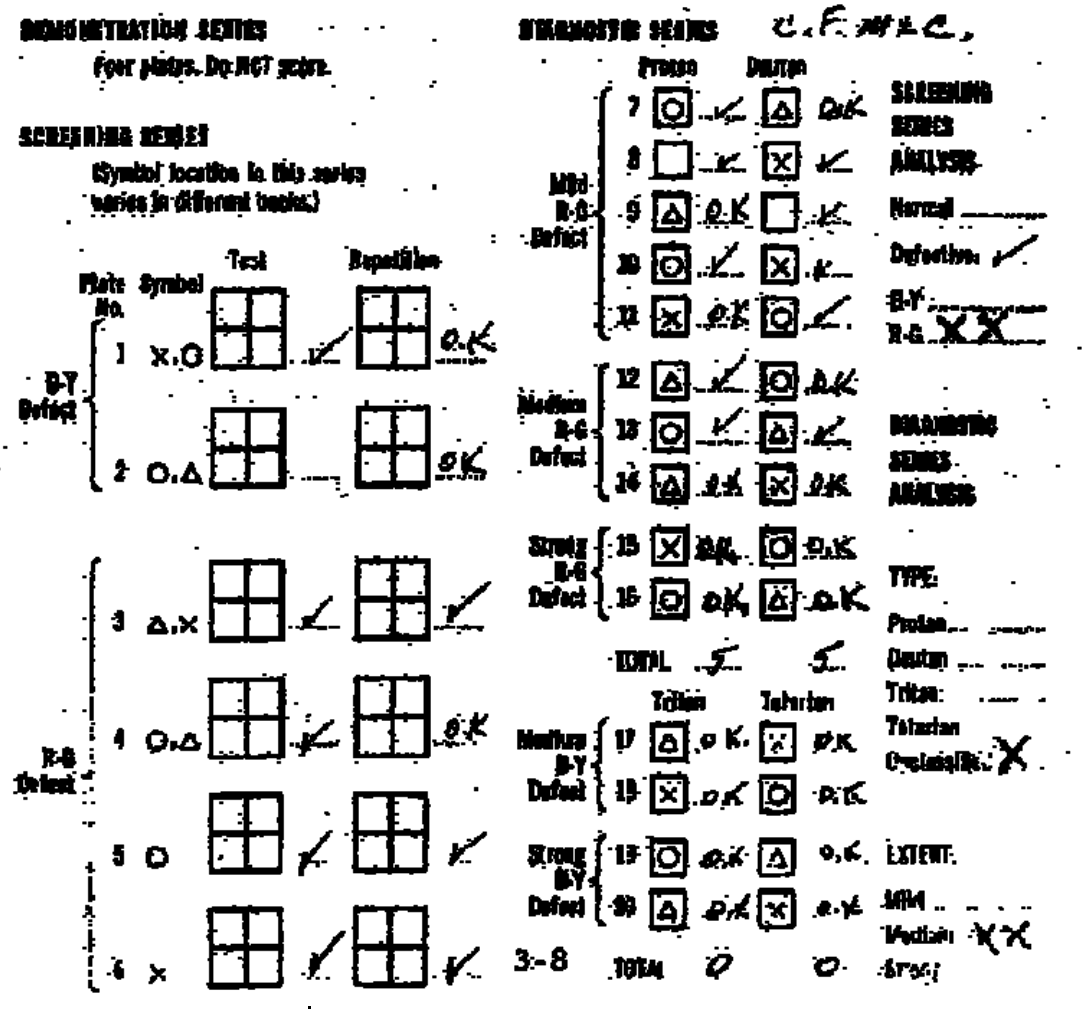


[[157]]

2. Goniometry: The intraocular pressures have been measured with a Schioetz Tonometer. The readings were taken three times, on 19 November 1967, at 10:30 AM (two days after the subject had seen the light).

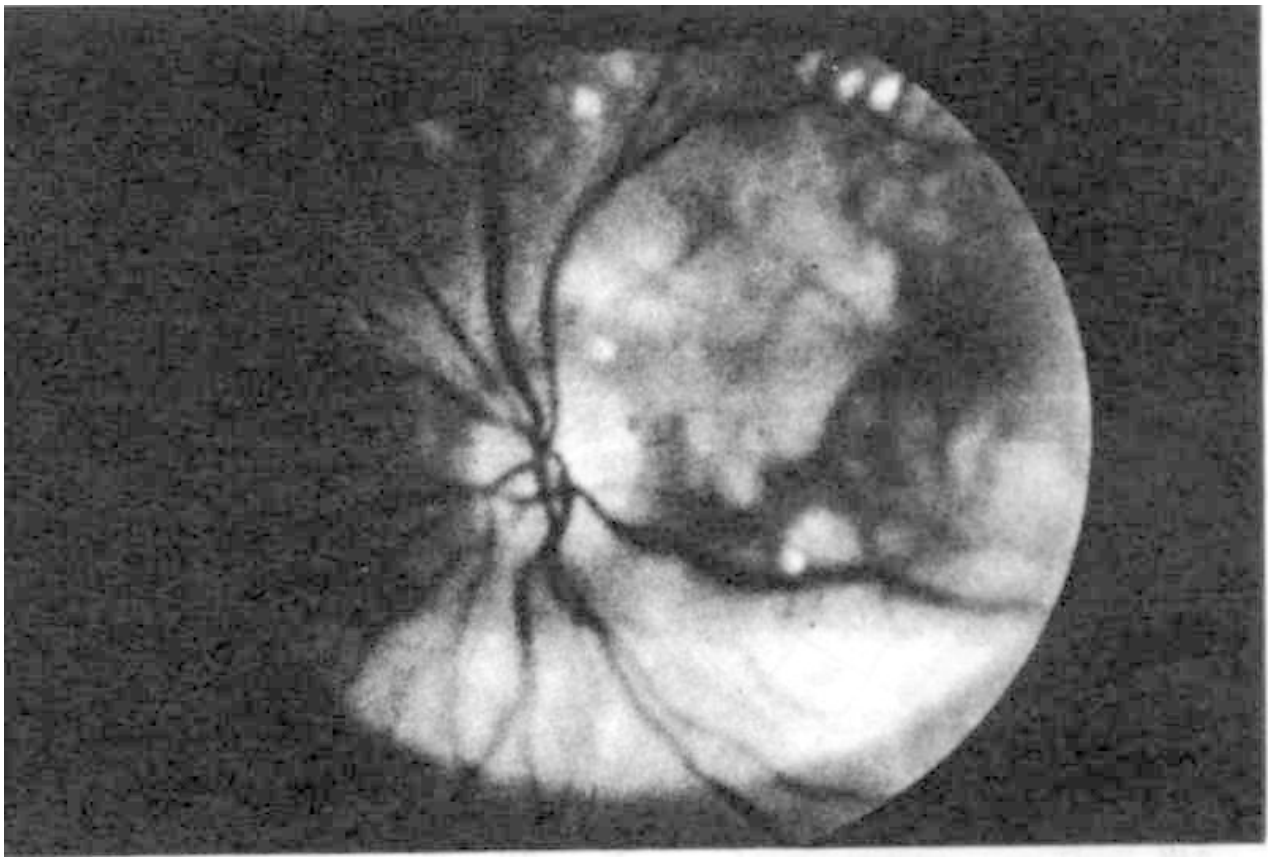
	Right Eye	Left Eye
#1	18	20
#2	21	17
#3	19	19

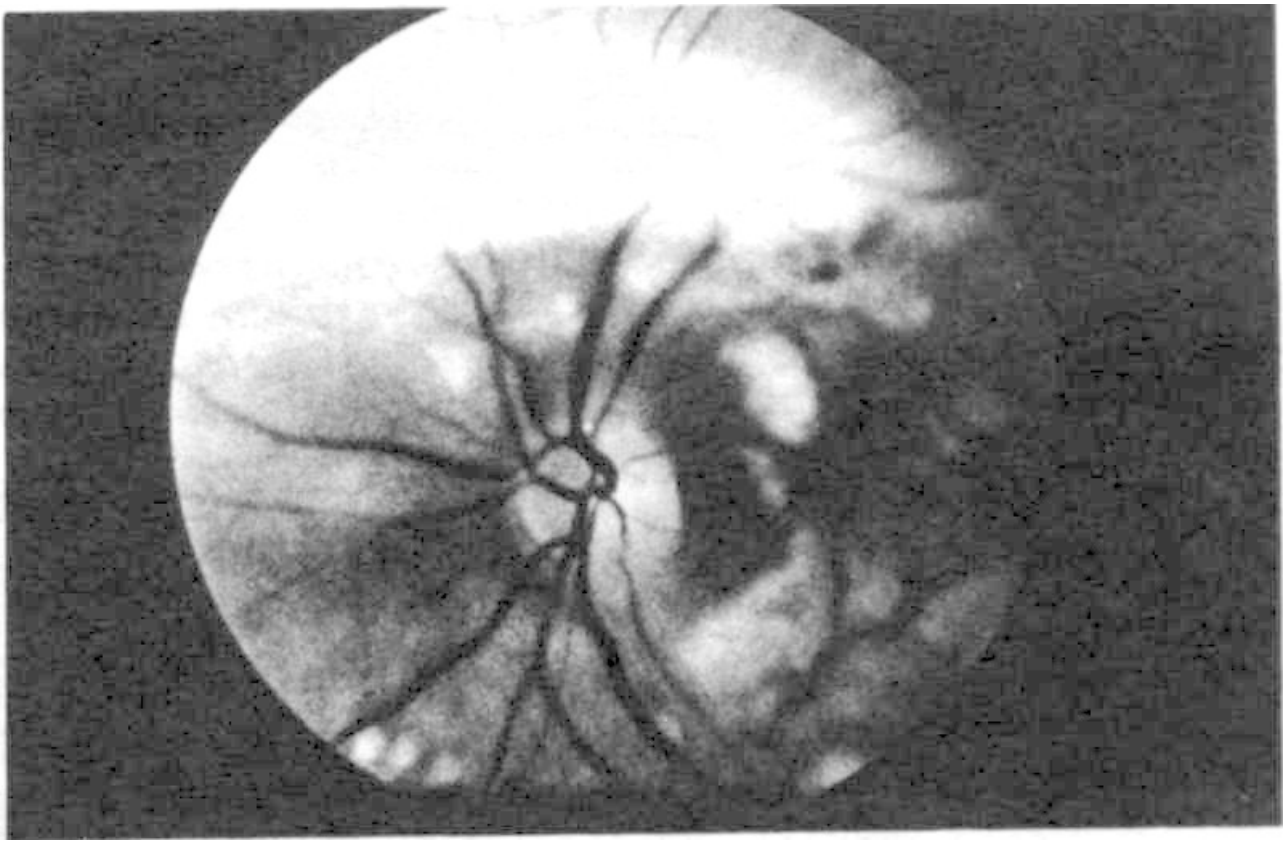
3. These consistently normal pressures would dictate against the presence of glaucoma.
4. Visual Acuity: Using the modified Snellen Charts, the right eye showed an acuity of 20/30 and the left eye of 20/35.
5. Color Vision: (Measured with the American Optical Pseudoisochromatic Plates in 60 footcandles of light): moderate red-green dyschromanopsia was revealed about which the patient claimed he had no previous awareness.



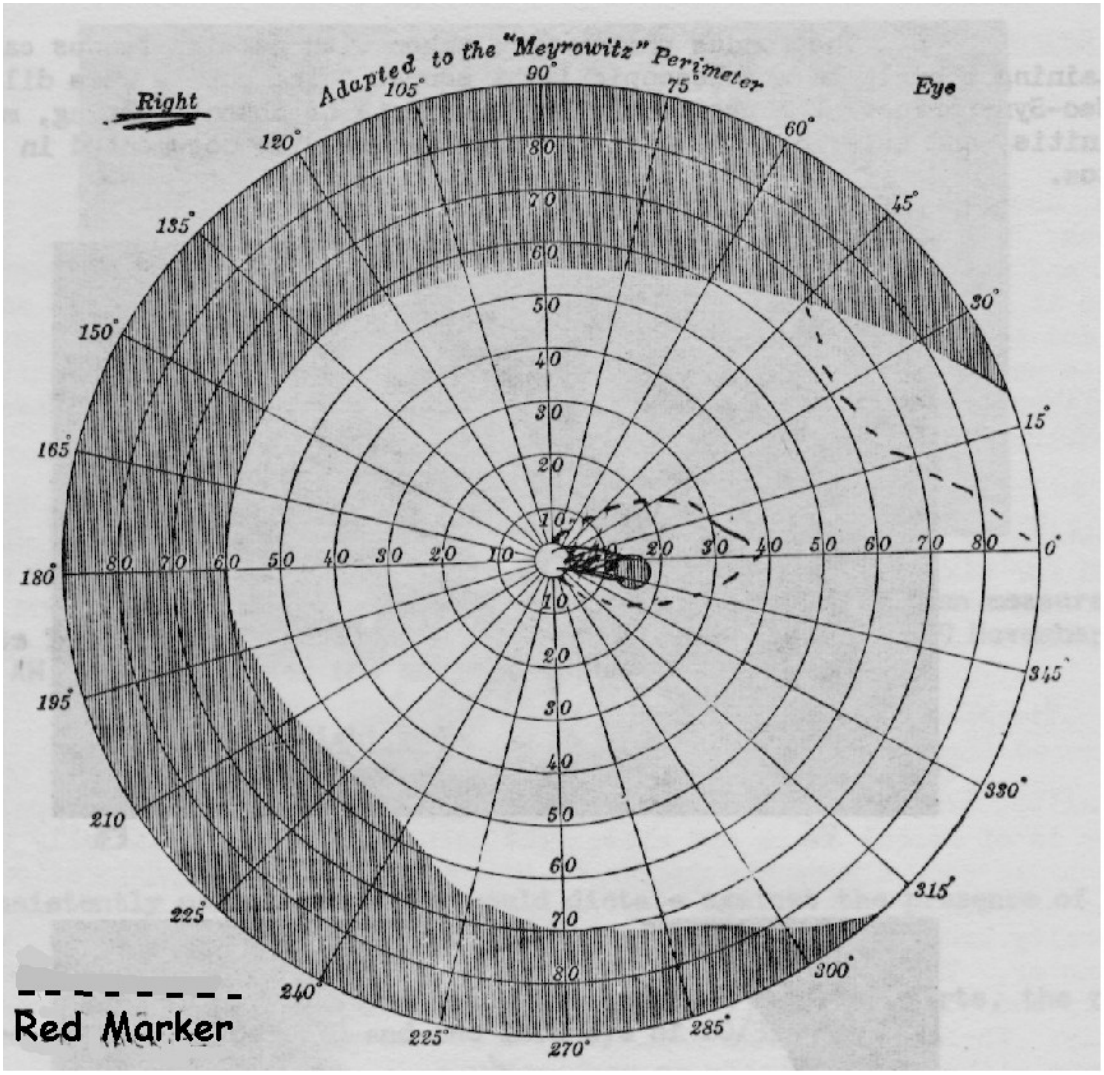
[[158]]

5. The fundus photos were taken with a Zeiss fundus camera containing a built-in stroboscopic light source. The pupils were dilated with 1% Neo-Synephrine. The previously noted defects of absent cupping, mottled retinitis, and arteriovenous disproportion are readily documented in these photos.



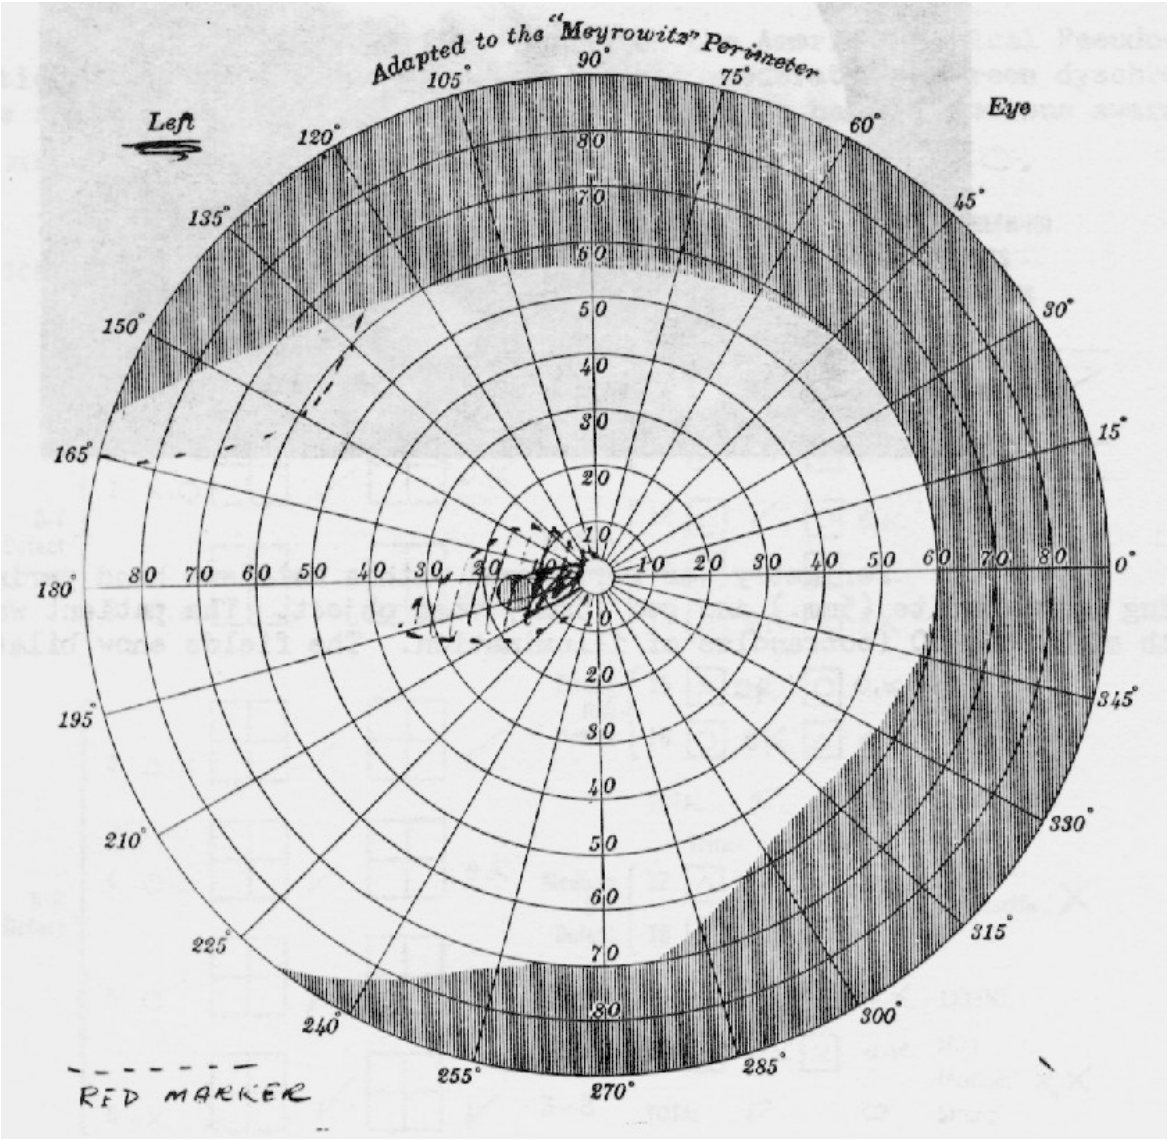


6. Perimetry was performed with a Matalene hand perimeter, using both a white (5mm.) and red (5mm.) test object. The patient was tested both at 50 and 10 footcandles of illumination. The fields show bilateral



Perimetry Diagram, Right Eye

.



Perimetry Diagram, Left Eye

[[160]]

centrocecal scotomata larger for the red object than for the white. There is a superior temporal quadrant defect bilaterally of approximately 30° with the red object stimulus which is not present with the white object. In reduced illumination the subject is completely unable to see any of the test objects.

7. Ophthalmodynomometry was performed with a Cuilbert-Routit dynomometer (using 1% Pontocaine anesthetic) with direct vision of the end point O.D.: 70/30 units; O.S.: 65/30 units. There were no carotid bruits or thrills; the simultaneous systemic blood pressure was 140/80 sitting and 130/80 standing.
8. Opticokinetics (using a one meter by ten centimeter red background cloth with a 10 cm X 8 cm. white check) was performed at a distance of one meter horizontally bilaterally and vertically. The nystagmus response in all directions was normal.

D. Summary of Positive Findings

1. A history of 6-8 weeks of tearing, misty vision, and photophobia.
2. A pale optic nerve with absent cupping; sluggishly reacting pupils; impaired red light reflex.
3. Confluent retinal mottling, obscured macula, mild red-green dyschromanopsia.
4. Bilateral centrocecal scotomata; bilateral superior temporal quadrantanopsia (for red stimulus only. Vision in decreased light (10 foot-candles): grossly impaired to absent.

E. Discussion and Creditability Score

The definite retinitis, field defects for red vision, and red-green dyschromanopsia, along with a history of tearing, misty vision, and photophobia are all consistent with the diagnosis of tobacco-alcohol amblyopia (Ref. 1). This condition is also supported by the findings in the General Medicine Evaluation, where other effects of excessive smoking and alcoholism are evident.

The subject's retinal pathology is severe; in terms of the specific event he claims he saw, it is extreme. His "sighting" is highly unlikely because he attaches both color and shape to it in the face of specific deficiencies in each of these areas. His attestation about seeing the object best when looking straight at it (see Psychiatric Anamnesis) is uncreditable because his central macular vision has been so severely compromised by retinitis. It is conceivable that what actually happened is that he 1) received a transient visual stimulus (i.e., car or airplane lights) which 2) set off some abnormal receptor firing in a damaged retinal area and 3) in turn was misperceived.

Creditabillty score 5%.

Ref. 1 Walsh, P.B.: Clinical Neuro-ophthalmology, Williams & Wilklna, Baltimore 1957, p. 1182.

IV. Neurologic Evaluation

A. Neurologic History:

Subject is right-handed and denies any degree of ambidextry. He denies periods of euphoria, uncontrolled behavior or delirium. He denies recent changes or difficulty with dressing, eating, or writing. He states that he does not feel that he has recently become clumsy or weak. He said he had never had the experience of deja-vu episodes or of performing acts over which he had no control and no unpleasant tastes or odors that he couldn't explain. He states that he is not aware of any increased difficulty in expressing himself or understanding the speech of others. He has no problem with calculation or with seeing objects as smaller or larger than they really were. He is not aware of any difficulty with color vision, flashing lights, or other forms of visual hallucinations.

He admits to headaches which occur after he has been drinking heavily; these have been decreasing in frequency. He states that he has never lost consciousness (with associated tongue biting, incontinence, or period of confusion upon awaking). He denies trauma or infections of his head, eyes, ears, or neck.

B. Neurologic Examination:

Mental Status: See Section V (Psychiatric Evaluation).

Cerebellar Function: Finger-to-nose and heel-to-shin intact; rapid alternating movements are rhythmical and coordinated; no awkwardness or other abnormalities in any gross or fine movements. Foot dexterity and Figure eight test are performed without difficulty. No broad-based gait or ataxia noted.

Cranial Nerves:

I Olfactory: Each nostril perceived cloves (stimulus was identified with patient's eyes closed).

II Optic Nerve: Reported in detail in Section III (Neuro-ophthalmology).

III, IV, VI Nerves: See Section III (Neuro-ophthalmology).

V Trigeminal: All sensory divisions are intact to pin prick. The corneal reflex is present bilaterally and equally. The masseter and pterygoid muscles show equal strength of good quality. The jaw jerk is normal.

VII Facial Nerve: There is no asymmetry of the resting facial muscles. There is no weakness or asymmetry upon raising the eyebrows, closing or opening the eyes, or showing the teeth. Taste was intact bilaterally for sugar and salt.

VIII Acoustic:

a. Cochlear Portion: Patient perceives normal conversation without difficulty. Weber and Rinne testing show no lateralization. Air conduction is greater than bone conduction.
b. Vestibular Portion: There is no abnormal nystagmus, past-pointing, or veering when walking.

IX, X Glossopharyngial and Vagus Nerves: The palate is midline and freely movable, with bilaterally equal elevation on stimulation. Gag reflex is intact bilaterally. No difficulty in swallowing and no regurgitation occurred when swallowing water.

XI Accessory Nerve: The trapezius and sternocleidomastoid muscles have good strength, without fasciculation, atrophy, and spasm.

XII Hypoglossal Nerve: The tongue protrudes in the midline; there is no evidence of atrophy or fasciculation; there is good strength in both directions. There is no difficulty with articulation and no dysarthria.

Sensory Examination: There is no impairment of vibration sense, position, pain, or light touch.

Deep Tendon Reflexes:

Pectoral (C6-8): +2 bilaterally
Biceps (C5-6): +3 bilaterally
Radial Pronator (C6-7): +2 bilaterally
Triceps (C7-8): +3 bilaterally
Finger Flexion (C7-T1): +2 bilaterally
Deep abdominal (T6-12): +2 bilaterally
Pubo-adductor (L2-4): +1 bilaterally
Patellar (quadriceps) (L2-4): +3 bilaterally
Hamstring (sciatic nerve) (L4-S2): +2 bilaterally
Ankle jerk (gastrocnemius) (S1-2): +2 bilaterally
Gluteal (L4-S2): +2 bilaterally

Superficial Reflexes:

Plantar reflex; both great toes are unequivocally down-going (flexon). Chaddock, Oppenheim, and Gordon reflexes are also down-going. Superficial Abdominals react equally bilaterally.

Motor Function:

Good strength both proximally and distally in upper and lower extremities. Wrist flexors and extensors are equal bilaterally; grip is strong bilaterally.

Other Cortical Tests:

Frontal Lobe: No suck, grasp, snout, or palmomental reflexes.
Temporal Lobe: No hemianopsia on confrontation.
Parietal Lobe: No stereognosis, bimanual extinction, or impaired 2-point discrimination.
Occipital Lobe: See Section III (Neuro-ophthalmology).

Autonomic Function: There is no abnormal sweat level and no flushing is in evidence.

C. Pertinent Laboratory Studies

	Normal Value	Subject
Blood:		
Calcium	9 - 11 mg/100 ml.	9.3 mg/100ml.
Phosphorous	3 - 4.5 mg/100 ml.	4.0 mg/100ml.
Magnesium	1.5 - 2.5 mEq./L.	1.6 mEq./L.
Barbiturates	less than l0mm/hr.Wintrobe	18 mm/hr.
a) long-acting	less than 5 mg/100 ml.	none
b) short-acting	less than 1 mg/100 ml.	none
Dilantin	none	none
Bromides	1 - 2 mEq./L.	3 mEq./L.
Carbon Monoxide (Carboxyhemoglobin)	less than 5%	none
Urine:		
Coproporphyrins	none	none
Uroporphyrins	none	none
Lead	0 - 0.12 mg/24hr.	none
Arsenic	0.1 mg/liter	none
Mercury	10 micrograms/24hr.	none
Salicylates	none - 30mg/100ml.	none
Ethyl Alcohol	none	none
Phenothiazines	none	none
Alkaloid screening		
a) atropine	none	none
b) ergotamine	none	none
Serologic Test:		
FA-ABS (Fluorescent Treponemal Antibody Absorption Test)	negative	negative
Brucella Agglutination	negative	negative
Coccidiomycosis	negative	negative

D. Summary of Positive Findings
1. Optic Nerve changes: (see Neuro-ophthalmologic Evaluation).
2. Bromides and atropine detected in urine.
3.

E. Discussion and Creditability Score:

Since the head of the optic nerve (disc) is directly visible for examination, its state is often used as a reflection of the condition of the other nerves. It can be reasonably conjectured that the same metabolic or toxic insults that have produced the abnormal appearance of the subject's optic nerve are also subtly influencing his other nervous system functioning (even although no gross neurologic signs can be elicited). One likely effect of such changes would be increased irritability and associated behavioral effects. These would also be expected to occur as a result of the bromide or atropine toxicity (associated with the subject's excessive use of non-proprietary sleeping medication).

In this case, the subject's abnormal liver function (reversed A/G ratio, etc.) increases the danger of such toxicity because of his impaired ability to bind, detoxify, and excrete both bromides and atropine. Hallucinations are among the outstanding toxic effects of both these drugs (Ref. 2). It would thus not be unlikely that the contents of the sleeping pills have not only contributed to the subject's current psychic disequilibrium but have specifically affected his propensity to "see things".

Creditability score 75%

[[164]]

V. Psychiatric Evaluation
A. Anamnesis

The subject was seen for psychiatric evaluation on each of two successive days for one and a half hour interviews. The first interview took place 36 hours after he had seen the luminal object. He is aware of why he is being seen, says he "doesn't mind a bit", but feels nervous because he doesn't know exactly what he will be "expected to tell" about himself.

He came to live in the Tucson area 12 years ago because of his widowed mother's failing health and a doctor's recommendation that she move from East Boston (where they had always lived) to a drier climate. Since her death 9 years ago, he has carried on alone, at first in their apartment and then in a boarding house where his meals are prepared and his laundry is done for him. Although he is not enthusiastic about his living arrangement, he seems quite proud of his association with a branch of the local bank. In the past five years, he has advanced from assistant bookkeeper to teller to head teller to the banks' real estate loan section, of which he has been the chief for a week. He says that it was five days after he had assumed this new responsibility that he saw the "odd light in the sky".

He describes the scene as follows: He had been having trouble getting to sleep for two months (doesn't know why) and this particular night was no exception. Although he had taken several "Sleep-eze" tablets, he still felt edgy and very wide awake at 2:30 AM. So he got up from bed to get a cigarette and a shot of bourbon. He then sat facing his closed window and gazing out, preoccupied, for about half an hour. He remembers everything seemed very still and quiet but can't recall what he was thinking about. About 3 AM he became vaguely aware of a new light near the mountains off to his left (northeast).

It seemed to be moving toward his direct line of vision and as it did so became increasingly vivid. The light was a diffuse, pale, yellow-green color. It seemed very large (twenty to thirty times the size of an airplane at the same distance) and its shape was like that of a humped disc that was flat at the bottom. At times, it seemed to be hardly moving at all, at others it bobbed up and down as if from a breeze. He felt peculiarly drawn to it and seemed unable to avoid looking at it. When he tried to glance to either side of it, the disc seemed to fade, and he felt almost as though his direct gaze was the only thing holding it there. At the same time, he felt almost as though he were being called upon by it to stare. Afterwards, upon reflecting, he decided that it was the unusual nature of the object that had created these peculiar feelings in him.

After a couple of minutes it seemed less bright and looked like it was beginning to move away. At that point he felt as though he wanted to follow it. By the time it had completely faded away, he felt a little sad, lonely, hopeless, or something, he's not sure which.

It never occurred to him to call anyone else's attention to the light (probably because of the late hour, he says) and he was surprised to be asked about that by the police the next day. He says, however, that anyone in the city who was looking in a northeasterly direction at the right time that

[[165]]

night couldn't have missed that light. Although it was an unusual sight, it seemed very real to him and is still very vivid in his mind. He had never seen anything like it before and in fact had never previously had the occasion to report anything whatever to the police. He says that the only reason he had reported seeing the light was a sense of duty, after he had read in the morning paper that someone else had also seen an unusual object in the sky on the same night.

The patient was the youngest male and third youngest child among seven siblings born in Boston into a lower class urban situation, during the Depression. His father, Irish by heritage, was an occasional bartender who was rarely home, paid little attention to his children, and is best remembered as "scary" because of his violently angry outbursts at the mother when he had been drinking. The patient's early memories include 1) a scene in which his forlorn-looking mother is bending over a tub scrubbing clothes in an icy cold kitchen and 2) an episode in which his oldest sister snatched his doll away from him but was later made by the mother to return it. It is that same sister whom he now visits during his vacations; she is married but childless and still lives in Boston. He would like to live permanently with her, if her husband were better dispositioned. His other sisters all have children, and it makes him nervous to be around them.

He says he always got along better with his sisters than his brothers and has not kept in touch with any of the latter. He has never had many friends; even as a boy, he was a "loner" and a "homebody" who was more than once called a "mamma's boy" by his peers. He didn't involve himself in school athletics or neighborhood games because he seemed to be so clumsy, but did sell newspapers in another part of the city for several years for the sake of the family budget. His leisure hours were spent reading and re-reading old comic books, making up stories about his adventures with Ali (a make-believe playmate from whom he was inseparable until he was 12), and helping his mother in various ways.

It is still difficult for him to talk about his dead mother, although he says he thinks about her all the time. Painfully, he revealed that he feels he was never a good enough son to her, that he had wanted to make up to her for all her hardships at the hands of his father but that he had never been able to fill a certain void for her (despite his long-term devotion and protectiveness).

He tends to blame himself in a sense for her death and says that it is his fault that she spent her final days so unhappily far away from all her other children; apparently, he had insisted that she follow her doctor's advice and took her west for the sake of her "asthma" condition. She had died on her seventieth birthday. He didn't know the cause. He had come home and found her on the floor of their Tucson apartment near the phone (which was off the hook). It had been 7 PM when he had arrived, having stopped for a couple of drinks at the neighborhood bar. He says he still gets sick to his stomach when he thinks about how he was sitting in that bar while she was dying and trying to reach him.

He remained in Boston, unemployed, for six months after the funeral, during which time he slept a lot, ate little, and hit the bars more often than usual. By the time he could bring himself to face Tucson and the apartment again, he had lost his accounting job.

For three months, he worked as a grocery store clerk (in order to pay his angry landlady for accumulated rent) but found the work intolerably fatiguing and took a switchboard job which he did for the three years prior to going to the bank.

His bank work record has apparently been very good. He has taken only two sick days in the entire five years and is never late. Frequently, he wakes up in the morning feeling as though he can't make it to work, but his respect for and sense of responsibility to the institution itself (rather than to any superior or individual person) always win out.

He has no close friends where he works, although he occasionally takes lunch with one of the younger male tellers. His female co-workers irritate him; they seem coarse and loud. Some of the single women tease him about having a mistress (which he doesn't), but he doesn't know where they got that idea. In fact, he doesn't date at all and hasn't for several years now. He guesses it's because he doesn't seen to come in contact with women who are his type (sweet, quiet, feminine). Nor does he seek out partners for intercourse. With considerable embarrassment, he explains that while he was in the Army 13 years ago, he had tried on three separate occasions to have sexual relations with a girl he liked but had been unable to sustain an erection. Part of the problem at the time seemed to be a preoccupation with his mother and how disappointed she would be in him if she knew what he was doing with this girl. Since then, he has not tried to have intercourse again. He says it is not because he is afraid of failure or embarrassment, but more because for him it is a dispensable activity.

The closest he ever gets to a woman is the back row in a local bar where he likes to watch the performance of a certain belly dancer (his mother was half Syrian). He doesn't know her personally, but something about her arouses him. Whenever he masturbates in his room (approximately once a week), he pictures her face and upper torso in his mind's eye; at the same time, he imagines himself removing her round, plastic, chartreuse nipple covers, which seems to be the one thing that will lead to his having an occasional ejaculation. He has felt very upset with himself for masturbating ever since he first did it at the age of 16. This examiner and his old Army buddy are the only people to whom he has ever

acknowledged any such activity. He says he still cannot help but feel that it is an unnatural, perverted practice. Sometimes he wonders whether he is driven to it by a hormone problem or whether it is because of a mental sickness of some kind. He used to think that he would not ever be fit to touch a woman if he masturbated. He says he has never been involved in any homosexual activity, although his Army buddy had once suggested it to him.

His leisure hours are spent watching TV in the bar or in his room, going to movies, either alone or with someone at the boarding house, and reading an occasional magazine story. He likes to sunbathe on his porch on the weekends. He says that he still enjoys making up adventure stories and keeps adding to an on-going serial in which he is the only person living in a desert oasis where he gets into various predicaments and is rescued and nursed back to health by lovely, gracious women who happen to pass by. He never dreams, he says, and doesn't think he ever has.

[[167]]

He says he rarely gets angry because he doesn't like the feeling. Once a man in a bar began saying insulting things to him, unprovoked, and then took a swing at him but the bartender had intervened. He was just plain scared in that situation and relieved when the tension had abated. A long time ago he had felt like hitting his brother-in-law when the latter had said something or other cruel to his sister (but instead had walked out of hearing range). He had felt intensely, inexplicably angry for several days at age 16 when his father died of a stroke; he remembers wishing he could destroy everything in sight by kicking and pounding it to pieces.

He doesn't see himself as particularly depressed and has no suicidal thoughts, although he acknowledges that after his mother's death, he wished he could have died with her or instead of her. He never has fantasized actively taking his own life, however, and feels it would be very wrong to do so. He does say he feels nervous a lot, especially in the last two months and that certain things upset him more than they used to. For example, noisy laughter at work or in a bar is so unpleasant lately that he usually tries to find an excuse to leave the room. He feels increasingly impatient, particularly in waiting lines, and says he has jumped from smoking one to two packages of cigarettes a day. For the first time in his life he finds himself wishing he could take a whiskey break in the middle of the work day; he then gets preoccupied with the taste of whiskey and with thoughts of how good swallowing it would feel.

After work, he always stops by a certain bar near the house and has from two to five quiet bourbon and waters before returning home. Now, he stays longer at the bar and arrives at the boarding house well past the dinner hour. This is because he isn't hungry, usually, is sick of the food, and finds the commotion at the dinner table disturbing. He does feel he is treated with more respect and deference at the boarding house than he needs or deserves. About his insomnia, he says simply that one pill helped until about a month ago but that lately he has been taking four or five over a two-hour period with no appreciable effect.

He claims he has no notion as to why he should be feeling on edge for these two months, but in the next breath he begins to talk about his bank boss's interest in acquainting him with his daughter. He uncomfortably describes a scene at the last Labor Day picnic in which the boss brought his daughter around to meet him and then walked off, leaving him stranded with her for the rest of the afternoon. Thereafter, some of the people at the bank had teased him about his secret romance with her (which was non-existent). He senses that his boss now seems less friendly, although the older man made no known attempt to stop his promotion. He has no desire to advance any further up the bank totem pole, says he never expected to do even this well, and would be more than satisfied with his present post for the duration of his working days (though he really liked doing bookkeeping better).

In addition to the information already mentioned, his developmental history has the following other significant points: he was breast fed for nearly two years because his mother couldn't afford to buy store milk. Toilet training was completed by age 15 months, but he was enuretic from age two until he was nine. The boys in school found out about it and nicknamed him "Pee-pee".

[[168]]

Although he was generally unpopular among his schoolmates, he did very well academically, especially in mathematics. He skipped the third and seventh grades, was first in his boys' parochial high school class and received a full-tuition scholarship to Boston College, where he took business administration courses. He never was one to participate in extracurricular activities, but always maintained a part-time job and gave his entire earnings to his mother. He does not see

himself as particularly religious but is faithful in his Mass attendance. He does not expect to ever have a vision, mostly because he believes himself to be too mediocre a Christian. Twice after his mother's death he thought he heard her calling to him in the night and is still not sure that she didn't. He has no opinions about UFO's; although it interests him to read about them, he knows no one who has ever seen one.

In part because of the nature of his description of the light in the sky (and his associated feelings), the examiner was alerted to his description of the belly dancer's chartreuse nipple coverlets, which apparently have significant meaning for him. Attempts to subtly pursue possible connection here reveal the following: The subject's recent anxiousness had begun at about the tine he learned he was to be promoted, ever since which he had felt lonelier than ever before and once again very desperate about the loss of his mother. He comments that he thinks his mother would have been very pleased and proud of his success at work, that it would have given her something about which to hold up her head again. It also would have meant (were she still alive) that he could provide nicer living quarters for them both. Now that she is dead, however, such improvements are unimportant; he feels they would be wasted on himself alone.

Along with this loneliness, he acknowledges feeling empty. He says he can't get excited about anything (not even the belly dancer) although he feels extremely tense and has tried more often lately to get some relief via masturbation. He has been thinking about his mother so much he acknowledges that her image gets confused with that of the belly dancer, even when he tries to concentrate just on the latter's nipple covers.

B. Mental Status Examination

General Behavior and Appearance: The subject presents himself as a well-groomed man of medium build. His dark brown hair is moderately long with side burns and a small neatly trimmed mustache. He is dressed in a white shirt, tie, and conservative dark blue suit; his shoes are polished. He sat with head down and steadily smokes throughout the interview. He expresses himself generally well without excessive gestures. He was initially ill at ease and mildly defensive with the interviewer but became more comfortable as the session progressed. He was cooperative and he gave the impression of wishing to be highly candid.

Stream of Talk: There is no evidence of blocking or unusual difficulty in choosing words. His vocabulary was moderately well-developed. The subject speaks in a slightly monotonous manner but his speech is halting at only two points (when he spoke about feeling guilty about his mother and about masturbating). He uses no neologisms, rhymes, or puns. There was no evidence of flight of ideas or clang [sic] associations. There is no stuttering, dysarthria, or mispronunciation; he is able to repeat four tongue twisters without difficulty.

Mood: The patient appears to be moderately depressed) his posture is slightly slumped, his expression often dejected, and he sighs frequently. His general affect borders on being flat but is not otherwise inappropriate. He fails to show any enthusiasm about anything, claims he has no special interests or hobbies. He seems basically apathetic about both his present and future life. Although constricted but not highly controlled, his anxiety is poorly masked when he talks about conflictual material and certain feelings.

Thought Content: Subject is generally guarded about what and how much he says. When put under some stress by the examiner (during a period when he was less defensive), his associations became briefly mildly loose. His usual preoccupations center around certain guilt feelings, a yearning for his dead mother, and (more recently) the desire for whiskey. Although obviously depressed, he denies suicidal preoccupation. He does tend to ruminate about any teasing from women, but there is no evidence of any kind of paranoid ideation. The content of his day-dreams and masturbatory fantasies are described in the anamnesis (see previous section). The impression that his gaze was somehow holding the odd light in place in the sky is the only evidence suggesting that he has ever felt he had any special powers. Prior to seeing that light, he apparently never experienced a deja vu, or any illusory or definite hallucinatory phenomenon (see anamnesis regarding hearing dead mother's voice).

Rituals, obsessional thoughts per se are denied, except for his recent, uncontrollable preoccupation at night with his dead mother. He acknowledges a definite fear of flying (to the point that he has never set foot in an airplane) and is also afraid of heights.

Orientation: Subject is fully oriented as to time, person, and place. Previous amnesia and disorientation (place and time, only) have occurred only acutely following heavy drinking bouts.

Intellectual Status: Attention is consistently well-sustained. Memory (in which there has been no known change in recent years) is generally above average. There was no inconsistent historical data which would indicate his remote memory, or intermediate memory, or recent memory as being confabulation or perseveration. His 24-hour recall is without disparities after several recountings, and immediate recall is normal (he can repeat 6 digits forward and 5 digits backward). Two hours after presentation, he could remember all four test objects (a pencil, key, blotter, and the color yellow). Simple calculations (multiplication, division, addition, and subtraction) were done accurately, serial 7's (from 100-0) were done somewhat slowly but without any errors. General comprehension is at least average; he was able to repeat the "cowboy story" with only four minor mistakes. His proverb interpretation (with six proverbs) [were] done very hesitantly but were adequately abstracted.

Judgment: There is no gross impairment in this area (as evidenced by responses to hypothetical questions) but the interview suggests a mild limitation, particularly in relation to social situations.

Insight: The subject is not psychologically minded and seems to be both unable and disinclined to understand the sources of his current anxiety, insomnia, and general despair. He did communicate a considerable amount of useful psychiatric data but, in the process of so doing, seemed very unaware of how much he was saying about himself and his feelings.

MMPI REPORT

CASE NO: 00000 37 BFSI NO: 00000 6456
AGE 37 MALE

THE TEST ITEMS APPEAR TO HAVE BEEN ANSWERED TRUTHFULLY WITH NO EFFORT TO DENY OR EXAGGERATE.

THIS PATIENT APPEARS TO BE CURRENTLY DEPRESSED AND ANXIOUS. HE SHOWS A PATTERN WHICH IS FREQUENT AMONG PSYCHIATRIC PATIENTS. FEELINGS OF INADEQUACY, SEXUAL CONFLICTS AND RIGIDITY ARE ACCOMPANIED BY A LOSS OF EFFICIENCY, INITIATIVE AND SELF CONFIDENCE. INSOMNIA IS LIKELY, ALONG WITH CHRONIC FATIGUE. HE IS ANXIOUS, TENSE, AND OVERLY SENSITIVE. SUICIDAL THOUGHTS ARE A POSSIBILITY. IN THE CLINICAL PICTURE, DEPRESSION PREDOMINATES. PSYCHIATRIC PATIENTS WITH THIS PATTERN ARE LIKELY TO BE DIAGNOSED AS DEPRESSIVE REACTION OR ANXIETY REACTION. THE CHARACTERISTICS ARE RESISTANT TO CHANGE, ALTHOUGH SYMPTOMATIC RELIEF MAY BE OBTAINED WITH BRIEF TREATMENT.

HE TENDS TO BE PESSIMISTIC AND COMPLAINING, AND IS LIKELY TO BE DEFEATIST, CYNICAL, AND UNWILLING TO STICK WITH TREATMENT. HE MAY NEED FREQUENT REASSURANCE ABOUT HIS MEDICAL CONDITION. DYNAMICALLY, HE IS A NARCISSISTIC AND SELF-CENTERED PERSON WHO IS RIGID IN THOUGHT AND ACTION AND EASILY UPSET IN SOCIAL SITUATIONS.

REPRESSION AND DENIAL ARE UTILIZED AS A DEFENSE AGAINST ANXIETY. IN PERIODS OF HEIGHTENED STRESS HIS ANXIETY IS LIKELY TO BE EXPRESSED IN SOMATIC SYMPTOMS. HE MAY RESPOND TO SUGGESTION AND REASSURANCE.

HE IS A SELF-CONTROLLED CAUTIOUS PERSON WHO MAY BE SOMEWHAT FEMININE IN HIS INTEREST PATTERNS. HE IS IDEALISTIC, SOCIALLY PERCEPTIVE AND RESPONSIVE. HE SHOWS SOME SELF AWARENESS, BUT HE IS SENSITIVE AND PRONE TO WORRY. HE IS VERBALLY FLUENT, PERSUASIVE AND ABLE TO COMMUNICATE IDEAS CLEARLY.

THIS PERSON IS HESITANT TO BECOME INVOLVED IN SOCIAL SITUATIONS. HE MAKES AN EFFORT TO CONSCIENTIOUSLY CARRY OUT HIS RESPONSIBILITIES, BUT HE IS RETIRING AND SOMEWHAT WITHDRAWN FROM INTERPERSONAL RELATIONSHIPS.

NOTE: ALTHOUGH NOT A SUBSTITUTE FOR THE CLINICIAN'S PROFESSIONAL JUDGMENT AND SKILL, THE MMPI CAN BE A USEFUL ADJUNCT IN THE DIAGNOSIS AND MANAGEMENT OF EMOTIONAL DISORDERS

CRITICAL ITEMS

THESE TEST ITEMS, WHICH WERE ANSWERED IN THE DIRECTION INDICATED, MAY REQUIRE FURTHER INVESTIGATION BY THE CLINICIAN. THE CLINICIAN IS CAUTIONED, HOWEVER, AGAINST OVERINTERPRETATION OF ISOLATED RESPONSES.

133. I HAVE NEVER INDULGED IN ANY UNUSUAL SEX PRACTICES. (FALSE)

182. I AM AFRAID OF LOSING MY MIND. (TRUE)
349. I HAVE STRANGE AND PECULIAR THOUGHTS. (TRUE)

156. I HAVE HAD PERIODS IN WHICH I CARRIED ON ACTIVITIES WITHOUT KNOWING LATER WHAT I HAD BEEN DOING. (TRUE)
537. I FEEL ANXIETY ABOUT SOMETHING OR SOMEONE ALMOST ALL THE TIME. (TRUE)

EXHIBIT
SELF

D. Summary of Positive Findings: Psychiatric Evaluation and Character Assessment (with supportive data).

Mr. McC. is an oral character who shows a moderately severe passive-dependent life style. This is evidenced by the direction of his relationships (mother-equivalents) and his drinking habits, as well as the content of his fantasies. He is also a withdrawn chronic depressive in acate exacerbation. There may be an underlying endogenous element to his depression but it appears to be primarily reactive and related to the death of his mother.

All the psychiatric evidence points to the event of 17 November 1967, as an acute illusory phenomenon in which his regressed oral yearning for his mother was symbolically represented in the "light". That the object took the color and shape that it did (like the nipple covers) further demonstrates his all-pervasive oral fixation.

D. Discussion and Creditability Score.

The subject's retinal pathology is such that he could not have accurately perceived on direct gaze a greenish, luminous disc in the sky. It may well be that the initial stimulus for his "vision" was a distant light which then was grossly distorted by both his abnormal retina and his highly disturbed emotional state.

Creditability score 5%.

VI. Integration of Findings and Composite Assessment of Central Nervous System Functioning

A. Discussion and Creditability Score

Without the benefit of the results of this medical evaluation, one would probably be inclined to view Mr. McC. as a highly creditable observer. In favor of such an impression are 1) his respectable bank position, 2) his general demeanor (which is very appropriate and does not suggest attention-seeking or his actual psychiatric problems), 3) his claim to seeming good health and 4) the nature and quality of his report of the "light" observed event to the police.

However, on evaluation it was discovered that he was an early alcoholic cirrhotic who was suffering from early occult alcohol-tobacco amblyopia such that he could not have perceived the detailed colored nocturnal event he thought he had seen.

What had actually occurred was the first major hallucinatory experience of his life. In a twilight state, his eye first perceived some kind of stimulus from the night time sky which was then transformed into a rather magnificent symbolic representation of his unconscious wishes and underlying character pathology. The episode occurred when it did because of the subject's state of psychic decompensation. His resistance to a transient hallucinatory experience was lowered by 1) his currently agitated depressed state 2) the adverse effects of toxins (from drugs and liver) on his central nervous system and 3) the visual distortions produced by his diseased eyes.

The entire clinical picture is best explained in terms of the subject's passive-oral-dependent character pathology which is intimately related not only to his acute emotional state but is the underlying source of his physical problems (i.e., alcoholic liver and retina, drug toxicity). This case is thus a good example of multifactorial influences on observer creditability which, in this instance, can be integrated in terms of an underlying source.

Overall observer creditability score 5%.

THE USE OF PROBABILITY SCORING FOR OBSERVATIONAL CREDITABILITY

In order to translate the results of an extensive, multidisciplinary medical evaluation into a handy estimate of observer creditability, a percentage-evaluation scoring method has been devised. These "probability of creditability" scores are mainly intended to serve the non-medical expert. They are numerical statements reflecting the level and quality of observational ability and are based on all the obtained findings relative to central nervous system integrity.

The scores will be presented in conjunction with (not in place of) summaries of the results of each part of the medical assessment (i.e., medical, neurological, neuro-ophthalmological, and psychiatric) of an individual observer. A composite score will also be offered to suggest the overall level of observational creditability. This final score is based on careful scrutiny, extrapolation, and interpretative integration of all the findings at hand, as they would be expected to influence (in a highly multifactorial way) any reported observations. The nature and extent of an individual's abnormalities will thus be reflected in his creditability score(s), a scale for which has been set up as follows:

Degree of Impairment	Creditability Score
none	95%
mild	75%
moderate	50%
severe	25%
extreme	5%

The scores wlll be variably useful, depending on their applicability to the situation in question. It is expected that they will be helpful in the screening and selection of candidates for observational jobs (i.e., predictive evaluations). They will usually be more reliable as measures of creditability, however, when they are part of a retrospective evaluation that is being done on an individual who has already reported a particular event. This is because the examiner-scorer is able to avail himself of specific observational material on which to "zero in" and check out, including occasional clues to physical and psychological pathology. In those instances where there are different stories from several individuals who report having witnessed the same event, the value of the creditability scoring can be further demonstrated for sorting out conflicting data.

It is readily acknowledged that this scoring method is somewhat arbitrary. Its reliability and reproducibility will depend largely on the sophistication and the abilities of the scorer. It is essential that the physician doing these studies have 1) a high-level working knowledge of the four specialties involved, that he 2) be specifically well-informed in the pertinent interdisciplinary material related to observational phenomena, and that he 3) be adept in the matter of investigating, synthesizing, interpreting, and finally applying the ramifications of his "pure" medical findings to observational situations. It is further recommended that 4) he himself be thoroughly checked out as a creditable observer, since this proposed method [of] assessing observers rests heavily on the physician's own ability to make accurate observations and sound judgments.

It is probably true that, at this point in time, there are few men in medicine who are adequately trained to do this multispecialty kind of assessment. This is a remediable situation, however, once the projected need for such professional preparation has been recognized and established.

Biographical Sketch for Dr. Sydney Walker, III

July 22, 1968

Sydney Walker III, M.D. is a 36 year old neuropsychiatrist who was born in Chicago, raised in Pasadena, did undergraduate study at UCLA, followed by graduate work in physiology and pharmacology, and received his medical training at Boston University School of Medicine. Following some neurosurgical training, he did university residencies in both psychiatry and neurology. He has contributed numerous articles in both these specialties and is the author of a recently published book, Psychiatric Signs and Symptoms due to Medical Problems, Charles C. Thomas, Springfield, Illinois, 1967. His interest in neuro-opthalmology has been more recent and has emerged from his research in connection with the preparation of another monograph, The Neuropsychiatric Evaluation of the Eye Witness (to be published in late 1968).

Observational Evidence of Anomalistic Phenomena [1]

Robert M. L. Baker, Jr.[2]

Abstract

A summary of the data obtained from a series of analyses and experiments, which were initially carried out by the author under the auspices of Douglas Aircraft Company and based upon movie film containing anomalistic data, originally provided by the United States Air Force, is presented. It is concluded that, on the basis of the photographic evidence, the images cannot be explained by any presently known natural phenomena. On the other hand, the quality of the images is insufficient to determine the nature of the anomalistic phenomena recorded on the movie film.

Introduction

Two anomalistic unidentified flying objects (UFO's) were sighted and later photographed at about 11:30 a.m. Mountain Standard Time on August 15, 1950, by Nicholas Mariana at Great Falls, Montana. Mr. Mariana owned and operated a radio station in Missoula, Montana, and was the owner of the Great Falls baseball team.

All of the soft-data (eye witness reports of Mr. Mariana and his secretary) indicated that the objects were silvery in appearance with a notch or band at one point on their periphery and could be seen to rotate in unison, hover, and then "... with a swishing sound, floated away to the left (SW) ..." The hard data from the film showed inarticulate bright white dots. Figure 1 shows the manner in which the diameter of the bright dots decreased with time. The objects passed behind a water tower and are exhibited in Fig. 2, along with the associated frame number (the frames below 65 exhibited no foreground). According to Mariana, 35 of the earlier frames, allegedly lost by the Air Force, showed a larger image, complete with a "rotating notch." Figure 2 was constructed from iconolog measurements (a film viewer with movable cross hairs and a digitalized coordinate output) using the foreground reference points marked (3), (5), and (6). This figure is drawn like a panorama on the assumption that the photographer kept his stance without moving appreciably (which was reported by him

and was well borne out by the consistence [sic] of his perspective). These initial measurements were made by the author at Douglas Aircraft Company in 1955-1956.

Analysis

The "Montana" film contains six independent data (as functions of time) on about 225 frames (frames 65 to 290), which describe the UFO images, i.e., the two degrees of freedom of each dot (as depicted on two-dimensional film after the foreground appears on frame 65) and the apparent diameter of the developed image of each on all 290 frames (no ellipticity could be seen in the images except for occasional image smear due to uneven panning). In the analysis it was convenient to treat the UFO's as a system. The four degrees of freedom chosen for this system were the azimuth and altitude of the midpoint on the line of centers between the images, their angular separation and their inclination to the horizon. The inclination to the horizon was found to be very small, the objects appearing to move almost in a plane parallel to the ground. There is a slight decrease in the angle of inclination as the objects regress, but its small value is almost masked by random errors inherent in the measurements. Figure 3a presents a plot of the angular altitude, *h*, and the azimuth, *A*, of the midpoint of the line of centers after frame 65 (i.e., after a measurable foreground appears), and Fig. 3b presents the separation distance ratio $theta_e/theta$ as a function of time, where $theta_e$ is the initial angular separation (frame 1) and *theta* is the angular separation at any given time. In both of these plots some frames were not measured, e.g., due to obscuration of the images during water-tower passage, or were missing (there were frames missing between frame numbers 177 to 180 on the 35 mm print that was measured for separation distance, but these were accounted for in the time scale using the 16 mm original as a basis). About 225 frames after the foreground (ventilator duct) appears on the film (i.e., after the 290th frame), the objects can no longer be clearly identified and measurements become very uncertain.

[1] Manuscript submitted November, 1967. Paper was presented at an AAS Seminar at the Jet Propulsion Laboratory, Pasadena. A manuscript on the same subject matter was originally submitted in 1962. The complete review of this earlier manuscript, after receiving three favorable reviews, was accepted.

[2] The Senior Scientist of System Sciences Corporation, a subdivision of Computer Sciences Corporation, 690 N. Sepulveda Blvd., El Segundo, Calif. 90245, and the Department of Engineering, UCLA.

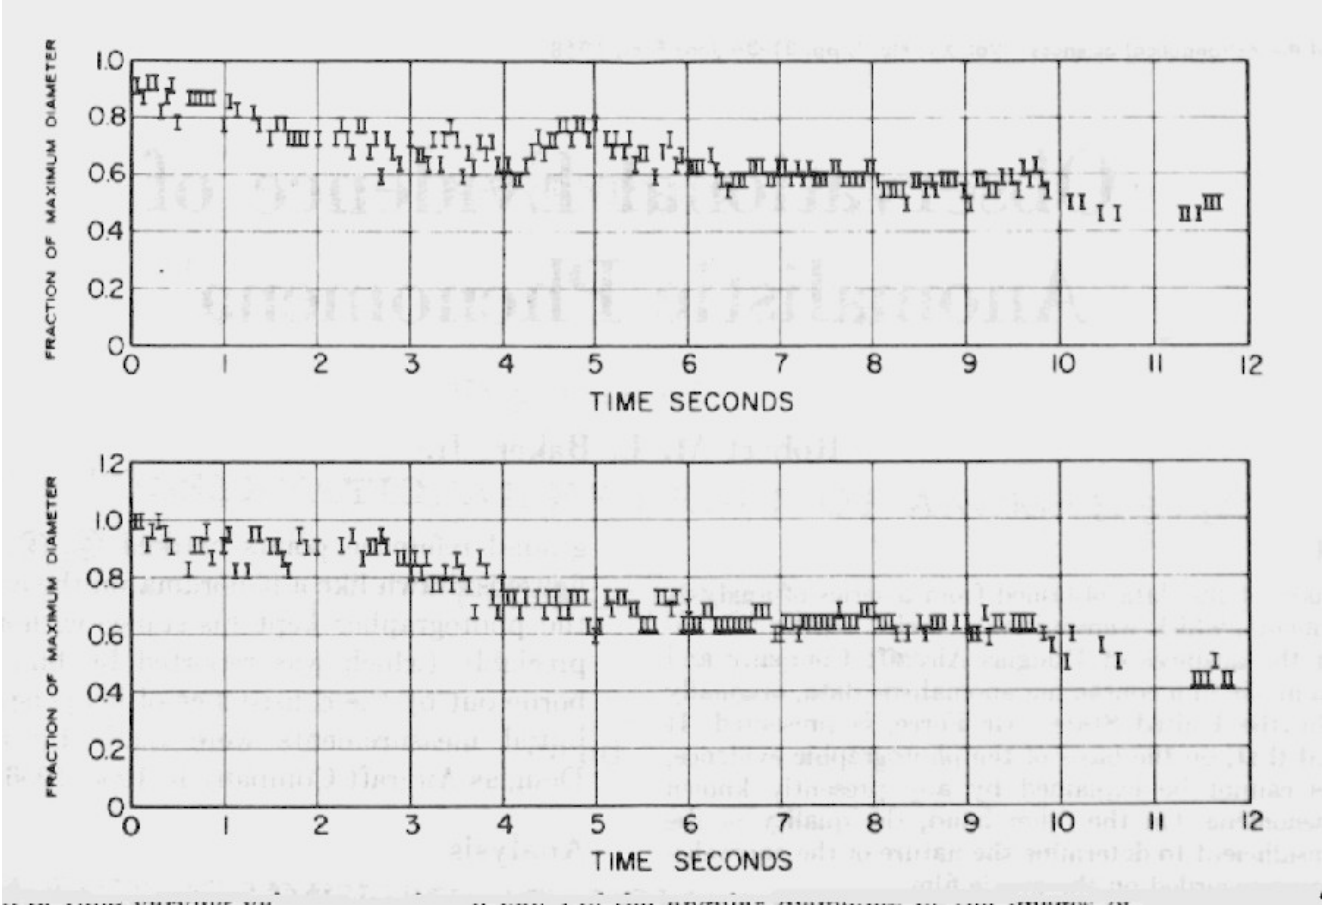

Fig. 1. Ratio of time varying value to maximum value of the angular diameters of the images of UFO #1 and UFO #2.

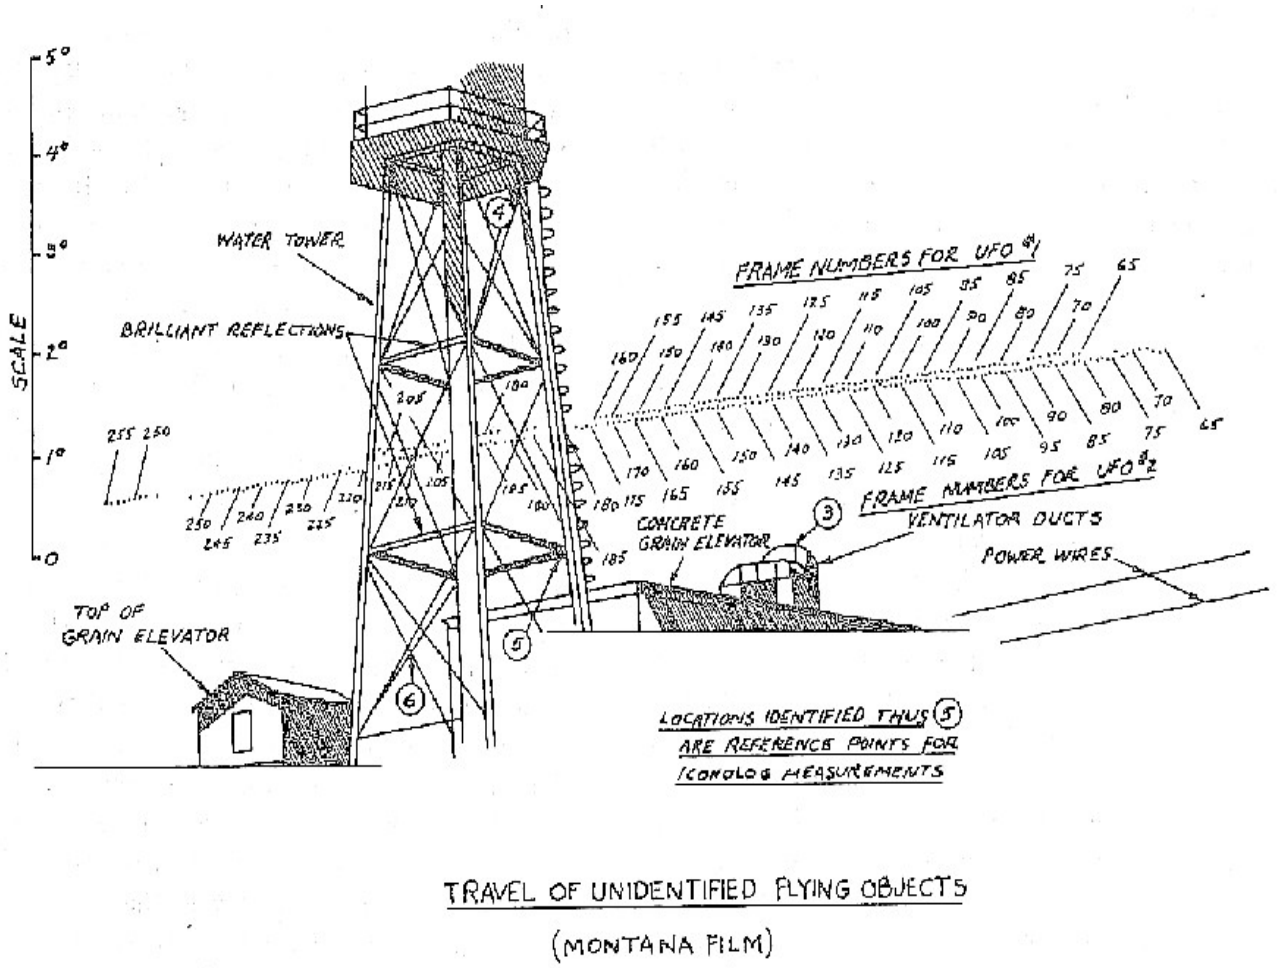

Fig. 2. Motion of unidentified flying objects relative to foreground.

In Figs. 3a and 3b the dotted lines represent what would be the locus of the data points if the objects remained the same linear distance apart and moved linearly in a horizontal plane. The headings, delta, of 169° to 177° are exhibited. All of the data seems to be consistent with a heading of 171°. Of course, one cannot absolutely rule out some other curvilinear motion of the objects. However, any such motion would necessitate the coincidence of azimuth, altitude, and separation, all varying proportionally in some very peculiar fashion to a tolerance of 1%. Figure 4 is a map of Great Falls, Montana, and includes overlays of the UFO system's motion at various hypothetical distances. (no absolute determination of

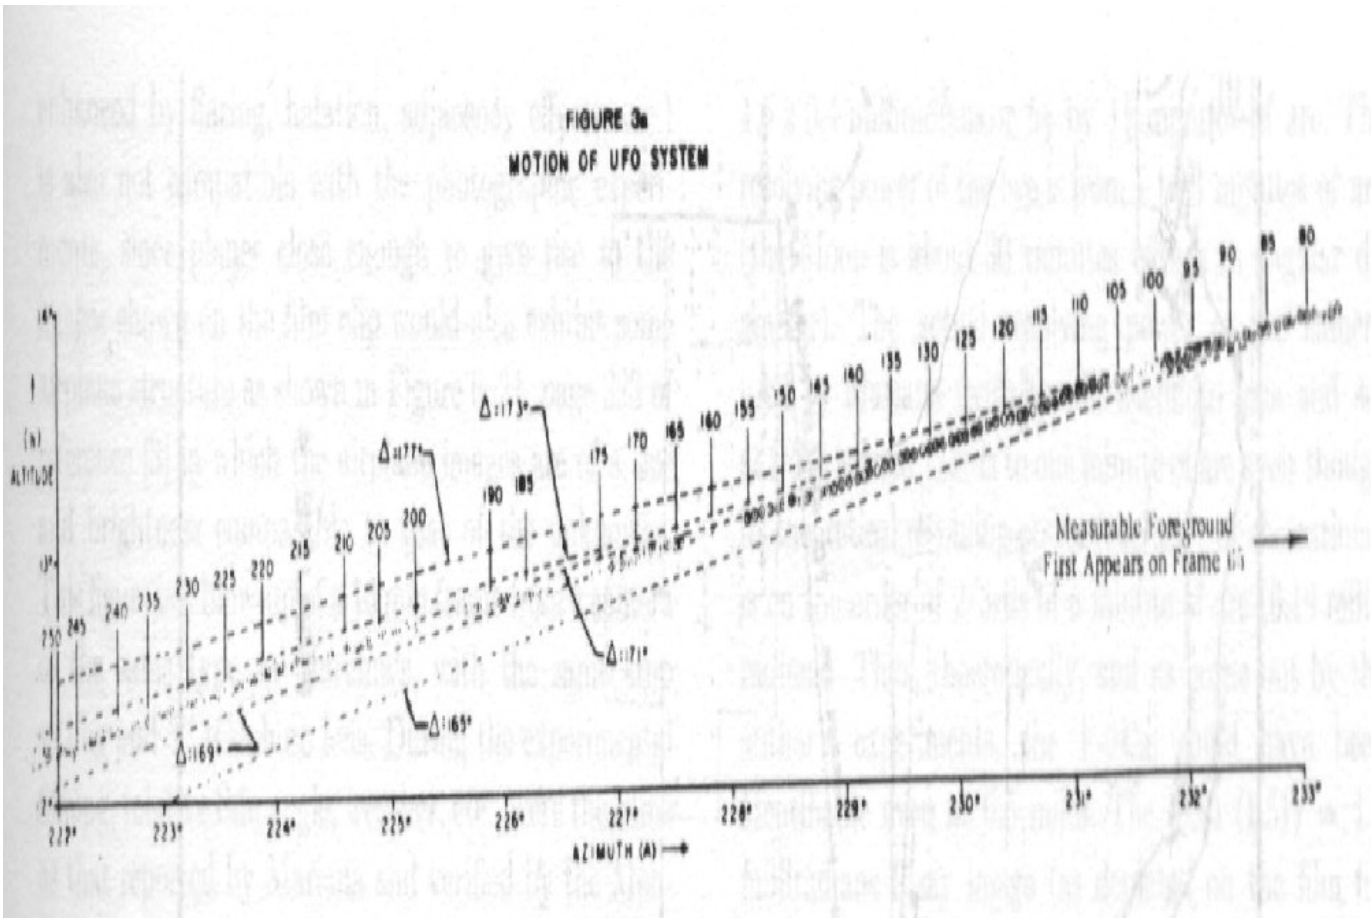

Fig. 3a. Motion of UFO system in altitude and azimuth.

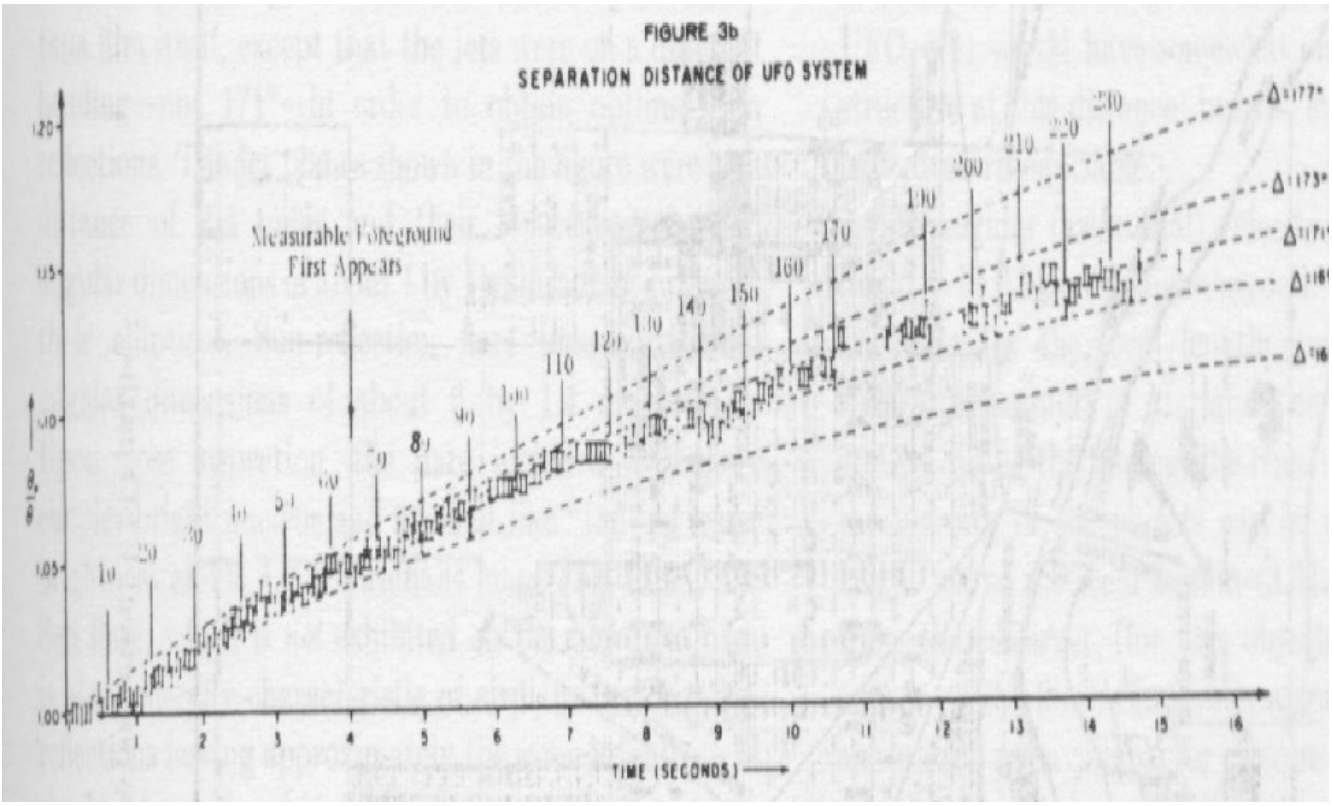

Fig. 3b. Separation distance of of UFO system as function of time.

distance can be made on the basis of the angular data presented by the film.) Figure 4 also shows where Mariana and his secretary first viewed the "hovering and rotating" UFO's near an Anaconda smoke stack.

After over a decade of speculation and hypothesis checks, all natural phenomena (e.g., birds, balloons, insects, meteors, mirages, etc.) have been ruled out, except airplane reflections, on the basis of winds (which the weather bureau reported as blowing in the opposite direction); the lack of an observable trail (which would have betrayed a bifurcated meteor); and brightness, angular speed, and steady motion, which could not be reconciled with the supposition that they were birds or insects. These same facts, together with the weather bureau report [1] and the Sun angle, also seemed to rule out various forms of optical lens flare, atmospheric mirages, or cloud reflections. From analyses of speed and geometry, which included a knowledge of the Sun's azimuth at the time of the photography (as confirmed by the shadows on the film) the images could have been (although not without some stretch of the imagination) specular Sun reflection from airplane fuselages. This explanation seemed attractive since it was rumored (although not verified [2]) that two jet airplanes (F-94's) were landing at Malmstrom Air Force Base at the approximate time of the sighting. This rumor was reinforced by a presentation by E. J. Ruppelt to a panel of experts in January, 1953 (the panel's membership was not revealed) but may have been called the "Robertson panel" [4]). Ruppelt [5] indicates "the intelligence officer at Great Falls had dug through huge stacks of files and found that only two airplanes, two F-94's, were near the city (Great Falls) during the sighting and that they had landed about two minutes afterwards. ... First we studied the flight paths of the two F-94's. We knew the landing pattern that was being used on the day of the sighting and we knew when the two F-94's landed. The two jets just weren't anywhere close to where the two UFO's had been." Figure 4 bears this conclusion out since the objects were in the opposite direction from Malmstrom Air Force Base and headed away from the air field. The panel, however, did not consider this as positive proof for eliminating the jet-plane hypothesis.

Experiment

Using a camera similar to Mariana's (Revere turret type with a 3" focal length telephoto lens), a series of photographic experiments were carried out by the author on an array of objects (see Figure 6-22 on page 321 of reference [3]) at various distances and Sun angles and on jet plane reflections. The results of these experiments, however, made the hypotheses of airplane reflections quite strained.

The long persistence of the images would have required the airplanes to have moved on a unique parabolic path with Mariana at the focus. Unfortunately, these hypothetical parabolic paths would be incompatible with the 171° heading defined by the data. In addition, the apparent size of the images (admittedly

[[179]]

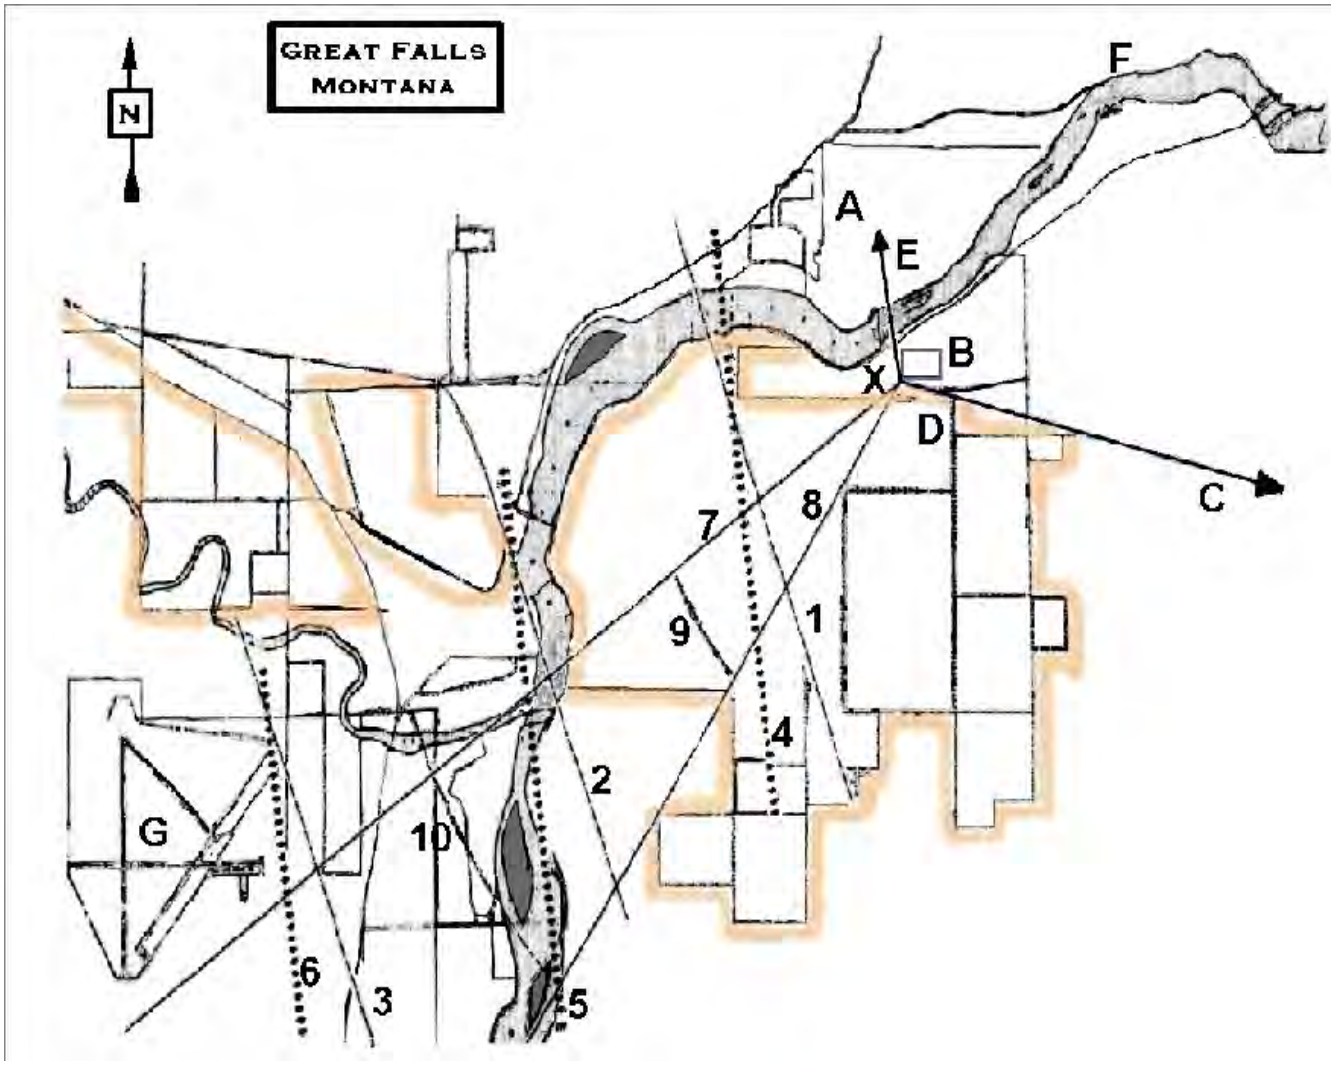

Fig. 4. Map of Great Falls, Montana, including hypothetical UFO paths.

[[180]]

enhanced by flaring, halation, adjacency effects, etc.) is also not compatible with the photographic experiments, since planes close enough to give rise to the images shown on the film clip would also exhibit some airplane structure as shown in Figure 6-24, page 323 of reference [3] in which the airplane images are of a size and brightness comparable to that of the unknowns.

This figure is a blow-up of a 16 mm frame from a camera of the same type as Mariana's, with the same stop setting and 3" telephoto lens. During the experimental filming, relative Sun angle, weather, etc., were the same as that reported by Mariana and verified by the Montana film itself, except that the jets were on a different heading -- not 171° -- in order to obtain optimal Sun reflections. The jet planes shown in the figure were at a distance of 2.5 miles and their structure

exhibited angular dimensions of about 4 by 1 milliradians, whereas their elliptical, Sun-reflection flare image exhibited angular dimensions of about 6 by 1.4 milliradians.

Upon close inspection, the flare included a roughly circular bright nucleus and a comet-like "tail" of lesser brightness about 4.4 milliradians long. This comet-like Sun flare, which is not exhibited on the Montana film, is also generally characteristic of airplane-fuselage Sun reflections having approximately the same brightness as the Montana film objects. Even with the larger comet-like flare, the jets photographed during the photographic experiment are clearly identifiable.

Finally, airplanes at the limiting distance for resolution of structure (over 6.5 miles), with the 3" telephoto lens used, would have to have been traveling at speeds in excess of the capability of the F-94's (above 600 mph [6] in order to have been compatible with the angular rates of the images displayed on the film. At 6.5 miles a typical 50 foot airplane (such as an F-94) subtends angles of 1.5x0.4 milliradians or 5½ by 1¼ minutes of arc. The resolving power of the eye is from 1 to 3 minutes of arc (the Moon is about 30 minutes of arc in angular diameter). The actual resolving power of the camera used by Mariana (with the 3" telephoto lens and set at f/22) is from 2/3rds to one minute of arc even though its theoretical resolving power (exclusive of aberrations) is on the order of 2/3rds of a minute of arc (0.19 milliradians).

Thus, theoretically, and as borne out by the author's experiments, the F-94's would have been identifiable even at 6.5 miles. The (0.8) (1.51) = 1.2 milliradians fuzzy image (as depicted on the film for UFO #1) would have somewhat obscured an airplane structure at this distance; but the structure would still have been recognizable.

The angular (azimuthal) velocity of the objects was found to be 0.019, 2 radians/second. Equipped with the knowledge of the focal length and frame speed (16 frames per second) of Mariana's camera and the foreground during the filming, the transverse component of the velocity of the objects can be correlated to their height above the local terrain (3,312 ft) and distances from the observer (for the objects when they first appear on the film). Since only angular distances from one station are available for measurement, their actual range cannot be determined. On the other hand, Table I can be constructed on the basis of a variety of hypothetical ranges.

The measurements of the diameter of the developed images presented in Fig. I are the least accurate of all the data because of the smallness of the dimension and the fuzziness of the images. The image of any brilliant light source as seen by either the eye or a camera can appear much larger than the source itself. This fact had obvious bearing on the analysis of the

TABLE I

Hypothetical Ranges, Heights, and Speeds

Range (Miles)	Height (feet)	SPEED (mph) Transverse	at 171° heading	for Optimal Sun Reflection	COMMENTS
0.5	690	552	642		Upper limit to bird speed; but birds would have been resolved. [3]
2	2,730	1572	1972	3822	Usual F-94 speed in a landing pattern is 130 to 190 mph; but would have been resolved.
6.5	8,860	4702	6002	1,140	Maximum (dive) F-94 speed is 602 mph; but would have been resolved.
563	950,000 (290 km)	39,000			Low-speed meteors [7]; but would not be detected at this range on a bright day. Atmosphere too thin above 100 km for bolides or fireballs.
2,260	5,610,000 (1,710 km)	156,000			High-speed Meteors [7]; but would not be detected at this range on a bright day. Atmosphere too thin above 100 km for bolides or fireballs.

[1]Above the observer -- Add 3,312 ft. for absolute altitude.
[2]Includes 20 mph component of head winds.
[3]Ducks, etc. would be flapping or swooping and would not appear like the objects on the film at any distance.

film and motivated the photographic experiment conducted by the author during December, 1955. December, rather than August, was chosen due to the lower latitude of Los Angeles relative to Great Falls and because of the unique (smogless) visibility during the course of the experiment. The experiment was devised in order to obtain empirical information on the effect of distance, lens focal length, iris stop, frame speed, etc., in the photographic images of various small bright sources of reflected sunlight; some 118 combinations of these variables were examined. The experimental results appeared to indicate that if the first few frames of the film show Sun reflections from airplanes, which are optimally oriented with respect to the Sun (not the 171° heading), then the planes would have been on the order of one to three miles distant from the camera. If, however, these first few frames represent images of the reflection from airplanes not quite optimally oriented, then the planes could have been closer. In either event, their structure would also have been visible. The images were found to be much brighter than those that any birds could produce.

The brightness of a constant luminosity source, as it recedes from view, gives rise to a photographic image whose diameter varies somewhere between [the] inverse square root of the range to the inverse square of the range. (Ordinarily, however, with the inverse square for images as bright as the Montana objects.) The effects, which account for this uncertainty in image-size vs. range relationship, involve light scattering in the atmosphere, optical aberrations, flaring at the lens surfaces, diffraction, turbidity in the film, reflections off the film backing (halation), and adjacency effects (chemical reactions between over-exposed and underexposed areas on the film).

On the basis of Fig. 1, we find a decrease in angular diameter of the first object of about 62%, and the second about 61 %. Under the 171° heading assumption, the initial distance is about 78% less than the final distance (at disappearance). Thus, it would seem that the 171° heading hypothesis is also in agreement with the film images being the result of a constant brightness light source receding from the camera. That is, the inverse square distance decreases some 61%. Because the relationship of the developed image size to source range is not precise and because it is doubtful that we are dealing with constant-luminosity isotropic radiators, the third confirmation «f the 171° heading must be regarded as considerably less precise than the confirmations provided by Figs. 3a and 3b.

Conclusions

Because of the conflict between every hypothesized natural phenomenon and one or more details of the hard-data, photographic evidence analyzed (in addition to the uncertainty of the soft data, reported accounts (or rumors) of jet aircraft), no clear-cut conclusion as to a natural phenomenon can be made and the anomalistic images, having no real detail, cannot be analyzed further. These unexplainable images, taken alone, do not provide data on mass, shape, size, or linear speed and, indeed like the early single-camera meteor photographs or even like the early examples of attempts at photography through a microscope, are merely unresolved blobs and simply indicate the presence of a phenomenon. In these past, historical instances, supplementary data and equipment improvement were sought after in a systematic fashion even though there was only conjecture as to the exact character of the phenomena. See reference [8].

A number of other films have been viewed by the author, which purport to be UFO's, and they all seem to exhibit the common quality of poor image definition. This situation is not especially surprising since most of them have been taken with amateur equipment or they were accidentally taken from a great distance by cinetheodolites that were not "tracking" them. Like the Montana film, some of these films definitely cannot be explained on the basis of natural phenomena (others can be "explained" if one stretches one's imagination).

References and Notes

1. A copy of the local half hourly surface weather observation for August 15, 1950, was obtained from the Great Falls, Montana Municipal Airport Station of the Weather Bureau. It shows that the surface wind increased during the forenoon to readings between 26 and 28 mph between 9 a.m. and noon, and that it reached 37 mph at 12:30. The surface wind direction was constantly from the southwest from 10 a.m. until 4 p.m. It was clear (visibility of 60 miles), the temperature was 77°F at 11:27, and the barometer was at about 30.0".
2. In November of 1955, an inquiry by phone was directed to Colonel Donald M. Hamilton, Commanding Officer of Malmstrom Air Force Base. He advised us by letter dated November 7, 1955, that "as far as I can determine, there were no jet aircraft based here at that time, so that if any were in the air, they would have been transients."

Future Experiments on Anomalistic Observational Phenomena

The requirement for additional experiments in the area of anomalistic phenomena is given, based upon the paucity of "hard data"; relevant data collected by astronomers, meteoriticists, and meteorologists, which would be either overlooked or not detected; and the possible "filtering" and/or "editing" out of pertinent data by our various space surveillance systems prior to its evaluation. An experiment involving two cameras slaved to a detection radar is outlined broadly and it is concluded that such a system should be constructed for use in meteoritic, meteorological, astronautical, psychological, and "UFO" study programs.

The majority of our astronomical equipment (e.g., conventional photographic telescopes, Baker-Nunn cameras, meteor cameras, Markowitz dual-rate Moon Cameras, etc.) are special-purpose by their very nature and would probably not detect the anomalous luminous phenomenon reported by the casual observer if it were indeed present. Their photographic speed, field of view, etc. put definite limits on their capability to collect data on objects other than those for which they have been specially designed. Even if such data WCPP collected, the recognition of their uniqueness or anomalous character by an experimenter is improbable. Examples abound in celestial mechanics of minor planets being detected on old astronomical plates that had been measured for other purposes and then abandoned. ~~Tombaugh's discovery of Pluto from rather old astronomical plates in storage is a well-known example.~~ The space surveillance systems are almost programmed to overlook anomalous data. Any hard-data arising from an object or manifestation that did not move on a nearly two-body orbit, had a low radar cross-section, or followed an erratic path would most probably be filtered out of the system by various data-editing, or data-weighting procedures [1], which are inherent in most of our sophisticated space surveillance systems.

A representative space surveillance radar may have a beam width of 1/6° for detection and require accurate orbital information good to 0.01° for fine tracking. Needless to say, such radars often miss even well-known spacecraft and would be completely inadequate for "locking-on" to a hypothetical "UFO." To be sure, advanced radar systems are being developed for our missile defense systems, such as the ALTAR (ARPA Long-range Tracking and Instrumentation Radar), TRADEX (Target Resolution and Discrimination Experiments) and the phased array RESER (Re-entry System Evaluation Radar) system. Although they extend the field of view, they still are developed to filter out anomalous signals. As Cheettam [2] points out, "Power and aperture will be programmed after a learning measurement cycle to conserve and efficiently distribute available energy when and where (reentry) targets are estimated to exist."

Not only are conventional sensors almost insensitive to anomalous data, but observations published by trained scientists, that could be hard-data records of anomalistic phenomena, are often too quickly categorized and then forgotten. The observation by Mohr [3] in a letter to *Science* in 1966 gave an account of a "most unusual fly" and described a very remarkable and almost bizarre event that might or might not have been ball lightning. The Tunguska event of 1908 may well have been a impacting comet [4] and is usually studied in the context of meteoritics [5], Similarly, the Canadian fireball procession of 9 February 1913 could have been an ephemeral natural satellite of the Earth [6] or it could have been something more involved. In most such cases, and as in also the situation in published UFO studies [7], [8], [10], information-rich hard-data of high quality are rather hard to come by. It therefore suggests itself that a special experimental program is in order. The scientific method usually dictates experiments in the face of anomalous data and, at the moment,

there seems to be sufficient unexplained anomalous hard-and-soft data to warrant an experimental program. Several experiments suggest themselves and might include geological studies, searches for scraps of material evidence, psychiatric-medical studies of witnesses, or radar/optical arrays.

In broad outline, one recommended experiment would involve a large aperture tracing radar that would slave two cinetheodolite-type optical trackers if and when an anomalous object appeared. The radar "lock-on" and tracking-data-analysis program would be especially designed to avoid satellites and, if possible, common meteors and airplanes, but would, for example, detect comet or macrometeorite entry, ball lightning, and any erratic or anomalous object within its range (a range that would probably be limited to 500 km or less). Thus, the system might at least provide accurate positional information that would provide useful meteoritic data and meteorological data in the absence of more bizarre phenomena. The cameras (preferably using Schmidt-type, Maskutov, or Baker catadioptric type optics and, perhaps, computer-enhanced digitalized pictorial data [11]) would be on a 5 to 10 km base line (the "lock-on" program for the active skin-tracking radar might follow the modified Leuschner differential-correction system suggested on pp. 114 and 115 of reference [1] and the system would need to be reliable enough to operate unattended for weeks at a time. As shown by studies of meteorite and comet flux, such as Hartmann's [12], Shoemaker and Lowery [13], McCrosky [14], and Lamar's [5], a waiting period of a year or so is necessary in order to have significant probability of detecting and tracking such natural extraterrestrial objects.

The question of the proper geographical location of the experimental site would almost be as important as the specification of the radar/optical and computer/communications complex itself. The meteoriticist would probably prefer an area with good atmospheric seeing and of low population density such as the "... Tucson area..." [15]. The geologist would prefer a location near dry lakes [16] in order to facilitate the possible recovery of meteoritic or other material, or timely study of manifestations of cometary impact or sub-end-point meteoritic debris [17]. The psychiatrist would be concerned with the psychiatric-medical credence levels of eye witness (soft data) associated with any hard data that might be obtained by the experimental array [18] as well as the general psychological analysis of the "... tendency all over the world to believe in saucers and to want them real, ..." [19]. Thus, he would tend to prefer a site in a moderate population density area. The physicist interested in ball lightning might wish for a site in which atmospheric electrical disturbances were

frequent. As Singer noted [20], "The specific properties of ball lightning, which present particular difficulty in experimental duplication, are formations of the sphere in air (at near-atmospheric pressure and at a distance from the source of energy) and its extensive motion. It is evident that additional clarification of both theoretical and experimental aspects of this phenomenon is needed." Often marsh gas exhibits bizarre observational data and a location near a marsh might be useful in the examination of such phenomena. Clearly, an overall reconcilement of these diverse and interdisciplinary requirements must be accomplished during the site (or, perhaps, sites) selection process.

In summary, then, four points are to be made:

1. That we have not now nor have we been able in the past to achieve a complete or even partially complete surveillance of space in the vicinity of the Earth, which would betray the presence of any anomalistic phenomena.
2. That so-called hard data on anomalistic observational phenomena do, in fact, exist; but that they are of poor quality due to the equipment employed in obtaining them.
3. That it follows from the scientific method that an experiment or experiments be devised to define better the anomalistic data.
4. That, in order to justify such an experiment or experiments, it is not necessary to presuppose the existence of intelligent extraterrestrial life operating in the environs of the Earth or to make very dubious speculations [9], [10] either concerning "their" advanced scientific and engineering capabilities or "their" psychological motivations and behavioral patterns.

Establishing Observer Creditability: A Proposed Method[1]

Sydney Walker III, M.D.[1]

Abstract

This article is a brief review of the critical chain of linked processes -- anatomic, physiologic, and psychological -- which operate to determine the nature of the observations made by an individual, whether of an accident, a planned experiment, or an extraterrestrial phenomenon such as a "UFO," One purpose of such a review is to demonstrate how, through the use of proper medical examination, the integrity of the observer system can be established in such a way that eye witness creditability does not have to be left to the kind of speculation in which it so frequently finds itself today. Without some such investigation, it is not known whether the reporting observer has, for example, serious visual abnormalities, a brain tumor that causes visual hallucinations, or character pathology such that he is prone to attract attention to himself by fabricating or frankly lying about what he has seen.

That such observer evaluations have not been previously proposed is probably because adequate assessment depends on incorporating the approaches and tools of several medical specialties, rather than one.

Introduction and Rationale

Human testimony to events which have been observed is crucial to science, law, and the national security. Yet the creditability of such testimony is frequently left either entirely to speculation or, at best, inadequately ascertained.

One need merely to look at the current controversy and confusion surrounding the issue of unidentified flying objects (UFO's) to appreciate the need for careful observer assessment. Only after observer creditability has been established, can one sort out the "soft data" of UFO reports and scrutinize them for scientific usefulness [1].

One recourse, or course, is to deal only with "hard data" and to simply refuse to deal in any way with eye witness reports, contending that such observations are unlikely because they are too bizarre or have previously been reported only by "crazy people." This kind of reaction reflects scientific closed-mindedness. It is apt to be based in prejudice or fear of the unknown (particularly when that unknown, if taken seriously, would threaten one's safety or survival). Such an attitude is among those which the scientist who wants to be objective will guard against, in the interest of truth and progress. On the other hand, the opposite position of complete, unquestioning faith in observer reports is no better.

This author suggests an initial attitude of "benevolent skepticism" because of an acute awareness of the myriad of individual processes (and maladies) that determine what has been witnessed and how it is described. Further, and more importantly it is proposed that specific, specialized medical assessment of individual observers is essential to establishing the integrity of the observer system. Following careful, clinical investigation, much of the human error in observation can be placed into a perspective which eliminates the "blind faith" in eye-witness testimony and gives the reported data a confidence proportionate to its value.

Although it is well-known that specific training can serve to increase observational acuity, the basic individual ability is variable. People differ considerably in terms of genetic endowment, neurologic integrity, and personality characteristics and dynamics -- all of which account for what they see or say they have seen. By applying selected methods used in medicine, particularly in neurology, psychiatry, and neuro-ophthalmology, observers can be clinically evaluated for creditability, both predictive and retrospective. Such an approach offers both quantitative and qualitative assessment of central nervous system functioning as it would be reflected in observational reporting.

Adequate clinical assessment of an observer must involve cross-disciplinary integration because of the nature of the bodily processes involved in seeing and reporting an event. In the beginning, the event is perceived. Usually, this is basically a matter of seeing, although other sensory modalities can also be involved. The initial critical consideration, then, is the state of the eye (cornea, lens, retina) and its connections with the brain (optic nerve, tract, temporal, parietal, and occipital lobes). A careful examination of these structures (both directly and indirectly) can establish whether or not it would have been possible for a particular individual to have perceived what he has reported or whether, on the sole basis of the state of his input apparatus, his observation was distorted.

Once it has been established that a visual image can be picked up and transmitted, unmolested and unaltered,

[1]Manuscript submitted February 1968.

along normal pathways to the back of the brain to allow for perception, the next question is how the brain codes it. This involves the ability to deal with detail, to make associations and spatial relationships, and to do other intellectual work, all of which occurs very rapidly and before the processed material is made available at the tempero-parietal lobe level for communication or for a reaction of any other kind. A great many pathways and a number of brain areas are operative in this critical coding step, and a number of problems, both anatomic and physiologic) can affect the process, either subtly or grossly. The responsibility of the clinician here would be to test cortical integrative ability with the various neurologic

testing techniques available to him. He must also rule out (by careful history, general physical examination, and certain laboratory' measures) the innumerable disease states -- toxic, infectious, endocrine, metabolic, deficiency, and neuropathologic -- that can subtly alter cortical functioning and thus interfere with the coding of an observation.

The next step in observer evaluation is the psychiatric part which, if properly carried out, will probably be the statistically most fruitful for uncovering observer creditability gaps. This is in part because the same types of disease processes listed above for interfering with cortical integration (coding) also can cause such mental aberrations as frank hallucinations and delusions or lead a person to fill in with make-believe details (confabulate) the parts of a report that his brain condition no longer allows him to remember.

In addition, there are the purely psychological problems, based in background factors, which lead an observer to deliberately fabricate or unwittingly distort what he has seen. If consciously driven, his motivation may be fame, fortune, competitive strivings or some rather specific, complicated need which has been tapped by finessing the event he is reporting. If the distortion has its roots at an unconscious level, it is likely that it was triggered by something about the event in relation to the patient's remote past. In the case of a functionally psychotic person, the entire observation may be the product of his own intrapsychic life instead of having had anything at all to do with an external event. On the opposite end of the continuum is the normal or only mildly neurotic person whose "hang-ups" are such that they have either not substantially affected his report or have only very subtly colored a small detail. It may be just as important to ascertain this.

Other aspects of the psychiatric part of observer examinations are the matters of intellectual differences and language factors, both of which would have some bearing on the reporter's strengths and limitations as a creditable and adequate observer.

A sound systematic method for ascertaining observer creditability would have widespread application. People in the legal profession grapple daily with this problem [2]. Eye-witness testimony determines individual life and death decisions in courtrooms. On an even grander scale, it shapes far-reaching diplomatic and military policy. In the laboratory or other scientific settings, when inaccurate, it can lead to an horrendous waste of money and professional man-hours. In all these situations, we should be demanding to know more about the likelihood of a crucial observation before acting on it.

Many people in science, technology and government perform basically observational roles. Some of these individuals are in such responsible positions that what they think they see or say they have seen, and how they respond to it, could profoundly affect the course of human events. (Such a statement will not seem overdramatic or exaggerated to those readers who have some knowledge of how, for example, our national security system operates.) The choice of these people on the basis of tenure, military rank or years of good conduct seems hardly pertinent, since these factors don't necessarily reflect anything about the state of their central nervous system. Given our extreme reliance on some of these individuals, it is suggested that they be screened for observational integrity prior to placement in key positions and that they also be given periodic follow-up evaluations.

All-encompassing medical assessments of observers have not, to this author's knowledge, been previously proposed. This is probably because developing the idea and applying the methods entails a working knowledge of at least three of those medical specialties which focus on the central nervous system. It also demands an eagerness to integrate certain aspects of each specialty, for purposes of problem-solving. The desired end, in this case, is a more complete understanding of the individual observer.

Rather than extensively elaborating on the necessary examination techniques, the following outline stresses processes, structures, and diseases that determine the nature of reported observations. The specifics of the material are intended mostly for the non-medical reader, since the question of observer creditability is so often his business and since he will be the one in the position to decide when to request the special assessment.

Method

The initial phase of integrated eye-witness assessment is a general medical evaluation. This involves, besides the complete physical examination, a careful history and selected laboratory' studies. The rationale for beginning in this way is screening, since many disorders of other organ systems are well-known for their adverse effects on central nervous system functioning. Knowledge about the background and current status of the observer's general bodily health will alert the physician to which areas will need further investigation and which of the later, special examinations will

warrant particular scrutiny [3]. When diabetes, for example, is known to be present, the physician will look for specific related abnormal findings when he checks the eye and does the neurologic and mental status examinations.

Since observations usually begin with the eye and/or some other sensory organ, the next step (once adequate general medical screening has been done) might naturally be a neuro-ophthalmologic examination. This would concern itself with the major structures of the visual apparatus and any of their abnormalities which might influence accurate reception of the visual images [4].

The cornea, the most external structure, accounts for visual distortion through scarring and clouding. These changes are caused by such insults as trauma to the eye, exposure to toxic fumes, infections, and deficiency or degenerative diseases. Inspection with an ophthalmoscope and/or slit lamp will positively establish corneal integrity.

The lens of the eye is the main structure for directing light rays from external phenomena to the retina. It has a wide range of possible variation, on both a genetic basis and, like the cornea, as a result of aging, trauma, deficiency diseases and infections. The configuration of the lens, as it is suspended in front of the eye by delicate muscles, accounts for the sharpness (and shape) of the image known as refractive ability.

The aqueous humor which bathes the lens is of particular concern because of the pressure it exerts on the rest of the eye. Increased pressure changes in this medium, measurable with a goniometer) are responsible for glaucoma which can result in serious impairment of visual acuity. After a period of time, the increased pressure will also lead to a characteristic constriction of the visual fields, which can be established by examination (perimetry).

The vitreous humor fills the eyeball and is the other fluid through which the light rays of a visual image must pass before they reach the retina. This medium is subject to clouding and other signs of early inflammation. "Floaters," which are abnormal proteinaceous particles in the vitreous humor, are sometimes mistaken by people as moving objects that are in their outside environment. Again, ophthalmoscopic and slit lamp examination will serve to determine the status of the vitreous humor.

The retina is the structure on which the visual image is actually received; loosely, it can be likened to camera film. Located in the posterior eyeball, it is the beginning of the neural perception linkage which eventually reaches the brain and consciousness. The retina is subject to many and varied abnormalities which can severely disturb both visual sharpness (acuity) and range (fields), as well as color perception. Retinal pigment accumulation, inflammatory, and other exudates, vascular problems and other types of pathology can come between an otherwise observable event and the retina, such that part or all of the event is obliterated or distorted in various ways. Ophthalmoscopic inspection will yield a great deal of information about the anatomic integrity of the retina, but a complete assessment must also include detailed mapping of both visual fields by perimetry, with attention to the size and shape of the blind spot. The observer's ability to perceive color at the retinal level may be challenged with Ischihara charts, which are most popularly used for detecting color blindness. These charts also will pick up abnormalities in color perception which are due to drugs, other toxic conditions, and higher, cortical integrative problems.

The head of the optic nerve (disc) can also be easily inspected with the ophthalmoscope, as it sits bare at the back of the eye. The optic nerve is subject to similar pathologic processes as those mentioned above: i.e., developmental, inflammatory, metabolic, and toxic. The color, texture and anatomic configuration of the nerve head indicate not only the integrity of the optic nerve at this vital point but also offer highly suggestive inferential information about the state of the rest of it, which is not directly visible. In addition, when there is increased intracranial pressure due to any type of brain abnormality, it can be reflected in the appearance of the optic disc.

The optic nerves from both eyes join in the area of the pituitary gland and then redivide in such a way that fibers from both eyes are represented in the optic tracts that form. Each tract then travels along either side of the brain (medial aspect of parietal and temporal lobes) via optic radiations to the occipital cortex. These pathways, although not directly visible, are accessible through the use of several maneuvers. Composite findings on neurologic examination, including visual field results, are traditionally used, but opticokinetic studies should also be done because of the abundance of information they can give about the integrity of the optic radiations. This involves the use of a moving, checkered tape which the patient watches and to which his eyes should involuntarily respond with rapid, rhythmic movements (nystagmus) [5]. If, on the basis of these studies, some kind of local pathology or other interfering process is suspected, the physician can then make use of special x-ray procedures (pneumoencephalography, arteriography) for looking at the areas in question.

Once the examining physician has satisfied himself as to the status of an observer's visual apparatus (to the point where the cerebral cortex takes over), he will want next to proceed with a detailed neurologic examination. His index of suspicion about the presence of absence of pertinent central nervous system disease had already been altered by his findings on general physical evaluation, as well as from the eye examination.

There is a clinical format for doing a complete neurologic examination; it is well-known to neurologists and

other interested physicians. Certain of the maneuvers, particularly those which test cortical integrative function, are extremely important in the evaluation of an eye-witness. This is because they will indicate the ability of the observer's cerebral cortex to process what his visual apparatus has fed in -- to differentiate various kinds of sensory input, process detail, make associations, and integrate spatial relationships. More specifically, those tests that reflect cortical sensory status are particularly pertinent for eyewitness assessment. This is because there are numerous medical disorders that cause neurologic disruption at the cortical sensory level, resulting in hallucinations, delusions, distortions, and confabulations [6].

"Organic" hallucinations and distortions often seem very real, even afterwards, to one only transiently afflicted and are apt to be reported as witnessed events. They can occur in people suffering from acute infections, adrenal insufficiency, brain tumors, chronic pulmonary disorders (respirator acidosis), complications from vitamin deficiencies and alcoholism, abnormal calcium metabolism, low blood magnesium levels, epilepsy (for several reasons), and Sydenham's chorea. In addition, there are scores of commonly used drugs which will produce hallucinations if taken in toxic quantities or, by certain people, in prescribed amounts. These include antihistamines, meprobamate ("Milltown"), dephenylhydantoins (antiepileptic agents), atropine (found in many non-prescription sleeping pills), and bromides (as in Bromoselzer). The report of an eye-witness who has been scrutinized for these possibilities alone (by history, examination, and necessary laboratory data) will understandably assume more creditability.

The possibility that an observation may have been influenced by an "organic" delusion should also be investigated. Frequently, as with the hallucinations, there will be clues to this situation from the observer's history or from some examination findings. Among the underlying medical causes of delusions are trichinosis, syphilis, hypothyroidism, calcium disorders, various blood disorders, encephalitis, and pellagra. Some of these same disorders can, of course, also influence observational reporting through other channels.

Confabulation, as a neurologic sign, is particularly important to rule out in the eye-witness report because it can be so deceiving. In fact, it serves as a cover-up for memory impairment by filling in the gaps with sundry (but inaccurate) details. Typically, confabulation is seen in association with peripheral neuropathy (careful examination is thus apt to alert the physician) and is the result of either a blood) disorder or, more commonly, exposure to toxins [7].

Many gross mental aberrations, such as hallucinations and delusions, are not associated with abnormal physical or neurologic signs and can be causally traced to underlying psychologic disorders. These are likely to be recognized and so labeled in the neurologic phase of the assessment where, as in psychiatry, a standard mental status examination is used for ferreting out emotional disorders, as well as memory and other intellectual impairment. For example, the schizophrenias and psychotic depression (which are the more frequent functional disorders associated with hallucinations and delusions) usually have well known clinical characteristics and will be obvious to physicians doing formal mental status testing [8].

It is because of the less florid kinds of psychopathology that a thorough psychiatric evaluation should be part of an observer creditability assessment. The complexities and vagaries of the human personality can lead to some gross distortions and fabrications around an event, particularly when finessed by people who are borderline psychotic, paranoid, sociopathic, hysterical or inadequate personalities. Some of these people, when stressed, have brief, episodic breaks with reality in which they are frankly psychotic and hallucinate, yet then resume previous functioning.

During a sophisticated psychiatric evaluation, the physician would be likely to recognize a propensity for such episodes. His main job, however, would be to gather enough information about the observer as a person to be able to check him out generally, psychologically, for creditability. This would involve complete developmental and psychosexual history, studying family relationships (past and present), assessing intellectual ability, elaborating on areas of major conflict, assessing for characterologic make-up and evaluating for ego-strength or weakness.

In instances where an observer is being retrospectively evaluated (i.e., he has already reported an event) there should be an intensive effort made to explore the observer's feelings about what he has seen and described. Such discussion, when properly guided, is likely to uncover inconsistencies and other helpful clues, in the case of the noncreditable observer. Unconscious motivational forces that have led to inaccurate reporting can sometimes be uncovered by exploring the observer's fantasy life, listening for slips of the tongue, or attempting free association. In an occasional observer, where substantiation of his creditability is crucial and there is vague reason to suspect it, a pentathol interview may be indicated.

In instances where frank lying about an event is suspected, the observer can be questioned while monitored by a polygraph. This machine measures some of those bodily responses that are under the control of the autonomic nervous system which is, in turn, partly regulated by cortical centers. If the observer being studied is truly sociopathic and has never developed a super-ego, or conscience, the polygraph will not be able to pick up his lie, since he will have no associated conflict on telling it. The lying will be picked up, however, when the polygraph is used on other personality types.

Up to this point, this paper has focused on the many factors that interfere with observer creditability. There

is as well, an obvious positive application for these assessments. The psychiatric evaluation, for example, can be useful for further screening for the strengths of observer candidates who have already been ruled medically and neurologically intact. In addition to making some sound predictions about accuracy of reported observations, the psychiatrist could also explore the candidate's ability to appropriately respond, under stress, to what he has seen. This aspect of an individual's make-up is of grave importance (as implied earlier) in some military, security, and other key positions.

GENERAL DISCUSSION AMONG SYMPOSIUM PARTICIPANTS

1. General Discussion
2. Article Summary Read into the Record
3. Adjournment

Mr. Roush. Thank you, Dr. Baker.

I anticipated we would have difficulty keeping the members of the committee here at a time when important legislation is considered on the floor. We thought we would reserve the final few minutes for those of you who have made presentations to discuss among yourselves questions which may have been aroused by one of your colleagues' presentation today.

With that in mind, we are going to permit you to have a real free for all. Dr. Sagan.

Dr. Sagan. I just wanted to underline one point that Dr. Baker made. Congressman Roush, in his detailed presentation of the various Air Force systems, I am afraid that the main point won't come across to a lay audience, and that is that with relatively little expenditure of funds, it would be possible to significantly improve the available information.

Apparently what is now happening is that the Air Force surveillance radar is throwing away the data that is of relevance for this inquiry. In other words, if it sees something that is not on a ballistic trajectory, or not in orbit, it ignores it, it throws it in the garbage.

Well, that garbage is just the area of our interest. So if some method could be devised by the Air Force to save the output that they are throwing away from these space surveillance radars, it might be the least expensive way to significantly improve our information about these phenomena.

Mr. Roush. Thank you.

Dr. Baker. Let me just make a comment: That is quite true. At the present time our space surveillance sensors are about 200 percent overtasked. That means they could make about 50 percent of their time available to us. They task too many space objects, their capacity is much greater than the space objects that they are tasked to watch. The space population may grow to fill this void, but currently what Dr. Sagan says is true, we could as I indicated in conclusion (4) modify our current space surveillance system.

It is not an expensive thing to modify existing radars. The FPS-85 itself costs something like $100 million. The software modification called for here I am sure would be much less.

Mr. Roush. Dr. Hynek.

Dr. Hynek. I would just like to concur in what Dr. Sagan has said. I understand there are several hundred UCT's a month, uncorrelated targets, that because they don't -- 1 understand -- which since they do not follow ballistic trajectory, they are tossed out. It would not be expensive to introduce a subroutine into the computer to take care of these things for a short while. I strongly second Dr. Sagan's and Dr. Baker's suggestions.

Mr. Boone. Mr. Chairman.

Mr. Roush. Mr. Boone.

Mr. Boone. I think the gentleman should advise you too, though, when you do that, you must make a trajectory determination on each target including aircraft which may put a terrific burden on the radar you are insisting on upgrading.

Dr. Hynek. I will certainly grant that.

Dr. Harder. I would only respond to Mr. Boone by suggesting you could reject all objects that were found, for instance, under 90,000 feet.

[[190]]

Dr. Sagan. That is just what I was going to say. Certain velocity and altitude limitations.

Mr. Boone. With that I agree. But I don't think we make many sightings at that altitude. We do have a problem here of what you want to look at. So in fact I think the thrust of Dr. Baker's argument here was that most of the Air Force equipment do not supply the material you would like to have.

So you are going to have to go to a much lower altitude, and you are going to have to check a much larger number of targets.

Dr. Sagan. I may have misunderstood, but my understanding was, since all of these "uninteresting" trajectory objects are thrown away, we have no way of knowing at the present time whether there are or are not large numbers of interesting objects at altitudes above 90,000 feet.

Mr. Boone. What this means is you check each one and determine its trajectory, and then throw it away, so it no longer becomes a simple task of saying "Oh, I only want to look at the unidentified ones." I have to check each one, and discard it.

Dr. Sagan. Isn't that being done already?

Mr. Boone. No, it doesn't do it below certain altitudes.

Dr. Sagan. Right.

Mr. Boone. All right. Certain targets are picked up at certain ranges, are they not?

Dr. Sagan. Right. So therefore the suggestion is that within the altitude range, that is being used anyway by the surveillance radar --

Mr. Boone. You complicate the procedure.

Dr. Sagan. Slightly.

Mr. Boone. The procedure is used but it involves the software again which is much more difficult to add to the systems than I believe is being presented. It can be done, there is no question it can be done.

Dr. Harder. I would agree the amount of effort that goes into the relative softwares, although by no means a $100 million project, it is not a very simple project.

Mr. Roush. Dr. McDonald, do you have a comment?

Dr. McDonald. Yes. I would underscore another one of the points, the general points that Dr. Baker made. I think it addresses itself to the question raised. Both scientists and members of the public are quite aware we have many monitoring radar systems, optical and so on.

This question is raised often, why aren't UFO's tracked? The point one is struck with in studying each of these systems in turn is the large degree of selectivity that is necessarily built into them. Good examples were cited by Dr. Baker.

It has to be kept well in mind that even systems like SAGE when they were developed necessarily had to have programmed into them certain speed limits both lower and upper, certain safe requirements like if the target was on an outbound path it could be ignored. In almost every monitoring system you set up, whether for defense or scientific purposes, if you don't want to be snowed with data, you intentionally built selectivity in, and then you do not see what you are not looking for.

Consequently, this point is important, that despite our many sensing and monitoring systems, the fact that they don't repeatedly turn up

[[191]]

what appear to be similar to UFO's, whatever we define those to be, is not quite as conclusive as it might seem.

The second comment I would make concerns Dr. Baker's remark that we should move ahead to instrumental techniques and perhaps lessen attention on the older data.

I too agree that we have much need to replace what police officers and pilots saw with good hard instrumental data, the sooner the better, but there are many fields in which once you get instrumental data, say seismology, and being to learn about the phenomenon you are studying, seismology, astronomy, meteorology, once you understand these things you do go back to exploit the knowledge that is implicit in older data. Seismologists do study old earthquake records to improve the seismicity data available. Ecologists do look at old shifts in plant and animal patterns. Astronomers do look at old eclipse information, because once you begin to understand a problem, you can then sort out much better the important material.

I would not want to see excluded entirely -- in fact, I think it would be folly to exclude observations that go back 20 years, and a part of the problem we have not talked about today, still earlier observations.

Dr. Baker. Yes, I concur in that.

My message there was that if we preoccupy ourselves with continually going over past history, it is going to be frustrating. I think we can always use past history in retrospect. In order to go back, as you say, to look at the data and to put it in the proper perspective, when we learn more about the phenomena. So I agree.

Mr. Roush. Is there any other aspect of previous presentations that any of you would like to question?

Dr. Baker. I have a question of Dr. Harder about the Ubatuba magnesium.

Was this magnesium terrestrial? In other words, it is granted that Ubatubas couldn't produce it, but could the magnesium have been produced terrestrially, and if so, in what connection would we produce and employ such magnesium here on earth?

Dr. Harder. Well, such pure magnesium is indeed produced terrestrially in connection with Grignard reagents, and produced by the Dow Chemical Co., where magnesium is produced in greater purity actually than this.

At the time in 1957, the Brazilians did not have a sample of magnesium from the U.S. Bureau of Standards that was as pure as this Ubatuba magnesium with which to compare it. I might enlarge upon the data which was produced, or which was gotten at the request of Dr. Craig, that of the impurities found by the Colorado group, the principal one was zinc strontium with barium being a runner-up. these are very curious kinds of alloys from any terrestrial point of view.

No detected aluminum, and only three parts per million copper, and those are the most likely alloying elements from the terrestrial point of view.

Dr. Baker. Would you say that the sample was partially terrestrialized, and it might be the remnants of an ultrapure nonterrestrial alloy, or did it appear these particular impurities were in the sample from the beginning?

[[192]]

Dr. Harder. This was done by a neutralization [sic] analysis on a very tiny slicer [sic]. It would be hard to say to what extent over the intervening 9 years there might be some terrestrialization, but certainly it would not have taken out aluminum or copper. It might have added zinc or barium, although that seems somewhat unlikely.

Dr. Sagan. So some comparison analysis has been made for example of the magnesium flares. A magnesium flare has an abundance of impurities?

Dr. Harder. It would hardly be 99.9 percent purity.

Dr. Sagan. That is what I meant.

Dr. Harder. Yes, that is right.

Mr.Roush. Dr. McDonald

Dr. McDonald. Both Dr. Hall and Dr. Sagan remarked in different contexts on the intense emotional factors that predispose some people to certain systems of belief, and I would like to remark on that to be sure that some perspective is maintained on that part of the problem.

In the witnesses I have interviewed -- I have intentionally stayed away from those who immediately show a very strong interest in a salvation theory, or something like that -- so I have cut down my sample right at the start.

I would want to leave the point strongly emphasized that though there are a few people, and some of them rather visible and vocal, who are emotional about the problem and tie it to almost religious beliefs, the body of evidence that puzzles me, that bothers me, and I think demands much more scientific attention, comes from people who are really not at all emotional about it; they are puzzled by it, they are reliable, a typical cross-section of the populace. They have not built any wild theories on it.

In fact, let me mention one important sighting in New Guinea. I didn't interview the witness in New Guinea, out in Melbourne, Australia. An Anglican Missionary, Rev. William B. Gill, was teaching the school in New Guinea, and when he and some three dozen mission personnel saw an object hovering offshore with four figures visible on top of it, even this minister didn't begin to put any religious interpretation on it. He said this is what he saw, and he wrote very careful notes about it. It is that kind of evidence, and not evidence that comes from people with emotional factors predisposing them to system [sic] beliefs that impress me.

Mr. Roush. Let's have the psychologist speak here for just a moment.

Dr. Hall. Thank you.

I welcome that clarification.

The point I was making was not that the witnesses generally are emotional and precommitted to a position at all, but that the people who are interpreting the evidence after it has been gathered are usually precommitted beyond the point of rationality, and it is a very important distinction that you brought out.

The primary problem of witnesses, it seems to me, is this reluctance to report based apparently on a feeling that they will be ridiculed -- that their evidence is not welcome -- and I guess I can't resist telling the little story from the Wall Street Journal, quite recently, of a man who had five pet wallabys in Westchester County. A wallaby

is a miniature kangaroo. These five wallabys escaped, and rather than upset people he didn't report this, he waited for people to tell him that they had seen them. And nothing happened for days and days.

Well, when they were finally relocated and caught then lots of people started admitting, yes, they had seen these wallabys, but after all, if you see a tiny kangaroo loping across the road in New Rochelle, you are reticent to report it.

Mr. Roush. Dr. Hynek again.

Dr. Hynek. I think that is a most interesting point that ties in. I think sometimes we don't ask ourselves really very fundamental questions, and that is, how is it that these reports exist in the first place?

It is not just because they are strange, because we don't have reports of Christmas trees flying upside down, or elephants doing strange things in the sky; the reports are strange, but they do have a certain pattern.

Now, I have often asked myself, well, why do the reports exist in the first place? And how many are reported?

Whenever I give a presentation to some group I frequently will ask them, well, how many of you have seen something in the skies you couldn't explain; that is a UFO, or some friend whose veracity you can vouch for?

I have been surprised to find that 10 to 15 percent, albeit it is a specialized audience, they are there already because they are interested, hence there is a selection factor, but nonetheless I am quite surprised that many respond.

Then I ask the second one, Did you ever report it to the Air Force? And maybe one or two will say that they have.

Now, why, then, should people make reports anyway, since they face such great ridicule? They do it for two reasons, those that I have talked to: One, is out of a sense of civic duty. Time and again I will get a letter saying, I haven't said this to anybody, but I feel it is my duty as a citizen to report this. And many letters come to me. In fact, even saying, please do not report this to the Air Force.

The second reason is that their curiosity finally bugs them. They have been thinking about it and they want to know what it was they saw, and many letters I get will end in a rather plaintive note, can you possibly tell me, or can you tell me whether it is possible what I saw?

Those two reasons are the "springs" of why the report is made in the first place. I don't know how much store can be put in the Gallup poll, but I understand when, about 2 years ago a poll was made on this subject, there was something like -- the poll reported 5 million people, 5 million Americans had seen something in the skies they could not explain. Over the past 20 years the Air Force has had some 12,000 reports. Therefore, one can logically ask, who is holding out on the other 4,988,000 reports?

I think there may be quite a reservoir of reports that simply have not come out into the open because of this natural reluctance of people to speak out.

Mr. Roush. Dr. Hynek, your experience has been similar to mine, although much more extensive. In the 10 years I have served on this committee I have had occasion to ask various witnesses their beliefs

as far as UFO's are concerned. They have included Air Force generals and Army generals, and usually they display a great interest. Sometimes they will say, I don't believe, But my wife does; some will say.

The other day I was engaged in a colloquy over on the floor of the House, not a part of the record, but just as a side conversation, with two of my colleagues who sit on this committee.

(At this point, discussion was off the record.)

Mr. Roush. Back on the record.

As a result of my experience on this committee I have been privileged to visit the tracking stations which NASA has throughout the world. Each place I have visited I have asked the question, "Have you tracked any unidentified flying object?"

Well, it is obvious they apparently don't have the ability to track, but the response was "No," everywhere except in South Africa. Then they said, "anything we track, which we do not understand, we turn over to the Department of Defense," inferring there were some things they did not understand.

The same is true with those places in the world where there is a Baker-Nunn camera. I asked the same question of them. For the most part there was a boundless curiosity, but a negative response.

Dr. Hynek. I might respond to that, of course, in talking to them, you have represented officialdom, and they may themselves be a little afraid to say anything to a Congressman that might get them into trouble.

But I get reports sub rosa that are to the effect that people, trackers, and so forth, have seen things, but they would not dare think of reporting it.

Now, that is hearsay. I am sorry it is not hearsay; it has happened to me.

But it is not what I would call "solid evidence,"

Mr. Roush. Just one other comment. I serve on the board of trustees of a college back in Indiana. In the course of a year they had numerous lectures by outstanding people in their lecture series, quite outstanding people on various subjects, but they scheduled one lecture given by a student at the college on unidentified flying objects. Needless to say, he had the best attendance of the entire series.

Dr. Harder.

Dr. Harder. Following on something that Dr. Hynek said about the small percentage of actual sightings that are reported, this would suggest that the two instances that I brought out, which to my knowledge are the only extant pieces of what you might call scientific information -- information containing information of a scientific nature, might well be multiplied by a factor of 10, if it were not for this ridicule bit, and furthermore, if it were not the subject of ridicule, many people would perhaps take greater care in the observations that they do make, and perhaps come up with similar kinds of anecdotal nature of somewhat more importance than just flashing lights.

For instance, the plane of polarization or -- well, many kinds of observations came to us. We would have even at this point far more anecdotal information of a scientific nature and of scientific importance than we now have.

Mr. Roush. I think those of you who have sat on this panel today have made perhaps a greater contribution than you realize in adding

some respectability to the interest the American people have in this phenomena. Perhaps we can, by further activity on the part of this committee, and you on your part, and by the public reading what you have said today, cause people to be more responsive and to report what they see. Perhaps we can thereby give an air of respectability to these sightings which will permit people to go ahead without being embarrassed or ashamed of reporting what they have seen.

Does anyone else have anything here?

Mr. Fulton. Mr. Chairman, sightings of UFO's in western Pennsylvania have now increased to the point where interested citizens have established a UFO Research Institute with a 24-hour answering service, to investigate reports and sightings.

In my congressional district, there is the Westinghouse astronuclear plant, whose fine work is well known to the members of our committee. As I have been asked by Mr. Stanton T. Friedman, a nuclear physicist at Westinghouse who makes a hobby of investigating UFO sightings and publicly speaking on the subject, it is a pleasure to insert a statement by Mr. Friedman, "Flying Saucers Are Real" into the record at this point. He is one of the few observers with the candor to conclude and so state that "the earth is being visited by intelligently controlled vehicles" from outer space.

(Mr. Friedman's statement follows:)

SUMMARY OF "FLYING SAUCERS ARE REAL"

BY STANTON T. FRIEDMAN, NUCLEAR PHYSICIST

After considerable study, first-hand investigation, and review of a great variety of data, I have concluded that the evidence is overwhelming that the earth is being visited by intelligently controlled vehicles whose origin is extraterrestrial. This does not mean that I know why they are here, where they come from, how they operate, why they don't seem to be talking to us. It also does not mean that I believe that everything that people see that they cannot identify is an extraterrestrial spaceship. Quite the contrary, I believe that most things that people report as UFO's can be identified as relatively conventional phenomena seen under unconventional circumstances just as most isotopes cannot fission or fusion, most chemicals don't cure any diseases, most people cannot run a four-minute mile, and most women don't look like Brigitte Bardot. The scientific approach to any problem is to sift the information to find that which is relevant to the solution of the problem at hand. The fact that most initially strange objects in the sky and on the ground can be identified is totally irrelevant to the question of the existence of extraterrestrial spaceships. Also irrelevant are the facts that we cannot yet comfortably visit other planets, that some of us might behave differently from the way our visitors act, that we have not yet publicly been exposed to pieces of such a vehicle, or to an extraterrestrial humanoid on television.

While almost everyone has heard of flying saucers and has an opinion about them, most people including the non-believing scientists who have made such definite statements about their non-existence are ignorant not only of the facts concerning UFO's but also of the technology that might aid one in understanding the vehicles' motion, the possibility of interplanetary and interstellar travel, or the possibility of life on Mars.

Sightings of UFO's are relatively common and have occurred all over the world. One out of every 25 adult Americans has seen a UFO. Judging from the one detailed, official, scientific investigation that has been published, one-fifth of the sightings can be labeled as Unknowns. These Unknowns are completely separate and distinct from the 20% of the 2199 sightings which were labeled "Insufficient Information" because some vital piece of data was missing. Many of the Unknowns are reported by highly trained, competent witnesses who have close-up sightings lasting for many minutes. UFO's have been observed on radar and been subsequently labeled as Unknowns. There have been simultaneous radar and visual sightings. Comparisons between Knowns and Unknowns clearly showed definite differences in color, shape, size, velocity, maneuverability, etc.

This data, which most people have never seen or even heard of, is published in a document entitled "Project Blue Book Special Report, Number 14" which was completed in 1955 and has never been made readily available. The low percentage of Unknowns since that time is the direct result of deception on the part of the U.S. Air Force whose entire approach since that time has been based upon the assumption that everything can be identified.

The usual arguments made against "visitations" are based upon false assumptions, wrong (unanswerable) questions and faulty knowledge. "Things cannot go that fast in the atmosphere -- spaceflight is impossible -- trips to the stars are impossible, if they were here they would talk to us ... etc." The typical educated non-believer focuses on the irrelevant UFO's and poor sightings by incompetent observers and carefully neglects the UNKNOWNS seen by competent observers. The great probability that there are civilizations thousands, perhaps millions of years, ahead of us and possessing technology about which we are probably totally ignorant is neglected. The distressing thought that we, the inhabitants of this planet, might not be worth talking to is pushed aside. The most effective filter between the facts as they are and the widespread distribution of those facts has been ridicule. Fewer than 1% of the sightings that have occurred have been investigated or reported. Documents containing solid data about UFO's rather than IFO's have been privately published so that most people have never seen the data that they contain. An entire mythology of false information has been widely distributed instead. Now is the time to break through the "laughter curtain." Studies done six years ago at the Jet Propulsion Laboratory showed that trips to the stars in reasonable times are feasible with the knowledge we have today using staged fission or fusion propulsion systems both of which are under development. A tremendously large body of data connected with magnetoaerodynamics even suggests we might be able to build something very much like the reported UFO's -- and

also solve many of the problems of high speed flight and produce the electromagnetic effects so frequently associated with UFO sightings. "It's impossible" is said instead of "We don't know how."

Literally hundreds of reports from all over the world also testify to the existence of humanoid creatures associated with UFO's on the ground. Once again ridicule has kept the facts from being known. More than 200 landings have been documented for 1954 alone.

There are good pictures of UFO's from all over the world -- most of which have also not received the publicity that they deserve.

A good example of the ridiculousness of the professional skeptics' attitude is the statement that "life as we know it cannot exist on any other body in the solar system." It sounds sensible until we note that we expect to send men to the moon and to Mars. The primary attribute of an advanced intelligent civilization is its ability to create its own environment almost everywhere such as the bottom of the ocean, in outer space, and on the surface of airless, waterless bodies such as the moon and Mars. For those who believe that the Mariner IV pictures of Mars proved that there isn't life there, it should be pointed out that of 10,000 pictures taken of the earth from a satellite with cameras of the same resolving power as those used on Mariner IV, only 1 (one) gave any indication of life on earth.

Max Planck once said that new truths come to be accepted not because their opponents come to believe in them but because their opponents die and a new generation grows up that is accustomed to them. Perhaps this is what will happen with UFO's.

Mr. Roush. Dr. Baker, and Dr. Hall, Dr. McDonald, Dr. Harder, Dr. Hynek, and Dr. Sagan, I believe that you people have made a real contribution here, and I think the time will come when certain people will look back and read what has been done here today and realize that we have pioneered in a field insofar as the Congress of the United States is concerned. They will be very mindful that something worthwhile was done here today.

As a personal note, I would like to say this has been one of the most unusual and most interesting days I have spent since I have been in the Congress of the United States.

Thank you.

I thank each of you.

The committee stands adjourned.

(Whereupon, at 4:39 p.m., the committee was adjourned.)

PREPARED STATEMENTS

STATEMENT BY DR. DONALD H. MENZEL

1. Biography
2. Prepared Statement

(The biography of Dr. Menzel follows:)

DR. DONALD H. MENZEL

Dr. Donald H. Menzel, a native of Colorado, received his Ph. D. from Princeton University in 1924. After one year as instructor at the University of Iowa, another year as Assistant Professor at Ohio State University, Dr. Menzel went to Lick Observatory in 1926, as Assistant Astronomer. While at Lick he participated in many observing programs with the large telescopic equipment. His major work, however, was in the interpretation of the spectrum of the atmosphere of the sun, from photographs taken at various total solar eclipses. He participated in the observation of two such eclipses, in the years 1930 and 1932.

In the fall of 1932, Dr. Menzel came to Harvard University, where he has been ever since, except for three years of service as a Commander in the U.S. Navy, during World War II. His studies have covered a large number of fields, from pure physics to pure astronomy. Of special concern has been the sun itself, in which field he is a recognized authority. His studies have employed a combination of observation and theory. In 1936 he was director of the Harvard-M.I.T. eclipse expedition to USSR. In 1945 he directed the Joint U.S.-Canadian eclipse expedition to Saskatchewan. He has also observed the total eclipses of 1918, 1923, 1954, 1959, 1961, 1963 and 1967.

In an attempt to obtain basic information outside of a total solar eclipse, Dr. Menzel developed the first coronagraph in the United States and established the station at Climax, Colorado, where it is now known as the High Altitude Observatory. Originally operated jointly by Harvard and the University of Colorado, this scientific institution is now wholly under the jurisdiction of the latter university. The observations of solar activity obtained at Climax had an immediate application to problems of solar-terrestrial relationships, especially on the propagation of radio waves.

To expand the work in this field and to provide for more nearly unbroken records of solar activity, after World War II, Dr. Menzel suggested that the Air Forces establish a second solar station. After several years of site surveying, Sacramento Peak Observatory was established near Alamogordo, New Mexico on a mountain some 5000 feet above the Tularosa Basin, overlooking the White Sands Proving Ground and the Holloman Air Force Base. The large instruments, including the 16-inch coronagraph, were all designed and built under Harvard auspices, collaboratively with scientific personnel from the High Altitude Observatory. In 1956, with Air Force sponsorship, Harvard built a Solar Radio Observatory near Fort Davis, Texas, to record the radio waves of solar origin. The data from these observatories are revolutionizing our knowledge of the sun and solar activity.

In 1952 Dr. Menzel became acting Director of Harvard College Observatory and, in 1954, was advanced to the Directorship. He resigned as Director on March 31, 1966. In Harvard University he is Paine Professor of Practical Astronomy and Professor of Astrophysics. On July 1, 1966 he also accepted appointment as Research Scientist on the Smithsonian Astrophysical Observatory staff. He has lectured extensively in Spanish throughout Latin America. In 1968 he was a Visiting Professor at the University of Chile, and served as State Department Specialist for Latin America in 1964.

From 1954-56 he was President of the American Astronomical Society. He is Vice President of the American Philosophical Society, a member of the National Academy of Sciences, the American Academy of Arts and Sciences, and a large number of other professional organizations. He is a senior member of the Institute of Electrical and Electronics Engineers and a Foreign Associate of the Royal Astronomical Society. From 1948-1955 he was President of the Commission on Solar Eclipses of the International Astronomical Union, and from 1964-1967 was President of the Commission on the moon. He is also a member of the International Radio Scientific Union (URSI), and the International Union for Geodesy and Geophysics. He has been Chief Scientist of GCA Corporation since 1959. He was a member of the Board of Directors of the Association of Universities for Research in Astronomy, Inc. from 1957-1966. (In 1954 he received the honorary

degree of D.Sc. from the University of Denver, his Alma Mater, and their John Evans Award in 1965.)

Dr. Menzel has been a prolific writer. His books, articles, and scientific papers cover a broad field, and have been translated into many languages. He has even ventured briefly into the realm of science fiction.

His book, "Our Sun," published by the Harvard University Press, is one of the so-called Harvard series on astronomy and a standard reference work, despite the fact that it is written in popular style for the general public. Two popular books on the subject of Flying Saucers, the second written with Lyle Boyd and published in 1963, analyze the various reports and demonstrate conclusively that these highly controversial "objects" are only various manifestations of different natural phenomena, not machines from outer space. His first book on Flying Saucers was translated into Russian. He has lectured extensively on UFO's around the world, including South America and Mexico.

Dr. Menzel's interest in promoting good writing by scientists, led him to produce "Writing a Technical Paper," co-authored by Professor Howard Mumford Jones of the Harvard Department of English and Lyle Boyd, a science editor. He is also author of a "Field Guide to the Stars and Planets," a popular handbook for beginning astronomers.

PREPARED STATEMENT BY DONALD H. MENZEL

UFO: FACT OR FICTION?

Flying saucers or UFO's have been with us for a long time. June 24, 1968 marked the 21st anniversary of the sighting of nine bright disks moving rapidly along the hogback of Mount Rainier. However, similar sightings go far back in history, where they have assumed various forms for different people. Old records refer to them as fiery dragons, fiery chariots, wills-o'-the-wisp, jack-o'-lanterns, ignis fatuus, firedrakes, fox-fire, and even the devil himself.

And now a new legend -- a modern myth -- has arisen to explain a new rash of mysterious sightings. Certain UFO buffs argue that the peculiar properties and maneuvers of these apparitions, as reported by reliable people of all kinds, are so remarkable that only one explanation for them is possible. They must be vehicles from outer space, manned by beings far more intelligent than we. because the operators have clearly built vehicles with capabilities far beyond anything we can conceive of.

On the face of it, this reasoning sounds much like that of Sherlock Holmes. who said on several occasions: "It is an old maxim of mine that when you have excluded the impossible, whatever remains, however improbable, must be the truth."

I am willing to go along with this formula, but only after we have followed Holmes and excluded every possibility but that of manned UFO's. And we must also show that no further possible solutions exist.

The believers are too eager to reach a decision. Their method is simple. They try to find someone, whom they can establish as an authority, who will support their views. They then quote and often misquote various authorities or one another until they believe what they are saying. Having no real logic on their side, they resort to innuendo as a weapon and try to discredit those who fail to support their view. The UFO magazines refer to me as the arch-demon of saucerdom!

I concede that the concept of manned spaceships is not an absolute impossibility. Neither are the concepts of ghosts, spirits, witches, fairies, elves, hobgoblins, or the devil. The only trouble with this last list is the fact they are out of date. We live in the age of space. Is it not natural that beings from outer space should exhibit an interest in us? But, when we consider that these beings -- if indeed they are beings -- have been bugging us for centuries, why should one not have landed and shown himself to the President of the United States, to a member of the National Academy of Sciences, or at least to some member of Congress?

Please don't misunderstand me. I think it is very possible that intelligent Life -- perhaps more intelligent than we -- may exist somewhere in the vast reaches of outer space. But it is the very vastness of this space that complicates the problem. The distances are almost inconceivable. The time required to reach the earth -- even at speeds comparable with that of light

-- range in hundreds if not thousands of years for our near neighbors. And it takes light some billions of years to reach us from the most distant galaxies, times comparable with that

[[199]]

for the entire life history of our solar system. The number of habitable planets in the universe is anybody's guess. Any figures you may have heard, including mine, are just guesses. I have guessed that our own Milky Way may contain as many as a million such planets. That sounds like a lot, but the chances are the nearest such inhabited planet would be so distant that if we send out a message to it today we should have to wait some 2000 years for a reply. Alas, the evidence is poor for intelligent life in our solar system, though I do expect some lower forms of life to exist on Mars.

With respect to UFO's my position is simply this. That natural explanations exist for the unexplained sightings. The Air Force has given me full access to their files. There is no vast conspiracy of either the Air Force or CIA to conceal the facts from the public, as some groups have charged. The basic reason for continued reporting of UFO's lies in the possibility -- just the possibility mind you -- that some of them may derive from experimentation or secret development by a hostile power. And I don't mean hostile beings from outer space!

The Air Force has made its mistakes. They never have had enough scientists in the project. They have failed to follow up certain sightings of special importance. Their questionnaire is amateurish, almost cleverly designed in certain cases to get the wrong answer and lose track of the facts. The Air Force is aware of my criticism and, on a voluntary basis, I have helped them improve the questionnaire. It was not an easy job. Especially when the Air Force rejected some vital questions as "an invasion of the privacy of the individual."

From 1947 until 1954 a bewildered group of Air Force personnel tried honestly and sincerely to resolve the UFO problem. Many highly reliable persons had reported seeing "objects" moving at fantastic speeds, and apparently taking evasive action in a manner impossible for known terrestrial craft. By 1952 a sizable number of those in the Air Force group had concluded that extraterrestrial vehicles were the only explanation. Some of this unrest leaked out. Popular writers exploited these ideas and soon various UFO clubs came into existence. In 1958, a committee of scientists, headed by the late H. P. Robertson of California Institute of Technology met at CIA to consider a number of the Air Force's most convincing cases. They immediately solved many of them. Others could not be solved because of poor or insufficient data. They concluded that all cases had a natural solution. There was no evidence to support the idea that UFO's are vehicles from another world.

Nevertheless, the UFO buffs believe, almost as an article of faith, that "trained observers," such as military or airline pilots, could not possibly mistake a meteor, a planet, a star, a sundog, or a mirage for a UFO. This viewpoint is absolutely nonsense and the Air Force files bear witness to its falsity! They contain thousands of solved cases -- sightings by "reliable individuals" like the pilots: But such persons have made huge errors in identification.

A huge meteor flashes in the sky! The co-pilot thinks it is going to strike the plane and takes evasive action. The pilot disagrees and he is right. The UFO proves to be a fireball or meteor a hundred miles away! Such occurrences are frequent, not rare. They have even increased with the growing number of re-entries and spectacular decay of satellite debris from the space operations of the U.S.A. and the U.S.S.R.

Distances overhead are uncommonly hard to estimate -- either on the ground or in the air. A bird's feather, shining brightly in the sun and floating a mere 20 feet overhead may seem to be a distant object moving at very high speed. Conversely, a pilot may think that a bright object on the horizon, in reality a star or planet, lies just beyond his wing tip. Sometimes, a layer of warm air, sandwiched between 2 layers of cold air, can act as a lens, projecting a pulsing, spinning, vividly colored, saucer-like image of a planet. Pilots, thinking they were dealing with a nearby flying object, have often tried to intercept the image, which evades all attempts to cut it off. The distance may seem to change rapidly, as the star fades or increases in brightness. Actual "dog fights" have been recorded between a confused military pilot and a planet. I myself have observed this phenomenon of star mirage. It is both realistic and frightening.

Such observations fortified the UFO legend -- that these objects "maneuver as if under intelligent control." But the pilots failed to realize that the "intelligent control" came from within themselves. And I think that Air Force personnel of Project Blue Book still do not appreciate this important UFO phenomenon.

[[200]]

Mirages are not the only apparitions that appear to maneuver. I think I was the first person, to point out that a special kind of reflection of the sun (or moon), sometimes called a sun dog (or moon dog), also can perform evasive action. Layers of ice crystals are necessary, like those found in cirrus clouds. An aviator flying through cirrus sometimes sees a peculiar metallic appearing reflection, a reflection of the sun or moon. He may elect to chase it. The apparition will recede if approached, or approach if the pilot reverses his course. The object seems to execute evasive action! As the pilot runs out of ice crystals, the UFO will seem to put on a burst of speed and disappear into the distance.

But such behavior does not imply, as the UFO addicts argue, the presence of an intelligent pilot to guide it. No! It's like chasing a rainbow, which recedes as you approach it or advances as you move away.

As we look over the Air Force files, we find that some 90 per cent of the solved cases result from the presence of material objects in the atmosphere. I list some of these objects. Reflections from airplanes, banking in the sun, simulate saucers. Momentarily, a bright reflection appears and then vanishes. The plane is invisible in the distant haze. An imaginative person concludes that an interplanetary vehicle has come in fast, reversed course, and rapidly receded into the distance. Often the observers say "It couldn't have been a plane," because "no noise was heard" or because "it moved too swiftly." And yet careful study proves beyond doubt that the object was indeed an aircraft. The brilliant landing lights of a plane can almost dazzle a person on the ground. Sometimes such lights may appear to be very close -- only a few hundred feet away.

You'd be surprised at the variety of mundane objects that people have reported as UFO's. Balloons, child's balloons, weather balloons lighted or unlighted, and especially those enormous plastic balloons as large as a ten-story building, which carry scientific instruments to altitudes of 100,000 feet! Reflecting full sunlight while the earth below lies in dim twilight, these balloons shine more-brilliantly than Venus! Advertising planes or illuminated blimps frequently become UFO's.

Birds, by day or night, often reflect light from their shiny backs. Windblown kites, hats, paper, plastic sacks, feathers, spider-webs, seed pods, dust devils have all contributed their share of UFO sightings. Insects single or in swarms. Saucer-shaped clouds, reflections of searchlights on clouds! Special space experiments, such as rocket-launched sodium vapor releases or balloons from Wallop's Island have also produced spectacular apparitions! Ball lightning and the Aurora Borealis occasionally contribute.

Reflections from power lines, insulators, television antennas, radars, radio telescopes, even apartment windows! These, too, have produced realistic UFO's.

I could add to this list almost indefinitely. But the chief point I want to make is that simple phenomena like the above have tricked intelligent people into reporting a UFO.

But there are a few other phenomena that can produce UFO's of a type that, as far as I know, the Air Force still does not recognize.

I quote from an article on "Vision" in Volume 14 of the McGraw-Hill Encyclopedia of Science and Technology. "... any observant person can detect swirling clouds or spots of 'light' in total darkness or while looking at a homogeneous field such as a bright blue sky." If you want to see flying saucers just look up. If you don't see them, you probably are not "observant."

I see them most clearly in a dark room or on a moonless night with the sky even darker with heavy clouds. I find stars somewhat distracting. Just lie down on your back, open your eyes and see the saucers spin. The show is free. You will almost surely see bright, irregular patches of light form. Most of them seem grey green, but I occasionally see silver or gold and occasionally red. I can imagine windows in some of them. As you move your eyes they will cavort over the sky. To speed up the action just rub your eyes like a person coming out of a sleep. Occasionally the whole field becomes large and luminous. Now, I ask you, how canyon be sure that the UFO reported by an airline pilot is not one of these spurious images? And even if an alerted co-pilot confirms it, he might also be responding to a similar effect in his own eyes!

The chemistry and physiology of the human eyes are certainly responsible for many UFO sightings. The eye responds in different ways to different kinds of stimuli. A sudden burst of bright light, like that from a flash bulb, for example, exerts an enduring effect on the eye. The light from the flash produces an immediate change in the so-called visual purple of the retina. In a sense the retinal spot on which the image fell becomes fatigued. For some minutes after the flash

you will be able to see a bright, usually greenish, floating spot, which could be mistaken for a UFO by someone unfamiliar with the problem.

Let me take an actual case, which is typical of a large number actually in the files of Project Bluebook. A child, going to the bathroom turns on a bright light and accidentally awakens one of his parents who is blinded by the sudden illumination. The light goes off and the parent gets up to investigate and just happens to glance out of the window. He is startled to see a peculiar spot of light floating over the trees and making irregular, jerky motions. He watches the UFO for a minute or two until it finally disappears.

He cannot be blamed for failing to realize that the erratic and often rapid movements of his UFO are those of the after-image, drifting with the similar movements of his own eye. The UFO appears in the direction he happens to be looking. That is all. And yet he may describe it graphically as a luminous object "cavorting around in the sky."

Many such stimuli are possible by day or night. Some time ago I was driving directly toward the setting sun. When I came to a stop-light and looked out the side window of the car, I was startled to see a large, black object shaped something like a dirigible, surrounded by dozens of small black balloons. I suddenly realized that they were after-images of the sun. The big one was where I had been looking most fixedly. The spots were images where my eye had wandered. A UFO buff could have sworn that he was seeing a "mother ship" and a swarm of UFO's in rapid flight,

I once had another similar experience. I suddenly glanced up and was surprised to see a whole flotilla of UFO's flying in formation across the blue sky. They looked like after-images, but I hadn't been conscious of the visual stimulus responsible. I quickly retraced my steps and found it: sunlight reflected from the shiny surf ace of the fender of a parked car.

I am sure that many UFO's still unknowns, belong to this class. Look fixedly at the full moon for at least 30 seconds and then turn away. A greenish balloon will swim over your head and perform maneuvers startling or impossible for any real object. I'm been able to attain the same effect with the planet Venus, when near maximum brilliance. Yet most observers will swear that such UFO's are true objects. And the Air Force questionnaire, failing to recognize even the existence of this kind of UFO, contains not a single question that would help them to identify it. In fact the words signifying UFO, unidentified flying object, show the state of mind of the Air Force personnel who invented this abbreviation. What I am saying is that the UFO's are not unidentifiable, they are often not flying, and many are not even objects. It is this point of view -- to regard the apparitions as actual solid objects -- that has retarded to solution [sic] so long.

After-images possess still other complicated characteristics. A colored light tends to produce an after-image with complementary color. A green flash will cause a red after-image and vice versa. Color-blind persons and persons with defective vision will often experience effects different from those of people with normal eyesight.

Another optical phenomenon that can produce an illusion of flying objects lies within the eye itself. Again, look at some uniformly bright surface -- sky or ceiling. Relax your eyes. By that I mean focus your eyes on infinity. The changes are that you will see an array of dark spots. These specks, which may seem to be near like a swarm of gnats or as ill-defined objects at a distance, are either on or in your eye. They may be dust floating on the lens, minute imperfections in the cornea, or possibly blood cells on the retina. These, too, can simulate evasive and erratic movement

The eyeball jumps a little every time you blink. Walking transmits vibrations to the eye at every step. Many individuals think they see stars, planets, or satellites oscillating when the movement is actually that of the eye itself. Here is an example.

On our return across Minnesota we had an experience which I have always remembered as illustrative of the fallacy of all human testimony about ghosts, rappings, and other phenomena of that character. We spent two nights and a day at Fort Snelling. Some of the officers were greatly surprised by a celestial phenomenon of a very extraordinary character which had been observed for several nights past. A star had been seen, night after night, rising in the east as usual, and starting on its course toward the south. But instead of continuing that course across the meridian, as stars invariably had done from the remotest antiquity, it took a turn toward the north, sunk toward the horizon, and finally set near the north point of the horizon. Of course an explanation was wanted.

My assurance that there must be some mistake in the observation could not be accepted, because this erratic course of the heavenly body had been seen by all of them so plainly that no doubt could exist on the subject. The men who saw it were not of the ordinary untrained kind, but graduates of West Point, who, if any one, ought to be free from optical deceptions. I was confidently invited to look out that night and see for myself. We all watched with the greatest interest.

In due time the planet Mars was seen in the east making its way toward the south. "There it is!" was the exclamation.

"Yes, there it is," said I. "Now that planet is going to keep right on its course toward the south."

"No, it is not," said they; "you will see it turn around and go down towards the north."

Hour after hour passed, and as the planet went on its regular course, the other watchers began to get a little nervous. It showed no signs of deviating from its course. We went out from time to time to look at the sky.

"There it is," said one of the observers at length, pointing to Capella, which was now just rising a little to the east of north; "there is the star setting."

"No, it isn't," said I; "there is the star we have been looking at, now quite inconspicuous near the meridian, and that star which you think is setting is really rising and will soon be higher up."

A very little additional watching showed that no deviation of the general laws of Nature had occurred, but that the observers of previous nights had jumped at the conclusion that two objects, widely apart in the heavens, were the same.

Those words came from a book called "Reminiscences of an Astronomer," published in 1903 by Simon Newcomb, who was in charge of the American *Nautical Almanac* office from 1877 until 1897. The event actually occurred in 1866. The similarity to modern UFO's is overpowering. A star cavorting across the sky! Military officers as responsible witnesses!

In his delightful book, "*Light and Colour in the Open Air*," the well-known Dutch astronomer, M. Minnaert, wrote.

"Moving Stars.

"In the year 1850 or thereabouts, much interest was aroused by a mysterious phenomenon; when one looked intently at a star, it sometimes seemed to swing to and fro and to change its position. The phenomenon was said to be observable only during twilight, and then only when the stars in question were less than 10° above the horizon. A brightly twinkling star was first seen to move with little jerks, parallel to the horizon, then to come to a standstill for five or six seconds and to move back again in the same way, etc. Many observers saw it so plainly that they took it to be an objective phenomenon, and tried to explain it as a consequence of the presence of hot air striae.

"But any real physical phenomenon is entirely out of the question here. A real motion of ½° per second, seen by the naked eye, would easily be magnified to 100° or more, by a moderately powerful telescope; that means that the stars would swing to and fro and shoot across the field of vision like meteors. And every astronomer knows that this is sheer nonsense. Even when atmospherical unrest is at its worst the displacements due to scintillation remain below the limit of perceptibility of the naked eye. Psychologically speaking, however, the phenomenon has not lost any of its importance. It may be due to the fact of there being no object for comparison, relative to which the star's position can be easily observed. We are not aware that our eye continually performs little involuntary movements, so that we naturally ascribe displacements of the image over our retina to corresponding displacements of the source of light.

"Somebody once asked me why a very distant aeroplane appears invariably to move with little jerks when followed intently with the eye. Here the same psychological cause obviously comes into play, as in the case of the 'moving' stars, and 'very distant' seems to point to the fact that this phenomenon, too, occurs most of all near the horizon.

"And how can we account for the fact that, suddenly and simultaneously, three people saw the moon dance up and down for about thirty minutes?"

This is the phenomenon of "Telekinesis," the apparent erratic motion of an object caused by the erratic motion of the human eye. I have seen a number of UFO reports in which the observer stated that the object could not have been a meteor or a satellite because it moved irregularly.

For you who wear eyeglasses there is still another way of seeing a UFO. Look directly at some bright light, with your head turned slightly to the left

or right. You will probably see a faint roundish out-of-focus spot. This is light reflected from the front surface of your eyeball, back to the lens, and then back into the pupil of your eye. A bright source, to one side and slightly behind you, can also reach your eye through reflection from the internal surface of the spectacle lens.

To this moment I have not mentioned still another method of detecting saucers -- one not subject to the vagaries of the human eye. I mean radar, of course. Radar is a machine. It can't make mistakes. Or at least that is the common argument advanced by UFO buffs.

Radar is cursed with all the potential afflictions that any complicated electrical gadget can suffer. But let me mention only one: mirage. Let me explain briefly what a radar does. It sends out a pulse of radio waves. We know the direction, Northeast for example. We know the elevation above the horizon. An echo returns. From the interval between transmission and reception of the pulse, we know how far away the object is that reflected the pulse back to us. We think we detect a plane -- or a UFO in flight -- because the radar directs the pulse upward.

We have no way of following the pulse in its path toward the target. A layer of warm, dry air or even a layer containing a few bubbles of warm air will bend the radar beam back to earth. The reflection may be from a distant building, a train, or a ship. No wonder that planes, sent to intercept radar UFO, find nothing. In one such case, a well-known writer on flying saucers wrote: "The discovery of *visible* saucers had been serious enough. -- The discovery now of invisible flying saucers would be enough to frighten anyone." Small changes in the atmosphere can make the UFO seem to maneuver at fantastic speeds, executing right-angle turns or suddenly vanishing completely from the radar scope. I was very familiar with such effects from having worked with them during Naval Service in World War II. The greatest radar saucer flap of all times occurred in the hot, dry month of July 1952, when a whole fleet of UFO's were detected by radar at Washington National airport. Subsequent research by the Weather Bureau completely confirmed what the UFO buffs pointedly refer to as my "Hot Air Theory." After all why should one be surprised to find hot air over Washington?

I know of no reliable case of simultaneous visual and radar sightings. In view of the physical properties of the eye, the surprising fact is that so few cases have been reported.

Time will not permit me to elaborate on still other relevant phenomena. For example the Air Force appears to have neglected completely the psychological angle of which mass hallucination is just one phase. Back in 1919, in Spain, a not unrelated phenomenon occurred. Thousands of people -- reliable people -- swore that they had seen images of saints rolling their eyes, moving their hands, dripping drops of blood, even stepping out of their panels. One person would call out, others would imagine they had seen something! There are many similar events recorded through the ages.

There are hundreds of known hoaxes, such as the ingenious one perpetrated by students of the University of Colorado. Spurred by the allotment of an Air Force grant for studying UFO's to the University of Colorado, enterprising pranksters made hot-air balloons from candles and plastic bags, the kind used for packaging dry cleaning. The show was spectacular. And it gave the University investigators a good opportunity to see how poor the evidence can be, a fact well-known to the legal profession. This is still another point that the Air Force has sometimes failed to realize. Moreover their poor questionnaire only further confused an already confused picture. A recent similar sighting south of Denver, later identified as plastic-bag balloons and candles, produced fantastic reports from "reliable" witnesses.

Several times I have used the phrase "UFO's cavorting across the sky." I did so deliberately because it seems to be a favorite phrase of my good friend Dr. J. Allen Hynek of Northwestern University and consultant to the Air Force Project Blue Book. He has sometimes expressed doubts about the UFO because stars don't "cavort" across the sky. What I have tried to show is that many kinds of optical stimuli can produce weird effects.

With all these kinds of phenomena masquerading as UFO's, many of them, like those related to physiology of the human eye still practically not investigated, I think I can reasonably claim, applying the criterion of Sherlock Holmes, that we

have not excluded all the impossibles. I have shown that the arguments advanced in favor of the interplanetary nature of UFO's are fallacious. Their alleged high speeds and ability to maneuver have completely natural explanations.

I think the time has come for the Air Force to wrap up Project Blue Book. It has produced little of scientific value. Keeping it going only fosters the belief of persons that the Air Force must have found something to substantiate belief in UFO's. In making this recommendation I am not criticizing the present or recent administration of the project. But it is time that we put an end to chasing ghosts, hobgoblins, visions, and hallucinations.

More than twenty years of study by the Air Force and an additional year of analysis by the University of Colorado have disclosed no tangible evidence supporting the popular view that UFO's are manned interplanetary vehicles. An irresponsible press, which has overpublicized the sensational aspects of the phenomenon, has been largely responsible for keeping the subject alive. Both newspapers and leading magazines must bear the blame for mishandling the news. But such publications are not scientific journals. They present incomplete data and draw sensational conclusions without supporting evidence.

The question of UFO's has become one of faith and belief, rather than one of science. The believers do not offer additional clear-cut evidence. They repeat the old classical cases and base the reliability of the sighting on the supposed honesty of the observer. I have shown that many honest observers can make honest mistakes.

The press has recently played up a story to the effect that, even in the U.S.S.R., an official UFO investigation has been started, under government sponsorship. Nothing could be farther from the truth! But the newspapers failed to retract after an official statement from the National Academy of the U.S.S.R. appeared in Pravda, to the effect that the reported study was the work of an unofficial and irresponsible amateur-group. The Academy statement further disclaimed any support whatever for the view that UFO's are other than, badly misinterpreted natural phenomena, and certainly not manned extraterrestrial vehicles.

I am aware that a small but highly vociferous minority of individuals are pressing for further studies of UFO's supported -- of course -- by huge congressional appropriations. The heads of a few amateur UFO organizations urge their members to write Congress, asking for investigations of both UFO's and the Air Force. The members have responded enthusiastically, and Congress reacted by financing a special study, which led to the project at the University of Colorado. And now, when it seems likely that the report from this study will be negative, the same vociferous group is again turning to Congress with the same appeal but with no more chance of success. Time and money spent on such efforts will be completely wasted. Congress should strongly disapprove any and all such proposals, large or small. In this age, despite the doubts expressed by a very small group of scientists, reopening and reopening the subject of UFO's makes just about as much sense as reopening the subject of Witchcraft.

Within the vast field of atmospheric physics, there exist many imperfectly understood phenomena which deserve further study, such as ball lightning and atmospheric optics. But any investigations of such phenomena should be carried out for their own sake, not under the cloak of UFO's.

I express my appreciation to Congressman Roush for the invitation to present my views on UFO's. I append herewith my telegram to him dated July 24, 1968.

JULY 24, 1968.

J. Edward Roush,
Committee on Science and Astronautics,
Rayburn House Office Building,
Washington, D.C.:

Received your letter of July and will contribute paper as you suggest. Am amazed, however, that you could plan so unbalanced a symposium, weighted by persons known to favor Government support of a continuing, expensive, and pointless investigation of UFOs without inviting me, the leading exponent of opposing views and author of two major books on the subject.

Donald H. Menzel,
Smithsonian Astrophysical Observatory.

STATEMENT BY DR. R. LEO SPRINKLE

1. Biography
2. Prepared Statement

(The biography of Dr. Sprinkle follows:)

R. LEO SPRINKLE, Ph.D.,
University of Wyoming, Laramie, Wyo.

Name: Ronald Leo Sprinkle.

Born: August 31, 1930, Rocky Ford, Colorado, U.S.A.

Education:

Elementary Education: Washington School, Rocky Ford, Colorado

High School: Rocky Ford High School, Rocky Ford, Colorado

Academic scholarship received from the University of Colorado:

B.A. in Psychology, Education, Sociology, and History, University of Colorado, August 1962.

M.P.S. (Master of Personnel Service) in Counseling, University of Colorado, August 1956.

Ph.D. in Counseling and Guidance, University of Missouri, August 1961.

Professional Experience:

Residence hall supervisor. Men's Residence Halls, University of Colorado, 1954-1956.

Instructor-Counselor, Counseling Services, Stephens College, Columbia, Missouri, 1950-1959.

Acting Director of Extra Class Activities, Stephens College, Columbia, Missouri, 1959-1961.

Assistant Professor of Psychology, University of North Dakota, Grand Forks, North Dakota, 1961-1964.

Assistant Director of Counseling Center, University of North Dakota, 1962-1963.

Director, Counseling Center, University of North Dakota, 1963-1964:

Associate Professor of Guidance Education, University of Wyoming, 1964-1965.

Counselor and Assistant Professor of Psychology, University of Wyoming, 1965-67.

Counselor and Associate Professor of Psychology, University of Wyoming, 1967.

Professional Affiliations:

Member of the American Psychological Association, (Divisions of Counseling Psychology, and the Society for the Psychological Study of Social Issues).

Life member of the American Personnel and Guidance Association, (Divisions of American College Personnel Association, Association of Counselor Education and Supervision, Association for Measurement and Evaluation in Guidance, and professional member of National Vocational Guidance Association).

Licensed as Professional Psychologist in Wyoming, January 1, 1966.

Certified as Counseling Psychologist by the Board of Examiners, North Dakota Psychological Association, May 11, 1962.

Member of American Association of University Professors.

Member of Psi Chi (Psychology Honorary).

Associate Member of Parapsychological Association.

Member of Wyoming Personnel and Guidance Association.

Member of Wyoming Psychological Association.

Member of American Society of Clinical Hypnosis.

Life Member of American Association for the Advancement of Science.

Professional Organizational Activities:

State delegate to the annual meeting of the American Association of State Psychology Boards, St. Louis, Missouri, August, 1962.

Secretary, Board of Examiners, North Dakota Psychological Association (NDPA), 1962-63.

President, Board of Examiners, NDPA, 1963-64.

Member of Commission VIII, Student Health Programs, of the American College Personnel Association, APGA, 1962 to present. (Chairman of symposium sponsored by Commission VIII at the APGA Convention, Minneapolis, Minnesota, April 13, 1965.)

[[206]]

Publications:

"Measured vocational interests and socio-economic background of college students." *The College of Education Record*, University of North Dakota, 1962, 47, No. 4, 54-56.

"Counselor competence and the nature of man," *The College of Education Record*, University of North Dakota, 1962, 47, No. 5, 70-73.

With Gillmor, D. "A first step in evaluation." *The Superior Student*. (Inter-University Committee on the Superior Student, Boulder, Colorado) 1964, 6, No. 2, 30-33.

"Psychological implications in the investigation of UFO reports." In Lorenzen, L. J. and Coral E. *Flying saucer occupants*. N.Y.: A Signet Book, 1967. pp. 160-186.

Professional Research and Writing:

"Permanence of measured vocational interests and socio-economic background" : Unpublished Ph.D. dissertation, sponsored by Dr. Robert Callis, University of Missouri, 1961.

"Student health and demands for academic accomplishment: an attitude survey of students at the University of North Dakota." Unpublished manuscript presented at the American Personnel and Guidance Association (Commission VIII, Student Health Programs), Boston, Massachusetts, April 8,1963.

"A hypothetical view of communication and human evolution." Unpublished manuscript presented at the North Dakota-South Dakota Psychological Association Convention, May, 1963.

Received a small grant ($278.00) from the Grants-In-Aid Committee, Society for the Psychological Study of Social Issues, in support of a study to investigate the relation of personal attitudes and scientific attitudes. (Survey of persons interested in UFO reports.)

*(Manuscript has been rejected by the Journal of Social Issues.)

**Military History:

United States Army, Artillery, 1952-1954; graduated as Honor Student No. 1, Class No. A-5324, 7th Army NCO Academy, Munich, Germany; served as corporal in 194th F.A.Br., Wertheim, Germany.

Personal Hobbies:

Reading; composing verses and songs; observing and participating in athletics ; travel; home work-shop activities.

Personal Information:

Married on June 7, 1952 to Marilyn Joan Nelson (born in Gurley, Nebraska, on April 28, 1930; and graduated from the University of Colorado with a B. Mus. Educ. in June 1953); oldest son, Nelson Rex Sprinkle, born February 20, 1958; younger son, Eric Evan Sprinkle, born on March 22, 1961; youngest son, Matthew David Sprinkle, born on May 4, 1964; daughter, Kristen Martha, born on April 16, 1967.

PREPARED STATEMENT BY R. LEO SPRINKLE, Ph.D.

To The Honorable J. Edward Roush, M. C., Ind. Chairman, Symposium on Unidentified Flying Objects, The Committee on Science and Astronautics (The Honorable George P. Miller, M. C. Calif., Chairman), The House of Representatives, Washington, D.C. 20515.

From R. Leo Sprinkle, Ph.D., Counselor and Associate Professor of Psychology, University of Wyoming, Laramie, Wyoming 82070.

Re Symposium on Unidentified Flying Objects.

*Psychological Problems in Gathering UFO Data: a paper presented in a symposium sponsored by Division 21, Engineering Psychology, at the American, Psychological Association convention, Washington, D.C., September 4. 1967.

**Some Uses of Hypnosis in UFO Research; a paper which will be presented at the annual meeting of the American Society of Clinical Hypnosis; Chicago, Ill.; October 10-13, 1968.

Thank you for your kind invitation (July 22, 1968) to submit a statement to you and your colleagues in regard to the problem of Unidentified Flying Objects (UFOs). I recognize some of the difficulties which confront you gentlemen, particularly in relation to the amount of information which becomes available to you when you wish to arrive at informed decisions. Also, I recognize some of the difficulties which confront college professors, especially when they try to be lucid and brief!

Elsewhere, a more extensive attempt has been made to present views on the psychological implications of UFO reports. (Sprinkle, R. L„ Psychological implications in the investigations of UFO reports. In Lorenzen, L. J., and Coral E., *Flying saucer occupants*. N.Y.: A Signet Book, 1967. pp. 160-186.) Thus, in submitting this short statement, the attempt is made to present my personal views on the significance of UFO investigations. Hopefully, these personal views can be of some assistance to you in considering the statements being submitted to you by the distinguished scientists whom you have .invited to .participate in the symposium.

PERSONAL VIEWS OF UFO INVESTIGATION

I accept the hypothesis that the earth is being surveyed by spacecraft which are controlled by representatives of an alien civilization or civilizations. I believe the "spacecraft hypothesis' is the best hypothesis to account for the wide range of evidence of UFO phenomena. (For a more informed description of various UFO hypotheses, see Salisbury, F. B„ The scientist and the UFO. *Bio-Science*, January 1967. pp. 15-24.)

I have read thousands of reports and I have talked with hundreds of persons about their UFO observations; either I must accept the view that thousands of people have observed physical phenomena, or I must accept the view that some persons have the ability to project mental images in such a manner that other persons can observe, photograph, and obtain physical evidence of those metal images. (For a more extended discussion of these hypotheses, see Jung, C. G., *Flying Saucers*, N.Y.: Harcourt, Brace and Company, 1959, Pp. 146-158.)

On two occasions, each time in the presence of a person who shares my claim, I observed unusual aerial phenomena which I could neither identify nor understand. My first observation of a "flying saucer" led me to change my position from "scoffer" to that of "skeptic." My second observation of a UFO led me to change my position from "skeptic" to "unwilling believer."

As a result of my second observation, I began to join organizations (NICAP and APRO) and conduct investigations. The Grants-in-Aids Committee of the Society for Psychological Study of Social Issues, a Division of the America Psychological Association, provided a small grant, and Richard Hall, former assistant director of NICAP, cooperated in a study of the attitudes of persons interested in UFO reports. (See enclosure.) Later, I became a consultant to APRO. Mr. and Mrs. L. J. Lorenzen, directors of APRO, encouraged my interest in learning more about the psychic aspects of UFO phenomena.

At the present time, I am conducting a non-supported investigation of some psychological attributes of persons who claim to experience psychic impressions of UFO phenomena, including their impressions of possible motives of UFO occupants. As a member of the Parapsychological Association and the American Society of Clinical Hypnosis, i am interested in the possibility that reliable observations are being made by persons who claim to see UFO occupants and, in some unusual cases, experience "mental communication" with these UFO occupants. Use of hypnotic techniques with UFO observers seems to be useful procedure, in some cases, to obtain further information about UFO observations. (See enclosure "Personal and Scientific Attitudes: A Survey of Persons Interested in UFO Reports.")

CONCLUSIONS

If these reports by UFO observers are found to be reliable and valid, I believe we shall enter the threshold of a most exciting and challenging period in man's history. In my opinion, the attempt to achieve contact with other intelligent civilizations is a goal which is worthy of great personal and social effort.

I plan to do what I can in furthering investigations of these phenomena, in hopes that these efforts can assist the contributions of other investigators.

However, I believe that the mysteries are too deep, the investigations are too difficult, and the implications are too great for these efforts to be made on an informal basis. I believe that the establishment of an international research center is the most appropriate method to follow in reaching the goal of greater

understanding of these phenomena. If this method is not feasible, then I believe that a national research center is needed for continuous, formal investigation of the physical, biological, psycho-social, and spiritual implications of UFO phenomena.

Establishment of a continuing research center could provide for those facilities, equipment, and personnel to conduct the necessary field work and theoretical investigations of UFO reports. In my opinion, the staff of such a research center should be encouraged to avail themselves of scholars and experts in various disciplines, including astronomical, mathematical, physical, chemical, biological, medical, psychological, sociological, military, technical, legal, political, theological, and parapsychological fields of knowledge.

I recognize some of the difficulties which attend such a proposal; I recognize some of the arguments which have been, are being, and will be raised against such a proposal. However, I trust that you gentlemen are aware that the present difficulties of enacting such a proposal are inconsequential when compared to the historical impact created by those persons who dare to exert that leadership which could determine the powers, purposes, and persons who control the spacecraft which we call "Unidentified Buying Objects."

Thank you for your attention to these comments. I shall be most happy to respond to any question which you may have about these or related views.

Respectfully submitted,

R. Leo Sprinkle, Ph.D.

PERSONAL AND SCIENTIFIC ATTITUDES: A SURVEY OF PERSONS INTERESTED IN UFO REPORTS*

(By R. Leo Sprinkle, University of Wyoming)

A questionnaire survey was conducted among 3 groups: 26 Ph.D. faculty and graduate students in a Psychology Department (Psychology); 59 graduate students enrolled in an NDEA Guidance Institute (Guidance) ; and 259 members of an organization which is interested in "flying saucers" or Unidentified Flying Objects (UFOs), the National Investigations Committee on Aerial Phenomena (NICAP). It was hypothesized that there would be no differences between the scores of the three groups on the *Personal Attitude Survey* (Form D, Dogmatism Scale, Rokeach, 1960) and the *Scientific Attitude Survey* (Sprinkle, 1962).

The results showed significant differences ($P<.001$ between the 3 groups with respect to their mean scores on both inventories, with the NICAP group scoring higher on both "dogmatic" and "scientific" inventories, followed by the Guidance group and Psychology group, respectively. Also, the survey showed differences in regard to social status and education. Psychology and Guidance subjects received an *Index of Social Status* (McGuire & White, 1955) which would classify them in the Upper Middle Class, while NICAP subjects would be classified mainly in the Upper Middle and Lower Middle Classes. The average years of education were tabulated as follows: Psychology, 18.8 years; Guidance, 17.2 years; and NICAP, 14.0 years.

The results suggest that the NICAP group is more "dogmatic" and more "scientific" than the Psychology and Guidance groups. There are two feasible interpretations of these results: 1) *The Scientific Attitude Survey* (Sprinkle, 1962) is not useful in assessing "scientific" attitudes, and/or 2) the two inventories have assessed the tendency of the 3 groups to exhibit the "Yeasay-Naysay" pattern (Couch & Keniston, 1960). The latter interpretation indicates that there may be more "Yeasayers" (those with an agreeing response set or a readiness to affirm) in the NICAP group, followed by the Guidance group, and Psychology group, respectively.

SOME USES OF HYPNOSIS IN UFO RESEARCH

(By R. Leo Sprinkle, University of Wyoming)

ABSTRACT

First, a brief review of UFO literature is presented. References are cited which offer hypotheses (Salisbury, 1967) to account for UFO observations, and positions (Sprinkle, 1967) taken by various investigators in regard to the significance of UFO reports.

Second, examples are described in the use of hypnotic techniques in the investigation of persons who have observed UFO phenomena. Advantages and disadvantages of hypnosis are discussed in regard to obtaining further information from UFO observers.

Third, some speculations are offered in regard to the possible relationships of paranormal or ESP processes and the observations of UFO phenomena. Cases are described which indicate possible relationships of hypnotic and psychic experiences of UFO observers.

Fourth, some suggestions are presented for further investigation of UFO phenomena through the use of hypnotic and parapsychological procedures. These procedures may be useful to assess the reliability of information from UFO observers.

In conclusion, the speaker believes that investigation of UFO reports should proceed along as many lines as there are interested investigators. Considerations of hypnotic procedures and techniques are only one aspect of these investigations, but these considerations may be helpful in obtaining and evaluating information submitted by UFO observers.

STATEMENT BY DR. GARY C. HENDERSON

1. Biography
2. Prepared Statement

(The biography of Dr. Henderson follows:)

DR. GARRY C. HENDERSON,
Senior Research Scientist, Space Sciences,
Fort Worth, Tex.

Garry C. Henderson was born in Brownwood, Tex., on October 23, 1935. He received the B.S. degree in mathematics from Sul Ross State College, Alpine, Tex. in 1960, the M.S. degree from Texas A&M University, College Station, in geophysical oceanography in 1962, and the Ph.D. degree in geophysics from Texas A&M University in 1965.

He held the post of Research Assistant in the Texas A&M Research Foundation from 1960-1963. During this time he served as a technician, operator, and data interpreter with the LaCoste-Romberg S-9 Sea-Surface Gravity Meter. From February-June 1962 he worked for Dr. G. P. Woollard aboard the NSF Polar Research Vessel ELTANIN where he was in charge of testing the S-9 gravity meter and interpreting meter performance. He was an IBM 709 operator and senior programmer in the physical sciences for the Texas A&M Data Processing Center until the latter part of 1964. He received his Ph.D. while in the position of Chief Marine Geophysicist for Oceanonics, Inc., where he worked in techniques, instrumentation, and interpretation in the fields of gravimetry, magnetics, electrical methods, and computer operations. He joined the Applied Research Group of the Fort Worth Division of General Dynamics in the latter part of 1965. Since that time he has been engaged in studies of the methodology, instrumentation, and interpretation of geophysical investigations on lunar and planetary surfaces, particularly in the fields of gravimetry and electrical methods. He is currently Project Leader on the lunar surface

gravimeter/surveying system and leader of the space sciences section of the applied Research Group.

Dr. Henderson is a member of Alpha Chi, the American Geophysical Union, the Society of Exploration Geophysicists, the American Astronautical Society, the Marine Technology Society, the Working Group on Extraterrestrial Resources, and Sciences Subcommittee Chairman of the Marine Geodesy Committee.

PREPARED STATEMENT BY G. C. HENDERSON

UFO'S DEFINITELY DO NOT EXIST-DO THEY?

INTRODUCTION

It is not the purpose of this essay to specifically reiterate the feelings of certain members of the scientific community regarding UFO phenomena; rather it is the objective here to briefly review the state of the problem and to analyze the means at hand of acquiring information which would be sufficiently reliable to convince the scientific community and others of the hardware existence or fallacy of the UFO.

Although the common image persists of the scientist as an infallible front of wisdom and knowledge, the majority of reported activities of scientists relating to UFO studies has been nonprofessional by nature, i.e., prominent scientists have addressed themselves to the problem in a manner which they would certainly not approach problems within their respective fields. Such an example is the unfortunate selection of the University of Colorado team headed by a respected scientist, with the result that the squirrel-cage atmosphere usually associated with UFO interest has been augmented by built-in bias and confusion, rather than eliminated by one group of scientists' involvement. One scientist has even published an article in *Science* (15 September 1967) implying that competent scientists would accept magic (or "semi-magic") as an answer to the

existence of UFO's, and that our limited capabilities in their current stage may be our ultimate technical heritage. Is there not the slightest chance that, even today, there actually remain a few physical phenomena which we do not understand, or of which we are not even aware -- and perhaps a few we misinterpret, but for which we are shrewdly able to concoct a convenient "law" by way of appeasingly [sic]* sufficient (but not necessary) explanation? If "others" exist, are they limited to our level of advancement?

As noted in the *Special Report of the USAF Scientific Advisory Board Ad Hoc Committee to Review Project "Blue Book"* (March 1966) some sightings classified as "identified" resulted from too meager or too indefinite evidence to permit positive listing in that category. The keys to scientific achievement have several notches, but the material is comprised of competent open-mindedness, which appears to have been all too commonly lacking in the topic of concern. Historically, many of the most astonishing accomplishments have been performed by those who persisted even in the fog of ridicule exuded by their capable but narrow-minded colleagues. Several professional, qualified observers with proper instrumentation, planning, and time *should be able* to devise schemes in an unbiased manner to (1) determine what UFO's ARE NOT, then (2) determine what, if anything tangible, they ARE.

AVAILABLE INFORMATION

Most thoughtful persons will dismiss the theatrical claims of trips on "saucers." cavorting with little green men, and the like; however, some very plausible reports from highly trained, capable, and reliable individuals cannot be so readily discarded by anyone willing to admit that there are still a few things we do not understand. God help us if our military and commercial pilots and radar facilities so commonly mistake temperature inversions, balloons, atmospheric disturbances, the planet Venus, etc. for maneuvering vehicles. Have you ever tried to convince two veteran pilots that the object they reported sighting on a clear day with CAVU conditions, free of traffic lanes, showing on their radar .screen, exhibiting high maneuverability, in close proximity, etc., is meteoric debris? If so, then the wrong people are being examined.

To my knowledge, all "facts" on UFO's, here and abroad, exist in the form of visual sightings and a few, apparently unretouched photographs. Not to discredit the value of unaided observation, but with our degree of technological sophistication, these are hardly the sort of facts to justify the position of the

Air Force (and a few scientists) in their proclamations of "non-existence." The public has been led to believe that everything has been done to either prove or disprove the existence of UFO's -- rubbish! Available information of a truly reliable nature should tend to increase activity, not place it in neglect, or worse, in ridicule.

Classified (or "unavailable") reports, mostly by the military, rob the public and scientific parties who are interested in and willing to participate in the UFO investigations. How can we even begin to evaluate for ourselves if we must depend nearly 100 percent on information doled out by the news media alone? Many scientists communicate with each other on the subject, often at scientific meetings (aside), but this route is hardly sufficient to establish a recognized basis for realistic study of the problem.

The current USAF trend seems to be merely a statement that UFO's do not pose a threat to the security of the United States, and therefore warrant neither credence nor further concern. Similar words come from some of the few Congressmen with whom I have communicated. The discovery of Noah's Ark in Times Square would not necessarily pose a threat to national security either, but it would certainly be a find worthy of the most intensive investigation whether certain individuals accepted its existence or not.

REQUIRED INFORMATION

Is it not obvious that what we need to establish the existence or non-existence of UFO's is not merely a review of sighting incidents, but an implemented plan to acquire hard facts? Rapid, accurate reporting of sightings is obviously a valuable tool in studying UFO phenomena, but many of the most creditable observers (military personnel and airline pilots, for example) are not only hesitant to do so, they are understandably adamant when facing the alternatives of silence versus inviting ridicule, and possibly jeopardizing their positions. The obvious addition to gathering interview data is to enlist the aid of the impersonal machine. Evaluate, compile, and catalog reported data according to: time of day and year; atmospheric conditions (cloudy, humid, temperature, calm, and other easily recountable gross observations); geographic location; approximate size, shape, altitude, velocity, heading, maneuvers; and phenomena reportedly associated with the UFO presence. This can be done with existing information. Update and upgrade the files with new data by soliciting information

(particularly military and commercial pilots). Then prepare a plan designed by scientists, engineers, pilots, and perhaps psychologists, on means to acquire instrument observations of UFO's hopefully coupled to visual observations.

Field-instrument packages could easily be placed in areas where UFO sightings are most concentrated, perhaps according to the time of day or year, atmospheric conditions, or some factor suspected to 'be related to sighting activity. Such packages might be composed largely of military "surplus" instrumentation such as an infrared scanner, an active rf unit, a wide-band electromagnetic detector, a directional radiation counter and ionization gauge, a high-speed photographic camera, a three-component magnetometer, and recording environmental devices (temperature, humidity, barometric pressure, etc.). If it became advantageous to include a higher degree of sophistication, such items as a tracking television camera, a communications telemetry system, a sensitive audio recorder with a directional antenna might be added. Deployment and maintenance of the field package could easily be performed by military, university, or industrial technicians, but all data reduction and interpretation should be done by competent scientists familiar with the respective measuring techniques.

We should anticipate gathering sufficient data leading to proof of the existence or non-existence of UFO's, and, if they are real, the size(s), shape (s), flight characteristics (speed, rates of turn and climb, preferred direction of travel, etc.), possible means of propulsion and navigation, perhaps the establishment of communications, and eventually their origin.

Questions of expense and management responsibilities immediately come to mind, but I think the government would be surprised how many qualified scientists, engineers, and technicians would be willing to participate on a low-dollar, volunteer, "as can" basis in support of such a program. At least an inexpensive newsletter could be distributed to the scientific and pilot groups for comments, as a start. Because of the history of wasted funds and unwieldy publicity associated with the UFO problem, the public may not be very receptive to such a proposal

just for the pure joy of attempting to resolve the problem, unless it turns out that the UFO's are irrefutably proven to be extraterrestrial in origin, thereby gaining incentive as a popular curiosity. A Working Group on UFO's could be painlessly commissioned, much as other working groups comprised of scientists and engineers.

CONCLUSIONS

If there are UFO's in existence here, and IF they are extraterrestrial, by mere intuition I seriously doubt that they would be manned. I know of no animal to take the reported g's undergone by some UFO's. In all due fairness to those who believe otherwise, we must readily admit that only a few years ago spacecraft, airplanes, nuclear power, television, human transplants, and many other items presently taken for granted were "impossible," even deemed foolish for consideration.

Conditions in our solar system appear to limit life as we know it (the catch phrase) to Earth, but the probability of almost identical environments just within the visible universe is extremely high. Even if, for some reason obscure to me, life must exist "as we know it," there are, in my opinion, innumerable possibilities of such existence. Manned travel over the required distances would take life-support systems, fuel, and means of propulsion beyond our present ability to deliver in time for us to realize results; therefore it *must* be impossible if *we* can't do it!

Certain publicized activities under contract purport to be concerned with scientific and engineering studies related to UFO's (for example, Raytheon's Autometric Division, Stanford Research Institute, University of California, National Center for Atmospheric Research, Ford Motor Company, etc.). These may yield worthwhile results in the UFO study if the primary goal is not to pursue funded research for its own sake, as is too often the case.

There is only one concrete proposal which I would extend at this time. Either we admit (1) that past funds are wasted; (2) that our technology is not up to the job; (3) that we can afford to ignore one of the potentially most significant "phenomena" in the recorded history of the human race; (4) that we will close our minds to that part of human curiosity which seeks to extend our knowledge; and (5) that we are willing to make these decisions on the flimsiest of evidence, i.e., for-the-most-part-personal opinions, OR we will make a long-overdue, concentrated, unemotional effort to ascertain (1) the existence or non-existence of hardware UFO's, and if they exist, (2) the origin of UFO's, (3) the means of propulsion, navigation, and associated operational characteristics of UFO's, (4) the intent of the presence of UFO's, and (5) surely a multitude of knowledge, and perhaps greatly extended capability which would result from studying a UFO craft and communicating with the occupants, if any.

STATEMENT BY STANTON T. FRIEDMAN

1. Biography
2. Prepared Statement
3. Appendices

(The biography of Mr. Friedman follows:)

STANTON T. FRIEDMAN

Born -- July 29,1934, Elizabeth, New Jersey.

B.Sc. -- Physics, M.Sc. -- Physics, University of Chicago 1955, 1956.

Since 1966 -- Westinghouse Astronuclear Laboratory, Pittsburgh; NERVA nuclear rocket Program -- Fellow Scientist concerned primarily with radiation shielding experiments and nuclear instrumentation.

1963-1966 -- Allison Division, General Motors, Indianapolis, Indiana. Military Compact Reactor program (responsible for all shielding aspects), magnetohydrodynamics, desalination, other projects.

1959-1963 -- Aerojet General Nucleonics, near San Francisco. Development of various nuclear systems for space and terrestrial applications; Fusion propulsion for space, consultant on radiation shielding.

1956-1959 -- General Electric, Aircraft Nuclear Propulsion Department, Cincinnati. Experimental and analytical aspects of radiation shielding for nuclear aircraft.

Mr. Friedman has a relatively unique background in advanced technology, having been actively involved in the development of all of the following advanced systems: nuclear aircraft, nuclear power for space, terrestrial nuclear power, nuclear rockets, fusion rockets.

Professional affiliations include the American Physical Society, the American Nuclear Society, the American Institute of Aeronautics and Astronautics, the Aerial Phenomenon Research Organization, the National Investigations Committee on Aerial Phenomena. Mr. Friedman is on the Board of Directors of the UFO Research Institute of Pittsburgh and on the Standards and Program Committees of the Shielding Division of the American Nuclear Society.

Mr. Friedman has presented papers at technical society meetings and has chaired sessions at such meetings. He has written numerous classified and unclassified reports and has published articles on UFOs as well as on radiation shielding.

Mr. Friedman has made dozens of radio and TV appearances across the United States and in Canada. These include the Joe Pyne Show (Los Angeles - radio), Long John Nebel (New York City), the J. P. McCarthy Show in Detroit, all four TV stations in Pittsburgh, and others in Raleigh, Akron, Detroit, Baltimore, Toronto, Waco, Phoenix, Calgary, Albuquerque, etc.

Mr. Friedman, his wife, and three children reside at 702 Summerlea Street in Pittsburgh, Pennsylvania.

PREPARED STATEMENT BY STANTON T.FRIEDMAN

UFO's and Science

I am grateful to the House Committee on Science and Astronautics for inviting me to present my views on Unidentified Flying Objects.[1] These viewpoints shall be presented in the form of answers to specific questions with the references, tables and figures presented at the end of the article. A partial list of the technical organizations to which I have presented a lecture entitled "Flying Saucers are Real" is given in Appendix 1. Appendix 3 is a reprint of an article I wrote.[2] Appendix 2 is a list of patents of saucer-like vehicles. The viewpoints are mine and mine alone and are not to be construed as those of any of the organizations to which I belong or of my employer, Westinghouse Astronuclear Laboratory. The opinions are based upon ten years of study of UFOs and discussions all over the U.S. and in Canada on a private level for eight years and a public level since late 1966 both in question and answer sessions following my illustrated talks and with newspaper, radio, and television reporters with whom I have publicly discussed this subject.

1. To what conclusions have you come with regard to UFOs?

I have concluded that the earth is being visited by intelligently controlled vehicles whose origin is extraterrestrial. This doesn't mean I know where they come from, why they are here, or how they operate.

2. What basis do you have for these conclusions?

Eyewitness and photographic and radar reports from all over the earth by competent witnesses of definite objects whose characteristics such as maneuverability, high speed, and hovering, along with definite shape, texture, and surface features rule out terrestrial explanations.

3. Haven't most sightings been identified as conventional phenomena?

Yes, of course. However, it is only the *unidentified* objects in which I am interested and on which I base my conclusions. The job of science is to sort data and focus on that which is relevant to the search at hand. Fewer than 1% of Americans have hemophilia or are 7 feet tall or can run a mile in under 4 minutes -- we certainly don't dispute the reality of hemophilia, Wilt Chamberlain, or 4 minute miles.

4. Are there any good unknowns?

Yes, there are very many good unknowns which have been reported and investigated and undoubtedly very many more which have not been reported because of the "laughter curtain". In the most comprehensive detailed scientific investigation ever conducted on this subject, and reported in Reference 3, it was found that 434 out of 2199 sightings evaluated had to be classified as Unknowns. This is 19.7% or a far higher percentage than most people have associated with UFOs. The complete breakdown is shown in Table 1. Table 2 shows the breakdown of sightings by quality. Fully one third of the 9.7% of the sightings labeled as Excellent were identified as Unknowns: one fourth of the Good sightings were labeled Unknown. All it would take to prove the reality of extraterrestrial vehicles is one good sighting not hundreds.

Footnotes at the end of article.

TABLE I -- CATEGORIZATION OF UFO SIGHTING REPORTS[1]

Category	Number	Percent
Astronomical	479	21.8
Aircraft	474	21.6
Balloon	339	15.4
Other	233	10.6
Unknown	434	19.7
Insufficient Information	240	10.9
TOTAL	2,199	100

[1]Data from reference 3.

TABLE 2 -- QUALITY DISTRIBUTION OF UNKNOWNS[1]

Quality	Number	Percent of total	Unknowns	Percent of group
Excellent	213	9.7	71	33.8
Good	757	34.5	188	24
Doubtful	794	36	103	13.3
Poor	435	19.8	72	16.6
TOTAL	2199	100	434	19.7

[1]Data from reference 3.

5. Aren't most of those "unknowns" really sightings for which insufficient data is available to identify an otherwise conventional object?

Absolutely not. If there was not enough information available about a sighting it was labeled "Insufficient Information" not "Unknown" -- again contrary to what many people believe about UFOs.

6. Were there any differences between the Unknowns and the knowns?

A "chi square" statistical analysis was performed comparing the Unknowns in this study to all the "knowns". It was shown that the probability that the unknowns came from the same population of sighting reports as the knowns was less than 1%. This was based on apparent color, velocity, etc. Maneuverability, one of the most distinguished characteristics of UFOs, was not included in this statistical analysis.

7. Weren't most sightings of very short duration, say less than a minute?

The average duration of the sightings labeled as "Unknown" was greater than that for the knowns. More than 70% of the unknowns were under observation for more than 1 minute and more than 45% for more than 5 minutes.

8. Isn't it true that UFOs have never been sighted on radar?

No, it is not, Ref. 3 specifically mentions radar unknowns. In ref. 4, Edward Ruppelt, former head of the official UFO investigative effort, makes specific mention of not only "Unknowns" observed on radar but of combined visual and radar "Unknowns". Hynek[5] also mention radar and visual sightings.

9. Where can I get more information about "Unknowns" ?

Ref. 6 presents an unbiased description of about 160 "Unknowns". Ref. 7 includes data on over 700 Unknowns. References 8 and 9 contain many others.

10. Why haven't the worldwide Smithsonian Network of Satellite Tracking cameras picked up "Unknowns"?

The former head of the film evaluation group concerned with the Smithsonian sky watch said [10] that the purpose of the search was to get data on satellite orbits. If a light source on the film could be shown not to be a satellite then no further measurements were made. 10% to 15% of the plates showed anomalous light sources which were not a satellite but were not otherwise identified.

11. How about the other space surveillance radar installations?

Baker in Ref. 11 deals with this question in detail. In summary, the systems are set up to reject signals which refer to anything other than the objects of interest -- typically ballistic missiles coming from certain directions.

Footnotes at the end of article.

12. Aren't the reported maneuvers of UFOs in violation of existing laws of physics?

Not at all. This argument ("It's Impossible") is used when what should really be said is we don't know how to duplicate these maneuvers. Piston aircraft can't fly faster than the speed of sound and a conventional dynamite bomb couldn't have wrecked Hiroshima and a vacuum tube circuit can't fit on the head of a pin but surely we don't say that supersonic flight, atom bombs and microcircuits violate the laws of nature or physics. Present aircraft can't duplicate UFO maneuvers; no laws of physics have been violated by UFOs.

13. Haven't astronomers proved that trips to other stars are impossible?

Again, the answer is no. The studies [12] that conclude that trips to other stars are impossible are based upon false or unnecessary assumptions such as, assuming, that the flight be at orbital velocity.[13] The one comprehensive study of interstellar travel conducted by a JPL group actually concerned with space hardware [14] concluded that with present technology trips to nearby stars are feasible with round trip times being shorter than a man's lifetime and *without* violating the laws of physics. They assumed that staged vehicles would be used having either fission or fusion propulsion systems.

14. Are fission and fusion propulsion systems actually being developed?

Both fission and fusion propulsion systems for space travel are under development. I have worked on both. The NERVA program has successfully tested a number of nuclear rocket reactors suitable for use in flight throughout the solar system. Flight rated systems offering substantial advantages over chemical propulsion systems could be ready in less than a decade if the current program at Aerojet General, Westinghouse Astronuclear Laboratory, and Los Alamos Scientific Laboratory is supported. References 15 and 16 are good reviews of the nuclear rocket program. The fusion work is not nearly as far along but has been productive at Aerojet General Nucleonics, San Ramon, California. An older review of some of the aspects of this program is given in Ref. 17.

15. Are these the only possibilities?

Not at all. This is one of the major flaws in the "non-believers" arguments; they presume that our technology is the ultimate -- a presumption made by each generation of scientists in the last 75 years and proved wrong by the next generation of engineers and applied scientists. If there is one thing to be learned from the history of science it is that there will be new and unpredictable discoveries comparable with, say, relatively, nuclear energy, the laser, solid state physics, high field superconductivity, etc. It is generally accepted that there are civilizations elsewhere which are much more advanced than are we. Look what technological progress we have made in the last 100 years. Who can guess what we will accomplish in the next thousand years -- or what others have accomplished in the thousand or million or billion year start they may have on us. We still don't know about gravity, for example, no less anti-gravity.

16. Could UFOs be coming here from our own solar system?

They certainly could. We have no data from any other body in the solar system which definitely rules out the existence of advanced civilizations. We frequently forget that the resolution of present photographs of the other planetary bodies is extremely poor. As a matter of fact, there does seem to be a direct correlation between the number of sighting reports per unit time and the closeness of Mars to the earth. Both have periodicities of about 26 months.[18] We make certain space shots at "favorable times". The reverse may also be true but without the restrictions on payload and trajectory placed upon us by our crude, inefficient, space propulsion systems which no thoughtful engineer considers the ultimate.

17. Didn't the Mariner IV pictures prove there isn't any life on Mars?

The Mariner pictures didn't provide proof of life on Mars but they certainly didn't rule it out and were not intended to. Studies[19] of 10,000 pictures of earth taken from orbit with cameras having resolving power equivalent to those on Mariner IV provided only one picture which could be taken to indicate that there is life on the planet called earth.

18. Isn't it true that life as we know it cannot exist on any other body in the solar system?

This statement, though repeated many times, is quite obviously untrue. Consider for a moment the fact that we intend to send men to the moon and by the end of the century to Mars. We expect these men to stay for a while and to return despite the fact that Mars and the moon both supposedly aren't fit for life as we know it. One characteristic of an advanced technological civilization is the ability to provide suitable conditions for life almost anywhere; including under the

Footnotes at the end of article.

ocean, in the void of space and on the surface of the airless, waterless moon and Mars. More and more we are also finding that life exists under almost all circumstances.

19. If we are being visited why haven't they landed?

The fact of the matter is that there are many reports of landings. The comprehensive study by scientist J. Vallee [20] reviews 200 landings which occurred in 1954 alone; many of them with multiple witnesses giving reports of humanoids in addition to strange craft either on or just above the ground. Most scientists have unfortunately not examined this data since it was published in a UFO Journal and laughter comes easier than facing up to the .evidence.

20. Has the attitude of the scientific Journals and professional community been changing?

There has been a quiet yet enormous change in the attitude of the technological community. I say technological to include the applied scientists and engineers who are far more responsible for the progress of the last 30 years than the academic scientists who are prone to tell us all that is impossible. Examples of the change include the publication of articles by Science [21 22 23 24 25] Astronautics and Aeronautics, [26] the Journal of the Astronautical Sciences [11 27] the American Engineer [28 29 30] Industrial Research, [33] Scientific Research [32 33] Aviation Week and Space Technology. [34 35]. In addition, numerous pro-UFO talks have been presented to local and national meetings of professional groups (see Appendix 1 and Ref. 36, 37) and the American Association for the Advancement of Science is planning a UFO seminar for a national meeting. The AIAA has even set up a UFO Committee.

21. Have there really been any electromagnetic effects associated with UFO sightings?

Indeed such reports are numerous, see for example Ref. 38, which includes stopping of car engines and headlights, and interference with radio and TV reception, magnetic speedometers, and watches.

22. Could these conceivably be related to a propulsion scheme?

There is an enormous amount of work available concerned with magnetoaerodynamics. I received a NASA bibliography with more than 3000 references. Ref. 39 contains abstracts of more than 800 publications dealing with interactions between vehicles and plasmas. Much of this work is classified because ICBM nose cones are surrounded by plasmas. In any event, there is a body of technology which I have studied and which leads me to believe [2] that an entirely new approach to high speed air and space propulsion could be developed using the interactions between magnetic and electric fields with electrically conducting fluids adjacent to the vehicles to produce thrust or lift and reduce or eliminate such other hypersonic flight problems as drag, sonic boom, heating, etc. These notions are based [on] existing technology such as that included in Ref. 40 through 49 though one would expect that a considerable development effort would be required.

23. Have any electromagnetic propulsion systems been operated?

So far as I know no airborne system has been operated which depended on electromagnetic forces for propulsion. At Northwestern, turning on a magnet inside a simulated re-entry vehicle with a plasma around it resulted in a change in the color of the plasma and its location relative to the vehicle. However, an electromagnetic submarine has actually been built and successfully tested. It is described in some detail in References 50-52.

24. Can an EM submarine really be related to a UFO?

Dr. Way's electromagnetic submarine which, incidentally, is silent and would be quite difficult to detect at a distance, is directly analogous to the type of airborne craft I envision except that the shape of the aircraft would most likely be lenticular and the electrically conducting seawater would be replaced with an electrically conducting plasma of ionized air.

25. Would lenticular vehicles fly?

I certainly think so. We seem to believe that airplanes have the only possible shape probably because the Wright brothers plane had the same outline which in turn was like that of birds. As pointed out by Chatham in Ref. 53, flight is still only a byproduct of high forward velocity leading to the need for long runways and high speed landings and takeoff. Present airplanes are quite obviously inefficient in terms of fuel consumption, payload fraction, and volume of air and airport space per passenger. After all the SST will only carry a few hundred passengers though it will occupy the space of a football field capable of holding at least ten times as many people. Fuel weight is greater than payload weight and neither

Footnotes at the end of article.

is a very high fraction of system weight. It is interesting to note that most scientific progress has come from doing things differently rather than using the same technique -- microcircuits aren't Just smaller vacuum tubes; lasers aren't just better light bulbs. Many people are not aware that the U.S. Patent Office has granted more than ten patents for what one might honestly call flying saucer shaped craft all of which claim great maneuverability and the ability to rise vertically. Some can supposedly hover. None of these use magnetoaerodynamic techniques. For those who are interested, the patents are listed in Appendix 3. This list hasn't been up-dated for a couple of years.

26. Have any members of your audience seen any UFOs?

I have taken to asking whether any members of my audiences have seen what they would call a UFO. Typically 3-10% are willing to raise their hands and usually there are others who approach me privately. These data, though limited, tend to support the Gallup Poll of 1966 which revealed that 5 million adult Americans claimed to have observed a UFO. Interestingly enough the official files contain fewer than 12,000 reports.

27. Were these sightings by your audience reported to investigative bodies?

In general, no. At Los Alamos Scientific Laboratory 20 of the 600 listeners indicated that they had seen something odd but only one had reported what he had seen.

28. Is there some way to get more data about UFOs besides reading reports?

There are several approaches that should be taken.

(*a*) Lift the "laughter curtain" so that more observers are willing to report what they see and more scientists will become involved.

(*b*) Using existing technology establish instrumented investigative teams and automated observation instrumentation such as that recommended by Dr. Baker before the Committee on Science and Astronautics.

(*c*) A world wide communication and study effort should be begun.

(*d*) A very large survey should be conducted to determine the characteristics of the objects that have been observed. The most comprehensive picture we have of ball lightning resulted from carefully conducted surveys by McNally [54] and Rayle.[55] UFOs in my opinion are definitely not ball lightning or other natural plasmas but are analogous to ball lightning and earthquakes in that their appearance cannot be predicted and they cannot be reproduced in the lab or in the field but they have been observed.

29. Are there any other references of interest to scientists?

Yes, References 56-62.

30. Haven't you biased your comments by not discussing at any length the work of Marcowitz, Menzel, and Klass?

The paper by Marcowitz [12] and the books by Menzel [63 64] and Klass [65] will undoubtedly be read by scientists of the 21st century as "classics" illustrating a non-scientific approach to UFOs by people who, for whatever reason, would not examine the data relevant to UFOs or advanced technology. Marcowitz was totally wrong about fission and fusion propulsion systems, didn't even consider electromagnetic propulsion, and was obviously unaware of current technology and the data such as I mentioned earlier about UFOs. McDonald [62] has discussed Menzel's approach in detail, but let me also point out that in Ref. 64, fewer than 30 sightings ever listed as "unknowns" were discussed and no mention was made of the 434 "Unknowns" of Ref. 3 or even the 71 Excellent Unknowns of this study. I agree with Klass on only one item, many people have observed glowing plasmas; but I believe they were adjacent to vehicles rather than ball lightning or corona discharge. He didn't even consider this possibility despite all his talk about plasmas and despite the enormous amount of plasma-vehicle data which is available. In summary, I feel that these three gentlemen have made strong attempts to make the data fit their hypotheses rather than trying to do the much more difficult job of creating hypotheses which fit the data.

U.S. PATENTS FOR CIRCULAR AIRCRAFT

Patent No.	By	Title	Granted
3,067,967	I.R. Barr	Flying machine	Dec. 11, 1962
2,772,968	J.C. Fischer, Jr	Circular aircraft and control system therefor	Nov. 27, 1956
2,947,496	A.L. Leggett	Jet-propelled aircraft	Aug. 2, 1960
2,801,058	C.P. Lent	Saucer-shaped aircraft	July 30, 1957
2,876,964	H.F. Streib	Circular wing aircraft	Mar. 10, 1959
2,997,013	W.A. Rice	Propulsion system	Aug. 22, 1961
3,124,323	J.C.M. Frost	Aircraft propulsion and control	Mar. 10, 1964
2,876,965	H.P. Streib	Circular wing aircraft with universally tiltable ducted powerplant	Mar. 10, 1959
2,939,648	H. Fleissner	Rotating jet aircraft with lifting disk wing and centrifuging tanks	June 7, 1960
3,103,324	N.C. Price	High velocity, high altitude VTOL aircraft	Sept 10, 1963

APPENDIX 3

FLYING SAUCERS ARE REAL

There area few standard responses to any statement that "the earth is being visited by intelligently controlled vehicles whose origin is extraterrestrial." The simplest is ridicule, coupled with a comment that flying saucers are figments of the imagination, or optical illusions, or motes in the eye, or hoaxes, or misidentified conventional phenomena seen under unusual circumstances by untrained observers. These, however, are all Identified Flying Objects, and not the Unidentified Flying Objects with which my statement is concerned.

The next simplest response is: "We are certainly not alone in the Universe and surely some civilizations are more advanced than ours, but interstellar travel is not feasible because of the vast distances between such civilizations and the great quantity of energy and time required for the trip." These critics ignore our lack of data on intercivilization distances the possibility of unknown (to us) flight technology, and studies in this area.[1] Another response is that the reported activity of UFOs is not rational since, if "they" were advanced enough to get here, they would surely try to communicate with us.

These responses avoid coming to grips with the reported data. Those interested in data -- and there is plenty of it [2-13] -- are advised to consult the References and derive a hypothesis other than extraterrestrial vehicles to fit the facts, rather than to try to make the facts fit the hypothesis that "we are not being visited because -- " (in 25 words or less).

A particularly interesting aspect of the data from all over the world is that electromagnetic effects are frequently observed in association with the presence of UFOs, along with the fact that many observations suggest that what is being observed is a "vehicle" having a plasma region adjacent toil -- "vehicle" because of its metal-like surface, large size, maneuvers indicating intelligent control, well-defined shape, surface features such as "port holes, antenna, landing gears," lights, etc.; and plasma because of bright glows rather than color, changes in the color of the glow associated with changes in velocity, luminous boundary layers, and appearance on film of regions not seen by the naked eye. The EM effects include interference with the operation of automobile engines, radios, and headlights; interference with the operation of radio and TV sets, compasses, magnetic speedometers, power systems; residual magnetism in metal objects, watches, etc. [13]

During the past decade a vast amount of terrestrial technology, much of it classified, has been developed concerning the interactions of airborne vehicles and

Footnotes at the end of article.

plasmas.[14] The development of lightweight, compact, high-field superconducting magnets has also led to much work on the potential benefits to be derived from placing a magnet within a high-speed vehicle to interact with a plasma around the vehicle. Such a combination might be used to reduce vehicle heating, control aerodynamic drag, exert control forces on the vehicle, provide power for its operation, open a "magnetic" communications window, and change the vehicle radar profile. In addition, the magnets might be used to provide shielding against space radiation. Numerous reports cover such applications.[13-17]

A review of this literature and an extrapolation of existing technology suggest that with considerable effort an entirely new EM approach to hypersonic flight might be developed which, in many respects, could duplicate UFO characteristics. In turn, this leads to the notion that observed UFO behavior is not so unreasonable as might at first appear to be the case. The measurement of EM parameters of UFOs could well provide information on both UFO characteristics and new propulsion.

STATEMENT BY DR. ROGER N. SHEPARD

1. Biography
2. Prepared Statement

(The biography of Dr. Shepard follows:)

DR. ROGER N. SHEPARD

Roger N. Shepard is professor of psychology at Stanford. University. Previously he was professor and then director of the psychological laboratories at Harvard and, for eight years before that, member of technical staff and then department head at the Bell Telephone Laboratories. He obtained his Ph.D. in experimental psychology from Yale (1955), and has published some 30 technical and scientific papers on human perception and memory and on computer methods for discovering patterns in large arrays of data. Although, he has had a long-standing interest in the problem of UFOs, this is his first paper on this particular subject.

PREPARED STATEMENT BY ROGER N. SHEPARD

SOME PSYCHOLOGICALLY ORIENTED TECHNIQUES FOR THE SCIENTIFIC INVESTIGATION OF UNIDENTIFIED AERIAL PHENOMENA

Abstract
Unpredictability of UFO Phenomena
UFO Phenomena as Psychological Problem
Three Extreme Case Types
Potential Contribution of Psychological Techniques
Reconstruction by Recognition
Convergence of Independent Reconstructions
Use of Concrete Stimuli
Photographs as concrete Stimuli
UFO Photographs as Evidence
Assessment of a Set of Test Materials
Use of the Computer
ACKNOWLEDGEMENTS
REFERENCES

ABSTRACT

Even if our interest is in the study of UFO's as some sort of extraordinary physical phenomenon (whether of natural or, possibly, of intelligent, extraterrestrial origin), our study cannot ignore the inescapable fact that nearly all of our evidence comes -- not from physical measuring instruments -- but from human observers. So far, however, we have consistently sold the human observer short Indeed, in neglecting to make use of psychologically oriented techniques that would more fully enable observers to bring to bear their really rather remarkable powers of perception and recognition, we may have been forfeiting the opportunity of obtaining evidence from independent observers that would be sufficiently convergent and well-defined to clarify the true nature of the phenomena.

The extent to which the apparent unpredictability of UFO Phenomena Hinders their scientific study

The scientific investigation of a set of phenomena becomes possible whenever those phenomena exhibit some discernible degree of order or pattern. Scientific study is of course greatly facilitated when, as in astronomy, the order strongly emerges in the form of a space-time pattern of the very occurrences themselves. For, only then, can we arrange to have suitably trained observers suitably "training" powerful and, hence necessarily, highly directional recording and measuring instruments on the right place at the right time.

Indeed, by contrast with astronomical phenomena, those loosely classified together as "Unidentified Flying Objects' ("UFO's") or (with perhaps somewhat less commitment implied as to their real nature) "Unidentified Aerial Phenomena" sometimes appear almost inaccessible to scientific study. Certainly phenomena that are rare and fleeting are difficult enough but, if in addition they are totally capricious and unpredictable when they do occur, then the scientific method is to no avail and we are reduced to awaiting each new happening in the same primitive state of uncomprehending docility.

The repeated successes of science, however, have encouraged us always to search for pattern and order even when none at first appears. And, although a scientific study does of course become enormously more difficult when the occurrences of the phenomena do not fall into any predictable pattern in space and time, it remains a possibility so long as some regularity exists within the phenomena themselves -- whenever they *do* happen to occur. Thus, in the field of psychopathology, even if it were the case that some psychological phenomena (such, say, as psychotic episodes) occurred wholly unpredictably -- striking any person at any time, quite at random, we could still study the internal patterns of such episodes when they do strike. We might for example find that when symptom A appears, it is usually accompanied by symptom B, but seldom by symptom C, and so on. This, too, is a kind of predictability and can even lead to a degree of understanding and perhaps, eventually, to a method of treatment.

Similarly, in the case of UFO episodes, it may be possible to discover some regularities or patterns within these episodes even though any clear overall pattern in their mere occurrences (except, possibly for the tendency to unpredicted local concentrations in space and time) continues to elude us. This is not to say that efforts -- such as those of Michel (1958) and of Vallee and Vallee (1966) -- to detect some overall pattern should not be pursued, but only that the attempt at a scientific study need not await a positive outcome of those efforts.

The principal sense in which the problem of UFO phenomena is a psychological problem

In the meantime, a scientific study of these phenomena is not impossible -- just more difficult. For, we are faced for the most part with a problem -- not of making physical measurements -- but of interpreting verbal reports. We are faced, in short, with a problem amenable more to the methods of the psychologist than to those of the physical scientist

It is the principal purpose of this note to propose that, despite the relatively primitive state of development of psychological science, psychological and social scientists and even, indeed, law enforcement specialists have devised some techniques that could as well be applied to further the scientific study of UFO's.

I do not mean to suggest by this that most reports of UFO's can probably be shown to arise from purely psychological aberrations such as illusions, hallucinations, delusions, after-images, and the like. On the contrary, a careful examination of most of the best-documented cases has convinced me -- as at least one psychologist who has studied rather extensively into the fields of normal and psychopathological perception-that very few such cases can be explained along these lines. Indeed, I have the impression that the claims that the UFO's reported even by seemingly responsible citizens represent lapses of a basically psychopathological character have generally come from people who have neglected to study closely either into the literature on psychopathology, or into that on UFO's, or (in many cases, I fear) both.

The desirability of separating three psychologically extreme types of UFO Cases

I have so far ignored the reports of the so-called "contactees" and related cultists who seem to form a relatively distinct class and who are generally readily identifiable without the benefit of extensive psychological training. Insofar as possible, I should also like to disregard the reports of out-and-out hoaxters. Admittedly, however, these present a somewhat more troublesome problem to which we must return later -- particularly in connection with photographs and other types of alleged physical evidence.

Of course there always are ambiguous cases which are difficult to place certainly within the triangle defined by the three, psychologically distinct "corners" representing the deluded contactee, the conscious pranksters, and the involuntary but responsible witness of some real but puzzling phenomenon. However, as has often been remarked, the existence of twilight does not deter us from distinguishing between night and day -- nor should it.

In fact, science generally proceeds most rapidly by focusing first on the purest and most clear-cut cases, and by leaving for later any "mop-up" operation of dealing with the remaining cases that are to varying degrees complicated, mixed, messy, borderline, or obscure. Thus the social scientist who is primarily interested in studying the formation and perpetuation of delusional belief systems will do well to focus precisely on the members of the "contactee" cults, the archetypal examples of which are situated in the south-western United States and are heavily constituted by persons (often predominantly women rather past middle age) who have relatively little formal education together with a history of professed beliefs in the mystical, the spiritual, or the occult. Likewise, a clinical psychologist interested in the ways in which socially responsible adult behavior emerges or fails to emerge out of the play and testing behavior of childhood may learn something from an intensive study of any of the almost canonical cases of adolescent boys who, often in pairs and in accordance with an almost tiringly regular pattern, attain at least transitory notoriety by submitting their photograph of a "flying saucer" -- replete with dome, antenna, and, perhaps, portholes and fins.

Just so, if we are, as here, primarily concerned with the possibility of unexplained but objective phenomena taking place within our atmosphere, then we should eschew not only the two pure sorts of cases just mentioned, but also the

various more-or-less obscure or ill-defined cases falling somewhere within the "triangle." (Indeed, to throw all such intermediate cases together, without adequate regard for the reliability or credibility of each report -- as some investigators have tended to do for the purposes of compiling over-all statistics concerning "UFO activity" -- can, I think, lead to a largely uninterpretable picture. For, there is then no way of assessing or parceling out the "noise" contributed by the contactee, the prankster and, of course, the many well-meaning citizens who, under unusual circumstances, will continue to misidentify familiar phenomena.) Rather, we stand to learn most from an intensive study into those numerous cases represented by the remaining "corner" of the triangle in which converging evidence from apparently involuntary, independent, and responsible witnesses strongly points to the occurrence of an objective phenomenon of an unexplained character.

The potential contribution of psychological techniques to the study even of purely physical phenomena

Even though our primary interest is, then, on the unexplained objective and presumably physical phenomena that may give rise to such UFO reports, our problem remains as much a psychological as a physical one. For, the vast bulk of the data upon which we must base our scientific investigation comes -- not from physical recording or measuring devices -- but solely from one or more human observers. Moreover these are observers who were not, evidently, selected for their powers of observation or description and who have good reason to be reluctant as well -- particularly in view of the likelihood of ridicule, often encouraged, curiously, by the very investigators who profess to be seeking the truth (cf., Fuller, 1966, pp. 211-220; Weitzel, 1967).

It is here, surely, that we have been most glaringly remiss in our attempts to put the investigation of UFO's on a scientific footing. We have, simply, failed to make anywhere near full use of the one recording and measuring instrument at our disposal; namely, our unwitting human witness.

Now it is true that one of the more exotic psychological techniques, hypnotic regression, has already been attempted with interesting -- if considerably less than conclusive results in at least one UFO case of a rather sensational nature (Fuller, 1967). However, although astonishing claims have sometimes been made for the kind of detail that can be recovered under hypnosis (e.g., by McCulloch in von Foerster, 1952, p. 100), the results of controlled experiments on accuracy of recall have generally been less impressive (Reiff & Scheerer, 1959). More reliable, in my opinion, are some techniques based on certain psychological facts of a more mundane but better understood character.

The power of methods guided by recognition rather than description in the reconstruction of a fleeting event

It is, I suppose, a fact familiar to us all that we can take in and remember much more information than we can readily communicate to others. Contrast, for example, how easily we recognize the face of a friend in a crowd with how difficult it is to describe that face so that any other person could then do it for us. Quite generally, our powers of recognition exceed our powers of description (and, indeed, surpass anything that we have yet been able to accomplish by physical instrument or machine). In an experiment on recognition memory, I once presented human subjects with over 600 different pictures, one right after the other, and then found that they could immediately distinguish between, those "old" pictures and otherwise completely comparable "new" pictures with median accuracy of over 98% (Shepard, 1967). Even when the test

was not given until a week later, the discriminations between "old" and "new" pictures were still 92% correct. Moreover, the advantage of recognition over verbal description, should become especially pronounced when the object or event to be remember is unfamiliar and, so, not uniquely or succinctly "captured" by readily available terms or labels.

Over and over again, witnesses of "UFO's" have provided descriptions that, while they strongly suggest that a clear view was obtained of some well-defined but extraordinary object or phenomenon, leave the investigator frustratingly in the dark as to its precise appearance or behavior. A closely viewed, "spinning metallic" object is said, for example, to have been "mushroom-shaped," or to have resembled "an inverted top." But what does this mean? What sort of mushroom? With or without the stalk? And what on earth (!) is referred to, precisely, by "a 30 foot inverted top?"

Some psychologists have been expressly studying the ways in which people come to describe nearly nondescript objects to others (e.g., Krauss & Weinheimer, 1964, 1966). Often a person will feel that the ambiguous term he comes up with (such, for example, as "an inverted top") does quite well. Possibly this is because he is picturing some particular interpretation (e.g,, a particular toy that he played with as a child). For the listener who does not have that particular picture in mind, however, the description may prove either meaningless or, worse, completely misleading (cf., Glucksberg, Krauss, & Weisberg, 1966). An indication of the same sort of problem is the tendency of witnesses to say things like "it looked about the size of a football." Further circumstances make clear that they must have been referring to its apparent visual size rather than its real, physical size (which could, after all, hardly be estimated without also knowing its real, physical distance). More pertinently here, it appears that they were really talking more about its shape than its size. Possibly, the presence, so to speak, of a very vivid image in the mind of the witness causes him to lose sight of the total inadequacy of his verbal encoding of that image.

This problem is already implicitly recognized in certain situations of more obviously pressing practical concern. Investigators in cases of homicide do not rest content with the weak and fuzzy descriptions typically offered by a witness but, in addition, may employ a skilled artist (such as Richard Kenehan of the New York Police Department) to work with the witness in an attempt to reconstruct a usable likeness of the murderer's face. The witness may be asked to select eyes, eyebrows, nose, mouth, or ears from series that are systematically graded in size and shape. The witness can then help to adjust their positions on an outlined face. This will generally provide a sufficiently concrete stimulus to enable the witness, finally, to become reasonably explicit about further refinements concerning hair, complexions, lines, scars, asymmetries, and so on. In a number of cases (such as the recent one in which Richard Speck was charged with the murder of several nursing students in Chicago) a likeness constructed in this way from a single surviving witness has proved remarkably accurate and, in more than one instance, has actually led to the apprehension of the criminal (cf., Schumach, 1958).

This provides perhaps the most directly pertinent substantiation for the one central point that I want to leave with those concerned with the investigation of UFO's. Briefly, it is this: Even when an event occurs without warning, leaves little time for careful observation and, indeed, occasions extreme fear or anxiety, the average witness often retains an accurate, almost photographic record of the event -- a record, moreover, that can be largely recovered from him even though he lacks the words to describe it himself. Possibly then, in allowing our investigations to depend solely upon our informant's inadequate, his misleading and, yes, his sometimes even ludicrous choice of words, we have done both him -- and ourselves -- a telling disservice.

The desirability of establishing a system permitting convergence of independent reconstructions

Admittedly, in the case of UFO's, the value of information provided by a single, isolated witness -- however detailed that information may be -- is, by itself, always quite small (except, of course, for the witness himself!). For, from the standpoint of any other person, there is always at least the possibility of hallucination, delusion or, more likely, just plain fabrication. This is amply pointed up by the relative lack of evidential value of the many quite detailed photographs purported to have been taken of UFOs by solitary witnesses.

It is only when there turns up an otherwise inexplicably close correspondence between the information furnished by two or more *independent* witnesses that the evidence becomes at all compelling at the public or scientific level. But we do not provide for even the possibility of a close correspondence unless we elicit sufficiently detailed information. Thus, when one person reports a "glowing mushroom-shaped object" while another, remote witness refers to the passage of an "inverted top," we have little basis for evaluating the likelihood that they have both observed a physical object -- let alone the *same* physical object

Now it is true that certain rather suggestive regularities have already emerged in the more or less spontaneous reports of observers. Among the very most common, for example, are the frequent references to disk-like shapes, to extraordinary velocities, to abrupt simultaneous changes of color and direction and, perhaps most strikingly, to the so-called "pendulum" or "falling-leaf" type

of descent. Still, much more detailed information concerning such things as shape could presumably be extracted by techniques (akin to those already used in criminal cases) designed to take fuller advantage of the witnesses' usually untapped but vastly more discriminating powers of recognition.

The point, here, is that such more detailed information is needed not merely for its own sake. It is needed, even before that, because the establishment of the very validity of the information in question hinges upon the demonstration of the kind of point-for-point correspondence between reports that becomes possible only when those reports are sufficiently detailed. If two, unrelated witnesses both claim to have seen a disk-shaped object at about the same time and place this is not sufficiently compelling. (Evidently! For it has already happened many times.) But, if artists working with the two witnesses, independently, construct pictures of what appears to be the very same object or, alternatively, if the two witnesses independently point to the very same drawing or photograph in an array of 50 or more different pictures of such objects, then the coincidence becomes more interesting. (And, of course, if the pictures reconstructed or singled out in this way just once turned out to coincide, also, with an actual photograph taken at the time, we should at last have opened the door for the more precise measurements of physical science-including the sophisticated and powerful photogrammetric methods being developed for the analysis and interpretation of lunar photographs.)

The establishment of a pre-tested and standardized procedure for reconstructing information by the sort of psychologically oriented techniques envisaged here, moreover, would be incomparably cheaper than the implementation of other more physically oriented schemes that have sometimes been proposed -- such as the construction of a far-flung network of automatic radar-and-camera stations. For, instead of having simultaneously to cover all possible sites in advance, we could simply move in to recover the desired information *after* an incident is first reported.

There is, however, one unavoidable aspect of the psychologically oriented type of approach proposed here that I, anyway, regard as quite regrettable. To the extent that any detailed pictures reconstructed by these techniques are made publicly available, we cannot guarantee that pictures obtained from subsequent witnesses will be suitably independent for our purposes. Consequently, rather tight security precautions would have to be imposed on the more detailed reconstructions, if the purely scientific purposes of the investigation are not to be compromised.

The use of concrete stimuli to provide a basis for the independent, recognition-guided process of reconstruction

The need for ensuring independence of information supplied by different witnesses is in fact so great that it is doubtful whether much reliance could safely be placed on different pictures reconstructed with the help of the same artist. Despite the best intentions of the artist, he might unwittingly guide different witnesses along somewhat similar channels by means of subtle, perhaps unconscious cues (cf., Rosenthal, 1966). Moreover, even if a different artist could be supplied for each witness, we would still be left with the problem of evaluating the likelihood that any two pictures constructed in this way could have turned out as similarly as they did by chance alone.

For these reasons and for reasons of feasibility, convenience, and economy, it would be preferable to develop a standardized set of materials containing suitably representative and graded series of shapes to which each witness could independently respond. Some such materials would be needed, in any case, in order to provide stimuli suitable for tapping the witnesses' powers of recognition. Possibly even separate arrays should be constructed for distinguishable parts such as "domes" or other projections (just as separate series of eyes, or mouths may be helpful to the witness in criminal cases). By means of suitable standardization and control in the preparation and presentation of such materials, then, we could be reasonably sure that the responses of one witness are not unduly influencing the choices of another. Moreover, since each witness would make his choices from a pre-tested, fixed set of alternatives of known size, we would be in a favorable position to assess the probability that any coincidences of choice might have occurred merely by chance.

All things considered, the best procedure might be to divide the questioning of a witness into the following three distinct phases: first, the recording of the

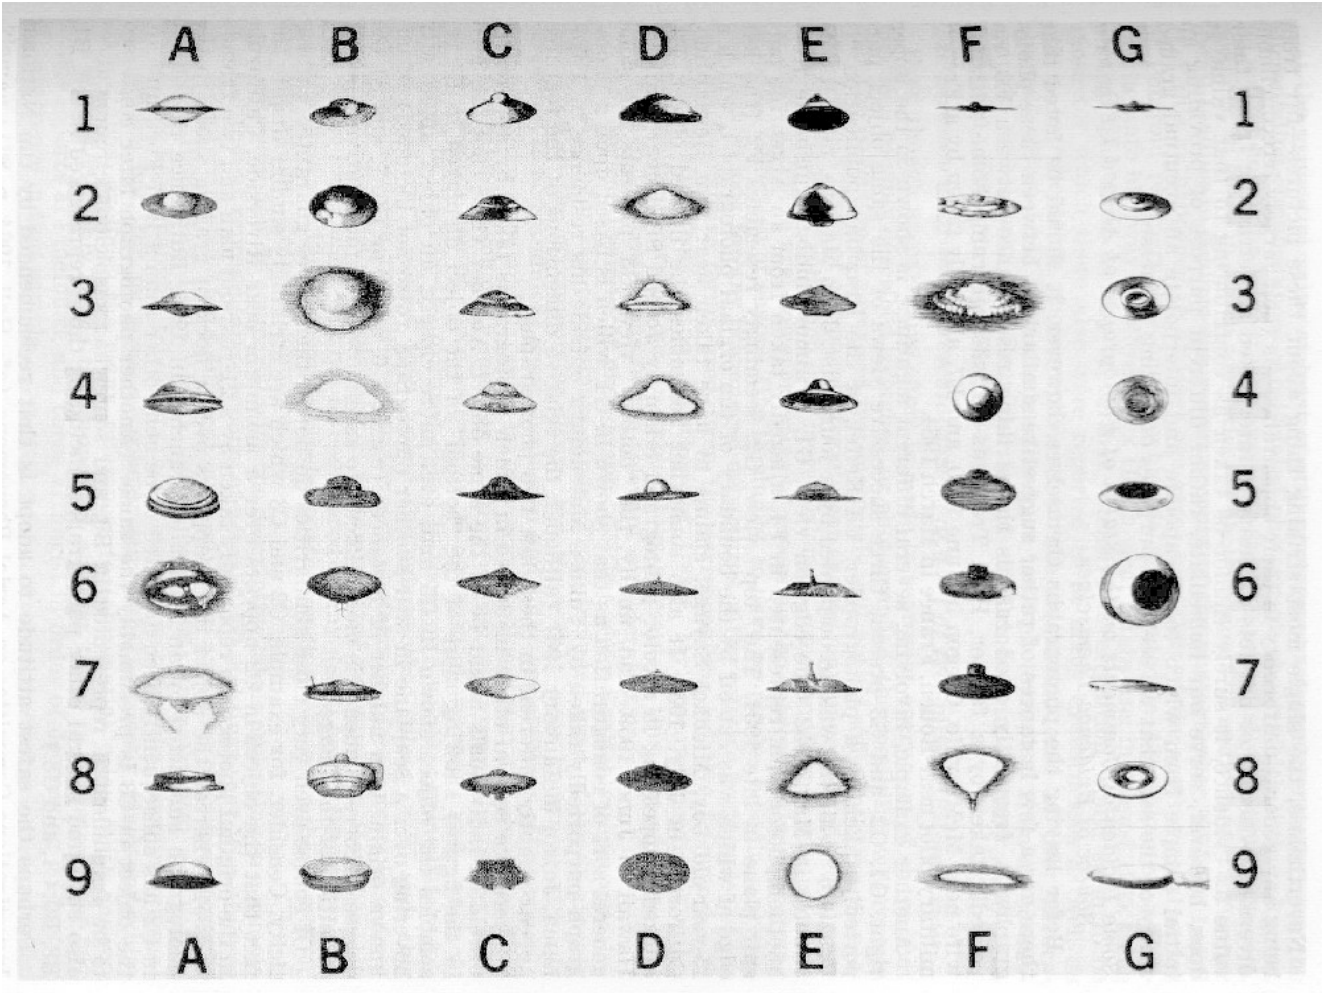
witness describing what he saw as completely as he can, in his own words, and without any cues (whether verbal or pictorial) that might bias him in one direction or another; second, the recording of his responses to the standardized, pictorial materials; and third (if the case seems to warrant it) the foil reconstruction of a new picture with the help of a suitably trained artist. Such a new picture, if sufficiently novel or well-defined, might then be incorporated in future revisions of the materials used for the second phase of the interview.

The effectiveness of the proposed procedure would depend very heavily upon the amount of thought, care, skill and, above all, pretesting that went into the preparation of the materials. The arrays of alternative shapes should of course include all types of shapes that have been clearly described, sketched, or (allegedly) actually photographed by some previous witness of at least reasonable reliability. One helpful attempt at systematizing the kinds of shapes that have been reported has in fact already been published (see Hall, 1964, p. 144). However, more extensive and refined work would be necessary in order to cover the great variety of reported shapes, and to do this in a sufficiently concrete and realistic manner to promote recognition and, possibly, further specification by witnesses.

The use of photographs of alleged UFOs as a source of concrete test materials

Since photographs represent an especially tempting vehicle for the hoaxter and, in addition, are easily faked, they are individually of little value as evidence -- except in the rare cases in which there were independent, corroborating eyewitnesses. Photographs purporting to be of UFOs are, however, surprisingly numerous. (I myself have assembled well over 150 distinct such photographs merely from published reports.) Moreover, since at least one of these photographs might be authentic and since we have no sure way of knowing in advance which one it might be, we can not afford to eliminate any distinct type that hasn't already been proved to be a fraud. In the meantime, moreover, the other, spurious photographs can serve (in somewhat the same way as the non-suspects in a police "line-up") as a means of assessing consistency of choice or, contrary-wise, mere guessing on the part of different witnesses.

The accompanying figure reproduces drawings in which I have tried to portray, as accurately as I could, representative objects from 63 of these photographs. The greater contrast of the drawings renders them more readily duplicatable than the original photographs. Moreover, I was also able in this way to reduce them all to uniform size and to eliminate background details which, although useful for estimating size or gauging authenticity, are only distracting for present purposes. Some of the photographs are from well documented or widely publicized cases while others are of more obscure or dubious origin. At least two cases have subsequently been admitted to be hoaxes, while circumstances surrounding some of the others make them difficult to dismiss in this way.



UFO Shape Array

[[229]]

Nevertheless, the single most striking tiling about these pictures -- far from [there] being any general uniformity in their appearance -- is their largely irreconcilable diversity. Whether or not this diversity is interpreted as detracting from their value as evidence, it surely cannot be taken as contributing to that value. It does, however, serve our immediate, rather different purpose of providing an initial sample from which to extrapolate and interpolate an eventual graded array of the sort that we seek for purposes of testing witnesses.

Some Incidental Comments on the Status of Photographs of Alleged UFOs as a Source of Evidence Themselves

Before leaving the photographs themselves, however, it should be noted that there *are* a few instances of rather suggestive similarities between these photographs. A frequently cited case is the striking resemblance between E6, reportedly taken by a farmer, Paul Trent, as he was returning home with his wife near McMinville, Oregon in June 1950, and ET, allegedly taken by a French military pilot near Rouen, France in March 1954.

Another example, involving several different sightings, is shown in the upper right. G1, G2, and. G3 present three successive views of the same object purportedly taken by a photographer, Ed Keffel, of the Brazilian publication "O Cruziero" while he was accompanied by a journalist, Joao Martins, near Rio de Janeiro in May, 1952. The edge-on view, G1, is almost indistinguishable from another photograph, represented in F1, allegedly taken from an Argentine pursuit plane in late 1954. The "top" view, G2, seemingly resembles F2 (the left edge of which was cut off by the boundary of the original photograph), which a 15-year-old boy, Michael Savage, claims to have taken near San Bernardino, California in July, 1956. It also somewhat resembles the lighted object, F3, allegedly appearing in a color photograph taken by Joseph

Sigel near Waikiki, Hawaii in June, 1959. And, finally, the "bottom" view, G3, presents the same general sort of configuration as that shown in G4, which is based upon a photograph purportedly taken by Yukuse Matsumura outside his residence in Yokohama, Japan in January 1957 (although the relative dimensions of the features appear slightly different in these last two photographs).

There are several other instances in which photographs taken by apparently unrelated individuals might be of the same object. Another view (not included in the figure) showing more of the "bottom" of the object displayed in E4 resembles the object shown in G5 and, even more closely, an object apparently hovering over a seaplane in still another photograph (also not included) of unknown origin. In a number of instances (e.g., F5, 6, and 7 or D6, 7, and 8) the degree of correspondence is more difficult to assess owing to the relatively poorer definition of the images.

Of course even very close similarities do not in themselves guarantee authenticity. Consider, for example, C2 and C3 which are strikingly similar despite the fact that the object in C2 appears over a mountain near Riverside, California in the original photograph reportedly taken by a 21-year-old man and two friends in 1951, whereas the object in C3 appears over a flock of grazing sheep in the photograph submitted by an Australian rancher in 1954. But, since the object in C2 has subsequently been admitted to be none other than a 1967 Ford hubcap, the object in C3 is presumably the same. (Another photograph later confessed to be fraudulent is represented in B6, and somewhat suspicious circumstances also surround several other photographs, including those represented in A9, B1, B8, B9, C1, and G8.)

Perhaps the safest attitude to adopt is that recommended by the National Investigations Committee on Aerial Phenomena (cf., Hall, 1964, p. 86); namely,

that the evidential value at least of still photographs depends entirely upon the surrounding circumstances. An isolated photograph about which little is known, no matter how impressive it may appear in itself, is essentially worthless -- except, possibly, in cases in which sophisticated photogrammetric analysis yields further detail tending to confirm the verbal account of the photographer. (I have heard that this has happened in at least one case; viz., that of the controversial series of Polaroid photographs -- one of which is represented in A8 -- taken by a California state highway employee, Rex Heflin, near Santa Ana in August 1965.) The photographs most worthy of further intensive investigation would seem to be those for which there also were reported to be many eyewitnesses as well as other, corroborating photographs -- as in the celebrated case of the "saturn-shaped" object (A1) that was said to have been photographed from an oceanographic vessel near the Brazilian island of Trindad in January 1958 (see Lorenzen, 1966, pp. 145-153, 164-174).

The assessment of the representativeness of a set of recognition test-materials,

Even though an extensive effort is made to represent every sort of shape that has been reliably described, sketched, or photographed, the possibility will remain that the collection of proposed test materials will not be sufficiently representative. Certain types of completely fraudulent shapes may unnecessarily inflate the already unwieldy collection and, more seriously, some significant types may still be missing. There are, however, ways of assessing the representativeness of any proposed collection of shapes. One is, simply, to have people describe these shapes and then to look for any pronounced departures of the relative frequencies of the various descriptive terms used from the corresponding relative frequencies in reports issuing from actual sightings of UFOs. My research assistant, Miss Shelley Meltzer, carried out an exploratory attempt at this sort of thing that may help to illustrate some of the relevant considerations.

From our total sample of photographs, 75 that seemed suitably representative were selected for this preliminary study. These included most of the 63 already portrayed in the accompanying figure, but those that were known or strongly suspected to be fraudulent were eliminated and a number of others of less sharply defined shape were added (since many reports indicate that the shape was not clearly visible). Each of 19 subjects, mostly students at Harvard University, then looked through one of three subsets of 25 of these photographs and, for each, attempted to describe the pictured object in their own words. (Immediately following that, each subject then looked through another subset of 25 and, this time, indicated the appropriateness for each photograph of each term in a *fixed set* that we had listed in advance on a standardized rating sheet. However this part of the experiment will not be considered in any detail here.) Of most immediate interest are the descriptive labels spontaneously produced in the 19 x 25 or 475 subject-photograph encounters.

These could now be compared with the descriptive labels appearing in a sample of 206 different representative reports of actual UFO sightings that Miss Meltzer had already extracted (for a different purpose) from a number of sources (mostly Edwards, 1966; Hall, 1964; Michel, 1967; Olsen, 1966; Ruppelt, 1956; and Vallee, 1965). The accompanying table lists those descriptive terms that pertain to visual appearance but, for purposes of comparison with the mostly black-and-white photographs, excludes the many references to (chromatic) color. With one exception (#33), only terms that appeared at least twice in the sample of 206 actual reports are included, and these arranged in order of decreasing frequency of occurrence in that sample.

[[231]]

	Label description; visual appearance (excluding chromatic colors)	in 206 actual UFO cases	in 475 photograph descriptions	Appreciable discrepancies
1	Disk shaped	27	42	
2	Circular	24	24	
3	Round	22	25	
4	Metallic	19	41	
5	Domed top	15	21	
6	Starlike (point of Light)	14	6	-
7	Cigar shaped	13	1	- -
8	Spherical	12	9	
9	Bell shaped	11	0	-
10	Fiery appearance	11	0	-
11	Trail of vapor or smoke	10	13	
12	Portholes or windows	10	0	-
13	Pattern of lights	9	0	-
14	White filaments emitted	9	0	-
15	Oval	6	19	+
16	Flat	6	8	
17	Elliptical	5	9	
18	Dumbbell shaped	5	0	
19	Football shaped	4	1	
20	White	4	0	
21	Saucer shaped	3	12	+
22	Egg shaped	3	5	
23	Diamond shaped	3	0	
24	Silvery	3	0	
25	Saturn shaped	2	7	
26	Top shaped	2	5	
27	Conical	2	3	
28	Washtub shaped	2	0	
29	Two washbowls rim-to-rim	2	0	
30	Two plates rim-to-rim	2	0	
31	Long tail	2	0	
32	Emitting flame	2	0	
33	Hat shaped	1	35	+ +

The two columns of numbers, then, present the resulting frequencies of occurrence (a) in the 206 actual UFO reports and (b) in the 475 opportunities for these same descriptive terms to arise in the experiment with the photographs. Direct numerical comparisons are somewhat hazardous owing to the different circumstances in which the two sets of descriptive terms arose. In terms merely of opportunities, the numbers in the second column should be about twice as large as those in the first. However, the totals for the two columns are nearly equal and, so, the real encounters evidently were relatively more productive of descriptive terms on the average. Numerically small departures or departures in which the second number is somewhere between the size of the first number and twice that size are probably not very significant therefore.

The remaining positive and negative discrepancies of appreciable size are indicated by the plus and minus signs in the right-most column. Some of these are probably explainable in terms of the two-dimensional, achromatic, and stationary

character of the photographs (e.g., #10 & 13), or in terms of differences in vocabulary to be expected between the unselected witnesses and the college-educated subjects of the experiment (e.g., #9 & 15). Other discrepancies, however, suggest either that some shapes, such as the so-called "cigar" (#7), were not adequately represented in the sample of photographs, or that some shapes, such as those most frequently said to resemble a "hat" (#33), are especially likely to have been of fraudulent origin. (Among the objects included in the above figure that were often said to be hat-like are C3, which we already noted is almost certainly a 1937 Ford hubcap; E4, which doesn't seem to fit very well with the usual descriptions of UFOs; and G2, which, although it too doesn't coincide with at least my notion of a "flying saucer," does however correspond rather closely with several other photographs.)

The Use of the Computer in the Design of Recognition Test-Materials and in the Analysis of Results

Our sample of only 206 actual UFO cases is really too small and haphazard for the purpose of ensuring that all types of reported shapes are adequately represented in any proposed recognition array. Many descriptive terms that have repeatedly been used (such as "doughnut," "ring," "mushroom," flattened ball," "double-convex lens," "bullet," "blimp," and "submarine") didn't happen to appear more than once in our particular sample). Ideally, for this work, one would like access to a centralized library of all reasonably documented cases -- suitably coded for retrieval via computer. Indeed, at present the scientific study of the UFO problem is greatly hampered by the circumstance that the thousands of reported sightings have not been adequately coded or systematized in any uniform way and are, in fact, still scattered among such diverse and often mutually hostile organizations as the U.S. Air Force, NICAP, APRO, and the University of Colorado Project -- not to mention a number of more-or-less private files assembled by individual investigators both here and abroad.

Recent developments in computer technology -- particularly in computer graphics -- could be utilized, also, in the construction of arrays of shapes for a recognition test. Thus for any specified shape, the computer (together with suitable graphical output equipment) could automatically generate alternative pictures of the same object as viewed from any desired angle (e.g., Noll, 1965; Zajac, 1964); and could even generate other test shapes intermediate between that shape and some other specified shape. (In fact, as on-line graphical facilities become more widely available, even a relatively unartistic witness, seated in front of a suitable display device, should be able to reconstruct his own object by techniques of these general sorts.)

For the present, however, perhaps the most promising use of the computer in this connection would be in finding an optimum arrangement of the alternative test shapes in the recognition array. This is a matter of real concern owing to the large number of shapes that should be included. (Even the 63 exhibited in the above figure fall far short of covering all the varieties that have been sketched or described.) If the alternatives could somehow be arranged so that similar shapes are close together, then the witness could quickly narrow down to the most relevant region of the array in order to make his final, most refined discriminations.

In order to do this we would first need to obtain some measure of the perceived similarity between any two shapes. One could of course obtain a direct, subjective judgment of similarity from experimental subjects. However, it might be more convenient to obtain a derived measure of similarity based upon the frequency with which different subjects will sort the two shapes into the same pile, or upon the overlap in their application of the same descriptive terms to the two shapes in the kind of task described in the preceding section (cf,, Rosenberg, Nelson, & Vivekananthan, in press).

Once we have any such measure of similarity for every pair, we can apply powerful new computer-based methods for mapping the objects into a two-dimensional arrangement in such a way that their similarities are preserved, in so far as possible, in the spatial proximities among them (Kruskal, 1964 Shepard, 1962; Shepard & Carroll, 1966). Moreover, these same methods could yield a quantitative metric of similarity that would then enable us to specify just how similar an object identified by one witness is to the object identified by another witness. Indeed, they could even tell us something about the basic dimensions along which UFO phenomena differ or, with the help of recently perfected methods for "hierarchical clustering" (Johnson, 1967), they could provide an indication of the basically different classes into which these phenomena undoubtedly fall.

Possibly, some of these classes of unidentified aerial phenomena will turn out to be of purely natural origin. I once even ventured to suggest this for certain puzzling types of cases myself (Shepard, 1967b) -- though, admittedly, attempts to develop such explanations in terms of known principles of atmospheric physics, generally, have run into competent and serious criticism (McDonald, 1968). Still. even if some of the phenomena *are* of natural origin, a more complete and

accurate characterization of their appearance and behavior should be of some interest to the physical scientist -- indeed, all the more so to the extent that they appear to conflict with known physical principles.

In any case, it appears that techniques now exist that could provide the basis for a psychologically oriented, but genuinely scientific investigation into unidentified aerial phenomena, whatever their nature may ultimately prove to be.

[[233]]

ACKNOWLEDGEMENTS

The development of some of the techniques described here and the preliminary experimental tests of these techniques on UFO materials were carried out as one part of a more general project on psychological scaling and data analysis supported by Grant No. GS-1302 from the National Science Foundation to Harvard University. The author is indebted to the Foundation for its support and, also, to Miss Shelley Meltzer for her extensive assistance in the project

STATEMENT BY DR. FRANK B. SALISBURY

1. Biography
2. Prepared Statement

(The biography of Dr. Salisbury follows:)

FRANK BOYER SALISBURY

Born: Provo, Utah, August 3, 1926. Married 1949; six children.

B.S. University of Utah 1951; M.A. Utah 1962; Ph.D. California Institute of Technology 1955.*

Army Air Force 1945.

Field is plant physiology.

Assistant Professor of Botany, Pomona College 1954-5.

Assistant Professor of Botany, Colorado State 1955-61.

Full Professor, Colorado State 1961-66.

Professor and Head, Dept of Plant Science, Utah State University 1966-.

Member: AAAS; Society of Plant Physiology; Ecological Society; Astronautical Society.

Interests: Physiology of flowering; space biology; physiological ecology.

The following reprint from Bio-Science, volume 17, No. 1, 1967, pages 15-24, was submitted by Dr. Frank B. Salisbury, head, plant science department, Utah State University, as summarizing his views on UFOs.

A phenomenon is abroad in the land. Since shortly after the beginning of recorded history, but particularly during the past two decades, many people have reported visual observations of phenomena which they interpret as objects so intricate in their structure and proficient in their maneuvers that they far surpass the current human technology. The apparent objects are usually in the sky, but in a few cases they are on the ground or landing or taking off from the ground. Although they may not be flying and they may not be objects, they are called unidentified flying objects: UFO's for short.

What is the significance of these strange, typically aerial phenomena? There are many extremely important implications in the area of psychology. Perhaps the most obvious is the possibility that the UFO's may be purely psychological phenomena

such as hallucinations. Of much greater importance, however, could be the psychological questions of interpretation. These are valid regardless of what elicits the response in the witness -- a real spaceship from Mars or a spotlight shining on a gossamer cloud.

The number of witnesses to these phenomena has increasedtremendously in recent years (probably a sizable fraction of 1% of the world's population has been involved in "good" sightings), therefore the phenomenon is of obvious sociological importance. It could influence the relationships between nations or programs of space exploration. It might even, given the proper circumstances, develop into a panic of severe proportions. There is ample justification from the sociological standpoint for a detailed study of the UFO phenomenon.

My interest developed from the field of exobiology. If the UFO's are extraterrestrial spaceships guided by intelligent beings (as many of their witnesses insist), then they are of the most pressing interest to the exobiologist. Current speculation about life on Mars (Jackson and Moore, 1965; Salisbury, 1962, 1966) would be naive indeed if such were the case. Although they would have virtually no significance to exobiology if they are not extraterrestrial, the possibility that they might be seems great enough to merit at least a preliminary investigation.

We might well consider the UFO's from the standpoint of the philosophy of scientific method. Even if the scientific community at large were sincerely interested in the study of the phenomena, it would encounter many difficulties in knowing what approach to take. UFO sightings are events which usually cannot be repeated. The astronomer may also witness such events, e.g., the flares on Mars (Salisbury, 1962; Ley, Willy and Werner Von Braun, 1960), but at least he is a trained observer, and none of his colleagues are likely to doubt his word. In the case of the UFO's, although many observers may be highly trained in certain aspects of contemporary modern life, few, if any, could claim much competence as carefully schooled UFO observers! Frequently, they are not trained to differentiate between observation and interpretation, and often there is a strong tendency for all but close friends to doubt their word. Here, then, is a phenomenon of nature which could, and should, be of extreme interest to the scientist. But it is a difficult one for even him to study. How do we study events which cannot be repeated and which are recorded only through the minds of observers who can scarcely resist the temptation to enlarge their stories and to intermingle the facts with their own interpretations and psychological responses?

*An artist's conception of the Boiani New Guinea, June 26-27, 1959, sighting. Object is drawn from sketches made by the witnesses at the time. Note the other two objects hovering at a greater distance. Supplied by the Aerial Phenomena Research Organization.

About all we can do at present is to evaluate the reports, although sufficient desire might make more than this possible (in the Exeter sighting described below, observers could have actually waited, fully equipped with high-speed cameras and other devices, for the return of the objects). Professor J. Alien Hynek (1966), the Director of the Observatory at Northwestern University, and for the past 18 years consultant to the Air Force in their study of UFO sightings, has often stated that to make progress we must accept the fact that the UFO's do exist -- *as reports*. The Air Force and several private groups have accumulated bulging files of these reports, containing everything from detailed interviews to the remnants of pancakes submitted by a witness who claimed he had received them from a space man! These reports and the many which will be obtained in the future (using hopefully better means of information gathering) are the data with which we must work, and the only data so far available. What can we do with them?

One obvious approach is to propose as many possible interpretations as can be devised and then to evaluate the data in terms of these hypotheses. The process will be a circular one, in which hypotheses are formulated on the basis of the data, and the data are then re-examined in terms of the hypotheses. In the following paragraphs, five hypotheses are discussed and then a few representative sightings are considered. The subject has been reviewed by several authors in book form, often competently, but virtually always with some degree of prejudice (for: Hall, 1964; Keyhoe, 1960; Lorenzen, 1962, 1966; Michel, 1958; Vallee, 1965; Vallee and Vallee, 1966 -- against: Menzel and Boyd, 1963).

I. Extraterrestrial Spaceships or Other Machines

Although earlier observers usually interpreted the UFO's in terms of miraculous religious events, most UFO observers during the past 19 years have suggested that the objects which they observed were extraterrestrial spaceships.

Can we eliminate the spaceship hypothesis in any rigorous scientific manner? Logically one might think of two approaches: either we must show in each and every instance ever reported that the object was not an extraterrestrial spaceship, or we must show by some sort of scientific logic that it is impossible for extraterrestrial beings to visit us.

Obviously, we cannot show in every case that a purported UFO was not an extraterrestrial spaceship. The data may not be available, and the events cannot be repeated. Furthermore, in several instances, very detailed data do exist in relation to a sighting, and yet it cannot be rigorously stated that the UFO was not an extraterrestrial machine.

Nevertheless, this approach has been followed in an attempt to eliminate this hypothesis, notably by Professor Donald Menzel, Director of the Harvard Observatory (Menzel and Boyd, 1963) and by the United States Air Force. Menzel is aware of the logical limitations, but he takes a statistical approach. He reasons that since many sightings can be positively eliminated as extraterrestrial spaceships, those which cannot could be if only more data were available. This is an excellent example of the inductive form of reasoning which has been so productive in science. Can we confidently apply it in relation to the UFO phenomena? To do so, the cases for which ample data exist and which prove not to be spaceships must be representative of the class as a whole. To many of us this seems unlikely, since other cases fortified with considerable data cannot be eliminated as extraterrestrial machines, and in many ways they appear to have little in common with the cases which can. On purely formal grounds, then, we cannot be absolutely convinced by Menzel's approach.

It is also logically unreasonable to say with absolute certainty that it is impossible for extraterrestrial beings to visit us. Although we know a great deal about the universe, we do not yet know enough to make such an all-inclusive negative statement. Nevertheless, many of the arguments are highly compelling, and two are especially worthy of our attention. The first argument is that the UFO's contravene the laws of nature, or more properly, that they are contrary to our experience. It is first assumed that they could not originate within our solar system because only the earth harbors intelligent life, and then it is reasoned that because of the extreme distances between stars they could not be visitors from some other planetary system. My initial contact with the UFO problem came because of my doubts in relation to the first assumption (Salisbury, 1962; 1964; 1966).

Certainly we have no conclusive or even compelling evidence that Mars might support an intelligent civilization. We do, however, have a number of observations which seem to be in agreement with this assumption. The network of lines referred to as the canals still defies explanation in terms of nonintelligent phenomena, although such an explanation may well be apparent when we obtain more data about Mars. The satellites of Mars, with their almost perfectly circular, equatorial orbits and their small size have certain of the characteristics of artificial satellites. Brilliant flares of light occasionally seen on the surface of Mars are too short in duration and too bluish-white in spectral quality to be similar to our volcanoes, yet they are too long in duration to be readily explainable as meteorite impacts. An occasional associated white cloud would seem to eliminate them as reflections. It is even possible, if one is willing to stretch the imagination a bit, to find evidences [sic] for intelligence in the Mariner photographs of Mars. These ideas have recently been discussed in considerably more detail elsewhere (Salisbury, 1966).

There was an interesting correlation from 1948 to 1957 in the number of UFO sightings per unit time and the closeness to the planet Mars (Fig. 1). This was shown by Vallee and Vallee (1962; 1966) to be expected on statistical grounds less than one time in a thousand. Both Venus and Jupiter are far more prominent in the skies than Mars (both have often been misinterpreted as UFO's), and yet no such correlation exists with their apparent brightness in the skies and the number of UFO sightings.

Assuming that there is no intelligence on Mars and that the UFO's would have to cross interstellar space, can we really state with confidence that this is an impossibility? Do we know so much? Of course we do not. We are even searching for possible solutions to the problem of interstellar travel. Perhaps the roost compelling "impossibility" argument is the reported

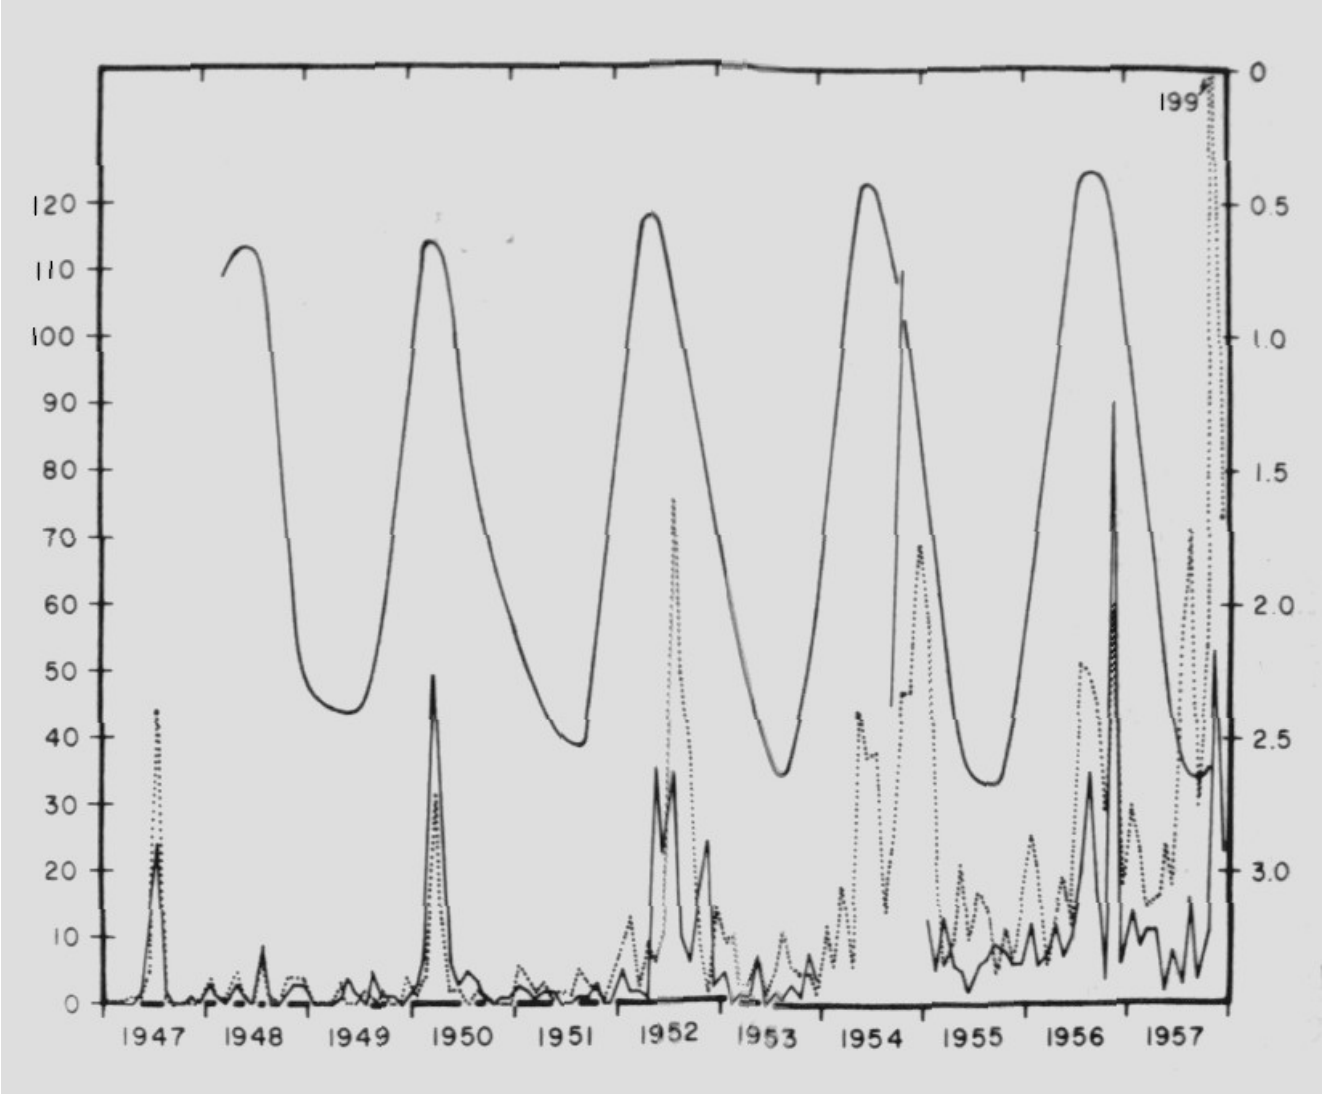

Fig. 1. UFO sightings and the oppositions of Mars.

physical activity of certain UFO's (Menzel and Boyd, 1963). In several "good" sightings (those which, for reasons discussed below, do not readily fit any of the remaining four hypotheses), UFO's have appeared to accelerate at tremendous rates or even make right-angle turns while traveling at speeds of several hundred or thousand miles per hour. Although they move in the atmosphere at velocities which surely exceed that of sound, no sonic booms are heard (they are often essentially silent) nor do they appear to burn up with frictional heat. The skeptic says: "Granted that we have a lot left to learn about our universe, we surely don't expect the fundamental laws to be rejected. That we may refine them as Einstein did, it is true, but inertia is inertia, and a right-angle turn at several thousand miles per hour is a simple physical impossibility."

This may be the most compelling argument against the spaceship hypothesis, but there are two counter-arguments. First, one can simply reject the above statement. I do not see how Newton's laws could be so flagrantly violated, but others (Lorenzen, 1962; Michel, 1958; Vallee and Vallee, 1966) have come up with various suggestions. Perhaps inertia is the gravitational interaction between an object and all other objects in the universe. If this gravitational attraction could some way be severed (some mysterious antigravity shield surrounding the spacecraft for example!), then right-angle turns at high speeds might be feasible. Would the surrounding antigravity field also nullify the sound barrier problem? Some think so. I haven't the faintest idea, but we could be wrong about what is impossible. Second, one might remember that not all UFO's perform "impossible" feats. The topic is sufficiently interesting if only one UFO proves to be a spaceship from Mars!

Another argument against the spaceship idea concerns the lack of formal contact with the UFO occupants. Since visiting spaceships ought to be piloted by some sort of intelligent beings, wouldn't it be reasonable to expect that they would desire

contact with other intelligent beings, namely us? Or why hasn't a flying saucer landed on the United Nations Building to establish formal diplomatic relations?

This argument assumes that we can understand the motives of an extraterrestrial being. Of course we cannot. How could we know the minds of such beings? To inductively extrapolate from our own current sociological approaches to those of other intelligent. entities would be to commit the logical sin of extrapolation in a most flagrant manner. It is easy to imagine several reasons why the extraterrestrials might not want to contact us. Did they plant us here as a colony many thousands of years ago and are carefully observing our evolutionary development? Do they envy us for our natural resources and want to conquer us, although present logistic problems make such an effort impossible? Are they waiting for us to straighten out our wars and race problems? Are they simply uninterested in us as contemporaries, preferring to observe us as specimens? Entomologists study the honeybees very carefully but make no diplomatic contact with the queen!

Imagine the Aborigines of Central Australia, who are still in the stone age and who have not even developed the bow and arrow. They have had no contact at all with modern civilization. What happens when a jet plane flies overhead and one of them observes it? When he tells of the huge, shiny bird that didn't flap its wings, had no feet, made an ear-splitting roar, and even had smoke coming out of its tail, surely his fellows assume that he is crazy. Or if the phenomenon becomes so common that it must be accepted as real, they could hardly be expected to deduce from it the conditions of our modern civilization, let alone our motives. "Why," they might ask; don't the intelligent beings who guide this mighty bird land and trade bone nosepieces with us?" Actually, many of the Aborigines, even those who have come in contact with civilized men, still interpret the airplane in a religious context, as witness the establishment of the cargo cults among these peoples (Worsley, 1959).

We cannot, then, eliminate the spaceship hypothesis, although some of the arguments against it are quite impressive. We should, in deference to the scientific method, examine with a completely open mind any evidence which might be marshalled in favor of the hypothesis. Let us consider the four alternatives to it

II. Conventional Phenomena Misinterpreted

Given certain special circumstances, nearly anyone can be confused and amazed by the appearance of some conventional object which under other circumstances might cause no bewilderment whatsoever. What psychological factors lead to such misinterpretations? In various instances, reported UFO's have clearly been demonstrated to be balloons, kites, birds, conventional aircraft, artificial satellites, planets and stars, meteors, clouds, natural electrical effects such as ball lightning (Klass 1966), and optical effects such as reflections, mirages, sundogs, and refractions caused by inversion layers in the atmosphere (see Menzel and Boyd, 1963, and Air Force files). Let us consider the level of certainty in classifying a given sighting here.

Often, the sighting may be placed here with absolute certainty. A balloon reported as a UFO was never out of sight of its launchers. A perplexing light in the sky takes form as an airplane as it gets closer.

[[238]]

My children woke me at 6:00 a.m. in Tubingen, Germany, saying that they were watching a hovering UFO over the city. I grabbed my binoculars and watched the brilliant light move rather rapidly both toward us and away from us and even from side to side. After about a minute, I decided to make my observations more precise, backed up against a doorway, and aligned the object with a spot on the window frame. Upon doing this, it stopped moving, and we were soon able to identify it as Venus, then the morning star. Its lateral motions were apparently illusions due to our own movements, and its rapid approach and retreat were due to a thin, rapidly moving layer of mists which caused it to change intensity.

Within the last year I have positively identified UFO's over Fort Collins, Colorado (pointed out to me usually by phone) as a weather kite, the planet Venus, and the stars Vega, Capella, Betelguese, and Sirius. Some of the stars close to the horizon flashed red, green, and white, and only a star chart and much discussion could convince the viewer that he was not observing a spaceship.

In many other cases, data are not quite complete enough to be positive, but one can state with a high degree of certainty that a given UFO was quite likely such and such a conventional object or phenomenon.

In the most interesting cases, the sighting seems absolutely to defy explanation in these terms.

One important conclusion becomes apparent: There is a very high noise level in UFO observations. This is exactly what one might expect. People do become excited by news stories and thereby predisposed to such experiences themselves. We cannot, however, from this high noise level write off the entire phenomenon as belonging to this category of conventional objects misinterpreted. Sagan (1963) attempted to do this by pointing out the great diversity which occurs within the sightings. This might well be only the noise. Even if spaceships are visiting us, many people are still seeing conventional objects and interpreting them as spaceships.

The sightings which do not fit well into the conventional-objects-misinterpreted category have certain characteristics concerned primarily with the detail which is observed and with the nature and reliability of the witnesses. Sometimes other evidence is also available.

If only a moving light is seen at a great distance, one can hardly be tempted to run out and meet our big brothers from Mars. Even a disc or a globe with fairly sharp-appearing edges might well be an optical effect of some sort. A report is more impressive when the object is seen at close hand, especially landed on the ground. A very distinct shape with highly distinct edges and a solid, often metallic-appearing surface is described. Windows or other markings may be apparent. Lights are frequently an associated part of the observation, and sometimes (both day and night) the brilliance was said to be so high that the observer found it difficult to continue looking at the UFO. Occasionally, one part of the UFO is described as being in motion relative to other parts, (The rim of a disc may be rotating around the disc.) "Occupants," both humanoid and otherwise, have been reported in conjunction with UFO's, landed and flying. The quality of a sighting is always enhanced when the time of observation is long enough for the observer to consciously consider what he is observing while he is observing it. A light that moves by in less than 5 seconds can hardly produce a very impressive account. In some cases UFO's have been observed for 1 or 2 hours or even longer.

We are primarily concerned with witnesses. Their background and training are especially important, and it is valuable when a single sighting is described by more than one witness. The likelihood of hoax is decreased if the witnesses were unknown to each other before the sighting.

In some cases an account may be supported by various forms of supplementary evidence. There are many cases in which photographs have been taken while a UFO was witnessed by several apparently competent observers. Holes have been left in the ground where a UFO had supposedly landed or vegetation has been damaged or on fire. Occasionally (rarely), radioactivity has been detected. In one case a fence was magnetized where a UFO had passed over it. Many strange samples have been left, such as Liquid residues, "angel's hair," and other materials.

In no case, of course, are these things by themselves conclusive, since virtually any sort of evidence could be fraudulently produced. We remain dependent upon the reliability of the witnesses, but sometimes these secondary evidences can contribute to an evaluation of the sighting.

Many radar sightings of UFO's are on file. In a few cases, a UFO has been simultaneously observed by radar and by witnesses, both on the ground and in an aircraft. Menzel and Boyd (1963) have clearly pointed out, however, that radar evidence is far from positive proof. There are many natural atmospheric and other phenomena as well as imperfections in radar instruments which can produce so-called radar angels. We must consider the argument from both sides, however. Just because radar angels are not necessarily UFO's, we are still not entitled to conclude that any unusual blip on the screen is a radar angel. We should certainly not conclude that UFO's cannot be extraterrestrial spaceships, because if they were, our radar net would pick them up. The fact of the matter is, our radar net does pick up many returns which are not identifiable in terms of known aircraft (e.g., apparent objects moving several thousand miles per hour through the atmosphere). Many of these are undoubtedly radar angels in the true sense of the word, but we can't say that some are not spaceships from Mars!

A secondary form of supporting evidence is that of pattern. While Sagan (1963) fails to see any pattern because of the noise, other investigators feel that many patterns can be established from the reports. Figure 1 (UFO's and Mars oppositions) is an example of such a pattern. Various other patterns have also appeared. Michel studied the sightings in France in 1954 and found that occasionally (Fig. 2) they appeared to fall upon great circle arcs of the earth's surface (Michel, 1958). It is extremely difficult (Menzel, 1964; Vallee, 1964) to evaluate the significance of such a pattern. In many cases, the lines could be due purely to chance. In the example illustrated, however, with six points upon a single line, one can't help but be somewhat impressed.

If all of these criteria are met for a given UFO report, then it is highly

[[239]]

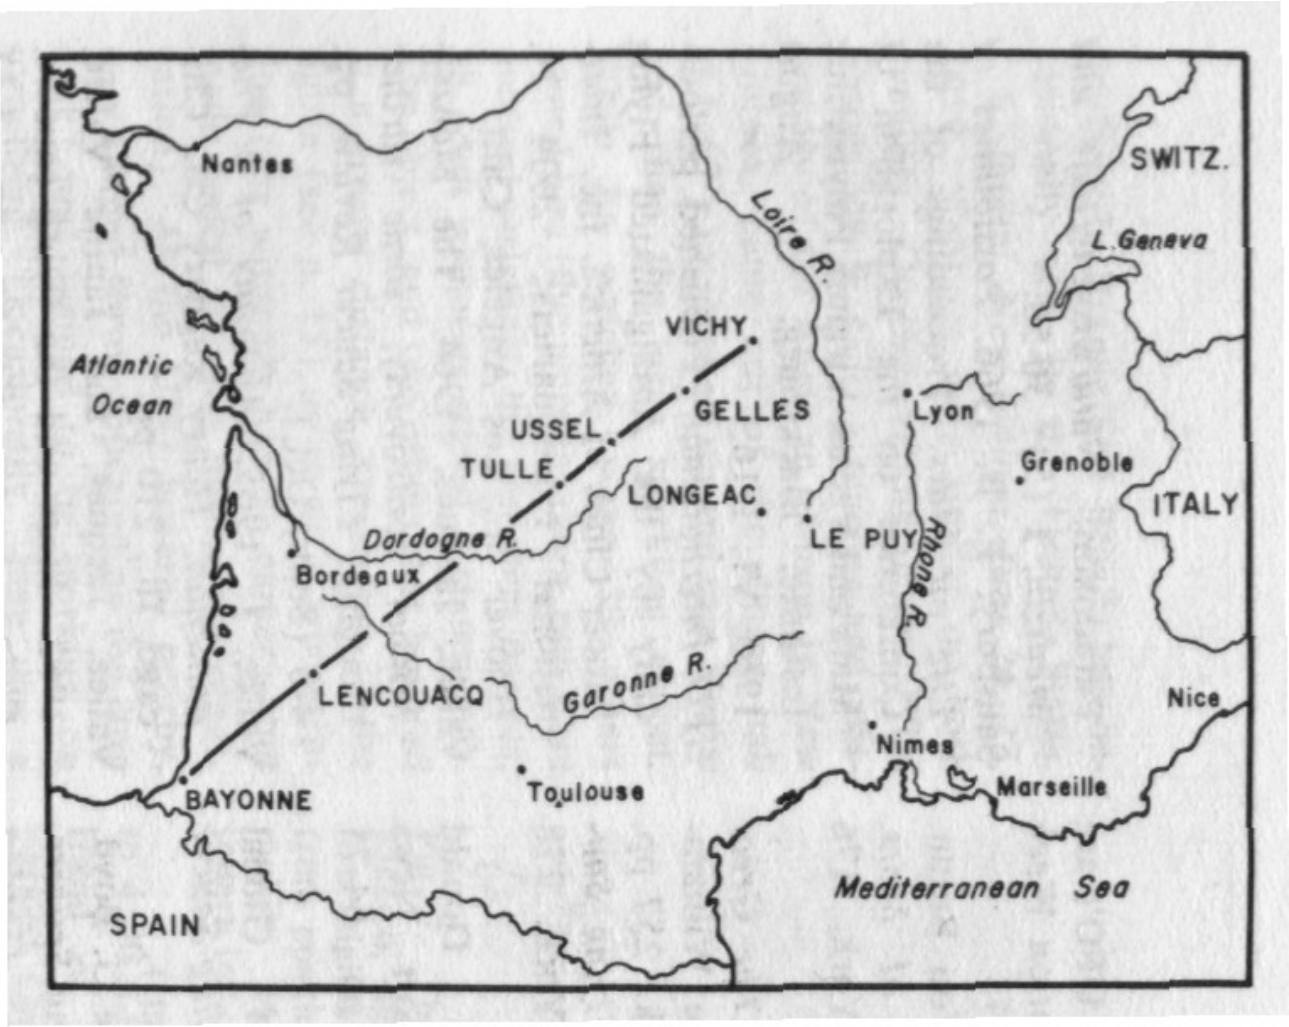

Fig. 2. French Straight-Line Sightings

likely that we are not dealing with a conventional object misinterpreted. The detail usually precludes this. In such a case, the UFO could be an extraterrestrial spaceship or it could fit into one of the categories discussed below.

III. Psychological Phenomena

Can the UFO's be pure figments of the mind -- hallucinations, dreams, and the like? Probably there are cases for which this is the proper explanation, but it is a difficult one to apply to situations in which many witnesses describe with reasonable uniformity a single UFO. In such cases, the psychological explanation would have to fall back on areas such as extrasensory perception, which are really not much more respectable in modern science than spaceships from Mars. In cases in which radar observes the object at the same time that it is observed visually and/or it is photographed, we would have to postulate that one mind can project an object into the heavens in such a way that instruments such as radar and the camera detect it. This would be as exciting as spaceships!

Certainly we do not know all there is to know about the operation of the human mind, so this hypothesis cannot be completely eliminated. And even if the UFO's arc spaceships, psychological factors play an important part in the phenomenon. Nevertheless, this hypothesis is not really satisfying. Probably the most detailed study of the UFO's by a psychologist was carried out by Jung (1959). He was able to document a great many extremely fascinating psychological

Implications of the UFO. In his final conclusion, however, he could only state that psychological explanations were not sufficient for the phenomenon as a whole.

IV. Hoaxes or Lies

An obvious and straightforward explanation of the UFO's is that the witnesses are lying or that the object is a hoax. Yet the Air Force, always acutely aware of this possibility, explained only a very small percentage of the cases which they investigated in this way. Often it is very difficult to imagine that a hoax is involved. The witnesses give all of the outward signs of being extremely sincere: often they are emotionally upset by their recent experience. Frequently, their background and general competence seem to argue strongly against the idea of hoax. Furthermore, in sightings in which hundreds and even thousands of witnesses are involved (and a few such sightings are on record), one must reject the idea that all the witnesses were lying. If a hoax were involved, it would have to be the object itself.

Before completely eliminating this explanation, we must remember that a hoax can be amazingly effective. I saw the great Blackstone on a stage apparently pass a rapidly moving handsaw blade directly through the neck of an assistant in a trance. A block of wood below the neck was sawed in half amidst much noise and flying sawdust Yet this was admittedly a hoax. Would it be possible to some way cause an illusion in the sky which could completely fool hundreds of witnesses? I cannot absolutely say that it would not. On the other hand, in many cases, producing such an illusion would appear to be almost as great a feat as building a flying saucer itself.

One aspect of the UFO story does seem to be deeply involved in hoax. This is the so-called contactee cult. Many people now located over much of the world claim to have had direct contact with the flying-saucer people. (Adamski and Leslie, 1958; UFO International).

Perhaps the contactee is informed by mental telepathy that he should report promptly to a certain lonely spot in the desert. Upon obeying, he is met by a flying saucer whose occupants are, as a rule, beautifully humanoid and who. frequently take him into their confidence by allowing him to photograph themselves and their craft, inviting him in for a look at the control panels, and perhaps taking him for a quick spin, sometimes to Mars or Venus but best of all to the mysterious planet on the other side of the sun, unobservable from mother earth.

Everything about these stories seems to cry hoax. The proof is typically a series of photographs (which could easily be fraudulent) and copious quantities of pseudoscience. Someone who had really contacted visitors from another world should surely be able to do better than that. Why should visitors from another world bother with such obscure representatives of the human race, anyway? Their message is always that man must cease his wars or be destroyed, but why should such an important message be given to someone who is bound to be considered a liar when he delivers it?

It is interesting to consider the possibility that the contactees are genuine. When considering the UFO phenomenon, all sorts of wild alternatives come to mind. If the extraterrestrials wanted to be ignored by the scientific community on earth, they could hardly choose a better and more effective way than the delivering of profound messages to the souls who presently claim contact!

V. Secret Weapons

It is possible that secret devices being tested by earthly governments are misinterpreted as extraterrestrial machines. That this explanation might account for the phenomenon as a whole is, however, quite unreasonable. To begin with, the performances of the UFO's makes our present rockets appear puny indeed. Could any modern government suppress such a capability for nearly 20 years (since 1947)?

Most convincing is the fact that the UFO phenomenon goes way back into history. UFO enthusiasts, for example, often cite the first two chapters of the Book of Ezekiel in the Old Testament as an excellent example of a flying saucer sighting, (Menzel and Boyd, 1963, indicate that it was probably a sundog, but this is a far-fetched explanation for the details reported by Ezekiel.)

Vallee (1965) documents the sightings previous to 1947. He states that he has on file more than 300 UFO sightings prior to the 20th century, although he apologizes because he has never had the time to make a thorough search. He considers his cases to be only a small sample of those which might be available. They were carefully chosen for their high quality, roughly conforming to the criteria of good sightings described above. Some 60 of these 300 accounts occurred previous to 1800, and the remainder were recorded during the 19th century. The great majority of these more recent accounts were recorded in the scientific literature, particularly that of astronomy (often in the annals of the various astronomical observatories). It is important to emphasize that these are accounts which are not readily explainable as natural phenomena.

Classic, for example, are the observations in Nuremberg (April 14,1561) and in Basale (August 7, 1566) which have been analyzed in some detail by Jung (1959). Both of these sightings involved large inclined tubes in the sky from which spheres originated, an event occurring sometimes in more recent times (Vallee, 1965, cites 13 examples between 1959 and 1964). Spheres and discs appeared to fight each other in aerial dances. The inhabitants of these two relatively large cities observed this strange phenomenon for a long interval of time on the dates given.

A great attempt was made to consider the scientific accounts of the 19th century in terms of the natural universe. They were referred to as interesting cases of ball lightning or bolide meteors. Nevertheless, the descriptions are of discs and wheels and the like, and the behavior follows very closely that of the modern UFO. These "meteors" would move slowly, appear to hover, change directions, accelerate at great speeds, have an apparent diameter two or three times that of the full moon, etc. In one instance, called ball lightning, an object slowly emerged from the ocean, moved against the wind, hovered close to the ship from which it was observed, and then rushed away in the sky and disappeared in the southeast (for details, see Vallee's book, 1965).

Sightings during the early part of this century were relatively few. The so-called Miracle of Fatima (Vallee, 1965; Walsh, 1947), which took place on October 13, 1917, in a field at Fatima, a small village some 62 miles north of Lisbon, Portugal, is a fascinating tale, to say the least. Today it would be considered a contactee story, since three children were supposedly contacted at monthly intervals (always on the 13th of the month), beginning in May, by a beautiful, "transparent" woman dressed in white, who arrived in a globe of light. Following the first visit, other witnesses besides the children observed strange events (a buzzing noise, etc.), but only the children saw the "vision." At the time of the miracle itself, some 70,000 people were gathered in the field by Fatima to wait for the promised sign. It had been raining when suddenly the "sun" appeared through the dense cloud cover. It was a strange sun, however, looking like a flattened disc with a very definite contour, not appearing as a dazzling object, but rather having a clear, changing brightness which one could compare to a pearl. The disc began turning, rotating with increasing speed as the crowd began to cry with anguish. It then began falling toward the earth "reddish and bloody, threatening to crush everybody under its fiery wake." After an interval of dancing before the crowd, it retreated back through the clouds and disappeared forever. It would be difficult to imagine a sighting which fits the above criteria better than this one. It is also difficult to imagine that the Fatima "sun" was a secret weapon being developed by Russia or the United States!

Some Representative Sightings

Since the study of the UFO's must be based on the reports, let us consider a few sightings exemplifying various points.

1. The Arnold Sighting, Mt. Rainier, Washington, June 24, 1947.

Although Vallee (1965) calls our attention to a fascinating wave of sightings in Scandinavia during the summer of 1946, it did not occur to anyone at that time to consider these as extraterrestrial spaceships, but only as secret rockets being developed by Russia or the United States. The current sightings date back to that of Kenneth Arnold. Other better sightings exist for the same period, and even for several days before (as early as April), but Arnold turned his story over to the newspapers, the term "flying saucer" was coined, and the world's attention was focused on the phenomenon.

Arnold saw a formation of silvery discs flying from one peak or ridge to another around Mount Rainier in the state of Washington. By timing the elapsed period from one landmark to another, he was able to estimate their speed at not less than 1,200 miles per hour. Menzel and Boyd (1963) "explain" Arnold's sighting as a mirage brought about by inversion layers in the atmosphere which made the peaks appear to be separated from the mountains below them. Presumably, their apparent motion would be due to the motion of Arnold's airplane. A second explanation proposed by these authors is that Arnold saw the lens-shaped clouds which sometimes occur in the area. They present pictures of such clouds (which look exactly like lens-shaped clouds and not at all like the objects described by Arnold). They further cast aspersions upon Arnold's reliability as a witness by describing in some detail his subsequent actions in attempts to get publicity, etc. Arnold

is supported in his story, however, by the fact that it fits perfectly into the pattern of sightings during that period. Various authors (Hall, 1964; Lorenzen, 1962) have summarized these events, and among than a recurring theme is that of formations

of silvery discs. Such sightings are rare, or essentially absent, from the reports of more recent years.

It is interesting to wonder about how many apparitions of this type were observed and not reported. My wife's uncle, Mr. Earl Page, then a resident of Kennewick, Washington, had observed on July 12, 1947, a formation of six or eight silvery discs pass by his small airplane at fantastic speed. Mrs. Page and their son were present and saw the objects, which "fluttered as a group for a second or two, and then stabilized ... alternating between these two modes." The Pages were flying north over Utah Lake. Mr. Page told his story to a few friends who laughed at him, and from then on be mentioned it to no one.

Any one of the sittings of formations of saucer-like objects during the summer of 1947 could perhaps be dismissed from the mind. A large number of independent sightings, however, produces a pattern which is quite impressive.

2. The Chesapeake Bay Case, July 14, 1952.

This is one of the best documented sightings on record, involving extremely high speeds and a sharp change of direction (Fig. 3). First Officer William B. Nash and 2nd Officer William H. Fortenberry were flying a commercial plane from New York to Miami, approaching Newport News, Virginia. At 8:12 (just after dark) a brilliant red glow suddenly appeared in the west It was soon resolved as six coin-shaped objects flying in line formation. They glowed with a brilliant orange-red color on top, were estimated to be 100 feet in diameter and 15 feet thick. They moved rapidly toward the plane, at one point breaking slightly in their perfect formation as the second and third objects wavered slightly and almost overran the leader. They turned in unison on edge and reversed position in the formation, the last object moving up to the front position with the others following. They then abruptly reversed direction, moving off somewhat to the right with the original leader again in the lead position. The turn was executed almost like balls bouncing off a wall with no wavering or arc apparent. Two other objects raced out from beneath the plane and took up positions seven and eight in the formation. They decreased in brilliance just before making the

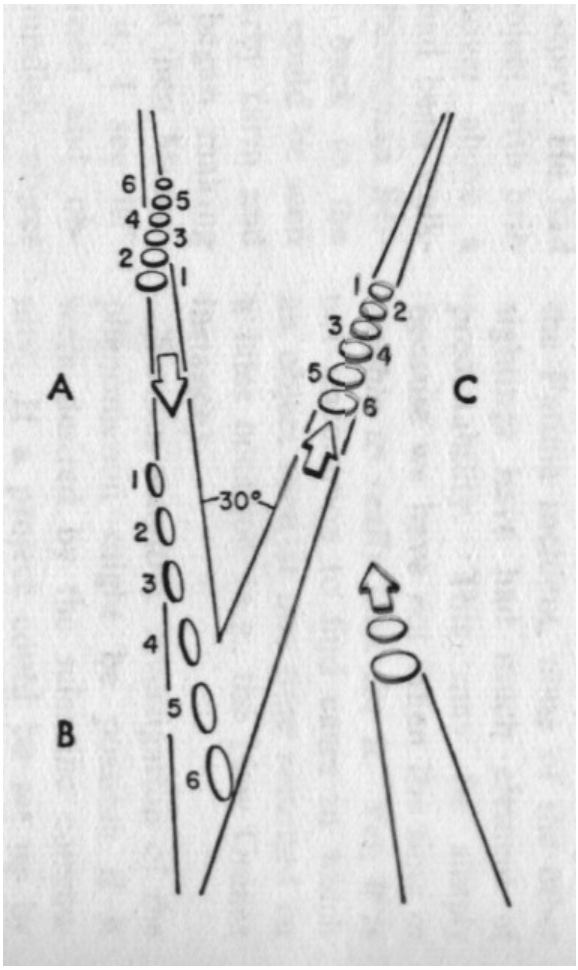

Fig. 3. Reported Actions of Chesapeake Bay Discs

turn; objects seven and eight were by far the brightest as they approached the formation; and for a brief interval or two all eight blinked out and then came back on again. They sped off, climbing to an altitude above that of the airplane, and then one by one but at random their lights blinked off and the sighting was finished. In repeating mentally their observation, the pilots estimated that it had lasted only about 12 to 15 seconds.

Menzel and Boyd (1963), after considering many possible explanations for the sighting, concluded that the pilots must have seen the illuminated discs produced by a red searchlight shining through nearly transparent thin layers of haze. Charles Maney (1965) corresponded with Menzel for several months, considering all of the possible explanations that might come to mind. Apparently Menzel would have readily accepted several explanations if Maney had not one by one clearly demonstrated their implausibility. The pilots themselves thoroughly rejected Menzel's searchlight hypothesis, saying that they were familiar with such phenomena, and this was simply not what they observed. The details described above are certainly difficult to reconcile with a searchlight hypothesis. The extremely short duration of the sighting, however, makes one question the absolute accuracy of the account. Did some points develop a bit with discussion and remembering? Furthermore, the velocities of the UFO's calculated at Between 6,000 and 12,000 mph through a dense atmosphere at 2,000 feet and including an instantaneous reversal in direction, are, to say the least, extremely difficult to fit into our present concepts of the universe. Light images could perform these maneuvers, but how could they perform some of the other maneuvers reported by the two pilots?

This case is presented as an example of the problems met by a UFO researcher. To solve a sighting such as this to everyone's satisfaction would require turning the clock back.

3. Trindade Island, January 16, 1958.

Figure 4 shows a photograph taken by a Mr. Almiro Barauna, a professional photographer, from the deck of the Almirante Saldanha, a Brazilian Navy ship. Several UFO's had been seen in the vicinity of Trindade Island (a Brazilian possession off the coast of Africa) during its reactivation as a naval base in connection with the International Geophysical Year. In the instance reported here, several sailors at opposite ends of the ship spotted the approaching object simultaneously and began to shout the news to everyone else. Soon the approximately 100 sailors on board, including various officers, were watching the object. Mr. Barauna was preparing to take some photographs and had his camera ready.

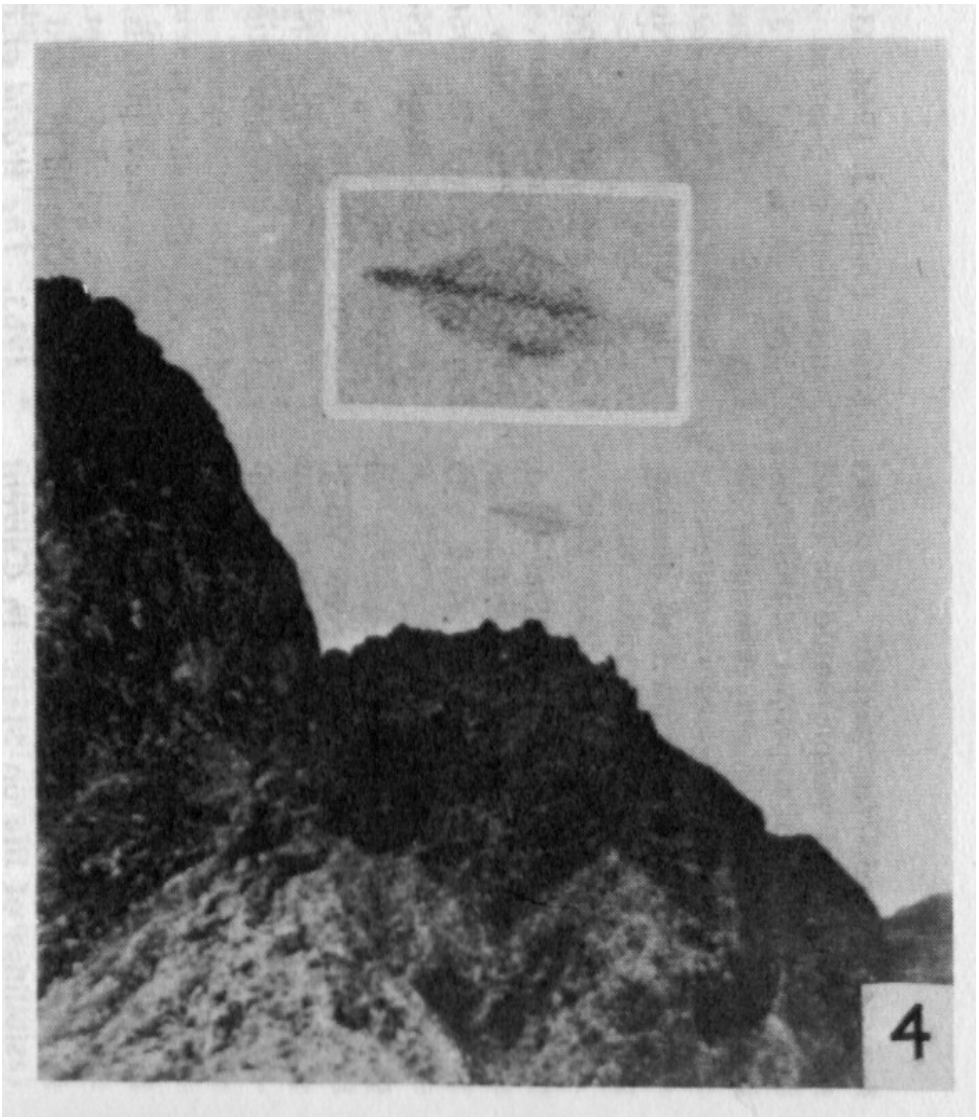

Fig. 4. Trinidade Island Photo

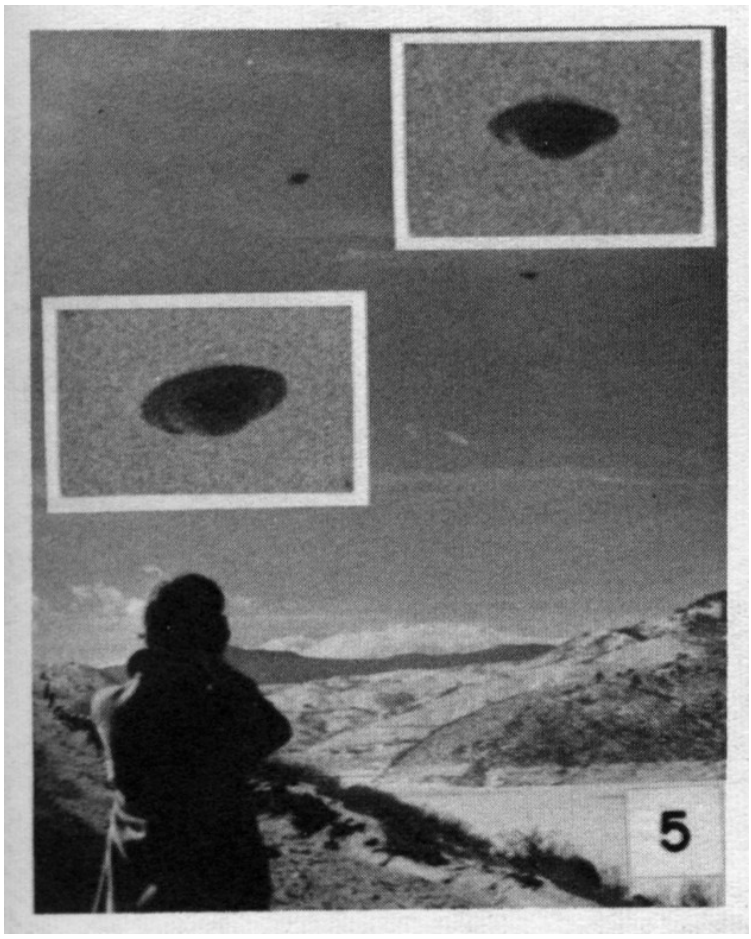

Fig. 5. Fake UFO Photograph

He shot six frames, of which two failed to show the object. He explained that due to the excitement be was bumped during these two and that they showed only the deck of the ship and the ocean. A darkroom was improvised below deck, the film was developed, and the minute object on it was identified by the sailors (Lorenzen, 1962).

This is an excellent sighting because of the number of witnesses involved and the excellent quality of the pictures (especially the third one, the one shown in the figure). Conventional objects can hardly explain the sighting.

Menzel and Boyd (1963) and apparently the United States Air Force consider the sighting to be a hoax. Of the available hypotheses, only this one and that of extraterrestrial machines seem to apply. The hoax explanation must also probably fail if the object was really witnessed by 100 sailors. Menzel and Boyd tell the story differently (their version is based on a report from astronomer friends of Menzel in Rio de Janeiro who did not personally investigate the incident), saying that only Barauna and two or three of his close friends claim to have seen the ob}ect. Yet newspaper reporters interviewed the sailors after the Almirante Saldanha landed several weeks later. I have received several reports on the sighting, including a personal conversation with Dr. Alavio Fontes, a medical doctor in Rio de Janeiro who investigated the case exhaustively. These reports fully support the version that virtually all the sailors witnessed the object.

Obviously, our evaluation of the story must hinge upon this aspect The photographs, although extremely convincing, could be fraudulent. To prove this I spent several days in an attempt to duplicate them and succeeded fairly well as indicated in Figure 5. We are still left with the question of the veracity of witnesses.

4. St. George, Minnesota, October 21, 1965.

Driving home from a hunting trip, Mr. and Mrs. Arthur Strauch and their son Gary (age 16), and Mr. and Mrs. Donald Grew, all of Gibbon, Minnesota, sighted a hovering object and got out to observe it. Binoculars were used, and Mr. Strauch took one photograph on an 804 Instamatic Kodak camera using Ektachrome X film. The photograph is shown in Figure 6 along with an artist's conception of the sighting. The object moved toward the witnesses almost directly overhead, making a high-pitched whining sound and traveling at very high speed. It disappeared in the southeast within seconds.

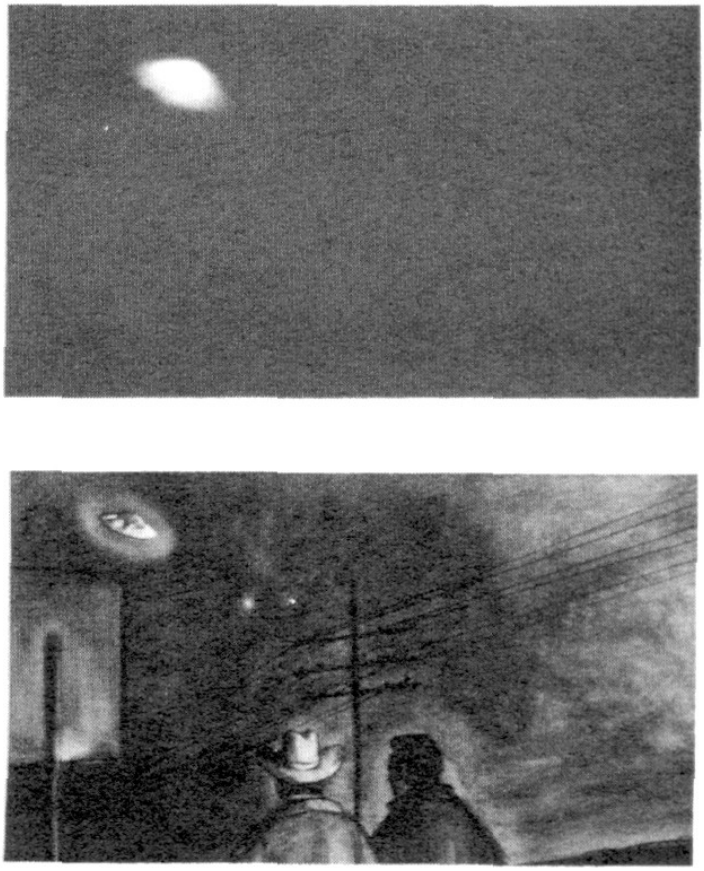

Fig. 6. St. George, Minn Sighting

Much detail was observed, several witnesses were present, ample time was available, a photograph was taken, and hence this instance meets the criteria nicely.

5. Socorro, New Mexico, April 24, 1964.

Patrolman Lonnie Zamora was following a speeder when he saw a blue flame to the southwest. He recognized the area as one which contained a dynamite shack and where teenagers sometimes tried to accelerate their cars up the steep slopes. He decided to investigate. Driving over a mesa (Fig. 7), he caught sight of something which he interpreted as an automobile standing on end with two children or small adults dressed in white clothing and standing by it. He radioed Patrolman Sam Chavez, asking for assistance, and continued down through a gully where he lost sight of the object. Coming up across the next mesa, he parked and got out of his car, moving toward the gully to see the object. It was immediately apparent that he was not observing an automobile wreck. There was a hemispherical object standing on four legs and suddenly an ear-splitting roar. Thoroughly frightened, he turned and ran, collided with the hood of his car, and then threw himself on the ground, noticing again that the object was rising in a slanting trajectory toward the southwest. As it rose, it displayed a blue flame.

Upon investigation of the site, four distinct, rather deep impressions were found in the ground where Zamora claims to have seen the landing gear. Two smaller round depressions were in the place where a ladder was placed, leading to a marking on the object which could have been a door. Bushes below where the object had been were burning. Detailed investigations were carried out by the Air Force and by several private flying saucer investigating groups.

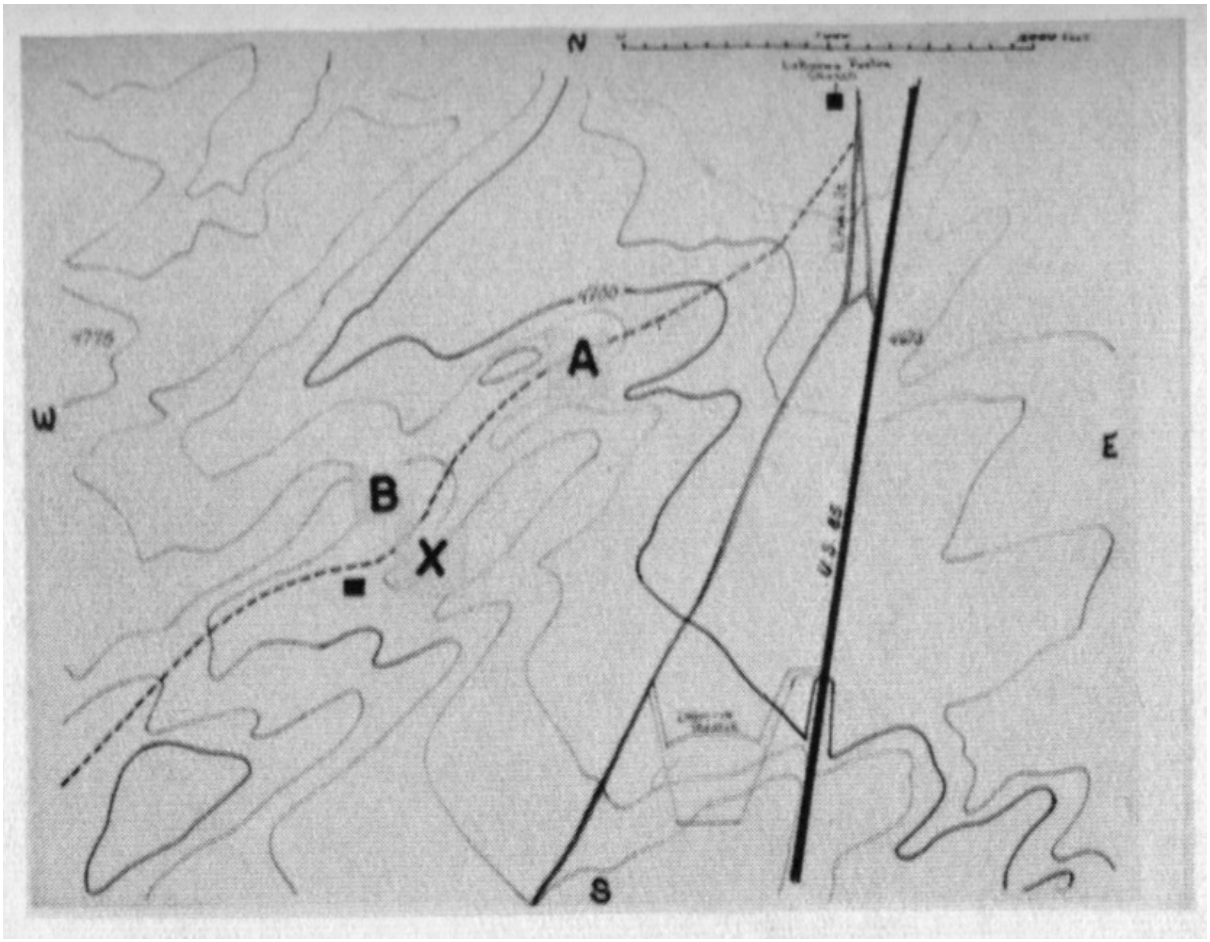

Fig. 7. Socorro N.M. Sighting: Terrain

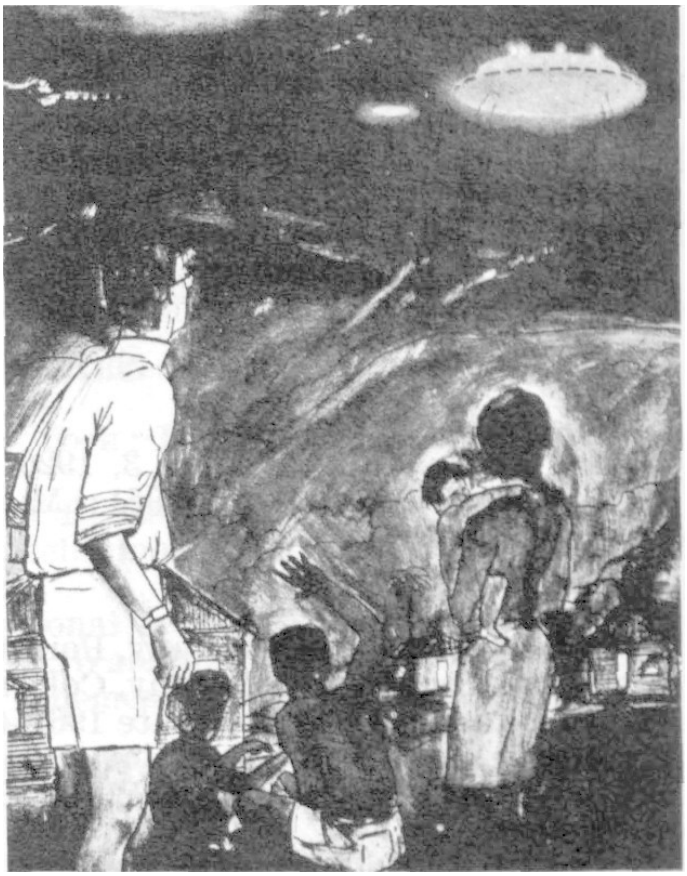
The sighting is a good one in terms of detail and primary evidence. A landing with observed humanoid "occupants" is also of interest. It is bad in only one respect: namely, that Zamora was the sole witness (one or two leads appeared, but other witnesses could never be located), but his apparent sincerity was impressive. Investigators studied the surrounding area for tracks of possible perpetrators of a hoax but could find none, although the ground was soft. The sighting is typical of many similar reports, particularly in France and Brazil, but occasionally also in the United States.

6. Boiani, New Guinea, June 26, 27, 1959.

Sightings were similar on both evenings. On the evening of the 27th, Father W. B. Gill, a teacher and missionary of the Anglican Church in New Guinea, came out of the dining hall at. 6:45 p.m., looked up and saw Venus and then the large sparkling object. While he watched, some 39 others joined him (five were teachers, two were medical assistants, the rest were natives; 28 adult witnesses signed a statement). The object and two others that hovered at a greater distance are shown in the figure (see p. 15) as an artist's conception (the witnesses had no cameras but made pencil sketches during the observation). As the UFO hovered nearby, Man-shaped forms appeared on the "top Deck" and seemed to be working on something. Occasionally, there was a bright blue, thin beam of light which projected toward the sky. The object itself had an orangeish cast, and the "men" appeared to be dressed in silver suits of some kind. The most seen at one time were four.

When one of the figures appeared to glance over the crowd. Gill waved his arm, and the figure returned the gesture. Gill and some of the natives then raised both arms, and two of the figures on the object did the same. The object came lower but did not land. The sighting lasted until 7:20 when the blue spotlight went out and the object moved into a cloud.



New Guinea Sighting

The witnesses, the time, and the detail make this an exceptionally good sighting, one of the best on record. The only available explanation other than the spaceship one would seem to be a complex hoax perpetrated by Gill and all of his associates.

7. Exeter, New Hampshire, September 3, 1965.

A remarkable sighting occurred rather recently in New Hampshire and was studied and documented by several UFO investigators but particularly by Mr. John G. Fuller, a columnist for the Saturday Review. He has assembled his results into book form (Fuller, 1966), and a preliminary account was published in Look Magazine (February 22, 1966). The sightings are remarkable not only because of their nature but in a very real sense because of Mr. Fuller's investigation.

The basic sightings occurred in the early morning hours (about 2:00 a.m. to 4:00 a.m.). Patrolman Eugene Bertrand of Exeter had checked on a parked car and found a woman who told him that a huge and silent airborne object had trailed her from the town of Epping 9 miles away. The object had brilliant flashing red lights and kept within a few feet of her car. Developing tremendous speed, it had disappeared among the stars. The patrolman could not believe the story and had not even taken the woman's name.

When Bertrand checked into the police station, Norman Muscarello had just arrived and told his story. He had also seen a large dark object with brilliantly flashing lights hover above a field through which he had been walking on his way home. Patrolman Bertrand accompanied him back to the scene. Although nothing could be seen at first, horses on a nearby farm and dogs in nearby houses began making a great deal of noise, and then Muscarello screamed, "I see it, I see it!" Patrolroan

Bertrand turned and observed the brilliant roundish object moving toward them like a leaf fluttering from a tree. Its red lights along the sides were so brilliant that the entire area was bathed in light. It came within about 100 feet of the two witnesses, hovering with a rocking motion, absolutely silent. The lights seemed to be dimming or pulsating from left to right and then from right to left, taking about 2 seconds for each cycle. The lights were so brilliant that it was difficult to make out the shape of the object itself. It darted, turned rapidly, slowed down, and performed other such maneuvers.

Patrolman David Hunt had heard the radio conversation between Bertrand and the station in Exeter and drove to the site, witnessing the object for a few minutes before it disappeared, A B-47 flew over shortly after, providing an extreme contrast to the object which they had previously witnessed.

In Fuller's study of the case, he was able to find some 60 different people who had witnessed similar objects over a period of several days or weeks in the fall of 1965. Muscarello was so impressed by his sighting that he and his mother waited on a mountainside nearly every evening for 3 weeks following the event. On one of these evenings, they again witnessed the object. Other people in the area would park by high tension lines (in the Exeter sightings, the objects were frequently associated with power lines) and watch for the objects, occasionally being rewarded with the sight of one.

This sighting is not only a good one because of the detail, the number of witnesses, and the several occasions involving comfortable intervals of time, but it adds one other extremely encouraging note. If Muscarello and other New Hampshire residents could go out and watch for the objects, occasionally being able to see them, why couldn't properly equipped scientific investigators do the same? Except for the Fatima incident, none of the other sightings have had much element of predictability. This may be simply because we have not taken the time or trouble to really look for it. Yet, it is not uncommon to find cases in which an object seen at one time returned on a later occasion (e.g., the New Guinea instance).

Serious scientific investigation of the phenomenon might be possible if it were desired by the scientific community. If a project could be set up by a number of scientists, it might be feasible to have everything in readiness for another wave of sightings such as that at Exeter or the subsequent one in the Michigan swamps. When such a wave appeared (and the proper kind of publicity might help in detecting it -- although it could also contribute to the generation of a wave of fraudulent sightings), the team of researchers might converge immediately upon the area and carry out some sort of previously planned program of investigation. If the investigators themselves were too

busy to remain for periods of weeks to months, local people could be hired and trained in the proper techniques, Such a procedure might eventually reward us with the kind of tangible data with which science is used to dealing.

Unidentified Flying Objects: An Historical Perspective

American Society of Mechanical Engineers
Design Engineering Conference
George W. Earley
Americana Hotel, New York City
May 15-18, 1967

Abstract

The paper presents an examination of the overall UFO scene during the past 20 years. Several representative unsolved sightings reported in the United States are summarized and the global nature of sighting reports is discussed. Brief mention is made of pre-2Oth Century sightings. The activities of hoaxers, psychotics and liars-for-a-profit are outlined. Attitudes towards sightings and the investigatory efforts of the USAF are examined.

Possible explanations of the causes of UFO sightings are summarized and the hypothesis that some UFO's may be extra-terrestrial vehicles is advanced.

In conclusion, some general suggestions are advanced for more effective studies of 'the UFO phenomenon.

In opening, I'd like to thank the sponsorsof the Design Engineering Conference for inviting me to New York and giving me the opportunity to speak to you all this evening. My topic is a highly controversial one; and controversy particularly when it grows out of opinions directly opposed to governmental agencies - seems to be a dirty word much too often these days.

Now - the things that I have to say, and the things that you all have read and heard about flying saucers will doubtless raise questions in your minds. Fine. I will be happy to answer as many as I can in the time available following my talk.

But first - a word from my sponsor. I am here this evening as a representative of The National Investigations Committee on Aerial Phenomena, NICAP - a privately supported, non-governmental UFO investigatory organization with headquarters in Washington, D.C. NICAP was formed in 1956 to provide a place where persons could report UFO sightings without being subject to ridicule or harrassment. Aided by its Sub-Committees and Affiliated groups, NICAP endeavors, to the best of its ability, to investigate in a scientific manner UFO reports made to it. Operating funds come from member dues - $5 annually for which the members receive six issues of the UFO Investigator, an 8-page newsletter of current UFO events. In July of 1964, NICAP published the UFO EVIDENCE, a documented study of over 7OO UFO cases from NICAP's files. NICAP membership, over ten thousand at present, encompasses a representative cross section of our population. The Board of Governors and Panel of Special Advisers includes scientists, engineers and professional people in a variety of fields. Many of these men have earned doctorates in their specialty.

In the 20 years since the term came into existence, flying saucers have become a scientific controversy second only to the famed Canals of Mars. And, like the Canals of Mars, the term flying saucer is a misnomer created by the press. On June 24, 1947, while flying his private plane in the vicinity of Washington's Cascade Mountains, Idaho businessman Kenneth Arnold observed 9 objects flying near Mount Ranier and Mount Adams. "They flew", Arnold told newsmen, "like a saucer would if you skipped it across the water." [1] Arnold's saucers were not disc shaped, but resembled a crescent moon. The press, however, called them flying saucers, and the name stuck. In addition to the disc or saucer shape, other aerial unknowns have been described as having a cigar, rocket, or fuselage-without-wings shape. Arrowheads or flying triangles have also been reported, with Arnold's crescent shape and a rubber-heel shape also being reported in much less frequency. Because it was felt that the term "flying saucer" was misleading, the Air Force and the majority of other investigatory groups prefer the term Unidentified Flying Objects. A sighting is called a UFO when "the description of the object and its maneuvers could not be fitted into the pattern of any known object or phenomenon."

Once Arnold's sighting hit the press wires, other sighting reports began to make the papers. It wasn't long before people were seeing saucers, hubcaps, sausages, and all manner of peculiar looking aerial objects. About this time, the USAF began to take an interest in flying saucers, but no official conclusion was released until early 1949. Of course individual

Air Force officers had voiced opinions, but they had not been representing any official investigatory group. The report released April 27, 1949, stated that 270 sightings had been investigated, including 30 from foreign countries and that 40% could not be explained. Since that time, according to subsequent Air Force press releases, 11,107 sightings have been investigated through December 31, 1966, with about 10% of this total still unidentified.

This, of course, does not take into account innumerable sightings made in foreign countries, as well as sightings made in this country and not reported to the USAF.

I might digress a moment to note that reports of strange aerial phenomena are not peculiar to the post WW II period. As NICAP staffers Lore and Deneault have shown [2], scores of unexplained sightings were reported prior to the 20th century by astronomers and other scientifically trained observers. However, coming back to the recent past - just what have people reported during the past two decades? How reliable are the sighters? I'll recap briefly some of the more outstanding sightings.

In 1956 a Navy Super-Constellation transport was flying west across the atlantic, carrying aircrews returning from overseas duty in Europe. Nearly 30 men were aboard - pilots, navigators, flight engineers. The night was clear, visibility unlimited. The Connie was cruising at 19,000 feet. Next stop, Gander, Newfoundland; final destination, the Naval Air Station at Patuxent, Maryland. Glancing down, the pilot saw a collection of lights where only open seas should be. The radio man reported no signals from below, and that no ships were scheduled to be bunched in the area. Curious, the pilot put the plane into a circle to examine the lights better. As they circled, the lights dimmed, and then they saw several colored rings appear and begin to spread out. It was then noticed that one ring was rushing up toward the plane. The pilot rolled out of his circle and tried to climb away, but the ring outclimbed him, reached their altitude, leveled off, and raced towards them. Then they realized that the ring of light was coming from the rim of a huge disc-shaped object. By this time, all men aboard were wide awake and watching out the windows. The disc raced toward the plane, flipped on edge, and angled past the port wing tip; then slowed, reversed course, and paced the plane off the port wing. The observers agreed that it was about 30 feet thick and 350 - 400 feet in diameter, with a blurred uneven glow from the rim. The glow was sufficient to show the disc's curving surface. The pilot held to a straight course, while the disc slowly drew ahead, then tilted upward, accelerated sharply, and was lost in the night sky. The pilot called Gander Airbase at once and asked if they had seen anything on the radar. Gander replied that they had had something on the scope along side the Connie, but that the unknown had not answered radio queries. The time it took the disc to get up to the Connie indicated a speed of 1600 mph or more. The speed it made climbing away was estimated at that or greater.

After landing at Gander, all personnel were thoroughly interrogated by Air Force Intelligence personnel. "They asked lots of questions, but gave us no answers," one Navy man grumbled later. When the Connie finally reached Patuxent Naval Air Station, the air crews were again interviewed, and they furnished Naval Intelligence with written statements as to what they had seen. Several days later the pilot was contacted by a scientist in another government agency who wished to talk to him about his sighting. After getting the necessary clearances, the pilot said okay. The scientist showed up, had the pilot go over his sighting again, and then unlocked a dispatch case, pulled out some photographs, and asked the pilot if the object he had seen resembled any of the pictures. The pilot picked out one as being virtually identical. The scientist thanked him, locked up the pictures again, refused to answer questions and left. The pilot, needless to say, was - and still is - a frustrated and bewildered man. [3]

Here's a case which occurred near an Air Force missile site. On August 25, 1966, the officer in charge of a North Dakota missile crew, based in a concrete capsule 60 feet underground, suddenly found his radio transmission interrupted by static. At the same time that he was trying to clear up his problem, other AF personnel on the surface, reported seeing a UFO - described as a bright red light - apparently alternately ascending and descending. A surface AF radar installation also reported tracking the object at an altitude of 100,000 feet. The report of the base operations director stated "when the UFO climbed, the static stopped. The UFO began to swoop and dive. It then appeared to land ten to fifteen miles south of the area. Missile-site control sent a strike team (well-armed Air Force guards) to check. When the team was about ten miles from the landing site, static disrupted radio contact with them. Five to eight minutes later the glow diminished, and the UFO took off. Another UFO was visually sighted and confirmed by radar. The one that was first sighted passed beneath the second. Radar also confirmed this. The first made for altitude toward the north, and the second seemed to disappear with the glow of red." [4] Still unsolved, the case is termed by Dr. J. Allen Hynek as "typical of the puzzling cases" he has studied in his 18 years as the Air Force's scientific consultant on UFO's.

One of the best radar confirmed sightings - so stated by Captain Ed Ruppelt, [5] who headed the Air Force saucer investigations for several years - occurred near Rapid City, South Dakota, the evening of August 12, 1953. The events of that night started out like this. Shortly after dark, a woman spotter of the local Ground Observer Corps rang up the Air Defense Command radar station at Ellsworth AEB just east of Rapid City, and reported an extremely bright light to the northeast. The radar swung to the area the spotter had designated, and picked up a solid blip moving slowly. The heightfinding radar also picked it up and established the UFO at 16,000 feet. The warrant officer on duty at the radar station got a direct wire to the spotter, and they compared notes for about two minutes. In the middle of a sentence, the woman suddenly said that the object was starting to move towards Rapid City. The radar scope confirmed this, and the warrant officer sent two men outside for a visual check. They reported a large bluish-white light moving toward Rapid City. The three groups - the radar people, the outside men, and the woman spotter - watched the UFO make a swift sweep around Rapid City and then return to its original position. The warrant officer then called a jet fighter on patrol and put him on an intercept course. The light was still at l6,OOO feet. The pilot spotted the light visually, and had moved to within three miles of it, when the light took off north towards the Badlands. The pilot followed it 120 miles, with the light staying a couple miles ahead; and then, with fuel running low, the jet returned - with the UFO trailing him!

The jet squadron at the air field then stated that they were scrambling another F-84, with a skeptical combat veteran of World War II and Korea at the controls. Once he was airborne, radar worked him toward the UFO. The pilot quickly reported visual contact, and maneuvered to get above the light. The light headed northeast, with the F-84 behind but several thousand feet above it. The pilot, even though getting radar reports and seeing the light, was still skeptical. Once away from the Rapid City area, he turned off all his lights to see if it was a reflection on his canopy. The light was still there. Next he rolled his plane, to see if some unnoticed ground light was causing it. The light's position didn't change. Next he checked its motion against three bright stars - it moved with relation to them. He then figured, if it is real, my gunsight radar should pick it up. He activated his gun cameras, turned on his radar and got a solid blip. At this point he got scared - and remember, this was a man who'd fought Hitler's best airplanes and tangled with Mig 15's over Korea. But that large, bright, bluish-white light was more than he cared to chase any longer. He requested and received permission to abandon the chase. The UFO headed off toward Fargo, North Dakota, and a check minutes later showed that spotter posts between Rapid City and Fargo had seen and reported a fast-moving, bluish-white light. So there you are - two serial visuals, an aerial radar lock-on, two ground radar sightings, numerous ground visuals from several locations, and gun camera film which, when developed, showed a blurry object. No details - just a light source.

On April 224, 1964, near Socorro, New Mexico, shortly before 6:00 p.m. local time, Patrolman Lonnie Zamora was chasing a speeding car. [6] Seeing and hearing what he then thought was a dynamite shed exploding, Zamora abandoned the speeder and drove over a rough, dirt road towards the apparent impact spot. Briefly, during his approach, he saw a shiny object about the size of an overturned car. Beside it were two "man-like" figures in white - no details of hands, feet or face were visible. Based on a nearby bush, later measurements indicated that the figures were about 4 and a half - 5 feet tall and that the bottom of the object was about the same distance above the ground. Because of intervening hills, Zamora lost sight of the object and when he again had it in view, the figures were gone. Parking about 150 feet away, he began to approach the object on foot when it suddenly began to spew flame from its underside. Believing it was about to explode, he ran the other way. When the noise ceased, he looked back and saw it fly away, narrowly missing a nearby dynamite shed. Investigators from nearby military installations, local police, NICAP representatives, and Air Force investigators from the Air Technical Intelligence Center in Ohio and Northwestern University thoroughly examined the scene. Several depressions, apparently from the object's four legs, were found and nearby bushes and grass appeared to have been seared by intense heat. Soil samples were taken but no traces of fuel residues were found following laboratory tests. Zamora's reliability and integrity are unquestioned and the Air Force still carries the sighting as one of an unidentified vehicle. [7]

Of course, these are only four of many similar outstanding UFO sightings from all points in the USA. But sauceritis is not a peculiarly American ailment. Radar reports, visual reports both day and night, and combined radar-visual reports have also been received from British, French, Australian; Italian, Belgian, and other foreign sources. For example, in November of 1962, the Argentine Embassy in Washington, D.C., furnished NICAP with official reports of UFO sightings made by Argentine Navy pilots. Argentine Navy Captain Luis Moreno informed NICAP that the Argentine Navy had been constantly concerned about UFO's for the preceding 10 years. [8] Representative accounts of puzzling foreign sightings can be found in The UFO Evidence as well as in the works of the French mathematician-astronomer

Jacques Vallee. [9] And, of course, even the Russians got into the act - they said that saucers were all a capitalistic hoax designed to keep up the production of war material. [10]

As is often the case with sweeping Russian pronouncements, there is a grain of truth in this one - there have been saucer hoaxes. Some have been of the practical joker variety - cardboard or aluminum discs stuffed with junk radio parts and lit up by railroad flares. One man, to win a bet, bought, chloroformed, shaved, and ran over a monkey, which was then passed off - until a vet queered the game - as a man from Mars. Numerous people have claimed contact with space people - some even claim to have ridden in saucers. I know a man near Pittsfield, Massachusetts, who claims that there is a saucer base under the Berkshire mountains. None of these contactees have presented any verifiable proof and most have declined to take lie detector tests. Several hoaxers have gone after money and apparently done pretty well. A few years ago, TRUE magazine reported on Otis T. Carr, a one time elevator operator and hotel night clerk, who has reportedly acquired several hundred thousand dollars from trusting souls who think he has an engine and spaceship that will revolutionize present day propulsion techniques. [11] Frankly, I wish he really did - I'd like to go space travelling myself but based on present day planning, it doesn't look possible for many years. So, hoaxers, psychotics, and liars-for-a-profit are with us, and have contributed quite a bit to fogging up the UFO question. That, however, is no excuse for failure to conduct a proper investigation.

Now - what has the Air Force done in the field of UFO investigations? The answer is, surprisingly little. There have been innumerable press releases telling of all the studies that have been conducted, of investigations and the like; but when you look closely at the record, you see that very little has really been done. For example, even at the height of the UFO sightings, there were never more than three or four men permanently assigned to investigate UFO's. Investigations were usually made long after a report, and the investigators often seemed more interested in seeing how they could explain away the sightings than in getting all the facts from the witnesses. Airline crews have been accused - anonymously - of being drunk on duty. Radar sightings have been passed off as resulting from temperature inversions, even when weather-bureau records did not bear out such a claim. There have been several instances when UFO sightings have apparently resulted in a rapid and substantial increase in background radioactivity, but the USAF has made no attempt to set up any radiation-detection stations in areas where there have been repeated sightings over the past 14 years. NICAP has offered to sit down with the Air Force and review the reports in NICAP's files and to publicly correct those disproved by the Air Force. [12] The Air Force, however, refused such joint meetings and insisted that NICAP furnish its data for secret review. Results released following such secret reviews would not include any basis on which to evaluate the validity of the Air Force conclusions. These are but a few examples. The overall record is worse; and speaking as an ex-Air Force officer, I can only say that I have no confidence in the Air Force UFO investigation program to date.

Criticism of the Air Force position, as well as the position held by far too many of his fellow scientists, has recently come from Dr. J. Allen Hynek, the chief civilian consultant on UFO to the Air Force. Dr. Hynek, head of Northwestern University1s Dearborn Observatory, stated flatly: "No true scientific investigation of the UFO phenomena has ever been undertaken, despite the great volume of hard data... we should put as much effort on one of these puzzling cases as we would on a Brinks robbery or a kidnap case. [13]

In fairness to the Air Force, it should be noted that they are finally coming to realize that their attitude has tarnished their image in the public eye. A civilian scientific review committee was convened in February, 1966, by order, not of the Director of Aerospace Research, but of the Director of Public Information! This civilian scientific panel, while it did not endorse the possibility of extra-terrestrial visitors, did make strong recommendations that the Air Force substantially increase its UFO investigatory teams and solicit aid from the scientific community to more adequately examine both future and past UFO reports. [14] NICAP is fully in accord with such recommendations - indeed, a full-scale scientific investigation on a global basis has long been one of our major goals. In Dr. Hynek's words "Instead of having UFO a synonym for crackpot and ridicule, let's make it scientifically respectable." [15] We know that more and more scientists are willing to discuss the subject of UFO's "off the record" but we sincerely hope that more will follow the example set by Dr. Hynek and by NICAP's own scientific advisers. And, of course, we also hope that the recently begun 15 month study program, funded by the Air Force but to be conducted independently by the University of Colorado, will be the beginning of a full scale, impartial scientific investigation of UFO's. We, quite frankly, see this study as vindication of our long held position that the Air Force investigatory program has been both inadequate and unscientific.

All right - we've looked at some reports of UFO's, and some attitudes towards reports Now, the inevitable questions that arise are, just what are these UFO's and where do they come from? It has been suggested that they are:

1. Secret Russian devices based on German devices obtained after World War II,

2. Secret American devices in the missile and/or aeronautic fields,

3. Misinterpretation of various conventional objects such as stars, planets, birds, weather balloons, insects, meteors, airplanes, vapor trails, etc., etc.

4. Interplanetary space ships from outside our solar system.

Let's look at each of these suggestions. The Russian and American origin suggestions can be disposed of together. If the UFO's were of Russian manufacture, this meeting would be sponsored by Soviet Society of Mechanical Engineers and I'd be a visiting Commissar lecturing on Applied Marxism. And if the UFO's were American - well, we wouldn't be spending 13 million dollars per day on Project Apollo.

After all, the speed and maneuverability displayed by these UFO's calls for propulsion systems far in advance of anything we now have. The entire vehicle represents, in terms of present earthly knowledge, a tremendous technological break-through. Such a break-through would be quickly reflected in hundreds of allied fields, as well as in fields never dreamed of before. Look at the applications of nuclear energy since 1945 - even the most imaginative science fiction writer never dreamed, before Hiroshima, of all the applications that would be found in less than 20 years. The break through required to create a terrestrial UFO would have even more far-reaching effects.

Misinterpretations? These already account for a large number of the many sightings of UFO's. Perhaps 80% of those investigated by the Air Force to date. There's no denying that many people have been fooled by balloons, meteors, high-flying airplanes, the planet Venus, peculiar vapor trails, and the like - and thought they saw UFO's.

Glowing clouds, resulting from chemicals released hundreds of miles in the air by NASA rockets, have caused UFO reports. So have re-entering space satellites as well as oribiting satellites seen under peculiar atmospheric conditions. These, like the other misinterpretations already mentioned, can be readily explained. They do not, however, explain the sightings I spoke of earlier nor do they explain the hundreds of still unsolved reports made to the Air Force, to NICAP, and to other UFO investigatory groups over the past 20 years.

So we are left with the Interplanetary theory. And when I say "we", I include not only myself and the majority of the Board of Governors of the National Investigations Committee on Aerial Phenomena, but also many officers of the USAF, innumerable pilots and aircrewmen - private and commercial, foreign and domestic - many eminent scientists, missile experts, and just plain people. Speaking for myself, I accepted this theory only after examining the UFO question for over a dozen years. No single sighting report led to my acceptance of this hypothesis, but rather the ever growing accumulation of reports by reliable and trained observers. I have never seen a UFO, but as Dr. J. E. McDonald put it, the idea of extra-terrestrial vehicles seems to be "the least unsatisfactory hypothesis for... the intriguing array of credibly reported UFO phenomena that are on record" [16] - reports such as those mentioned earlier in this talk.

Now - regardless of your feelings as to the validity of the extraterrestrial hypothesis, I would hope that we are in general agreement that "something" has been seen and that the recurrence of such reports from reliable observers over the past two decades requires a more extensive investigation than has taken place heretofore.

With that thought in mind, then, I want to conclude by outlining some ideas on what is needed in the way of a more thorough investigation. Let me say too, that these ideas are not just mine but are a synthesis of those of Hynek, [17] Vallee, [18] LeBlanc, [19] the NICAP staff and other sources.

1. Sighting stations should be established on a global basis These could either be new stations or existing stations, military or scientific, which have been supplied with detailed instructions and instruments to provide for standard observations and records. Photographs, spectrographs, data obtainable by broad band radiation detectors, etc., should be secured if possible.

2. The data on hand, as well as future data secured by field investigations on standardized report forms, should be computerized so that new reports can be rapidly and accurately compared with older reports and trends and patterns in sightings quickly identified.
3. Policemen, civil and military pilots, and others whose jobs keep them outdoors for long periods of time, should be equipped with good cameras and trained in their use. Service or civic clubs could, perhaps, furnish such equipment to their local police.
4. Anthropologists, archeologists and other students of the past should carefully study the legends of ancient peoples to determine if contact with extra-terrestrial beings may not have already occurred. Harvard astronomer Dr. Carl Sagan [20] recounts a legend concerned with the rise of the Summerian civilization (4000 B.C.) which is suggestive of such contact and is certainly deserving of further study.
5. Sincere, qualified amateur groups should be encouraged to assist by researching past cases, delving into newspaper files and similar historical documents. Such searches have already turned up much useful data on older sightings; there is little doubt that much more data remains to be dug out. Such research, however, would need to be coordinated by the official group to prevent duplication of effort. Other qualified amateurs, such as ex-military intelligence personnel, could assist in field investigations of current sighting reports. Again, coordination with the official group would be necessary.

Finally, assuming that the efforts outlined above warrant the expense, serious thought should be given to the building of a "saucer trap", not to "capture" physically but to "trap" information by instruments. Many apparently reliable reports have commented on the seeming "curiosity" of UFO's about the works of man. It would seem possible that a large installation, built with a maximum of clearly visible activity and located in an otherwise barren area, might attract the attention of UFO's. If such an installation were equipped with all manner of detection and recording apparatus capable of covering the entire visible, audible and electromagnetic spectrum a wealth of valuable information might be obtained.

All of the above, of course, presupposes a willingness on the part of the scientific community at large to examine the entire UFO question with open minds, devoid, insofar as possible, of emotion charged prejudgment that the entire subject is "utter bilge". [21] It is the hope of all of us in NICAP that the Condon study group will be the beginning of a major change in attitude toward the study of UFO1s by the scientific community.

National Investigations Committee On Aerial Phenomena

What To Do With Sturrock?

Robert J. Durant

July 28, 1998

.

Public opinion polls show that over 50% of adult Americans think UFOs are "real," over 70% think the government is hiding information about UFOs, and 40 % think that the government is concealing information proving the existence of UFOs, presumably hardware or bodies. Only one out of three are skeptics.

Those are extraordinary numbers. They mean that more Americans believe in UFOs than the number who voted for Reagan or Bush or Clinton. Roman Catholics are the largest religious denomination in the U.S., and the UFO "believers" outnumber them two to one. Fundamentalist Christians comprise about 10% of the population, and exert a huge influence on the Congress. UFO "believers" outnumber them by five to one.

Almost without exception since the press began reporting the UFO story in 1947, journalism has demeaned the topic and those who take it seriously. The climate of ridicule surrounding the UFO phenomenon has prevented meaningful activity by those elements of our society in a position to study it. I mean, the scientific and academic communities. UFO research has been pushed into a tiny backwater, unfunded and without the resources that are automatic in every established discipline.

There are some "good" reasons why scientists steer clear of UFOs, but the "bad" reasons are the overwhelming rule. This is a cultural issue, not a scientific one.

When 70% of the population believes its government is engaged in a program of systematic deception on a topic of such fundamental importance as UFOs, this presents an ominous social issue. Regardless of one's belief about the "reality" of UFOs, this fact alone should militate for an open study. This is not a "scientific" reason for such a study, but in a society increasingly alienated from its ruling institutions, it is nevertheless a compelling reason.

A related topic is the Search for Extraterrestrial Intelligence. It consists of a search for radio signals, and from the outset the practitioners have made extraordinary efforts to distance themselves from UFOs. SETI began in 1959. Thirty nine years later, they have not a single piece of data. Yet they continue to spend lavishly, using the taxpayer's money at a rate of 11 million dollars per year until that was cut off, and then raising a similar sum from private sources. In fact, most SETI funding is still begged, borrowed and stolen from publicly funded programs.

Contrast SETI with the UFO situation, in which we have no funding at all -- and a mountain of data.

Several central figures in SETI recently appeared on National Public Radio as part of their continuing public relations campaign. They complained that the UFO issue is always raised when they speak to the public. Apparently Mr. and Mrs. America are so stupid that they assume their money is being spent in a

real search for extraterrestrial intelligence, not just the absurdly narrow search for radio signals. So much for the unwashed, or so I gathered from listening to the boffins.

I said that journalism has ridiculed UFOs, almost without exception. The exceptions are quite instructive. The first instance was the Air Force "swamp gas" explanation for a series of sightings. For reasons that escape me, the press suddenly came to life, denouncing not UFOs and UFO observers, but the Air Force for this preposterous claim. Newspapers throughout the country wrote editorials making fun of the Air Force, and published clever cartoons skewering the Swamp Gas officials.

The second instance is recent, and that is the postscript Air Force "explanation" for Roswell. I refer to the "crash dummies," and the ensuing furor in the press, nearly all of it denouncing the Air Force.

Almost on the heels of the "dummy" paroxysm, we have the Sturrock Report, which was on the front page of most newspapers, including such important journals as the Washington Post and the Atlanta Constitution. The story was played "straight," meaning without the usual attempts at demeaning cleverness. A panel of real scientists had concluded that UFOs deserve serious study. (That's what the press said, and it is a telling and unfortunate thing that ufologists have ignored that message, opting instead to engage in endless nit-picking of what the Panel did or did not write.) This was not just "news," it was front page news, and it was a huge vindication not only for ufologists, but for the great majority of the American public.

The first instance in which the press sided with "us" resulted in a congressional inquiry and then in the establishment of the Condon study. Such is the power of this topic when combined with a "good press."

Politicians would much rather be called crooks than fools. That is why the favorable press treatment of UFOs is critical. Without fear of ridicule from the press, the politicians will hasten to pander to the public's enthusiasm for UFOs.

The Sturrock Panel story closely following the "dummy" fiasco, combined with the intense public interest and belief revealed by public opinion polls, should set the stage for action on Capitol Hill. What is past is prologue.

My suggestion for putting the Sturrock Report to practical use is to meld all of the factors listed above, and use them to mount a public relations campaign of our own. The target should be the Congress. The goal should be to set up a long term study of UFOs. This time around we know how NOT to do it. For example, don't put a known crackpot- debunker in charge of the study.

Most Senators and Representatives would endorse such a study. In fact, "studies" and "commissions" are the politician's dream come true. This is a time-honored way to evade and avoid making hard decisions. At the same time, it gives the public what the public plainly wants -- the appearance that something worthwhile is being done about UFOs.

President Clinton would welcome anything that might put his other problems on page two. A UFO Commission would also get Laurance Rockefeller off Clinton's back.

But with just a little bit of luck, a genuine inquiry can be made, using the federally funded resources required for this awesome task, but that are forever beyond the grasp of civilian ufology.

I would commend, mainly as a public relations trick, that we demand that half of all current SETI funding be allocated to UFO research. This will certainly make good sense to the taxpayer, and to the press, and therefore to the politicians, and it will panic the SETI crowd and their fellow-travelers. The panic will probably result in a "political" settlement in which ufology gets the grudging support of the SETI folks in return for being allowed to continue their strange hobby, though on a somewhat reduced allowance.

Several years ago I was browsing in a Government Printing Office store, where I found a NASA brochure on SETI. It was elaborately printed on fine paper and in color, and seemed written for the seventh grade student needing something for a "report." I wrote to NASA inquiring about what the brochure cost. They replied: $76,000. This is chump change to NASA and the SETI crowd, but a fortune to ufologists. It would pay for half a dozen very worthy projects in this field.

An attack on the "radio only" SETI program, and a demand for a piece of their funding, would find great favor with the public, and with talk show hosts, and eventually with the politicians in Washington who can fund UFO research. The tale of the SETI brochure can be used to great effect in these forums.

The politicians are not likely to take the initiative. But I predict that they will eagerly take the bait if it is offered to them in a concrete proposal. The UFO Coalition can do that, and should begin at once.

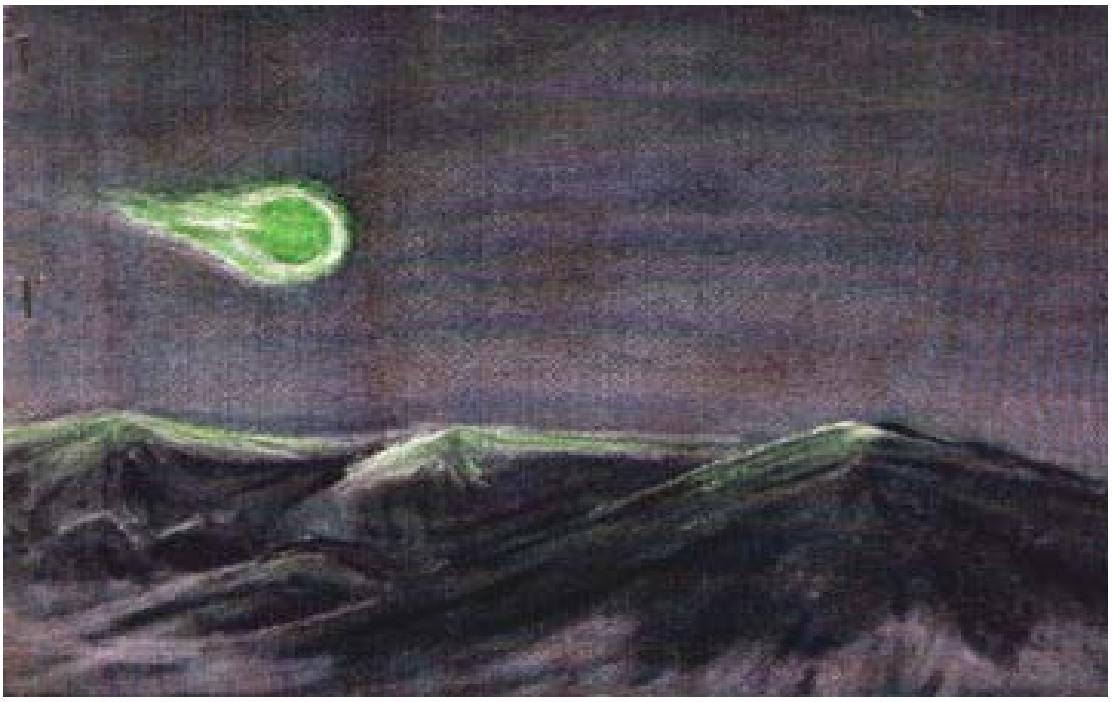
National Investigations Committee On Aerial Phenomena

Scholarly Commentary on LIFE article of April 7, 1952

[NICAP Comment: Although the Monroe picture no doubt attracted a lot of readers it also had the tendency to make the UFO subject seem somewhat frivolous.]



This is a scrupulously accurate eyewitness painting of a mysterious green fireball rushing through the night sky over New Mexico. It was done by Mrs. Lincoln LaPaz, wife of an authority on meteors. Both she and her husband have observed the fireballs at first hand.

[NICAP Comment: Although this claims to be "a scrupulously accurate eyewitness painting" the picture is a bright green whereas Dr. Lincoln LaPaz repeatedly stressed that one of the key unusual features of the fireballs was that they were bright YELLOW-green, NOT bright green. Did LIFE incorrectly calibrate the color on its reproduction of the painting, which seems unlikely given LIFE's world-renowned expertise in photography, or was Mrs. LaPaz strangely in error in her painting despite the on-site input of her husband? The traffic-signal green color in this drawing is probably altered from the actual pale yellow-green of the real green fireballs in order to catch copycats falsely claiming to have seen the fireballs.]

HAVE WE VISITORS FROM SPACE?

The Air Force is now ready to concede that many saucer and fireball sightings still defy explanation; here LIFE offers some scientific evidence that there is a real case for interplanetary saucers.

LIFE Magazine, April 7, 1952
by H. B. Darrach Jr. and Robert Ginna

For four years the U.S. public has wondered, worried or smirked over the strange and insistent tales of eerie objects streaking across American skies. Generally the tales have provoked only chills or titters, only rarely, reflection or analysis.

Last week the U.S. Air Force made known to LIFE the following facts:

- As a result of continuing flying saucer reports the Air Force maintains constant intelligence investigation and study of unidentified aerial objects.
- A policy of positive action has been adopted to find out, as soon as possible, what is responsible for observations that have been made. As a part of this study, military aircraft are alerted to attempt interception, and radar and photographic equipment will

be used in an attempt to obtain factual data. If opportunity offers, attempts will be made to recover such unidentified objects.

[NICAP Comment: These new efforts at instrumented investigation of UFO's, note even the phrase "unidentified objects," stem from the initiative of the deputy to Maj. Gen. John A. Samford, the Director of AF Intelligence, beginning in January 1952. The deputy, Brig. Gen. William M. Garland, was Samford's Assistant for Intelligence Production. Both had received a series of briefings on UFO's from AF staff.]

- Already all operational units of the Air Force have been alerted to report in detail any sightings of unidentified aerial objects. Other groups -- scientists, private and commercial pilots, weather observers -- all trained observers whose work in any way concerns the sky, and what happens in it, are urged to make immediate reports to Air Technical Intelligence Center at Wright-Patterson AFB, Dayton, Ohio of any unidentified aerial objects they sight.
- Further, for the first time since Project "Saucer" was changed from a special-type project to a standard intelligence function, in December 1949, the Air Force invites all citizens to report their sightings to the nearest Air Force installation. All reports will be given expert consideration and those of special interest will be thoroughly investigated. The identity of those making such reports will be kept in confidence; no one will be ridiculed for making one.

[NICAP Comment: This was the critical phrase in the entire article, the AF for the first time "invites all citizens to report their sightings to the nearest Air Force installation." This was part of the plan approved by Gen. Garland to give civilian and anecdotal cases one more chance to prove they had any intelligence value at all, at a time when AF Intelligence under Garland's leadership was in the process of downgrading or rejecting all anecdotal reports on any intelligence subject, Soviet aircraft, missiles, radars, UFO's, etc. Air Technical Intelligence Center (ATIC) UFO Project Grudge chief Lt. Edward J. Ruppelt had told Garland that if they could only get enough civilian reports from a given area they could get triangulations of UFO size, altitude and speed, and if they announced interest in public reports this "publicity plan" might yield scientific data. But when the UFO wave of July 1952 struck, this "invitation" by the AF was blamed for the avalanche of UFO reports. Then ATIC at Wright-Patterson AFB tried to deny they had ever sponsored or approved any such "publicity plan."]

- There is no reason as yet to believe that any of the aerial phenomena commonly described as flying saucers are caused by a foreign power or constitute a clear and present danger to the U.S. or its citizens.

[NICAP Comment: This seems to suggest the AF was discounting at present the ET possibility but then a few paragraphs later the ET explanation is all but asserted, perhaps as LIFE's own interpretation.]

These disclosures, sharply amending past Air Force policy, climaxed a review by LIFE, with Air Force officials, of all facts known in the case. This review has resulted from more than a year of sifting and weighing all reports of unexplained aerial phenomena -- from the so-called flying saucers to the mysterious green fireballs so often sighted in the Southwest. This inquiry has included scrutiny of hundreds of reported sightings, interviews with eyewitnesses across the country and careful reviews of the facts with some of the world's ablest physicists, astronomers, and experts on guided missiles. For the first time the Air Force (while in no way identifying itself with any particular conclusions) has opened its files for study.

Out of this exhaustive inquiry these propositions seem firmly shaped by the evidence:

- 1. Disks, cylinders and similar objects of geometrical form, luminous quality and solid nature for several years have been, and may be now, actually present in the atmosphere of the earth.
- 2. Globes of green fire also, of a brightness more intense than the full moon's, have frequently passed through the skies.
- 3. These objects cannot be explained by present science as natural phenomena -- but solely as artificial devices, created and operated by a high intelligence.
- 4. Finally, no power plant known or projected on earth could account for the performance of these devices.

[NICAP Comment: Points 3 qand 4 all but assert the ET origin of UFO's, but apparently represent LIFE or its staff writers' own conclusions, perhaps unofficially encouraged by the AF.]

Let us first review some widely known facts.

The shapes and inscrutable portents of the flying disks first broke upon the skies of the world in the early months of 1947, with several sightings reported to the Air Force. The story first reached the nation on June 24, 1947, when a private pilot named Kenneth Arnold was flying from Chehalis to Yakima, Wash. Some 25 miles away, Arnold saw nine "saucer like things ... flying like geese in a diagonal chainlike line," approaching Mount Rainier. They swerved in and out of the high peaks at a speed Arnold estimated to be 1,200 mph.

Arnold told the whole story to his hometown newspaper, and like summer lightning it flashed across the country. Within a month, saucers had been reported by people in 40 states. For the public (as LIFE itself merrily reported in its issue of July 21, 1947) he saucers provided the biggest game of hey-diddle-diddle in history. Any man, woman, or child with talent enough to see spots before his eyes could get his name in the newspaper.

Nevertheless in serious moments most people were a little worried by all the "chromium hubcaps," "flying washtubs" and "whirling doughnuts" in the sky. Buried in the heap of hysterical reports were some sobering cases. One was the calamity that befell Air Force Captain Thomas F. Mantell on Jan. 7, 1948. That afternoon Mantell and two other F-51 fighter pilots sighted an object that looked like "an ice-cream cone topped with red" over Godman Air Force Base and Fort Knox, Ky. Mantell followed the strange object up to 20,000 feet and disappeared. Later in the day his body was found in a nearby field, the wreckage of his plane scattered for a half mile around. It now seems possible that Mantell was one of the very few sighters who actually were deceived by a Skyhook balloon, but the incident is still listed as unsolved by the Air Force files.

There was no such easy explanation for the strange phenomenon observed at 2:45 a.m. on July 24, 1948 by two Eastern Air Lines pilots. Captain Clarence S. Chiles and Copilot John B. Whitted were flying in bright moonlight near Montgomery, Ala. when they suddenly saw "a bright glow" and a "long rocket like ship" veer past them. They subsequently agreed that it was a "wingless aircraft, 100 feet long, cigar-shaped and about twice the diameter of a B-29, with no protruding surfaces, and two rows of windows ... From the sides of the craft came an intense, fairly dark blue glow ... like a fluorescent factory light." They said the weird craft "pulled up with tremendous burst of flame from the rear and zoomed into the clouds at about 800 miles an hour," rocking their DC-3 with its "prop or jet wash."

Just as inexplicable was the experience of Lieut. George Gorman of the North Dakota Air National Guard. On Oct. 1, 1948 Gorman was coming in at dusk to land his F-51 at Fargo,

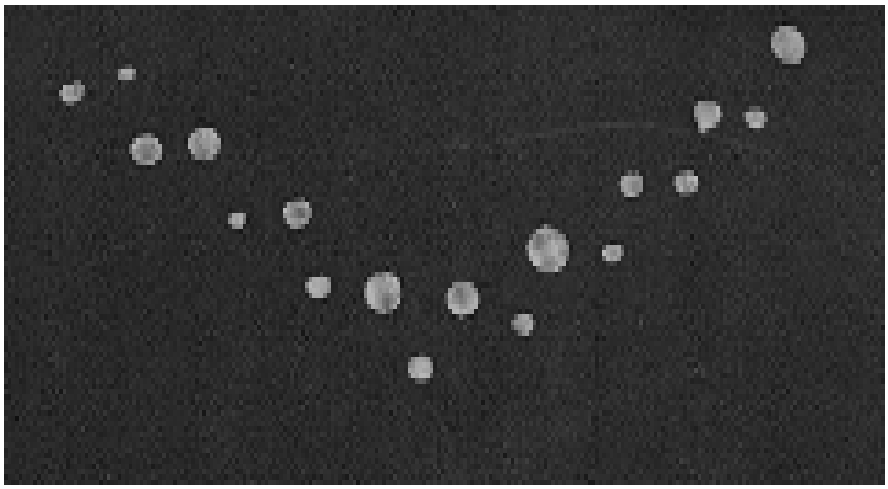
when he saw an intense, bright light pass 1,000 yards away. Curious, Gorman followed the light and saw that it seemed to be attached to nothing. For 27 hair-raising minutes Gorman pursued the light through a series of intricate maneuvers. He said it was about 6 inches in diameter and going faster than his F-51 (300-400 mph). It made no sound and left no exhaust trail. After Gorman landed, the light having suddenly flashed away in the upper air, he found support for his story -- the chief of the control tower had followed the fantastic "combat" with binoculars.

The occurrences, jarring though they must have been to the participants, left the official calm of the Air Force unruffled. The project set up to investigate the saucers ("Project Sign," known to the press as "Project Saucer") seemed to have been fashioned more as a sedative to public controversy than as a serious inquiry into the facts. On Dec. 27, 1949, after two years of operation, Project Saucer wrote off all reports of unidentified aerial phenomena as hoaxes, hallucinations or misinterpretations of familiar objects -- that is, all but 34. These stubborn 34, seemingly unexplainable, were briskly dismissed as psychological aberrations.

While these assurances appeased most of the press and pacified the public, some elements in the Air Force just about this time began to worry a bit more seriously. Saucer reports continued to come in a rate of about one a day and were handled under the code name of "Project Grudge." Officers at policy level began to show concern. "The higher you go in the Air Force," conceded one Intelligence officer, "the more seriously they take the flying saucers."

There was good reason to be serious. As review of all records has shown, these years have produced literally dozens of incidents defying simple explanation -- and provoking the most incredible questions.

Checked and rechecked, 10 cases out of the formidable list on record are here presented in essential detail. Of these, three were discovered in the course of LIFE's own investigation and are reported for the first time.



The Lubbock Lights, flying in formation, are considered by the Air Force the most unexplainable phenomena yet observed. These photographs (only one shown above) were made at Lubbock, Texas, on August 30th, 1951 by Carl Hart, Jr. Scientists say lights were not natural objects, but they traveled too fast and too soundless for known machines.

INCIDENT 1

At 9:10 p.m. on Aug. 25, 1951, Dr. W. I. Robinson, professor of geology at the Texas technological College, stood in the back yard of his home in Lubbock, Texas and chatted with two colleagues. The other men were Dr. A. G. Oberg, a professor of chemical

engineering, and Professor W. L. Ducker, head of the department of petroleum engineering. The night was clear and dark. Suddenly all three men saw a number of lights race noiselessly across the sky, from horizon to horizon, in a few seconds. They gave the impression of about 30 luminous beads, arranged in a crescent shape. A few moments later another similar formation flashed across the night. This time the scientists were able to judge hat the lights moved through 30 degrees of arc in a second. A check the next day with the Air Force showed that no planes had been over the area at the time. This was but the beginning: Professor Ducker observed 12 flights of the luminous objects between August and November of last year. Some of his colleagues observed as many as 10. Hundreds of nonscientific observers in a wide vicinity around Lubbock have seen as many as three flights of the mysterious crescents in one night. On the night of Aug. 30 an attempt to photograph the lights was made by 18-year old Carl Hart Jr. He used a Kodak 35-mm camera at f 3.5, 1/10 of a second. Working rapidly, Hart managed to get five exposures of the flights. The pictures exhibited by Hart as the result of this effort show 18 to 20 luminous objects, more intense than the planet Venus, arranged in one or a pair of crescents. In several photographs, off to one side of the main flight, a larger luminosity is visible -- like a mother craft hovering near its aerial brood.

Carl Hart, 18-year-old student, photographed the Lubbock Lights with Kodak 35.

Professors at Texas Tech who saw Lubbock Lights (left to right), Dr. Oberg, Prof. Ducker, and Dr. Robinson, discuss them with Dr. E. L. George.

EVALUATION

The observations have been too numerous and too similar to be doubted. In addition the Air Force, after the closest examination, has found nothing fraudulent about Hart's pictures. The lights are much too bright to be reflections, and therefore bodies containing sources of light. Since Professors Ducker, Oberg, and Robinson could not measure the size and distance of the formations, they could form no precise estimate of their speed. However they calculated that if the lights were flying at an altitude of 5,000 feet they must then have been traveling about 1,800 mph. The professors, along with other scientists, agree that in order to explain the silence of the objects, it must be assumed that they were at 50,000 feet in the air; in which case they were going not 1,800 but 18,000 mph. [Note: See follow-up letter from professors at end questioning authenticity of Hart's photos.]

INCIDENT 2 On July 10, 1947 at 4:47 p.m., one of the U.S.'s top astronomers was driving from Clovis to Clines Corners, N. Mex. [Note: Later revealed to be Dr. Lincoln La Paz -- see Incident 10, green fireballs, which La Paz investigated.] His wife and his teen-aged daughters were also in the car. (For professional reasons he has asked LIFE to withhold identity.) It was a bright sunny day, but the whole western half of the sky was a "confused cloud sea." All at once, as the car headed toward these clouds, "all four of us almost simultaneously became aware of a curious bright object almost motionless" among the clouds. Instantly, from long habit in dealing with celestial phenomena, he began to make calculations. with what crude materials he had at hand. He held a pencil at arm's length, measured the size of the object against the windshield of the car, measured the distance between his eyes and the windshield, etc. His wife and two daughters did the same, each making independent calculations. The object, says the scientist, "showed a sharp and firm regular outline, namely one of a smooth elliptical character much harder and sharper than the edges of the cloudlets... The hue of the luminous object was somewhat less white than the light of Jupiter in a dark sky, not aluminum or silver-colored.... The object clearly exhibited a sort of wobbling motion ... This wobbling motion served to set off the object as a rigid, if not solid body." After 30 seconds in plain view, the ellipsoid moved slowly behind a cloud (273 degrees azimuth, elevation 1 degree) "and we thought we had lost it." But approximately five seconds later it reappeared (275 degrees azimuth, elevation 2 degrees). "This remarkably sudden ascent thoroughly convinced me that we were dealing with an absolutely novel airborne device." After reappearing, the object moved slowly from south to north across the clouds. "As seen projected against these dark clouds, the object gave the strongest impression of self-luminosity." About two and a half minutes after it first came into view, the thing disappeared finally behind a cloudbank.

EVALUATION

The astronomer vouches for the approximate accuracy of his observations and computations. He determined that the object was not less than 20 nor more than 30 miles from his viewing point; that it was ellipsoidal and rigid; that it was 160 feet long and 65 feet thick, if seen at minimum distance; or 245 feet long and 100 feet thick if at maximum; and that its horizontal speed ranged between 120 and 180 mph and its vertical rise between 600 and 900 mph. He also observed that the object moved with a wobble, no sounds, and left no exhaust or vapor trail. His wife and daughters support his observations, and their computations were in accordance with his own, though slightly less conservative. The object's appearance and behavior answer no known optical or celestial phenomenon. No known or projected aircraft, rocket or guided missile can make such a rapid vertical ascent without leaving an exhaust or vapor trail.

INCIDENT 3

On April 24,1949 at 10:20 a.m., a group of five r the genera J. Gordonautical engineer emplo ed by the Office of Naval Researg to laun loon near A small balloon was sent up first to heck the weaMoore Jr., an aer al Mills in cosmic ray research) was tracking the weathe balloonlite -- a pic instr es degrees of azimuth and elevation (horizontal and v) fo r any object it is sighted on. At 10:30 a.m. Moore leaned back from the theodolite to glance at the balloon with his naked eye. Suddenly he saw a whitish elliptical object, apparently much higher than the balloon, and moving, in the opposite direction. At once he picked the object up in his theodolite at 45 degrees of elevation and 210 degrees of azimuth, and tracked it east at the phenomenal rate of 5 degrees of azimuth-change per second as it dropped swiftly to an elevation of 25 degrees. The object appeared to be an ellipsoid roughly two and a half times as long as it was wide. Suddenly it swung abruptly upward and rushed out of sight in a few seconds. Moore had tracked it for about 60 seconds altogether. The other members of his crew confirmed his report. No sound was heard, no vapor trail was seen. The object, according to rough estimations by Moore and his colleagues, was about 56 miles above the earth, 100 feet long and was traveling at seven miles per second.

EVALUATION

No known optical or atmospheric phenomenon fits the facts. A natural object traveling at seven miles per second has never been seen to make a sudden upward turn. There is no known or projected source of silent, vaporless power for such a machine. No human being could have borne the tremendous "G" load brought to bear on the craft during its abrupt vertical veer.

INCIDENT 4

One night in the summer of 1948 Clyde W. Tombaugh, the discoverer of the planet Pluto, was sitting in the back yard of his home at Las, Cruces, N. Mex. With him were his wife and his mother-in-law. It was about 11 p.m. and they were all sitting quietly, admiring the clarity of the southwestern sky, like any proper astronomical family. All at once they all saw something rush silently overhead, south to north, too fast for a plane, too slow for a meteor. It seemed to be quite low. All three of the witnesses agreed that the object was definitely a solid "ship" of a kind they had never seen before. It was of an oval shape and "seemed to trail off at the rear into a shapeless luminescence." There was a bluegreen glow about the whole thing. About half a dozen "windows" were clearly visible at the front of the ship and along the side. They glowed with the same blue-green color as the rest of the ship, only the glare was brighter, and had a touch of yellow in it.

EVALUATION

The object bore a resemblance to the craft seen by Pilots Chiles and Whitted. It bore resemblance to no aircraft known to be in operation on earth.

INCIDENT 5

In this case LIFE's informant is an Air Force officer who holds a top military post at a key atomic base. Since his assignment and whereabouts must be kept a secret he has asked LIFE to withhold his name. He has the highest security rating given. Before he took his present assignment, this officer was in command of the radar equipment that keeps watch over a certain atomic installation. One day in the fall of 1949, while watching a radarscope that covered an area of sky 300 miles wide and 100,000 feet deep, he was startled to detect five apparently metallic objects flying south at tremendous speed and great height. They crossed the 300-mile scope, in less than four minutes. The objects flew the whole time in formation.

EVALUATION

There is no dead-certain explanation of this phenomenon -- radar is as full of tricks as an old-maid's imagination. However, the officer involved is an experienced observer, well aware of the eccentricities of the instrument. He believes that in this instance he made a legitimate radar contact. If so, it can be said that the only natural objects known to travel at such a speed are meteors, but meteors do not fly in formation. If the officer picked up machines, they were performing in a manner that rocket experts agree is still beyond the capabilities of earth's most advanced weapons.

"Civilian Saucer Investigations" was organized by Sighter Ed J. Sullivan (standing), who urges other sighters to write to P.O. Box 1971, Main Post Office, Los Angeles. CSI includes Dr. Walter Riedel (behind Sullivan), who was chief designer at great German rocket laboratory at Peenemunde.

INCIDENT 6

On May 29, 1951 at 3:48 p.m., three technical writers for the aerophysics department of North American Aviation's plant at Downey, outside Los Angeles, were chatting on the factory grounds. They were Victor Black, Werner Eichler and Ed J. Sullivan. All at once they stared at the sky. Sullivan describes what they saw: "Approximately 30 glowing, meteor like objects sprayed out of the east at a point about 45 degrees above the horizon, executed a right-angle turn and swept across the sky in an undulating vertical formation ... that resembled a tuning fork on edge. It took each of them about 25 seconds to cross 9O degrees of the horizon before performing another right-angle turn westward toward downtown Los Angeles.... We estimated their diameter at 30 feet and their speed to be 1,700 mph. Each appeared as an intense electric blue light, round and without length. They moved with the motion of flat stones skipping across a smooth pond."

EVALUATION

No known natural or optical phenomenon, makes the peculiar light, in bright day, attributed to these objects by Sullivan and his colleagues; nor can any natural object, hurtling at such a speed, execute a right angle turn. As in the Moore theodolite sighting, the execution of such a turn would have crushed any human crew under the impact of "G" forces. Finally, of course, no known machine travels at 1,700 mph without making a sound or leaving an exhaust or vapor trail.

INCIDENT 7

On Jan. 20, 1951, at 8:30 p.m., Captain Lawrence W. Vinther of Mid-Continent Airlines

was ordered by the control tower at the Sioux City airport, to investigate a "very bright light" above the field. He took off in his DC-3 with his copilot, James F. Bachmeier, and followed the light. All at once the light dived at the DC-3 almost head on; it passed silently and at great speed about 200 feet above its nose. Both pilots wrenched their heads back to see where it had gone, only to discover that the thing had somehow reversed direction in a split second and was now flying parallel to the airliner heading in the same direction. It was a clear moonlight night and both men got a good look at the object. It was as big or bigger than a B-29, had a cigar-shaped fuselage and a glider type wing, set well forward, without sweepback and without engine nacelles or jet pods. There was not exhaust glow. The white light appeared to be recessed in the bottom of the plane. After a few seconds the object lost altitude, passed under the DC-3 and disappeared. A civilian employee of Air Intelligence was a passenger on the flight, saw the object and confirms the description by the pilots.

EVALUATION

The conditions for observation were excellent. One fact alone -- the astonishing reversal of direction performed by the object -- suffices to classify it as a device far beyond the known capacities of aeronautical science. Although its shape is different, the soundlessness of the object and the absence of observable means of propulsion relate it to the saucer class of phenomena.

INCIDENT 8

At 6:45 a.m., just before sunup on Feb. 18, 1952, a photographer named C. E. Redman was driving through Albuquerque, N. Mex. on his way to photograph a wedding. Stopped for a traffic light, he noticed two bright things in the sky. "They were hovering above Tijeras Canyon.... The one to the north was on its edge. The other was lying horizontally. They were bright, bluish white.... It was probably the most astonishing thing I've ever seen. Those things were soundless. They were not jets or vapor trails. I've seen hundreds of jets and vapor trails." Redman was questioned later the same day by a LIFE reporter and a prominent scientist, working together. From his testimony, and from the lay of the land, it was estimated that the disks were 20 miles away and four miles in the air, and that they had a diameter of about 136 feet. Another witness saw the same objects Redman saw, and at the same time, but from the other side of town. W. S. Morris, a retired master sergeant of the Air Force who is now a news dealer in Albuquerque, was out to drop off his morning papers when he saw two strange objects over Tijeras Canyon. "I watched them for 12 minutes. They were a blinding silver, long and thin, gleaming all over. They hovered, one kind of above the other to the right. They seemed brighter than the sun, which wasn't yet over the Sandia mountains. It just touched their bottoms and they glowed red. They didn't flutter or move. They just hung there. It must have been 20 miles away. Then they just suddenly dropped down behind the mountain, and the upper one tilted so that I could see its profile. It looked like a bell pepper-with a bump on top, that is."

EVALUATION

Kirtland AFB acknowledged that there were no aircraft in that area at that time. The observations reinforce each other and point to several striking facts. First, one disk proved itself three dimensional when it tilted, to descend. Second, the suddenness of the disk's descent indicates that the bodies contained a source of power. Third, the power that can suspend a three-dimensional body, of the size Morris describes and in the position he indicates, without turning a blade or roaring a jet, is unknown.

How discs looked in relation to each other is shown by C.E. Redman of Albuquerque.

INCIDENT 9

On Jan. 29, 1952, just before midnight, a B-29 was on r Wo as flying at less than 200 mi les an hour, at an altitude somewhat above 20,000 feet. Simultaneously the tail gunner and the fire-control man in the waist saw a bright round orange object in the sky near the plane. Both said it was about three feet in diameter, flew with a revolving motion on a course parallel to theirs, and wore a halo of bluish flame. It also appeared to pulsate. The object followed the B-29 for about five minutes, then pulled ahead and shot away at a sharp angle. On the same night a similar globe was seen by the tail gunner and waist man of another B-29, 80 miles away over Sunchon, but flying at about the same height. The globe followed the plane for about a minute, then disappeared.

EVALUATION

Theoreticians in the Air Force believe the fireballs were not natural phenomena but propelled objects. They bear some similarity to the balls of fire called "fireball fighters" or "foo fighters" -- which flew wing on Allied aircraft over Germany and Japan during 1944-45 and which have never been satisfactorily explained. In the Korean incidents, the fireballs seem -- on the evidence of their sharp acceleration, their blue light and their abrupt, angular swerve -- to resemble the saucers described earlier.

The same disks sighted by Redman were seen by W.S. Morris, ex-Air Force master sergeant.

INCIDENT 10

On the night of Nov. 2, 1951 a ball of kelly-green fire, larger than the moon, and blazing several times more brightly, flashed eastward across the skies of Arizona. It raced, straight as a bullet, parallel to the ground, and then exploded in a frightful paroxysm of light --- without making a sound. At least 165 people saw the incredible thing; hundreds more witnessed the similar flight of countless other fireballs that since December 1948 have bathed the hills of the Southwest in their lunar glare. In the last year they have been seen as far afield as Pennsylvania, Maryland and Puerto Rico. The chief Air Intelligence officer for the Albuquerque district saw one. Colonel Joseph D. Caldara, USAF, attached to the Joint Chiefs of Staff, saw one in Virginia. Hundreds of pilots, weather observers and atomic scientists have sighted them. Reports came so thick and fast during 1948 that in 1949 the Air Force established "Project Twinkle" to investigate them. Project Twinkle established a triple phototheodolite post at Vaughn, N. Mex. to obtain scientific data on the fireballs. Day and night, week in, week out, for three months, a crew kept vigil. Ironically, while fireballs continued flashing everywhere else in the Southwest, they saw nothing until the project was transferred to the Holloman Air Force Base at Alamogordo, N. Mex. There, during another three-month siege, they saw a few but were unable to make satisfactory computations because of the fireballs' great-speed. Search parties have had no better luck. They have combed in vain the countryside beneath the point of disappearance; not a trace of telltale substance has been found on the ground.

EVALUATION

The popular Southwest belief that a strange meteor shower was underway has been blasted by Dr. Lincoln La Paz, mathematician, astronomer and director of the Institute of Meteoritics at the University of New Mexico. He points out that normal fireballs do not appear green, they fall in the trajectory forced on them by gravity, are generally noisy as a freight train, and leave meteorites where they hit. The green New Mexican species does none of these things. Neither do the green fireballs appear to be electrostatic phenomena -- they move too regularly and too fast.

If the fireballs are the product of a U.S. weapons project, as some Southwesterners believe, it is a very secret one indeed: the Atomic Energy Commission and every other government agency connected with weapons development has denied to LIFE any responsibility for the fireballs.

Could they be self-destroying Russian reconnaissance devices? Not likely. While the U.S. believes the Russians have an intercontinental guided missile, there is no intelligence that indicates they have developed silent power plants or objects capable of moving nearly as fast as meteors (12 miles a second). Yet -- for whatever it may be worth -- the only reports of green fireballs prior to 1948 came from the Baltic area.

If the fireballs do not respond to gravity, they could only be explained as lighter-than-air craft or electrical phenomena -- but they have characteristics which rule these out. Therefore they must be propelled. If propelled and not natural phenomena, they must be artificial. The extreme greenness of the fireballs has impressed most witnesses. When asked to indicate the approximate color on a spectrum chart, most of them have touched the band at 5,200 angstroms, close to the green of burning copper. Copper is almost never found in meteorites; the friction of the air oxidizes it shortly after the meteor enters the upper atmosphere. However, a curious fact has been recorded by aerologists. Concentrations of copper particles are now present in the air of Arizona and New Mexico, particularly in "fireball areas." These were not encountered in air samples made before 1948.

WHAT THEY ARE NOT -- AND WHAT THEY MAY BE

What are the flying saucers, the luminous fuselages, the foo fighters and the green fireballs? The answer -- if any answer at this time is possible -- lies in the field of logic rather than of evidence. What the things are may be adduced partially by reviewing what they are not.

THEY ARE NOT PSYCHOLOGICAL PHENOMENA. Although the Air Force cheerily wrote off its 34 unexplained incidents with this pat theory, the explanation does not hold up. There is no evidence, beyond textbook speculation, for such a supposition, and there is the direct evidence already cited against it. To doubt the observers in the foregoing cases is to doubt the ability of every human being to know a hawk from a handsaw.

THEY ARE NOT THE PRODUCT OF U.S. RESEARCH. LIFE investigated this possibility to exhaustion. Not fully satisfied by the public denials of President Truman, Secretary Johnson and others, the investigators put the question directly to Gordon Dean, chairman of the Atomic Energy Commission. He said: "There's nothing in our shop that could account for these things, and there's nothing going on that I know of that could explain them." Still unconvinced, LIFE checked the whereabouts and present business of every scientist who might have anything to do with the development of super aircraft. All were accounted for in other ways. Careful feelers through the business and labor world encountered no submerged projects of the immensity necessary to build a fleet of flying disks. And there is still the conclusive fact: U.S. science has at its command no source of power that could put a flying machine through such paces as the saucers perform.

THEY ARE NOT A RUSSIAN DEVELOPMENT. It is inconceivable that the Russians would risk the loss of such a precious military weapon by flying a saucer over enemy territory. No man-made machine is foolproof; sooner or later one would crash in the U.S. and the secret would be out. Nor is there any reason to believe that Russian science, even with German help, has moved beyond not only the practical but the THEORETICAL horizons of U.S. research.

THEY ARE NOT DISTORTIONS OF THE ATMOSPHERE RESULTING FROM ATOMIC ACTIVITY. To quote the answer David Lilienthal, former AEC commissioner, once made to that suggestion: "I can't prevent anyone from saying foolish things." Nor are they aberrations of the northern lights. Magnetic disturbances cannot account for them and neither can a notion (recently fathered by Dr. Urner Liddel, the Navy physicist) that they are "vertical mirages" -- reflections from a vertical (instead of a horizontal) layer of heated air.

THEY ARE NOT SKYHOOK BALLOONS. This was the, original Liddel explanation, and in a few instances it may have been correct. But not many. They could scarcely be "fireflies in the cockpit," as one Air Force colonel suggested, since most of the observers were not in a cockpit when they saw their saucers. And it is hard to believe that saucers could be the reflections of automobile headlights on clouds, when they are seen in daylight under cloudless skies. These being the dead-end alleys of negative evidence, is there hope of an explanation on the open avenues of scientific theory? The answer is yes.

The rank of science has taken the saucers far more seriously than the file of laymen and, after five years of close watch on all reports, a number of scientists were ready with some conclusions. One of these was Dr. Walther Riedel, once chief designer and research director at the German rocket center in Peenemunde, now engaged on secret work for the U.S. Dr. Riedel has never seen a saucer himself, but for several years he has kept records of saucer sightings all over the world. He told LIFE: "I am completely convinced that they have an out-of-world basis."

Dr. Riedel has four points to his argument: "First, the skin temperatures of structures

operating under the observed conditions would make it impossible for any terrestrial structure to survive. The skin friction of the missile at those speeds at those altitudes would melt any metals or nonmetals available.

"Second, consider the high acceleration at which they fly and maneuver ... In some descriptions the beast spirals straight up. If you think of the fact that the centrifugal force in a few minutes of such a maneuver would press the crew against the outside, and do likewise to the blood, you see what I mean.

"Third.... There are many occurrences where they have done things that only a pilot could perform but that no human pilot could stand.

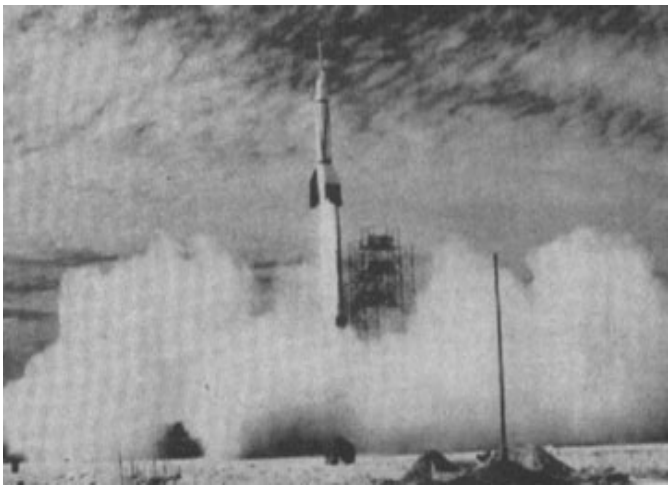
"Fourth, in most of the reports there is a lack of visible jet. Most observers report units without visible flame ... and no trail. If it would be any known type of jet, rocket, piston engine, or chain-reaction motor, there would be a very clear trail at high altitude. It is from no power unit we know of ..."

Dr. Riedel's arguments are reinforced by those of Dr. Maurice A. Biot, one of the leading aerodynamicists in the U.S. and a prominent mathematical physicist. From an aerodynamical viewpoint, says Dr. Biot, the saucer shape makes very little sense if the machine is to travel in the atmosphere. A disk has a high drag and is a poor airfoil unless stabilized; when whirled at high speed through the air, it "wobbles" distressingly -- a movement observed in several of the saucers sighted. However, for space travel, where there is no atmosphere to oppose, the disk has significant advantages. The sphere, theoretically better, presents several difficult problems of construction and utilization. The disk, easier to build, has almost all the virtues of the sphere and some of its own. Reviewing the evidence presented here, Dr. Biot said: "The least improbable explanation is that these things are artificial and controlled ... My opinion for some time has been that they have an extraterrestrial origin."

WHO? WHAT? AND WHEN?

There, at least, is a plausible explanation of the disk shape. But the real depths of the saucer mystery bemuse penetration, as the night sky swallows up a flashlight beam. What of the other shapes? Why do the things make no sound? How to explain their eerie luminosity? What power urges them at such terrible speeds through the sky? Who, or what, is aboard? Where do they come from? Why are they here? What are the intentions of the beings who control them?

Before these awesome questions, science -- and mankind -- can yet only halt in wonder. Answers may come in a generation -- or tomorrow. Somewhere in the dark skies there may be those who know.



A U.S. rocket is launched from a proving ground. Neither this nor any known U.S. missiles fit the descriptions of the sighted saucers and fireballs.

Visitors From Space?

April 28, 1952: Letters to the Editor

Sirs:
"Have We Visitors from Space?" (LIFE, April 7) is the most comprehensive report I have read on the subject. I was very closely associated with Projects "Twinkle" and "Grudge" at Alamogordo, N. Mex. where I was chief of the technical photographic facility at Holloman Air Force base. I have seen several of these objects myself, and they are everything you say they are as to shape, size and speed.

Daniel A. McGovern
Captain, USAF
Alexandria, Va.

Sirs:
I first learned about the green fireballs from Marine Corps night fighter pilots while I was an aviation intelligence officer in Korea.
Pilots often reported seeing strange bright green objects in the skies, unlike anything they had ever seen before, and moving too fast and regularly to be explained or identified or analyzed by the pilots themselves or the intelligence officers.

Edward A. Kolar
Captain, USMCR
Tenafly, N.J.

Sirs:
LIFE has again rendered a distinct service to its readers. The authors' painstaking work in compiling and evaluating known data has made a case for interplanetary space ships which is entirely logical and sensible.

Donald J. Falvey
Deep River, Conn.

Sirs:

As observers of the Lubbock lights, we feel the record requires that we point out that the groups of objects shown in the Hart photographs are, in these respects, essentially different from any of the 12 or more groups that we sighted.
1) All but three of the groups we sighted had no geometric form; those three were smooth arcs, not V-shaped.
2) Those three could not be conclusively determined to be composed of individual lights, but certainly they were not made up of two distinct rows of alternately spaced lights.
3) None of our sightings was either bright enough, nor in view long enough (3 seconds) to offer any possibility of being photographed.
4) Even if the lights we saw had been particularly rich in nonvisible ultraviolet light, they could not have been photographed without special equipment.
5) All of our sightings were close to the same speed of 30 degrees per second, at which speed it would be impossible to follow them with a camera accurately enough to obtain an unblurred image.

W. I. Robinson
A. G. Oberg
W. L. Ducker
E. F. George
Lubbock, Texas

- Air Force experts had considered these objections of Professor Ducker and Doctors Oberg, Robinson and George. But they are still convinced that Hart was able to get exposures of the two groups he saw (4 seconds for each to cross the sky, 1-1/2 minutes apart) and found no reason to repudiate his pictures. -- ED.

Sirs:
Your article overstates the strangeness of the fireballs it describes...
You imply that the 1951 fireball display in the Southwest was not a meteor shower. We obtained and photographed approximate paths for 11 fireballs reported as falling Oct. 30 to Nov. 9 inclusive. The plot showed that all came from a small area in and near the constellation Taurus. This indicates a shower, perhaps related to the well-known shower whose members are seen falling away from Taurus in October and November.

C. C. Wylie
Professor of Astronomy
University of Iowa
Iowa City, Iowa

- Although there were meteor falls during this period, Dr. La Paz says: "Almost all of the green fireballs observed in the Southwest between December 1948 and December 1951 radiated from the circumpolar region of the sky. They came from points 35 to as much as 105 degrees distant from the Taurid fireball radiant, and therefore obviously were not related to this radiant." -- ED.

Sirs:
It is rather chilling to see that our plans for hospitality include interceptions and recover. It would be tragic indeed if the harmless and friendly behavior of these crafts from elsewhere were met with military destruction. Not only would the

morals of such a course be a regrettable indication of man's immaturity, but the practical consequences might include drastic reprisals....

Mason Rose
Los Angeles, Calif.

Sirs:
... The only reason the preponderance of this saucer-fireball-cigar activity is taking place in the American Southwest is that this is the area which has brought itself to interplanetary (or perhaps I should say, intergalaxial) attention. It was done so by virtue of the fact that it was the site used for the original A-bomb experiments....

Bill Ryan
San Diego, Calif.

> The Air Force, which has attempted to correlate the frequency and location of saucer reports with the testing of atomic weapons, has found no significant relationships. -- ED.

TRUE, March 1950

Navy Officer Tells

HOW SCIENTISTS TRACKED A FLYING SAUCER

by

Commander Robert B. McLaughlin, USN

In its January issue TRUE said that the flying saucers are real and interplanetary. Its story was widely supported by the nation's press and radio.TRUE's findings are here confirmed by Commander McLaughlin, a rocket expert at White Sands Proving Ground, who worked independently of this magazine's investigation. He reveals how a troup of Navy men and scientists tracked a flying disk with a precision instrument and tells of flights he and others witnessed.

On a bright, clear Sunday morning in April, 1949, a detachment of Navy men and a group of scientists released a balloon from a point 57 miles northwest of the White Sands Proving Ground base.

They were interested in getting weather data from the upper atmosphere, and as the balloon rose, they charted its flight as usual with a theodolite and a stop watch. There were five observers in all; four of them coordinating the instrument data. One followed the balloon through the theodolite's telescope. One called off the readings. One recorded them, and the fourth man held the watch.

Shortly after the balloon was aloft west of the observation point, the theodolite operator swung his instrument rapidly to the east.

A strange object, seen by everyone present, had crossed the path of the balloon. The instrument man, confused, had followed it. Swiftly, one of the scientists grabbed the theodolite and began tracking the missile.

An accurate plot of the object's course was recorded. Analyzing this data later, I can state definitely that:

1. The object, viewed in cross section, was elliptical in shape.

2. It was about 105 feet in diameter.

3. It was flying at an altitude of approximately 56 miles. (This was determined by a ballistics expert. An object at a lower altitude on this particular bright day could not have fitted the data taken. For security reasons, I cannot go deeper into this method of calculating altitude.)

4. Its speed was about 5 miles per second.

5. At the end of its trajectory, it swerved abruptly upward, altering its angle of elevation by 5 degrees -- corresponding to an increase in altitude of about 25 miles -- in a period of 10 seconds. Rough calculation indicates that a force of more that 20 G's (20 times the pull of gravity) would be required to produce this elevation in this time.

6. The object was visible for 60 seconds.

7. It disappeared at an elevation of 29 degrees.

Close questioning of the observers prior to the official report that went to "Project Saucer" at Wright-Patterson Field in Dayton, Ohio, produced an almost unanimous judgment that the objects was discus shaped and that it was a flat white color. High powered binoculars showed no exhaust trail, no stream of light or other evidence of a propulsions system. And, no sound. What was it?

I am convinced that it was a flying saucer and, further, that these disks are space ships from another planet, operated by animate, intelligent beings.

I think it is safe to say that it wasn't any type of aircraft known on Earth today. Even if, as is likely, there are top secret models which you and I know nothing about, there is no human being in this world who could take a force of 20 G's and live to tell about it.

I doubt that it was meteor. These small bullets from space frequently light up our sky as they burn, from friction generated by hurtling through our atmosphere. But only occasionally are they visible in the daytime. And besides, meteors remain in view for only a few seconds -- 10 or 12 at the maximum. This object was watched for 60 seconds.

Its size rules out the possibility of its being a bird or other known creature. No cloud could have moved in such a trajectory.

It was not a balloon, I can state positively. A number of men who saw it were experienced balloonists. Furthermore, they were in a position to know that no balloon capable of approaching the object's altitude was in the area. Even at 120,000 feet, near the peak altitude for any present type, a balloon would have to have been moving at 1,700 miles per hour to conform to the trajectory data.

And to clinch it, the wind 20 miles up was, as it happens, moving from east to west -- opposite to the motion of the object.

Hallucination? Optical illusion? I think it is reasonable to say that illusions do not appear simultaneously and identically to five different trained weather observers.

I cannot think of any other possibilities. Reliable observers saw the object. A sensitive instrument tracked it. The atmosphere was bright and clear in an area where we considered it a dull day if you could not see 50 miles horizontally with the naked eye.

The only flaw was that I -- up to that time -- had not seen a Flying Saucer personally.

Nonetheless, the information excited me. I began to seek an explanation -- a respectable, convincing answer in terms of physics, mathematics, aerodynamics and astronomy as we know them today.

Before I had completed my theories, I saw a Saucer for myself.

On morning late in May, I was standing outside of my office at the White Sands base during the flight of an Army upper atmosphere missile. These, of course, rise much faster than a balloon and usually you loose sight of them shortly before they reach peak elevation. You are very fortunate if you can spot them again on the way down.

The missile had just been fired, and we had just lost sight of it when a lieutenant commander standing next to me yelled: "There it goes."

A Marine captain and I saw what he was pointing at. (A civilian engineer and a Marine major with us did not.) A white object was proceeding very slowly westward. As I watched, it rapidly gained speed.

The object had now passed overhead, and I thought it was going to fall near a ranch house two or three miles west of us. But it spurted like a scalded cat, shot over the Organ Mountains behind us and disappeared.

This was a very serious matter to us. We always took precautions to prevent missiles from leaving the range. Immediately, I phoned the range safety officer.

"I've just seen your missile leave the range to the west of here," I said.

He groaned. As we debated what to do, we both heard the thudding impact of our missile well to the north of us and in the center of the range.

What, then, had I seen? I now faced the problem of every Flying Saucer witness. What was truth? What was imagination?

Two Saturday Evening Post articles last year by Sidney Shalett concluded that the disks were hallucinations, upper atmosphere weather balloons, astronomical phenomena, or the result of vertigo or self hypnosis. In the January issue of this magazine, Donald E. Keyhoe, aviation expert for TRUE, asserted that the saucers are visitors from another planet.

I thought back as carefully as I could over what I had seen. I realized I was slightly better off than most witnesses. I had not expected to see a Saucer, but I had expected to see something. My eyes, fairly used to this kind of observations, had been looking for a fast moving missile.

These impressions I settled on as accurate:

1. The Saucer, at the time it was first sighted, had been going at an extremely slow speed, perhaps 1 mile per second.

2. Despite the relative slowness, I could not determine its shape, although I judged it was similar in size to Saucer No. 1 because it was visible at an altitude above 25 miles.

3. It accelerated to a speed far in excess of anything obtainable with present day rocket motors.

4. The object passed within 5 degrees of the sun and was still visible to the naked eye. This would hardly have been true if the the object had been a meteor.

5. Again, there was no evidence of a propulsion system.

The last appearance of Flying Disks which I feel is reliable enough to report occurred in early June. I did not see it personally, but the circumstances are impressive enough for me to include them here.

This day we were firing a Navy upper atmosphere missile. Shortly after its take-off, two small circular objects, guessed to be approximately 20 inches in diameter, appeared from no place and joined the Navy missile on its upward flight. (Similar small disks have also been previously reported as well as the larger types mentioned earlier.)

At about the time the Navy missile was doing well over 2,000 feet per second, the object on the west

side passed through the exhaust gases and joined its friend on the east. They then apparently decided the missile was not going fast enough for them. They accelerated, passed the Navy missile and sailed off upward and eastward.

Some eight minutes after the Navy missile had fallen back into the range, I received a radio report from a very powerful optical observation post located on a mountain top. The Navy missile, it said, had just passed over the mountain and was going out of the range to the west. This could have been one of the two objects that we had seen and which had changed direction, or it could have been a third one.

The odd thing is that before long I had reports from eleven men in five separate OP's, none of which could communicate with each other and which were located at different points of the compass. All had seen the two objects perform as I have described.

Putting together all the data observed in three appearances, one of which I had seen for myself, and all which I believe beyond doubt, I decided that it was necessary to look outside the known world for an answer.

No one realizes better than I do that the explanations which follow may be incorrect. I think, however, that there is too much evidence from too many reliable sources for us to be content with inconclusive explanations, and we must press on to find an answer.

I think that the saucers are piloted space ships, first, because of their flight performance. The White Sands Saucers were most definitely capable of changing their direction while above our atmosphere. This extreme maneuverability -- plus their large size -- eliminates for me the likelihood of their being operated by remote control.

My own experience with rockets leads me to feel that a Saucer with such characteristics is far beyond the technical powers of anyone on earth. Our present system of rocket propulsion, using thermochemical energy, is entirely inadequate to duplicate the terrific 5 degree gain in altitude observed during the flight of Saucer No. 1.

If you accept this, you are led to assume that the Saucers can be propelled only by power derived from the atom.

What kind? And how? Well, I suggest a "radiation pressure motor."

Radiation pressure is one of the oldest known physical phenomena. You have seen it work if you have ever noticed a little glass enclosed gadget that jewelers often place in their shop windows. This is the "Crookes radiometer," a device more that 100 years old. Inside a small glass globe four metal vanes, black on one side and silver on the other, rotate on an axis, although there is apparently no motor driving them.

Light supplies the power. It radiates a "push" that varies from the surface of one vane to that of the one next to it. Now, where could the Saucer engineers get enough light to propel their missile through space?

I envision a motor somewhat like a fluorescent lamp. An inner core is filled with fissionable material, probably a gas. An outer tube surrounding the core contains a fluorescent material.

The fissionable gas activates the fluorescent material, causing light. Light exerts pressure -- a propulsive push or thrust -- against a heavily shielded curved reflector. The push propels the missile.

The activity of the fluorescent material is controlled by increasing or decreasing the amount of fissionable gas in the inner core. And fluorescent material is pumped into the outer tube as it is used

up. This is greatly oversimplified, and certain major problems remain.

There is, for instance, no known substance out of which the tubes could be constructed. Any material we can compound would disintegrate under the fissioning process. I would also hesitate to say what kind of shield would completely protect the Saucer crew from radiation effects.

The theory of a radiation pressure motor has been discussed with experts at a number of universities. Some scoffed. Some were encouraging. Since our present investigations of atomic power are in the primer stage, however, I think it's early to say the idea is impossible. Let's simply admit that if the Saucer people utilize anything like this principle, they have probably refined and perfected it.

While I have my neck out really far, I'd like to add that a Saucer would use three sets of motors.

The main set would be used to launch it and propel it on its space voyage. These motors would be placed in one segment of the edge of the disk. A second set, probably located in the flat under surface of the disk, would be used to sustain it in flight while it hovered or prepared to land.

The third would be a small set to control roll and tilt. Since radiation from the main power plant might be great, I should imagine that the crew would be confined to a segment of the leading edge of the disk.

This would leave a large area of the midsection for fuel storage tanks, food supplies and other equipment.

One case, described by both Shalett and Keyhoe, involves a disk conforming to this pattern.

At 2:45 a.m., on July 24, 1948, an Eastern Airlines DC-3, enroute to Atlanta, Georgia, from Montgomery, Alabama, sighted a "brilliant, fast moving object" about a mile away. Captain Clarence S. Chiles, an ex-Air Transport Command flier, and Pilot John B. Whitted, formerly a B-29 pilot, both observed it clearly.

They agreed that it was about 100 feet long, shaped like a cigar. It was wingless. When the object passed them, at about eye level, they saw two rows of "windows" along the fuselage. These glowed with a blinding white light. A dark blue light ran the length of the shape, along the underside. There was a red orange flame exhaust which rocked the DC-3 at the missile veered off and zoomed out of sight.

It seems to me that rather than a cigar shaped fuselage, what the pilots may have seen was a disk, edge on. The two rows of ports would be the vents of the main power plant. The blue light came from the belly motors, thrusting downward to enable the disk to operate at the slow speed of 500 to 700 miles per hour which the pilots estimated. The flame I am less sure about. Possibly the fact that it was traveling within the Earth's atmosphere (the DC-3 was at 5,000 feet during the encounter) made exhaust particles visible. The jolt it imparted to the DC-3, however, is not surprising. I should say that the plane felt a light energy blast, a product of radiation pressure motor operation.

The discus shape, as such, conforms to aerodynamic law and would provide a perfectly feasible flying machine.

I believe, though, that the design is employed as a temperature compensating device. By varying the angle of tilt, the disk in its flight through space could control the amount of heat it received from the sun. Flat side toward the sun, it could absorb considerable heat, edge on very little.

Design, construction and operation of the Saucers indicate to me that a very superior intelligence is at work. Not only at work, but present within the disks. I cannot believe that the ready maneuverability shown, for instance, by Saucer No. 2 in avoiding the uprising Army missile was

remotely controlled.

What these people look like I have no idea. Since I insist that they are actually at the controls of their strange craft, however, I must suggest that they are considerably smaller than we are. We already know that while 6 G's are a tremendous strain on the human frame, creatures smaller than ourselves can bear up under incredible pressures. A bee can probably take 20 G's, an ant even more. Saucer crewmen would also have to be pretty small to ride Saucers No. 3, the 20 inch disks. It is staggering to imagine intelligent beings that small, but we must not disregard any possibilities.

Where the Saucers come from can only be answered by guesswork. My guess is Mars. Mars "cooled off" and perhaps became capable of supporting some form of life millions of years before the earth did. The Martians, if such there be, would have a big start in scientific development.

I believe that the frequency of the Saucers' appearance over the southwestern section of the United States may have been influenced by the relation of Mars to Earth on July 16, 1945.

On this date Mars was in a good position to see our surface. And at 5:30 a.m. on that morning, the first atomic bomb was exploded in New Mexico, in the northwest corner of the present White Sands range. It is conceivable that the flash was viewed from afar by sensitive optical instruments.

What are the Saucers up to? So far, their behavior would indicate that they are interested only in observing us. The fact that the Saucers' operations so far have been peaceful also seems to knock out the suspicion that they have been launched by a foreign Earth power such as Russia. If a nation were fiddling with long range missiles, why would it experiment over the United States, where a crash could deliver the object and all its secrets on our doorstep?

Will the Saucers land? The small ones might. If their occupants decide they could survive on Earth, the small Saucers might be dispatched from the larger missiles.

The larger disks, even assuming maximum motor efficiency, probably could not risk the loss of accumulated momentum that would occur in landing. It would be too difficult to generate again the momentum necessary to return home.

Why don't you see Saucers?

The atmosphere over about 75 percent of the Earth's surface is filled with moisture particles. These give us a "white sky" much of the time. Against such a background, it would be mere chance which allowed anyone to sight a Flying Saucer. At White Sands, we undoubtedly had near perfect atmospheric conditions and excellent visibility.

I know that this is a fantastic story. I cannot prove the theories I have outlined. I probably can't even prove the disks are real until I've ridden in one.

But in terms of the very limited knowledge we of the Earth possess, these ideas perhaps offer a clue to the solution of a great puzzle.

Whatever the answer, I can't feel that there is anything terrible, hostile or dangerous about the Flying Saucers or their occupants.

The challenge of space travel has fascinated the people of Earth for centuries.

It is not fantastic for us to explore other planets, why should it be fantastic for Martians, say, to visit us?

So far, all I have suffered is a little hurt pride. They got here first.

-- Commander Robert B. McLaughlin

Commander Robert Bright McLaughlin is an expert in naval ordnance and guided missiles. For the past three years he has been in charge of the Navy unit assisting in classified projects at the White Sands Proving Ground, Las Cruces, New Mexico.

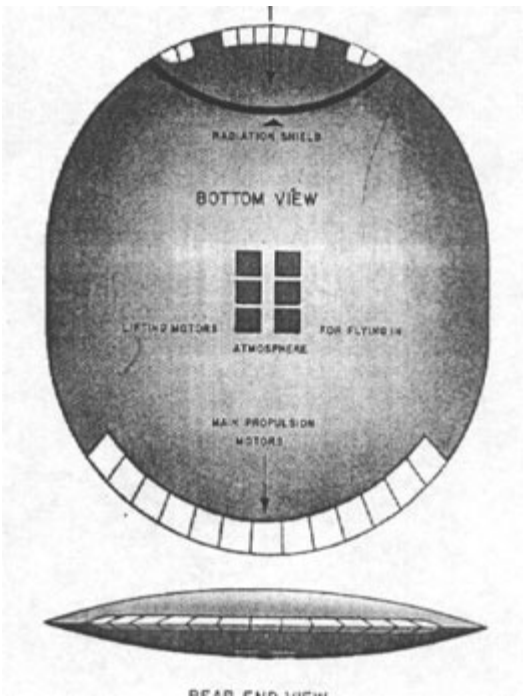
He began his researches in the guided missile field in 1939, four years after his graduation from the Naval Academy. A post-graduate student of engineering at that time, he was assigned to a Navy board evaluating the effectiveness of antiaircraft gunnery. By 1941, he had outlined the technique for a "beam rider" guided missile which, by the ability to "change its mind" after being fired, heightened antiaircraft accuracy against swift, evasive, high altitude aircraft targets.

During the war he was gunnery officer aboard the aircraft carrier Intrepid and saw action in the major Pacific campaign from Kwajalein to the Philippines. He was with the Intrepid when it underwent an attack by thirty three Japanese Kamikaze (suicide) planes in three and a half minutes.

In August, 1946, he was assigned to White Sands. He is 37, a stocky, round faced man with curly brown hair, blue eyes, and a crisp, precise manner of speaking. He is married and has two youngsters, a girl of 2 1/2 years and a boy of 10 months.

At present he is skipper of the destroyer Bristol.

Control section and cabins



Schematic views of space ship driven by radiation pressure

When the Air Force early this year declassified the hitherto secret Project Saucer files, it revealed that 375 incidents of "unidentified flying objects" had been analyzed by consulting scientists. Of these, 341 had been explained to the Air Force's satisfaction.

It was officially admitted that for 34 incidents, there was no "apparent ready explanation." Among these was the opening incident of Commander McLaughlin's article.

Even these 34, the Air Force said, might be rationally explained if the "psychological and

physiological" factors were taken into account. But the Aero-Medical Laboratory, which was most concerned with such factors, acknowledges that "it will never be possible to say with certainty that any individual did not see a space ship, an enemy missile or other flying objects. All that is possible is to judge the likelihood that he saw such objects."

In short, Project Saucer experts admit that statistical probability -- rather than scientific proof -- was the best it could expect to achieve.

The Editors of TRUE believe that the admitted existence of 34 "unexplained incidents" indicates that the announced discontinuance of Project Saucer was premature. TRUE further believes that the official announcement was ill advised, made in haste, and that the United States Project Saucer has in fact been continued without interruption under another code name. The 34 "unexplained incidents" which the Air Force concedes -- there are no doubt others -- are the best documented and the hardest to explain in any fashion other than by the interplanetary thesis first set forth by Donald E. Keyhoe in TRUE for January and here repeated by Commander McLaughlin.

NAVY OFFICER TELLS

HOW SCIENTISTS TRACKED A FLYING SAUCER

by

Commander Robert B. McLaughlin, USN

In its January issue TRUE said that the flying saucers are real and interplanetary. Its story was widely reported by the nation's press and radio. TRUE's findings are here confirmed by Commander McLaughlin, a rocket expert at White Sands Proving Ground who worked independently of this magazine's investigation. He reveals how a group of Navy men and scientists tracked a flying disk with a precision instrument, and tells of flights he and others witnessed.

The author, now on active naval duty.

On a bright, clear Sunday morning in April, 1949, a detachment of Navy men and a group of scientists released a balloon from a point 57 miles northwest of the White Sands Proving Ground base.

They were interested in getting weather data from the upper atmosphere, and as the balloon rose, they charted its flight as usual with a theodolite and a stop watch. There were five observers in all, four of them co-ordinating the instrument data. One followed the balloon through the theodolite's telescope. One called off the readings. One recorded them, and the fourth man held the watch.

Shortly after the balloon was aloft, west of the observation point, the theodolite operator swung his instrument rapidly to the east.

A strange object, seen by everyone present, had crossed the path of the balloon. The instrument man, confused, had followed it. Swiftly, one of the scientists grabbed the theodolite and began tracking the missile.

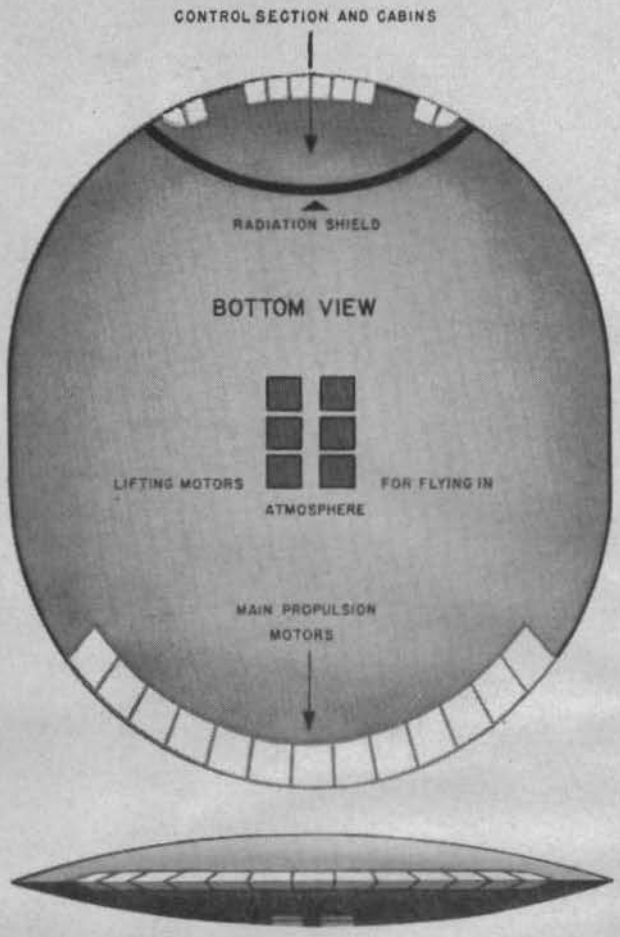
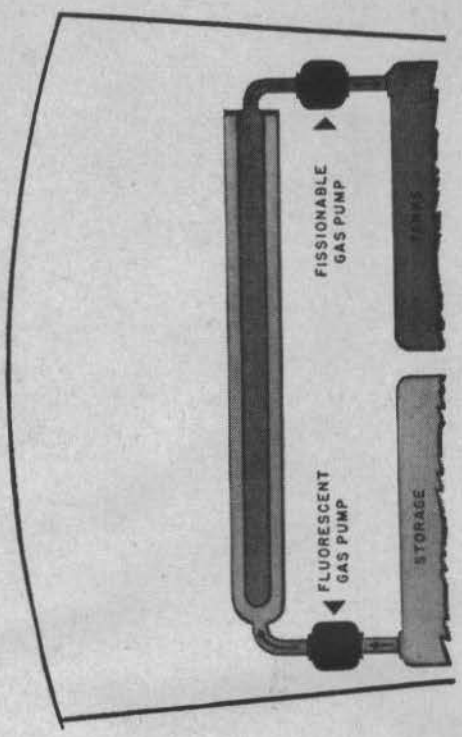
At present he is skipper of the destroyer Bristol.

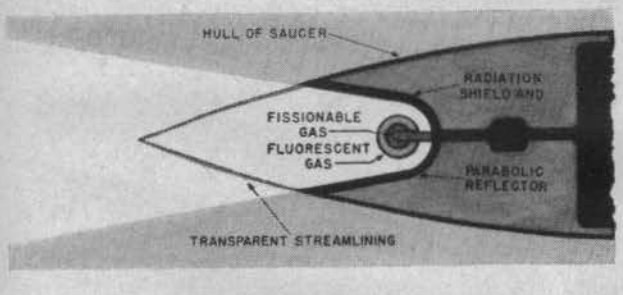


Schematic views of space ship driven by radiation pressure.

An accurate plot of the object's course was recorded. Analyzing this data later, I can state definitely that:

1. The object, viewed in cross section, was elliptical in shape.
2. It was about 105 feet in diameter.
3. It was flying at an altitude of approximately 56 miles. (This was determined by a ballistics expert. An object at a lower altitude on this particular bright day could not have fitted the data taken. For security reasons, I cannot go deeper into this method of calculating altitude.)





Light from motor, shown top and side, gives "rocket" thrust.

4. Its speed was about 5 miles per second.

5. At the end of its trajectory, it swerved abruptly upward, altering its angle of elevation by 5 degrees—corresponding to an increase in altitude of about 25 miles—in a period of 10 seconds. A rough calculation indicates that a force of more than 20 G's (20 times the pull of gravity) would be required to produce this elevation in this time.

6. The object was visible for 60 seconds.

7. It disap- [*Continued on page* 96]

How Scientists Tracked a Flying Saucer

[*Continued from page 27*]

peared at an elevation of 29 degrees.

Close questioning of the observers, prior to the official report that went to "Project Saucer" at Wright-Patterson Field in Dayton, Ohio, produced an almost unanimous judgment that the object was discus-shaped and that it was a flat white color. High-powered binoculars showed no exhaust trail, no stream of light or other evidence of a propulsion system. And no sound. What was it?

I am convinced that it was a Flying Saucer and, further, that these disks are space ships from another planet, operated by animate, intelligent beings.

I think it is safe to say that it *wasn't* any type of aircraft known on Earth today. Even if, as is likely, there are top-secret models which you and I know nothing about, there is no human being in this world who could take a force of 20 G's and live to tell about it.

I doubt that it was a meteor. These small bullets from space frequently light up our sky as they burn, from friction generated by hurtling through our atmosphere. But only occasionally are they visible in daytime. And besides, meteors remain in view for only a few seconds—10 or 12 at the maximum. This object was watched for 60 seconds.

Its size rules out the possibility of its being a bird or other known creature. No cloud could have moved in such a trajectory.

It was not a balloon, I can state positively. A number of the men who saw it were experienced balloonists. Furthermore, they were in a position to know that no balloon capable of approaching the object's altitude was in the area. Even at 120,000 feet, near the peak altitude for any present type, a balloon would have to have been moving at some 1,700 miles per hour to conform to the trajectory data.

And to clinch it, the wind 20 miles up was, as it happens, moving from east to west—opposite to the motion of the object.

Hallucination? Optical illusion? I think it is reasonable to say that illusions do not appear simultaneously and identically to five different trained weather observers.

I cannot think of any other possibilities. Reliable observers saw the object. A sensitive instrument tracked it. The atmosphere was bright and clear in an area where we considered it a dull day if you could not see 50 miles horizontally with the naked eye.

The only flaw was that I—up to that time—had not seen a Flying Saucer personally.

Nonetheless, the information excited me. I began to seek an explanation—a respectable, convincing answer in terms of physics, mathematics, aerodynamics and astronomy as we know them today.

Before I had completed my theories, I saw a Saucer for myself.

One morning late in May, I was standing outside my office at the White Sands base during the flight of an Army upper-atmosphere missile. These, of course, rise much faster than a balloon and usually you lose sight of them shortly before they reach peak elevation. You are very fortunate if you can spot them again on the way down.

The missile had been fired, and we had just lost sight of it when a lieutenant commander standing next to me yelled: "There it goes."

A Marine captain and I saw what he was pointing at. (A civilian engineer and a Marine major with us did not.) A white object was proceeding very slowly westward. As I watched, it rapidly gained speed.

The object had now passed overhead, and I thought it was going to fall near a ranch house two or three miles west of us. But it spurted like a scalded cat, shot over the Organ Mountains behind us and disappeared.

This was a very serious matter to us. We always took every precaution to prevent missiles from leaving the range. Immediately, I phoned the range safety officer.

"I've just seen your missile leave the range to the west of here," I said.

He groaned. As we debated what to do, we both heard the thudding impact of our missile well to the north of us and in the center of the range.

What, then, had I seen? I now faced the problem of every Flying Saucer witness. What was truth? What was imagination?

Two Saturday Evening Post articles last year by Sidney Shalett concluded that the disks were hallucinations, upper-atmosphere weather balloons, astronomical phenomena or the result of vertigo or self-hypnosis. In the January issue of this magazine, Donald E. Keyhoe, aviation expert for TRUE, asserted that the saucers are visitors from another planet.

I thought back as carefully as I could over what I had seen. I realized I was slightly better off than most witnesses. I had not expected to see a Saucer, but I had expected to see *something*. My eyes, fairly used to this kind of observation, had been looking for a fast-moving missile.

These impressions I settled on as accurate:

1. The Saucer, at the time it was first sighted, had been going at an extremely slow speed, perhaps 1 mile per second.

2. Despite this relative slowness, I could not determine its shape, although I judged it was similar in size to Saucer No. 1 because it was visible at an altitude above 25 miles.

3. It accelerated to a speed far in excess of anything obtainable with present-day rocket motors.

4. The object passed within 5 degrees of the sun and was still visible to the naked eye. This would hardly have been true if the object had been a meteor.

5. Again, there was no evidence of a propulsion system.

The last appearance of Flying Disks

which I feel is reliable enough to report occurred in early June. *I did not see it personally, but the circumstances are impressive enough for me to include them here.*

This day we were firing a Navy upper-atmosphere missile. Shortly after its take-off, two small circular objects, guessed to be approximately 20 inches in diameter, appeared from no place and joined the Navy missile on its upward flight. (Similar small disks have also been previously reported as well as the large types mentioned earlier.)

At about the time the Navy missile was doing well over 2,000 feet per second, the object on the west side passed through the exhaust gases and joined its friend on the east. They then apparently decided the missile was not going fast enough for them. They accelerated, passed the Navy missile and sailed off upward and eastward.

Some eight minutes after the Navy missile had fallen back into the range, I received a radio report from a very powerful optical observation post located on a mountaintop. The Navy missile, it said, had just passed over the mountains and was going out of the range to the west. This could have been one of the two objects that we had seen and which had changed direction, or it could have been a third one.

The odd thing is that before long I had reports from eleven men in five separate OP's, none of which could communicate with each other and which were located at different points of the compass. All had seen the two objects perform as I have described.

Putting together all the data observed in three appearances, one of which I had seen for myself, and all of which I believe beyond doubt, I decided that it was necessary to look outside the known world for an answer.

No one realizes better than I do that the explanations which follow may be incorrect. I think, however, that there is too much evidence from too many reliable sources for us to be content with inconclusive explanations, and we must press on to find an answer.

I think that the Saucers are piloted space ships, first, because of their flight performance. The White Sands Saucers were most definitely capable of changing their direction while above our atmosphere. This extreme maneuverability—plus their large size—eliminates for me the likelihood of their being operated by remote control.

My own experience with rockets leads me to feel that a Saucer with such characteristics is far beyond the technical powers of anyone on Earth. Our present

system of rocket propulsion, using thermochemical energy, is entirely inadequate to duplicate the terrific 5-degree gain in altitude observed during the flight of Saucer No. 1.

If you accept this, you are led to assume that the Saucers can be propelled only by power derived from the atom.

What kind? And how? Well, I suggest a "radiation-pressure motor."

Radiation pressure is one of the oldest-known physical phenomena. You have seen it work if you have ever noticed a little glass-enclosed gadget that jewelers often place in their shop windows. This is the "Crookes radiometer," a device more than 100 years old. Inside a small glass globe four metal vanes, black on one side and silver on the other, rotate on an axis, although there is apparently no motor driving them.

Light supplies the power. It radiates a "push" that varies from the surface of one vane to that of the one next to it. Now, where could the Saucer engineers get enough light to propel their missile through space?

I envision a motor somewhat like a fluorescent lamp. An inner core is filled with fissionable material, probably a gas. An outer tube surrounding the core contains a fluorescent material.

The fissionable gas activates the fluorescent material, causing light. Light exerts pressure—a propulsive push or thrust—against a heavily shielded curved reflector. The push propels the missile.

The activity of the fluorescent material is controlled by increasing or decreasing the amount of fissionable gas in the inner core. And fluorescent material is pumped into the outer tube as it is used up. *This is greatly oversimplified, and certain major problems remain.*

There is, for instance, no known substance out of which the tubes could be constructed. Any material we can compound would disintegrate under the fissioning process. I would also hesitate to say what kind of shield would completely protect the Saucer crew from radiation effects.

The theory of a radiation-pressure motor has been discussed with experts at a number of universities. Some scoffed. Some were encouraging. Since our present investigations of atomic power are in the primer stage, however, I think it's early to say the idea is impossible. Let's simply admit that if the Saucer people utilize anything like this principle, they have probably refined and perfected it.

While I have my neck out really far, I'd like to add that a Saucer would use three sets of motors.

The main set would be used to launch it and propel it on its space voyage. These motors would be placed in one segment of the edge of the disk. A second set, probably located in the flat undersurface of the disk, would be used to sustain it in flight while it hovered or prepared to land.

The third would be a small set to control roll and tilt. Since radiation from the main power plant might be great, I should imagine that the crew would be confined to a segment of the leading edge of the disk.

This would leave a large area of the midsection for fuel storage tanks, food supplies and other equipment.

One case, described by both Shalett and Keyhoe, involves a disk conforming to this pattern.

At 2:45 a. m., on July 24, 1948, an Eastern Airlines DC-3, en route to Atlanta, Georgia, from Montgomery, Alabama, sighted a "brilliant, fast-moving object" about a mile away. Captain Clarence S. Chiles, an ex-Air Transport Command flier, and Pilot John B. Whitted, formerly a B-29 pilot, both observed it clearly.

They agreed that it was about 100 feet long, shaped like a cigar. It was wingless. When the object passed them, at about eye level, they saw two rows of "windows" along the fuselage. These glowed with a blinding white light. A dark blue light ran the length of the shape, along its underside. There was a red-orange flame exhaust which rocked the DC-3 as the missile veered off and zoomed out of sight.

It seems to me that rather than a cigar-shaped fuselage, what the pilots may have seen was a disk, edge on. The two rows of ports would be the vents of the main power plant. The blue light came from the belly motors, thrusting downward to enable the disk to operate at the slow speed of 500 to 700 miles per hour which the pilots estimated. The flame I am less sure about. Possibly the fact that it was traveling within the Earth's atmosphere (the DC-3 was at 5,000 feet during the encounter) made exhaust particles visible. The jolt it imparted to the DC-3, however, is not surprising. I should say the plane felt a light-energy blast, a product of radiation-pressure motor operation.

The discus shape, as such, conforms to aerodynamic law and would provide a perfectly feasible flying machine.

I believe, though, that the design is employed as a temperature-compensating device. By varying the angle of tilt, the disk in its flight through space could control the amount of heat it received from the sun. Flat side toward the sun, it could absorb considerable heat, edge-on very little.

Design, construction and operation of the Saucers indicate to me that a very superior intelligence is at work. Not only at work, but present within the disks. I cannot believe that the ready maneuverability shown, for instance, by Saucer No. 2 in avoiding the uprushing Army missile was remotely controlled.

What these people look like I have no idea. Since I insist that they are actually at the controls of their strange craft, however, I must suggest that they are considerably smaller than we are. We already know that while 6 G's are a tremendous strain on the human frame, creatures smaller than ourselves can bear up under incredible pressures. A bee can probably take 20 G's, an ant even more. Saucer crewmen would also have to be pretty small to ride Saucers No. 3, the

20-inch disks. It is staggering to imagine intelligent beings that small, but we must not disregard any possibilities.

Where the Saucers come from can only be answered by guesswork. My guess is Mars. Mars "cooled off" and perhaps became capable of supporting some form of life millions of years before the earth did. *The Martians, if such there be, would have a big start in scientific development.*

I believe that the frequency of the Saucers' appearance over the southwestern section of the United States may have been influenced by the relation of Mars to Earth on July 16, 1945.

On this date Mars was in a good position to see our surface. And at 5:30 a. m. on that morning, the first atomic bomb was exploded in New Mexico, in the northwest corner of the present White Sands range. It is conceivable that the flash was viewed from afar by sensitive optical instruments.

What are the Saucers up to? So far, their behavior would indicate that they are interested only in observing us. A TRUE BOOK-LENGTH FEATURE

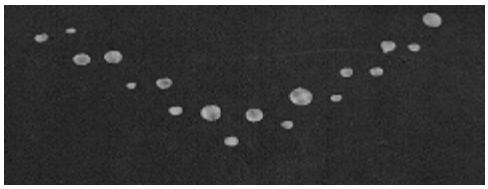
What Our Air Force Found Out About UFOs.



Photographs of the famous Lubbock Lights, by an 18-year-old amateur, were "never proved to be a hoax."

From 1951 to 1953 Mr. Ruppelt was in charge of Project Blue Book, the official Air force investigation of Unidentified Flying Objects. This is what he learned from them.

BY CAPTAIN EDWARD J. RUPPELT, USAFR

On August 12, 1953, a woman in the Ground Observer Corps in the Black Hills of South Dakota reported a light hovering in the sky to the east of her position. Two operators from a radar station went out to check the thing visually while the woman was still on the telephone. While they were scanning the sky, the woman reported, "The thing is beginning to move over Rapid City." At the same time, the two radar men observed the light start to move. They returned to their radar to pick it up and the woman reported that the object was moving back to its original position. The radar got a fix on it at that spot.

An F-84, in the air at the time, was vectored in to the target. The jet pilot sighted the light visually and started after it. The object headed north with the jet after it, and the radar operators observed the chase on their scope. The Unidentified Flying Object stayed ahead of the jet and seemed to put on speed whenever the pilot speeded up the jet. After chasing the object 120 miles, the pilot ran low on fuel and was granted permission to return. When the jet turned around the UFO also turned and followed him back.

After the first jet landed, a second F-84 went up to investigate. He was talked into position and spotted the thing visually above him. He went up to 20,000 feet, reported that he was level with

the light and again the object took off to the north with the jet in pursuit. Again the chase was observed on ground radar, with both the UFO and the jet showing plainly on the scope.

In the second pursuit, the pilot made a number of tests to rule out some of the common phenomena that have been mistaken for "flying saucers." He turned off all his instrument lights and kicked the plane around to make certain that he was not chasing a canopy reflection. He was not. He observed the object carefully in relation to the stars, and swore that it moved across them, thus eliminating the possibility that he was chasing a planet or a

star. Finally, when he though he was closing in on the object, he switched on his radar gun sights. This type of jet has a light on the instrument panel that goes on to indicate a "lock on" with the target by the radar sights. The light went on.

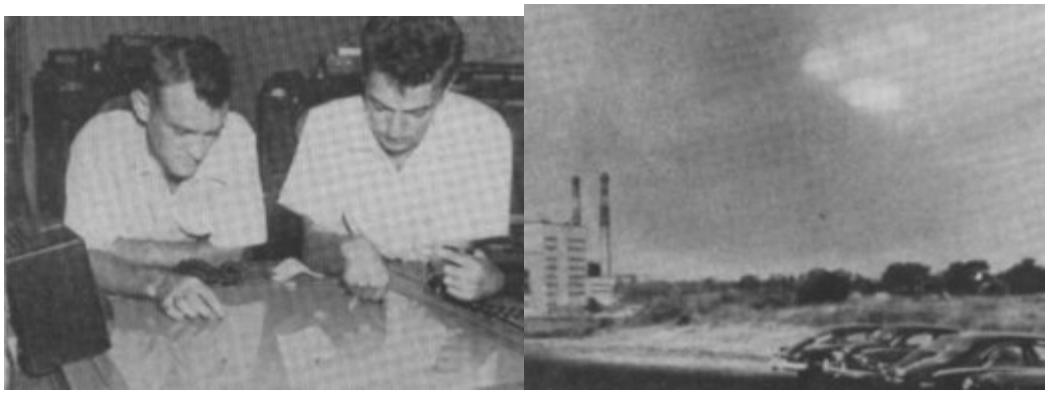
The second jet chased the light 160 miles to the north before abandoning the pursuit. This time the UFO continued flying north. The Ground Observer Corps Filter Center ahead was alerted and observers there reported a light speeding north.

This was indeed an astounding occurrence. There were simultaneous visual sightings from two ground sites linked by telephone, simultaneous ground and radar sightings, simultaneous ground-radar and jet-visual sightings, a pursuit in which the UFO outran the jet, a reversal in course, a second jet-visual sighting confirmed by ground radar, an air-radar "lock on" and finally a sighting from the ground hundreds of miles away.

What was the object? For two years, from 1951 to 1953, I flew 200,000 miles, conferred with dozens of top American scientists and an exotic collection of hot-eyed screwballs, stumbled through Florida mangrove swamps, dragged myself out of bed at 3 a.m. to answer transatlantic telephone calls, inspected scores of strange photographs and watched one short amateur movie ninety-seven times in an effort to answer this and similar questions.

My colleagues and I were lambasted by fellow Americans for concealing the biggest news story in the history of modern man, and by Radio Moscow for the setting the stage for atomic war.

I was called an ignorant dupe, a Charlie McCarthy manipulated by powerful forces in the Pentagon. I was consulted by the White House, and I briefed the highest figure in the Air Force, who listened respectfully and let me do all the talking.



Radar operators James Copeland and James Ritchey saw "unidentified blips" on Washington National Airport's scope in 1952. Right: Photograph, July 16, 1952, by a Coast Guardsman purports to show five flying saucers over Salem, Mass.

For two years, with the help of the best brains in the country, we worked on a giant jigsaw of a puzzle that was either utterly meaningless or would rock the world.

For every piece that we fitted into place, we found that two more had been added to the puzzle pile.

I finally found myself soberly inspecting a piece of cow manure to learn if it had come from outer space.

From 1951 to 1953, I was in charge of the official Air Force investigation of Unidentified Flying Objects, the things that whiz through space under the popular name of "flying saucers."

The Age of the Flying Saucer was in Year Five when it plucked me out of my job as technical intelligence analyst for the Air Technical Intelligence Center at Wright Field, Dayton, Ohio.

Year One had opened on June 24, 1947, when a Boise businessman named Kenneth Arnold reported seeing a chain of nine "saucerlike things" glinting in the sun as they flew at 1,200 mph--twice the speed of sound--near Mt. Rainier. His story snared the nation's imagination with one baffling fact. No known aircraft in the world had broken the sound barrier at that time. "I don't believe it," Arnold said, "but I saw it."

If Arnold's story had stood alone, the Age of the Flying Saucer would have opened and closed with a one-day stand. But in the next thirty days there were fifty-three more reports of saucers. Near Portland, Oregon, a could of deputy sheriffs reported "twenty in a line going like hell to the west." A Chicago housewife saw one "with legs" and ran into the house and slammed the door. A Prospector in the Cascade Mountains spotted five or six of them "with tails" and was startled to see his magnetic compass "gyrating wildly." In Spokane, a woman reported five of them "about the size of a five-room house." Hers were shaped "like washtubs." A remarkably cool gentleman in Seattle spoke out and reported, "Why, they come through our yard all the time."

At the time, I was out in Yellowstone National Park, on vacation from Iowa State College, where I was studying aeronautical engineering. It was my second try for a degree. I had dropped out the first time, in 1942, to enlist in the Air Force. I had been assigned as bombardier in the first B-29 squadron organized, flown the Hump out of India, and then moved over to Tinian for the big raids against Japan. Our group flew the last mission of the war, a raid against Tokuyama, just 15 minutes before the end of the war.

Within a few days after Arnold's sighting Youngsters were tossing paper plates over our lodge at Yellowstone and yelling, "Saucer, saucer!" Some of the tourists started seeing things and would come in and tell about them, as if their vacation was complete. I read Arnold's story and shrugged it off. Twice over Japan I'd seen strange objects in the sky. One was an orange-yellow light that followed our B-29 for awhile and then suddenly winked out. The consensus was that it was a "foo fighter" --the strange light spotted dozens of times over Europe and Japan. The theory was that it was a static-electricity phenomenon. Another time, flying home with jumpy nerves after a rough mission, I cut loose with six .50-caliber guns at a bright object just about dawn. After getting the crew in an uproar, I suddenly realized I was shooting at the planet Venus.

Among the sightings that followed Arnold's, however, there appeared some that looked like more than hysteria. They came from pilots acquainted with the tricks that flying can play on the eyes, from scientists, from other presumably sober and unexcited observers. A meteorologist in charge of the U.S. weather bureau station at Louisville, Ky., reported an orange light "rolling through the night sky." At Muroc Air Field, in California, site of secret government experimental plane tests, Lt. Joseph McHenry spotted "two silver objects of either spherical or disklike shape." He summoned three other people from the base and they saw the same things. Three more witnesses joined the group, and five of the seven saw a third object. No experimental craft were in the air. The objects moved against the wind and hence were not balloons. A few hours later, a major and a colonel at Muroc made a separate sighting of "a thin metallic object" that sported over the field for eight minutes.

Two United Air Lines pilots, E.J. Smith and Ralph Stevens, flying from Boise to Portland, reported following four or five "somethings" for 45 minutes before they "disappeared in a

burst of speed." They described them as "thin and smooth on the bottom and rough appearing on the top."

The Air Force, I learned later, wavered between two schools of though during this first rash of sightings. Some fairly high officials felt concern over them. The U.S. had seen complacency lead to one Pearl Harbor, and international tensions were beginning to tighten under the climate of the "cold war." These officials felt that we ought to find out--and quickly--what was causing the epidemic of saucer stories.

Opposed were those who argued that Arnold's story had triggered a mass hysteria. They felt that the publicity given to the first sightings set millions of people to scanning the sky to "see a saucer," and that they deluded themselves with all sorts of things--blowing paper, birds, reflections from planes. This group reasoned that the sightings would dwindle in the normal course of events.

The skeptics were bolstered by the discovery that Arnold's account had some holes in it. His estimates of the size of

the objects and their distance from his plane did not jibe. He reported them to be 20 to 25 miles away and from 45 to 50 feet in length. When his sighting was analyzed, it was discovered that objects of that size cannot be resolved by the naked eye at that distance. If his estimate of size was correct, the objects were only six or seven miles away--and flying at about 400 mph, well inside the range of conventional craft.

The early skepticism was strengthened when none of the objects indicated any menace, landed, or crashed where examination would establish that they were indeed something new under the sun.

The early dispute over the handling of the Unidentified Flying Objects stories was settled by the UFO's themselves. They persisted, month after month, with a hard core of incidents that came from seasoned observers and defied analysis. The Air Force decided to concentrate the investigation and build up a body of data that could be analyzed.

They set up Project Sign and went after the saucers in earnest. Later the code name was switched to "Grudge." We changed it later to "Blue Book" when someone in the Pentagon suggested that "Grudge" gave the impression that the project was tackling the job begrudgingly. The code "Blue Book" was taken from the traditional college blue books which had all the answers to the examination questions. It did not prove a particularly apt choice.

The sightings kept coming in through 1947, 1948, 1949 on an average of about one every three days. The controversy over them built up and the confusion multiplied. Articles began to crop up in international magazines and radio commentators periodically broadcast "the inside story of the saucers," with each account contradicting the other. They were secret U.S. weapons, new Russian craft, emissaries from another planet scouting the earth.

In 1949, the Air Force submitted the 375 sightings then on hand to an intensive reevaluation and issued a thick report on its findings. Dr. J. Allen Hynek, head of the astronomical department at Ohio State University, screened the reports for things of astronomical nature, such as stars, planets, meteors. The Air Force Weather Service checked the reports for balloons. The Rand Corporation (a high level research group that has nothing to do with the business-machine firm), the Air Force Geophysical Laboratory, the U.S. Weather Bureau, and Dr. F.M. Fitts, a psychologist from the Air Force Aero-medical Laboratory, made some

general appraisals from their specialized viewpoints.

The Rand Corporation commented: "We have found nothing which would seriously ert simple rational explanations of the various phenomena in terms of ball onventional aircraft, planets, meteors, bits of paper, optical illusions, practical jokers, psychopathological reporters and the like."

Dr. Hynek: "Assuming evidences of observers and investigators to be correct, it is concluded that 32 percent can be explained astronomically, 35 percent can be attributed to birds, balloons, sky

rockets, aircraft, etc., and 38 percent either lacked necessary evidence or a suitable explanation was not apparent."

The USAF Air Weather Service stuck to its own field, commented that "12 percent apparently were balloons."

Of the 375 reports, 13 percent did not have readily explainable solutions. Dr. Fitts advanced a theory: "There are sufficient psychological explanations for the reports of Unidentified Flying Objects to provide plausible explanations for reports not otherwise explainable. These errors in identifying real stimuli result chiefly from the inability to estimate speed, distance, and size."

Supporting these analyses were bulky articles of carefully reasoned and qualified considerations of the data. The press, always eager for an answer that will fit into two lines of headline type that counts twelve letters to the a line, condensed the whole report into a "write-off" by the Air Force. The UFOs ignored the Rand Corp., Dr. Hynek, the press, et al, and continued to fly. In 1950 exactly the same number landed in the project files--152--as showed up in 1949.

Then in 1951, they began to dwindle.

Meanwhile I had finished my college work at Ames and had rolled up my new sheepskin just in time to be recalled to Air Force duty because of Korea. They stationed me at Dayton, where for the first seven months I worked on conventional aircraft that you can see, feel and measure.

The primary function of the Air Technical Intelligence Center is not, as some people believe, analyzing the UFO mystery. It is charged with the prevention of technological surprise by a foreign country. It studies all the data it can get on enemy aircraft, guided missiles, and technological advances on anything that flies. It got the saucer project because the one thing that every observer agreed on was--the things flew.

This once stirred a harassed Blue Book investigator to complain. "Why in the hell don't the damn things swim so we can turn them over to the Navy?"

By the summer of 1951, Grudge was down to one man, the sightings were dwindling, and it looked as if the project would fold for lack of business. In June, for the first month in four years, not a single sighting came in. In August the lone investigator was transferred, and the project was turned over to a friend of mine, Lt. Jerry Cummings. I used to drop in and kid him about the poor state of the saucer business.

"You're going to be out of work, boy," I told him.

"You're right," he told me, "but for the wrong reason. I got a discharge coming up."

At 3 p.m. Sept. 12, 1951, the project suddenly came to life. The ATIC teletype began chattering out a yard-long message from northern New Jersey. When it signed off, it looked as if the Garden State had been invaded by something out of H.G. Wells.

It had started two days before, on Sept. 10, at 11:10 a.m., when a student operator was giving a demonstration to a group of visiting brass at a radar school in New Jersey. He had been picked for the show because he was the top man in his class. He demonstrated the set under manual operations for awhile, picking up local air traffic. Then he announced that he would demonstrate automatic tracking, in which the set is put on a target and follows it without help from the operator. The set could track objects flying at jet speeds.

The operator spotted an object about 12,000 yards southeast of the station, flying low toward the north. He tried to lock on for automatic. He failed, tried again, failed again. He turned to the audience of VIP's embarrassed.

"It's going too fast for the set," he said. "That means it's going faster than a jet."

A lot of very important eyebrows lifted. What flies faster than a jet?

The object was in range for three minutes and the operator kept trying without success, to get an automatic track. It finally went off the scope, leaving a red-faced operator talking to himself.

Twenty-five minutes later, the pilot of a jet trainer, carrying an Air Force major as passenger and flying 20,000 feet over Point Pleasant, N.J., spotted a dull silver disklike object far below him. He described it as 30 to 50 feet in diameter and as descending toward Sandy Hook from an altitude of a mile or so. He banked over and started down after it. As he shot down, he reported the object stopped its descent, hovered, the sped south, mad a 120-degree turn and vanished out to sea.

The Jersey puzzle then switched back to the radar group. At 3:15 p.m. they got an excited call from headquarters to pick up a target high and to the north--which was where the first "faster than a jet" object had vanished--and to pick it up in a hurry. They got a fix on it and reported that it was traveling slowly at 93,000 feet. They also could see it visually as a silver speck.

What flies 18 miles above the earth?

The next morning two radar sets picked up another moving target that couldn't be tracked automatically. It would climb, level off, climb again, go into a dive. When it climbed, it went almost straight up.

The two-day sensation ended that afternoon when an unidentified hovering object was picked up for several minutes.

A copy of the long New Jersey report went to Washington, and shortly later Dayton got instructions to go up, investigate and report to the Pentagon. In a matter of hours, Lt. Cummings and an ATIC lieutenant colonel were flying out to see what was up.

Two days later they were back with reams of raw data. Before Cummings could start sorting out the jigsaw, he got his discharge.

Up to this point, I done the work I was assigned to and paid little attention to flying saucers.

But the New Jersey outbreak fascinated me. Whatever had happened there was plainly a lot more than the occasional "saucer" story I'd read in the papers, where a Dakota farmer saw something zip over his barn, or a housewife saw six disks wobbling through the sky while she hung up her wash. My

curiosity overcame the ancient rule that men in uniform have followed since Hannibal's day. I volunteered.

I told myself that I'd solve the Jersey puzzle and then go back to my regular work. It turned out that I did neither. As if to jeer at my brash confidence, the UFOs suddenly started flying all over the country. In a matter of days I found myself down in Texas tangled up in one of the classics of the saucer sage--the Lubbock lights.

I went into the UFO investigation with curiosity and no preconceptions. I soon found that the job had enormous difficulties. The basic one was that there were no precedents, rules or manuals for chasing flying saucers. The evidence you work with--with few exceptions--is the recollection of observers, usually excited, puzzled or frightened humans trying to describe events completely foreign to their experience. And what they had seen usually appeared unexpectedly and vanished in a matter of seconds. After a few months I got so I could predict the start of their stories.

"Now listen," they would say, in a mixture of apology and belligerence, "I never believed in those things before. I laughed at them like everybody else. You can check me with any of my friends. I'm not cracked and I wasn't drunk. I don't know what it was, but I tell you, I SAW it. . . ."

What did they see? Trying to evaluate it led you into a dozen complex technical fields -- psychology, meteorology, physiology, astronomy, aerodynamics, electronics, physics, logic, chemistry, plan and fancy detective work.

Most of the people we talked to tried earnestly to tell us exactly what they had seen. But human beings are imperfect observers. This is not something unique to saucer sighters. Police and newspapermen have struggled with it for years. Ten eyewitnesses to an auto wreck will tell ten different stories, and each will be positive that his is the true account. Autos travel only 60 or 70 miles an hour. The incidents we investigated involved things supposedly moving as fast as 25,000 miles an hour. And they were seen from great distances, usually under the worst possible conditions for accurate reporting, often at night and for only a few seconds.

The data in the Lubbock case was much better than in 99 percent of the incidents that came into Blue Book. It involved multiple sightings by a group of Ph.D.'s, backstopped by a series of independent sightings. In addition, there were pictures--four of them.

The sightings had been going on for weeks before we got word of them. They had started on the evening of August 25, when four professors from Texas Technological College were sitting in the back yard of one of their homes watching for meteors. At 9:30, a flight of weird bluish-green lights, in a roughly crescent formation, raced across the sky. The sight caught them by surprise. Being men of science, the deplored the fact that their first startled observation had been hasty and incomplete. The vowed to do better if the lights reappeared. That night they made a second sighting. In the next few weeks, they made twelve more.

When I got to Lubbock, they had compiled what data they could. They had measured the

angular velocity and found it to be 30 degrees per second. In an effort to compute the speed, they had set up an ingenious two-way radio system and had tried to get sightings from two spots and make a rough triangulation. This had failed but the failure provided a clue.

The sightings had been reported to the local paper. In the nights following the first appearance of the flying lights they were seen by hundreds of nonprofessional witnesses. Arguments were raging all over Lubbock as to whether the objects were secret missiles, space ships--or ducks.

On the night of August 31, an 18-year-old amateur photographer shot some pictures. He had the prints and the negatives. The pictures were later reproduced all over the world, and are included in almost every book about the saucers.

"I was lying in bed when I saw a flight of the lights go over," he said. "I grabbed my loaded Kodak 35 and went out in the back yard. In a little while a second flight came over and I made two shots. Then a third flight passed over and I took three more shots." The camera was set at f 3.5 and the shutter at 1/10 of a second.

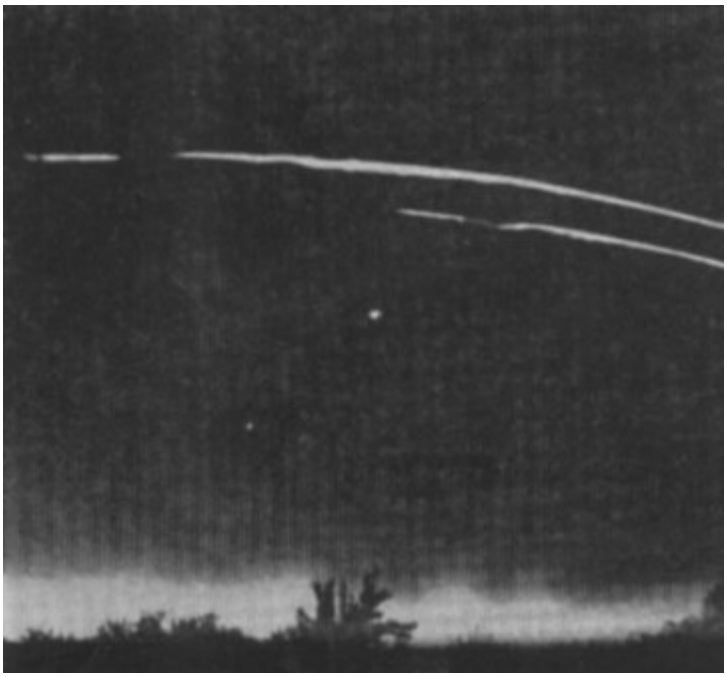
His prints were clear, and showed the lights in a sharply defined V. One of the negatives had been misplaced, but we had four for analysis. Each showed 18 lights in the V formation, with a larger one off to the right. This was promptly labeled "the mother ship" by the science-fiction boys--an analysis that struck me as about 99 percent fiction and about one percent science.

Close examination showed a peculiarity in the pictures that has been ignored in almost every account of them that I have read. There is a marked dissimilarity in the lights in the four pictures. In one, they are diagonal dashes; in the next, roughly circular; in the third they are tadpole-shaped, with their tales all pointed to the left; in the fourth, they are like arrowheads. In each picture, the "mother ship" changes shape to match her brood.

I have read dozens of accounts that "the Air Force indicated these pictures to be authentic." The Air Force said nothing of the sort. The pictures were submitted to intense scrutiny at the photo laboratory at Wright Field. There was little that could be evaluated. There were no points of reference in the pictures--only the lights. The photo had not been retouched. The Air Force said only that "The photos were never proved to be a hoax."

The endless retellings of the Lubbock story recount the multiple sightings, the impeccable reputation of the observers, the supporting evidence of the "authentic" pictures--and stop there. The full story contains some intriguing facts. It is told here for the first time.

First, whatever the pictures show, they are not the lights seen by the professors. They looked at the pictures and said so. Their first two sightings were roughly crescent, the



In 1947, some unexplained objects flashing across Kentucky night skies were photographed by a Louisville newspaperman.

rest showed no geometric pattern--V-shaped or otherwise. None of the independent sightings was V-shaped either. The pictures, however, are as precise in formation as a double row of Radio City Rockettes.

Second, the pictures were taken on a clear night, with plenty of stars. No stars show in the pictures. This means that the lights were much brighter than the stars--and in Texas, the stars at night are big and bright. Neither the professors nor the other observers described their lights as big and bright. Theirs were dull and glowing.

Third, with much of the town scanning the sky, no one else in Lubbock reported the lights on August 30, when the photographer saw his three bright, spectacularly geometric flights.

Fourth, we reconstructed the scene later at Dayton, attempted to duplicate tures, and failed The photographer had showed me the site in his backyaause of trees and other obstruc tions, it afforded a span of 120 degrees of clear sky. I questioned him about the speed at which the lights crossed the sky. He estimated it at 30 degrees a second--a figure that agreed with the earlier estimates by the professors. To double check, I had him move his hand across the sky and checked him. It was close to 30 degrees a second. This gave him four seconds in which to shoot each flight--two pictures one time, three the next.

The Kodak 35 has a hand wind to feed fresh film into place. At Dayton we simulated 120 degrees of open sky with lights traveling 30 degrees a second, took a Kodak 35, and tried to shoot and wind until we had three shots. We couldn't do it. We tried over and over with different people. The best anyone could squeeze in was two badly hurried shots. And with the shutter at 1/10th of a second the two shots were badly blurred.

In poking around Lubbock, I talked to many people who had seen the lights and were sure that they were birds. One old gentleman had seen the lights several nights. His description matched that of the professors.

"Shucks, officer," he drawled. "Them things is plovers."

I went off to read up on plovers. They're water birds about the size of quail with light

breasts that could reflect light. A local game warden told me there were plovers in the vicinity.

A few blocks from the area where most of the sightings had been made was a boulevard lighted by mercury vapor lights that gave off an intense bluish-white glare. The I recalled an odd bit of information. When the professors had tried to set up a second observation post elsewhere, they saw nothing, while the sightings continued at the original spot--near the lighted boulevard.

Four times in the following year, at Fargo, N.D., Greenville, S.C., Randolph Air Force Base, and Bakersfield, Calif., we got cases that duplicated the Lubbock affair. Each time they proved to be birds reflecting ground lights.

The project files carry the Lubbock lights as "unknown." The pictures were never proved to be a hoax. Maybe, under intense excitement, one man in a thousand can shoot three unblurred shots with a handheld Kodak 35 in four seconds. I'll believe it when I see it done.

But so far as what the professors saw, I think that 10-guage shotgun would have brought down the Lubbock saucers in a shower of feathers.

While I was in Lubbock, a temporary investigator, Lt. Henry Metscher, had made some sense out of the Jersey mystery that had lured me into saucer chasing. Among the data that Cummings had brought back on the "faster-than-a-jet" radar objects were some plots on locations and times. It turned out that the objects that had outsped the automatic tracking and startled the VIPs actually plotted out at an unspectacular 400 mph. On questioning, the operator conceded that he had got excited because of the visiting brass. The object undoubtedly was a conventional plane.

The "disk" spotted over Sandy Hook by the jet? Merscher learned that a large balloon painted silver for radar tracking had been launched near Sandy Hook just before the pilot and the AF major saw their UFO. What about the maneuvering? Hang on to that question for a bit.

The excited all the next morning from headquarters? Another balloon carrying a radar target. The HQ officers had a bet on about its altitude, wanted a fast report, didn't bother to tell the radar crew the reason for the urgency. By this time the radar boys had the saucer fever and were ready to see anything. The second supersonic object proved to be a weather blip. The last saucer that hung ominously over New Jersey was definitely tabbed as another balloon.

I congratulated Metscher and settled down to the business of knocking off saucers like an ace skeet shooter. If the saucers can laugh (we had several that whistled), they probably zipped through the stratosphere chuckling to themselves.

One of the many things I did was go back over the files of the project from its inception. There were some odd facts and some baffling sightings. One thing I learned was that Arnold wasn't the Columbus of the flying saucer at all. The project had thirteen listings prior to June 24, 1947--the supposed dawn of the Saucer Era. They all had come into the project after Arnold told his story, with the usual explanation that the observers had been reluctant to tell their tales until Arnold had broken the ice.

Among the post Arnold sightings were three classics--the tragedy in which Capt. Thomas Mantell was killed, the dogfight between an F-51 and a light at Fargo, N.D., and the sighting of a "space ship with lighted windows" by an airliner near Montgomery, Ala.

The Mantell case was headlined across the nation as "Flier Killed Chasing Saucer." His tragedy is interwoven with saucerian folklore, and frequently is told in conjunction with a local story of a plane that takes off after a "thing" in the sky and is never seen again. I have heard local variants of this story perhaps twenty times. Each time the account starts out: "You remember when Mantell was shot down by a saucer? Listen to what happened here last month. . . ."

On the afternoon of January 7, 1948, two airmen in the control tower at Godman AFB, near Louisville, Ky., began getting calls about an unidentified object spotted by civilians in the area. They checked with Flight Service about experimental craft, were told that none was in the vicinity. Shortly later, one of them spotted an object from the tower, pointed it out to his companion. They summoned their officers, who also saw something.

At this point, four F-51's of the Kentucky National Guard approached the base. Mantell, the flight leader, was asked to check on the object and try to identify it. One of his planes had to land because of fuel shortage. Mantell and the other two took out after the thing in the sky.

The Air Force account of the case was monumentally fouled up. It had all three fliers describing the object as "metallic and of tremendous size," and told how Mantell climbed away from his mates, radioing reports back to the tower until he suddenly fell silent. Some time later his body was found with the wreckage of his plane scattered over a wide area. The account then reports that the first analysis of the case indicated that he was chasing the planet Venus.

The obvious public reaction to this account was: "Who do they thing they are kidding?" If three fliers agreed that the was "metallic" and "tremendous" how could it have been the planet Venus? Later in the project, we had many instances of pilots mistaking Venus (and other planets) for something flying through the sky. None of them ever described it as "tremendous."

In examining the original reports on the tragedy, I learned the following:

1. The two men in the Godman Tower were joined by five officers while the chase was in progress. None of the seven men agreed on their description of the thing in the sky. One called it an "ice cream cone tipped with red," a description that was picked up in the Air Force release as agreed upon by all the observers. Actually, the other descriptions varied greatly: "round and white," "huge and silver or metallic," "small white object," "one-fourth the size of the full moon," "one-tenth the size of the full moon."

2. One wingman never saw the thing at all. He radioed: "What the hell are we looking for?" When the other landed, he described it as "resembling a reflection in the canopy."

3. There was almost no agreement among the seven men listening on the tower squawk box as to what Mantell actually said. Only one said he heard Mantell call the UFO "metallic and of tremendous size."

The project learned later that there was a huge skyhook balloon in the vicinity. It was spotted later southwest of Louisville by two observers with telescopes, and was identified as a balloon. Such identification should have plucked the planet Venus out of the Air Force speculation.

Why should an experienced pilot like Mantell chase a balloon? The skyhooks were new at that time so he may not have known about them. To him a balloon was one of the small weather models frequently launched from air fields.

What happened to his plane? Why was the wreckage scattered over such a wide area if it was not blown to bits by a hostile saucer?

The wreckage showed that the plane was trimmed to climb. Mantell had no oxygen aboard, and he was near 20,000 feet--almost four miles up--when his wingmen abandoned the climb. It is likely that he blacked out from lack of oxygen. At some higher altitude, the plane's power would drop off and the F-51 level out with an unconscious man at the controls. The propeller torque would pull it in to a slow left turn, into a shallow dive, then an increasingly steeper descent under power. Somewhere during the screaming dive, the plane reached excessive speed and began to break up in the air. . . .

Classic No. Two--the "dogfight between the plane and the saucer." It is listed as the lone case of "combat" between a plane and a saucer. Actually there were three other such cases.

The pilot was George F. Gorman, a 25-year-old second lieutenant in the North Dakota Air National Guard. On October 1, 1948, starting at 9 p.m., he chased an apparently disembodied light for 27 minutes in his fast F-51. He described the UFO as "a small ball of clear white light, between six and eight inches in diameter." For awhile it winked on and off, then it appeared to put on power and glowed steadily. Gorman pushed his F-51 to the limit and was unable to catch it. He reported that it made one turn that he couldn't follow and twice came at him in what appeared to be ramming attacks. Both times he dived his plane out of the collision course. The "dogfight" ranged from low level up to 17,000 feet, and the light finally pulled straight up and disappeared.

"I had the distinct impression that its maneuvers were controlled by thought or reason," Gorman said.

Four other observers at Fargo partially corroborated the story. An oculist, Dr. A.D. Cannon was near the field in his plane with a passenger, Einar Neilson. They saw a light "moving fast," but did not witness all the maneuvers that Gorman reported. Two CAA employees on the ground, saw a light move over the field once.

Here are the other dogfight cases:

On June 21, 1952, at 10:58 p.m., a Ground Observer Spotter reported that a slow-moving craft was nearing one of our atomic energy installations. An F-47 patrol in the area was vectored in visually, spotted a light and closed on it. They "fought" from 10,000 to 27,000 feet and several times the object what seemed to be ramming attacks. The light was described as white, 6 to 8 inches in diameter, blinking until it put on power. The pilot could see no silhouette of anything attached to it. The similarity to the Fargo case is striking.

On the night of Dec. 10, 1952, near another atomic installation, the pilot and radar observer of a patrolling F-91 spotted a light while flying at 26,000 feet. They checked and were told that no planes were known to be in the area. They closed on the object and saw a large, round white "thing" with a dim, reddish light coming from two "windows." They lost visual contact, but got a radar lock-on. They reported that when they attempted to close on it again, it would reverse direction and drop away. Several times the plane altered course itself because collision was imminent. There was a solid undercast of clouds, which would eliminate the possibility of refraction of ground lights.

In each of these instances, as well as in the case narrated next, the sources of the stories

were trained airmen with excellent reputations. They were sincerely baffled by what they had seen. They had no conceivable motive for falsifying or "dressing up" their reports.

The other "dogfight" occurred September 24, 1952, between a Navy pilot of a TBM and a light over Cuba. It had a sequel that revealed some fascinating information about the illusions the supposedly objective human eye can contrive.

"As it (the light) approached the city from the east it started a left turn. I started to intercept. During the first part of the chase the closest I got to the light was 8 to 10 miles. At this time it appeared to be as large an SNB and had a greenish tale that looked to be five to six times as long as the light's diameter. The tail was seen several times in the next 10 minutes in periods from 5 to 30 seconds each. As I reached 10,000 feet it appeared to be 15,000 feet and in a left turn. It took 40 degrees of bank to keep the nose of my plane on the light. At this time I estimated the light to be in a 10 to 15 mile orbit.

"At 12,000 feet I stopped climbing, but the light was still climbing faster than I was. I then reversed my turn from left to right and the light also reversed. As I was not gaining distance, I held a steady course south trying to estimate a perpendicular between the light and myself. The light was moving north, so I turned north. As I turned, the light appeared to move west, then south over the base. I again tried to intercept but the light appeared to climb rapidly at a 60 degree angle. It climbed to 35,000 feet, then started a rapid descent.

"Prior to this, while the light was still at approximately 15,000 feet, erately placed it betwee n the moon and myself three times to try to identify a solid body. I, and my two crew men, all had a good view of the light as it passed the moon. We could see no solid body. We considered the fact that it might be an aerologist's balloon, but we did not see a silhouette. Also, we would have rapidly caught up with and passed a balloon.

"During its descent, the light appeared to slow down at about 10,000 feet, at which time I made three runs on it. Two were on a 90 degree collision course, and the light traveled at tremendous speed across by bow. On the third run I was so close that the light blanked out the airfield below me. Suddenly it started a dive and I followed, losing it at 1,500 feet."

When he landed, anyone who would have tried to tell him he was chasing a lighted weather balloon would have had a

rough time. Twenty-four hours later, he was convinced that he had chased a balloon.

The following night, a lighted balloon was sent up and the pilot was ordered up to compare his experiences. He duplicated his "dog fight"--illusions and all. The Navy furnished us with a long analysis of the affair, explaining how the pilot had been fooled. It is recommended reading for anyone who believes that an experienced pilot cannot be fooled by what he sees.

In each of the four cases of "dog fights," including Gorman's, a balloon was known to be in the vicinity.

In the case involving the ground observer and the F-47 near the atomic installation, we plotted the winds and calculated that a balloon was right at the spot where the pilot encountered the light.

In the other instance, with the "white object with two windows," we found that a skyhook balloon had been plotted at the exact site of the "battle."

Why can't experienced pilots recognize a balloon when they see one? If they are flying at night, odd things can happen to their vision. There is the problem of vertigo, as well as disorientation brought on by flying without points of reference. Night fighters have told dozens of stories of being fooled by lights.

The third saucer classic did not involve a saucer at all, but a "wingless aircraft, 100 feet long, cigar-shaped and about twice the diameter of a B-29." It was sighted the night of July 24, 1948, near Montgomery, Ala., by C.S. Chiles and J.B. Whitted, pilots of an Eastern Airlines plane. The underside of the thing had a "deep blue glow," there were "two rows of windows from which bright lights were glowing, and it had a 50-foot trail of orange-red flames!" Only one passenger of the flight was awake at the time. He saw only "a trail of fire."

On the basis of later experience, the project was fairly sure that this was meteor. At about the same time, a plane flying between Blackstone, Va., and Greensboro, S.C., reported independently that it had see a "bright shooting star" in the direction of Montgomery.

On the night of November 24, 1951, there was a similar incident, with multiple sightings. It started when a CAA tower in southern Michigan told the Air Force Flight Service that an airline crew had seen a huge object with bluish-white flames going southwest at an extremely high speed. At about the same time, other reports flooded in from Air Force personnel at Selfridge AFB, north of Detroit, from a soldier on leave at Battle Creek, from another CAA tower, from some sheriff's deputies. All reported the same sort of object going the same direction. Most of them described it as rocket-shaped. One, an experienced pilot, was certain it was a V-2 type missile. All these observers--at scattered points--reported the thing "about four miles east." It turned out to be a very large meteor passing over the New England states; we verified it with experienced meteor observers and the time checked to the dot. I talked to a number of the witnesses later and they remained firm in their belief that they had seen a Something.

The science-fiction boys, of course, converted the Chiles-Whitted Something into another "mother ship." It was in sight for only a few seconds, was seen by only three people, and then vanished into the dark night. But it flies on endlessly in the pages of saucer lore, a transport from outer space packed to the gunwales with flying disks.

It is popular folklore among the more fanatical saucer fans that the Air Force has either bungled or deliberately sabotaged the saucer investigation. Our sterner critics imply that a saucer could land within ten feet of a Project Blue Book man, and he would turn his back on it and walk away. Frank Scully says, "It's high time that the Air Force stop fumbling with the saucer question and turn the investigation over to a competent civilian group."

It is utter nonsense, of course, to charge that Blue Book doesn't want to verify the existence of the saucers. If they come from outer space, the first man to lock down proof of it would go down in history with a bigger name than Christopher Columbus. He'd be remembered when such minor figures as U.S. Presidents were long forgotten. Every time a good sighting came into Blue Book, you could feel the suppressed excitement runt through the staff, an unspoken "Maybe this is it."

Here is what Blue Book did in its efforts to pin down the facts about the flying saucers. Virtually all the evidence we had to work with was the reports of witnesses. Shortly after I took over the project, we set about preparing a model questionnaire that would get the maximum amount of data from the witnesses. If there was a pattern to the saucer stories, we wanted to find it.

The project had tried a variety of questionnaires in the past. We gathered all these together along with a cross section of accounts by witnesses. We took this material to the psychology department of a Midwest university that is noted for the excellence of its statistical questionnaires. We got together a panel of engineers, physicists, mathematicians, astronomers and psychologists to list the questions they would like to have answered. The project also listed the things it wanted to know. The psychologists determined whether it was feasible to expect an eyewitness to answer each question and if so, how it should be worded.

When we got through with all this, we used the result as a test model, and sent it out to several hundred saucer-sighters. When the reports were returned, we revised the questionnaires again, from the way it had worked out. The result is the standard questionnaire that Blue Book is using today.

The questionnaire ran eight pages and had 68 questions. It was booby-trapped in a couple of places to give us a cross-check on the reliability of the reporter as a witness. We got quite a few questionnaires answered in such a way that it was obvious that the signer was drawing on his imagination.

From the standard questionnaire, the project worked up two more. One dealt with radar sightings of UFOs, the other with sightings made from a plane.

At the instigation of Blue Book, the Air Force sent out orders to every one of its installations in the world, instructing them on the reporting of "saucers." Immediate reports were to be made by wire to ATIC, listing the basic data such as time, date, location, description of the object, names of observers, etc. These initial reports were to be followed up with expanded written reports. Blue Book was also given authority for direct communication with any installation in the U.S., thus cutting a lot of red tape and speeding up the investigations.

This AF regulation, unfortunately, was issued on the same day that Life magazine came out with a flying-saucer story that reversed its previous attitude and considered the question soberly. A lot of people added two and two and got six. The story went around that Life was "softening up the public for the truth" while the new Air Force regulation was "alerting the military." Actually, it was coincidence.

We obtained the cooperation of astronomers all over the country. Scores of them were queried on whether, in their constant watching of the skies through giant telescopes, they had ever seen anything that resembled a space ship. The answer was no. There are also a number of stations across the U.S. where automatic cameras photograph the sky at intervals every night they year around to help track meteors. We asked these people if their cameras had ever caught anything that resembled a flying saucer. The answer was no. Both the astronomers and the sky-photographers were asked to notify the project if they ever turned up anything unusual. They never did.

We sent out special cameras to places where there had been a high number of sightings in an effort to get pictures of our own. Each camera had two lenses, one of which had a diffraction grid to split light into its component parts and thus give a clue to the source of the light--whether it was coming for a jet's tail, a balloon, or what? We had a lot of trouble with the cameras, and got only five or six pictures, all of which were worthless. The light-gathering power of the lenses was too low. The cameras have been re-equipped, and the Air Force recently has redistributed them.

We did not rely solely on our own resources in trying to unravel the UFO riddle. In January 1952, Col. Frank Dunn, then chief of ATIC, decided that we should hire several well-qualified scientists on a consultant basis, to help us gather certain technical information, to

review outstanding "unknowns," to go over our conclusions and to suggest future courses of action. The names of these people have never been made public, and it is unlikely that they will be. The project

126

learned early that publication of anyone's name in connection with the saucer stories brought on a deluge of mail, telephone calls and visits from cranks.

The invariable comment of scientists who examined the project's data was that they offered insufficient solid information for evaluation. Several hundred people, of all different sorts, said they had seen something that they couldn't explain, under a wide variety of circumstances. Where did you go from there?

The new questionnaire and the Air Force order came at a fortunate time--just before the enormous upsurge of sightings in 1952. By the end of the year we had a much better collection of data--both in quantity and quality--and we decided to summon a week-long conference of scientists to look it over and tell us what they though.

They met early in 1953. Like our consultants, they cannot be named, and for the same reasons. But the group consisted of some of the nation's top people in astrophysics, operational research, intelligence, physics and psychology.

First we briefed them thoroughly on the operation of the project, on our methods of evaluation, on our conclusions and how we arrived at them. When were through, they examined the "best" of the UFO cases that the project had been unable to explain. They viewed movies, looked at still photographs of "saucers," and heard reports from specialists on radar and photo-interpretation.

At the end of the week, they unanimously concluded that we had nothing that proved--or even indicated--that any type of vehicle was violating U.S. air space. There was discussion that possibly some new natural phenomenon was causing some sightings, but this was rated doubtful.

On the possibility of emissaries from outer space, they made this statement: "We as a group do not believe it is impossible for some other celestial body to be inhabited by intelligent creatures. Nor is it impossible that these creatures could have reached such a state of development that they could visit earth. However, there is nothing in the so-called "flying saucer" reports that would even vaguely indicate that this taking place."

This group viewed--and rejected as proof of the existence of saucers--the controversial Tremonton movies.

These pictures were taken at 11:10 a.m., July 2, 1952, a few miles out of Tremonton, Utah, by Warrant Officer Delbert Newhouse, a Navy photographer. He was driving in his car with his wife when they saw some white objects circling in the blue sky. Newhouse took out his camera, a 16 mm. Bell and Howell, and shot 40 feet of film. After he had the film developed, he set it to Blue Book for analysis.

I've sat through ninety-seven showings of the film. When I first saw it, I was impressed by it--and puzzled. It shows several groups of white spots orbiting against the blue Utah sky. There are no points of reference--only the moving spots and the sky. Near the end of the film, one of the spots moved away from the others, and Newhouse panned the camera along to follow it. When turned back, he reported, the other spots had vanished.

I sent the film on to the Pentagon, where it was received by Maj. Dewey Fournet, liaison man for ATIC. Fournet, an excellent engineer, holds strongly that saucers are real and come from outer space. He has since left the service and is in private industry in Texas. He was tremendously excited with the movies.

The movies were inspected by a group of high officers at the Pentagon and were sent back to Dayton for analysis by the Air Force photo laboratory. The lab examined them and reported that there was no evidence of fraud, and that the objects were not spherical balloons. It was the consensus of everyone who viewed the movies, incidentally, that they were not a hoax, that they showed something that Newhouse and his wife had seen. We decided to send them on to the Navy photo lab for further evaluation. They were taken there by Fournet, and I understand that he gave them quite a buildup to the Navy technicians.

The Navy subjected them to an intense analysis, involving thousands of rs of work, and ca me up with an astounding report. The gist of their evaluation was that the movie was authentic, and that the objects were not birds, balloons, planes, or anything earthly. The examined the film, frame by frame, and analyzed the density of light on each object. They reported that the objects appeared to be rotating in three groups, with each light increasing in brilliance, then decreasing, disappearing and returning as if spinning about an axis.

On the panel of scientists that inspected them later were some men with excellent reputations in the field of astronomical photo analysis. They viewed the movie a number of times, and questioned the Navy analysts closely about their methods of evaluation. They concluded that the Navy's method of measuring light density had been faulty, and the conclusions drawn from it were therefore unsound. They suggested that the whole study be redone by new methods before the analysis be released.

Among the panel were a number of people who were convinced that the objects were sea gulls soaring on a thermal current. This theory also has been advanced by other persons familiar with gulls, who had seen the movie earlier. The ultimate decision of the experts was that the movie did not warrant the great time and expense of second analysis.

At the time I was doubtful of the gull explanation. But later, while in San Francisco on an investigation, I saw a group of gulls soaring on a bright day over the bay. I was astounded by the similarity between the sight before my eyes and the movie that I had seen almost 100 times.

The project received three other movies that got considerable attention. One, in color, was taken at Great Falls, Mont., and showed two bright spots of light speeding across the sky and passing behind a water tower. Two F-94's were in the area, and the lights could have been reflections of the sun on these jets, but we were not able to come to any definite conclusion.

The other two movies were made at White Sands Proving Grounds with Askania Cine theodolites--scientific tracking cameras for following guided missiles. The first was made on April 27, 1950. Shortly after a missile was fired and had soared into the stratosphere and fallen, someone spotted an object in the sky. The theodolites were hooked up by an intercom system, and several stations were instructed to try to get pictures. Unfortunately, only one camera had film. The pictures showed a smudgy, dark object, not very well defined. It was moving.

On May 29, 1950, after word of the first picture had got around and the stations were more alert, another object was sighted just before a missile was to be fired. A second station was called, and they reported that they also could see the object visually. Both stations swung into action and took photos. On

developing the film, it turned out that each was tracking a different object--bright dots of light--and again we had no triangulation. Whatever the dots were, they were impossible to evaluate.

As a result of these incidents, the Air Force set up "Project Twinkle," two askanias to be manned 24 hours a day. The project was operated for a year and didn't get a picture. It was first set up in an area where there had been many "saucer" sightings, but as soon as it was in operation, the sightings stopped and we began to get a flock of sightings from another area about 100 miles away. After months of inaction, the Askanias were moved to that spot, whereupon the sightings stopped there and resumed at the original site.

When I told this story to a dedicated saucer fan later, he had an immediate explanation. "Of course," he said, "the saucers were watching you guys."

We were always on the lookout for "hardware"--any sort of tangible object that conceivably might have dropped, been wrenched or stolen from a saucer. We got a variety of things that people said had fallen from the sky and we had them all analyzed. Among them were some slag from Virginia, an aluminum mop handle from Washington, D.C., and a tar-covered marble from Illinois.

Once a Texan reported that something had flashed across the sky and plunged through the ice into a pond on his farm. Investigators went out with hollow tubes and probed into the ooze under the jagged hole in the ice. They sent me one sample of the cross section from their pipes that puzzled them. It turned out to be cow manure.

We naturally tended to give more credence to sightings from a group of witnesses than from a single observer. One person can have spots before his eyes or hallucinations, but they won't be seen by a friend. This elementary rule-of-thumb resulted in one saucer-sighter risking his happy home in an effort to convince us.

We got a report, from a town that is going to remain nameless, that a citizen was sitting in his car when it was buzzed by a flying saucer. We wrote back to the intelligence officer to whom the report was made and asked him if there was any corroboration, pointing out that an unsupported story was--an unsupported story.

"Look, mister," the citizen told the officer, "I'm not the only one who saw it. There was a woman with me, and she saw it too. The trouble is, she wasn't my wife." This was the lone case that we received of a saucer flying down Lovers' Lane.

Because of a run of saucer incidents that turned out to be balloons, we attempted to set up a system that would give us information on every balloon in the country. The complex project yielded some results, but explained only a small percentage of the unknowns.

We got flying-saucer reports from a weird assortment of origins--an oil drum exploding in a city dump, paper plates caught in an updraft, bugs silhouetted against the sun. Birds flying over a well-lighted area, like an athletic field at night, caused a lot of reports of "glowing object.

We were always being collared by volunteer experts. Each non-believer always had some revolutionary theory that would explain away every saucer in the country. Invariably it was something that fifty people had thought about years before. For some reason or other, there were a lot of military generals who "knew what the saucers are." They would tell us that

each sighting was just a reflection on a plane's canopy, and then go into long stories about their own experiences with canopy reflections. Whenever we were badly outranked we would listen carefully and try to nod at the proper time.

About the fifteenth time that an earnest member of the brass started unveiling the canopy reflection theory, I rebelled.

"Look, sir," I said, "what about the thousands of sightings on the ground by people who don't have canopies?"

"Hmmm," mused the two-star theorist, "I never thought of that."

The variety of the UFOs, the many different circumstances under which they were sighted--in bright sunlight, at dusk, at night, from planes, from the ground, by radar, by groups of people--should have ruled out any attempts to explain them away by a single theory. But people kept trying.

Professor Donald H. Menzel, in a book entitled Flying Saucers--History, Myth, Facts, attempted a single explanation for the stubborn 20 percent of unknowns that the project could not account for. His theory was that "this mysterious residue consists of the rags and tags of meteorological optics, mirages, reflections in mist, refraction and reflections of ice crystals."

His explanation failed to account for the many cases where there was a simultaneous radar fix on a UFO and a visual sighting. Mirages and reflections can and do fool the naked eye, but they don't show up simultaneously on a radar scope.

On the one batch of spectacular UFOs that looked as if they ought to have a meteorological explanation, the explanation collapsed. These were the flock of green fireballs that appeared in the Southwest.

They caused considerable concern because they showed up in sizable numbers around the Atomic Energy Commission's vital installations at Las Alamos and Sandia. They all showed the same characteristics and were seen by hundreds of people, including a lot of top-flight government technicians and scientists.

They were large, often described as big as the full moon, only brighter, and kelly-green in color. They traveled at terrible speeds at apparently low altitudes. One airline pilot flying west of Albuquerque swerved his plane, nearly throwing the passengers out of their seats, in his fear that he was going to collide with one. They began appearing in December 1948, and had their biggest night on December 5, when crews of both civilians and military aircraft and ground observers sighted them. They appeared sporadically afterward, and then vanished. I talked to many people who had seen the fire balls, and they have been an impressive sight.

The obvious initial theory was that they were meteors, and that they had shown up in one section of the country by a fluke of the law of probability.

Dr. Lincoln La Pez, director of the Institute of Meteoretics at University of New Mexico, strongly opposed this theory. He is one of the world's leading authorities on meteorites--and he had seen the green fireballs. I had a long talk with him in July 1952, and he had some convincing reasons.

1. The color was wrong. Although there are green meteors, the color described by hundreds of people was too bright a shade of green.

2. Meteorites as low and as bright as the green fireballs would be as noisy as jet bombers. The strange fireballs were silent.

3. The fireballs did not follow the trajectory of a meteor, which arcs down under the pull of gravity. They flew in a straight line from horizon to horizon.

4. D. La Pez was never able to locate any fragments of the green fireballs. He has long experience in plotting the paths of meteorites, determining where they explode and finding fragments. And witnesses did not report the fireballs as exploding.

I heard many reports that the copper content of the air in the New Mexico area showed a marked increase during the invasion of the weird green balls of fire. This was reported flatly as fact by a national magazine. We tried diligently, but were unable to authenticate this story.

On the green orbs, the project draw a blank, and the visitors to the Southwest remain a big question mark in the Blue Book files. But whatever the emerald mysteries were, they were a separate puzzle from the classic flying saucers. They had no characteristics in common with the silvery disks except they flew.

As our experience in investigation broadened, we found that the reliability of saucer reports varied inversely with the detail that the observer reported. The hoaxes were almost always marked by a vivid description. When a witness could tell us exactly how many rivets the saucer had, we started checking his background.

One morning when we arrived at work we found an urgent telegram from a Military Air Transport Service base in Florida. It told about a scoutmaster who had been attacked by a saucer and burned. The incident had been witnessed by three scouts, and the local intelligence officer had made a quick check on the

story and could find no holes in it. He reported that the scoutmaster had a good reputation for reliability, which of course is what you'd expect.

I showed the report to my superior at ATIC, Col. Frank Dunn, and he approved an on-the-scene investigation. In 20 minutes we had a B-25 ready with two pilots. I threw some things in a bag, got Lt. Robert Olssen, a Blue Book investigator, and we headed for Florida. Just before we left, we called Florida and asked them to have a doctor examine the scoutmaster's burns.

We landed late in the afternoon and reviewed the case with the local intelligence officer. He was pretty well sold on the man's story. It was an exceptionally detailed account, and when I heard the whole thing, I smelled a hoax.

He said that he had conducted a scout meeting in the basement of a church, and at the end of the meeting, started to drive four of the boys home. He dropped off one, and then headed into the nearby town where the other three lived. He took a back road that led through a sparsely settled area. This struck me as odd, but I checked the map and found that it was the logical route from the first scout's house to the town where they were going.

By this time, his story went, it was around 9 p.m. As they drove through a sandy section with scrub pine, he saw some lights come down low into the trees and disappear. The scoutmaster's first thought was that a plane had made a crash landing. The boys didn't see

the lights, but he told them about them and said he thought he ought to investigate. The boys were afraid to be left alone in the car, and he started to drive on when peered back into the trees and saw something glowing. This time the boys thought they saw it too. The scoutmaster decided that it was his duty to see if a plane was in trouble.

He had the radio on in his car, and a quarter-hour program was just starting. He told the boys to wait until the program was over, and if he hadn't returned, they were to go to a farmhouse a short way down the road and summon help. Taking a flashlight and a machete, he headed into the woods.

He stumbled through the night, keeping his light on the ground, until he came to a clearing a short distance from the road.

"I suddenly noticed something odd that frightened me," he said. "I felt damp, muggy heat on my face. It did not feel natural. At the same time I smelled a faintly pungent odor.

"I stepped into the clearing and the heat and odor got worse. It felt diation from a furnac e. I glanced up to check the position of the North Star. It was a clear night and I had spotted the star when I left the auto, to orient myself. The whole sky was black.

"I was paralyzed with fear and turned my flashlight up. The beam shone on the bottom of something. It looked like battleship-gray linoleum. Whatever it was, it was so low I could have jumped up and hit it with a machete.

"I backed up until I could see the stars again. Then I flashed the light up again and could see the object plainly. It was about 50 feet in diameter, with things on the side like ventilators. The device was dome-shaped, with a slightly convex bottom. As I stepped back, the heat diminished and I could feel the cool, fresh air on the back of my neck.

"Suddenly I had the strange feeling that something was watching me. From the saucer there came the sound of something moving, of metal against metal, like a safe door opening.

"A glowing red ball appeared and started to float down toward me. In a reflex action, I threw my arms up to protect my face, with my clenched fists over my eyes. I was engulfed in a red mist and lost consciousness."

Back on the road, the scouts grew frightened, piled out of the car and ran to the farmhouse for help. The farmer called the state police, who relayed the alarm to the sheriff. Two deputies arrived on the scene just as the scoutmaster came stumbling out of the woods.

"He had the most scared look I've ever seen," one of the deputies told me. The scoutmaster poured out his fantastic story to the deputies and then accompanied them back to the clearing. They found his flashlight on the ground, still burning, and a crushed place where someone had been lying.

The whole party went off to the sheriff's office, where the scoutmaster was examined. They found that the backs of both arms were scorched and the top of his cap--long-visored fishing or skiing mode--had been scorched, too. They notified the Air Force.

We questioned the scoutmaster at length the evening after we arrived. He told a consistent story. When we got through, he asked if he could talk to anyone about the event, or should he keep buttoned up? "That's up to you," I told him. "The Air Force doesn't try to censor these stories."

We talked to his employer, who said he was a fine fellow. The next morning we went out to

the scene and combed it foot by foot. The only theory we had was that he had been struck by lightning--possibly ball lightning--but there was no sign of lightning having struck the area.

We returned to the base and found it in an uproar. The scoutmaster had a lurid account in the local paper. He reported that "top Air Force officials from Washington" had questioned him. "The Air Force and I know what this thing was," he went on cryptically, "but I'm not allowed to tell because it would create a panic."

I looked at Olssen and he looked at me. "Screwball," we said simultaneously.

The scoutmaster knew that we were from Dayton, not Washington, that we were plain AF captain and a lieutenant, not "top officials," that we had offered no theory about the "saucer," had told him he could talk freely. That afternoon we learned he had hired a press agent. That evening we did some extensive digging into his background, and the next day we flew back to Dayton.

We brought his hat back for a check at the lab. They reported that the scorch marks were peculiar, as if they had been burned by a hot iron. There were folded areas that were not scorched at all. The lab expressed strong doubt that hat was on anyone's head when it was burned.

We sent out a few queries here and there, and found that he had a peculiar background for a scoutmaster. He had told a strange story about serving in the Marines in the Pacific, where he had landed alone on Jap-held islands and mapped them at night to make the Marine landing easier.

We queried the Marines and they told us that he had served six months and never left the country. He had gone AWOL, got mixed up in a stolen car case, had been kicked out of the corps and had served time. We checked the institution where he had done his term and learned that he was a somewhat unstable character, to put it charitably, given to spinning wild yarns. He reportedly had once told New York police he had seen two men hurl a woman out of a skyscraper and that the body landed at his feet. Up sped a black limousine,

he said, out jumped two other fellows who picked up the body, threw it in the back seat and roared off. The police went with him to the scene, and sure enough, there wasn't any body there. There wasn't any blood on the sidewalk, either.

We tipped off the Scout council and wrote off the story as a hoax. The fellow kept telling it, however, and it got better all the time. Within a month, the saucer had acquired an unspeakable monster, so foul that there were no words to describe it.

Later we had an even more fascinating "manned saucer" story from a radar station up near the Canadian border. Two radar men stepped out of their shack one night and were astounded to see a great glowing UFO low in the trees a few miles away. The generator that operated the radar set wasn't operating and one of the man ran around to the Quonset hut to get it started.

While he was in the hut, the saucer flew up to the radar shack and halted, hovering in the air. A sliding door opened, and a little man 4 feet high, came walking down some invisible steps. He was quite remarkable, even for a saucer crewman--he had two heads, one an old one and the other a young one. With proper respect for age, the young head let the old one do the talking.

"May I please have a drink of water?" the elderly head asked the radar operator.

The man stammered that they had no water, which subsequent investigation indeed proved to be the truth. The old head thanked him politely, and the creature mounted the invisible steps and re-entered the saucer which flew back to its original position among the trees. A little later the radar pair pointed it out to several people, all of who saw it clearly. The other witnesses, however, insisted that it was merely the moon.

A formal report was filed on this and forwarded to Dayton. We were still puzzling over it when we got a terse supplementary notation from the local intelligence officer who had interrogated the men. Behind the radar shack he had found two cases of empty beer bottles. "Please ignore original report," he wrote. "Disciplinary action has been taken."

In general, we didn't pay much attention to the reports that involved saucer crews, whether they were little men, indescribable monsters, or spacemen with junior and senior heads. Once West Virginia came up with a report of a metallic monster that blew poison gas at some children. We got an urgent phone call from the local newspaper asking us when we would be down to investigate. I took the call.

"Has this monster got a saucer?" I asked the reporter.

"Well, there's talk about some lights seen landing in the vicinity, but no one has located anything."

I asked him how the monster got around, when he walked or flew.

"The stories say he's been crashing through the underbrush," the reporter said, "so I guess he's walking."

"If he walks, he's an Army problem," I said. "Call me back if he starts to fly."

We never got a call, and the monster crashed off into one of the Sunday supplements.

The saucers hit the front pages in 96-point type in July, 1952, when they "buzzed" Washington, D.C. The story caught the Air Force completely off balance and the handling of it got fouled up beyond all recognition. It finally took a couple of generals and a press conference to straighten things out.

It started shortly after nine o'clock Saturday night, July 19, when the Air Route Traffic Control Center of the Washington National Airport noticed some odd targets on their radar scope. They seemed to be the shape and size of aircraft, but they didn't fly right. They would cruise around aimlessly at from 100 to 130 mph and then suddenly vanish--"in a burst of speed," the saucer Boswells added later, in dressing up the story. Shortly before midnight, the National Airport controllers called Bolling Air Force Base, just across the Potomac, and asked if they had anything strange on their radar. Bolling also was picking up strange targets. About this time Andrews AFB chimed in and reported that they had some unknown objects on their scopes, too. Bolling, Washington National and Andrews are all tied together in the common communications net, and they started comparing notes over the squawk box.

Once, at a point close to the Andrews range, where the three radar systems overlapped, they all picked up what seemed to be the same target. Several people at Andrews were alerted and spotted a big orange-red object hovering just about where radar had it.

Washington National called all commercial aircraft in the area and asked them to look for lights that they couldn't identify as other aircraft. At 3:15 a.m., Capital Airlines Flight 807 reported seven lights between Washington and Martinsburg, W. Va.--a section where some of the mysterious blips had shown on the scopes. The captain of the airliner, a man with seventeen years' flying experience, described the lights as hovering awhile and then moving up and down. Shortly later a Capitol-National flight approaching Washington from the south reported that a light had followed them to within four miles of the airport.

At 4 a.m. an F-94 all-weather jet fighter was flown into the area and combed it thoroughly and could find nothing.

The location of this flare-up--practically over the White House--plus the radar angle and the fact that a fighter had been scrambled combined to make this story big news. The radar aspects in particular impressed the newspapers and the wire services, and the case was played up as the first time that "saucers" had been spotted by radar. All over the country people said, "They must be real if radar picks them up." The night fighter roaring aloft to chase saucers away from Capitol Hill was the final touch.

Actually, radar is as tricky as the imagination of a scared youngster alone in the house at midnight. There are a number of ways radar can pick up objects that simply aren't there. An inversion layer in the air will bend the radar beam and cause it to interfere with another radar station that ordinarily is out of range. Or inversion will cause the scanning station to pick up ground targets--such as a big truck. On the night the saucers "buzzed Washington" there was a temperature inversion and all the sets were getting weather blips. That fact that three of them showed a blip at the same spot didn't necessarily mean a thing. They all showed blips wherever they were turned.

When we talked to the men at Andrews who had seen the orange-red object they had already figured out that it was a planet. The fact that a fighter had been sent up was not at all unusual. It is standard procedure whenever the Air Defense Command gets a target that they can't identify over a "sensitive" area. That's their job. We couldn't account for the airline sightings, and listed them as unknown.

But by the time we had pieced all this together, the Washington saucer story was a couple of days old, the papers were back on politics and hardly anyone was interested in a complex explanation of just why an exciting story hadn't been true. This time lag was a real drawback in keeping the public informed about the evaluations of the project. Someone out in Seattle or San Antonio or What Cheer, Iowa, would report a saucer and the local paper would call us up and ask, "How about this? What was it, anyway?" We'd tell them, in all honesty, "We don't know. We haven't been able to make our evaluation yet." The story would hit the paper's front page the next day under the headline:

PREACHER SEES SAUCER
AIR FORCE CAN'T EXPLAIN

Just one week after the saucers buzzed Washington, they came back and buzzed it again--and again we stubbed our toe on the story. The reporters got word of the story and hurried to the airport. This time the all-weather fighters were called down right away. Commercial traffic was cleared out of the area and things were set up to work an "intercept." Here the trouble began; some of the procedures used in the situation are classified, so the reporters were shooed out of the radar room. Everyone was excited, and the reporters bewildered by the sudden bum's rush. They knew that "something" had been spotted over the capital again, and pretty soon they heard our jets roaring up and down through the night--while something big went on behind firmly closed doors. The next

day the papers broke out with 120-point bold headline type:

SAUCERS ELUDE 600 MPH JETS

Which was, after all, accurate in its way. The jets had been unable to find anything over Washington. They would be directed to the spots where the "saucer" blips showed on the radar and fly right through them. This was merely confirmation of what we'd learned the week before, that the blips were radar aberrations.

The big black headlines were on every news rack in Washington when the n got a call f om the White House asking just exactly what was going on. Wh calls were ordinarily ha dled by at least a three-star general, but in this ca aptain--Ruppelt--was given the honor of e xplaining what was going on over the head of the President. I think there was something in the tone of the query that downgraded the assignment to my level. I made a reassuring report to Mr. Truman's air aide. Later I was told that the President was listening in on the briefing but he didn't let out a peep.

The scare stories in the Washington press came smack in the middle of a record wave of saucer sightings. The year 1952 had started modestly with eleven sightings in January and built steadily to 149 in June. This was almost as many as the project normally received in an entire year. While we were digging our way out from under the unprecedented June reports, July inundated us with 409. The two summer months produced as many sightings as the first four years of the Age of the Saucer. We went on a 16-hour day.

"I wonder," said Olssen, "what ever happened to the guys who said the saucers would go away as soon as people stopped talking about Kenneth Arnold?"

Prodded by the hubbub over the Washington flare-up and by the record crop of sightings, the Air Force called a press conference on July 29 at the Pentagon. Maj. Gen. John A. Samford, Air Force director of intelligence, went up against the biggest assemblage of newspapermen to turn out for an Air Force conference since World War II. He was accompanied by Maj. Gen. Roger Ramey, director of operations, and four technical men from ATIC--Col. Donald Bower, Capt. Roy James, Burgoyne Griffing, and myself.

Samford gave the project a pat on the back for disposing of a lot of unknowns, but added:

"However, there have remained a percentage of this total--about 20 percent of the reports--that have come from credible observers of relatively incredible things. We keep on being concerned about them." He stressed that the most careful examination of the reports indicated no menace to the United States.

The press was much more interested in the "saucers over Washington" angle and fired dozens of questions about that incident, concentrating on the radar "confirmation." It seemed to be news to many of them that radar is not infallible, that it is not a crystal-clear mirror that gives back exactly what is in front of it.

Many of the newsmen were amazed that a big "naval battle" had been fought in World War II with a nonexistent enemy because of tricks played by radar. The conference also brought out the fact that a fighter pilot, following a radar "target" caused by a temperature inversion, once had followed the bend of the image four times and found himself flying right at the ground. These incidents took a lot of the edge off the capital saucer sensation.

I never got adjusted to the tremendous partisanship that the flying saucers inspired. Hardly

anyone was neutral about saucers. People would bend our ears by the hour proving: (1) Saucers were a lot of damned nonsense and the Air Force was out of its mind to bother with investigating them, or (2) They were space-ships whose existence was beyond question and the Air Force was out of its mind to try to cover up the truth about them.

Both groups would wind up fixing us with a stern glare and demanding--"What do you think?"

I would tell them we were trying to conduct an open-minded investigation, and that so far we didn't have sufficient data for a firm conclusion. This would just pour gasoline on the fire. People wanted a firm "yes" or "no" about the saucers.

We had our most bitter arguments with the "fans," as we called the believers. They believed in saucers with a passion that made a reasonable discussion almost hopeless.

Once, I talked to a well-known psychiatrist about this. He was a nonbeliever.

"Look," I said, "I can understand how a man like Arnold feels strongly about the existence of saucers. He saw something. I can understand why anyone who has seen something that he can't explain will argue for the existence of space ships. Such a theory gives him an answer to a personal riddle. But why do thousands of people who have never seen a saucer swear that they exist?"

"I think that they want to believe in saucers from another planet," he said. "The will-to-believe is a powerful thing, and it edits out reality. Visitation from another planet is a fascinating idea.

"The world we live in is becoming a place of increasingly unbearable tensions. The threat of atomic destruction hangs over us all, and we are losing faith in the invincible intelligence of man. In eight long years, the best brains on earth have frustrated each other in removing the specter of mass destruction of whole nations.

"If the saucers are real, if they came from outer space, what vistas they would open up! So far they have shown no menace. Whatever controlled them would be of a higher intelligence since we are only beginning to fumble with the problem of space travel.

"So to people living humdrum and menaced lives, they hold out bright adventure that might remake the world. Man is doing a poor job, so we bring into being something better than man."

In addition to the plain believers, there were the cultists and the screwballs. The cultists had clubs, societies, associations, pins, conventions and special publications, and preached the saucer the way a devout Mohammedan preached his belief in Allah.

According to their unshakable dogma, the Air Force is hiding the truth about the saucers in fear it will panic the public. Secret safes at Dayton bulge with sensational sightings, authentic close-up pictures, and wonderful movies of saucers, many in Kodachrome. Whenever a saucer lands or crashes, teams of tight-lipped investigators rush out, scoop up the saucer or the pieces and cart it off to a hidden laboratory. Meanwhile their colleagues hurry to the newspapers, flash their badges on the editor and kill the story.

Everyone knows that Capt. Mantell was shot down by a giant saucer--his body was riddled with bullets (version A) and his plane was scored with mysterious "lines of force" (version B). The project at Dayton has rooms full of little men, pickled in

alcohol, who landed in Colorado or Arizona or Oregon and were killed by breathing our unfamiliar oxygen. Usually the little men are green, although some were baked to crisp brown when our atmosphere turned their saucer into an incandescent toaster.

The saucers that didn't carry little men are manned by monsters. And no questions, please, about whether little men and the monsters are blood brothers or kissing cousins.

Each new item in this catalog of nonsense has been told as the straight truth.

The cult is nourished by literary procurers who seize on every sighting and process it for consumption. They strip each report of any information that points to a natural explanation. They drop off all qualifying data. They omit the analysis--except when the project frankly admits when it is baffled. Then they present the residue as verified fact "straight from the files of Blue Book." A popular variant on this is "from secret Air Force records."

In the scriptures of the cultist, everything reported to Blue Book is a saucer. The actual report may describe the UFO as a light six inches in diameter, an orb twice the size of the moon, a black speck in the sky, a strange blip on a radar scope, a cone-shaped object, a vague glow in the sky, a cigar-shaped figure, or a splash of light like a comet's tail. These dissimilar objects are all converted with a flick of the typewriter, into saucers.

All estimates of height, speed, and maneuvering are treated as cold fact. If a traveling salesman driving down a highway at 65 mph, glances up and sees something flash across the sky at what he guesses is 20 miles up and 8,000 miles an hour, the saucerian account comes out like this:

"At 3:17 p.m., on August 12, 1953, four miles west of Dubuque, Iowa, Joseph Doakes, a businessman, saw a saucer traveling 8,000 mph 20 miles above the earth. Doakes, a man of excellent reputation who does not drink, reported, 'I never saw anything like it.' The Air Force analyzed the sighting and was completely baffled."

A few months ago, in Hollywood, I talked to Frank Scully, whose book Behind the Flying Saucer went through ten editions and sent a shinning, slivery chain of disk-shaped dollars spinning at supersonic speeds into Scully's bank account. I was ribbing him about a couple of Southern California characters who were outdoing each other--and Scully--with fantastic saucer stories. One wrote a book about a citizen from Venus who landed his saucer in the California desert and had a long conversation with the author. Character No. Two topped that one with a yarn about riding on a saucer to a hitherto unknown planet named Clarion, whose female residents presumably are known as Clarionettes.

Scully, the staid old scientist who first put the story of the "little men from the saucers" between book covers, was appalled at such "irresponsible stories." He complained bitterly about "the lunatic fringe invading the saucer business," which gives a rough idea of the prevailing standards. The cultists are nearing the limits imposed by the law of diminishing returns. About the only sensation left for an author trying to break into the racket is to have his book delivered by little men riding bona fide saucers with Venusian license plates.

The cultists watched the operation of Blue Book like suspicious wives eyeing wayward husbands. Everything that we did--or failed to do--had significance. If we investigated a flamboyant "little men" hoax, it was because we knew there are little men and we were trying to keep the secret bottled up. If we ignored the story, we were playing a shrewd game of poker and cloaking the truth with a show of contempt. The cultists even used to analyze our facial expressions at press conferences. I usually made a "bland show of unconcern."

Once one of the project's technical advisers made the mistake of lapsing into mild satire in his report. In considering the saucers-from-space theory, he noted that there had been speculation that some of the UFOs behaved like animals. "There are few reliable reports," he commented dryly, "of extraterrestrial animals." This quip was pounced on by the cult as an enormously significant slip-up in our great conspiracy to hide the truth, and became an "official Air Force admission that some of the saucers carried beings from outer space." Raymound Plamer, a science-fiction publisher, and Kenneth Arnold, in their book The Coming of the Saucers, reprint this passage and exult: "But those few, gentlemen! Those few! Where did you get them?"
Such experiences tended to make us cautious in our public announcements, and we tiptoed on verbal eggs. This, of course, was taken by the cultists to further evidence of Operation Cover-Up.

The saucer project attracted screwballs in droves. One gentleman, who was a plasterer through the week and the shepherd of some off-beat religious sect on Sunday, telephoned me incessantly until I gave him an appointment. He was a tall, hollow-eyed fellow who looked like an undertaker down on his luck. A sister in his flock had solved the riddle of the saucers. She had it all written out, with citations from the Bible as documentation, and he clutched the historic document tightly and kept a wary eye on me. All he wanted was $15,000 cash.

I told him, as gently as possible, that the government didn't hand out that kind of money for a saucer in the poke.

"All right, mister," he said, "I'll tell you what the saucers are. But you'll have to put the cash on the barrelhead to find out how Sister Betty figured it out."

He took a deep breath. "The saucers are four angels dancing in a circle."

He grew surly when I didn't hand out a roll of crisp $100 bills, fresh from the U.S. Treasury, and start counting them out for him.

"What's the matter, mister?" he asked. "Doesn't the Air Force want to solve this problem?"

I got off the hook by telling him that our budget had been cut and that he could make more with Sister's secret peddling it to one of the big national magazines. He went off with a gleam in his eye.

Then there were letters. They went into a special file with the cryptic notation "C.P."--for crackpot. We got them by the hundreds.

From Campbell, Ohio, a gentleman offered us "spectrograms of saucer lights"--at a price--and warned us that he was selling "to the highest bidder, domestic or foreign." "These spectrograms are protected against forcible seizure," he noted tersely, "and I would not recommend such action on your part."

From Long Beach, Calif., a woman writes us a long series of letters about saucers "torching" her day and night. "They also nip your toes," she complained. "They just make you sick."

My favorite was from a gentleman who signed himself "Uncle Sam's Most Unique Booster." He offered us three working saucers in exchange for train fare from California to Dayton. "I fly them by changing the potential energy in centrifugal force to a kinetic energy of 33 pounds to the square inch in the form of a jet propulsion," he wrote. "Roll that around in your attic." His saucers were powered by vacuum cleaner motors. If we weren't

interested in them, he had an atomic machine "that makes yours look sick," and a helicopter that folded up into a suitcase.

Obscured by the hoaxes, distorted by the literary charlatans who hail every vagrant light as a verified space ship, the case of the flying saucer rests on the inexplicable instances that have cropped up year after year since 1947.

In 1952, we extracted the best sightings from the files to see what kind of sense we make from them. These represented the cream of the reports and most of them had come through military channels. This meant that they either had been made by military personnel or had undergone a preliminary check at the point of origin.

Of the 2,199 sightings, 434--19.7 percent--were listed as unknown. Among them were sightings reported by scientists and veteran pilots of excellent reputation, many of whom had been scornful disbelievers until they had sighted their saucers. These reports included instances of flight performance and maneuvers beyond the abilities of any known craft.

In addition to the Black Hills, South Dakota, case which I've already described, here are some of the cases that the project was unable to crack:

INCIDENT NO. 2--On July 29, 1952, near Port Huron, Mich., two F-94s were in the air making night practice runs on

a B-25. A radar station in the vicinity picked up an unknown object and asked one of the planes to investigate. The jet went up to 20,000 feet where the pilot spotted the object visually. He started to chase it, and the fleeing UFO and the pursuing jet both showed up on the radar scope, which tracked the chase. The jet pilot switched on his gun radar, got an automatic lock-on. The object easily kept out in front of the jet, even when the pilot kicked on his afterburner. Our investigation showed there were no other planes in the vicinity, and the double radar verification ruled out planets, stars, reflections, hallucinations.

INCIDENT NO. 3--On July 24, 1952, two Air Force colonels stationed at the Pentagon were en route in a B-25 from Hamilton AFB to Colorado Springs. They were flying at 11,000 feet near Carson Sink, Nev. It was 3:40 p.m. on a calm, clear day with unlimited visibility. Suddenly they sighted three silver objects shaped like arrowheads approaching them at terrific speed. The objects first appeared at the 1 o'clock position and passed the B-25 in a continuous bank. The two colonels both observed the three strange objects carefully and were positive that they were no craft that they had ever seen before. They estimated their size at about hat of an F-86, and their distance at the point of passage at between 400 and 800 yards. Both men reported that the objects had a "definite ridge along the top," and had sharply defined outlines. Neither man was a flying saucer believer.

INCIDENT NO. 4--On January 28, 1953, at 9:35 p.m., a jet pilot near Albany, Ga., spotted "an extremely bright light" at 10 o'clock high. At first he thought it was another aircraft or an unusually bright star, but when he went up to 10,000 feet it appeared to be ahead and a bit below him. When first spotted, the light was white, but later it began changing constantly from white to orange and back to white again. The object was in view for 17 minutes. In the last 15 seconds it changed shape from circular to triangular, and then the triangles split into two triangles--one immediately above the other--and both disappeared as if someone snapped off the light.

The pilot called Albany, Ga., but before he could make his amazed report, ground asked him if he had seen anything unusual. they advised him that ground radar had picked up both the

jet and a strange target. On the radar scope, when the jet had speeded up, the target had stepped up, too, to maintain its lead on him.

INCIDENT NO. 5--Shortly after midnight on August 5, 1952, two airmen were walking toward the tower at Haneda AFB in Japan to begin their shift when they spotted a large round object bearing a light in the sky. Hurrying to the tower, they pointed it out to the other tower operators, and they took turns observing the object through 7x50 binoculars. Under the glasses, a less brilliant light could be seen around the edge of the object. The tower people called radar and gave them a bearing on the thing, and radar picked up a target in the immediate area. By correlating movement of the radar target and the visual UFO, they established that they were both observing the same object. The radar tracked the object at speeds verifying from hovering to 300 knots. An F-94 was scrambled and vectored into the target. It got a radar lock-on and started to close on the object. At 6,000 yards, the jet lost radar contact and at the same time the tower and ground radar lost it, too. At the end of the sighting, the object as seen on the radar "broke up into three pieces which flew formation at quarter-mile intervals." During the incident, a weather balloon was released at the base, and the witnesses reported its light was much dimmer than that of the UFO. One of the puzzling aspects of the incident was that neither the jet pilot nor the radar crew was able to get a visual sighting on the object, although each was closer to it than the air base tower.

INCIDENT NO. 6--On the night of January 26, 1953, a group of Air Force people stationed at a radar site in New Mexico observed a "very bright, reddish-white" object west of their station and then picked it up on their radar. The object was in view about 45 minutes both visually and by radar. The object moved behind a hill and the reappeared. Radar showed it 9 miles from the station, traveling north at a lazy 12 to 15 knots at 10,000 to 15,000 feet. Although a balloon was in the vicinity, the UFO traveled steadily almost directly into the wind.

INCIDENT NO. 7--On February 16, 1953, at 11:30 p.m., a pilot and an instructor in a C-47 over Turnagain Arm--a bay near Anchorage, Alaska--saw a red light that they judged to be a jet aircraft, five miles away. But as they watched it, it got bigger and brighter, as if headed toward them. Unable to see any green navigation light, they asked the tower at Elmendorf AFB if any other craft were in the area. The tower said there was none, and then made a radar check with negative results. The object was first seen low and definitely below the horizon. The C-47 was flying at 2,000 feet. The object continued to close on the C-47, increasing in brilliance and size until it was two or three times the original size. Then it seemed to stop and hang suspended for five minutes. The pilots, still thinking it might be another aircraft, headed toward Elmendorf, where the tower asked if they could still see the light. It was still visible, and the tower asked them to try to intercept it. As the C-47 took up the chase, the light appeared to accelerate and shortly vanished.

The following night, about 8 p.m., five Air Police on patrol spotted the same--or another--red light near the end of one of the Elmendorf runways. By comparing it with known lights at the base, they judged it to be similar to a 36-inch light seen from 3/8 mile away. It was in a gradual climb, at about jet speed, headed for Anchorage. The Air Police called the tower. It had nothing on radar, but ordered up a jet to intercept. As the jet became airborne, the object showed a noticeable increase in speed, and when the jet came around to get on an intercept course, the light climbed vertically into the overcast at 5,500 feet.

The Air Police did not know of the original sighting when they made their report. A careful check showed no balloons in the area. Stars and planets were eliminated because the first night the object was below the horizon, and the second night there was a solid overcast. If it had been a conventional craft, the radar would have picked it up. If it had been a stray

balloon that wandered in from some distance, on the first night the C-47 should easily have closed on it and passed it. On the second night, its sudden vertical rise disposed of the drifting balloon theory.

These cases, and the hundreds more like them, are the core of the flying saucer mystery. Despite our best efforts over a period of seven years--assisted by top-grade technical and scientific advisers--we were unable to crack them. They remain to baffle and intrigue millions. And despite the improvement in methods of analysis that has resulted from our experience, scores of unknowns are added to the project's files each year.

Hundreds of people have asked me, "What do you think, yourself?"

The job of Project Blue Book was fact-finding, not speculation. Our investigation of the saucer sightings was aimed at compiling as much data as we could, in the hope that it would provide the basis for analysis that would answer the

seven-year mystery. The project failed in this attempt. The mystery of the saucers is still as baffling as it was the day that Kenneth Arnold landed his plane and told the story of what he had seen near Mt. Rainier.

My own opinion is that either the saucers are interplanetary or they do not exist. I do not believe that there is enough evidence at hand to choose between these alternatives. You can argue either case independently, and in then end you will have only an opinion.

In the operation of Blue Book, we briefed a number of assemblies of scientists--guided missile experts, atomic people, experimental aircraft technicians, physicists, etc. We found them intensely interested in the saucer mystery. At Los Alamos, for example, we jammed an amphitheater with standees and answered questions for three hours after we concluded our briefing.

These people were trained in the scientific attitude, as opposed to the cultists who accept every wild-eyed report as a certified, gold-sealed fact. Among them were people who had seen things that they could not explain. They were eager for facts that would help them put their experience into perspective.

These are the facts upon which I think that any responsible conclusion about them must be based:

1. To my knowledge, the Air Force has not concealed any secret sensations about the saucers. In the earliest days of the investigation, the project was secret. There was considerable alarm then, and some officials thought that the objects might be something new from Russia. As the alarm waned, the information was declassified. Whatever secrecy has been thrown around subsequent incidents has been only to protect classified information--precise locations of radar stations, performance data on jet fighters, etc. We also protected the identity of informants who wished to remain anonymous. We did this to encourage people of standing to feel free to report any credible incident. Beyond these exceptions, the Air Force knows nothing about the subject that it is not telling.

2. Project Blue Book was given no orders from above about "handling the saucer problem." The story that we were a bunch of dupes, reciting whatever the top echelons told us to say, is a lot of nonsense. We briefed the echelons above us, not vice versa. I once made a personal report to Secretary for Air Thomas Finletter at the Pentagon. He was accompanied by a full squad of advisers and technicians. He thanked me when I was

through. I gave him no information that is not in this account.

3. We had no evidence whatever that the saucers are some supersecret U.S. development. On the contrary, we had specific disclaimers of this from top Air Force, Army, Navy and Department of Defense officials. Ordinary horse sense is against this theory. If the U.S. had flying saucers that can perform the way saucer-sighters describe them, why would the government be pouring billions of dollars into conventional--and inferior--planes?

4. We also had no evidence that the saucers are of foreign manufacture. Again, logic opposes such a belief. The chief suspect in the "foreign saucer" theory is Russia. Why would Russia try out such a revolutionary device over the U.S. when it has vast stretches of land behind the Iron Curtain, where the test could be conducted in complete secrecy? Any man-made device is certain to fail sooner or later. The more complex the device, the higher the failure probability. Yet in seven years, with thousands of saucer sightings, not one has been known to have crashed.

These four points may bring you to the possibility that the saucers are craft from outer space. As staggering as the implications may be, to my mind this is the most acceptable theory--if the saucers exist. There is no other alternative.

What is the argument that they are nonexistent? Is has some stubborn facts on its side.

First, the residue of unknowns shows no common characteristics. Their shapes, performances, times of appearance, colors, locations showed the same bewildering variety as the 80 percent that we were able to explain. The 434 unknowns included little lights, big lights, multicolored lights, disks seen by day, cigar shapes, orbs and dots of lights. To argue that the hard core of unknowns are all "saucers" is inaccurate. They include a variety of dissimilar objects. This variety gives strength to the theory that the unknowns are merely the same known objects as the 80 percent of sightings we were able to explain. There is a strong belief in the Air Force that the unknowns are "unknown" only because we lacked sufficient data on them. This belief is supported by the fact that our percentage of explanations rose with the intensity of our investigation.

Secondly, there were no bursts of unknowns. Over the years they roughly d the total number of sightings, rising and falling with the volume of repo n general, there was no geographic cl stering of unknowns. For a time, th e more sightings around certain atomic installations and defense areas. Tentration was not large enough, in our opinion, to have significan e. Resid such areas are more security conscious that people living in nonsensitive and quite possibly we got more sightings from atomic and defense sections because more people there were scanning the skies.

Some theorists have figured that another planet sending emissaries to the earth would dispatch them at the point where their orbit would bring them closest to earth. Assuming a set travel time, this would bring their craft into our ken at a regular time. For several years there was a sharp rise in saucer reports during the month of July. But in 1953, the sightings in the month took a sharp drop.

Thirdly, in the seven years there has been no physical evidence of the existence of saucers. The Air Force has found no evidence that a saucer has ever crashed or landed. It has seen no photographic evidence that it can credit. It has seen no "hardware" that it cannot explain as man-made.

Against those arguments stands the testimony of hundreds of people. They have seen something incredible. They include hundreds of people who scoffed at flying saucers until they saw something that bore no relation to anything they had ever seen. They include hard-

bitten airmen familiar with all the hallucinations of flying, sober scientists who applied every natural explanation--and stubbornly insisted, "It was something else."

Among these sightings have been a small number that have been confirmed by radar. Whatever the object was, it was not a hallucination. And frequently, it outperformed any craft known on earth.

The fact that the unknowns show a variety of shapes and sizes might be explained by two things. One is the unreliability of witnesses. A saucer described as "50 feet in diameter" may be 150 feet--if it is further from the observer than he believes. The variety in sizes of the unknowns could be explained by misjudgments in distance, a common error. If more accurate data were available, the unknowns might well show a greater consistency in size.

The same is true of shapes. A disk traveling broadside to the witness would appear to be an orb. As its angle tilted, it would become football-shaped and finally take on the appearance of a cigar.

The sighting of lights at night may have no relevance to the actual size of the craft that carries them--just as a navigation light on a plane gives no hint to the size of the ship.

The absence of physical evidence--such as crashed saucers-- supports the theory that they are not of this world. We have reliable data on the failure factor of man-made devices. If the saucers were made by Americans or Russians, their imperfections would have brought them down by now. But if they are interplanetary, they may be contrived by a civilization so far advanced as to have reduced the probability of failure to near zero. Or they may utilize a principle of flight unknown to us. A craft capable of traversing the vast distances of space might fly almost endlessly in the relatively tiny confines of our air envelope without failure.

The Air Force has never ruled out the possibility that we are being visited from outer space. It says only that it has no evidence to support this possibility.

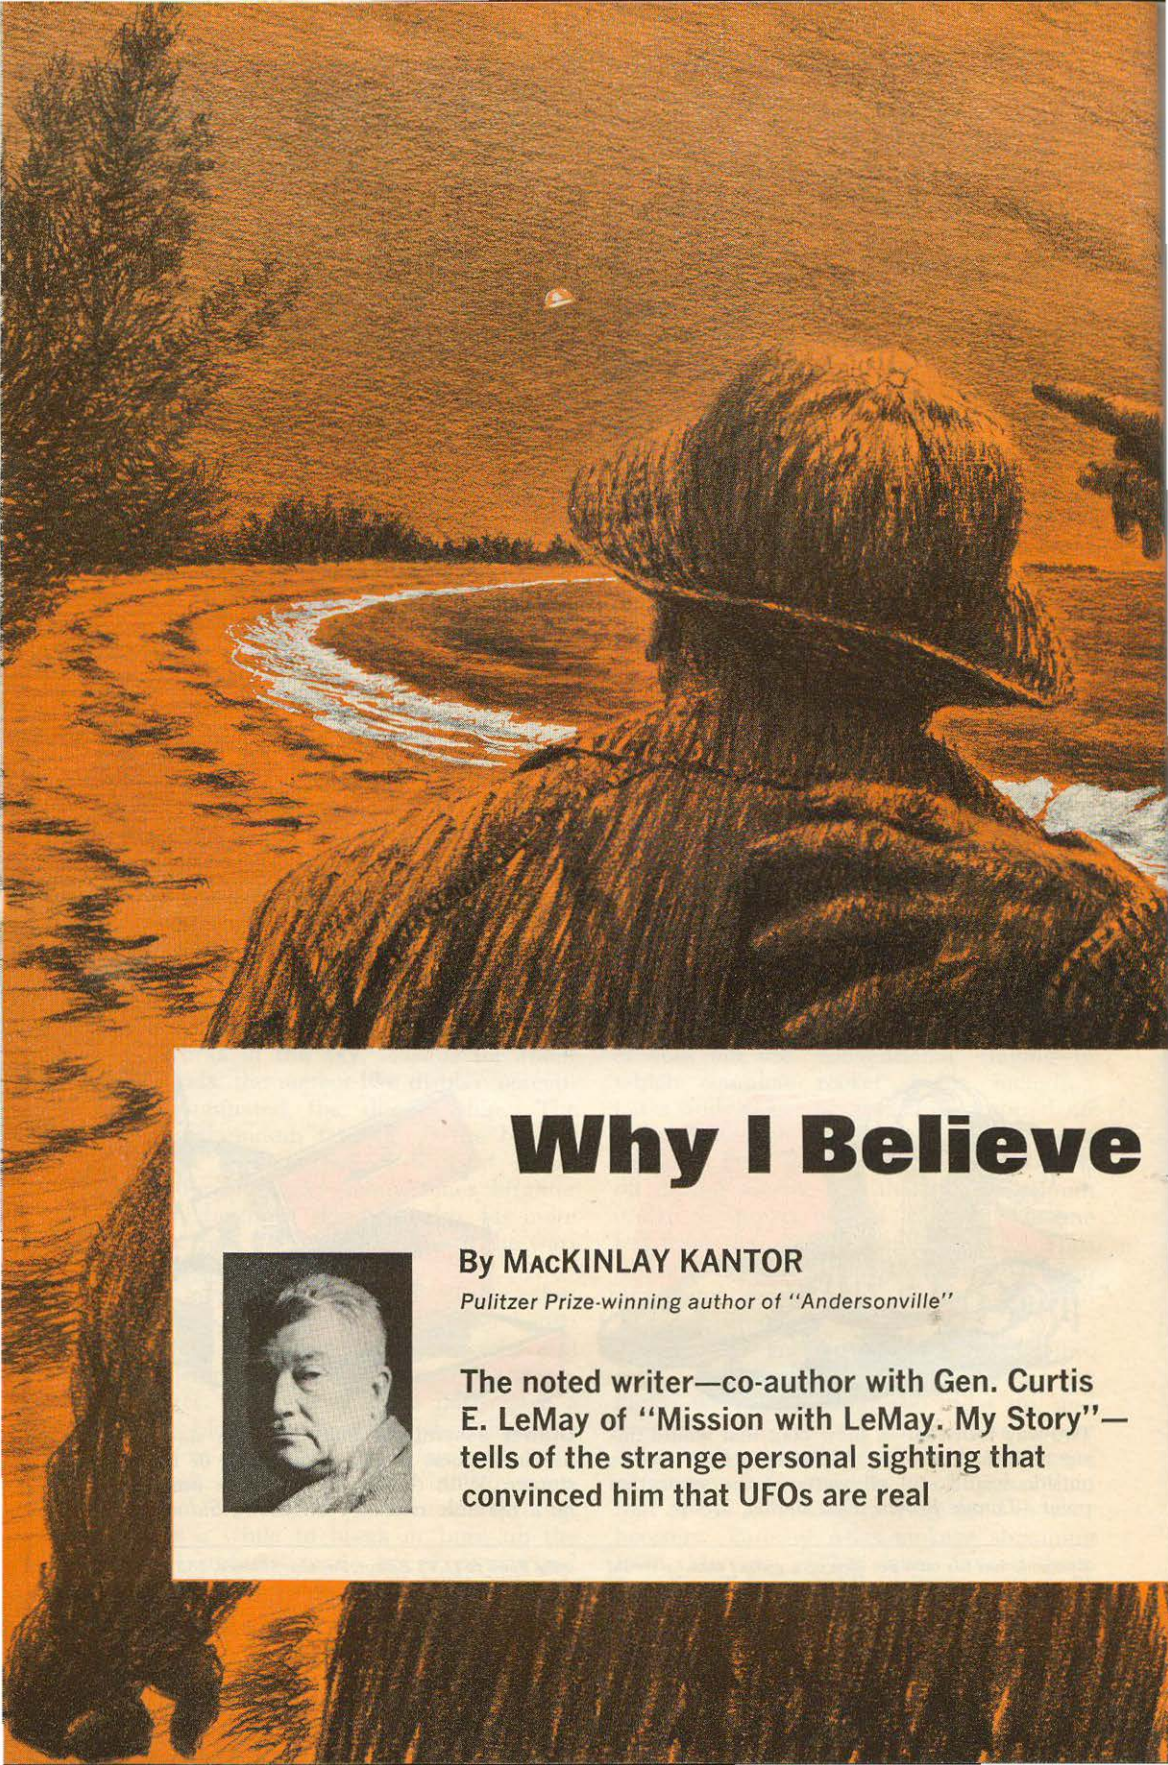
WHY I BELIEVE IN FLYING SAUCERS ... An Eye-Witness Story by MacKinlay Kantor

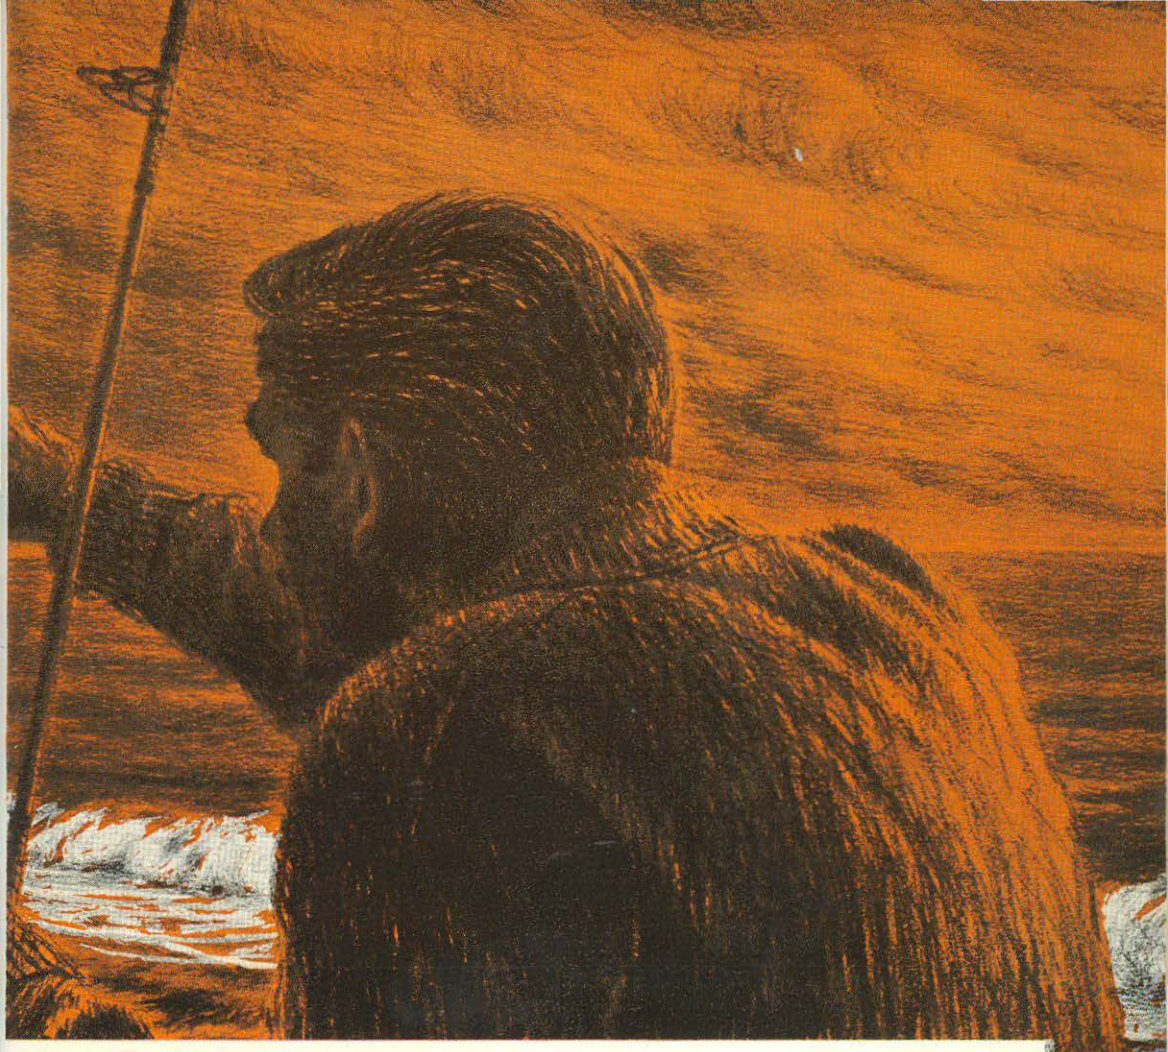


Why I Believe

By MacKINLAY KANTOR

Pulitzer Prize-winning author of "Andersonville"

The noted writer—co-author with Gen. Curtis E. LeMay of "Mission with LeMay. My Story"—tells of the strange personal sighting that convinced him that UFOs are real



in Flying Saucers

Well, to begin with, I saw one.

But for some years previously I had believed that Unidentified Flying Objects must exist. I'd heard the calm testimony of too many experienced pilots and other observers, not to believe.

Let's say that you are a skeptic—the same sort of grimly determined Doubting Thomas that I used to be. Would your skepticism still prevail if you could hear the dry steady voice of Gen. Curtis E. LeMay saying—as indeed I've heard him say:

"Repeat again: There were some cases we could not explain. Never could."

When I first spotted the UFO it was hanging motionless in the sky.

I looked at my wristwatch. 6:07 p.m.

The date was January 4, 1954, a Monday. The place: My own beach on the

Continued

Gulf of Mexico, about five miles from downtown Sarasota, Fla., on an island called Siesta Key.

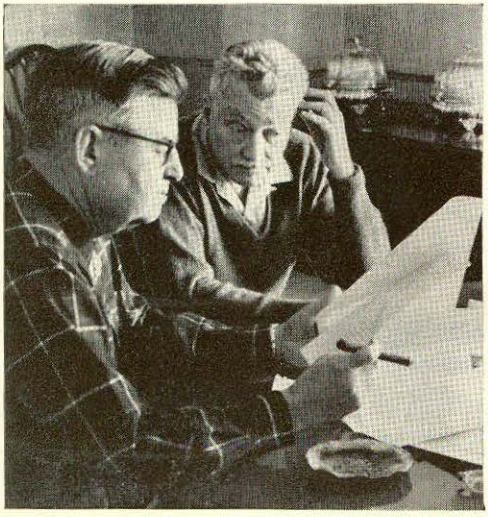
On viewing the UFO, I felt a great wave of thankfulness. By golly, I thought, at last it's here. Now I don't just have to *believe*. Now I *know*.

It looked like the top third of an apricot. The sun had fallen below the horizon a few minutes before, and earth and Gulf were now in shadow. But that object in the sky still gleamed brightly. I assumed that the orange coloration came from the sun's reflection on a curved surface of metal or some similar substance, rather than from any light radiating from the critter's interior. Also, there seemed to be some sort of rim around the bottom.

It was at too great a distance: I couldn't tell whether there were any windows or ports. And, both on the right and left sides of the curved body, dark shadows came up to claim the surface and accentuate a brilliant sheen on that portion of the curve nearest me.

I noted the position, and approximate height above some pines. I nailed the thing to its relationship with the tallest two trees: It was directly above them. Later I used instrumental aid to determine the exact height at which the object had hovered above the horizon. Eleven degrees up. As for a compass reading, the bearing would have been anywhere from 187 to 192 degrees.

[*Continued on page 198*]



Former Air Force Chief of Staff, Gen. Curtis E. LeMay, discusses book he co-authored with MacKinlay Kantor after retiring from active duty.

Maj. Hector Quintanilla Jr. is head of the Air Force's Project Blue Book, which investigates and evaluates reports of UFOs.

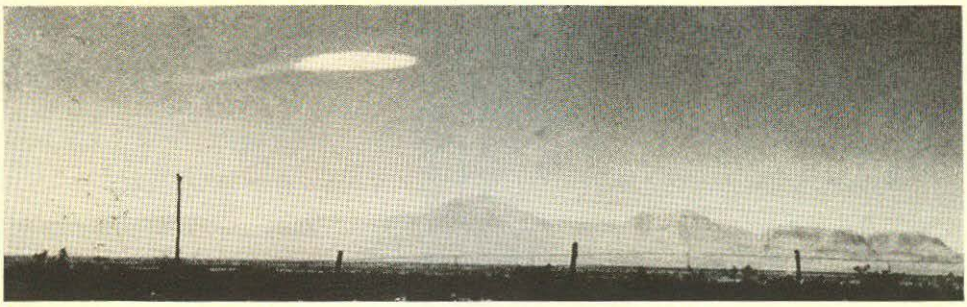
Are you up-to-date on UFOs?

Almost 10,000 UFO sightings have been reported to the Air Force since 1947, when it set up Project Blue Book, the official U. S. agency that analyzes and evaluates flying-saucer reports. There have also been sightings unreported to the project.

Not one has ever given any indication that it was a space vehicle under intelligent control, according to the Air Force, although the Air Force cannot account for the origin of many UFOs.

Maj. Hector Quintanilla Jr., chief of the Project, says, "We have determined in the vast majority of cases what the stimulus of the sighting was—stars that seem to move, operational and experimental aircraft, satellites, balloons, or just plain hoaxes." But he concedes that the origin of at least 672 UFOs has not been accounted for. The Air Force has no reason to believe that any of the UFOs unaccounted for came from another planet.

"There's no question that the people who spot UFOs see something," says Dr.



Flying saucer in flight was the report Project Blue Book office received on this picture taken in 1957 at Alamogordo, N.M. Photo analysis revealed the "unidentified object" to be a lenticular cloud.

Socorro, N.M., policeman Lonnie Zamora watches A. F. investigator Maj. William Connor use Geiger counter to check area in which he sighted UFO.

Flying light source over Sherman, Tex., was photographed by TV newsman last August. Air Force has not been able to determine what it was.

J. Allen Hynek, chairman of Northwestern University's Dearborn Observatory and the Air Force's chief scientific consultant on UFOs. "But the majority of cases we can't explain result from the fact that we don't have anything tangible that can be measured scientifically."

"I'd like to see just one piece of a UFO," Quintanilla says. His office at Wright-Patterson Air Force Base in Dayton, Ohio, has received all kinds of materials purporting to be pieces of flying saucers. But analysis of the samples has always shown them to be of earthly origin.

"We're certainly not trying to hold anything back," Quintanilla says. "The Air Force would have a lot of technical knowledge to gain from examining a real UFO."

UFOs are reported by people from all walks of life. "We accept every report as valid," Quintanilla says, "unless there is evidence to substantiate a report as a hoax."

Eighty percent of the cases are easily solved. "We have all the resources of the federal government at our disposal and much of private industry also," Quintanilla says.

One case still "bugs" Quintanilla. In the late afternoon of April 24, 1964, Patrolman Lonnie Zamora of Socorro, N.M., was chasing a speeding car on U.S. 85 when he heard an explosion. He immediately turned off the road and saw a white, egg-shaped vehicle, like a car standing on end. One or two men he believed to be occupants of the vehicle were standing alongside.

Then smoke and flame began to spout from the bottom of the thing and Zamora ran behind his car to shield himself. The vehicle rose to about 20 feet, hovered for several seconds, and then flew off. There were no other witnesses, but Air Force investigators found a great deal of physical evidence they could not explain—burnt vegetation and indentations in the ground.

Quintanilla thought the UFO might have been an experimental lunar-landing vehicle. "I've spent a lot of sleepless nights over that case," he says. "It has been well investigated and analyzed by experts. But it's still a mystery."

It won't cost you a cent to learn all the facts about using hand hacksaws, power hacks and band saws. That's what our 34-page booklet, "Sawology," is all about. Plenty of illustrations, plenty of clear descriptions, plenty of important facts every home craftsman should know about saws and their uses.

Why I Believe in Flying Saucers

[*Continued from page 74*]

As for true altitude and size, there was nothing to do but guess and wonder. The UFO had to be somewhere out over the Gulf of Mexico. Since I didn't know its size I couldn't establish any true altitude. Nor could I do more than guess at its distance from me.

The thing was motionless. It moved neither to right nor left, for a matter of minutes. It did not appear to become any larger; hence it was not advancing. It did not appear to become any smaller; hence it was not receding.

The instant after I had checked the time, on first viewing the object, I began to yell for my wife. I bellowed her name several times. No use. The house was less than 100 yards from where I stood, but she and some friends, who had been visiting us through the New Year's holiday, had the hi-fi turned on and didn't hear me.

On the next property an old man stepped onto the beach, Dr. Gillespie who had rented the place for the season. I headed for him as fast as I could move.

"Doctor! Doctor! Look!" I pointed as I ran. He stared, turned, gazed toward the sea. When I reached him he was looking a little too far to the west, and I put my arm around his shoulders and turned him more toward the south.

"Above the trees! Don't you see it?"

"I see it," he said, "but I can't make out just what it is. Doesn't that look like—? Isn't it two airplanes refueling in midair?"

"If it's two airplanes refueling in midair, aren't they headed in opposite directions?"

The doctor chuckled. "Guess they are."

"But, Doctor, that thing's absolutely motionless. It doesn't move to right or left."

"I guess you're right."

At that moment the object took off. It started with unbelievable speed, moving on a diagonal line, ascending as it receded into the southwest.

I didn't take my eyes off the thing. It was really traveling. I had never seen anything hurtle so rapidly except a meteorite. I have messed around with the Air Force for a good long generation, and have poked my nose into two wars.

I know of no aircraft which might move with such terrific speed through our atmosphere. Then it was gone.

The time was 6:11 p.m.

Why I Believe in Flying Saucers

Did anyone else on Siesta Key happen to see that thing?

Damned if I know.

Next morning I drove to MacDill Air Force Base at Tampa, to report the incident to Col. Michael McCoy, who was then commanding a bomb wing.

At MacDill, I found Mike McCoy in his office, and proceeded to sit down and tell him the whole story. I drew some sketches, too. When I was through, Mike sat tugging at his red-gray moustache.

"Well, what do we do, Mack? Send a report to Project Blue Book at Wright-Patterson Air Force Base?"

"No," I said. "I guess not."

"You saw it, didn't you?"

"Yes. But if we send in this report, some character will come along and tell me patiently that what I saw was the planet Venus or the planet Mars or the star so-and-so, or a Navy balloon, or a conventional aircraft; or that maybe I was the victim of an illusion induced by hysteria."

"Exactly," said Colonel McCoy. "That's what they're always saying. Let's just forget it."

"I won't forget it," I told him. "I'll remember it."

Recently Curt LeMay and I were discussing UFOs while I worked with him on his autobiography [*Mission With LeMay. My Story,* by General Curtis E. LeMay with MacKinlay Kantor. Doubleday, 1965].

Let me quote a few lines from what General LeMay had to say about UFOs.

"Some natural phenomenon might usually account for those sightings which had been seen and reported, and thus explain them. However, we had a number of reports from reputable individuals (well-educated, serious-minded folks—scientists and flyers) who surely saw something.

"Many of the mysteries might be explained away as weather balloons, stars, reflected lights, all sorts of odds and ends. I don't mean to say that, in the unclosed and unexplained or unexplainable instances, those were actually flying objects. All I can say is that no natural phenomena could be found to account for them. . . .

"Repeat again: There were some cases we could not explain. Never could."

It's 12 years since I saw my first UFO. Maybe it will be my only one. I've never seen the shine of one since. But I'm always watching. PS

GEORGE BURNS

Weather balloons, like the one this plane is approaching, explain some "disks," but not all.

WHAT YOU CAN BELIEVE ABOUT FLYING SAUCERS

By SIDNEY SHALETT

Is there "something funny" about the silence that still envelops the mysterious disks that alarmed us all and lured three military pilots to crash deaths? Were they missiles from Russia? From Mars? Air Intelligence probed 250 reports and here, for the first time, are its findings.

PART ONE

DATING as far back as the eighteenth century, and possibly earlier, the annals of our race bulge with solemn reports of queer things seen undulating through the sky. Except in publications frankly devoted to fantasy, American literature and journalism have until recently been relatively free of such frightening accounts. But the Great Flying Saucer Scare, coming like a long-delayed and violent reaction, showed us to be, when frightened, as credulous as anyone else.

The scare had its origin in June, 1947. On the twenty-fourth day of that month, at one minute before three P.M., Kenneth Arnold, of Boise, Idaho, piloting his three-place cabin plane in the state of Washington, from Chehalis to Yakima, saw what appeared to him to be nine shiny disks. They seemed to be flipping and flashing along over Mount Rainier. Arnold reported his experience, and the Great Flying Saucer Scare began.

Within a few days it had achieved a rich, full-blown screwiness. Observers in practically all the forty-eight states and the District of Columbia reported seeing "saucers." Descriptions of the mysterious sky-borne objects achieved a lush variance. Besides disks, there were flying doughnuts and flame-spurting teardrops; there were wingless fuselages and balls of fire which streaked through the heavens at supersonic speeds, or hovered like a helicopter, or oscillated like an electric fan.

In speculation, oral and published, the saucers—as the fearsome freaks came to be widely called—were attributed variously to the machinations of the Russians, of our own secret military research and even of men from Mars. The deaths of three military aviators stemmed from the scare; one actually losing his life in pursuit of one of the so-called saucers. The furor grew to such proportions that the United States Air Force—with considerable and understandable reluctance—finally set up a special project to investigate the reported phenomena. To date, those in charge of the projects have collected reports on some 250 instances of "unidentified flying objects," and, though the scare has subsided considerably in late months, the list of incidents continues to grow.

The hardiness of the scare suggests that it might break out again in full bloom at any time, maybe at an embarrassing moment in our international affairs, and, with this thought in mind, I have spent the better part of two months investigating it. I have had what seemed to be the wholehearted co-operation of the Air Force in Washington and in other parts of the country. I have found that if there is a scrap of bona fide evidence to support the notion that our inventive geniuses or any potential enemy, on this or any other planet, is spewing saucers over America, the Air Force has been unable to locate it.

In reaching this finding, I am necessarily accepting the assurances of the highest officers of the Air Force, and those of its research and development experts, that they have nothing concealed up their sleeves. Of course, there are a lot of people, some of them quite sober citizens, who insist that there is "something funny" about the saucer business. These will probably insist that the Air Force is kidding me. But I don't think it is.

One of the men who would be hard to convince that the Air Force is being completely frank is Kenneth Arnold, who saw those first famous nine. Arnold describes himself as sole owner of a small concern which distributes fire-fighting apparatus in five Western states. He also acts as Northwestern distributor for the type of plane he was flying on the day he spotted the saucers.

Arnold was flying at 9200 feet when he first saw them, he later wrote in the first of a series of articles he did on the subject for a Chicago-published magazine called Fate. His first article, titled I *Did* See the Flying Disks, happened to appear in the maiden number of Fate, which styles itself a "cosmic reporter." The maiden issue also included articles titled Behind the Etheric Veil and Invisible Beings Walk the Earth.

Arnold did a number of things to get a fix on the strange objects. He concluded (a) that they were "saucerlike disks" with no tails; (b) that they flew extremely fast and "in a rather chainlike line, as if they were linked together," and (c) that, at a distance which he estimated as between twenty and twenty-five miles, each appeared somewhat smaller than a DC-4 airliner. Arnold said he had the flashing objects in sight for two and one half to three minutes, then they got away from him.

It was the immediate newspaper reports of Arnold's unusual experience which set off the excitement of June, 1947. Between then and the following Fourth of July, the newspapers and public officials were deluged with saucer reports from all over. The newspapers, on the whole, played the thing big, most of them mixing a little nervous whimsey with the upsetting reports.

The baffling thing about the reports was that, although some of the later ones obviously came from hoaxers and publicity seekers, others were coming in from persons whose standing in society was respectable. Army officers assigned to scientific projects, sane and sober commercial-airline pilots, Air Force test pilots and intelligence officers, police officers and deputy sheriffs, businessmen, astronomers and weather observers had incidents to describe.

One of the earliest of the more perplexing cases occurred on July 8, 1947, two weeks after Kenneth Arnold's experience, at Muroc Air Field in California. Muroc is the Air Force's most hush-hush sanctum, where the Air Force and Navy test their secret supersonic models, so it's not a place where you would expect the personnel to get unduly excited by strange things in the sky. But something did occur at Muroc, and the Air Force maintains that no experimental craft was involved.

ACME

Kenneth Arnold, Idaho flier, twice saw groups of "saucers," set off coast-to-coast excitement.

It was Lt. Joseph C. McHenry, the billeting officer, who, walking toward his office at 9:30 A.M., first saw "two silver objects of either spherical or disklike shape, moving at about 300 miles per hour at approximately 8000 feet." He yelled at a couple of sergeants and a stenographer, who were near by, and they saw them too. Three more witnesses were summoned, but the objects had disappeared by this time. However, a third object hove into sight, and five out of the seven witnesses saw it. Everyone was certain that, because of the apparent speed and the fact that they seemed to be traveling against the prevailing wind, the objects couldn't have been any type of weather or cosmic-ray balloon.

At noon the same day, Maj. Richard R. Shoop, attached to the office of the Chief of Technical Engineering Division, had his attention directed by a Colonel Gilkey to "what appeared to be a thin metallic object," which played lazily over the field, diving, climbing and oscillating for eight minutes. At the same time, a test pilot in the vicinity saw a strange whitish object floating to earth from a high altitude. And another test pilot recalled that, on the previous morning, he, too, had seen a roundish object whirling around at 12,000-feet altitude.

Four days prior to this, on the Fourth of July, the city of Portland, Oregon, had fairly erupted with saucer sightings. It began when Patrolman Kenneth A. McDowell was feeding the pigeons on the parking lot back of Precinct I. "I noticed," he reported later, "that the pigeons became quite excited over something." He looked around to see what had disturbed them and saw five large objects, disk-shaped and of undetermined color, in the air. They dipped up and down in an oscillating motion at great speed and disappeared quickly. McDowell notified the police radio, which broadcast an alert to all patrol cars.

At exactly the same time in another part of the city, two other Portland patrolmen, W. A. Lissy, who is a private pilot, and D. W. Ellis, saw "three flat round disks which flew at terrific speed in straight-line formation, the last disk fluttering very rapidly in a sideway arc." They saw no evidence of what made the things go, no vapor of smoke trails and no sound. They estimated altitude of the disks as 40,000 feet. In still another part of the city, Patrolman Earl E. Patterson, a former Air Force pilot, saw one disk, and a harbor pilot, backed up by two witnesses, reported seeing "three to six" objects which resembled "a shiny chromium hub cap off a car." Various citizens also saw the things, including one housewife who described it as looking "like a new dime flipping around."

The Geese With a Humming Sound

IN near-by Vancouver, Washington, a crew of deputy sheriffs heard the Portland police broadcast. They ran out to look at the sky and, sure enough, over Portland they saw "twenty to thirty objects... like a flight of geese." The deputies even heard "a low humming sound."

That evening Capt. E. J. Smith, of United Air Lines, was piloting his ship from Boise, Kenneth Arnold's home town, to Seattle. According to a report published in Fate, Captain Smith, before taking off, had remarked, apropos of the disk stories, "I'll believe 'em when I see 'em." Over Emmett, Idaho, he said he did see nine strange objects, and his story was corroborated by Copilot Ralph Stevens and Stewardess Marty Morrow. First there were five "somethings" which were "thin and smooth on the bottom and rough-appearing on top," Smith told investigators. Later, four more came into view. In all, they were observed for some twelve minutes, silhouetted against the sunset.

One of the strangest and most tragic of all the saucer cases on record was the incident of January 7, 1948, at Godman Field, an Air Force base at Fort Knox, Kentucky. It was early afternoon—between 1:45 and 1:50 P.M.—when T/Sgt. Quinton A. Blackwell, chief operator in the Godman control tower, first saw the object appear over the south portion of the field. Fifteen minutes earlier the sergeant from the commanding officer's office had telephoned him to be on the lookout, saying that Fort Knox military police and the state police had warned that "a large, circular object, *(Continued on Page 136)*

shotgun gripped across her bosom. He came to a full stop.

"What's that?"

She met his glance, her face crowded with its embittering fear and its frozen purpose, and for perhaps ten long-running seconds this enormous concentration held her still; afterward a clear embarrassment thawed her expression, and she dropped her eyes and whirled away into the kitchen. He walked on to the barn, thinking, *Why, she'd have killed him.*

He rustled out the horses and threw on the harness and drove them up to the stage and made the hitch. Rheinmiller and Schwann and the rancher had packed Cort to the shed, and now came back; the woman stood at the stage door, her glance waiting for Taggart. He moved around her and opened the coach door and offered her his hand.

"You're rested," he said, "and the night drive will not be hard."

After she took her seat, she bent forward to speak, but he moved on and took the reins while Rheinmiller mounted. The other passengers stepped inside, ready to go.

He said to Rheinmiller, "If you should see Huckabine lying along the road, send back a shot. I'll come up for him. Otherwise I'll go out first thing in the morning and make a hunt."

He threw the reins to Rheinmiller, who, kicking off the brake, gave the horses a brisk shout and sent them on at a sudden run. Coach and animals boomed over the bridge, made a long swing with the winding road, and presently passed into the narrow break of the side canyon.

In the kitchen, Mrs. Campbell said to Ada, "I'll eat in the kitchen tonight, with Henry. You go out and eat with Kelsey. Your hair looks nice . . . you look nice. You go on."

"I can't help him," said the girl. "I can't say anything I've not said before. He's seen me a thousand times."

"Always comes a time when a man looks and sees what he didn't before."

Ada filled two plates with food kept warm in the oven, and carried them to the table. She checked the table and came back for the coffeepot and turned with it as Taggart walked into the front room from the yard. His head was down, and when he took his place, it appeared that the weight of weariness shoved him into the chair. He laid his elbows on the table's top and laced his fingers and sat this way in thought, forehead against fingers.

Mrs. Campbell looked on, some faint kindness sweetening on a face long since settled into disillusion. Ada had stopped at the kitchen's doorway with an air of panic upon her, and her breathing was quick and she seemed unable to move. She was, Mrs. Campbell thought, a pretty girl when strong feeling broke the mask on her face and the nice things came freely through. Ada stared at the floor and seemed to pull all her resolution back, and went in to put the coffeepot on the table and to take her place, but her face was sober again, hiding what she felt. Her eyes avoided Taggart. Mrs. Campbell thought, *You fool girl, didn't you learn anything from that woman?* She pushed the door almost shut and stood close to the small crack to spy upon the scene.

Taggart said, "You'd have shot him."

"I would . . . I'd have killed him," said Ada, and seemed to shrink away.

Mrs. Campbell couldn't see Taggart's expression, with his back to the kitchen, but there must have been something powerful in the continuing glance he put on the girl, for presently she looked to him and rose with a quickness that was straight out of impulse, and took the coffeepot. She walked behind Taggart and stood at his side while she filled his cup. Most clearly a wave of courage buoyed her; she laid her hand lightly on Taggart's shoulder. It was a terrible pity, Mrs. Campbell thought, that he didn't look around to see the tenderness Ada silently poured upon him.

"You've got it on your mind. You mustn't think of it. He wasn't any good. Don't you let it trouble you any more."

"All right, Ada. What's done's done. It's a hard country. Must be harder on you than on me."

Ada set aside the coffeepot and returned to her seat. "You shouldn't neglect your food—not the way you work."

He dropped his hands to the table and bent forward. "Ada," he said, "that a new comb?"

"I don't wear it much."

Mrs. Campbell doubled both hands together and softly wrung them with anxiety. This touch-and-go thing now coming on was so delicate that one cool look from the girl could kill it. The thickening silence ran forward. Taggart still bent in the chair to watch Ada. Whatever he said so insistently with his eyes had its wonderful effect; before Mrs. Campbell's delighted witnessing, Ada ceased to be a silent and obscure girl from a hard-scrabble ranch, filled herself with the attention which this man poured into her, and became a woman. Actually her face grew rounder and a glow came upon her, and she was sure of herself. It was in her voice.

"I'll heat water enough for you to take a bath. You have a drink and go to bed."

"I ought to have a drink now."

Ada laughed at him and rose. "All right. One now, one then."

Mrs. Campbell closed the door without a sound. It was done, and nothing could undo it, and the rest was as certain as tomorrow's sun. The woman from the stagecoach was a handsome beast who had used her flesh on Taggart without luck, but she had wakened him and, looking around, he had seen Ada. She heard Henry come about the house, and she put her head through the back door to summon him in, so amiable that he stared at her.

"You eat with me, Henry. The bottle's on the shelf and the food's warm."

WHAT YOU CAN BELIEVE ABOUT FLYING SAUCERS

(Continued from Page 21)

about 250 to 300 feet in diameter," had been seen over Madisonville, Kentucky, only ninety miles away.

Technical Sergeant Blackwell began telephoning and radioing, and in thirty minutes his control tower was jammed with practically all the brass hats on the airfield, including the C.O. himself, Col. Guy F. Hix. For the next two hours and fifteen minutes there was a lot of confusion. Everybody in the control tower had something to say about the object. Lt. Paul I. Orner, the detachment commander, thought it was hovering, and that it was shaped like a parachute, but with some strange red light reflecting from it. Capt. Gary W. Carter, the operations officer, thought

it was "round and white," and noted that it could be seen through the clouds. Lt. Col. E. Garrison Wood, the executive officer, was sure it was "at least several hundred feet in diameter." Colonel Hix reported, "It seemed at times to have a red border at the top and at the bottom. . . . I just don't know what it was."

Into the middle of all this confusion came a flight of four P-51 fighter planes. The fighters were Kentucky Air National Guard planes returning from Marietta, Georgia, to home base at Standiford Field near Louisville. The flight was led by twenty-five-year-old Capt. Thomas F. Mantell, Jr., a husky six-footer who had flown in the Normandy invasion and who had some 3000 military and civilian flying hours to his credit. Mantell, married and father of two small sons, had been a partner in a G. I. flying school since the end of the war; he was skilled and courageous, but not foolhardy.

In the control tower, Captain Carter, the operations officer, suggested that the P-51's be asked to chase the object. Sergeant Blackwell relayed the suggestion by radio. One of the P-51's peeled off and headed for Standiford, but Mantell and two other pilots, Lieutenants Clements and Hammond, roared upward.

At 2:45—five minutes after he began the bizarre chase—Mantell reported by radio: "Object directly ahead and above and moving about half my speed." At 3:15, he reported: "Object is above and ahead, moving about my speed (360 MPH) or faster. I'm trying to close in for better look."

By now, the three fighters were approaching the layer of the sky where the air is thin, and they had no oxygen equipment. Five minutes later two of the ships turned back. Mantell kept climbing.

Mantell's wing man said afterward that he lost the flight leader between 18,000 and 20,000 feet. On the ground, the last word they had from Mantell was: "Going to twenty thousand feet. If no closer, will abandon chase."

Somewhere at this point—as investigators since have reconstructed it—Mantell began to suffer from lack of oxygen. At 25,000 feet, Mantell, his eyes fixed on the gleaming object, must have lost consciousness. His plane, now pilotless, continued climbing to about 30,000 feet. Then it went into a dive.

Somewhere between 20,000 and 10,000 feet, the P-51 began to disintegrate. Pieces of it were found scattered over the landscape as far as six tenths of a mile from the place where most of it fell.

What was it that lured Mantell to his death? I believe, as a result of my research, that it was either the planet Venus or a giant plastic balloon escaped from a Navy cosmic-ray-study project near Minneapolis, which is some 650 miles away.

In Mantell's case, the Venus theory is a strong probability. Dr. J. A. Hynek, professor of astronomy at Ohio State University, who has been retained as a consultant by the Air Force to help unscramble some of the confusion, estimates conservatively that 25 per cent of the so-called saucer sightings can be blamed on planets, comets, shooting stars and other cosmic fireballs. Venus, the closest major planet to the earth, is a prime offender. In World War II, hundreds of rounds of antiaircraft ammunition were wasted on Venus at times of the calendar when the planet was particularly close to the earth and was picking up rays from the sun.

Doctor Hynek, after carefully checking the position of Venus on the day Mantell was killed, reported that "nearly all of the sightings check approximately with the position of Venus," though he thought it "a little surprising that it was so easily picked out during daylight by the naked eye." On August 19, 1948, when another silvery spherical object came into sight over Godman Field, an astronomer was consulted before the fighter planes were called out. The astronomer reported that the object clearly was Venus, then only three weeks from its period of greatest brilliancy.

However, a responsible naval-research official in Washington told me unequivocally that one of the Navy's giant plastic cosmic-ray balloons was known to be loose in the Godman Field area the day Mantell was killed, and he is firmly convinced that the pilot met his death chasing it. It is entirely possible that both Venus and the balloon were rampant in the area that day, because the thing—or one thing—was reported seen over a bewildering course, stretching through Illinois, Kentucky, Tennessee and Ohio.

Some weeks before the Mantell tragedy, the Air Force had already made the decision that the saucer business must be investigated. Gen. Hoyt S. Vandenberg, then Vice Chief (now Chief) of Staff for the Air Force, was instrumental in making the decision.

Guaranteed by Good Housekeeping

However illogical and absurd the notion of unexplainable objects soaring over America might sound, the Air Force could not afford to close its mind arbitrarily to the possibility that something new might be in the skies.

There were a number of factors that were subjects for legitimate concern. For one thing, reports of strange objects in the air had started trickling in from Alaska, a strategic military area, and from parts of Scandinavia and North Germany, where it might be entirely possible to witness some of the known Russian experiments with guided missiles and rockets. Queer-shaped objects leaving trails of green light were seen coming from Peenemünde, the ex-Nazi missile center now in Soviet hands. And Russian rockets had fallen inside the American zone of occupied Germany.

We also knew that the Germans had been much further along than we were in the missile field, and that the Russians had scooped up all the German scientists they could corral. We knew that the Russians, with the help of German scientists, had developed some small disks with explosive edges, launched by a compressed-air catapult, for possible use as an ordnance item. We knew that the Russians were hot for developing snorkel submarines capable of launching buzz bombs; our own Navy has been able to fire the Loon, its version of the German buzz bomb, from submarines off Point Mugu, California. And we remembered the Japanese wartime stunt of letting free balloons drift over to this country as a possible means of initiating incendiary or germ warfare; it was a slightly screwball undertaking, but some of the balloons did get here.

So the Air Force set up its project, under Air Intelligence, to investigate. For some obscure security reason, it still is not permissible to mention the code name of the project, so I will call it Project Saucer. Top supervision is from Washington, but the leg work, cataloguing and evaluating are done by the Technical Intelligence Division at Air Matériel Command Headquarters, Wright-Patterson Air Force Base, Dayton, Ohio.

Project Saucer at Wright-Patterson provides a task force of intelligence officers and civilian technical experts who can jump into a plane any time an important saucer sighting is reported and go out to investigate. In practice, the task force has not personally investigated many cases on the scene, but has left the questioning to local intelligence officers, who report all information back to Dayton. However, General Vandenberg feels that more of the original information should be gathered by the same men each time, so new instructions have been issued which should keep the task force traveling more.

One of the tentative decisions made by Project Saucer early in the game is that there's nothing much new in any of this. Strong suggestions of it appear in the published works of the late Charles Fort, a writer from the Bronx, who spent a lifetime collecting obscure references to the unexplained phenomena of the ages. One of Fort's theses was that Science was a fraud. Nobody was ever quite sure whether Fort was serious or had his tongue in his cheek, but the intelligence officers waded through four of his books. Fort, they learned, had reports of elephant-sized hailstones, orange-flavored and horned hailstones, flying disks, snowflakes the size of plates, and strange airborne visitations of beef, blood, butter, coal, salt, black powder, axes, clinkers, bricks, fireballs, human bodies, fish, frogs, toads, serpents, ants, worms and even a haycock. Most of the phenomena were slimly documented, many being based solely on newspaper-filler items telling about purported freaks of nature.

When I went to Wright Field armed only with reports of what witnesses said they had seen, the Great Flying Saucer Scare seemed reasonably mysterious to me. When I had finished my investigation in Dayton, Washington and elsewhere, the thing seemed less mysterious than odd. There are any number of logical and perfectly normal solutions by which most of the saucer sightings can be explained.

In addition to the 25 per cent or more bona fide cases of mistaken identification that can be blamed on astronomical phenomena, a large percentage can be accounted for by weather-observation and radar-target balloons. The military services and the Weather Bureau use numerous types of balloons to record atmospheric data. Some carry steady lights, some carry blinking lights and others hoist up gleaming gadgets of various shapes. There is no doubt that balloons have bemused many a sane observer.

The most common sources of innocent deception in the balloon field are the so-called RAWIN (radar-wind) target balloons. The balloons generally are white, and at 40,000 to 60,000 feet where they usually operate, they are invisible to persons on the ground. Dangling below each balloon, however, is a six-cornered "target" of aluminum foil, strung out on kitelike sticks. Radar operators on the ground track these aluminum targets for weather information. The targets oscillate and gyrate in the wind, and sunlight glinting from these shiny, wind-tossed objects can create a perfect illusion of a flying saucer. Movies of airborne RAWINs were taken for me, and in some shots the oscillating aluminum targets appeared perfectly round.

At the very time the saucer sightings were at their height, the Air Force had just turned over thousands of surplus RAWINs to Weather Bureau stations all over the country, so they were being

GROUNDS FOR DIVORCE

(COFFEE GROUNDS, OF COURSE)

By Phyllis I. Rosenteur

Percolator, vacuum, drip;
My husband snarls and curls his lip;
And instant coffee he turns down,
While Turkish types call forth a frown.

I brought a biggin* back from France,
His morning Java to enhance;
He hates it, and his day is spoiled
If I offer coffee boiled.

Caffeine-free he will not drink;
He pours my efforts down the sink;
But camping out, this captious man
Brews nectar in an old tin can!

*Early type of percolator

★ ★ ★ ★ ★ ★ ★ ★ ★ ★

used in greater numbers than ever before. Sometimes several RAWINS were released together, which might account for "disk formations."

Another common—and obvious—solution lies in the field of cosmic-ray-study balloons. The armed forces, seeking to learn more secrets about atomic energy, have set up projects all over the country to penetrate the stratosphere with giant balloons. They are often released in clusters.

The Navy, particularly keen to harness atomic energy for submarine and warship propulsion, has gone a step further in its Operation Skyhook, which it is carrying out in collaboration with the General Mills aeronautical laboratory at Minneapolis. A new type of plastic balloon—a huge, translucent thing with a long tail—has been devised to carry seventy pounds of equipment 100,000 feet and more into the air. When the balloon starts aloft with its case of instruments which is four feet tall, it is filled to only one per cent of its capacity with helium. When it reaches the stratosphere, expansion causes it to swell to a monstrous thing 100 feet tall and 70 feet in diameter.

The Skyhook balloons are released in the vicinity of Minneapolis, and the Navy even has released them from an aircraft carrier. Sometimes they carry lights. They travel to widely separate corners of the United States—one drifted as far as 1300 miles from base—before a timing device cuts loose the instrument container, allowing it to descend by parachute. The released balloon then breaks into pieces, and the descending fragments do some tricks of their own in floating earthward. According to a General Mills scientist, "At sunset the balloons glow like a large evening star in the reflected rays of the sun. Since they are far above the horizon, they may be visible for as long as thirty minutes after darkness has shrouded the earth. Thousands of people in the Minneapolis area have observed this phenomenon with mixed emotions, ranging from mild interest to terror."

How much of the scare can be blamed on experimental aircraft and missiles? Our research and development authorities insist that nothing they are doing with aircraft or missiles should cause people to see flying saucers. However, some of the sightings have been in the White Sands, New Mexico, area, where the frightening marriage of the German V-2 and the Wac Corporal is being forged, and the conclusions are obvious. Also, after Air Force officials had said that they knew nothing of anything flying in the vicinity of their highly secret Muroc base that might be making people see saucers, it came out that a former test pilot near Muroc had been playing around with a six-foot all-metal disk-shaped tow target. And both the Navy and Air Force, of course, are filling the air with strangely shaped experimental planes—needle-nosed things which break the sonic barriers; a "flying flapjack" plane that really looked like a saucer, but now has been dropped by the Navy; eight-engine "flying wing" bombers, rocket-assisted craft and planes with fire-belching ram-jet engines on their wing tips.

However, the investigating authorities have learned that all the logic in the world will not convince the witness who wants to believe that the thing he sighted was something sinister or maybe interplanetary. At Wright Field, for instance, there is a civilian technical consultant, an expert on rockets in his own right, who is convinced that the saucers are visitations either from Moscow or Mars.

Fate magazine, which has beat the drum for the interplanetary-spaceship theory, printed an article signed by Neil Stanley and Chester S. Geier, stating: "As no evidence has turned up as yet to show that the disks originated on this planet, it must be assumed that they are visitors from space." In an earlier issue, another writer opined that if Kenneth Arnold, who seemed to have started it all, actually had seen what he described, it must have been "a train of spaceships from some other planet."

Arnold himself has been conducting a one-man campaign to prove that he did see something out of the ordinary that day over Mount Rainier. Several witnesses to saucer phenomena elsewhere told me that after their stories were published they received correspondence from Arnold urging them to disclose full information. Arnold has written other articles for Fate—one titled Phantom Lights Over Nevada, and another Are Space Visitors Here? In the latter, discussing a fisherman's report of seeing weird purplish spheres with portholes maneuvering over the Crown River, in Ontario, Arnold wrote: "Once again, we can be sure that these Canadian blue-green-purple globes are not meteors, nor are they fragments of a comet or Venus. What, then, are they? Spacecraft from another world?"

I wrote to Arnold, asking for more information about his activities and his ideas. He replied, in part: "Since my first observation and report of the so-called 'flying disks' I have spent a great deal of money and time thoroughly investigating this subject. . . . It may be of interest to you to know there is a connection between tremendous amounts of furnace slag which is being found in giant dumps on our ocean floor, strange submarines, rocket ships and flying disks. . . . There is no doubt in my mind but what these objects are aircraft of a strange design, and material that is unknown to the civilization of this earth."

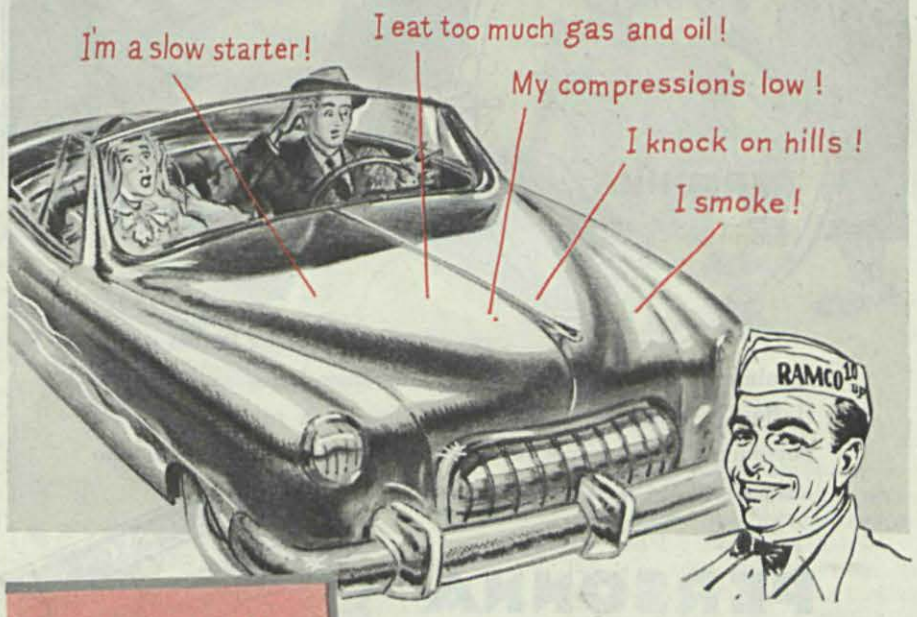
About five weeks after his first saucer sighting, Arnold appeared in another Northwestern town to investigate a report that two men had seen a "wounded" saucer—a sort of "doughnut-shaped aircraft" escorted by five similar craft—crash on an island off the coast. Arnold's account of this investigation in Fate is a real cloak-and-dagger epic, and he mentions that while flying to the scene of the investigation he spotted another covey of some twenty-five flying disks. He was joined in his investigation by Capt. E. J. Smith, United Air Lines pilot who had seen saucers while en route to Seattle.

Later, a Government investigation indicated that Arnold probably had run up against an elaborate hoax. In the course of his own investigation, Arnold telephoned 4th Air Force intelligence at Hamilton Field, California, with the result that two officers, Capt. William L. Davidson and Lt. Frank M. Brown, were sent out to see what it was all about. After talking with Arnold and the air line pilot, Smith, and also to one of the supposed actual collaborators in the hoax, the two officers pulled out after midnight to fly back to Hamilton Field.

On the way back to California, the B-25 bomber that Captain Davidson and Lieutenant Brown were flying crashed. Both men were killed.

Editors' Note: This is the first of two articles by Mr. Shalett on the Flying Saucers. The second will appear next week.

BAD language from your car is needless!



RAMCO RE-POWERING STATION

Here is what to do about getting a real CURE at the RIGHT PRICE!

Today's modern engines depend upon HIGH COMPRESSION to give you SPEED... POWER... GAS and OIL ECONOMY! When PISTON RINGS fail to maintain that high compression, due to wear... THEN TROUBLE STARTS!

Before attempting to cure BAD ENGINE BEHAVIOR you must make sure just what is causing it!

Compression Test

A simple compression test by a reliable specialist will give you the answer! If new rings are needed, then, do as millions have done! Make sure you get a LONG LASTING CURE, at *the right price* by having Ramco 10-Up Piston Rings installed by the RAMCO RE-POWERING METHOD.

Look for this sign!

Here you can be sure not only of getting the right rings but of getting the job done right.

Right Rings... Right Man

This man is an engine repair specialist who is skilled not only in piston ring installation, but also, carburetion, ignition and cooling service. Get acquainted with him... he is a good man to know! For name and address of your nearest RE-POWERING station, write: RAMSEY CORPORATION, 3755 Forest Park Blvd., St. Louis 8, Missouri.

WITH every installation of Ramco 10-Up PISTON RINGS you can get this...

RAMCO 10,000 MILE (ONE YEAR) GUARANTEE

AGAINST OIL PUMPING & BLOW-BY
Covers both Piston Rings and installation labor!

What You Can Believe About Flying Saucers

By SIDNEY SHALETT

Science growls "Bunk!" But in nervous times like these the air-borne disk scare can—and probably will—flare up again. If you see a "saucer," just do what Air Chief Vandenberg did.

CONCLUSION

THE men who constitute the high command of the United States Air Force do not believe in flying saucers, disks, space ships from Mars—or Russia—which citizens of the United States have been reporting with increasing frequency since the atomic age burst upon the world. But they are not surprised that people are seeing them. The Air Force generals have seen saucers themselves—or, rather, what would have passed for saucers with less knowledgeable observers. No one knows better than an experienced airman what strange tricks the sun, stars and senses can play upon you in the wild blue.

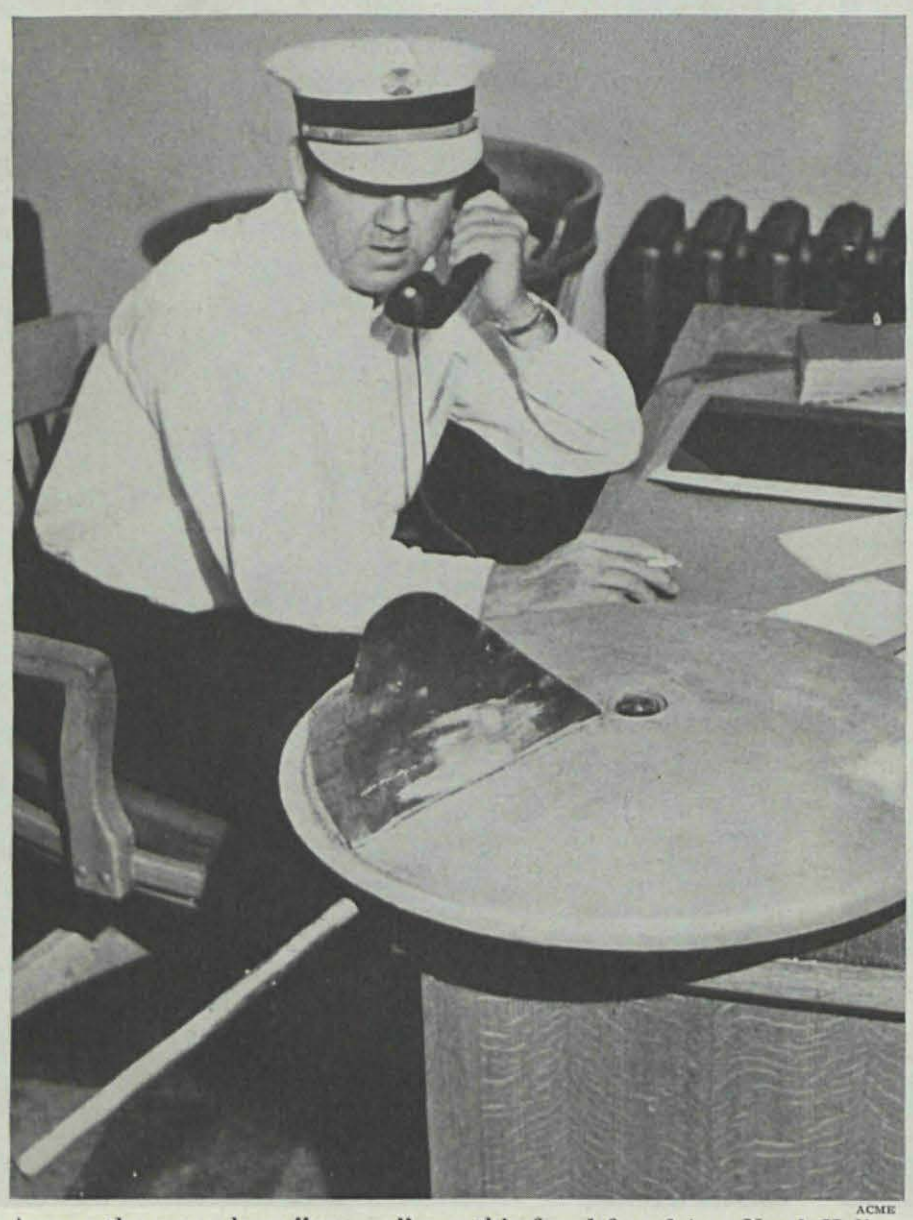
Less than a year ago, Gen. Hoyt S. Vandenberg, the Air Chief of Staff, who was responsible for the decision to set up an Air Force project to sift the saucer reports, was piloting a B-17 bomber on a night flight when a strange, disk-shaped, lighted object streaked by somewhere over to his right. If the general had rushed into print with his experience, it would have been another incident in the Great Flying Saucer Scare. Instead of getting rattled, he just experimented a bit by moving his head at different angles, and, sure enough, he could reproduce the saucer at will. It was merely a reflection of a ground light on his window.

Lt. Gen. Lauris Norstad, who has served both the Air Force and Army as director of Plans and Operations, was flying back from Maxwell Field one night when both he and his copilot noticed a strange large object pacing them above. It failed to answer their identification signals. A little calm reconnaissance, however, established that the aircraft was nothing but the reflection of a star on a cloud.

Other generals have been bewildered—but not for long—by highly realistic illusions from ground air beacons and searchlights. Even Col. H. M. McCoy, who heads up the intelligence division at Air Matériel Command headquarters at Wright-Patterson Field, Dayton, Ohio, where saucer reports are screened, once thought he saw a disk while flying a P-51 fighter in broad daylight. It turned out to be a glint of sunlight from the canopy of another distant P-51.

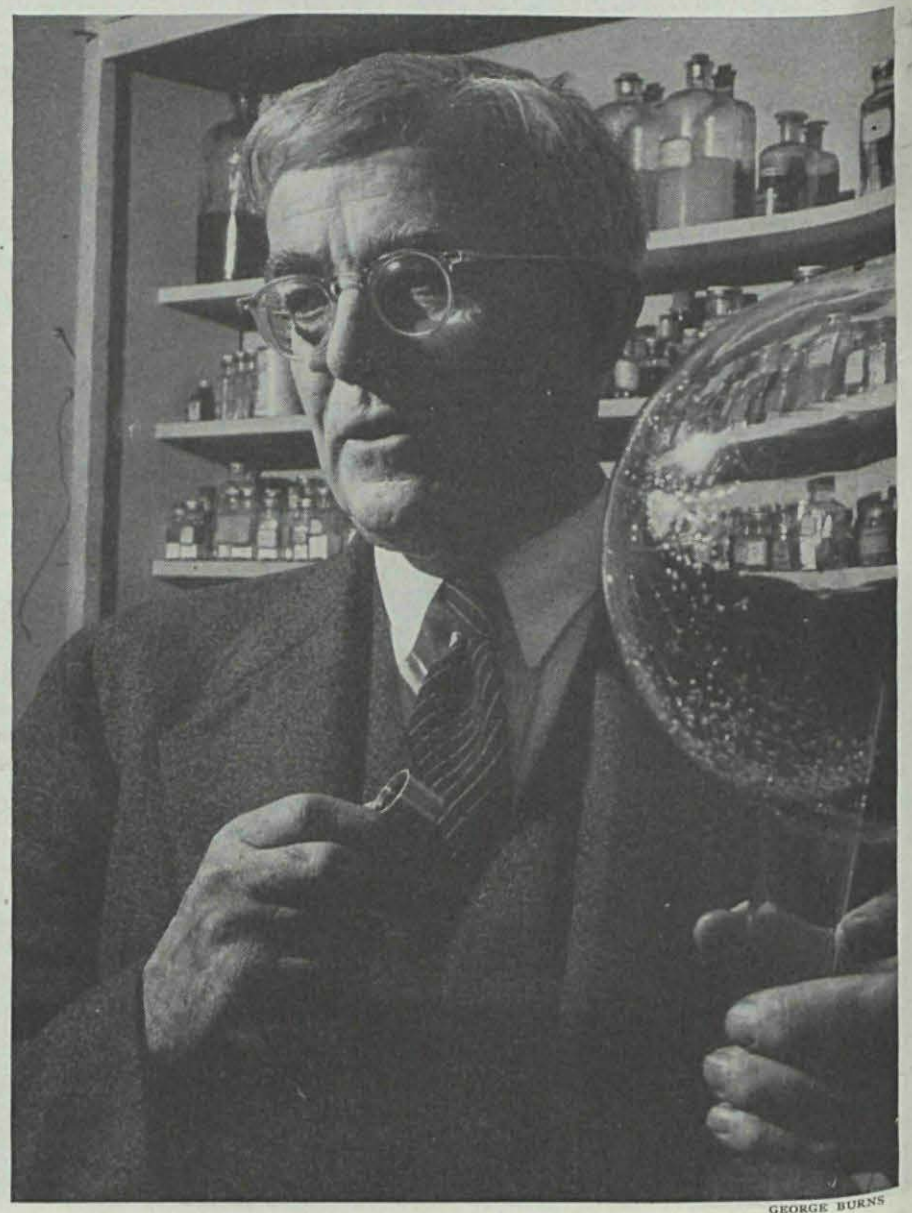
Lt. Gen. Curtis E. LeMay, now the tough-minded Strategic Air Command boss, was particularly rough on saucer reports when he headed up the Air Force's research-and-development program at the height of the scare. He put his weather expert on the trail, and substantial proof was uncovered that one out of six of the then current crop of reports could be traced to a certain type of aluminum-covered radar-target balloon then in wide use. LeMay said nothing for publication, but soon thereafter, when a certain lieutenant colonel gave out a lulu of a story on how he, too, had seen flying saucers, the general rebuked him blisteringly by telegram . . . and sent it collect.

Gen. Carl Spaatz, the retired Air Chief, is another who gets indignant when he thinks of saucer hysteria. "If the American people are capable of getting so excited over something which doesn't exist," Spaatz told me, "God help us if anyone ever plasters us with a real atomic bomb." He added, "I can tell you unequivocally that the reported sightings of so-called saucers were completely unconnected with any form of *(Continued on Page 184)*



ACME

Among the many hoax "saucers" was this fraud found in a North Hollywood yard. It was made of galvanized iron, a radio tube, a piece of pipe.



GEORGE BURNS

First to point out the planet Venus illusion, Nobel Prize scientist Langmuir says no real proof of "saucers" exists. His friendly advice: "Forget it."

WHAT YOU CAN BELIEVE ABOUT FLYING SAUCERS

(Continued from Page 36)

secret research that the Air Force was conducting during my term as Chief of Staff."

It is no secret, of course, that the Russians are experimenting with supersonic aircraft and guided missiles just as we are. But if any of the things which have popped up over America for a few seconds or minutes are Soviet gadgets, the cold brain of Air Intelligence—which painstakingly sifts reports—would like to know how they do it and then return to home base without being seen by more people. It also is reasonable to wonder why, out of more than 250 reported saucers, not one has crashed so we could lay hands on a tangible bit of evidence; so far, Air Intelligence does not have so much as one loose nut off any unexplained object to examine.

The officers and technical experts assigned to Project Saucer—a nickname for the top-secret Air Force investigative effort—sometimes get to feeling they're living in a dream world, so utterly unfettered and mysterious are some of the reports they are assigned to evaluate. One of the most fanciful came from a Montana man who wrote in to tell of sighting a large, blue-white ball that had beamed a bright light at him. "I am perfectly sincere and do not drink," the Montanan said, "so the foregoing is absolutely the truth."

An Army pilot at Dayton, Ohio, had three or four teardrop-shaped objects come so close to his plane that he had to duck to avoid collision. Asked to describe them, he replied, "Take about one half gallon of water and dump it two hundred yards in front of an approaching aircraft about two hundred feet above it, with the water taking the shape of a teardrop ——" In San Francisco, an aviation student strolling in Golden Gate Park said he was attacked by a mysterious light "like an electric arc," which seemed to have the power to "lower my hand like a sack of shot"; he said he had delicate skin and that it even left a bruise on him.

One of the main solutions to the reported phenomena lies in the aero-medical field. Both Air Force and Navy aero-medical experts have prepared volumes of research findings, spelling out in detail how vertigo, hypnosis and other sensory illusions affect pilots traveling at high altitudes and extreme speeds.

Vertigo is a loose term used to describe a condition of dizziness and stupor which pilots themselves call "the leans." Case histories set down by the Navy's School of Aviation Medicine at Pensacola have established that vertigo and self-hypnosis brought on by staring too long at a fixed light have caused pilots to dogfight with stars, to mistake ground lights for other aircraft, flying saucers or what not, and to have outright hallucinations about things which weren't even there.

Wright Field aero-medical experts confirm these findings. In general, they feel that when a flier starts chasing an illuminated weather balloon or a star, and vertigo or hypnosis sets in, the pilot can come down and practically tell you how many rivets were on the nose of that Martian space ship.

The trouble with all the logical explanations, however, is that the person who has had, or thinks he has had, a sufficiently vivid encounter with a saucer is absolutely certain none of those explanations can apply to him. And in a number of the cases it is pretty hard to apply any of the logical explanations to the reported facts. You have to keep reminding yourself that even an experienced pilot laboring under strain and excitement finds it difficult to judge distances, altitudes and speeds accurately.

One particularly baffling case was the encounter of twenty-five-year-old George F. Gorman, of Fargo, North Dakota, a second lieutenant in the North Dakota Air National Guard, with an apparently disembodied and soundless white light that could climb, swoop and outmaneuver any jet plane now operating. I flew to Fargo to interview Gorman.

Gorman, a native of Fargo, is an employee of a farm-machinery company. He bears a good reputation for veracity and personal habits. During the war he instructed French flying cadets. He is articulate and above average intelligence. He has had several years of college education, and describes himself as an amateur student of Freud, physics and other subjects. Gorman insists he was not particularly conscious of the flying-saucer craze at the time of his reported experience, October 1, 1948, though the saucer excitement had been bubbling since June of the previous year.

At nine o'clock that evening, Gorman, who had been flying with his outfit, the 178th Fighter Squadron, decided to take a turn over the local stadium and watch a night football game which was in progress. The other planes landed, leaving him alone in the air in a fast P-51 fighter. He had been watching the game for about five minutes, which perhaps is significant. The aero-medical people would hold that concentration on the floodlights for that period might bring on vertigo or autohypnosis, but Gorman told me emphatically he was certain the lights had not disturbed his vision.

He first saw the light pass over the football field. He was at 4500-feet altitude and the object, he said, was "a little below." It was "a small ball of clear white light, with no physical form or shape attached." It was perhaps six to eight inches in diameter, Gorman figured. It seemed to be making about 250 MPH at an altitude of 1000 feet. The light varied in intensity; it never was extremely bright and it blinked on and off.

To his surprise, he couldn't overtake it. He pushed his speed up to the limit, but the thing, which he thought had been traveling relatively slowly, exceeded him by at least 160 MPH. It seemed to Gorman, he said, that the light could outmaneuver and outrace him, though several times during the twenty-seven minutes he "fought" with it, he thought he came fairly close to the object. At one point he determined to ram it. He made a head-on pass, but lost his nerve and dived under it. During this pass, the object passed not more than 500 feet over his canopy, he estimated.

Later, the object initiated a pass at Gorman—"I had the distinct impression that its maneuvers were controlled by thought or reason," he said—and he tried to ram it again. This time it pulled up and streaked to 14,000 feet, with Gorman following. He said that he blacked out several times during the violent maneuvers, but not for long. He also said he eventually climbed to 17,000 feet without oxygen, but is certain it did not make him groggy. Vertigo, he stated, was "absolutely out of the question."

The object finally pulled away from him, climbing straight up until it was out of sight, Gorman said. Gorman was in touch with the Fargo airport tower during the encounter, broadcasting an account of his dogfight with the light. His story has partial corroboration. A sixty-seven-year-old flying grandfather, Dr. A. D. Cannon, an oculist, was in the air at the time in his plane. Cannon and a passenger, Einar Neilson, also had flown over the floodlighted football field. They saw a light in the air. It was "moving fast," Doctor Cannon said, and he thought it might be a Canadian

"I'm going to have them throw the book at me."

Vampire jet plane from Stevenson Field near Winnipeg, some 200 miles from Fargo. After landing, Cannon saw a light twice from the ground; it seemed to him to keep a constant altitude, and definitely changed its direction from east-west to north-south.

Also, Lloyd D. Jensen, the airport traffic controller, and Manuel E. Johnson, his assistant, Civil Aeronautics Administration employees and both extremely nonflighty citizens, each saw a strange light once, moving over the airfield.

I learned from the weather observer at the Fargo airport, George Sanderson, who is a member of Gorman's National Guard squadron, that a black weather balloon carrying a lighted candle had been released shortly before Gorman's strange encounter. But Sanderson, Jensen and Johnson, all experienced hands, insisted it couldn't have been the balloon-borne candle that perturbed the pilot. Sanderson said the balloon was being tracked by a theodolite, an observer's instrument, and that the wind direction and velocity were all wrong in relation to the course of the object Gorman said he was chasing. Sanderson said his assistant tracked the balloon until it disappeared, just before Gorman landed, at 12,000 feet.

Another solution suggests itself: Fargo is only about 200 miles away from the Operation Skyhook base near Minneapolis, where the Navy is releasing giant, light-bearing plastic balloons as part of a project to study cosmic rays. These balloons travel high and fast, and have frightened the wits out of observers wherever they have drifted. Navy scientists in Washington said it is entirely possible one of their balloons drifted over Fargo that night.

The Air Force checked across the border to determine if any Canadian jets had been skylarking over North Dakota that evening, and were assured that such was not the case. None of the ground witnesses heard the banshee whine typical of Canadian jets, anyway. Investigators even tested Gorman's fighter with a Geiger counter, but got a negative reaction for atomic radiation.

So it adds up to a sweet mystery. Was Gorman suffering from a combination of vertigo and confusion with a balloon or ground light? If so, how is the testimony of the ground witnesses, who certainly didn't have vertigo, to be explained rationally? Or did Gorman actually stumble onto something that has been kept secret successfully by the Air Force, or some other nation, or our friends up on Mars? Personally, after my investigation, I'll vote for the balloon and vertigo.

An encounter similar to Gorman's occurred as recently as last November eighteenth at the Air Force's great Andrews Field base on the outskirts of Washington, D. C. At 9:45 P.M., Henry G. Combs, a twenty-five-year-old second lieutenant in the Air Force reserve, was returning from a night mission with his squadron. Combs, a quiet, serious physical-culture enthusiast, is a young man who trained with the Air Force during the war, but never got overseas; he is so anxious to get back on active duty that he even has written President Truman asking if anything can be done.

As he was preparing to land, Combs spotted something. It was a "dull gray globe" six feet thick and twelve to fifteen feet across. It gave off a sort of frosty light and had rough edges; no blinking, no exhaust flames.

Just as Gorman did, Combs gave chase. For the next ten minutes the thing led him through astounding maneuvers, changing its air speed, Combs related, from seventy-five to 600 MPH and varying its altitude from 2000 to 7500 feet. In the back seat of his T-6 trainer was 2nd Lt. Kenwood W. Jackson, who was unhappy about the whole business. Jackson confirmed that a light was seen and chased, though his description of what happened differs somewhat from Combs'. He wanted to radio the control tower, but Combs wouldn't let him.

Combs' encounter ended, he said, when he stood his T-6 practically on its tail and flashed his landing lights squarely on the thing. At this point, Combs said, the thing streaked away toward the East Coast at 600 MPH and disappeared.

Here again it is a distinct possibility that a pilot was mixed up by a combination of vertigo and a balloon. However, the continued testimony of pilots that these "things" could outmaneuver them bothered me, as balloons are notoriously nonmaneuverable. So, while at Wright Field, I asked a pilot to go up and make a few passes at a weather balloon and see how it looked to him. He came down and told me, with some surprise, that, when he turned around the balloon, it definitely appeared to be turning at the same rate as his plane, and at times it even seemed to be turning faster than his aircraft.

Another wide area through which Project Saucer investigators have had to plow is the rich, intangible field of hallucinations, hoaxes and mass hysteria. For example, a man from Zelienople, Pennsylvania—who said he was "strictly scientific" in his thinking—wrote to the Air Force: "I am prepared to state that careful study and research has absolutely CONVINCED me that these 'Objects X' are creations of realms above or beyond our sphere; are, if you please, GHOST objects or craft, propelled by paranormal teleportion (the telekinesis of the poltergeist manifestation). . . . They are controlled by intelligent, ghostlike, invisible beings or animals bearing, I believe, very little likeness to human beings."

As for hoaxes: Near Black River Falls, Wisconsin, at the height of the Great Flying Saucer Scare, a "flying disk" was found at the county fairgrounds. The finder obligingly placed it on exhibition at fifty cents a look until the local chief of police confiscated it. FBI agents flew all the way up from Milwaukee in a chartered plane to see it. It was found to be a crude concoction of plywood and cardboard, with pieces of propellers and radio cells mounted on it—strictly an opportunistic fake.

A "flying disk" fell in the street in a Southern city. It was composed of aluminum strips, fluorescent-lamp starters, condensers, rivets, screws and copper wire. A little investigation resulted in a confession from the culprit, the superintendent of an electric-fan factory, who said he concocted the device and threw it from the roof of the factory, hoping to scare his boss, who was getting into his car.

Mass hysteria is a phenomenon that has fascinated philosophers and psychologists for ages; there is no limitation on what impressionable people will think they've seen if someone starts a sufficiently convincing rumor. Even an honest rumor will do the trick.

It is a jittery age we live in, particularly since our scientists and military spokesmen have started talking about sending rockets to the moon and about experiments to by-pass the law of gravitation by creating a man-made planet

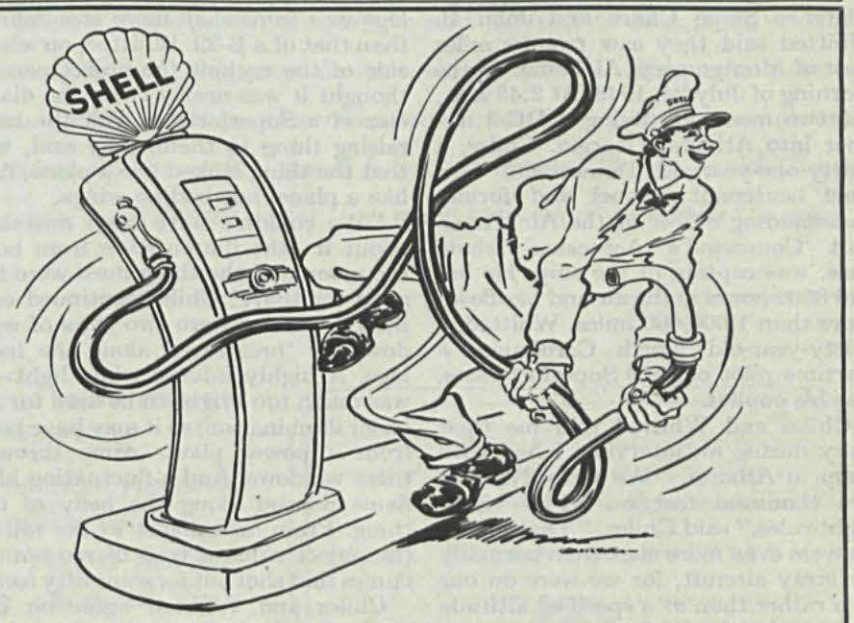
TRY EYE-GENE
AMAZING EYE-OPENING TEST!
Millions Thrilled Over Transformation It Makes!

Eyes can be so tired you want to close them for relief . . .

2 drops make this striking difference in SECONDS!
Clear, expressive eyes are fascinating. 2 drops of soothing, safe EYE-GENE in each eye floats away that tired, dull, strained, irritated look and feeling in *SECONDS*—dramatically lights up your whole expression! Safe EYE-GENE is like a tonic for your eyes. Use it every day. Insist on EYE-GENE. 25c, 60c, $1 eye-dropper bottles.
REPLACEMENT OR A REFUND OF MONEY Guaranteed by Good Housekeeping IF NOT AS ADVERTISED THEREIN



"Activated" Shell Premium is the most powerful gasoline your car can use!

that will streak off the earth at 25,000 miles per hour or so and start circling in our orbit. Though we have not yet produced the rocket-to-the-moon and the homemade satellite, it is small wonder that harassed humans, already suffering from atomic psychosis, have started seeing saucers and Martians.

Perhaps the most outspoken foe of the flying saucer in the United States is Dr. Irving Langmuir, the distinguished scientist and Nobel Prize winner. Doctor Langmuir, associate director of General Electric's Research Laboratory at Schenectady, has spent a lifetime debunking what he calls "pathological science"—that is, untruthful scientific theories which were carelessly accepted as truthful until someone came along to prick a hole in them—and he lumps saucers in this category. He also happens to be a member of the Air Force's Scientific Advisory Board. Though Doctor Langmuir speaks on saucers in his nonofficial capacity as a scientist, he has given the Air Force an earful on the—as it appears to him—absurdity of it all.

Doctor Langmuir was one of the first to point out that Venus was close to its peak brilliance the day an unfortunate National Guard pilot killed himself chasing a saucer in Kentucky. When shown a picture that someone took of a heel-shaped "saucer" flying over Phoenix, Arizona, he acidly inquired if anyone had taken the trouble to determine whether there was a violent squall over Phoenix that day.

"To me," he said, "the picture has all the scientific aspects of a piece of tar paper, or a torn blanket, or a collapsed balloon, tossing in a high wind.

"One of the characteristics of a thing that isn't so," Doctor Langmuir continued, "is the impossibility of bringing it out into the open. If a man tells me that two and two equal five—or that he has seen a flying saucer—I don't feel I have to prove he is wrong. I feel the burden is on him to prove that he is right."

I asked Doctor Langmuir what he would advise the Air Force to do about flying saucers. He snapped his answer, "Forget it!" The Air Force, I suspect, would like to forget it. But then something new comes along like the strange adventure of two Eastern Air Lines pilots with what seemed to be a flame-shooting, double-decker space ship, and Wright Field has to send out another team of investigators.

Of all the so-called saucer stories, the most difficult to rationalize is the account of what Eastern Air Lines pilots Clarence Shipe Chiles and John B. Whitted said they saw twenty miles west of Montgomery, Alabama, on the morning of July 24, 1948. At 2:45 A.M., the two men were flying a DC-3 airliner into Atlanta, Georgia. Chiles, a thirty-one-year-old Tennessean, wartime lieutenant colonel and former commanding officer of the Air Transport Command's Ascension Island base, was captain of the ship. He has had 8500 hours in the air and has flown more than 1,000,000 miles. Whitted, a thirty-year-old North Carolinian, a wartime pilot of B-29 Superfortresses, was his copilot.

Chiles and Whitted told me their story during an interview I had with them in Atlanta. "We were flying at five thousand feet on VFR—visual flight rules," said Chiles. "That meant we were even more alert than normally for stray aircraft, for we were on our own rather than at a specified altitude assigned by the CAA.

"I saw the thing first. 'Here comes a new jet job!' I yelled to John. He saw it too. Then we knew it was like no jet job we'd ever heard about. We had five to ten seconds to look at it. The moon was full and the object came quite close—not more than a mile away, I thought, and John here thought it was even closer. It was traveling on a southwesterly course—exactly opposite to our direction. Its velocity, allowing for our own air speed, could have been anywhere from five hundred to seven hundred miles per hour—I'm sure it was faster than any jet I've ever seen flown."

Despite the flashing speed with which the airliner and the reported object would have passed each other, both pilots noted a wealth of details.

They agreed the object was at least 100 feet long. Chiles thought the fuselage was somewhat more streamlined than that of a B-29. Whitted, on whose side of the cockpit the object passed, thought it was nearly twice the diameter of a Superfortress. But the hair-raising thing to them, they said, was that the thing looked like a plane, flew like a plane, but had no wings.

"We couldn't have been mistaken about it—the illumination from both the moon and the thing itself were too good for that," Chiles continued earnestly. "There were two rows of windows, or 'breathers,' along the fuselage. A highly intense white light—it was much too bright to be used for interior illumination, so it may have been from a power plant—came through these windows. And a fluctuating blue flame danced along the belly of the thing. From an exhaust in the tail of the object came a trail of red-orange flames that shot out for some fifty feet."

Chiles and Whitted agree on the above details. Chiles also paid particular attention to the nose of the thing, and observed that it had a radarlike protrusion from its snout that "looked like a swordfish," and that there were four to six metallic-looking objects in front that resembled streamlined windshields, or louvers.

As soon as the thing had disappeared, by pulling up sharply and climbing, Chiles and Whitted said, they started gaping at each other. They said they couldn't believe it. Chiles went back in the darkened interior of the plane and started asking the passengers if they'd seen anything. Apparently, the only one who had been looking out of the window at that hour was Clarence L. McKelvie, of Columbus, Ohio. He had seen a bright streak of light whiz by the window, but had observed no form or details. He told Air Force investigators that Chiles seemed genuinely excited when he came back into the cabin.

Chiles and Whitted still say they do not know what to think; they say they are certain that they were not suffering from hallucinations and that what they saw was a manufactured object—not a meteor—and unlike any aircraft or missile known to them. They immediately checked with the nearest control tower to ascertain if there were any commercial or Army aircraft in their vicinity, and were told there were not. The Air Force has confirmed it had nothing flying in the area at the time.

Both men are married and fathers. They had nothing to gain by their story, for it was bad publicity. Neither has tried to profit by the incident, nor were they responsible, so far as I could learn, for the story being given out to the newspapers. Chiles told me he didn't even report the incident to his superiors until the middle of the next day, and that he did so then only because he was worried that if the Army had any experimental craft flying in those lanes it might collide with some airliner.

The high command and the research-and-development chiefs of the Air Force gave me unequivocal assurance that nothing tested at Eglin Field, which is 130 miles to the south, possibly could answer the description of the Chiles-Whitted object. Not even the slow V-1 buzz bomb has been launched from there within the past two years, they said. They also pointed out that a guided missile does not perform in the manner described by the two pilots, and that a V-2 rocket would travel so fast they couldn't have seen it from their cockpit. As for aircraft, they said, maybe a wingless fuselage could fly, but it would have to have nothing short of atomic power to lift it from the ground.

While the Air Force finds it difficult to believe that the heavens are populated with inexplicable skimming saucers, diving disks, bounding balls or spooky space ships, even when the testimony comes from such excellent witnesses as pilots Chiles and Whitted, it does want to know about such things.

So, if you're standing out in your back yard or flying your plane some afternoon or evening, and see one of these things in the sky, here is what the Air Force would like to have you do: Before running for the telephone to call your favorite newspaper, take some mental notes on what and where the object is, and what it is doing. If possible, try to estimate how far it is from you by making comparisons with some fixed object, such as a town or mountain. If there is a mountain handy, you may be able to make some guess as to the object's altitude. Try to estimate its apparent angle above the horizon; if you're viewing it from the ground, hold your arm straight up—that's ninety degrees—and guess the angle of the object in relation to the ninety-degree mark. Try to estimate its size; if you have a rough idea how far you are from it, you can get a "fix" on its size by holding up a dime—or any small object, such as the blunt end of a pencil or the tip of your thumb—and seeing how much of the object is obliterated by the dime.

Take a photograph or make a sketch if you can; if not, remember all you can about its appearance and whether it has any protuberances. Carefully note its color and whether or not it reflects or projects any lights. Note what maneuvers it engages in and what it appears to be made of; whether it makes any sound, spurts flames, sparks or smoke or gives out an odor. If it is in horizontal flight, try to estimate its speed by timing how long it takes to travel between two points. Note weather and cloud conditions, and observe how it disappears—whether it explodes, fades or vanishes behind clouds. And, of course, if it is obliging enough to crash or shower down any fragments in front of you, by all means secure the pieces—if they seem harmless.

Then sit down and write a letter containing all this information to Technical Intelligence Division, Air Matériel Command Headquarters, Wright-Patterson Air Force Base, Dayton, Ohio. At the same time, maybe you'd better buttress yourself with an affidavit from your clergyman, doctor or banker.

If you've really seen something and can prove it, you may scare the wits out of the United States Air Force, but it will be grateful to you.

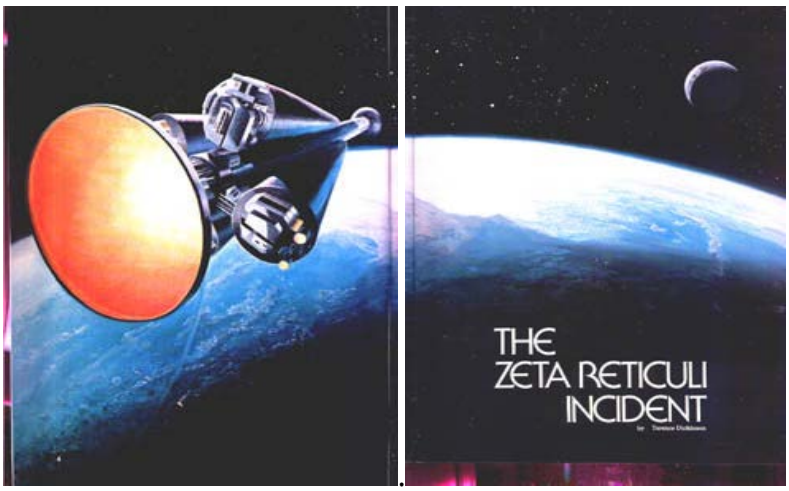
THE ZETA RETICULI INCIDENT

by Terence Dickinson

With related commentary by: Jeffrey L. Kretsch, Carl Sagan, Steven Soter, Robert Sheaffer, Marjorie Fish, David Saunders & Michael Peck. Astronomy, December, 1974



A nuclear-pulse powered starship begins a voyage to some nearby stars similar to our sun sometime in the 21st century. The first target is Tau Ceti, 12 light-years distant and seen in this rendering just to the right of the craft's sperical living quarters. This article chronicles how an unusual star map has led to new investigations of specific stars that might harbor Earth-like planets - and possibly advanced forms of life.

A faint pair of stars, 220 trillion miles away, has been tentatively identified as the "home base" of intelligent extraterrestrials who allegedly visited Earth in 1961. This hypothesis is based on a strange, almost bizarre series of events mixing astronomical research with hypnosis, amnesia, and alien humanoid creatures.

The two stars are known as Zeta 1 and Zeta 2 Reticuli, or together as simply Zeta Reticuli. They are each fifth magnitude stars -- barely visible to the unaided eye -- located in the obscure souther constellation Reticulum. This southerly sky location makes Zeta Reticuli invisible to observers north of Mexico City's latitude.

The weird circumstances that we have dubbed "The Zeta Reticuli Incident" sound like they come straight from the UFO pages in one of those tabloids sold in every supermarket. But this is much more than a retelling of a famous UFO incident; it's an astronomical detective story that at times hovers on that hazy line that separates science from fiction. It all started this way:

The date is Sept. 19, 1961. A middle aged New Hampshire couple, Betty and Barney Hill, are driving home from a short vacation in Canada. It's dark, with the moon and stars illuminating the wooded landscape along U.S. Route 3 in central New Hampshire. The Hills' curiosity is aroused when a bright "star" seems to move in an irregular pattern. They stop the car for a better view. The object moves closer, and its disklike shape becomes evident.

Barney grabs his binoculars from the car seat and steps out. He walks into a field to get a closer look, focuses the binoculars, and sees the object plainly. It has windows -- and behind the windows, looking directly at him are...humanoid creatures! Terrified, Barney stumbles back to the car, throws it into first gear and roars off. But for some reason he turns down a side road

where five of the humanoids are standing on the road.

Apparently unable to control their actions, Betty and Barney are easily taken back to the ship by the humanoids. While inside they are physically examined, and one of the humanoids communicates to Betty. After the examination she asks him where they are from. In response he shows her a three-dimensional map with various sized dots and lines on it. "Where are you on the map?" the humanoid asks Betty. She doesn't know, so the subject is dropped.

Betty and Barney are returned unharmed to their car. They are told they will forget the abduction portion of the incident. The ship rises, and then hurtles out of sight. The couple continue their journey home oblivious of the abduction.

But the Hills are troubled by unexplained dreams and anxiety about two hours of their trip that they can't account for. Betty, a social worker, asks advice from a psychiatrist friend. He suggests that the memory of that time will be gradually restored over the next few months -- but it never is. Two years after the incident, the couple are still bothered by the missing two hours, and Barney's ulcers are acting up. A Boston psychiatrist, Benjamin Simon, is recommended, and after several months of weekly hypnosis sessions the bizarre events of that night in 1961 are revealed. A short time later a UFO group leaks a distorted version of the story to the press and the whole thing blows up. The Hills reluctantly disclose the entire story.

Can we take this dramatic scenario seriously? Did this incredible contact with aliens actually occur or is it some kind of hallucination that affected both Barney and Betty Hill? The complete account of the psychiatric examination from which the details of the event emerged is related in John G. Fuller's 'The Interrupted Journey' (Dial Press, 1966), where we read that after the extensive psychiatric examination, Simon concluded that the Hills were not fabricating the story. The most likely possibilities seem to be: (a) the experience actually happened, or (b) some perceptive and illusory misinterpretations occurred in relationship to some real event.

There are other cases of alleged abductions by extraterrestrial humanoids. The unique aspect of the Hills' abduction is that they remembered virtually nothing of the incident.

Intrigued by the Hills' experience, J. Allen Hynek, chairman of the department of astronomy at Northwestern University, decided to investigate. Hynek described how the Hills recalled the details of their encounter in his book, 'The UFO Experience' (Henry Regnery Company, 1972):

"Under repeated hypnosis they independently revealed what had supposedly happened. The two stories agreed in considerable detail, although neither Betty nor Barney was privy to what the other had said under hypnosis until much later. Under hypnosis they stated that they had been taken separately aboard the craft, treated well by the occupants -- rather as humans might treat experimental animals -- and then released after having been given the hypnotic suggestion that they would remember nothing of that particular experience. The method of their release supposedly accounted for the amnesia, which was apparently broken only by counterhypnosis."

A number of scientists, including Hynek, have discussed this incident at length with Barney and Betty Hill and have questioned them under hypnosis. They concur with Simon's belief that there seems to be no evidence of outright fabrication or lying. One would also wonder what Betty, who has a master's degree in social work and is a supervisor in the New Hampshire Welfare Department, and Barney, who was on the governor of New Hampshire's Civil Rights Commission, would have to gain by a hoax? Although the Hills didn't, several people have lost their jobs after being associated with similarly unusual publicity.

Stanton T. Friedman, a nuclear physicist and the nation's only space scientist devoting full time to researching the UFO phenomenon, has spent many hours in conversation with the Hills. "By no stretch of the imagination could anyone who knows them conclude that they were nuts," he

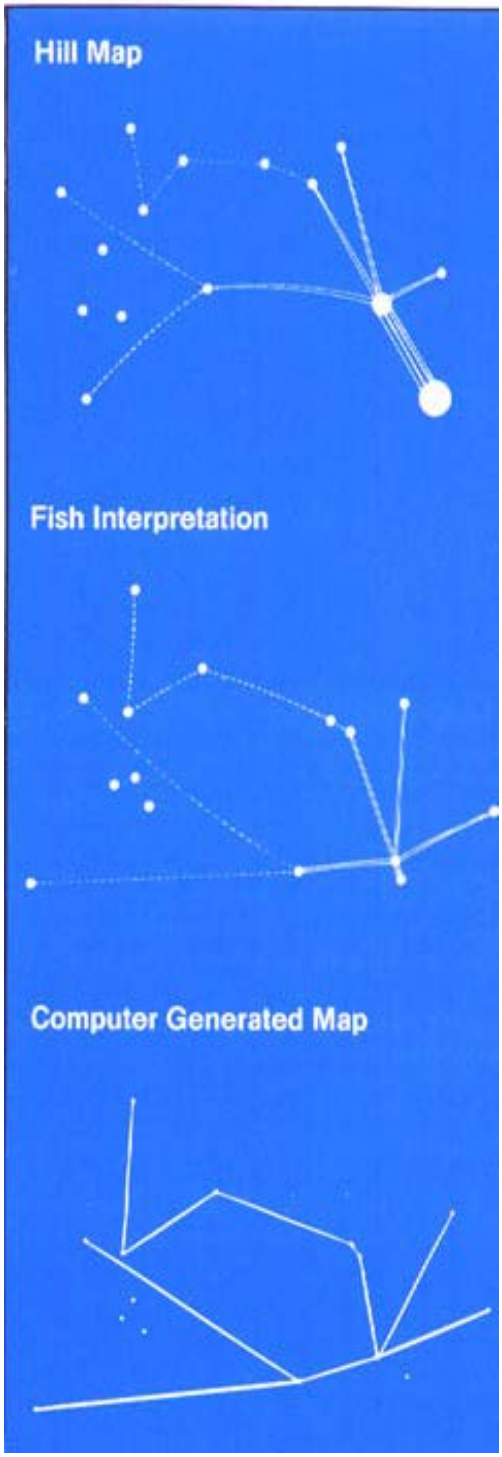
emphasizes.

So the experience remains a fascinating story despite the absence of proof that it actually happened. Anyway -- that's where things were in 1966 when Marjorie Fish, an Ohio schoolteacher, amateur astronomer and member of Mensa, became involved. She wondered if the objects shown on the map that Betty Hill allegedly observed inside the vehicle might represent some actual pattern of celestial objects. To get more information about the map she decided to visit Betty Hill in the summer of 1969. (Barney Hill died in early 1969.) Here is Ms. Fish's account of that meeting:

"On Aug.4, 1969, Betty Hill discussed the star map with me. Betty explained that she drew the map in 1964 under posthypnotic suggestion. It was to be drawn only if she could remember it accurately, and she was not to pay attention to what she was drawing -- which puts it in the realm of automatic drawing. This is a way of getting at repressed or forgotten material and can result in unusual accuracy. She made two erasures showing her conscious mind took control part of the time.

"Betty described the map as three-dimensional, like looking through a window. The stars were tinted and glowed. The map material was flat and thin (not a model), and there were no noticeable lenticular lines like one of our three-dimensional processes. (It sounds very much like a reflective hologram.) Betty did not shift her position while viewing it, so we cannot tell if it would give the same three-dimensional view from all positions or if it would be completely three-dimensional. Betty estimated the map was approximately three feet wide and two feet high with the pattern covering most of the map. She was standing about three feet away from it. She said there were many other stars on the map but she only (apparently) was able to specifically recall the prominent ones connected by lines and a small distinctive triangle off to the left. There was no concentration of stars to indicate the Milky Way (galactic plane) suggesting that if it represented reality, it probably only contained local stars. There were no grid lines."

So much for the background material on the Hill incident. (If you want more details on the encounter, see Fuller's book). For the moment we will leave Marjorie Fish back in 1969 trying to interpret Betty Hill's reproduction of the map. There is a second major area of background information that we have to attend to before we can properly discuss the map. Unlike the bizarre events just described, the rest is pure astronomy.



Three key phases in the analysis described in this article are illustrated here. Top right diagram is a copy of the map Betty drew, allegedly a duplicate of one she saw inside an extraterrestrial vehicle. Center map is derived from a model of our stellar neighborhood by Marjorie Fish. It shows the stars that coincide with those on the Hill map (the Fish model is illustrated on page 14). The only area of significant incongruity is the wide separation of Zeta Reticuli in the Hill version. Lower image shows a cathode ray tube computer readout that was run at Ohio State University as a check on the Fish model. Data used to derive the Fish model and the computer readout wre taken from Gliese catalog. Names of specific stars are given on pages 12 & 13.

According to the most recent star catalogs, there are about 1,000 known stars within a radius of 55 light-years of the sun.

What are those other stars like? A check of the catalogs shows that most of them are faint stars

of relatively low temperature -- a class of stars astronomers call main sequence stars. The sun is a main sequence star along with most of the other stars in this part of the Milky Way galaxy, as the following table shows:

Main sequence stars	91%
White dwarfs	8%
Giants and Supergiants	1%

Typical giant stars are Arcturus and Capella. Antares and Betelgeuse are members of the ultrarare supergiant class. At the other end of the size and brightness scale the white dwarfs are stellar cinders -- the remains of once brilliant suns. For reasons that will soon become clear we can remove these classes of stars from our discussion and concentrate on the main sequence stars.

The main sequence stars can be further subdivided.

Characteristics of Main Sequence Stars

Class	Proportion of Total	Temperature (Degrees F)	Mass (Sun=1)	Luminosity (Sun=1)	Lifespan (billions yrs)	-
A0	1%	20,000	2.8	60	5	Vega
A5	-	15,000	2.2	20	1	-
F0	3%	13,000	1.7	6	2	Procyon
F5	-	12,000	1.25	3	4	-
G0	9%	11,000	1.06	1.3	10	Sun
G5	-	10,000	.92	.8	15	-
K0	14%	9,000	.8	.4	20	Epsilon Erandi
K5	-	8,000	.69	.1	30	-
M0	73%	7,000	.48	.02	75	Proxima Centauri
M5	-	5,000	.2	.001	200	-

The spectral class letters are part of a system of stellar "fingerprinting" that identifies the main sequence star's temperature and gives clues to its mass and luminosity. The hottest, brightest and most massive main sequence stars (with rare exceptions) are the A stars. The faintest, coolest and least massive are the M stars.

Each class is subdivided into 10 subcategories. For example, an A0 star is hotter, brighter and more massive than an A1 which is above an A2, and so on through A9.

This table supplies much additional information and shows how a slightly hotter and more massive star turns out to be much more luminous than the sun, a G2 star. But the bright stars pay dearly for their splendor. It takes a lot of stellar fuel to emit vast quantities of light and heat. The penalty is a short lifespan as a main sequence star. Conversely, the inconspicuous, cool M stars may be around to see the end of the universe -- whatever that might be. With all these facts at hand we're now ready to tackle the first part of the detective story.

Let's suppose we wanted to make our own map of a trip to the stars. We will limit ourselves to the 55 light-year radius covered by the detailed star catalogs. The purpose of the trip will be to search for intelligent life on planets that may be in orbit around these stars. We would want to

include every star that would seem likely to have a life-bearing planet orbiting around it. How many of these thousand-odd stars would we include for such a voyage and which direction would we go? (For the moment, we'll forget about the problem of making a spacecraft that will take us to these stars and we'll assume that we've got some kind of vehicle that will effortlessly transport us to wherever we want to go.) We don't want to waste our time and efforts -- we only want to go to stars that we would think would have a high probability of having planets harboring advanced life forms. This seems like a tall order. How do we even begin to determine which stars might likely have such planets?

The first rule will be to restrict ourselves to life as we know it, the kind of life that we are familiar with here on Earth -- carbon based life. Science fiction writers are fond of describing life forms based on chemical systems that we have been unable to duplicate here on Earth -- such as silicon based life or life based on the ammonium hydroxide molecule instead of on carbon. But right now these life forms are simply fantasy -- we have no evidence that they are in fact possible. Because we don't even know what they might look like -- if they're out there -- we necessarily have to limit our search to the kind of life that we understand.

Our kind of life -- life as we know it -- seems most likely to evolve on a planet that has a stable temperature regime. It must be at the appropriate distance from its sun so that water is neither frozen nor boiled away. The planet has to be the appropriate size so that its gravity doesn't hold on to too much atmosphere (like Jupiter) or too little (like Mars). But the main ingredient in a life-bearing planet is its star. And its star is the only thing we can study since planets of other stars are far too faint to detect directly.

The conclusion we can draw is this: The star has to be like the sun.

Main sequence stars are basically stable for long periods of time. As shown in the table, stars in spectral class G have stable lifespans of 10 billion years. (Our sun, actually a G2 star, has a somewhat longer stable life expectancy of 11 billion years.) We are about five billion years into that period so we can look forward to the sun remaining much as it is (actually it will brighten slightly) for another six billion years. Stars of class F4 or higher have stable burning periods of less than 3.5 billion years. They have to be ruled out immediately. Such stars cannot have life-bearing planets because, at least based on our experience on our world, this is not enough time to permit highly developed biological systems to evolve on the land areas of a planet. (Intelligent life may very well arise earlier in water environments, but let's forget that possibility since we have not yet had meaningful communication with the dolphins -- highly intelligent creatures on this planet!) But we may be wrong in our estimate of life development time. There is another more compelling reason for eliminating stars of class F4 and brighter.

So far, we have assumed all stars have planets, just as our sun does. Yet spectroscopic studies of stars of class F4 and brighter reveal that most of them are in fact unlike our sun in a vital way -- they are rapidly rotating stars. The sun rotates once in just under a month, but 60 percent of the stars in the F0 to F4 range rotate much faster. And almost all A stars are rapid rotators too. It seems, from recent studies of stellar evolution that slowly rotating stars like the sun rotate slowly because they have planets. Apparently the formation of a planetary system robs the star of much of its rotational momentum.

For two reasons, then, we eliminate stars of class F4 and above: (1) most of them rotate rapidly and thus seem to be planetless, and (2) their stable lifespans are too brief for advanced life to develop.

Another problem environment for higher forms of life is the multiple star system. About half of all stars are born in pairs, or small groups of three or more. Our sun could have been part of a double star system. If Jupiter was 80 times more massive it would be an M6 red dwarf star. If

the stars of a double system are far enough apart there is no real problem for planets sustaining life (see "Planet of the Double Sun", September 1974). But stars in fairly close or highly elliptical orbits would alternately fry or freeze their planets. Such planets would also likely have unstable orbits. Because this is a potentially troublesome area for our objective, we will eliminate all close and moderately close pairs of systems of multiple stars.

Further elimination is necessary according to the catalogs. Some otherwise perfect stars are labeled "variable". This means astronomers have observed variations of at least a few percent in the star's light output. A one percent fluctuation in the sun would be annoying for us here on Earth. Anything greater would cause climatic disaster. Could intelligent life evolve under such conditions, given an otherwise habitable planet? It seems unlikely. We are forced to "scratch" all stars suspected or proven to be variable.

This still leaves a few F stars, quite a few G stars, and hoards of K and M dwarfs. Unfortunately most of the Ks and all of the Ms are out. Let's find out why.

These stars quite likely have planets. Indeed, one M star -- known as Barnard's star -- is believed to almost certainly have at least one, and probably two or three, Jupiter sized planets. Peter Van de Kamp of the Sproul Observatory at Swarthmore College (Pa.) has watched Barnard's star for over three decades and is convinced that a "wobbling" motion of that star is due to perturbations (gravitational "pulling and pushing") caused by its unseen planets. (Earth sized planets cannot be detected in this manner.)

But the planets of M stars and the K stars below K4 have two serious handicaps that virtually eliminate them from being abodes for life. First, these stars fry their planets with occasional lethal bursts of radiation emitted from erupting solar flares. The flares have the same intensity as those of our sun, but when you put that type of flare on a little star it spells disaster for a planet that is within, say, 30 million miles. The problem is that planets have to be that close to get enough heat from these feeble suns. If they are farther out, they have frozen oceans and no life.

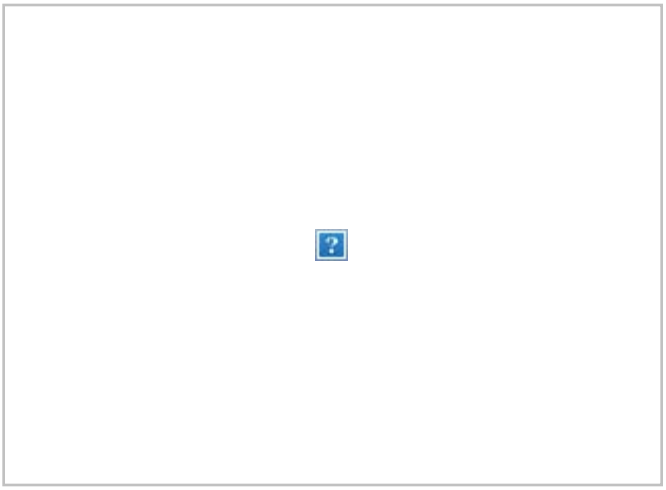
The close-in orbits of potential Earthlike planets of M and faint K stars produce the second dilemma -- rotational lock. An example of rotational lock is right next door to us. The moon, because of its nearness to Earth, is strongly affected by our planet's tidal forces. Long ago our satellite stopped rotating and now has one side permanently turned toward Earth. The same principles apply to planets of small stars that would otherwise be at the right distance for moderate temperatures. If rotational lock has not yet set in, at least rotational retardation would make impossibly long days and nights (as evidenced by Mercury in our solar system).

What stars are left after all this pruning? All of the G stars remain along with F5 through F9 and K0 through K4. Stephen Dole of the Rand Corporation has made a detailed study of stars in this range and suggests we should also eliminate F5, F6 and F7 stars because they balloon to red giants before they reach an age of five billion years. Dole feels this is cutting it too fine for intelligent species to fully evolve. Admittedly this is based on our one example of intelligent life -- us. But limited though this parameter is, it is the only one we have. Dole believes the K2, K3 and K4 stars are also poor prospects because of their feeble energy output and consequently limited zone for suitable Earthlike planets.

Accepting Dole's further trimming we are left with single, nonvariable stars from F8 through all the Gs to K1. What does that leave us with? Forty-six stars.

Now we are ready to plan the trip. It's pretty obvious that Tau Ceti is our first target. After that, the choice is more difficult. We can't take each star in order or we would be darting all over the sky. It's something like planning a vacation trip. Let's say we start from St. Louis and want to hit all the major cities within a 1,000 mile radius. If we go west, all we can visit is Kansas City

and Denver. But northeast is a bonanza: Chicago, Detroit, Cleveland, Pittsburgh, Philadelphia, New York and more. The same principle applies to the planning of our interstellar exploration. The plot of all 46 candidate stars reveals a clumping in the direction of the constellations Cetus and Eridanus. Although this section amounts to only 13 percent of the entire sky, it contains 15 of the 46 stars, or 33 percent of the total. Luckily Tau Ceti is in this group, so that's the direction we should go (comparable to heading northeast from St. Louis). If we plan to visit some of these solar type stars and then return to Earth, we should try to have the shortest distance between stops. It would be a waste of exploration time if we zipped randomly from one star to another.



Blow-up of above map

Route map. Click here.

The route map above shows the culmination of our efforts. This group of stars is a "natural" for exploration when we achieve interstellar flight. Even if, as most exobiologists contend, we are highly unlikely to find advanced forms of life in such a small sample, the physical exploration of planets of other stars by beings from Earth is inevitable, and the stars of this group should be among the first targets.

Now we are ready to return to the map drawn by Betty Hill. Marjorie Fish reasoned that if the stars in the Hill map corresponded to a patter of real stars -- perhaps something like we just developed, only from an alien's viewpoint -- it might be possible to pinpoint the origin of the alleged space travelers. Assuming the two stars in the foreground of the Hill map were the "base" stars (the sun, a single star, was ruled out here), she decided to try to locate the entire pattern. She theorized that the Hill map contained only local stars since no concentration would be present if a more distant viewpoint was assumed and if both "us" and the alien visitors' home base were to be represented.

Let's assume, just as an astronomical exercise, that the map does show the sun and the star that is "the sun" to the humanoids. We'll take the Hill encounter at face value, and see where it leads.

Since the aliens were described as "humanoid" and seemed reasonably comfortable on this planet, their home planet should be basically like ours. Their atmosphere must be similar because the Hills breathed without trouble while inside the ship, and the aliens did not appear to wear any protective apparatus. And since we assume their biology is similar to ours, their planet should have the same temperature regime as Earth (Betty and Barney did say it was

uncomfortably cold in the ship). In essence, then, we assume their home planet must be very Earthlike. Based on what we discussed earlier it follows that their sun would be on our list if it were within 55 light-years of us.

The lines on the map, according to Betty Hill, were described by the alien as "trade routes" or "places visited occasionally" with the dotted lines as "expeditions". Any interpretation of the Betty Hill map must retain the logic of these routes (i.e. the lines would link stars that would be worth visiting).

The Fish Model. Click here.

This model, prepared by Marjorie Fish. shows all the stars located in a vast volume of space extending out about 55 light years in the direction of Zeta Reticuli. The viewing angle is from a point in space beyond that limit looking back toward the Sun. Each star is suspended on a separate thread at its appropriate distance and position from the Sun, and colored according to its spectral type (solar type stars are yellow). The star "behind" the two components of Zeta Reticuli is Zeta Tucanae. From a model such as this, using the same viewing angle seen here, Marjorie Fish noted 16 stars whose positions are remarkably closeto the stars in the drawing made by Betty Hill. The fact that all of the stars in the "Hill configuration" are solar type stars is one of several intriguing areas that enshroud the "Zeta Reticuli Incident".

Keeping all this in mind, Marjorie Fish constructed several three-dimensional models of the solar neighborhood in hopes of detecting the pattern in the Hill map. Using beads dangling on threads, she painstakingly recreated our stellar environment. Between Aug. 1968 and Feb. 1973, she strung beads, checked data, searched and checked again. A suspicious alignment, detected in late 1968, turned out to be almost a perfect match once new data from the detailed 1969 edition of the Catalog of Nearby Stars became available. (This catalog is often called the "Gliese catalog" -- pronounced "glee-see" -- after its principal author, Wilhelm Gliese.)

The 16 stars in the stellar configuration discovered by Marjorie Fish are compared with the map drawn by Betty Hill in the diagram on page 6. If some of the star names on the Fish map sound familiar, they should. Ten of the 16 stars are from the compact group that we selected earlier based on the most logical direction to pursue to conduct interstellar exploration from Earth

Continuing to take the Hill map at face value, the radiating pattern of "trade routes" implies that Zeta 1 and Zeta 2 Reticuli are the "hub" of exploration or, in the context of the incident, the aliens' home base. The sun is at the end of one of the supposedly regular trade routes.

The pair of stars that make up Zeta Reticuli is practically in the midst of the cluster of solar type stars that attracted us while we were mapping out a logical interstellar voyage. Checking further we find that all but two of the stars in the Fish pattern are on the table of nearby solar type stars. These two stars are Tau 1 Eridani (an F6 star) and Gliese 86.1 (K2), and are, respectively, just above and below the parameters we arrived at earlier. One star that should be there (Zeta Tucanae) is missing probably because it is behind Zeta 1 Reticuli at the required viewing angle.

To summarize, then: (1) the pattern discovered by Marjorie Fish has an uncanny resemblance to the map drawn by Betty Hill; (2) the stars are mostly the ones that we would visit if we were exploring from Zeta Reticuli, and (3) the travel patterns generally make sense.

Walter Mitchell, professor of astronomy at Ohio State University in Columbus, has looked at Marjorie Fish's interpretation of the Betty Hill map in detail and tells us, "The more I examine it, the more I am impressed by the astronomy involved in Marjorie Fish's work."

During their examination of the map, Mitchell and some of his students inserted the positions of hundreds of nearby stars into a computer and had various space vistas brought up on a cathode ray tube readout. They requested the computer to put them in a position out beyond Zeta Reticuli looking toward the sun. From this viewpoint the map pattern obtained by Marjorie Fish

was duplicated with virtually no variations. Mitchell noted an important and previously unknown fact first pointed out by Ms. Fish: The stars in the map are almost in a plane; that is, they fill a wheel shaped volume of space that makes star hopping from one to another easy and the logical way to go -- and that is what is implied by the map that Betty Hill allegedly saw.

"I can find no major point of quibble with Marjorie Fish's interpretation of the Betty Hill map," says David R. Saunders, a statistics expert at the Industrial Relations Center of the University of Chicago. By various lines of statistical reasoning he concludes that the chances of finding a match among 16 stars of a specific spectral type among the thousand-odd stars nearest the sun is "at least 1,000 to 1 against".

"The odds are about 10,000 to 1 against a random configuration matching perfectly with Betty Hill's map," Saunders reports. "But the star group identified by Marjorie Fish isn't quite a perfect match, and the odds consequently reduce to about 1,000 to 1. That is, there is one chance in 1,000 that the observed degree of congruence would occur in the volume of space we are discussing.

"In most fields of investigation where similar statistical methods are used, that degree of congruence is rather persuasive," concludes Saunders.

Saunders, who has developed a monumental computerized catalog of more than 60,000 UFO sightings, tells us that the Hill case is not unique in its general characteristics -- there are other known cases of alleged communication with extraterrestrials. But in no other case on record have maps ever been mentioned.

Mark Steggert of the Space Research Coordination Center at the University of Pittsburgh developed a computer program that he calls PAR (for Perspective Alteration Routine) that can duplicate the appearance of star fields from various viewpoints in space.

"I was intrigued by the proposal put forth by Marjorie Fish that she had interpreted a real star pattern for the alleged map of Betty Hill. I was incredulous that models could be used to do an astronometric problem," Steggert says. "To my surprise I found that the pattern that I derived from my program had a close correspondence to the data from Marjorie Fish."

After several run-throughs, he confirmed the positions determined by Marjorie Fish. "I was able to locate potential areas of error, but no real errors," Steggert concludes.

Steggert zeroed in on possibly the only real bone of contention that anyone has had with Marjorie Fish's interpretation: The data on some of the stars may not be accurate enough for us to make definitive conclusions. For example, he says the data from the Smithsonian Astrophysical Observatory Catalog, the Royal Astronomical Society Observatory Catalog, and the Yale Catalog of Bright Stars "have differences of up to two magnitudes and differences in distance amounting to 40 percent for the star Gliese 59". Other stars have less variations in the data from one catalog to another, but Steggert's point is valid. The data on some of the stars in the map is just not good enough to make a definitive statement. (The fact that measurements of most of the stars in question can only be made at the relatively poor equipped southern hemisphere observatories accounts for the less reliable data.)

Using information on the same 15 stars from the Royal Observatory catalog (Annals #5), Steggert reports that the pattern does come out differently because of the different data, and Gliese 59 shows the largest variation. The Gliese catalog uses photometric, trigonometric and spectroscopic parallaxes and derives a mean from all three after giving various mathematical weights to each value. "The substantial variation in catalog material is something that must be overcome," says Steggert. "This must be the next step in attempting to evaluate the map."

This point of view is shared by Jeffrey L. Kretsch, an undergraduate student who is working under the advisement of J. Allen Hynek at Northwestern University in Evanston, Ill. Like Steggert, he too checked Marjorie Fish's pattern and found no error in the work. But Kretsch reports that when he reconstructed the pattern using trigonometric distance measurements instead of the composite measures in the Gliese catalog, he found enough variations to move Gliese 95 above the line between Gliese 86 and Tau 1 Eridani.

"The data for some of the stars seems to be very reliable, but a few of the pattern stars are not well observed and data on them is somewhat conflicting," says Kretsch. The fact that the pattern is less of a "good fit" using data from other sources leads Kretsch and others to wonder what new observations would do. Would they give a closer fit? Or would the pattern become distorted? Marjorie Fish was aware of the catalog variations, but has assumed the Gliese catalog is the most reliable source material to utilize.

Is the Gliese catalog the best available data source. According to several astronomers who specialize in stellar positions, it probably is. Peter Van de Kamp says, "It's first rate. There is none better." He says the catalog was compiled with extensive research and care over many years.

A lot of the published trigonometric parallaxes on the stars beyond 30 light-years are not as accurate as they could be, according to Kyle Cudworth of Yerkes Observatory. "Gliese added other criteria to compensate and lessen the possible errors," he says.

The scientific director of the U.S. Naval Observatory, K.A. Strand, is among the world's foremost authorities on stellar distances for nearby stars. He believes the Gliese catalog "is the most complete and comprehensive source available."

Frank B. Salisbury of the University of Utah has also examined the Hill and Fish maps. "The pattern of stars discovered by Marjorie Fish fits the map drawn by Betty Hill remarkably well. It's a striking coincidence and forces one to take the Hill story more seriously," he says. Salisbury is one of the few scientists who has spent some time on the UFO problem and has written a book and several articles on the subject. A professor of plant physiology, his biology expertise has been turned to astronomy on several occasions while studying the possibility of biological organisms existing on Mars.

Salisbury insists that while psychological factors do play an important role in UFO phenomena, the Hill story does represent one of the most credible reports of incredible events. The fact that the story and the map came to light under hypnosis is good evidence that it actually took place. "But it is not unequivocal evidence," he cautions.

Elaborating on this aspect of the incident, Mark Steggert offers this: "I am inclined to question the ability of Betty, under posthypnotic suggestion, to duplicate the pattern two years after she saw it. She noted no grid lines on the pattern for reference. Someone should (or perhaps has already) conduct a test to see how well a similar patter could be recalled after a substantial period of time. The stress she was under at the time is another unknown factor."

"The derivation of the base data by hypnotic techniques is perhaps not as 'far out' as it may seem," says Stanton Friedman. "Several police departments around the country use hypnosis on rape victims in order to get descriptions of the assailants -- descriptions that would otherwise remain repressed. The trauma of such circumstances must be comparable in some ways to the Hill incident."

Is it at all possible we are faced with a hoax?

"Highly unlikely," says Salisbury -- and the other investigators agree. One significant fact

against a charade is that the data from the Gliese catalog was not published until 1969, five years after the star map was drawn by Betty Hill. Prior to 1969, the data could only have been obtained from the observatories conducting research on the specific stars in question. It is not uncommon for astronomers not to divulge their research data -- even to their colleagues -- before it appears in print. In general, the entire sequence of events just does not smell of falsification. Coincidence, possibly; hoax, improbable.

Where does all this leave us? Are there creatures inhabiting a planet of Zeta 2 Reticuli? Did they visit Earth in 1961? The map indicates that the sun has been "visited occasionally". What does that mean? Will further study and measurement of the stars in the map change their relative positions and thus distort the configuration beyond the limits of coincidence?

The fact that the entire incident hinges on a map drawn under less than normal circumstances certainly keeps us from drawing a firm conclusion. Exobiologists are united in their opinion that the chance of us having neighbors so similar to us, apparently located so close, is vanishingly small. But then, we don't even know for certain if there is anybody at all out there -- anywhere -- despite the Hill map and pronouncements of the most respected scientists.

The only answer is to continue the search. Someday, perhaps soon, we will know.

The 46 Nearest Stars Similar to the Sun

Name	Distance (light-years)	Magnitude (visual)	Luminosity (Sun=1)	Spectrum
Tau Ceti	11.8	3.5	.4	G8
82 Eridani	20.2	4.3	.7	G5
Zeta Tucanae	23.3	4.2	.9	G2
107 Piscium	24.3	5.2	.4	K1
Beta Comae	-	-	-	-
Berenices	27.2	4.3	1.2	G0

Gliese 651	53	6.8	.4	G8
Gliese 59	53	6.7	.4	G8

This table lists all known stars within a radius of 54 light-years that are single or part of a wide multiple star system. They have no known irregularities or variabilities and are between 0.4 and 2.0 times the luminosity of the sun. Thus, a planet basically identical to Earth could be orbiting around any one of them. (Data from the Catalog of Nearby Stars, 1969 edition, by Wilhelm Gliese.) .

The View from Zeta Reticuli

The two stars that comprise the Zeta Reticuli system are almost identical to the sun. Thy are the only known examples of two solar type stars apparently linked into a binary star system of wide separation.

Zeta 1 is separated from Zeta 2 by at least 350 billion miles -- about 100 times the sun-Pluto distance. They may be even farther apart, but the available observations suggest they are moving through space together and are therefore physically associated. They probably require at least 100,000 years to orbit around their common center of gravity.

Both Zeta 1 and Zeta 2 are prime candidates for the search for life beyond Earth. According to our current theories of planetary formation, they both should have a retinue of planets

something like our solar system. As yet there is no way of determining if any of the probable planets of either star is similar to Earth.

To help visualize the Zeta Reticuli system, let's take the sun's nine planets and put them in identical orbits around Zeta 2. From a celestial mechanics standpoint there is no reason why this situation could not exist. Would anything be different? Because of Zeta 2's slightly smaller mass as compared with the sun, the planets would orbit a little more slowly. Our years might have 390 days, for example. Zeta 2 would make a fine sun - - slightly dimmer than "old Sol", but certainly capable of sustaining life. The big difference would not be our new sun but the superstar of the night sky. Shining like a polished gem, Zeta 1 would be the dazzling highlight of the night sky -- unlike anything we experience here on Earth. At magnitude -9 it would appear as a starlike point 100 times brighter than Venus. It would be like compressing all the light from the first quarter moon into a point source.

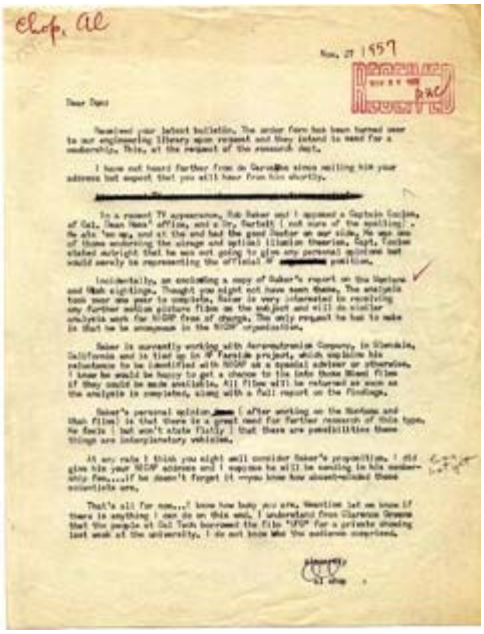
Zeta 1 would have long ago been the focus of religions, mythology and astrology if it were in earthly skies. The fact that it would be easily visible in full daylight would give Zeta 1 supreme importance to both early civilizations and modern man. Shortly after the invention of the telescope astronomers would be able to detect Jupiter and Saturn sized planets orbiting around Zeta 1. Jupiter would be magnitude +12, visible up to 4.5 minutes of arc from Zeta 1 (almost as far as Ganymede swings from Jupiter). It would not make a difficult target for an eight inch telescope. Think of the incentive that discovery would have on interstellar space travel! For hundreds of years we would be aware of another solar system just a few "light-weeks" away. The evolution of interstellar spaceflight would be rapid, dynamic and inevitable.

By contrast, our nearest solar type neighbor is Tau Ceti at 12 light-years. Even today we only suspect it is accompanied by a family of planets, but we don't know for sure.

From this comparison of our planetary system with those of Zeta Reticuli, it is clear that any emerging technologically advanced intelligent life would probably have great incentive to achieve star flight. The knowledge of a nearby system of planets of a solar type star would be compelling -- at least it would certainly seem to be.

What is so strange -- and this question prompted us to prepare this article -- is: Why, of all stars, does Zeta Reticuli seem to fit as the hub of a map that appeared inside a spacecraft that allegedly landed on Earth in 1961? Some of the circumstances surrounding the whole incident are certainly bizarre, but not everything can be written off as coincidence or hallucination. It may be optimistic, on one extreme, to hope that our neighbors are as near as 37 light-years away. For the moment we will be satisfied with considering it an exciting possibility.

Part Two:
NICAP Home



Nov 27, 1957

Dear Don:

Received your latest bulletin. The order form has been turned over to our engineering library upon request and they intend to send for a membership. This, at the request of the research dept.

I have not heard further from de Garvaho since mailing him your address but expect that you will hear from him shortly.

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

In a recent TV appearance, Bob Baker and I opposed a Captain Eccles, of Col. Dean Hess' office, and a Dr. Bartolt (not sure of the spelling) . We ate 'em up, and at the end had the good Doctor on our side. He was one of those endorsing the mirage and optical illusion theories. Capt. Eccles stated outright that he was not going to give personal opinions but would merely be representing the official AF position.

Incidentally, am enclosing a copy of Baker's report on the Montana and Utah sighting. Thought you might not have seen these. The analysis took over one year to complete. Baker is very interested in receiving any further motion picture films on the subject and will do similar analysis work for NICAP free of charge. The only request he has to make is that he be anonymous in the NICAP organization.

Baker is currently working with the Aero-nutronics Company, in Glendale, California and is tied up in AF Farside project, which explains his reluctance to be identified with NICAP as a special advisor or otherwise. I know he would be happy to get a chance to tie into those Miami films if they could be made available. All films will be returned as soon as the analysis is completed, along with a full report on the findings.

Baker's personal opinion (after working on the Montana and Utah films) is that there is a great need for further research of this type. He feels (but won't state flatly) that there are possibilities these things are interplanetary vehicles.

At any rate I think you might well consider Baker's proposition. I did give him your NICAP

address and I suppose he will be sending in his membership fee. . . .if he doesn't forget it --you know how absent-minded these scientists are.

That's all for now. . .I know how busy you are. Meantime let me know if there is anything I can do on this end. I understand from Clarence Greene that the people at Cal Tech borrowed his film "UFO" for a private showing last week at the university. I do not know who the audience comprised.

Sincerely

//signed//

al chop

TRANSCRIPTION NOTES:

- "1957" in the letter date is handwritten

- There is a "received" stamp just below the letter date with "Nov 28 1957" readable and the handwritten "RHC" just below that date

- There is a marked out sentence between paragraph 2 and paragraph 3

- There is a marked out word between "AF" and "position" in the last sentence of paragraph 3

- There is a handwritten check mark immediately after the word "Montana" in the first sentence of paragraph 4

- There is a marked out word between "opinion" and "after" in the first sentence of paragraph 6

- The handwritten notation "has not yet" is written in the letter margin immediately after the hyphenated word "member-" in the sencond sentence of paragraph 7; i.e., "member- (handwritten: "has not yet") ship fee"

- The letter is signed with a handwritten "Al"

The Debunkers vs. the UFO Menace; or, Is Ufology Tantamount to Communism?

by Jerome Clark
(written in 1992)

On August 23, 1983, an administrator at the University of Nebraska at Lincoln took a strange phone call from a man who had a complaint which he expressed at some length. When he finally got offf the phone, the administrator summarized the conversation in a memo to another university official:

"Mr. Phillip [sic] Klass ... is a member of the Committee for the Scientific Investigation of Claims of the Paranormal [CSICOP]. This committee has a much different view of unexplained phenomena than those groups we are working with as sponsors of "this conference [titled Exploring Unexplained Phenomena]. He was, in fact, quite adament [sic] in his position regarding the credibility of the conference presenters. Further, Mr. Klass has a personal feeling that the nature of this conference seriously questions the integrity of the United States Government. He feels that there is no scientific evidence to support the claims of the
presenters and indicated that these organizations, by publicly questioning the government, lend support to the Communist movement."

All ufologists, of course, know who Philip J. Klass is. A Washington-based aerospace journalist, Klass is the world's best known (and, some would say, most obsessed) critic of UFO reports and ufologists, the author of books with self-explanatory titles as UFOs Explained, UFOs: The Public Deceived, and UFO Abductions: A Dangerous Game -- all sacred texts of the debunking movement.

That same day the administrator phoned conference organizer Ray Boeche to inform him of the conversation. The administrator said Klass had called the chancellor's office and talked with someone
there. When Klass hinted that he was considering legal action against the university, the call had been transferred to the administrator, who told Boeche he thought he had been able to mollify Klass.

The university sent Klass a letter, thanking him for his interest, and assumed that would end the matter. It was wrong.

At the conference, held between November 11 and 13 at the university conference center, Boeche showed some of us a copy of the memo in which the administrator paraphrased Klass' suggestion that UFO cover-up proponents were serving the ends of Soviet foreign policy. Of course by now we were used to the sort of overheated rhetoric that flows in an unending stream of vitriol from the mouths and keyboards of CSICOP's bombast artists. After all, Klass and his CSICOP colleagues had already characterized us ufologists as antiscience cultists, cryptofascists, mental cases, money-grubbing exploiters, and raving irrationalists, and CSICOP chairman Paul Kurtz had repeatedly assured the press that societal acceptance of anomalies and the paranormal threatens the fabric of civilization.

Still, Klass' linking of ufologists with Communist subversion was a new wrinkle. Klass, we knew, would not be happy to learn that these peculiar private pronouncements were now peculiar public pronouncements. As it turned out, he wasn't just unhappy. He was livid.

On November 23 Klass wrote the administrator, who was startled to see large chunks of Klass' words from their three-month-old conversation quoted verbatim -- indicating, the administrator correctly surmised, that Klass had taped the two without informing him he was doing so. Klass said that since a "copy of your memo was 'leaked' to outsiders," he wanted to "clarify and expand upon statements" he had made. He said "we" -- presumably meaning himself and CSICOP -- did not seek to "prevent conferences or meetings by those who want to propose UFOs" but that he had some trouble with the university's sponsorship of a conference on the subject. What, he asked, would the university do "if

the American Nazi Party came in and said they [sic] wanted to hold a conference?"

"I emphasize to you that I am not, repeat not, suggesting that any of the people or any of the organizations are in any way affiliated with Communist Fronts or with the Soviet Union. But as a patriotic American, I very much resent the charge of 'coverup', of lying, of falsehoods, charged against not one Administration, not two, but eight Administrations going back to a man from Missouri named Truman, a man named Dwight Eisenhower. Because if this charge is true -- Cosmic Watergate -- then all of these Presidents were implicated, and all of their Administrations.... [In making this charge, ufologists] seek what the Soviet Union does -- to convey to the public that our Government can not be trusted, that it lies, that it falsifies. Now I'm not so naive -- remembering Watergate -- to say that never has happened in history. But from my firsthand experience (i.e., 17 years in the field of UFOlogy), I know this charge is completely false. And I resent it as an American citizen."

Remarkably, Klass distributed copies of this letter to others, including me, on the evident belief that it would exonerate him, in other words demonstrate that when read in context his sentiments would sound rational. He would even charge that the administrator's paraphrase had been "inaccurate," when if anything it made Klass' charge sound marginally less nutty. As I wrote Klass on December 6, "In the past, when your critics have accused you of engaging in McCarthyism, they were using the term in a metaphorical sense. Now, it seems, they will be able to use it in the most literal sense."

As ufologists gleefully copied and circulated both the administrator's memo and Klass' November 23 letter, Klass complained to the university about its release of the memo and threatened legal action. Late in January 1984 the administrator told Boeche, according to the latter, that he feared losing his job over the affair.

About six weeks later the administrator informed Boeche that the university would not sponsor another anomalies conference. The decision, he said, "came straight from the chancellor's office." Pressed for a reason, the administrator responded evasively but "strongly implied," in Boeche's words, that the decision had to do with the troubles the previous conference had brought them. A short time later Boeche received written notification of the decision. The letter gave no reason for the decision.

Boeche, who had hoped to make the conference an annual event, sought alternative funding without success. In October 1984, in a final desperate move, Boeche mailed a letter to all who had attended the 1983 meeting and urged them to encourage the chancellor to reverse his decision. One attender published a letter to the editor of the Lincoln Journal about the episode. Subsequently an Associated Press reporter interviewed the administrator, who said -- for the first time ever -- that the university had canceled sponsorship because it had lost money on the conference. The university repeated the claim in a form
letter it sent to all inquirers.

Till now, in all of Boeche's discussions with university officials regarding the conference-related problems, not one -- least of all the administrator -- had raised the issue of the conference's profitability. All those with whom Boeche spoke had talked only of Klass' legal threats. At no time was Boeche shown a financial statement documenting the university's belated version of events. In a November 2 meeting with the chancellor's assistant, who dutifully recited the new party line, Boeche asked whom he should believe: an administrator who was afraid of losing his job (and whose private statements had been markedly different from his later public ones) or a chancellor's assistant who could take that job away. "It was quite obvious that that was a question he didn't want to answer," Boeche recalls.

In fact, the previous January 11 Klass had written this man complaining about the university's failure to respond to an earlier letter. Klass said he expected the university to express "shock and disgust"

over the leaking of the memo and to apologize "for such irresponsible actions." If the university chose not to act, Klass wrote, he would consider taking "appropriate legal action to set the record straight and to clear my name." Eleven days later he wrote the chancellor's assistant again and asked for a "list of the Board of Regents of your University, together with their mailing addresses." Soon Klass was hearing from the university's attorney.

Meanwhile Klass and I were engaged in correspondence about this strange ongoing episode. Though not denying that he had threatened to sue the university -- indeed he sent me a copy of the just-quoted January 11 letter -- he continually tried to change the subject, citing conferences he had not called sponsors to complain about, as if these were relevant to anything or, even more crazily, evidence of personal virtue. He claimed not to object to "pseudoscience" conferences in principle, only to those that universities sponsored without bringing in speakers who shared Klass' views.

As of March 31, a letter of his to me makes clear, the university -- despite what by now had been a number of exchanges between it and him -- had not claimed that it lost money on the conference. To the contrary, Klass said it was his "understanding" that the university had not contributed money to the organizers or allowed uncompensated use of its conference facilities. Writing on May 14, he emphatically denied believing or suggesting that the university cancelled sponsorship because the conference lost money. He said he understood that the university shared neither profits nor losses from the conference.

On April 4 I remarked that "you really never addressed the issue I attempted to raise ... that you had a role, apparently the deciding role, in the University of Nebraska's decision not to sponsor next year's UFO/Fortean conference. As you are well aware, the threat of being sued is a powerful way of affecting somebody's behavior.... It is hardly surprising that the university did not want to involve itself in litigation and entirely predictable that it chose to scuttle the Fortean conference as a consequence. It just wasn't worth the hassle in the university's view. You, by your threats and meddling, apparently presented a problem the university did not want to deal with. It was easier to cancel next year's conference than to risk further problems. I am not aware that I accused you of deliberately setting out to sabotage the conference. I said that your acts had the effect of so doing."

In subsequent correspondence Klass insisted, ludicrously, that his legal threats could have had nothing to do with the university's decision because if they had, he implied, university spokesmen would have said so openly. He seemed to be suggesting that the university had simply seen the wisdom of his argument about the conference's lack of "balance" and acted accordingly. He went on to compare university sponsorship of a UFO conference to sponsorship of a Ku Klux Klan or Nazi Party meeting. Klass would also contend that proponents of a UFO cover-up were in effect accusing Presidents of treason, a "slanderous" charge.

All the while ufologists and the UFO press were having great fun at Klass' expense, with his desperate clarifications and rationalizations only fueling the merriment. Finally and hilariously, on October 18, notwithstanding his earlier assertions that the university had not lost money from the conference, Klass copied and distributed an October 14 AP article from the Omaha World Herald, in which the university introduced the loss-of-money yarn to the world. He cited it as proof that he had been right all along.

The Debunkers vs. the UFO Menace; or, Is Ufology Tantamount to Communism?

Part 2
by Jerome Clark
(written in 1992)

In 1986 Omni editor Dick Teresi asked if I would do a short article for an upcoming issue on censorship in science. I responded with a manuscript I titled "Anomaly Bashing"; it was published as "Censoring the Paranormal" in the February 1987 issue. (It was later reprinted in Ted Schultz's 1989 book The Fringes of Reason, page 203.)

The piece dealt with debunking extremism, much of it associated with CSICOP. In it I devoted a paragraph to the Nebraska episode. (See Part 1 for details.)

No sooner had the issue hit the stands than I was taking calls from Teresi and, shortly after, from Omni's attorney. Leading CSICOPs had contacted Teresi to let him know sentiments such as mine were unacceptable to the debunking thought police (I had urged an end to the "hysteria" and a return to the "serious business of dispassionate investigation," apparently just about the last thing the debunkers wanted to hear); more important, Klass had actually threatened to sue over my few words. Omni asked for additional documentation beyond what I had already provided, and that was the end of at least that much.

I had written CSICOP Chairman Paul Kurtz as long ago as December 7, 1983, to ask him what he thought of Klass' charge that ufologists were serving Soviet ends. Enclosing a transcript of Klass' remarks, I asked, "Does CSICOP condone these sorts of charges? Do you ... draw a line between hard-hitting criticisms of anomalous claims and the extravagant, even scurrilous charges Klass has made in his communications [with the Nebraska administrator]?"

Kurtz's response, dated December 20, can best be characterized as mealy-mouthed. After assuring me of his belief in free expression, he said Klass was speaking for himself and CSICOP members hold a range of opinions. Translation: Kurtz did not want to get involved. Even the leveling of charges most people would regard as McCarthy-ite could elicit no condemnation, or even a mild demur, from the leadership, which had already tolerated accusations from Klass and other CSICOP-affiliated debunkers that ufologists are exploiters, irrationalists, cultists, and so on. Perhaps, seen in this context, it is true that Klass' ufology-is-tantamount-to-Communism spiel amounted to no significant escalation of either vitriol or craziness.

Still, while CSICOP is immensely indulgent of even the most lunatic attacks on paranormal and anomalous claims and claimants, it has no tolerance whatever for criticisms of itself, as its high-dudgeon reaction to my Omni essay had already demonstrated.

In that vein, in a June 10, 1987, note, Kurtz sniffed about my "unrelenting attacks on CSICOP in Fate and other magazines."

I replied on July 8: "It is strange to get this [complaint] from someone who directs an organization devoted to nothing but 'unrelenting attacks' on proponents of anomalies and the paranormal. At least 'Fate and other magazines' -- unlike [CSICOP's magazine] Skeptical Inquirer -- devote only a small, even tiny, percentage of their pages to criticism of those with whom they disagree.... I realize that CSICOP, like any organization with political objectives, may not have the luxury of choosing its allies as carefully as it might like. But you can hardly protest when from time to time you are held accountable for the antics of those whose activities you promote and whom you seldom criticize in any meaningful way.... [I]t is more than a trifle hypocritical for you to react with shock and indignation when you are attacked in return. I'm reminded of what Edward G. Robinson said in the classic gangster film Little Caesar: 'You've been dishin' it out so long you can't take it no more'."

Skeptical Inquirer editor Kendrick Frazier, one of those who had complained to Teresi, wrote an indignant response to my Omni article in the September 1987 issue of his magazine. What it lacked in specifics, it made up for in sweeping proclamations, one of them that my words about Klass were "malicious" and, moreover, known by me "to be false." (If that were true, of course, Klass _would_ have had a legal case.) Frazier neither mentioned nor questioned Klass' McCarthyite slur of ufologists, thus becoming yet another CSICOP notable to maintain a tactful silence on the subject. Frazier did not answer my letter challenging him on these points.

I did, however, get a letter from Mark Plummer, then CSICOP's Executive Director, who wrote me on August 31 on another matter. In my September 4 reply, I said, in part:

"The whole controversy about my Omni editorial centers on the question of whether CSICOP contains individuals of extreme (i.e., lunatic fringe) views and whether CSICOP can fairly be criticized for same. In that regard it is surely significant that at no time has CSICOP publicly disassociated itself from the pronouncements of Philip J. Klass, who holds that UFO proponents are serving the ends of Soviet foreign policy, nor is there any evidence that it has reprimanded him in any way. In fact, the editor of Skeptical Inquirer has expressed outrage that anyone would take exception to such assertions, even suggesting that someone who did (me) could only have been acting out of malice.

"The clear implication is that CSICOP -- which continues to portray Klass as a responsible spokesman and to give wide publicity to his assorted pronouncements -- either agrees with these views or at least considers them acceptable expressions of opinion."

Plummer wrote back on September 17 to ask for "proof" that Klass had accused ufologists of serving Soviet ends. I provided such proof, which included a transcript of the phone conversation that Klass himself had given me (quoted at length in Part 1). The response was silence -- at least on his end. I heard not from Plummer but from Klass, to whom I learned Plummer had sent copies of my letters.

Klass' communication, dated October 5, was titled "AN OPEN-LETTER CHALLENGE TO JEROME CLARK." Referring to my September 4 letter, Klass noted my observation (though adding italics to it) that he "_holds that UFO proponents are serving the ends of Soviet foreign policy_." He grandly offered $5000 to the Center for UFO Studies (of which I am an officer) if -- Klass' italics again -- "you can find in any of my _published books or articles_ where I have said that 'UFO proponents are serving the ends of Soviet foreign policy', or words substantially equivalent." He hastily appended this amendment: the offer "does _not_ apply to my expression of personal opinion during a private telephone conversation" with the Nebraska administrator.

In an open letter of my own three days later, I pointed out the obvious: that at no time had I ever charged, indicated, implied, or hinted that Klass had _published_ his strange equation of ufologists with Communists; the issue all along had been his privately uttered words to the administrator. "Amusingly," I noted, "in making his 'challenge', Klass seeks to exclude the very evidence that bears on the issue."

Meanwhile, in an October 13 letter to Marcello Truzzi (who co-founded CSICOP with Kurtz but who had left the organization long since to become one of its major critics), Klass said he stood by the sentiments he had expressed to the administrator.

Having heard nothing from Plummer, I wrote him on November 18. "Now that you have been fully informed of Klass' excesses, may we expect to see an editorial in Skeptical Inquirer apologizing to the UFO community for being subject to such scurrilous accusations?" I asked. "May we expect to see a statement declaring that McCarthyism (or any other form of irrational excess) has no part in the anomaly debate? Or may we expect, as I'm afraid I do, absolutely no reaction whatever from CSICOP?"

On November 23 Plummer replied. Having reviewed the evidence, he saw nothing "excessive" in Klass' pronouncements. It was, he added, all my fault for "jumping to conclusions."

To this day not a single significant CSICOP figure has disavowed Klass' charges or chastised him for making them. Instead CSICOP has reserved all its criticism for those who, like me, have raised the issue. Publicly CSICOP pretends to believe that my portrayal of these events is false.

On April 26, 1990, Rick Moen of Bay Area Skeptics posted Klass'

account of the episode on a computer network used by debunkers. Hilariously, Klass fails to note anywhere that he had equated ufologists with Communist agents, though he does acknowledge that he "asked if the American Nazi Party wanted to rent its facilities for a meeting, whether the University would 'sponsor' said meeting" -- evidently a moral dilemma he found equivalent to sponsorship of a UFO conference.

Meanwhile, Philip J. Klass remains a CSICOP and debunking superstar, a regular speaker at CSICOP's conferences, and a frequent contributor to Skeptical Inquirer. Prometheus Books, which Kurtz heads, continues to issue Klass titles.

A final note:

On October 28, 1991, I asked Klass, "Do you still consider proponents of a UFO cover-up threats to the republic? Or do you now, at last, disavow the remarks you made -- you know, the ones so embarrassing to you that you threatened to sue the leakers -- to the University of Nebraska?"

Klass replied on November 26. After informing me, apparently as yet another ufologist equivalent to Communists, that I could have become one of the top writers for Pravda in the pre-peristroika era, he denied ever alleging that ufologists constitute a threat to the republic. In the next breath he affirmed that yes, he stood by his remarks to the Nebraska administrator -- in which he held that ufologists constitute a threat to the republic.

In a rational world CSICOP would have been laughed out of existence following revelations of its bumbling and double-dealing in the "Starbaby" scandal (as chronicled in side-splitting detail by Dennis Rawlins in Fate, October 1981). But in this irrational world CSICOP continues to masquerade as the voice of reason and, as one of its leading lights would have us believe, ufology is still tantamount to Communism.

UFOs: Challenge to SETI Specialists

Nuclear Physicist / Lecturer Stanton T. Friedman 5/02

Major news media and many members of the scientific community have taken strongly to the radio-telescope based SETI (Search for Extraterrestrial Intelligence) program as espoused by its charismatic leaders, but not supported by any evidence whatsoever. In turn, perhaps understandably, they feel it necessary to attack the ideas of alien visitors (UFOs) as though they were based on tabloid nonsense instead of on far more evidence than has been provided for SETI. One might hope, vainly I am afraid, that they would be concerned with The Search for Extraterrestrial Visitors (SETV). I would hereby like to challenge the SETI specialists, members of the scientific community, and the media to recognize the overwhelming evidence and significant consequences of alien visits and to expose the serious deficiencies of the SETI related claims. I have publicly and privately offered to debate any of them. No takers so far.

Here are my challenges for the SETI SPECIALISTS (SS):

1. Why is it that SS make proclamations about how much energy it would take for interstellar travel when they have no professional competence, training, or awareness of the relevant engineering literature in this area? As it happens, the required amount of energy is entirely dependent on the details of the trip and CANNOT be determined from basic physics. If one makes enough totally inappropriate assumptions, as academic astronomers have repeatedly done down through history in their supposedly scientific calculations about flight, one reaches ridiculous conclusions. But it is not necessary, for example, to limit the flight to 1G acceleration, or to provide all the energy needed for the round trip at the launch, or to use an utterly foolish trip profile (as devised by a Nobel Prize winning Harvard physicist) that involves accelerating at 1G for half the outward bound portion and the decelerating at 1G for the second half, etc. Do note that it only takes one year at 1G to reach close to c.

Cosmic freeloading can be very, very helpful in reducing fuel requirements and has been used for all our deep space missions such as Voyager, Pioneer, Galileo, Cassini, etc. A splendid example of the wrong assumptions to make was provided by Dr. John William Campbell (1), Professor of Mathematics and Astronomy at the University of Alberta, in 1941, when he attempted to compute the required initial launch weight of a chemical rocket able to get a man to the moon and back. Our successful trips to the moon beginning in 1969, still with chemical rockets, showed that the weight he "scientifically" calculated was too high by a factor of 300 Million!! Dr. Alexander Bickerton (2) in 1926 proclaimed that it would be impossible to give anything sufficient energy to place it in orbit around the earth. Professor Simon Newcomb (3) "proved" in October, 1903, that it would be impossible for a man to fly except with the help of balloons. This was 2 months before the first flight by the Wright Brothers (2 very sharp bicycle mechanics). These three bright professors made a whole host of totally inappropriate assumptions because of their ignorance of the technical situations with which they were faced. They hadn't read the ample literature available to any professional seeking truth.

For example, Dr. Campbell assumed a single stage chemical rocket, launched vertically and limited to 1G acceleration. He assumed much too low an exhaust velocity. The rocket had to carry a huge amount of fuel for use in the retrorocket supposedly required to slow down the rocket upon return to Earth. For Apollo we used multi-stage rockets (reducing system weight at each stage) launched to the East from near the equator (to take advantage of the Earth's rotation), a peak acceleration of many Gs (the faster to orbit, the less the losses to gravitation), the moon's gravitational field (to provide some free energy going in) and earth's atmosphere to do the deceleration upon approaching the earth, as highlighted, for example, in the movie Apollo 13. Cleverness was more important than power.

The exhaust velocity was certainly much higher than assumed by Dr. Campbell. Of course Campbell knew nothing about fission or fusion rockets (on both of which I have worked). The latter using D-He3 reactions exhaust charged particles which can be directed electromagnetically and are born with 10 million times as much energy per particle as can be obtained in chemical rockets. Most academics in my experience and in their publications (i.e. Krauss, Ref. 4) are ignorant of the fact that the most powerful fission rocket reactor propulsion system (Phoebus 2B, made by Los Alamos) operated at a power level of 4,400 Megawatts before 1970. Man has produced many controlled fusion reactions. See Luce (5) about fusion rockets. Any study of the history of technological development reveals that technological progress comes from doing things differently in an unpredictable way. Pocket calculators are not built with vacuum tubes. Supersonic flight is not achieved with propellers. Lasers are not just better light bulbs. In short, the future is definitely NOT a mere extrapolation of the past.

2. Why do SS assume that radio is the ultimate means of long distance communication, when we have only had this kind of technology for roughly 100 years? Just down the galactic street there are two sun-like stars (Zeta l and Zeta 2 Reticuli) only 37 light years away and a billion years older than the sun. Of great interest is the fact that they are less than 1 light year apart from each other. It is good to see recent recognition of the fact that we can already, with our primitive technology, create laser signals able to be observed by other civilizations in the neighborhood. Optical SETI is coming in to its own. But remember progress comes from doing things differently. What new communication techniques will we master in just 50 or 100 years??

3. Why do SS make proclamations about how aliens would behave, when, as physical science professionals, they have no training, experience, or special insights as to how Earthlings, no less aliens, would behave, or what their motivations are. One might consult psychiatrists, psychologists, social workers, lawyers, nurses, etc, but radio astronomers?? This is a field which, by its nature, has little to do with people other than those directly involved. We hear such comments as that aliens, once radio contact is established, would teach us about all the secrets of the universe. Just why would an advanced technological civilization share its secrets with a primitive society whose major activity (judging by how its wealth is spent) would certainly appear to be tribal warfare and for whom every new frontier is a new place to do battle? Earthlings killed about 50 million other Earthlings during WW 2 and destroyed 1700 cities. Currently almost $1trillion per year is spent on the military while 30,000 children die needlessly every day of preventable diseases and starvation.

4.Why is it that SS take every opportunity to attack the notion of alien visitations without any reference to the many large scale scientific studies? They act as though the tabloids are the only possible sources of UFO data. There are at least 6 large scale scientific studies (Ref. 6-11),more than 10 PhD Theses, and many dozens of published professional papers by professional scientists. These are all almost always ignored. There are, for example, 13 anti-UFO books and dozens of pro SETI books that don't even mention the largest scientific study done for the USAF (6). The work was done by the engineers and scientists at the Battelle Memorial Institute in Columbus, Ohio. They found that 21.5% of the 3201 cases investigated were UNKNOWNS completely separate from those cases deemed to provide "Insufficient Information". They found that the better the reliability of the reports, the more likely to be unidentifiable. Statistical cross comparisons between the UNKNOWNS and the KNOWNS showed that the probability that the former were just missed KNOWNS was less than 1% for 6 different characteristics.

The basic rules for the lack of attention to the relevant data by well educated, but ignorant about-UFOs-professionals, especially SS, seem to be:

1. Don't bother me with the facts, my mind is made up.

2. What the public doesn't know, I won't tell them.

3. If one can't attack the data, attack the people; it is much easier.

4. Do one's research by proclamation, investigation is too much trouble and nobody will know the difference anyway.

How else can one explain such totally baseless, but seemingly profound, proclamations as "The reliable cases are uninteresting and the interesting cases are unreliable. Unfortunately there are no cases that are both reliable and interesting." (See Sagan, Ref. 12).

The fact is that 35% of the EXCELLENT cases in BBSR14 were UNKNOWNS and therefore Interesting. Only 18% of the POOR cases were Unknowns. Surely professional scientists are supposed to base their conclusions on study of the relevant data, rather than proclamations?

5. Why don't SS understand that there are very clear-cut national security aspects of the entire UFO problem including the possibility of duplicating the far out technology and the concerns with the impact on the public of any announcement? Clearly if any earthlings could duplicate the saucer technology, the systems would make wonderful weapons delivery and defense systems. It is a lot easier to dream about distant civilizations whose existence will have little impact, if they can never reach here, or never have been here. Many quite extraordinary scientific and technological developments were conducted in TOP SECRET programs including the development of the atomic bomb, the proximity fuse, radar, etc. There is overwhelming evidence, never noted by the SS, that the subject of flying saucers represents a kind of Cosmic Watergate including the recovery of two crashed saucers in New Mexico in 1947 (13). According to Pulitzer prize winning journalist Tim Weiner (14), the annual Black Budget (Not under congressional control) was running $34. Billion.. several years ago. The NSA had openly admitted withholding 156 UFO documents even from a Federal Court Judge given a high security clearance. When these were "released" more than 15 years later, only 1 or 2 lines per page were not covered by whiteout. I have received formerly classified CIA UFO documents on which only 8 words are not blacked out.

USAF General Carroll Bolender stated (15) that "Reports of UFOs which could effect national security ·..are NOT part of the Blue Book System." One should note that the very high quality military monitoring systems operated by the Air Defence Command and the NRO and NSA produce data which is born classified and is not released to the public.

6. If the SS are truly interested in the SETI, why don't they examine the best UFO data instead of ignoring it? Without that data, they have no evidence to support the many assumptions they make about ETI. For example, it is assumed that there is intelligent life all over the place, that some of this life is more advanced than we are, and that ET communications and flight technology are stuck at the level of radio and chemical rockets, and ETs are trying to attract our attention via radio!! No evidence has been provided that any of these assumptions are true. And yet these same SS insist on ufologists providing them with an alien body!! SS have been joyous about finding 37 radio signals out of several billion that were tantalizing. But they choose to ignore the 21.5% of 3201 investigated UFO sightings that might indeed signal the existence of ETVs. The false reasoning is incredible. Since most sightings can be explained, therefore all can be. But since some very few radio signals were thought to be intriguing, we should follow that path of study!

7. Why is the assumption made that aliens wouldn't know there was a technological civilization here until they picked up our TV or radar signals? We are already , though in our technological infancy compared to a cosmic time frame, considering building a radio telescope with segments on opposite sides of the solar system that could directly observe earth size planets around all the stars in the neighborhood. Other civilizations in the neighborhood could have done this a billion years ago. As Sagan noted (16) signs of biological life here could have been observed at Earth by an alien spacecraft at our level of technological development 2 Billion years ago. Why not assume that every library in the local galactic neighborhood has known of our existence as a result of explorations done

millions of years ago? One should note that Columbus did not wait for a smoke signal from the Western Hemisphere natives before sailing westward. One of Magellan's ships sailed around the world in about 2 years. The Space Shuttle does it in 90 minutes. Progress comes from doing things differently.

8. Why is it that the SS don't understand that, at the end of WW 2, it was quite obvious to any visiting alien intelligence agents, that soon (less than 100 years) these primitive earthlings, whose brand of friendship is obviously hostility, could be traipsing around the local galactic neighborhood? Three new readily observable technologies: atom bombs, powerful V-2 rockets, and powerful radar systems set the pace. It is probably not a coincidence that the crashed saucers were recovered in Southeastern New Mexico near the only place on Earth (White Sands Missile Range) in July, 1947, where all three could be observed.

During any one century, because the progress from no space technology, to deep space travel, takes such a comparatively short time, it doesn't seem likely that there would be any other civilization in the local neighborhood going through the same transition. They are either ahead of us or behind us. Of course we would be of interest to them; if for no other reason that the equivalent of national security concerns. Compare the world's budget for National security with that for radio astronomy. One reasonable purpose from that viewpoint for visiting here would be to assure that we don't go out there until we get our act together. The word quarantine comes to mind. Does anybody really believe that aliens would want this primitive society out there before we get our act together and can even qualify for admission to the Cosmic Kindergarten?

9. Why is it that SS seem to assume that aliens would want to deal with them? They don't speak for the planet any more than ham radio operators speak for their countries. If their annual budget were even $100 Million, that is miniscule compared to the $1. Trillion for national security.

10. Why is it that SS so often try to stress how big and how old the universe is? In fact the sphere centered on the sun and having a radius of only 54 light years includes 1000 stars of which about 46 seem to be sun-like and suitable for planets and life (17). At least 2 of these sun-like stars are 1 Billion years older than the sun. If my car were stolen near my home in Fredericton, New Brunswick, it wouldn't make much sense to suggest that the thief might be any one of 6 billion Earthlings. It would appear to be much more likely that the thief was one of 725,000 New Brunswick residents or one of only 50,000 Frederictonians. The odds of finding the thief would be greatly enhanced.. Note, too, for example, that residents of Zeta 1 and Zeta 2 Reticuli, being less than 1 light year apart, could directly observe planets around the other star.

11. Why do SS focus on the Drake Equation which supposedly tells how many inhabited planets there are capable of sending radio signals? There is no evidence to support the many assumptions that are made and it takes no account of the processes most important for the distribution of intelligent life on Earth, namely migration and colonization. We have data on one planet in one solar system at the present time. We don't even know how many civilizations there may have been here on earth 10 million or 200 million years ago,. Schliemann had to dig down 75 feet to find Troy dating from just a few thousand years ago. How much of earth has been explored that deep no less the much greater depth that would be needed to tell us about civilizations that were lost due to asteroid collisions or nuclear wars or continental drift since hundreds of millions of years ago? One might just as well throw a dart at a dart board with numbers on it.

12. Why are proclamations made by SS that aliens can't possibly be humanoid, as described by UFO witnesses? We have no catalog of aliens in the neighborhood combined with travel schedules so we could predict how many would have three heads or 4 eyes, etc. After all these claims of non-humanoidness are based on assuming that any ETI has developed indigenously and independently of life from anywhere else and there has been no migration or colonization. Funny how the laws of physics and biology might even suggest that there are favored directions for how things develop. For

example, we find few examples of mammals with three legs or three eyes. There may well be advantages to certain configurations. Colonization and migration would lead to the dispersal of particular features. Proclamations without data are hardly scientific. Reports from all over Earth indicate humanoids are visiting in strange vehicles with extraordinary capabilities.. This, of course, does not mean that all aliens are humanoid. Presumably the ammonia breathers go to Jupiter.

13. Are the SS really unaware that public opinion polls have consistently shown that believers in alien visitations outnumber non-believers and that the greater the education the more likely to accept ETV? Two polls of engineers and scientists involved in research and development activities (18) even showed that 2/3 of those who expressed an opinion believe that some UFOs are ET spacecraft. After all, certain knowledge that Earth is indeed being visited would provide the best incentive for bigger budgets for space exploration. Of course, if aliens are indeed visiting, than the Radio Telescope Search for ET signals would seem a useless exercise and might indicate the SS have been on the wrong track all along. Learning sign language might be more productive in terms of Communicating with ETI.I have twice heard independent reports of military personnel recording radio signals from a UFO being monitored by nearby military radar. One wonders how many similar instances there have been.

14. Why do SS, who should know better, or at least should have done their homework, so often pronounce that it would be impossible for any one to withstand the "enormous" accelerations of UFOs so often observed for brief times? They quote no data to support their pronouncements despite the huge amount of data that NASA and others have compiled over the past half century. It turns out that trained and properly constrained humans can withstand "enormous" accelerations, for significant times, so long as the acceleration is in the appropriate direction vis a vis the body. Astronauts are launched while on their backs for a good reason. For example, a pilot can perform a tracking task while being accelerated for 2 minutes at 14 Gs. That is from zero to 36,000 miles per hour in 2 minutes. They can successfully withstand 30Gs for one second. Dr. Paul Stapp's rocket sled reached over 600mph in the early 1950s and he successfully withstood 43Gs when slowing down more rapidly than expected. Data should take precedence over proclamations.

15. Why do SS cite the Fermi Paradox as though it demonstrates that nobody is coming here or that we haven't been colonized, perhaps many times, in the past? Fermi was well known at the U. of Chicago for trying to teach by asking questions. Remember that he assumed it would only take a few million years for the entire galaxy to be colonized once those activities had begun. The beginning could have been a billion years ago.

16. Finally there seem to be no signs that either SETI leaders or UFO debunkers are willing to note the false reasoning of their own kind . This lack of internal evaluations provides a scientifically unhealthy and dogmatic, almost cult like atmosphere, with charismatic leadership, a strong dogma, and irrational resistance to outside or new ideas. Scientists and journalists have a serious obligation to study the relevant data rather than to make pronouncements having no factual basis. Does the end (presumably public rejection of flying saucer visitations and enhancement of the status of SETI) really justify the means of misrepresentation based on ignorance and arrogance? Ufologists are, in contrast, very critical of each other. Party lines should be for politicians, NOT for scientists.

More on UFO's

***Physics Today*, January 1971, p. 97.**
Stanton. T Friedman

W.T. Powers [June, page 14] is correct about the generic difference between "good" UFO reports and those that can be identified. The organized study he desires has already been completed. Reference 1 is the final report of a two-year study of 2199 UFO reports conducted by scientists and engineers at Battelle Memorial Institute in Columbus, Ohio. Every report was finally categorized and evaluated as shown in Tables 1 and 2. The "other" category includes a miscellaneous collection such as hoaxes, searchlights on clouds, birds and so on. Of special interest are the UNKNOWNS - "Those reports of sightings wherein the description of the object and its maneuvers could not be fitted to the pattern of any known phenomenon" and those labeled "insufficient information" defined as "some essential item of information missing or there was enough doubt about what data were available to disallow identification as a common object or some natural phenomenon."

The UNKNOWNS were NOT sightings for which there was not enough information. Note, too, that the higher the quality of the report the more likely it was an UNKNOWN, and the less likely that there was insufficient information - exactly what one would expect if the UNKNOWNS were indeed generically different from the KNOWNS. In addition, a chi-square statistical comparison between the characteristics (speed, color and so on) of the UNKNOWNS and the KNOWNS showed that the probability is less than 1 percent that the distributions are the same. The average duration of observation for the UNKNOWNS was no longer than for the KNOWNS with 45 percent being observed for more than 5 minutes. In short, UNKNOWNS are neither like KNOWNS (IFO's), nor are they rapidly passing lights observed for a brief period of time by an incompetent observer - quite contrary to the viewpoints of the scoffers who know so little of the facts concerning UFO's. If one were to apply the same fallacious reasoning as implied by the notion "because most sightings can be identified, all can," one would certainly reject the discovery of the anti-He3 particle (June, page 59). Obviously, if all but five of the 2 x 10^11 particles examined weren't anti-He3, none were.

After 11 years of study of UFO's I am convinced not only that some UFO's are extraterrestial vehicles but that the problem with the acceptance of UFO's is a psychological one just as was the acceptance of the Copernican universe 300 years ago. Antihelium particles don't upset our present notions about the universe or our own importance. UFO's do. For example, about 30 of the 100 reports discussed in the Condon report (2) could not be identified. The negative conclusions about UFO reality are in fact contradicted by the data in the rest of the report. Reference 1 is not even mentioned, though it is the largest study ever conducted and Condon knew it.

There is a great deal more that might be said about the inadequacy of the "Scientific study of UFOs". More to the point, a UFO study committee set up by the American Institute of Aeronautics and Astronautics concluded after three years that the University of Colorado study did not resolve the question of UFO reality and that what is needed are more quantitative investigations by members of the engineering and scientific community. Clearly, with Man having already walked on the moon, it is time to lift the "laughter curtain" and start thinking instead. A good souree of information is reference 3 and the many documents referenced therein.

ALFRED LOEDING

& THE GREAT FLYING SAUCER WAVE OF 1947

By Michael D. Hall
& Wendy A. Connors

Special Preface

We must be cautious of the hubris of the present. When UFOs first appeared in numbers during the great flying saucer wave of 1947, few people made the jump to an extraterrestrial hypothesis. The subject of this book, Alfred Loedding, is significant because he did eventually lean toward that assumption. Because he played such an instrumental role in the first official Air Force investigation into the phenomena, it is important to analyze the progression of his theories.

For the best part of the summer of 1947 most serious minds studying the flying disc mystery, like Alfred Loedding, considered that a domestic secret project might account for the sightings. After eliminating that possibility, the "foreign origin" option was exhaustively explored. By 1948 foreign origin became a catch word for visitors from outer space, but in 1947 it meant only one thing—Russians. In fact, worries that the Soviet Union may have gleaned a Nazi super weapon at the end of the Second World War remained in the minds of Air Force officials up through 1952. But by late 1947 some aeronautical engineers, like Alfred Loedding, began to consider that "flying saucers" may represent intelligently controlled machines from another world. Why? What was the mind set in 1947 that could rationalize such a conclusion? What was his perspective? Where was the proof?

It is very difficult with our 1998 view of popular culture to consider a time when there was no extensive set of preconceptions on extraterrestrial life. Without a Steven Spielberg to help us dream, or a Star Wars trilogy and a thousand other such productions dating back to 1949, we would not have the present-day mind set that we do. Yet, that is not to say there was not already some basis for the consideration of alien visitation.

The best way for us to understand one early perspective is to look at Halloween night 1938. During that famous evening the dramatic actor Orson Welles produced and narrated a radio drama based on H.G. Wells' book, The War of the Worlds. Like the famous account of a Martian invasion, the radio play was a frightening success. Unfortunately for many East Coast listeners, it seemed so real that thousands flew into a panicked frenzy—actually believing aliens were landing in Grovers Mill, New Jersey. The nation was certainly in a vulnerable state of paranoia due to the brewing storm clouds in Europe. The Second World War would begin just one year later on September 1st and Americans knew that they would soon be impacted by Hitler's madness.

2 Alfred Loedding and The Great Flying Saucer Wave of 1947

Many authors have used the panic caused by Orson Welles' radio drama as a foretelling explanation for later UFO sightings. In other words, a belief has arisen that the radio drama planted a seed in the public's mind—a self-fulfilling prophecy for extraterrestrial visitation. The historian, however, will realize the concept of extraterrestrial life had already been firmly ingrained in the public's mind since 1894 when Percival Lowell founded the Lowell Observatory near Flagstaff, Arizona.

Lowell believed he saw signs through his huge telescope of canals on the Martian landscape -- proving to him the existence of intelligent life there. Some scientists agreed while others were skeptical, but until the first Mars probes of the 1960s and 1970s showed just how lifeless the planet's surface actually was, many people kept an open mind about the possibility. UFOs, never the less, continued to be seen after we realized the near planets were uninhabited. Why?

UFOs are just that, unidentified objects in the atmosphere. Most of these turn out to be identified

or IFOs—always representing something of physical reality regardless of what they turn out to be. For years debunkers have tried to use science fiction stories as an impetus behind UFO reports. But the stimulus for the sightings is real, not imagined. Orson Welles had no more responsibility than Percival Lowell for UFOs because as Alfred Loedding finally realized, whatever they represent, they are a real phenomena. True, no proof has surfaced to tell us what the UFO phenomenon represents. The continuing record of sightings detailed in this book will demonstrate clues to its anomalous nature just as it did to Loedding. In the case of UFOs it seems the truth may be very extraordinary. That, at any rate, is what Loedding came to suggest. And for that reason it is perhaps best to remember the words of the late Dr. Carl Sagan who stressed that finding such extraordinary truths always requires extraordinary evidence. Unfortunately, if Loedding ever did come across conclusive evidence, it has not yet been discovered. As a result, this book studies the events of 1947 that we do know and presents them just as Alfred Loedding lived them.

We can not disavow that Loedding might have had some cultural preconceptions in the back of his mind. He did draft a formal conclusion to Air Force officials in mid 1948, stating that flying discs may represent extraterrestrial visitation. But, he based his famous Estimate Of The Situation draft on fact, not fiction. It was, however, rejected in part due to fears of generating another War of the Worlds fiction-like panic.

Beyond that no one can say if popular culture tainted the history of man's modern interpretation of UFO sightings. The point for the sake of objectivity had to be presented. Following is presented the story of Alfred Loedding and the great flying saucer wave of 1947.

Introduction

The morning of July 4th, 1947, at 3733 Shroyer Road Dayton, Ohio, began very peacefully. An initially hazy dawn yielded to a blue sky and a sunny but muggy day of eighty-one degrees. With the after effects of the Second World War still being felt, the nation welcomed the long and bright three-day holiday despite the heat. It felt strange, however, for Alfred Christian Loedding not to be at work on a Friday morning. Loedding was a civilian aeronautical engineer at the well known Army Air Force labs just down the road at Wright Field. He was also a workaholic who lived and breathed aviation. Yet for all his talents, relaxing at home was not one of them.

His son, Donald, remembers his father always doing something when at the house. So maybe that morning he was hard at work cleaning and tuning his prized 1946 Buick. Maybe he was down in the basement working on a host of experiments that over the years made him one of America's first Army-employed engineers to study rocketry and jet propulsion. Alfred preferred to be designing away in his cellar as to be anywhere else.

His home-spun research did pay off over the years, giving him the experience needed to start the first jet propulsion division at Wright Labs and file a whole host of patents. One of these even included a design of a low aspect ratio (flying wing) aircraft — another one of Alfred's specialties.

It is, in fact, because of his cutting-edge innovative brilliance that we would like to know Alfred's exact thoughts. Undoubtedly sometime during that Independence holiday he stopped to pay close attention to the news. Since June 24th there had been a small number of unique stories in the press concerning sightings of unidentifiable flying objects.

At the time these were coined "flying discs" or "saucers" after private pilot Kenneth Arnold likened the nine objects he saw over the Cascade Mountains to "saucers skipping across the water." No one then used the phrase UFO so "saucers and discs" became the catch words. But it was not until that Independence day weekend that the sightings dramatically increased in intensity and started to dominate news headlines. West Coast newspapers were the first to detail the stories,

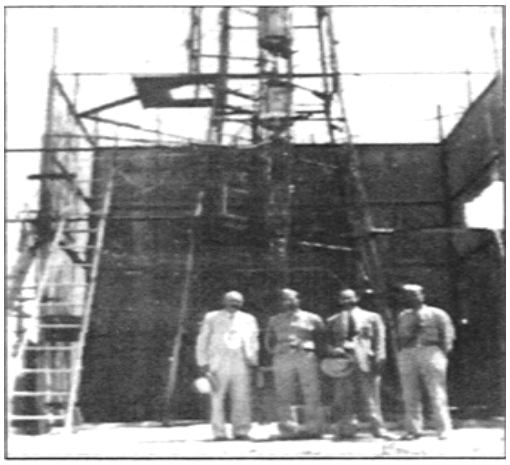
although, by Sunday of that weekend even the New York Times had a page-one feature on the discs and would do so for the next three days.

Alfred Loedding may have heard accounts of the latest sightings on the

WNBC Bob Smith morning radio news show that Friday at 9:00 A.M. By Saturday he could have caught some Midwest stories in print. Although when he began hearing or reading the accounts, it is unlikely that he was surprised. Well, perhaps surprised, but certainly not unprepared.

Loedding, like a number of people in the years prior to the famous Arnold account, had observed similar phenomena themselves. It was back in 1932 that Loedding, together with his wife Marion, saw something that they never could explain. A Dayton, Ohio, news article detailed their incident as follows:

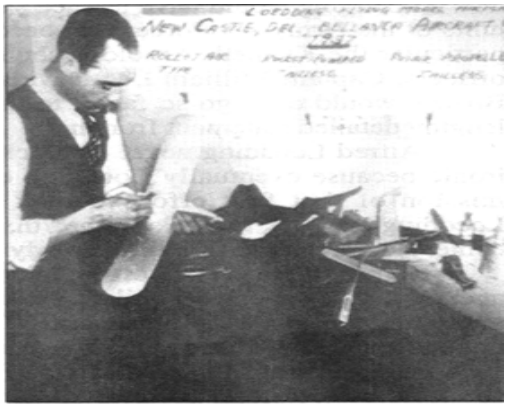
> **In October, 1932, the couple saw such an object one evening while driving near Plainsboro, N.J., he reported.**
>
> **At first they thought an aircraft was crashing nearby, Loedding said. Then the craft leveled off and flashed away at high speed, emitting a changing bluish-green light. On reaching his home, he immediately sketched the object from memory. Later, Loedding said former New York congressman L.G. Clemente reported he had seen such an object at about the same time. Loedding estimated the object he and his wife had seen was 100 feet in diameter and 500 to 600 feet high. He said the object gave off a weird light "like looking at a fire-fly" and appeared to change shape.**
>
> **He said he had seen nothing of a similar nature since.** 1



Alfred Loedding pictured second from the right with Dr. Goddard on far left at his testing sight in Roswell, New Mexico, during 1941.

Because he did not reveal that story until 1957, it is impossible to know his thoughts during that first rash of disc sightings. Yet it would be fun to have read the mind of this brilliant engineer who had graduated the Daniel Guggenheim School of Aeronautics back in 1930. This is especially important because Alfred had been privately designing flying wing-shaped aircraft (then termed low aspect ratio) and lecturing about the concept with a slide show since his 1932 sighting. Some of these concepts by 1947 were translated into small working models, looking more like flying saucers than flying wings.

He certainly knew aviation, having held a key position with the Bellanca family in their famous aircraft company before coming to work for Wright Labs in 1938. At Wright Labs he established the first jet propulsion division and became the resident expert on rocketry. Loedding became the base's key contact with rocket pioneer Robert H. Goddard. 2 However, having been periodically utilized from his T-3 engineering section by the base's T-2 intelligence branch, it is fair to speculate that Loedding might have had some hint of the more spectacular saucer stories before he returned to work on Monday, July 7th.



Loedding at Bellanca aircraft company circa 1937.

He may have even been intrigued by the July 6th Sunday New York Times exclusive on the recent deployment of two reactivated B-29 bomber groups to the West Coast—and how their appearance coincided in place and time with many of the disc sightings. Being a dedicated German Catholic he would have digested these stories after church on Sunday. And certainly that last day of the long weekend he would have been mulling over all he had learned to date.

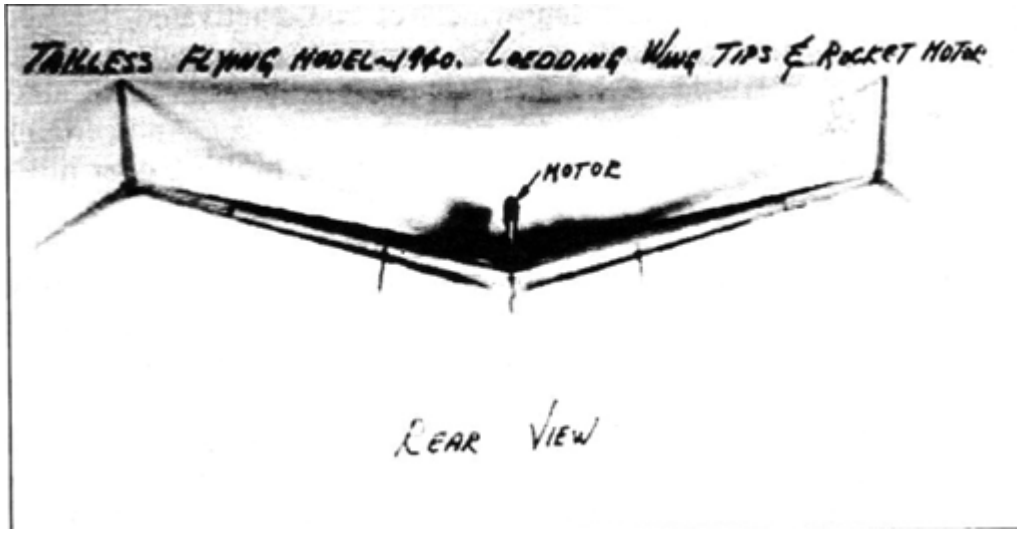
Up to this time the military had only issued a few and very contradictory statements on the incidents. Loedding would have surely been aware of these because he knew and worked for many key figures in the Army Air Force. On July 3rd, for example, Army Major Paul Gaynor stated that a preliminary investigation had been dropped for lack of evidence. Then that same day Boise Evening Statesman reporter Dave Johnson got a different slant from the commander of the Air Materiel Command, Lieutenant General Nathan F. Twining. Twining, who had the T-2 Army Air Force Intelligence group under his command, commented that officials were indeed looking into the matter of flying discs. He stated that even the top secret research conducted at the aviation labs at Wright Field had not produced technology comparable to that being observed. Continuing, he added that a "reputable scientist" had seen one of the discs and that his report is being studied.

Loedding would have learned shortly following that weekend that other units of the Army Air Force were becoming interested in the sightings and in particular the Kenneth Arnold account.

Fourth Army Air Force Intelligence officers, Captain William Lee Davidson and First Lieutenant Frank Mercer Brown, would even go so far as to interview Arnold for six hours, taking a lengthy detailed statement from him.

Alfred Loedding never had a chance to meet Brown or Davidson. It is ironic because eventually Loedding ended up inheriting and expanding the mission of that first effort to look into disc sightings. But by the time Loedding got back to work on the 7th, he would have had no idea what was to come. He may, however, have already started to be absorbed by the events.

It must have been shortly after driving onto Wright Field that morning and parking in front of building 11A that he caught the first hint of the mounting excitement and concern. Walking up to his office in room 252 in the overcrowded pre-war building that had been converted from an aviation museum—he heard the scuttle butt. The Independence holiday had indeed accounted for a huge number of sightings. The term "flying saucers" had arrived and was here to stay.



A model of one of Loedding's flying wing designs circa 1940.

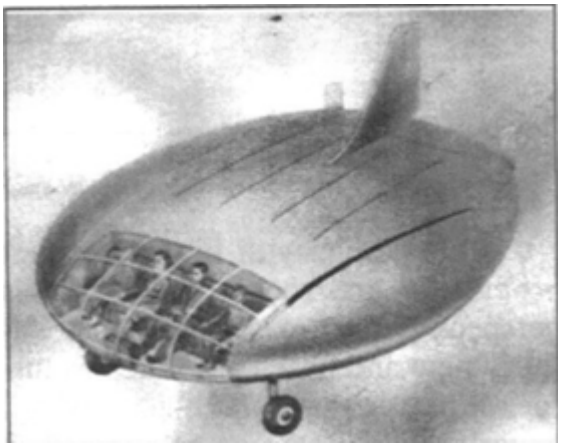
Chapter One
The
Famous Flying Saucers

In the summer of 1947 the phrase "flying saucer" entered the vocabulary of popular American culture. Before this period there were some rare and unverifiable stories of disc-shaped aircraft seen around the world, but only a few significant reports of any kind came to light after a series of so-called "phantom" airship" sightings in America around 1886 and 1887. The truly notable incidents, although not really describing saucers, centered around the "foo-fighter" of World War II and mysterious "ghost rockets" over Sweden in 1946. By 1947, the famous saucers had arrived and were here to stay.

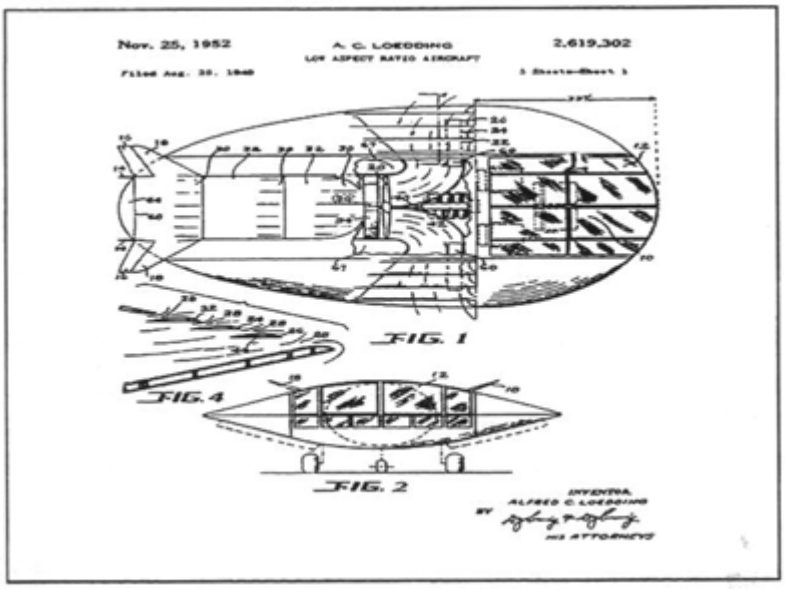
When the sightings hit the headlines, they almost exclusively described flying objects in the shape of discs. Actually, when the primary accounts of many of these reports are studied, the researcher reads stories more descriptive of Alfred Loedding's favorite obsession—flying wings or delta and swept-wing shaped aircraft. Such aerodynamic forms did emerge at the end of World War II and without doubt generated numerous flying saucer reports.



An artist's conception of one of the saucer-shaped aircraft that Loedding designed during this period.

For that reason it is understandable why Alfred Loedding became a chief player in the drama surrounding the early history of UFO sightings. By this period he was often seen running between the buildings at Wright Labs carrying his working models of an all-wing lifting body airfoil. Loedding hoped his design would eventually prove to be the ideal concept for light private aircraft. He envisaged a day when small flying airfoils would even

replace the family car. [1] Today we may laugh at his planned application for such a design, but at the time Loedding was justly respected for his interest in the concept of a saucer-shaped airfoil. This became all the more relevant by late June 1947 when "real" flying saucers were being seen in the skies of America. No one knew what they represented, but many were seeking answers from American scientific experts. Alfred Loedding thus entered the flying disc mystery of the great UFO wave of 1947.



Pictured above are actual blueprints of a saucer-shaped aircraft designed and patented by Alfred Loedding.

Loedding, with his background in radical aeronautics as well as jet propulsion and rocket design was a logical resource to utilize, as little perspective then existed for what was being seen. Jets, of course, were still fairly new and posed a possible solution to the mystery. The German jet and rocket planes that came into service at the tail end of the war startled even experienced pilots not only for their swept-wing design but also for the absence of a propeller. Those German aircraft along with the British Meteor and American P-80 jet fighters had speeds exceeding 500 miles per hour. Such speeds, even two years after the war, still attracted great attention. But jets could account for only a few of the many saucer sightings that summer—which often involved velocities accurately calculated by qualified observers at greater than 1,000 miles per hour.

Neither could other new aircraft designs answer all the questions raised by the disc mystery despite the fact that both the Germans and Allies had experimented with the flying wing concept. The Northrop company, for

example, tested large flying wing bomber designs in 1947 known as the XB-35 and YB-49 prototypes, but their flights were always documented. Despite many sensational stories on the subject, the well known Horten brothers who designed flying wing aircraft in wartime Germany never saw their machines attain practical use. Nor did the Soviet Union ever utilize the radical Horten airfoil concept.

Loedding with one of his many innovative aircraft test models.

Balloons, although a much lower level of technology, generated other reports as scientists began using this old invention by the thousands to conduct weather and cosmic ray studies of the stratosphere in the 1940's. The early balloons were made from neoprene which would turn smoky gray or black in the sunlight—just as some witnesses of suspected flying saucer events described seeing. The military and their civilian contractors also used balloons for a whole host of research and intelligence gathering duties. By July of 1947 many of these were no longer small gas bags, but huge silver (and sometimes clear) plastic envelopes made from polyethylene. These f would appear cone-shaped before their helium gas expanded and rounded out their internal volume at high altitude. Many times these and the older, neoprene balloons were tied together in clusters which could resemble formations of discs. Some of these larger polyethylene balloons could be seen by the naked eye at altitudes as high as 60,000 feet. Many saucer sightings, especially after a lot of news play on the subject, were undoubtedly the result of balloon launches. Perhaps as many as seventy percent of all early UFO sightings are attributed to balloons. Yet, balloons cannot explain away, accounts of flying-wings or discs with extraordinary flight characteristics. Loedding soon learned this as he talked to balloon experts who had disc sightings themselves.

The disc reports came from all over North America and around the world in 1947. Many were seen traveling at tremendous speeds, flying extremely high, sometimes hovering, and on numerous occasions making controlled changes in their flight path. These cases remain a mystery because

missiles of the day were only being tested in specific designated areas and had little endurance or range. The next generation of rockets like Sputnik, that were capable of intercontinental flight or earth orbit, were still a decade away. Aircraft, on the other hand, had not yet attained reliable means of reaching supersonic speeds, altitudes above 40,000 feet, or developed methods to hover. Because a large percentage of the first disc sightings occurred during daylight hours, astronomical events are difficult to associate with any but a few of the reports. Thus, 1947 has become a very important period to study. Accounts from reputable witnesses during the time are also significant because they had not yet had the opportunity to have their observations tainted by a vast body of previously

published UFO lore.

The military started a formal UFO investigation by the end of 1947, although, as early as July Army Air Force and Naval Intelligence as well as the FBI had studied some of the more well publicized reports. Loedding was associated with investigations out of Wright Field by July 9th, yet few records remain of this work. As in later waves, however, only a small percentage of the total number of sightings were reported to authorities. Less than five percent of the 1947 incidents were even indexed in military files. [2] Many of those can be found in the National Archives' holdings of USAF Project Blue Book files. [3] Some paperwork dealing with UFOs are also located at the Air Force Historical Center at Maxwell Air Force Base near Montgomery, Alabama, which primarily deal with records of the Fourth Air Force. Nine hundred and ten pages of lost Air Force documents from the late 1940s have also come to light from the National Records Center in St. Louis Missouri—via Wright-Patterson Air Force Base. Microfilms of early intelligence files have surfaced as well but are now held in private hands although are becoming available for sale to researchers. Recently released FBI files provide a very good insight into some of the early investigations too. Despite dedicated efforts to locate Naval records containing UFO cases by historian and researcher Jan Aldrich, these files are in large part still missing.

Another very good source dealing with 1947 comes from a book by Ted Bloecher entitled Report on the UFO Wave of 1947. In his work Bloecher surveyed 853 North American newspaper accounts of flying saucer sightings. Regrettably, many of those stories were not taken seriously by the newspapers themselves and lack details. In fact, after some news play on the subject a great deal of silliness arose in the press. Often it becomes hard to weed out the serious stories from that madness. Because most accounts were not followed up on at the time, the articles remain as the only documentation to many of the early UFO sightings.

The authors are indebted to the help of Jan Aldrich for a number of the news accounts to follow. Mr. Aldrich is engaged in a compilation known as Project 1947 that significantly expands on Bloecher's work. Aldrich has screened over 3,200 North American newspapers and others from all over the world for UFO reports. Aldrich's recent book, Project 1947: A Preliminary Report On The 1947 UFO Sighting Wave, is by far the most extensively researched publication available on the period. Today his work continues, searching out UFO accounts long lost in over 11,000 newspapers that were in print in the United States alone in 1947. When reading those accounts it is important to realize that UFOs were still not yet called unidentified flying objects. As stated, the term UFO simply did not yet exist. The media dubbed the strange objects "flying saucers" and "discs" following the Kenneth Arnold sighting. Those terms would predominate in the popular press until well into the 1950s.

The most important historical hindsight a reader can possess concerns the nature of what flying saucers then represented. Very few made the assumption that these discs represented extraterrestrial intelligence. Belief in so-called "alien visitation" did not mature until 1949 and then mainly in the cinema and tabloid-like magazines printed on pulpwood paper—"the pulp fiction." In 1947 flying saucers were assumed to mean scientific balloons or most likely classified military test craft. What else could a rational individual who had just lived through the wartime environment of secret weapons development think? Most people just hoped they were American and not Soviet—especially the military. Loedding thought likewise. At first he gave great weight to the consideration that the Soviets may have acquired some lost Nazi technology. It is interesting to note, however, that Loedding eventually became one of the first in official circles to conclude that the flying discs could

represent controlled extraterrestrial spacecraft. His chief, Colonel Howard M. McCoy, even said that November, "The possibility that the reported objects are vehicles from another planet has not been ignored." [4] But that was not a topic of discussion in the summer of 1947.

Although saucers were indeed very hot news by early July, they were not the only focus of the nation by any means. The Cold War had begun to heat up in late 1946 as tensions grew tighter each day. In that year, while responding to an invitation from President Truman to speak in Fulton, Missouri, Winston Churchill brought the phrase Iron Curtain into general use. Although voted out of office by that point, his beloved Britain then had to institute bread rationing in order to export enough grain to keep food riots from erupting in Allied occupied Germany. That was a hardship English

citizens had not even had to endure during the darkest days of the war. Subsequent pressure on Parliament led Britain to abandon efforts to check Communist expansion in the eastern Mediterranean. President Truman felt America had to fill that vacuum. To drum up Congressional support for aid to Greece and Turkey as well as aid to Europe, the Truman administration intentionally exploited public anxiety. The battleship Missouri sailed to the Mediterranean. [5] But as the Truman Doctrine and Marshall Plan took shape in 1947, real fears over a blockade of Berlin were already in the news.

The Berlin Crisis would only be a year off. President Truman would send a flight of B-29 bombers to England the next summer to dissuade ongoing Soviet threats to close the divided city from the West. The B-29s had no nuclear weapons, but the administration made every effort to suggest that they did. In fact, when the (Army) Air Force and thus Alfred Loedding officially became involved with UFOs, they did so largely out of fear of foreign, but earthly, intrusions into American air space.

The American military, after all, had already started mapping Soviet defenses on the Siberian frontier via the North Pole in converted B-29s. Recently declassified Air Force files even document US efforts to locate land masses in the Polar region that could be used for bomber bases. When the British later flew nighttime radar mapping reconnaissance missions over major Russian cities with American RB-45C jets out of England, it only stood to reason that the Soviets would try to do the same. [6]

The crucial point so often missed, concerns the significance of the 1947 sightings. If the nation believed they were seeing experimental aircraft or spy planes, then they were in fact seeing something. Today we know they were not Soviet—the USSR made no early incursions into continental US air space. But what were they? Undoubtedly many were misidentifications of domestic aircraft, balloons, and astronomical events—probably as many as eighty percent. But even the military came to the conclusion that there was a disturbing number of unexplainable events. By September 1947 Air Materiel Command, Wright Field, commander, Lieutenant General Nathan F. Twining, produced a memo based on research which Loedding assisted with. It characterized the discs as "real and not visionary." Future Air Force Intelligence Chief Major General Charles P. Cabell even stated in regard to the discs, "The conclusion appears inescapable that some type of flying object has been observed." Wright Field Intelligence Chief Colonel McCoy then concurred, "it is obvious that some types of flying objects have been sighted." [7]

From July 4-11, 1947 UFO reports dominated the newspapers, often featuring flying saucer sightings on their front pages. The stately New York Times ran four continuous days of page-one features starting on July 6th, this at a time when editors jealously coveted space for stories dealing with Berlin, the Marshall Plan, and serious flooding in the Midwest—which was a significant domestic news story. National Guard air units, the Army Air Force, and Navy were sufficiently concerned to send up "saucer patrols" along the Pacific Coast. That's significant alone because the regular military then had what they perceived to be a need to conserve fuel for upcoming Air Force Day celebrations. The sightings attracted such attention because most of them took place in broad daylight. This stood in great contrast to earlier and later UFO cases, many of which occurred at night or generated vague descriptions of objects that appeared so luminous or distant that they did not seem to be of substance. During this period many accounts describe very solid-looking objects maneuvering with the performance that some aircraft lack today. The reports do not all involve flying wing and saucer-shaped craft. The 1947 wave encompassed a great variety of observed phenomena including cigar-shaped rocket-like objects. Other forms include luminous balls, fan blades, boomerangs, triangles, diamonds, and light phenomena.

Sightings suddenly slowed in frequency after July 11th. Several dozen notable sightings would follow to end out the year, but whatever happened took place primarily between June 24th (and in force from July 4th) to July 11th. Granted, after the 11th, the news media did seem to lose interest in the story, but this alone cannot account for the marked decrease in reported activity after that initial onslaught of sightings. Some sort of phenomenon predominated in those very critical days of late June to early July.

Many claim it to be a form of mass hysteria generated by the widely publicized Kenneth Arnold sighting. If so, why did the sightings encompass the entire globe in a matter of only days with too little time for most people in foreign countries to read news accounts of the first American saucers? Why were there sightings before Arnold's? Would Arnold's story have become so publicized if not for actual incidents immediately following his event? Why did the intensity of the phenomenon end so suddenly after the 11th? If people were indeed caught up in a worldwide craze generated by media coverage, would not large numbers of reports still come in on the 12th instead of dozens the day before and only a handful until 1948? These same questions were asked by Alfred Loedding. The facts that follow are those that became available to Loedding during the course of 1947. Many of the UFO incidents of that year will be shown to result in specific actions taken by the military to formulate an investigation. That investigation, in large part, became the brain child of Alfred Loedding.

Chapter Two
Before Kenneth Arnold

The following accounts are the first reliable UFO sightings for 1947. [1] It is unknown exactly when Loedding became privy to the reports. Undoubtedly they were brought to his attention by the second week in July—being widely talked about in military circles by that point. Loedding and others in Intelligence at Wright Field saw it as proof that the disc mystery was real and not simply the result of news play on the Kenneth Arnold story.

To this day these cases are misquoted in virtually every book. They actually represent three separate incidents which took place during a six month period prior to mid-April. They were witnessed by Weather Bureau meteorologist Walter A. Minozewski at the Richmond, Virginia, weather station. In all of these curious events he described seeing a "silver disc" with distinct differences in shape and performance to that of a balloon. At some point after the events he reported the incidents to his superiors.

The last sighting occurred one April morning when Minozewski and his staff caught sight of a very bright metallic elliptical disc while they were tracking a small "Pi Ball" (or wind measuring) meteorological balloon then at 15,000 feet. He checked his observations through a theodolite telescope. (A theodolite is an optical device used for measuring horizontal and vertical angles—in this case used to track weather balloons.) The disc flew just below the balloon and remained in sight for fifteen seconds, appearing much bigger than the balloon with a flat level bottom and a dome on top. It remained on a westward heading at high speed until vanishing off into the distance. [2]

For some unexplained reason disc sightings often occurred in connection with balloon tests. It is ironic, because if it was not for the presence of highly trained balloon men in those instances, no one would believe the observations to be anything other than misidentifications of their own balloons. For that reason, and the expertise of such men, Loedding took special interest in all investigations involving balloon technicians.

As another side note, it should be mentioned that there is some mystery concerning the Minozewski sightings. In January of 1967 researcher Ted Bloecher reviewed the Minozewski case file at Wright-Patterson AFB in Dayton, Ohio, thanks to the assistance of Lieutenant Colonel George P. Freeman Jr. who arranged his visit. Bloecher's associate, atmospheric physicist Dr. James McDonald of the University of Arizona, then contacted Minozewski to confirm the details of the report with him. Minozewski recounted the fine points of the case just as they appeared in Air Force files but was baffled because he said he had never reported the incidents to the military. Equally perplexing is the fact that the Minozewski sightings are not now part of the Blue Book index released to the National Archives nor does the case file appear as complete as when Bloecher reviewed it thirty-two years ago. [3] As will be demonstrated in this chapter, it is apparent that sometime during or after the close of the twenty-two year long Air Force investigation into UFOs that followed 1947, a conscious effort was made to downplay any sighting which occurred prior to

the Kenneth Arnold incident. Those after Arnold's sighting were then often claimed to be the result of simple hysteria generated from his highly publicized account.

Only a few very sketchy reports can be found in May in any type of records, most without exact dates or times. Few of these came to the attention of the early investigators like Loedding, because they were not recorded until after the Kenneth Arnold sighting, and only then detailed in obscure newspaper articles. Others were not documented until private researchers started doing investigative work years later. For example, a Mrs. H.G. Olavick (later Rawlins) recalled to Dr. James McDonald in 1967 that she witnessed ten flying discs make some curious aerial maneuvers near Tucson, Arizona, on or about May 5th of 1947. One of those objects appeared larger than the other nine discs, perhaps as big as 100 feet in diameter. Viewed with her former husband, they both agreed at the time that the discs must be some sort of new high performance military aircraft. As they watched, the nine smaller craft began "playing around the cloud" in violent aerial maneuvers for about seven minutes as if making mock dogfights. Finally regrouping in a V formation behind the larger craft, they flew off with tremendous acceleration

toward the northeast. [4] FBI files document another sighting on May 5th between Ellensburg and Seattle, Washington. In that case three men sighted at 3:30 P.M. PST a silver object streaking erratically across the sky at great height and leaving a long pillar of "gas" which remained in the sky for over thirty minutes. [5]

Bloecher documents in his book a sighting by Mrs. W.C. Clark, of Memphis, Tennessee, who reported seeing two flying objects shaped like "tennis balls" pass over her yard around the first of May. [6] Another woman, Mrs. Slawuta, reported that on May 10th she saw a flying "shining elliptical object" with a gold band around it heading east over Newark, New Jersey. [7] This would be one of the first that Loedding might have taken keen interest in because of the feature of a central ring—perhaps structural in nature.

None of these early reports came to national attention until after the Kenneth Arnold sighting in June. A few were then investigated by local military intelligence officers. In the following case an Army Air Force security officer out of Tinker Field, Oklahoma, made a report and later the incident was reinvestigated by the FBI. This particular sighting impressed the military due to the reliability of the witness, Byron Savage.

A businessman and private pilot from Oklahoma City, Savage observed sometime on or about May 17th to the 21st a shiny disc-like object flying over the city. It was dusk, at the time of the sighting as Savage and his wife had just started to walk out to their car. At first he commented to his wife that a big white plane was coming over. He continued to watch the craft because it soon became evident that this thing was no ordinary aircraft. The object was as big as six B-29 bombers! It flew between 10,000 and 18,000 feet toward the northwest at a speed estimated at more than three times that of a jet, which in those days flew about 500 miles per hour. The disc reportedly made no noise except for a very faint "swishing sound." It passed over in a matter of fifteen to twenty seconds and had the appearance of a "perfectly round and flat" frosty white elliptical object. [8] Savage stated to FBI investigators that "he was sure this object was not a meteor and in his opinion it must be radically built and powered, probably atomic." [9] This was one of the first reports that ended up in Wright Field's (later the Blue Book) records, when Loedding began gathering all the paperwork he could on the flying disc mystery.

Similar objects appeared over Manitou Springs, Colorado, on the 19th when witnessed by Pike's Peak Railway mechanics Dean A. Hauser (a navy

veteran), Ted Weigand, Marion Hisshouse, T.J. Smith, and L.D. Jamison. They were on their lunch break around 12:15 P.M. MST as the men noticed some sort of shiny metal-like craft overhead. It flew around the area for over twenty minutes making erratic aerial maneuvers that no aircraft they knew of could undertake. [10]

While the news accounts on this incident are brief, a very interesting remark in one of the stories indicates that representatives of the 15th Air Force, then part of the Army Air Force, interviewed the rail workers on June 29th and sent their findings to Washington. This would certainly be one of the first indications of military interest in a UFO sighting. In fact, those who had the opportunity to view the Air Force files before they were released to the public in 1976 speak of this as one of its cases. Today, however, the file along with a notable number of other early cases is officially "missing." The National Archives lists them in the Air Force index but do not have them in their collection of declassified files turned over to them by the military in late 1975. Loedding had obviously been privy to it once he persuaded the Pentagon to send its UFO files to Wright Field in September of 1947. Unfortunately, further details of this case are lost with many others.

A more obscure sighting that even Loedding may not have heard about occurred around the 19th when an Augusta, Georgia, physician, Dr. Golden R. Battey, spotted four discs at 11:00 A.M. EST while fishing in St. Helena Sound near Beaufort, South Carolina. Battey stressed how bright they looked and related that the craft traveled at an altitude of more than 20,000 feet in a southeasterly direction. He said they were spinning on their axes with a circular rim around their lower quarter as they silently moved by in less than twenty seconds at great speed. [11]

Two flying discs accounts are found for the first day of June but like almost all of the early sightings, were not reported until after the Kenneth Arnold incident. Yet these did later make numerous newspaper stories and were undoubtedly read by many including Alfred Loedding on or by the 6th of July. One of these came from housewife Mrs. C.W. Parks in Bakersfield, California, who saw two groups of ten flying discs each moving at high speed in a southeasterly direction on June 1st. [12] That night another housewife, Mrs. Inez Nostrant, observed numerous bright luminous plate-sized objects flying in groups of twos and fours as high as planes over Grand Rapids, Michigan. [13]

On the 2nd of June private pilot Forrest Wenyon saw a jar-shaped rocket-like object fly across the nose of his aircraft at great speed near Lewes, Delaware, heading in an easterly direction around his own altitude of 1,400

feet. Wenyon reported his observation to the CAA, Eastern Airlines, and the FBI because the object was spotted in commercial airline space. There was some speculation on his part that there could have been a connection to a crash of a C-54 from such an object just two days before. The sighting did end up in Air Force records but for whatever reason was not released to the National Archives when other UFO files were made public in 1976. Earlier researchers who had the chance to view that file indicate that the military attributed the sighting to a rocket test. History, however, bears no documentation of rocket tests over that densely populated East Coast area. [14] This is one case in

which it would be interesting to know if Alfred Loedding consulted on due to his experience in rocketry. (The Wenyon incident is detailed in recently released FBI records.)

That same day Carl Achee, Jr. and John Scales, Jr. observed one circular flying object over Shreveport, Louisiana, along the Red River. This event, like others, were not thought by the witnesses to be of significance until they read accounts of the widely publicized Arnold account. For that reason those and reports from June 10th in Douglas, Arizona, and Weiser, Idaho, on the 12th have received little attention even by modern day researchers. [15]

Other early accounts come from overseas. According to the Times of India, flying discs were seen over Bombay as early as June 7th with other saucer-like accounts coming from South America. [16] Disc reports outside the United States are very rare prior to July of 1947, but at 3:30 P.M. local time on June 10th, Hungarian citizen Gyorik Ference saw four "yellow-red platter-like objects" fly over Budapest. They were sphere-shaped and silver in color, traveling at high speeds. [17]

Although it was in the United States that pilot Richard Rankin, a veteran flyer with more than 7,000 hours in the air, had the most notable flying saucer sighting prior to Arnold's. As with other early witnesses, he did not report it until others like Arnold had admitted to seeing such strange objects. Contrary to later accounts of the Rankin Case, his observation did not happen on the 23rd, but on the 14th, and did not occur at 2:15 P.M. but at 12:00 noon PST. Nor was Rankin in flight at the time, but saw the objects while watching a boy mow the lawn outside his friend's home in Bakersfield, California.

At the time of the sighting it was a clear and sunny day when both he and the boy saw ten round objects or "saucers" fly over in a loose "V" formation with one straggling in the rear." They were heading north, but

seven of the discs then reversed direction and came back over them toward the south. Their diameters appeared to be from 30 to 35 feet, and they were traveling at an estimated speed of 350 miles per hour around 8,500 feet. At the time of the sighting Rankin thought the craft must be some sort of new Army or Navy test vehicle much like the oval-shaped XF5U-1 "flying flapjack" and even commented as much to the lad mowing the lawn. Yet, military intelligence concluded Rankin's sighting represented no known aircraft type. [18] (No XF5U-1 were airworthy at that time.) [19]

Loedding, among others, greatly valued such observations from experienced pilots. Interviews with Loedding's son in 1997 and 1998 stressed that Alfred took special interest in any sightings made by pilots. Although the Fourth Army Air Force in connection with the FBI first investigated the case, Loedding had a chance to review the Rankin file sometime by the end of that summer. Again, it is not known what he thought but like other case files he inherited from the Brown and Davidson team, Loedding was surely struck by the similarities of the incident to others. The hallmarks of these included shiny saucer or wing-like objects flying fast and silently, often in groups or in special formations. An early such sighting comes from Lansing, Michigan on the 15th at 9:30 P.M. CST which added to the notable early cases:

> **Harry Von Riper was alerted by his landlady, Mrs. Letta Loree, and watched "balls of fire" jump in and out among the clouds "like clay pigeons" for about ten minutes. He tired of watching and returned to the house and did not see them again. He saw a searchlight beam, but the searchlight was stationary and could not, he thought, cause the phenomenon.** [20]

That same day, although apparently earlier in the afternoon, housewife Mrs. H. Ackley saw a

very bright silver balloon-like object appear to the northeast of Gering, Nebraska. [21] News accounts tell of another sighting the following day over Valley City, North Dakota at 9:00 P.M. CST:

> **Hjalmer Lokken, fireman at the State Teachers College, reported "something that looked like a ball, bright red in color [that] went shooting past. It was about the height of the flag pole on the college building (approximately 65 feet.)" It traveled to the west at terrific speed. [22]**

On the 17th a strange round object was seen traveling in a straight line over Logan, West Virginia. [23] Then in Dubuque, Iowa, a very unusual sighting took place as described again by a local press account:

> **Mrs. Louis Korn, 879 Rush Street, Dubuque, Iowa, saw over the Mississippi River six objects which all looked the same. They appeared to be two feet long and one foot wide, oval shaped ("Being deeper than a saucer, more like a shallow cup, with broken handle") and somewhat vaporous, like a white cloud. They seemed to float gently through the air, visible in each case for about an hour. Mrs. Korn and her husband saw similar objects on the 4th of July. [24]**

Also on the 17th a disc story comes from Bremerton, Washington, when Mrs. Emma Shingler saw more than one plate-shaped object flying west out over the Pacific at tremendous speed. This incident is interesting because that evening at 6:00 P.M. PST three flying discs were again seen over Bremerton heading west by Mr. and Mrs. H.K. Wheeler. [25] (Reports such as those, detailing the discs heading out to sea, led Alfred Loedding and the first military investigators to wonder if the objects could have been launched from Soviet submarines.) And before the night of the 17th ended, Professor Emeritus from the University of Wisconsin, E.B. McGilvery, spotted a round luminous object heading to the northeast of Madison. [26]

The next day on the 18th a notable sighting occurred in Green Springs, Alabama, when at 4:00 P.M. CST Mrs. H. Akins with others observed a blinking disc-shaped craft fly westward. [27] Another less well-known pre-Arnold sighting occurred in Oregon that day when E.H. Sprinkler and other residents of Eugene spotted multiple "saucers" in the southwest heading northeast. Sprinkler captured a picture of them. Unfortunately, the film revealed only dots because by the time that he had gotten his camera into position, the objects were speeding out of sight at tremendous velocity. [28]

On the night of the 19th, from his back yard, R.D. Taylor spotted eight to ten discs which were lighted from within as they zoomed over Cedar Rapids, Iowa. [29] Mrs. Jerry Neels said she saw some "bright and shiny" discs south of Kelso, Washington, on the 20th. [30]

That same day Mrs Annabel Mobley and her daughter Luanne observed three triangular-shaped groups of three discs flying toward the northeast of Hot Springs, New Mexico. [31] Also on the 20th, around 11:00 P.M. PST Archie Edes and his family saw an oval flame-like craft descend at high speed near Moses Lake, Washington. [32] A Spokane woman around the 21st added to the growing list of pre Arnold sightings when she saw eight discs descending with a "dead leaf motion" near the shore of the Saint Joe River in Idaho. [33] Two other sightings were reported for the 21st but are

dismissed as explainable phenomena. [34]

Edward L. de Rose had still another early sighting. At 11:30 A.M. EST on the 22nd he reported a "brilliant, round-shaped silvery-white object" moving in a northwesterly direction over Greenfield, Massachusetts. It traveled at a high rate of speed somewhere at around 1,000 feet of altitude and streaked across the sky in a matter of only eight to ten seconds before vanishing from view. He felt certain the mysterious craft could not have been a balloon and represented something very real when later filing this report with the A-2 section of Army Intelligence of the Atlantic Division. [35] That day a very similar sighting took place in Radium Springs, Oregon. In that case a "flying pie-plate" was seen by H.E. Hammond and his son L.V.W. Hammond, the secretary manager of the Eastern Oregon Federal Savings and Loan Association. [36] Before the 22nd ended a sighting occurred in Tucson, Arizona, when Walter Laos spotted a very strange-looking flying object. [37]

On Monday the 23rd at 2:00 A.M. EST a Mississippi woman, Elizabeth H. Hall, awoke to a frightening sight. Outside her bedroom window that early morning a very bright light grew larger and then receded. She knew that it could not be a star, nor could she determine its size or shape. After this pulsating brilliance continued three times, it silently disappeared on its fourth cycle. [38] This account came from the same date as that of E.B. Parks and a dozen other witnesses who saw two illuminated discs fly at terrific speed, low over Hazel, Green, Alabama. [39] Later that day at 3:30 P.M. CST, an unusual flying object traveling about 150 miles per hour appeared over the mountains

outside of El Paso, Texas. Dr. G. Oliver Dickson, an optometrist, described how it looked like a blimp with a point at each end. Although unlike a lighter-than-air craft, it remained bright or luminous. He stressed that because "The sun's rays were not reflected on it." [40]

Ironically, that night Richard L. Bitters, the editor of a large newspaper, saw strange flying objects over Wapakoneta, Oregon, but sat on his amazing story till after he saw Arnold's account published. [41] (This despite the fact that another similar sighting occurred in Cincinnati that same night.) [42] Thus, neither of those sightings made the papers before Arnold's account, but one story was actually reported to newspapers on the 23rd. The tale came from a railroad engineer in Cedar Rapids, Iowa. As he was climbing off his engine, he observed ten shiny disc-shaped objects flying in a string-like formation, "like wild geese." The six line story it generated produced little attention at the time. [43] The public's perception of this strange new flying disc phenomenon would, however, soon change.

1. Edward J. Ruppelt's personal papers do vaguely detail two fighter intercepts on a "violently maneuvering" UFO near England on January 16-17, 1947; and an undated post-war account of "disc-shaped aircraft" near Habberbishopshiem, Germany. (Ruppelt's private papers, File R104, courtesy of Professor Michael Swords.)

Chapter Three
Kenneth Arnold

and
The Aftermath

From Tuesday, June 24th to July 1 1th, hundreds of flying discs were seen in every corner of the globe by people of all walks of life. Most remember it beginning with a UFO sighting by private pilot Kenneth Arnold. As a result, the Kenneth Arnold Sighting officially marked the starting point of what is now called the modern UFO era. It also initiated Alfred Loedding's emergence into the drama.

The incident took place during a flight Arnold made in his small private plane from Chehalis to Yakima, Washington. Shortly into the trip at 2:59 P.M. PST he decided to take some extra time and keep an eye out for a Marine Corps transport reported down several days earlier. Soon eastward bound at 9,000 feet and nearing the Cascade Mountains of Washington State, he hoped that he might catch sight of it. Instead, he saw something quite different. Something that he would never forget.

At a right angle to his aircraft nine very bright disc-shaped objects came into view. They were flying extremely fast in a reversed echelon formation north and to the left of Mount Rainier. At first he assumed they must be some form of new military jet aircraft, but in the clear mountain sky he detected no tail surfaces or wings, just round all wing-like bodies. Arnold compared eight of them to "pie-pans," somewhat cloverleaf-shaped, with surfaces so bright they reflected the sun like a mirror. The ninth object looked heel- shaped. He then picked up a cowling tool to compare them in size to a DC 4 just off to his upper left at about 1,400 feet. [1] Arnold estimated the discs to be 45 to 50 feet in length, traveling north to south 20 to 25 miles ahead of his aircraft. It was no reflection or mirage because the formation clearly could be seen to weave in and out of mountain peaks at speeds estimated at 1,700 miles per hour!

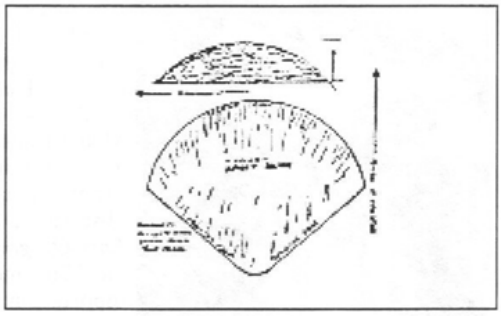
He derived this velocity by recording the time it took the objects to pass the 47 mile stretch between Mount Rainier and Mount Adams. Arnold reasoned that the disc formation was five miles in length and passed the 47 mile distance in one minute and 42 seconds. [2] The calculation was simple, but barring minor discrepancies just as equally fool proof. Prior to making his computations, Arnold felt certain he could determine what type of aircraft they were. Yet these figures defied explanation. No manned aircraft then in existence flew that fast. Even the new P-80 jets had only reached 623 miles per hour at the Muroc test range in California. Arnold knew aviation well and by then knew equally well that he had witnessed something incredible. Others would soon come to that realization too, but the primary line of thought would not be spaceships from another world, but some sort of new military test vehicle.

Arnold mentioned his sighting to the ground crew after he landed in Yakima and talked about the incident with Al Baxter, the manager of Central Aircraft. While Arnold talked with Baxter in his office they were joined by pilots Les Mills, Carl Apts, and Jacques Filliol. [3] By the time Arnold flew on to Pendleton the story had already preceded him. After detailing the sighting to newsmen Bill Bequette and Nolan Skiff at noon on the following day, newspapers soon made famous the term "flying saucer" by an off-handed remark of his—comparing the objects to "saucers skipping on the water." [4] His sighting went on to be the first to receive national media attention in more than 150 newspapers, being treated as a serious news story. This was due in part to the fact that Arnold was

not only an experienced mountain flyer, but a licensed air rescue pilot, a deputy sheriff, and a respected businessman. But it is equally important to remember that the story would not have gained the fame it did unless a host of other saucer sightings had not soon followed. Many of the observers to those incidents talked about what they saw before ever hearing news of Arnold's incident. Arnold's account has thus often been mislabeled as the first flying saucer encounter merely because it became the first well-known and the first believable sighting. [5]

The Army Air Force soon became interested in Arnold's account. On July 12th intelligence officers Captain William Lee Davidson and First Lieutenant Frank Mercer Brown interviewed Arnold for six hours, taking a lengthy detailed statement from him at Boise's downtown Hotel Owyhee. Just prior to that, Brown and Davidson had tracked down a well-known

acquaintance of Arnold's, David N. Johnson. Johnson was an aviation reporter for the Boise Evening Statesman and a widely respected wartime B-29 bomber pilot. Johnson gave Arnold a good recommendation as did many others who knew him. In fact, Intelligence officers took an immediate liking to Arnold — probably due to his aviation background. Brown and Davidson came to confide details of other cases to him because he had expressed such an interest and need to prove his own story. Arnold even claimed that they had told him that some in military Intelligence had become aware of saucer stories as early as April. [6]



All but one of the objects Arnold reported seeing were shaped like the sketch above.

That first effort to look into the discs sightings by Intelligence was spearheaded by the A-2 section of the Fourth Air Force out of Hamilton Field, California with Lieutenant Colonel Donald L. Springer in command. Brown and Davidson, under Springer's supervision, would draw most of the duty, interviewing many of the early witnesses. They were considered extremely bright and talented officers. Both were young men in their twenties who first received orders to investigate the disc reports following some spectacular sightings on July 4th. That directive came down from Army Air Force Chief of Staff General Carl Spaatz who wanted Hamilton Field Intelligence to "open a file." Although he specified that they should then report their findings to Intelligence at Wright Field in Dayton, Ohio. Some work on the disc mystery apparently also took place at Mitchel Field, New York, the headquarters of all air defense — once termed the Continental Defense Command and by mid 1947 referred to as the Air Defense Command. The FBI would soon enter the investigations too. Brown and Davidson were given orders to keep their reports classified and provided with ample assistance to do investigative work. This included a steno pool and two aircraft, an A-24 and a

stripped-down but aging B-25. Unfortunately, both Brown and Davidson were tragically killed after that B-25 crashed on the way back from a case investigation during the early morning of August 1st.

26. Alfred Loedding and The Great Flying Saucer Wave of 1947

While investigating Arnold's story, Brown and Davidson discovered sighting was not the only such incident that day. Others approached Arnold himself, reporting similar sightings. A report came to light that was made the same day and time by a member of the Washington State forest service who had been on fire watch at a tower in Diamond Gap. At 3:00 P.M. PST on the 24th he noticed "flashes" over Mount Rainier that appeared to move in a straight line. Arnold hoped to find I other accounts supporting his observation and even hung around the East Oregonian newspaper office until the 27th, monitoring additional saucer reports on the Associated Press Teletype. [7]

Kenneth Arnold

Then a really noteworthy case emerged. It came from a Portland prospector, Fred M. Johnson, who reported a disc sighting to Army officers after returning from the same mountainous area that Arnold had flown over. Johnson made his observation the same day and time as Arnold's when he had his attention drawn skyward by a brief flash and noticed five to six shiny round objects. The craft looked to have "tails" as they silently flew by at about 1,000 feet toward the southeast. They remained in view for about 45 to 60 seconds during which time the prospector examined one of them through a hand-held telescope. With the aid of the spyglass he could tell they were definitely real objects, round and about 30 feet in diameter but "tapering sharply to a point in the head end in an oval shape." He also observed some type of object in their tail shifting from side to side.

About that time Johnson looked down at his watch which had a compass attached to it and noticed that its needle fluctuated wildly. (Alfred Loedding became one of the few to make note of such an apparent electromagnetic effect in the early cases.) [8] Johnson also confirmed the time to be around 3:00 P.M. PST, the same period in which Arnold made his sighting. Johnson concluded in his statement that they flew off faster than anything he had seen before and resembled no object he had been witness to in his 40 years of prospecting the mountains.

Ironically, while the more famous Arnold sighting was investigated in far greater detail, it would be classified as a mirage. The Portland prospector case eventually found its way into Air Force records as the first unidentified case of an eventual 587 officially given that designation. (At one time Air Force files listed 701 unidentifieds but today only 587 are noted in the declassified index.) The unidentified classification (once termed unknown) was not lightly given and placed only on files that investigators could not attribute to a known cause. Witness reliability also served as a key factor. In this instance the records of both the Army and FBI considered Mr. Johnson of high reliability and character. [9] (See Appendix I for further details.)

Lieutenant Governor Donald S. Whitehead of Idaho and Chief Justice J.M. Lampert added to the list of those who saw a strange flying object that afternoon. At 3:30 P.M. MST they viewed from Lampert's office window in downtown Boise a most unusual sight high in the western sky. Called by some "The Boise Object," it appeared to hover or "hang" stationary in the sky, resembling a "comet." [10]

That afternoon at around 2:30 P.M. PST, in Richland, Washington, Leo Bernier reported several silvery-shaped discs high in the sky heading west by southwest. He stated they were traveling as fast as a P-38 fighter or about 400 miles per hour. Bernier was one of the first witnesses to suggest an extraterrestrial link. He was quoted in a July 3rd newspaper article, stating: "I believe it may be a visitor from another planet." [11]

Two sightings from the 24th reported nine disc-like objects just as Arnold had seen. One came from Charles Kastl as he was walking along a road ten miles east of Joliet, Illinois, at 1:50 P.M. CST. Kastl worked as a railroad engineer and described the nine discs as speeding along in a stretched out line formation at about 4,000 feet flying north to south. [12] The other incident was reported by Sidney B. Gallagher at 3:00 P.M. PST in Washington State when he saw nine shiny discs flash by to the north. [13] Then up to eight "platter-shaped" discs were seen in loose formation by Lester Swingleson and his wife and their two neighbor girls during that afternoon heading northwest from Lonejack, Missouri, toward Kansas City. [14]

28. Alfred Loedding and The Great Flying Saucer Wave of 1947

A Yakima, Washington, woman, Mrs. Ethel Wheelhouse, reported sighting several flying discs moving at fantastic speeds around the time of Arnold's observation. [15] At 4:00 P.M. PST Mrs. Dennis Howell saw a bright shiny silver object fly over Salem, Oregon. [16] Two hours later Mrs. Viola Wendt of Roseville, California, spotted one brightly reflective disc at about 10,000 feet. It came from the south, turned, then dipped, and finally flew off to the northwest on a straight course. [17] An hour later at 7:00 P.M. PST Glen E. Stewart and his wife witnessed a shiny object fly over Pendleton, Oregon. [18] At 9:00 P.M. PST William Kamp also saw a strange flying object over Oregon from his home in Portland. He noted that two reddish-white flares dropped from the mysterious craft. [19] Fifteen minutes later in Seattle, Washington, Mrs Elvira Forsyth reported to the press that she saw one disc-shaped flying object with two dark bands around it disappear into the clouds. Mrs Forsyth saw similar objects at 10:00 and 11:00 P.M. [20] Finally at 11:00 A.M. object resembling a flying plate was seen over Salem, Oregon, by Mrs. Gertrude Kirkpatrick. [21]

Wednesday 25 June

Notable incidents that were somewhat similar to Arnold's occurred the following day. At 3:00 A.M. EDT Mrs. G.E. Hart saw 13 luminous flying objects shaped like plates fly over Poplar Grove, Pennsylvania. [22] At 8:45 A.M. CST Mrs. Nels Thor of 10436 S Forest Ave. in Chicago, Illinois, observed one disc heading east over Lake Michigan. [23] Sometime after the noon hour that day W.I. Davenport, a carpenter in Kansas City, Missouri, observed nine speeding disc-like objects just as Arnold did although these made considerable noise and left vapor trails. [24]

Near Pueblo, Colorado, Lloyd Lowry and his wife observed two oval-shaped objects spinning on their axis while driving east in their car. They noted that the objects came from the east and veered south. Disc sightings involving two or less objects then came from Salem, Oregon; Alvarado,

Texas, at 5:30 P.M. CST; and Newcomb, New Mexico at 7:00 P.M. MST. [25] By 7:30 P.M. a single bright disc appeared in the skies over Utah and fifteen minutes later Homer B. Duncan and Mack McKague of Salt Lake City observed two discs moving eastward in unison. [26] At 8:05 P.M. MST Dr. R.F. Sensenbaugher and his wife and Mrs. C.B. Munroe and his sister-in-law observed one disc while riding in a car near Silver City, New Mexico. [27] Ten minutes later a ball of fire appeared over Seattle, Washington. [28] Later C.E. Holman reported seeing two "illuminated discs" which circled each other over Oklahoma at 10:00 P.M. CST. [29] Also that night Warren County Deputy Treasurer Louis Stebbins and Mrs. J.G. Caffrey saw a reddish object trailing blue fire which traversed over the countryside near Glen Falls, New York. [30]

Thursday 26 June

Saucers were sighted back in Oregon on the following day when nine shiny craft with fins wove in and out of the clouds over La Grande. The sighting was made by high school student Larry Jones and two Catholic nuns. [31] In the Arizona Grand Canyon, Dr. Leon Oetinger and three others observed a "silver ball" too swift to be an aircraft. [32] At 7:45 P.M. MST in Cedar City, Utah, observers reported seeing one silvery colored disc fly over at about 2,000 feet with great velocity heading eastward. [33] Apparently that same object was seen by Roy Walters, a private pilot who had his sighting while airborne near Cedar City. Royce R. Knight, the airport manager at Cedar City, visually confirmed Walters' sighting. Still another man, Charles Moore, told of seeing a single unidentifiable luminous object speeding east over Cedar City at the same time. Moore was manager for Western Airlines and in his mind dismissed the incident as a "large meteor." [34]

Interestingly, far to the north of Cedar City a teacher, Glen Bunting and two other independent witnesses, observed a very similar round disc moving eastward just three minutes earlier. [35] By 8:30 P.M. CST a round large disc

traveling at least 1,200 miles per hour flew over Oklahoma City at great altitude in an easterly

direction as witnessed by Dennis E. Donovan. [36] Later that night at 10:00 P.M. a UFO report came out of Ottawa, Canada, describing an object bigger than an aircraft with a bright light on it. [37] Then in Denver, Colorado, Henry Martin and Walter Harrod observed a group of bright "coffee can tops" at about 5,000 feet traveling southwesterly. [38]

Friday 27 June

Three UFO sightings came from New Mexico on Friday starting with an observation by Captain E.B. Detchmendy who reported "flame-like objects" over the White Sands proving grounds at 9:50 A.M. MST. [39] Mr. W.C. Dodds then confirmed seeing the same event. [40] And just north of the base at 10:00 A.M., in Captain, New Mexico, Mrs. Cummins and her neighbor, Erv Dill, saw a single shiny object that "seemed to land on nearby hills." [41] In fact, at 10:00 A.M. another sighting came from San Miguel, New Mexico, by Mrs. D. Appelzoller who observed a fast moving object at low altitude who also thought it might have landed. [42] Frankly, most researchers feel all of these New Mexico sightings describe an event very characteristic of V-2 missile tests which were being conducted that year at White Sands. (Four other accounts of unusual flying objects in New Mexico that day also suggest a rocket launch or an astronomical event.) [43]

The early disc reports were not thought to be attributable to any one specific cause. In general, the stories merely focused on the fact that unusual things were being seen and a number of solutions were posed. The best commentary for the 27th comes from two articles from the San Francisco Chronicle:

by Howard W. Blakeslee, Associated Press Science Writer
New York, June 27—The reports from five areas west of the Mississippi River about mysterious disc-like objects flashing across the sky agree roughly with the way light occasionally is reflected

from a distant airplane.
In clear air the flash of sunlight from a plane can easily be seen at 10 miles. This flash is round, the shape of the sun. Any other reflection at a great distance also is likely to be round, coming only from a small area on the plane. Not accounted for are the speeds reported by some observers. A distant plane does not appear to be moving fast. If any jet planes were sighted, their speeds probably would be noticeable and could fit into the estimates, where sight gave the impression of something traveling 1000 miles an hour. It rarely happens that the eye can make an accurate estimate of speed through the sky. Reports of unusual objects in the sky have been numerous since the war. Atomic bomb and rocket rumors have accounted for most of them. Speculative stories about what may be seen in the future spread all over the world. With those in mind, any unusual sight in the sky is likely to appear exaggerated.

Army Colonel Thinks "Discs" May have Been Jet Planes

White Sands, N.M., June 27 (AP)—Lieutenant Colonel Harold R. Turner says "flying discs" reported seen in several Western areas Wednesday night may have been jet airplanes. The White Sands proving ground commandant said jet planes have circular exhaust pipes and that these when heated might give an illusion of discs. Reports of new "flying saucers" were received today from Silver City, in southwestern New Mexico, and Joliet, Ill. A Silver City dentist and members of his family said they saw a disc half the size of a full moon sail slowly through the sky. A Joliet train engineer reported "circular objects" going "faster than any plane I ever saw." [44]

Disc sightings that day also came from El Paso and Houston, Texas; Lowell, and Tintown, Arizona; Mountain Home, Arkansas; Seattle, Kelso and Woodland, Washington; Rutland, Vermont; and Vancouver, British Columbia. [45]

Saturday 28 June

A report as unique as Kenneth Arnold's took place this day. The Army, however, paid more attention this time. They did so because it involved one of its own Air Force pilots, First Lieutenant Eric B. Armstrong, who was flying a P-51 fighter from Brooks Field, San Antonio, to Portland, Oregon.

During that flight while 30 miles north of Lake Meade, Nevada, at 1:15 P.M. PST, Armstrong spotted five to six round white discs in a close formation. He stated that they were about 4,000 feet below him at an altitude of 6,000 feet moving smoothly at his same air speed of 285 miles per hour toward the southeast. But they must have actually been moving at a faster rate because they soon passed out of sight on an angular course to his aircraft.

Armstrong estimated that the discs appeared about three feet in diameter and for that reason the Air Force finally concluded he must have seen a balloon cluster. [46] Yet it is known that serious discussion of this incident took place in the Pentagon and seems to have involved Alfred Loedding in some of his first liaison work between Dayton and Washington. Several years following the event Edward Ruppelt, when assuming command of UFO investigations in 1951, learned that this had been a notable sighting in the military's early consideration of the problem. [47]

At 3:45 P.M. CST that same day just north of Milwaukee over Rockfield, Wisconsin, a farmer, Marion Beuschler and his brother, observed seven to ten discs flying silently overhead toward the south. Later that afternoon identical objects were reported by radio news programs in Illinois. Dr. J.W. Abner of Atchison, Missouri, also spotted discs. He reported eight of them traveling in a southerly direction at a high rate of speed. [48] A Colorado farmer, H.E. Soule of Appleton, told Grand Junction authorities that he observed a small disc-shaped object that day come from the northwest, which flew just 200 feet above his house without making a sound. According to him the disc then headed eastward over highway No. 6 for a mile and finally turned southeast. [49]

Later that evening a woman in Oregon, Mrs. Sidney Smith and her daughter Joanne, reported seeing an alternately shining flying saucer just before sunset at 5:05 P.M. PST-heading southeast at high speed. [50] Detroit, Michigan, claimed two independent sightings that day; Los Angeles, California, one at 11:30 A.M. PST; Dallas, Texas, had an observation at 5:00 P.M. CST and another later that night; one that evening in Hooksett, New Hampshire; one in Montgomery, Alabama at 9:20 P.M. CST; and also one in Bath, South Carolina later that night. [51]

Sunday 29 June

In the days following the Kenneth Arnold incident many disc sightings still came from the Pacific Northwest. Beginning at 11:00 A.M. PST on the 29th Mrs. Morton Elder observed seven umbrella-shaped objects south of Pendleton, Oregon, flying north and emitting a humming noise. Other independent witnesses reported a similar sighting in the area. [52] That afternoon numerous people in Moscow, Idaho, reported seeing a single "flying disc" at 1:30 P.M. PST. [53] At 1:30 P.M. Msrin Tucson, Arizona, Charles Weaver and his wife saw one of the famous formations of discs just as Kenneth Arnold did five days before. [54]

One of the most stunning reports for June 29th also comes out of the west. It involved three naval research scientists involved in guided missile development. While driving to the White Sands proving grounds in New Mexico the scientists observed something that proved to be far more interesting than the V-2 tests which they were then working on. Dr. C.J. Zohn reported their amazing observation to Army Intelligence with supporting testimony from fellow scientists Curtis C. Rockwood and John R. Kauke. This report was one of the most interesting sightings to be studied by Wright Field Intelligence and Alfred Loedding although the investigation was instigated by Lieutenant Colonel George D. Garrett of the Pentagon Intelligence Collections branch. The incident began at 1:30 P.M. MST as the scientists were all in a car headed northeast down Route 17 to examine a launching site for a July 3rd V-2 test. Just then they had their attention drawn upward by a flash. All three men, and Curtis Rockwood' s wife who was in the car, observed "a silvery disc whirling through the unclouded sky." Kauke was driving and became so overwhelmed by the site that he stopped the car. The scientists then estimated the disc's altitude between 8,000 and 10,000 feet and were especially attracted by its bright surface. They agreed its shape appeared elliptical and flat. Dr. Zohn, a well-known rocket expert, stated that the object did not look like any rocket he had ever seen and that it could not have been a balloon. [55]

Later that day at 3:00 P.M. Mr. and Mrs. James Harbor of Richland, Washington, and many local residents saw a very similar shiny disc with a type of halo around it. Most agreed that its outer edge seemed to be spinning around a stationary center section. [56]

34. Alfred Loedding and The Great Flying Saucer Wave of 1947

By 4:45 P.M. CST a bus driver, Dale Bays, traveling from Des Moines to Mason City, Iowa, observed flying discs outside Clarion. At first he saw only one oval object pass across the sky moving south-southwest at about 1,200 feet. Then four similar objects followed. Bays quickly stopped and got out for a better look. Taking in the view of the countryside, he turned around and spotted in the opposite direction a flight of thirteen more discs. This formation was at about the same altitude as the first objects and judged to be traveling 300 miles per hour. They looked like "inverted saucers," "oval" in appearance. He guessed that they were anywhere from 175 to 250 feet in diameter and around twelve feet thick. Their color appeared a "dirty white" and he said they made a "motor or dynamo" type of noise while passing overhead. After a couple of minutes the discs were then lost from sight to the north-northwest. [57] Interestingly, a sighting came from 140 miles west of there near Sioux City, Iowa, just 30 minutes later. The witnesses, H.F. Angus and his wife, saw a silvery disc move rapidly to the south at high altitude. [58]

Around 5:30 P.M. CST motorist Mrs. E.D. Butts, her husband, and son all observed a bright object fly low over St. Joseph, Missouri. Traveling relatively slow, it headed southward. They described the event just as if they were looking at the sun peering through the overcast on a very cloudy day or like seeing a bright moon. But the day was very cloudy, too cloudy to be the moon. And because the object appeared from the north and moved continually to the south, it came

nowhere near where the sun was positioned. [59] Another family, Mrs. HJ. Beckmeyer and her brother E.W. Brown, in St. Louis accounted a similar story that afternoon but in this case they saw three bright discs. [60]

At 8:05 P.M. PST Mrs. Sidney B. Smith in Seaside, Oregon, added to the growing lists of reports when she observed a round silent object pass over very high, just east of the city. [61] An hour and two minutes later Frank M. King, his wife, and their three guests, watched an oval gleaming disc fly over San Leandro, California, at great speed between 4,000 and 5,000 feet headed on a northerly course. [62] That day the Associated Press reported dozens of such flying saucer sightings from Vancouver, British Columbia, to El Paso, Texas. The stories all had similar characteristics—involving fast moving objects shaped like discs or saucers, traveling south at high rates of speed. They made little or no noise and each of the objects were said to have a surface that gave

off a blinding reflection from the sun. [63]

Monday 30 June

Occasional mention has been made in this text about Edward Ruppelt. He is of such interest because his landmark book, The Report on Unidentified Flying Objects, documents not only the great UFO flap of 1952 but also gives many insights on the 1947 saucer wave. This is ironic because during the summer of 1947 Ruppelt hoped he had seen the last of the Air Force. In WWII he served a long stint as a bombardier and radar operator during the entire B-29 bombing offensive against Japan. He certainly had earned his GI bill that he was then going to school on—having survived some hard combat and winning a fist full of medals the hard way. Now he was working just as hard toward a degree in aeronautical engineering at Iowa State College—a happy civilian.

That day Ruppelt was in Yellowstone Park, enjoying the first lazy holiday in a long time. That's when he heard the new word "flying saucer." Just outside the lodge kids were sailing paper plates into the air yelling "saucer, saucer!" He soon read the news reports which filled him in on the unusual phrase, but little did he realize that three years later he would be back in the Air Force as project head of UFO investigations in Dayton. [64]

One of the first sightings Ruppelt read about came out of Idaho on Monday the 30th. It began at 2:30 P.M. MST when several observers saw a flight of eight to ten objects in a V formation near the town of Hailey flying toward Galena Summit. Witness Walter Nicholson stated that the left wing of the V formation contained five disc-shaped objects in perfect line but the ones on the right "seemed to weave." [65] Forest ranger Hunter Nelson, who was marking trees with Nicholson three miles from Galena Summit, counted seven to nine objects in the V formation.

He stated that they were moving extremely fast and were as high as 10,000 feet heading northeast. Although both men said the objects were so high that they only looked like shiny specks in the sky, they told UFO researcher Dr. James McDonald years later that they had never seen anything like it before or since and were positive they had not seen conventional aircraft. Both men stressed that point, stating that they flew "much faster than any aircraft of that day." [66]

That evening, J.P. Grumpier, a Rogers, Arkansas, real estate dealer, watched the approach of a strong wind storm. As he stepped out onto his porch, the clouds became even more dark and ominous. Suddenly a disc appeared out of the northwest and vanished rapidly into the southwest. [67] Although it is hard to determine a definite time for this report another disc sighting was documented at 6:00 P.M. CST in Tupelo, Arkansas. In that case the postmaster, T.A. Morris with Alien Jones and Oscar Jones, observed a silver disc fly toward the northeast at a high rate of speed and great altitude. [68]

Actually there were many accounts to come out of the South that night. For example, a round bright object flashed westward over Knoxville, Tennessee, at 8:00 P.M EST. [69] Then at 9:30 P.M. C.E. Brehm, acting president of the University of Tennessee, observed with his wife a bright fiery object resembling "a long cylinder" move at terrific speed across the sky in several seconds as it left "in its wake a shower of sparks." He told authorities that "I've seen many a falling star, but never one that behaved like this thing. It was high in the sky, though much lower than the stars." [70] Local residents, Mr. and Mrs. Bellam, saw a similar spectacle. Mr. Bellam, who worked at the Oak Ridge nuclear facility, agreed with the other witnesses and refused to dismiss the sighting as an astronomical event because the altitude of the object was described as relatively low — in one case 5,000 feet or less. [71]

On the 30th disc sightings also came from Arizona, Utah, Oregon, Washington, Massachusetts, and Ohio. [72]

Tuesday 1 July

On the first day of July Robert E. Johnson, the county juvenile probation officer in Tucson, Arizona, reported seeing a disc-shaped object fly northward over the Pima Indian Reservation at 9:30 A.M. MST. Johnson stated that it appeared to be silver in color and moving at great speed at 5,000 to 10,000 feet. He described its flight characteristics as fairly smooth and direct, remaining in view for three minutes. [73] By 11:00 A.M. CST two shiny objects were seen traveling south, very high and fast over Indianapolis, Indiana. [74]

Much further west Mrs. Herbert Balliet and her husband then reported seeing two groups of flying discs at 11:45 A.M. PST fly right over their new house in Portland, Oregon. They said the second group contained ten to twelve objects and flew low over the foothills near the Columbia River. [75] At noon Mrs. R.A. Hunt of Madras, Oregon, saw six "aluminum" colored saucers circle high overhead. [76] Forty-five minutes later another Oregon woman and others in the Astoria, Fort Stevens area told of seeing a bright shiny object for 15 minutes moving toward the Columbia River in a northerly direction. A local welder saw that same object—it being so bright he noticed it through his dark welding glasses. Then other observers saw the objects and their concern led to phone calls to the Army at Fort Stevens and the Coast Guard at Port Adams. Officials from those facilities, however, stated that they had noted no unusual activity. [77]

For some reason Oregon seemed to be a real hotbed of saucer sightings that day. An interesting report came from Mrs. Walter Clark as others in Pendleton spotted saucers in a formation of six to eight objects that afternoon. [78] At 12:45 P.M CST a Dallas, Texas, man, Tom Dean, traveling between Dallas and Fort Worth said he and his wife and daughter saw a disc-shaped object "going like blue blazes from northeast to southwest at cloud level." Dean recounted that it resembled a

flattened-out balloon as it zoomed by in a matter of only fifteen seconds. [79] Further north in Canada on Prince Edward Island, Dr. and Mrs. C.K. Gunn with two friends saw a strange luminous object traveling at great speed high in the sky. [80] Also in Canada over Edmonton, Alberta, at 3:00 P.M. MST, Mrs. A. Olson reported seeing a "silver-colored" craft heading southeast at a great speed. [81] That night in Wallaceburg, Ontario, Ray Stevens spotted a disc flash by with bright luminous flames heading south at 8:45 P.M. EST. [82]

In Albuquerque, New Mexico, Chamber of Commerce official, Max Hood, reported "a disc-like bluish object following a zig-zag path in the northwestern sky." Between Wilmington and St. George, Delaware, a man observed five oval objects with two short protrusions on their trailing edges. [83] (In some of Loedding's investigations he took particular interest in any such notation of control surfaces as in this account and that of Fred Johnson's

sighting on June 24th.)

Between 8:45 and 9:58 P.M. EST three reports came out of North Carolina and one from Kentucky and one from South Carolina. In each case one luminous saucer-shaped disc was reported moving rapidly overhead on a southerly course. [84] That same night at 10:10 P.M. CST US meteorologist, E.E. Unger of Louisville, Kentucky, told of seeing a circular object flying through the air as he left a neighborhood theater. He said it moved at least 100 miles an hour and gave off an orange light as it headed toward the southeast. [85]

By July 1st Washington DC time, a radar operator at Chitoze AAB, Mokkaido Japan, detected a target traveling at a speed in excess of 600 miles per hour. This became one of the first notable radar targeted UFO events as the object could not be attributed to any natural occurring phenomenon. Alfred Loedding was later called to Washington to consult on that particular case. Pentagon Intelligence concluded during the meeting that it must have been some type of manned "aircraft" because it made four changes in heading while on the scope. The event certainly caught the eye of Pentagon brass because very few aircraft at that time could reach speeds of 600 miles per hour. In the intelligence report, however, a Major Farrier is quoted as stating that the USSR was then known to possess a jet fighter capable of speeds in that range. [86]

On this date or near it, passengers and a ship's officer on the SS Llandovery Castle had a very disturbing sighting. At 11:00 P.M local time, while in the Madagascar Straits, they observed a cigar-shaped machine fly parallel to the ship just twenty feet above the water. It shined a searchlight-like beam on the water 50 yards from the ship. After a short while the craft flew out of sight without making a noise, but emitted "fierce flames" as it accelerated away. Passengers stated that it looked to be of entirely metal construction with a blunt end and no sign of windows. Although the most remarkable facet of the account involves the size of the UFO—described as four times the length of the ship and about four times its height! [87] Descriptions of "cigar-shaped" craft, sometimes of huge size, have become the second most common feature of unidentified flying objects sightings from 1947 and continuing on to this day.

Back in the United States, disc sighting on the 1st also came from Cincinnati, Ohio; Roxbury,

Massachusetts; Morrisonville, Wisconsin; Detroit, Michigan; Arkadelphia, Arkansas; Pocatello, Idaho; Phoenix, Arizona; and Salt lake City, Utah were 60 to 70 saucers were seen flying erratically overhead at great height around noontime! [88]

Wednesday 2 July

Something very unusual crashed in the desert near Roswell, New Mexico, on or near the evening of July 2nd. To date the Air Force is still covering up what really happened. Since 1947 they have released four different versions of the incident, the first stating that a "flying disc" had in fact crash landed. Then a weather balloon was blamed, but in 1994 they claimed the weather balloon had been used as a cover story for what was actually the crash of a high altitude "Mogul balloon."

Mogul balloons were part of an extremely secret project designed to scan for shockwaves in the upper atmosphere, indicating possible Soviet nuclear testing. The only problem with this scenario is that although two Mogul balloons definitely did go down near Roswell, the records of the Air Materiel Command show that these incidents occurred only on June 7th and July 5th. Aside from that, recently declassified FBI files clearly show that the Mogul project was know of (by name) even by low level intelligence units.

By the 6th of July the nearby 509th bomb group was already notified of an aircraft crash of some sort on a nearby sheep ranch. Manager of the ranch, W.W. (Mac) Brazel, had reported the incident to the sheriff's office by the 5th, stating that he found a wide area of aircraft-like debris on the morning of the 3rd following a severe storm the night before. (Other accounts state Brazel found the debris in mid June, and still others place his discovery on the 4th of July.)

Today there are many sensational stories circulating about the Roswell Incident. Most are to the effect that the propulsion unit of one or two flying saucers (perhaps after a collision) exploded and showered-down the debris found by Brazel. The main body of at least one disc is said to have then crashed, complete with four occupants, 75 miles northwest of Roswell. While there are a remarkable number of collaborating stories from many of those known to have been involved in the incident, there is no physical evidence to substantiate their claims.

40. Alfred Loedding and The Great Flying Saucer Wave of 1947

Recently the Air Force posed its fourth explanation for Roswell, stating that test dummies dropped from a high altitude aircraft accounted for the mysterious alien bodies. The problem this time is that the exercise occurred more than twelve years after the supposed incident. And it is no coincidence that the Air Force made this recent revelation on the morning of the 50th anniversary of the Kenneth Arnold sighting—completely overshadowing that historic event.

Recent discoveries of government documents confirming a saucer crash and even an autopsy film have not been authenticated. These tidbits of evidence, known as the MJ-12 papers and the Santilli film, are nevertheless very intriguing. One thing that makes them so remarkable is that, if they are fakes or hoaxes, they have been done at tremendous expense utilizing exceptionally specialized skills. Some have even speculated that the most frightening scenario of all would be if the Roswell "evidence" was a fake. If so, who or what group would have the finances and resources at their disposal to produce this kind of disinformation, and why? And contrary to popular belief, no UFO hoax has ever produced a profitable outcome for anyone.

Few believe the sensational stories, but something very real is known to have been collected from the desert by the 8th Army Air Force 509th composite bomb group based in Roswell. This is startling for that reason alone because the 509th was the only squadron then in existence authorized

to carry atomic weapons. Whatever crashed near this high security nuclear base was then flown to Carswell Army Air Force base in Fort Worth, Texas, and then to Wright Field (renamed Wright-Patterson AFB by 1948) in Dayton, Ohio.

In all likelihood the commanding officer of the 509th, Colonel William "Butch" Blanchard, who authorized the release of the "disc crash" story by July 8th did not initially realize the implications of the event. When his intelligence officer Major Jesse Marcel told him they had found the scattered debris of a flying disc, Blanchard probably first thought of a balloon crash or some such explainable event. The Arnold story was only eight days old and still being talked about. On the evening of July 2nd, local retailer Dan Wilmot even had a saucer sighting. In 1947, however, flying discs or saucers had not yet assumed the image of extraterrestrial visitors that they have taken on today. Almost everyone then took it for granted that flying saucers were research balloons or military experiments of some sort. Colonel Blanchard probably innocently thought their recovered disc would be just one more story added to the many already being reported in the news media.

If the debris did come from something terrestrial, but secret, it would make sense that General Roger M. Ramey, commander of the 8th, would have then retracted Blanchard's disc story with a weather balloon explanation. It

would make all the more sense if it was not just a low-level research experiment as Blanchard probably assumed, but a highly classified project, or a nuclear accident, or perhaps even something of Soviet origin. This would conceal the indication of any such event and thus prevent public embarrassment at a time of mounting Cold War tensions. It would also conveniently and completely defuse the situation—which it immediately did.

Press officer Lt. Walter Haut received authorization by Col. Blanchard to release the following story.

Of course, in order to accomplish that goal some very high ranking pressure from the Pentagon had to be placed on the owner of the local radio station, warning that his federal broadcasting license would be immediately revoked if he did not cease covering the story. Coercion was also used on local civilian witnesses who were, in certain instances, threatened with violence if they did not refrain from talking about the incident. Mac Brazel, in fact, was held incommunicado by intelligence agents for over a week. He went to his grave fearing to tell even family members what he had learned.

While such events show something very important was definitely being covered up, they do not suggest a crashed spaceship. Nor do they disprove the theory. Whatever went down in the desert near Roswell on July 2nd was something that Washington, for what ever reason, seemed to know a lot about

by the 8th—the same day Blanchard innocently approved release of the story during his haste to get ready to begin his leave. To his immediate regret, he received a "blistering rebuke" from Deputy Army Air Force Chief of Staff Lieutenant General Hoyt S. Vandenberg. Maybe Vandenberg was just tired of hearing more crazy reports about flying saucers, or maybe he already knew what had happened.

Yet if a spaceship of some kind had actually crashed, especially if it was in as many pieces as witnesses first claimed, months would have transpired before anyone would have become fully aware of what they had. Even if they had recovered an intact section from a second crash sight—

would there not be at least a brief period in which the military might speculate about a Soviet connection only if they theorized it may simply be a communist hoax to perpetrate disinformation or panic? How long would it take for scientists in 1947 to identify crash debris far in advance of current human technology—if indeed some was recovered?

Whatever went down near Roswell was identified by the chain of command quickly enough to stop it from becoming public knowledge. That fact is clear. Someday, perhaps soon, the story will finally come out. [89] Perhaps a spaceship did crash that stormy July night. Playing devil's advocate, it would certainly answer many questions—the most perplexing surrounding the question why discs sightings increased so dramatically by July 4th. Perhaps there was a reason for the saucers to come out that day and up through July llth. Were they, in other words, looking for a missing disc? Is that an over simplistic hypothesis?

More conventional UFO reports for this date are now being discovered by researchers. Flying disc reports, for example, came in from various parts of the Columbus, Cincinnati, and Springfield, Ohio, area. [90] (In Cincinnati that evening at 8:00 P.M. EST over a hundred spectators at a baseball game saw two disc move slowly over the field. [91]) Discs popped up in Lewiston, Idaho; Hot Springs, Arkansas; Royal Oak, Michigan; Rutland, Vermont; DeKalb and Texarkana, Texas; and Denver, Colorado. [92]

A sighting that day comes from Tehama County, California, rancher Stanley S. Teass who reported seeing a group of eight to nine strange objects flying south at high speed near Red Bluff. [93] Other sightings came from California at 2:15 P.M. PST in both San Francisco, and East Los Angeles, and then that night in Huntington Park at 7:10 P.M. PST, and Pasadena at 8:00 P.M. EST. Still more came from Beverly Hills, Montrose, Tuyunga, and Burbank, California. [94] (The 2:15 event involved State Highway Patrol Sergeant David Menary, of San Francisco's Golden Gate Bridge detail and passenger Walter Castro. They reported seeing six bright metal objects "about the size of a football" whiz overhead and fall into the sea.) [95]

That same evening two reports came from Sioux City, Iowa, describing three brightly luminous saucer-like flying objects moving in close formation to the southwest. [96] One disc was then seen over Green Bay, Wisconsin, at 6:30 P.M. CST. [97] Finally at 8:00 P.M. PST, Mrs. Margaret Gill observed a "red ball of fire" fly over just south of Auburn, Washington. Two other women, Mrs. Zamora Lucas and her mother witnessed the same sight, thinking it was a burning aircraft. In fact, all three witnesses were convinced the craft was in distress because they said the object appeared to fall to earth. [98] A report in Oregon at Klamath Falls conveyed an almost identical account. [99]

Thursday 3 July

By the 3rd, flying saucer reports slowly started to increase in frequency. Beginning in Omaha, Nebraska, at 3:30 A.M. CST Mrs. Fred C. Nelson saw three objects "glowing like a full moon." [100] At dawn in Texarkana, Arkansas, a bus driver and a fireman reported seeing one disc high above them. [101] Around 9:00 to 10:00 A.M. EST that morning up to 100 fishermen saw eight disc-shaped objects maneuver wildly in the clouds over Conowingo Dam in Pennsylvania. [102]

At 10:30 A.M. EST in Lockland, Ohio, a man saw a football-shaped silvery object heading south at high altitude. [103] By 7:45 A.M. PST a Monterey, California, housewife observed a glowing round object "flow over onto its edge" as it flew by in the course of ten to fifteen seconds. [104] In Denver, Colorado, at 8:55 A.M. MST William F. LeFevre witnessed a shiny, mirror-like disc zoom by at several thousand feet and make a forty-five degree turn before vanishing toward the southwest. [105] At noon in Cincinnati, Ohio, a housewife caught a glimpse of three discs streaking overhead on a straight course. [106]

About the same time a Staten Island man, Nicholas Kronyak, observed a ball-shaped silver colored object fly over New York just astern of an aircraft while S.M. Barker saw three discs race eastward over Keokuk, Iowa. [107] Also over the noon hour, a circular object sped over Nampa, Idaho, with an undulating motion as witnessed by Charles Hughes and Clarence Faust. [108]

One of the best for this day involved an astronomer, John F. Cole, who observed at 2:30 P.M. EST ten luminous objects above Harborside, Maine, from his location on the eastern shore of Penobscot Bay. He estimated their speed between 600 and 1,200 miles per hour as they passed by in a hazy blue sky toward the northwest. Unlike other incidents, these objects flew with a loud roar and did not appear to hold any definite formation but moved along like "a swarm of bees." Their size appeared to be from 50 to 100 feet wide although two objects in the formation looked to have dark areas that may have been wings. [109] This event comprised one of the first files to make its way to Wright Field, via the Pentagon, and received careful attention by authorities including Alfred Loedding. Intelligence never discovered a reasonable explanation for what Mr. Cole saw that day over Maine and thus marked the case unidentified.

Later that day on the other side of the country a Redding, California, couple saw a shiny "flying triangle" zooming silently over their state toward the north. [110] An even more startling report came out of California at 5:00 P.M. PST. The incident took place at the Naval Auxiliary Station at Santa Rosa and involved trained observers. The story made quite an impact in the local newspaper when one of those witnesses gave an interview:

I noticed it first a few minutes before 5 p.m., on Thursday. From my location, it seemed to be 1,000 feet above the main north-south runway at the airfield, and I would judge that it was 15 to 20 feet in diameter. . . it was impossible to judge size and distance accurately, because there was nothing about the object that enabled me to make an accurate approximation of size.

It was the shape of a giant pocket watch, without the stem, and it was covered by silver material that looked like airplane aluminum. There were no marks of any sort on the surface. It was perfectly smooth.

The object was moving at about the speed of a glider in normal flight attitude, and indeed on my first glimpse I automatically recorded it in my mind as a glider.

But an instant later I realized that there was something strange about it and looked back. Then I noted that it had no wings, no apparent projections of any sort.

It moved smoothly in a northerly direction until it reached the north end of the runway, then turned to the east, banking slightly and headed toward Santa Rosa. I was forced to turn my attention away from it for a moment, and when I looked again it was gone.

From my observation, I would believe that the object was controlled in its flight, either directly or by gyro-control. Its only deviation from a straight path was for wind currents, and after tipping or rising with a current it would recover its level flying position.

The recovery was made in much the same manner as a glider appears to recover when a thermal

current forces one wing up or down. At the same time, the return to normal was accompanied by an overcompensation effect which is typical of gyro control." [111]

During the early evening an account came out of St. Maries, Idaho, when eight luminous discs were reported by Mrs. Walter Johnson and her family while she was visiting her parents. The sighting occurred at 6:30 P.M. PST when her father Ben Beeman had alerted the whole family to "come out of the house quick!" As they all ran outdoors the family of at least nine saw eight to nine large objects flying from the south in a scattered formation. Mrs. Johnson said they approached very fast and soon became silhouetted against a nearby mountainside.

Mrs. Johnson later told the press that "suddenly they stopped in mid-air, then started again. When they reached a point over a clearing in the timber, they stopped again and settled down a few at a time until they were out of sight. The mysterious part was that we could see them flutter down into the timber, and yet we couldn't see that they did anything to the trees." She went, on stating that they looked thicker than discs—actually more like washtubs but as big as a "five room house." The most interesting part of her account described self-luminescent properties. She said they glittered like a mirror in

the sunlight, but that the sun was apparently obscured by overcast—indicating the light came from within the craft.

Because over a half dozen neighbors also witnessed this sight, the event drew a great deal of attention. Benewah County sheriffs deputies made a land search of the area and three days later the National Guard's 116th fighter group combed the area by air. Despite these efforts no landing traces were ever reported. It is odd that this case never made it into Air Force files because Mrs. Johnson reported the incident to officials at the Spokane Army Air Base when she returned to her home in Dishman Washington." [112]

Further north that day at 5:45 P.M. ADT, Brenton Clark, a Canadian farmer near Augustine Cove, Prince Edward Island, witnessed a similar (single) bright round object zooming southward at around 10,000 feet. Before disappearing from view it dove earthward leaving a vapor trail behind it. Neighboring farmer James Harris and hired-hand Herman Linkletter, near Sherbrooke, confirmed the same sighting. They commented that the craft they saw had such a brilliant reflection that its shape was indiscernible. Another neighbor, however, near Charlottestown, Ewen McNeill, clearly described seeing a "torpedo-shaped object of tremendous speed" at the time. [113]

That afternoon two Walkerton, Indiana, housewives saw several discs maneuver in circular movements. [114] Then in Arkansas, J.L. Hampton told newsmen he saw a kite-shaped craft going at great speed." [115] That same late afternoon Robert Jackson and William Baker, retired Navy Chiefs, saw three discs make controlled changes in their flight and circle near the San Diego Naval Air Station. [116]

By 5:30 P.M. EST in Greenhills, Ohio, a man saw a silver disc shaped like a football." [117] Around that hour in Asheville, North Carolina, four people noticed a star-like object at low altitude headed west. [118] At 5:00 P.M. CST a Waukesha, Wisconsin, city council member and two others described seeing a fifteen foot long, five foot wide, silvery disc fly high overhead toward the north. [119] By 7:00 P.M. EOT a District of Columbia housewife and her daughter saw another group of three discs. In this case they described them as bright gold and moving very fast in a straight line accompanied by a "jet-like

noise." [120] At 9:30 P.M. EDT Baltimore, Maryland, residents accounted for a sighting of a round object that was bright yellow in color and larger and faster than a falling star, heading on an even course from the northwest to the east over the course of five minutes. [121]

Around 9:00 P.M. EST in Mendon, Vermont, Mrs. Clara Spieski reported that she saw a tubular, luminous, greenish craft flying over low toward the southwest. [122] At 9:30 P.M. CDT a policeman, George Mayfield, west of Springfield, Illinois, reported seeing four flat luminous discs zoom by in straight flight. [123]

Adding to the nighttime sightings of luminous discs came reports from four people in Warren, Pennsylvania. [124] Then in Crawfordsville, Indiana, Kenneth Stanford reported five luminous discs going northwesterly at great speed. [125] Claude Price may have seen those same objects at that time in Decatur, Illinois. [126] By 10:30 P.M. CST a luminous disc appeared over Sioux City, Iowa, headed east as a yellowish disc was seen in Seattle, Washington, at 9:45 P.M. psr. [127] Ending out the night, a group of luminous discs were seen traveling over Oakland, California, by Mrs. Estelle DeVaughn at great velocity going east. [128]

Up to this time the military still had not yet organized any determined investigation at Wright Field of which researchers are aware of. Such work did not seem to begin until at least July 9th. News accounts, however, do show officials were considering the issue if only to issue a few and very contradictory statements. On July 3rd, as detailed in the Introduction, Army Major Paul Gay nor stated that a preliminary investigation had been dropped for lack of evidence. Then Boise, Idaho Statesman, reporter Dave Johnson wrote that the commander of the Air Materiel Command, Lieutenant General Nathan Twining, told him that officials were indeed looking into the matter of flying discs. Twining stated that even the top secret research conducted at the famous aviation labs at Wright Field had not produced technology comparable to that being observed. Continuing, he added that a "reputable scientist" had seen one of the discs and that his report is being studied. [129]

Chapter Four
The Onslaught

Maybe it all could just be chalked up to fireworks, but on Loedding's day off on Friday, July 4th, Independence Day, a nationwide rash of saucer sightings hit the headlines. New Jersey residents started off the long list when "balls of fire silently darting through the air at high speed" were reported between 1:00 and 3:00 A.M. EST. [1] During those same early morning hours, further west, Mrs. B.B. Connor of Bartlesville, Oklahoma, saw a group of star-like objects fly through broken cloud layers. She described them as maneuvering in an erratic manner. [2] From sun rise to mid

afternoon discs sighting came from Virginia, Idaho, Colorado, Texas, California, Louisiana, and Arkansas. [3]

At 11:00 A.M. PST a carload of people driving near Portland, Oregon, spotted four disc-shaped objects streaking past Mount Jefferson. Just before that Harry Hale, production manager of the Portland Oregonian, saw a shiny disc-like object in the sky west of Beaverton while driving to work that morning. [4] (Interestingly, around that same time a private pilot flying over Idaho saw a similar disc speeding toward Oregon as a V-shaped object was spotted by ground observers in Troutland, Oregon.) [5]

These were only the first few of many Oregon reports. The next came at 1:00 P.M. from a Portland radio station employee, Frank Cooley. He and many of his co-workers saw disc-shaped objects from the windows of the International News Service office in the Journal building. [6] Don Metcalfe, an employee at the nearby Oaks Amusement Park saw the same discs. His superintendent, William LeRoy, also saw them and made a report to police. [7]

Five minutes later a Portland policeman, Kenneth McDowell, had a sighting. While feeding pigeons behind Precinct House No. 1, he became surprised to see them suddenly startled away. McDowell looked up and to his

amazement observed five large oscillating discs, two going south, three east. They were traveling at a high rate of speed and looked like nothing he had seen before.

This prompted an all-car police alert to report any aerial objects. Five minutes later the first of many responses came back into headquarters. [8] At 1:10 P.M., for example, two Portland policemen in car 82 near Oaks Amusement Park, Walter A. Lissy and Andrew Fox, who were both civilian pilots and WWII veterans, reported six or seven "flat, round discs. They were flying at terrific speed in a straight-line formation" headed south within 30 seconds of one another. Lissy said they zig-zagged and made turns so sharp that he knew they could not be aircraft. Each of the objects headed east over the park at great height estimated as high as 40,000 feet. No engine noises or vapor trails were noted, but they did see "flashes" of light. The last disc "fluttered rapidly to the side in an arc" and they all appeared white against the clear blue sky. [9] In Car 13 officer Earl Patterson, at SE 82nd and Foster Road (three miles from Lissy), saw something too. He reported an "oval whitish aluminum-colored object" coming out of the west heading southwest at terrific speed at about 30,000 feet. Patterson, who was a former Army Air Force veteran, stated that it resembled no plane he had ever seen. 10

Then harbor patrolman, Captain K.A. Prehn, boat pilot A.T. Austad, and patrolman Kent C. Hoff reported to Portland police headquarters that they had seen three to six oscillating, flashing discs. These were described as being "shaped like chrome hubcaps" traveling very fast and high at about 10,000 feet toward the south over the Globe Mills. The men were uncertain of the exact number of objects because the flashes from the objects were so bright that they could not stand to stare at them. They did agree that the objects wobbled and oscillated as they flew with turning and weaving motions. [11]

Numerous Portland citizens also reported sightings. At 2:00 P.M. "metallic discs glinting in the sunlight" were seen across the Williamette River near the Rose Island bridge. Picnickers and a woman pilot saw silvery "spinning discs." One woman at 4:30 P.M. described viewing an object like "a new dime flipping around" over the Sandy District. Two white or silver objects flew over Portland at 4:58 P.M. heading southeast, and a third passed over at 5:30 P.M. KOIN radio station employee, Frank Cooley, a former Marine Corps observer, confirmed numerous disc sightings

around Portland throughout the day. Cooley, as stated, saw a formation of twelve discs himself as high as 20,000 feet at 1:00 P.M. He declared that they were "operated and

maneuverable devices," indicating that the objects were larger than many believed. He continued: "They plainly experienced maneuvers in the sky. . . At one time a number of the discs would get into formation and fly circles around another disc. It was hard to follow their behavior exactly because of the great height, their gleaming surface and their nature." [12]

In Milwaukie, Oregon, (due south of Portland) three discs in a line formation were observed flying in a northeasterly direction by State Police Sergeant Claude Cross during that 1:00 P.M. flurry of sightings. Also across the Columbia River from Portland near Vancouver, Washington, Clark County Sheriffs Deputies John Sullivan, Clarence McKay, and Fred Krives reported up to 30 such flying objects. Their sightings (which actually involved eight deputies but not Krives) began after hearing reports of flying discs broadcast on the police radio. The deputies then went outside of the sheriffs headquarters to have a look for themselves and soon caught sight of "round" objects flying over high and fast in a straight line toward the west and south. As they passed, a low humming noise could be detected. Witnesses told the International News Service that "they were there and no mistake about that." [13] They explained that the objects appeared in the southwest over the courthouse heading southwest at about 1,000 feet. The deputies saw numerous flights of discs—the first of which had seven objects in it. The tail end of that formation split off the main line to form a separate group rising above the others. They were described as disc-shaped with speeds approximating an aircraft. [14]

To date no has been able to determine exactly what all of these Portland and Washington State sightings represented. It should be noted, however, a flight of B-29 bombers followed by group of P-80 jet fighters did fly over Portland just before 1:00 P.M. at high altitude. Later, Army Air Force investigators made an assumption that they may have dropped "chaff strips of aluminum foil which were used in exercises and during wartime to jam enemy radar. This, in fact, may not be too far-fetched of an explanation as Burl Nolisch of 6604 North Burrage Street did tell reporters that day that he saw an aircraft fly over at 1:00. He mentioned this fact only because he saw pieces of aluminum foil swirling around afterwards—assuming they may have been dropped by the aircraft. [15]

Elsewhere in the country that afternoon at 3:00 P.M. MST, 38 miles south of Great Falls, Montana, Mr. and Mrs. Curt Dennis were enjoying the holiday by fishing off a bridge. Then, as in so many other cases, they were attracted by a flash in the sky. Above them twelve silver-colored objects flew over in a

single file formation headed northwest. [16] On the Sacramento River near Broderick, California, another family was enjoying a picnic when a shiny disc appeared far above. Mrs. Clarence Henn and her son, Robert, commented at the time that whatever it was, its surface must have had a highly polished finish to reflect the sun so brightly. When the object did leave, it did not gradually move out of view, but just vanished. [17] In Pocatello, Idaho, that afternoon R.A. Seymour observed seven high-flying star-shaped or spoked discs revolving around their own axis. They moved in steady flight,

about four times the speed of a conventional aircraft. [18] In Richland, Washington, Mrs. Nordman saw a similar "flying disc" zoom northeast with a "turning motion." She commented that it was only by chance that she glanced up to see it—indicating the craft emitted no noise [19]

Two separate disc sightings came at 6:20 P.M. EST from Charleston, South Carolina, then one from T.L. Huckaby in Pine Bluff, Arkansas, describing a grayish "wash tub" shaped object. Also in Arkansas, near Fayetteville, farmer Henry Seay had his livestock badly spooked by three low flying yellow discs. [20] In Santa Monica, California, at 5:00 P.M. PST pilot Dan J. Whelan and another flyer, Duncan Underbill, witnessed a "flying saucer" 40 to 50 feet in diameter "catapulting across the sky" at about 450 to 500 miles per hour toward the northwest on a steady course at 7,000 feet. [21] After a similar report from Mr. Nova Hart near St. Louis, one came from the Clark County Building Inspector of Las Vegas, Nevada, O.J. Morling. He stated that he and his wife saw up to two dozen "discs" pass over in a loose formation. They estimated the objects were traveling at about 100 miles per hour, at 500 feet of altitude heading toward the northeast.

Private pilot Raymond Harris also saw saucers over Nevada. From his 150 Voyager he and a friend observed five discs below them—so bright they were hard to look at. He turned his aircraft to give chase but could not intercept the saucers which were zipping off toward the southwest. After the incident he described the objects to his father, a deputy sheriff, as circular and brilliant. [22]

Around twilight at 5:30 P.M. PST while near his home in the Seattle

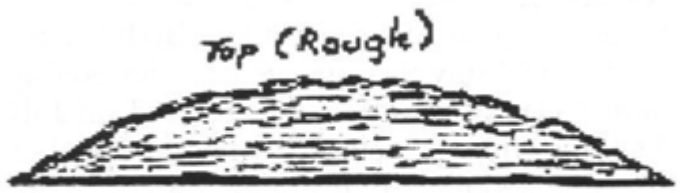
suburb of Lake City, Coast Guardsman Yeoman Frank Ryman captured a saucer on film. Initially he spotted it at a fair distance away, flying over the north end of Lake Washington. Before taking the photo he had a chance to view the disc through binoculars and estimated it to be traveling northward at about 10,000 feet - - - somewhere around 500 miles per hour. At least twenty other individuals watched with Ryman as he lowered his field glasses and replaced them with a camera. His photos were developed at the local military intelligence office but showed only a sharp point of light. The military attributed the image to a balloon, but the report, and its supporting evidence, is claimed to have been lost. [23] (Two other independent sets of observers in other parts of Seattle reported seeing multiple discs about a half an hour before Ryman took his photos.) [24]

That night an incident occurred which was second only to Arnold's sighting in terms of media coverage. Captain E.J. Smith and First Officer Ralph Stevens of United Airlines Flight 105 were the chief witnesses. Shortly after takeoff from Boise's Gowan Field at 9:04 P.M. MST, they observed from their DC-3 airliner five discs "silhouetted against the sunset in a loose formation." When Smith asked Stewardess Marty Morrow to come forward, she confirmed the observation. Ironically, before the crew boarded the plane, someone had asked them if they had seen any flying saucers—as the disc sightings were by then starting to receive more and more publicity. Smith snapped back with a smile that, "I'll believe them when I see them."

In that dark cockpit Smith remembered his famous last words as they watched the mysterious sight for several minutes as four more discs joined the group just as the original five faded from sight. The second group flew in a straight line formation of three together with the fourth one off by itself. Smith said "this group seemed to be higher than our flight path," [then at 7,000 feet] "and when they did leave, they left fast!"

The sightings lasted twelve minutes and covered 45 miles as the unknown objects moved in a northwesterly direction across Idaho. At one point Smith recalled that it looked almost as if some of the discs merged together. Reaching a cruising altitude of 8,000 feet, Smith had attempted to close in for a better look as the discs neared Oregon but could not attain an airspeed much above 185 miles

per hour. At that point he contacted the nearest observer he could reach—the radio tower at Ontario, Oregon. The attendant there could not see anything, yet neither could the pilots by that point. The objects had suddenly sped out of the area at tremendous speed. [25]



This sketch depicts the only details the crew could definitely give to Intelligence officers—thin oval craft "smooth on the bottom and rough on top." Smith told the International News Service that the mysterious objects "were as big as an airplane but definitely were not aircraft." This sighting ended up in Air Force files as the third of nine in 1947 records to receive the sparingly-given designation "unidentified." Known as the United Airlines Flight 105 Case, it was second in fame only to the Kenneth Arnold Sighting during 1947. This would be only the first of four cases involving United Airline flights over the following six weeks.

Captain Smith and Stewardess Marty Morrow.

54. Alfred Loedding and The Great Flying Saucer Wave of 1947

The news media was already waiting at Pendleton for a scheduled landing of the plane because many people had overheard the radio transmissions back and forth between Ontario tower and Flight 105. As a result, the story became an immediate sensation. Both Naval Intelligence and Brown and Davidson from Army Intelligence interviewed Captain Smith.

The Brown and Davidson interview occurred on July 12th just after they had finished talking with Kenneth Arnold at the Hotel Owyhee about his incident. Arnold then invited them to his home for coffee and sherbet. While at Arnold's house they heard Smith was in Boise for a layover, so they all went out to the airport to talk to Smith and were joined by Dave Johnson from the Boise Evening Statesman.

Alfred Loedding probably would not have had the fine details of the interview via the Fourth Air Force until several months later. Coordination until at least September of 1947 was very haphazard, not only between the 4th AAF but with Dayton and Washington. Yet, because he was a Pentagon liaison, Loedding probably knew more at any one given time that summer than any single group doing investigations. Edward Ruppelt later wrote about those days:

> **At first there was no co-ordinated effort to collect data on the UFO reports. Leads would come from radio reports or newspaper items. Military intelligence agencies outside of ATIC [Dayton] were hesitant to investigate on their own initiative because, as is so typical of the military, they lacked specific orders.**
>
> **When no orders were forthcoming, they took this to mean that the military had no interest in UFO's. But before long this placid attitude changed, and drastically. Classified orders came down to investigate all UFO sightings. Get every detail and send it directly to Wright Field. The order j carried no explanation as to why the information was wanted.**
>
> **This lack of an explanation and the fact the information was to be sent directly to a high-powered**

intelligence group within Air Force Headquarters stirred the imagination of every potential cloak-and-dagger man in the military intelligence system. Intelligence people in the field who had previously been free with opinions now clammed up tight. [26]

On that same night the manager of the Idaho United Press and a fifteen-year veteran reporter, John C. Corlett, had a sighting that seemed to confirm the presence of something strange near Right 105.

While relaxing at home in his garden, he and his wife with their dinner guests, famed Boise artist V.H. Selby and his wife, all had a disc sighting. It occurred around the same time as Captain Smith's encounter when the couples observed a white disc zoom across the sky in a matter of just seconds. The object came from the northwest and traveled southeast as it passed

silently overhead at an altitude of about 10,000 feet in a clear sky. [27]

Earlier that afternoon in Idaho, disc activity had been observed near the Twin Falls area. [28] Between 2:30 P.M. MST and 3:10 P.M. three groups of discs ranging from twenty to nine objects were seen by over sixty persons enjoying the 4th of July celebrations in the local park of Twin Falls. [29] At 7:00 P.M. PST as many as 200 people observed a disc at Hauser Lake, Idaho, just a few miles northeast of Spokane. George Aster described that event, stating, "I pointed it out to the others and they all stood around and followed it for about 30 minutes while it hovered at about ten degrees above the horizon." The witness saw the craft while celebrating the holiday at the lake and agreed that it must have hovered at about 20,000 feet until an aircraft came into the area and all of a sudden it shot straight up into the sky and vanished in "a fraction of a second."

Observers gave a host of physical descriptions ranging from a shiny aluminum disc-shaped craft to having the appearance of a silver dollar approximately 30 feet across. UFO researcher Dr. James McDonald tracked down George Aster in 1967 and confirmed the details of this remarkable event. He also learned from the interview that while the disc had hovered, it slightly wobbled. Aster said that this behavior completely discounted in his mind the possibility the object was an aircraft—due to these peculiar lateral oscillations. [30]

The Independence Day Sightings may have just been due to mass hysteria. Although contrary to popular belief, many people who reported "flying saucers" on the 4th had not yet heard the term. Soon, however, the phrase would become a household word as hundreds started seeing an onslaught of flying saucers.

Saturday 5 July

UFOs proved even more persistent the day following the Independence Day Sightings. In Augusta, Maine, at 1:15 P.M. EST dozens of reports came into the Civil Aeronautical Administration describing unidentifiable flying objects over the city—all heading in a northerly direction. Dan Kelly, program director at the local radio station WRDO, personally saw twelve of the discs.

By 8:00 A.M. PST on the other side of the country in Sacramento, California, Dr. A.K. Carr had

a remarkable sighting of two disc which may have been seen by others shortly afterwards. The local newspaper detailed this his sighting:

> **They came in from the west, Dr. Carr said, one was at about 10,000 feet, I would say and the other was traveling at about 10,000 feet, I would say and the other was traveling at tremendous speed at about 5,000 to 6,000 feet. We could see streams of vapor behind them. The lower one continued in an easterly direction, but the other, which I was observing through 12 power field glasses, banked sharply over the city and flew north. It seemed to stand on one edge as it turned.** [31]

Just 30 minutes later two similar discs were seen far to the south near Dana Point, California, by Mr. and Mrs. John K. Street. Street was an insurance company executive and he and his wife were spending the weekend at the beach side town enjoying the long holiday. At the time of the incident they were sight seeing just a few miles inland at the Capistrano Mission. Mr. and Mrs. Street described the objects they saw as two "saucer-like" craft which slowly flew up the canyon from the beach in a northerly direction toward the Capistrano Mission. [32]

Then about 50 miles north northwest of Dana Point two discs were once again seen by a third independent witness over Eagle Rock, California. Donald Levine, ten years old at the time, described them as yellowish and traveling at a high rate of speed flying straight toward the north. [33] About that same time a fourth observer just a few miles north of Eagle Rock saw disc-like objects over Glendale, California. In that case, however, observer Donald Dwiggins reported seeing four discs which changed shape and flew at 8,000 to 9,000 feet. [34]

A series of sightings occurred in Washington State around Spokane and Seattle that also involved independent observations of similar flying objects

between 10:45 and 11:00 A.M. PST. [35] In Covington, Kentucky, that afternoon, two women described seeing a flying saucer with "legs." Interestingly, that same day a Chicago woman reported an identical feature on a flying disc, stating: "it had legs." [36]

In Bethesda, Maryland, Jack LaBous, a visual artist, saw a very unusual flying object. He said it looked like a dome with an antenna protruding from beneath. This is of note because a Sioux Falls man described seeing an identical sort of disc the next day — also describing some sort of pole-like appendage sticking out of the bottom of the craft. [37]

Other reports on the 5th came from St. John, New Brunswick; Sherbrooke, Quebec; Port Huron, Michigan; Anaconda, Montana; Hollywood, California; Waterloo, Iowa; Akron and Cincinnati, Ohio; Portland, Oregon; South Bend and Huntington, Indiana; New Orleans, Louisiana; Albuquerque, New Mexico; Denver, Colorado; Seattle, Washington (where a "flying football" appeared); Wisconsin, Minnesota, Maryland, Connecticut, Utah, and Chicago, Illinois. [38]

Of special interest, around 11:00 A.M. PST in San Jose, California, Sergeant Charles R. Sigala of the Army Air Force said he and three others observed a "silvery" flying disc near his home. Sigala was on leave from Hamilton Field at the time and saw the object fly by in clear view. It circled around over some nearby mountains at about 5,000 feet, dipped several times, and then headed toward the sea. Sigala estimated the object to be as large as an automobile. [39] Further north in Albany, Oregon, at 3:20 P.M. PST ex-sailor Ted Tannish and his friend Bill Lemon observed a similar circular-shaped object rapidly flying south. They then watched it slow down before heading northward — finally disappearing into a cloud bank. [40]

At 7:00 P.M. EST TWA pilot Captain John L. Dobberteen and First Officer Frank Corwin, observed a strange looking object while over Neapolis, Ohio. They were on a ferrying mission from

the East Coast with an empty airliner at about 4,000 feet when the unknown object came into sight. Both pilots described it as a "whirling fan blade" about the size of a small private plane and moving at an estimated speed of 200 miles per hour. The Captain stated that it definitely resembled no plane or auto gyro he had ever seen and felt it may have resembled a flying disc if seen from the ground.

Dobberteen deviated slightly off course and followed it for a short time before correcting back to a heading for their destination in Chicago. After landing Dobberteen made a point of reporting the incident to air traffic control as the event had occurred in commercial air lane space and he feared that the mysterious object may pose a hazard. [41]

At sunset, two miles north of Fayetteville, Arkansas, Henry Seay (who had a sighting the night before) claimed he saw a ten to twelve foot wide luminous disc briefly land on his farm! Very conservative and set in his ways, Seay described the event to UFO researcher Dr. James McDonald years later.

He had been driving his cattle toward the barn for milking at the time. As he moved them up a road leading to the milking barn, a disc-like object flew over him and showered down an array of sparks. The sparks landed on Seay's bare arms but did not burn. The whole incident, however, badly frightened his cattle. For the next ten minutes Seay scurried around attempting to gather them up—being more concerned about his livestock than looking at the bothersome disc. Finally getting them rounded up to drive back toward the barn, he saw the disc again. This time it had touched down between him and the barn at a distance of 200 yards across the pasture. As he gazed at the object Seay could discern a round flattened shape that was luminous but not too blinding to look at—just too bright to clearly make out any distinct edges. Within seconds the craft silently rose up vertically to almost 40 feet and zoomed off horizontally at a speed around 50 miles an hour. As it did so, it again dropped a shower of sparks which fell to the ground but did not seem to damage his nearby oat field. Only ashes were evident from the event and Seay could not even find a mark on the ground to prove where the disc had landed. Yet, like the night before, his cattle remained badly spooked by the whole event. [42]

We know that Alfred Loedding was investigating such landing cases by at least 1948—the files of which have never been released by the Air Force. [43] But there is no indication Mr. Seay was ever contacted by anyone other than Dr. McDonald, although Seay did say his neighbors saw the disc too.

That night at 10:30 P.M. EST many Canadian residents of Wallaceburg, Ontario, observed two large formations of luminous discs traversing a wide area of the nighttime sky. [44] Back east in Shrewsbury, Massachusetts, Mrs. Jessie F. Willis reported that she saw eight blue flying discs heading in a northerly direction about 7:30 P.M. EST. She then observed others in groups of

twos and threes. [45] By 9:30 P.M. MST Mrs. Shirley Hefferon and her sister Lois Mae Gadbaw of Butte, Montana, saw several strange craft pass overhead in a northerly direction. [46] At 10:00 P.M. MST lights were reported on the horizon by Evanston, Wyoming, residents but these may have been attributed to searchlight beams from the fairgrounds in Salt Lake City. [47] By 9:45 P.M. EST Mrs. Scott Jones, daughter, and children witnessed a "shooting star" turn and float toward the Phillips

Packing Company in Cambridge, Maryland. It then turned again in an opposite direction. [48] Around 10:00 or 10:30 P.M. PST in Longview, Washington, Mrs. Margaret Carter told of seeing a spherical, aluminum-colored object in the southwestern skies headed northwest." The object "dipped" several times while it was in view for up to five minutes. [49]

In Norwalk, Ohio, that night two Huron County farm families saw saucers. They noted that "one disc over-lapped the other and traveled in the opposite circular directions." [50] At 12:23 A.M. EST the next morning, a sighting occurred in Paterson, New Jersey. Across the country John Neisswanger of Eugene, Oregon, was returning home on a dark and lonely road about 12:30 P.M. MST. Suddenly, he became startled by a slowly-moving aerial object. His description compared it to a child's drawing of the sun with lines around it. He then stopped the car, and he and his wife and another passenger watched the weird phenomenon until it passed. [51]

Sunday 6 July

By the end of the long three-day holiday, flying saucer incidents were still increasing in number. That Sunday morning began with one of the most unique cases for the year. Following is a complete account by the witness of a remarkable UFO encounter in Omaha, Nebraska:

> **Although I am in the greatest of hurries, being on my way to Omaha to go to the bedside of a sick relative, I must hasten to write you a few lines to describe an incident that took place only a little while ago. My boy and I have been driving steadily since we left Seattle yesterday, and came into this city only a little over an hour ago. It was just daylight, and as we drove down Main street, I happened to glance down one side, and saw a disc about the size of a farm wagon wheel float lightly to the middle of the street, and come to a stop. Instantly I put on my brakes, but I had to back up to get**

> **into the street where this thing lit. It stopped for only a few seconds, but I did get a good look at it, for it was only about 30 yards away, and almost still. It was not a saucer, but a disk. This was surrounded by a tube that had an enlarged opening at one end, like a funnel, and ended in a tapered point at the other. In the middle of the disk I could make out a bulge, as if a plate had been welded on the disk, and there were two narrow strips of metal running almost parallel to each other above and below the midsection.**
>
> **I started to get out of the car thinking that this queer object would fall over and give a chance to examine it closer, but something was holding it up. Something held it upright, and then the strangest thing took place. The disk was being subjected to a number of short jerks, moving forward each time a foot or two. The funnel part of the tube was set into the disk's rim so that the latter could roll freely, and after moving a distance of about 20 yards it rose easily and began at once to climb. I thought for that it was transparent, but no, that was due to the reflection of the light. The sun was not yet up, but this shimmering effect marked the upward climb of the disk. Once it seemed to stand still in midair, spinning rapidly, then it veered of [sic] to what I would say must have been northeast, and soon disappeared from view.**
>
> **The entire incident lasted only about forty seconds. I went over and examined the place where it had landed, but it seemed to have touched the ground so lightly that it left no mark. I am convinced beyond doubt that the disk's flight was controlled, that it gave out signals indicating its position, and also that it is harmless.** [52]

About 6:00 A.M. EST that day near Miami, Florida, multiple unidentified aircraft were seen. Observers, Fred Walsh and his wife described them as "round, silver objects which were about ten to fifteen feet across." Those UFOs first appeared out of the Everglades and headed due south. [53] At 9:30 A.M. one disc appearing larger than an airliner flew over Tampa, Florida, headed southeast. [54] Then by 10:00 A.M. CST a similar disc was seen over Alexandria, Louisiana. In that case four people tracked the unusual aerial object heading northwest. [55] Four discs were seen about that time

over New Orleans by US Army private Robert G. Hellman on leave from Camp Bliss. Hellman was on his way to his hotel room that morning when he spotted the discs high above Canal Street. He described them as flashing whirling colored saucers, pink and silver in appearance—flying in a V formation on a steady course. [56] And around that time of day sightings of more than one disc came out of Texas. [57]

Further west at 8:20 A.M. PST a veteran World War I pilot, Frank Tylman and his son, saw a disc shaped object while driving two miles west of Pittsburgh, California. Tylman sated that "It was shooting toward Mount Diablo. . . It revolved in a counter-clockwise direction, as we viewed it." Tylman estimated the height of the object at about 3,000 feet and definitely moving "faster than jet planes," although he did state that it approximated the size of a P-80 jet.

The object appeared "circular" and "it had a definite thickness, being curved outward on both upper and lower surfaces." He went on explaining that unlike an aircraft, it left no smoke or vapor nor made any sound that could have been heard above the noise of his own car and the wind. The sighting lasted only 30 seconds as the disc soon disappeared into the southern horizon. [58]

As that notable day went on, eight saucers were seen near a mountain in Washington State and Francis Howell claimed one "landed" very briefly near Tempe, Arizona. [59] The military apparently collected a file on this particular incident, but researchers found only an empty file folder when allowed to review Air Force records on UFOs in the late 1960s. By 1976 when those files had been turned over to the National Archives, no indication of any kind remained that this sighting had ever been investigated. After talking to Alfred Loedding's son Donald, it is believed this may have been one of the "landing cases" he remembers his father talking about. 60

Earlier that morning at 10:00 A.M. MST well known University of Arizona football coach Niles (Mike) Casteel had reported seeing a flying disc pass over Tucson, Arizona. This same object was reported by Wallace B. Magness of the Air Materiel Command from Davis Monthan AAFB. When describing the incident to UFO researcher James McDonald in 1967, Magness characterized the object he saw as a round light—brighter than he had ever seen before. [61] Also in Tucson the same day, a highly respected attorney, Joseph Hendron, and his wife observed three "silver colored discs" fly over at about 5:00 P.M. Three other Tucson witnesses reported discs just 30 minutes before. Among them, was Walter Laos who estimated their speed at 200 miles per hour and altitude between 5,000 to 6,000 feet. [62] (Laos had an earlier sighting on June 22nd.)

Arizona is also of note because on the evening of the 6th a series of strange sightings began in Tucson describing large discs accompanied by a

group of smaller objects. These were seen to merge with, and later separate from, the larger "parent craft." Amazingly, these same types of observations then moved clockwise around the circumference of the United States until almost the same time the following night. Cities accounting for sightings of "companion ships" associated with larger "mother discs" included Palmdale, California; Tacoma, Washington; Cicero, Illinois; and Manchester, Maine. [63]

Jumping back into the chronology of July 6th, at 1:00 P.M. Paul R. Bates, a passenger on an

airliner ten miles southeast of Boise, Idaho, witnessed a "flying saucer" flash against a mountainous background. He called a stewardess, who ran back to try to see it, but by that point the craft had disappeared to the southwest. [64]

Only forty-five minutes later, at 1:45 P.M CST, an Army Air Force B-25 crew reported a similar sight during a flight from Ogden, Utah. It became one of the few incidents where a UFO was seen from above. Their plane was 100 miles west of Kansas City, Missouri, at 10,000 feet when the pilot, Archie B. Browning, caught sight of a very bright object. He described it as "shaped like the top of a water tank"—some 30 to 35 feet in diameter. Weather conditions were clear with unlimited visibility when the disc first came into view ten miles ahead and below the left side of the B-25. The UFO may have initially been hovering because as the pilot closed to within one or two miles, the disc began to parallel their eastward bound course and speed of 210 miles per hour. Browning turned toward the strange craft, which was climbing to 11,000 feet. Yet, just at that moment, it accelerated off at great srjeed and virtually disappeared.

Although this report found its way into numerous Air Force files and was periodically commented on over the years, it did not receive an unidentified classification. Today the case has a notation on it attributing the event to a possible "reflection." Actually many such cases were earmarked with astronomical or meteorological explanations simply because Air Force consulting astrophysicist Dr. J. Alien Hynek, hired in 1948, would make comments to that effect on the case files he reviewed for the military.

In other words, remarks of his alluding to only one possible explanation were often seized on to complete the paperwork on an open case file. It is quite true that in those early years Dr. Hynek did not believe that there was much to the disc sightings. He, in fact, felt it could all be attributed to simple "post-war nerves." But his rather careless examination of the early cases was not due to any intentional debunking on his part or conspiracy on the military's behalf. Unfortunately we have no real knowledge of the interaction between Hynek and Loedding. Loedding entered the picture before Hynek but

obviously would have been used to brief him once the Air Force contracted for his consultations. Hynek's overall role during the early days of UFO investigations, in retrospect, seems minor.

Yet it must be kept in mind that many of these sightings from early July were never investigated by the military—less than three to five percent. [65] There were simply too many to ever be tracked down and studied. For example, numerous sightings were reported around different areas of the country that day which at best were only gleaned through newspaper accounts by Loedding and other investigators. This is regrettable because some, like the following, occurred around the same time of day. These may have been proved to be connected in some way if they had been investigated as a whole. The best of these sightings took place from an aircraft around 2:30 to 3:00 P.M. MST over Colorado and Kansas and is detailed by the Bartlesville, Oklahoma, Daily Enterprise:

> **John Phillips, Jr., of Phillips Petroleum aviation department and Henry Barbarick, company pilot, were flying at 10,000 to 12,000 feet. "Phillips who was piloting the plane saw the first 'flying saucer.' He yelled to Barbarick who was reading maps, but Barbarick said the 'saucer' went by so fast that he was unable to see it.**
>
> **A few minutes later Phillips saw another one of the strange flying objects which he said looked like a large 'hangar door' on the horizon but again Barbarick was unable to catch sight of it.**
>
> **A moment later another appeared in front of the plane and then shot up and over the plane, and this time Barbarick caught sight of the object.**

Phillips said that at least nine of the 'saucers' [appeared] in a space of fifteen minutes. Both men said the discs were flying at such a tremendous rate of speed that they were unable to get a good look at them. They tried unsuccessfully to clock them once when one flashed by. Phillips turned the plane to get a better look at it, but it had disappeared by the time the plane came around.

Phillips said the discs varied in size of a small plane up to a large transport. He said they looked saucer shaped with the front tilted up. He said they were definitely made of metal, since they glistened like silver in the sun. They appeared to be revolving, he said.

Barbarick said that it gave you a feeling "like someone was shooting flak at you." 66

Also in that area of the country at 2:45 P.M. MST a metallic disc moving very fast was spotted over Denver, Colorado, while one appeared at the same time over south central Wyoming. 67 Fifteen minutes later and 100 miles to the

north at 3:00 P.M. MST Casper, Wyoming, residents Mr. and Mrs. G.W. Gibson had a sighting of a single glittering disc. 68 Simultaneously, a very fast disc appeared over Santa Rosa, California. Observers Calvin McEntire and his brother Jack thought it to be the fastest thing that they had ever seen. 69 Four other sightings of a single metallic disc took place in California around that same time in Long Beach, Mill Valley, Hamilton Field, and Fairfield-Suisun ArmyAFB. 70

The incident at the Fairfield-Suisun base involved Army Air Force Captain James H. Burniston and his wife who spotted from their back yard an object traveling three quarters of the way across the sky in a matter of only 60 seconds. He noted an oscillating motion to the mysterious craft as it traveled in a southeasterly direction at about 10,000 feet, rolling from side to side three times, with one side strongly reflecting the sun. As it rolled it became harder to see, suggesting the object was thinner in one dimension than the other. Its j size was compared to a DC-3 and because of other aircraft noises in the j vicinity, Burniston could not ascertain if the object emitted any noticeable -j sound. This case did end up in Air Force records and became considered by j investigators like Loedding to be one of the truly unexplained cases. To this day it remains officially stamped unidentified in Air Force Files. 71

At 3:00 P.M. EST a Clearwater, Florida, woman reported "tumbling objects that looked like pie pans traveling very high in the air and at a very fast rate of speed." As the discs passed over on a west to southeast course, "trees bowed" from a strong gust of wind assumed to be caused by their passing. 72 At 4:00 P.M. CST, twelve people in Throckmorton, Texas, saw a disc that produced a "sizzling noise." 73

An hour and a half later in Emporia, Kansas, a silent UFO shaped like a dirigible "floated" low over a wheat field. This object approached three women working in the field from the south, but then veered off slowly toward the southwest. 74 Only half an hour later at 6:00 P.M. EST two shiny disc-shaped objects zoomed over Cincinnati, Ohio, traveling south to north 75

Proving to be the busiest day to date, the saucers' activities even made the front page of the New York Times and would do so for the next three days. UFOs also drew the attention of the military who had Army, Navy, and

National Guard aircraft patrolling the Pacific coast regions for flying discs despite what some

officials feared were low fuel reserves. [76]

At Manhattan Beach, California, A.W. McKelvey flew a P-51 fighter on patrol over Van Nuys at 35,000 feet. Five P-51s of the Oregon National Guard cruised the Cascade Mountains and a sixth over Portland—all without success. A new P-80 jet fighter at Muroc Army Air Field and six P-51s at Portland stood ready, but no sightings occurred. [77] An Air National Guard air unit at Sioux Falls, North Dakota, had a little more excitement when a report came in of a "silvery disc with a short tail." One of its pilots on patrol that afternoon received the call to intercept, but he could not locate the UFO. Back in the northwest, the Oregon Guard put eight P-51s in the air and three A-26 bombers armed with telescopic cameras. General Irving O. Schaefer of Colorado's Air National Guard told reporters that he had his fighter planes on ;; standby ready to make an intercept at a moment's notice. [78]

Military intelligence units also began to meaningfully enter the scene, making files on some sightings and even conducting a few low level investigations. [79] On that day the Army Air Force intelligence group under the Air Materiel Command in Dayton, Ohio, did feel the need to make a statement to the press, but could only say it had not collected any "reputable information." [80] (Loedding at this early date may have not even been consulted about the sightings.) Then, for some reason, Major General Curtis E. LeMay made a statement. LeMay had been the famed leader of the strategic bombing campaign of Japan but by then headed up research and development of all new technology at the Pentagon for the Army. He gave no real insight to military thinking on the phenomenon, simply stressing that the reports were nothing to worry about. [81] Thus, by July 6th, it is still too early to document Alfred Loedding as being involved in any meaningful way with the disc inquiries. However that would soon change.

Anyone involved with military matters that weekend would have been very curious about all the reports which continued coming in on the 6th. By evening a disc appeared over Beverly, Massachusetts. That night in Massachusetts two very similar discs were seen in Wenham. [82] At 5:15 P.M. EST Patrolman Frederick Schlauch of the Elizabeth, New Jersey, police department told of seeing two "shiny objects" flying toward the northeast.

He had just finished changing a tire when he caught sight of the objects. Schlauch stated that they were very shiny and moved erratically. Schlauch compared them to "chrome plates" which were "diving in a fluttery fashion." He estimated the speed of the objects close to that of a fighter plane—around 400 miles per hour but stressed they "were not planes." [83]

In Washington D.C. at 8:40 P.M. EST, former Army flying Cadet Hazen Kennedy glimpsed an "orange-colored" object flying at 1,000 to 1,500 feet moving at over 1,000 miles per hour. [84] In Rochester, New York, at 8:30 P.M. EST Mr. and Mrs. Kenneth Ohley observed from their back yard a white disc "zipping" eastward. [85] A man in Glen Falls had a similar sighting but noted red and blue fire-like lights on the object that he had seen. [86] In Valley Stream, New York that evening John Heathcote, fourteen years of age, saw three "plate-like" objects flying in a V formation toward the west. [87]

The night's activities continued with a sighting in Missouri at 6:00 P.M. CST near Mound City, when a Mr. and Mrs. Dunn and their children were taking a car ride with Mr. and Mrs. J.W. Hendrix and their children. The couples spotted what they described as a flying saucer about three to four miles east of Mound City. They then pulled off the road and Mrs. Hendrix noted that it had a silver hue and seemed to be of good size as it passed slowly toward the west. But after about five minutes an aircraft came into the area from the northeast causing the saucer to suddenly change direction and

head off rapidly to the north.

Thirty miles away in Industrial City Mr. and Mrs. George Painter reported seeing through field glasses an odd object traveling very quickly to the east at high altitude. It looked like a shiny light from the ground, but aided by his binoculars Mr. Painter could make out a disc surrounded by "a dark shadow-like haze." Around 7:00 P.M. W.C. Miller of St. Joseph and five other persons observed a bright flying disc very high in the sky traveling in a southwesterly direction. They had it in sight for about two and a half minutes. Around that same time the J.E. Johnson family of the 2900 block of Jule Street reported a flying saucer traveling over from the northeast to the southwest. It remained in sight for about five minutes. [88] The C.D. Frank

family and Ernest Smith and his wife also saw a silver disc while driving south of St. Joseph at 7:00 P.M. [89]

At 7:45 P.M. Dr. Walter Hoefer, with his son and daughter, reported seeing six round oval objects flying just west of St. Louis. Mr. Hoefer stated that they silently flew south at a very high altitude. He was able to run and grab his binoculars before they were out of sight. With the aid of the field glasses he noted a light spot in the center of the objects. [90]

At that same time several miles away in Shrewsbury, Mr. and Mrs. George Willson and their daughter and Mr. and Mrs. Charles Downs reported seeing two groups of three discs zooming eastward. [91] Just to the east in St. Louis, Mrs. N.P. McDonald and her daughter Nancy and Mrs. Walter Simonds at Scanlon Avenue saw an eastward bound flight of six objects in two groups of three each. [92] Another St. Louis resident, Miss Lois Bogner, confirmed the same sight from Sutherland Avenue as did Leonard Coleman and his sister from another part of town at Pershing Avenue. [93] Finally, in Ferguson, Missouri, William A. Good and his wife saw a disc at that same hour. [94]

At 8::55 P.M. CST Staff Sergeant Ira L. Livingston in Birmingham, Alabama, reported that he and his neighbor, Herman M. Sockwell, and others noticed a round object in the western sky heading south in an arched flight path. After it passed, they observed six more, one at a time, traversing the same course. Livingston, who had 250 hours as a pilot and aerial gunner, estimated that the objects were traveling 500 to 600 miles per hour at around 2,000 feet with a dim glow.

The Air Force file detailing Livingston's sighting fails to make any mention of the vast multitude of other sightings simultaneously going on around the city and in that whole area of the country like those from Missouri. In fact, hundreds of other Birmingham residents observed discs as the local radio station logged as many as 400 calls on the strange lights between 8:00 and 9:00 P.M. [95] One Birmingham witness, Marvin Pharo, said the objects steadily increased in numbers and seemed to "go over the mountain" to the south. J.H. Chatham, a state mine inspector, along with his neighbors, described seeing "egg-shaped" fluorescent discs flying "fairly low against the mountain" outside of Birmingham.

68. Alfred Loedding and The Great Flying Saucer Wave of 1947

Other city residents like Mr. and Mrs. J.R. Martin described them as "saucer-like." Miss Connie Murdock on 512 South 10th Court Street observed nine objects that she could only characterize as

"like gobs of light moving around in the sky." [96] Robert Crossland of the Birmingham Age-Herald captured two photographs of the strange objects. Army Intelligence did analyze the photos and agreed with professional Birmingham photographers that it represented "an actual image of the mysterious discs." [97]

Others back in St. Louis, Missouri, may have had still more sightings up to 8:00 P.M. CST. [98] As late as 9:30 P.M. at least one more Missouri report came in 50 miles to the south of St. Joseph. Filed to newspapers by S.D. Wilson of Independence, he told of spotting a "row of saucers" flying in single file in a northerly direction over Gardner Lake. They traveled at a high rate of speed in a straight line. Each appeared to have a bright light on their undersides. [99]

Aside from the various accounts of the disc sightings, the national media via the newspapers and radio were also running stories by the 6th on possible explanations for the phenomena. Many theories were expressed including a possible link to nuclear testing and even a suggestion the sightings could represent physical manifestations of signals from Mars. Most scientists, however, chose to ignore the subject and those that would comment, suggested a connection to military testing.

Two of the country's leading astronomers were quoted by the press on that point. Dr. Gerard Kuiper, head of the University of Chicago's Yerkes Observatory at Williams Bay, Wisconsin, and Dr. Oliver Lee, head of Northwestern University's Dearborn Observatory at Evanston, stated that the curious discs were "man-made" and probably "radio-controlled." Lee said that "the Army, Navy and Air Force are working secretly on all sorts of things." [100] Ironically, many in-the military by that date were themselves starting to wonder if some other branch of the service had an experimental test vehicle undergoing secret trials. Time, however, would prove no such domestic program ever existed. Although that was one theory the early investigators, like Alfred Loedding, had to examine.

Monday 7 July

Sightings were already worldwide by Monday. In England a clergyman's wife had her attention drawn skyward by "a dark ring with clear-cut edges"

speeding across the sky. [101] In Mexico five discs were spotted over Mexicali and two over Ciudad Juarez. [102]

Back in the United States at 2:30 AM. PST in Tacoma, Washington, two police officers saw glowing, turning, discs moving overhead on an erratic course. At first the objects would glow red, then turn purple, and work into a blue-white hue before returning to a red color. They noted one "central saucer" which appeared to act as a sort of "flagship." Around it, smaller saucers were said to make repeated "sorties" to the larger disc. [103] This same type of strange phenomena was then repeated by a woman in Palmdale, California. She also described seeing a "mother saucer" with a "bunch of little saucers playing around it." [104] At Riverside, California, an even more fantastic report came to light. There, a man stated that he saw six discs the size of small plates hovering over a power line while he was outside trying to find the cause of the static on his radio. [105] By 6:21 A.M. PST yet another case comes from Colton, California, where eight silvery "egg or disc-shaped" objects were observed silently flying by in a straight line. One of the craft was described as elliptical-shaped and "flashing." [106]

About two hours later a disc was sighted in Lawton, Oklahoma, headed west. Then just five minutes later near San Carlos, California, at 10:35 A.M. PST Stanley Miramon and his mother observed 30 strange objects circle overhead at about 2,000 feet. Miramon compared them to the size

of an automobile and round and silvery in appearance. [107] By that afternoon near Glenn, California, two farmers harvesting barley noticed the sun reflecting off three "rows" of discs flying overhead. They estimated that there were at least twenty-five craft flying at great speed, moving with an up and down and side to side tipping motion. Before they passed out of sight the three row formation changed into a perfect V formation. [108] Still another sighting occurred near Sacramento:

> **William Smith, a photographer for the Bee, saw a round object which appeared to be tumbling over and over, alternately showing a dark and a bright side. It was unlike any plane he had seen as a former Naval aviator. He went for his camera, but when he returned it was gone.** [109]

Another very interesting article describes a disc sighting that morning

at the Rodgers Airport in Springfield, Missouri:

> **A flying saucer was spotted over Springfield yesterday by three observers at the Rodgers airport, a city policeman reported last night.**
>
> **The officer, Frank Walker, who flies a plane in his spare time, said he took off from the Rodgers airport yesterday morning, bound on a short pleasure cruise toward Ozark and back.**
>
> **Walker said his trip was uneventful, and he didn't sight any of the shiny discs personally, but when he returned to the airport later three friends who had watched his takeoff told of seeing an object "trailing" him for some distance.**
>
> **"They said it was flat-shaped and shiny," Walker said, "and that it appeared to have some sort of fins on it" The fellow who first saw it thought I was towing a target of some kind. Altogether, three persons saw it, I believe.**
>
> **Walker said the men told him the object appeared to be rolling over steadily. He said the observers reported that the discs followed him for some distance toward the northeast and vanished as Walker's plane turned toward the southwest.** [110]

In Los Angeles, California, pilot Vernon Baird, while flying a war surplus P-38 fighter for the Fairchild Photogrammetric Engineers Company, told of a very close aerial encounter he had with a UFO. Baird and an assistant, George Suttin, were mapping the region between Helena and Yellowstone Park for the Reclamation Bureau. They were at 32,400 feet traveling at 360 miles per hour when a flying disc appeared 100 yards behind their aircraft. It had a pearl gray color and looked to be around fifteen feet in diameter and four feet thick with a type of plexiglass canopy or dome on top. When the disc started to overtake the P-38, Baird took evasive action, causing it to be suddenly buffeted with strong air currents or propwash. Baird believed the saucer may have broken up during the maneuver because after the encounter it appeared to split into two clamshell-like sections and lose altitude over the Tobacco Root Mountains of western Montana. [111]

Although unheard of at the time, many UFO reports in later years would describe similar aerial separations. Often appearing as if an aircraft had broken-up in flight—rather, they seem to indicate some sort of complex change or maneuver. Interestingly, after this sighting made headlines, the Fairchild Company became so inundated with phone calls that a plant spokesman soon stated the incident had never really happened and was just the result of some wild talk. But it was JJ. Archer, Baird's boss, who branded it a hoax, not Baird or Suttin. [112]

That is not an infrequent problem with UFO reports. After the fact, some witnesses, or their friends, will make a similar claim simply to put an end to the nuisance of public interest. Sorting out the actual reports from the hoaxes in such a case, especially after so many years, is often impossible.

Another air-to-air sighting took place that morning seven miles north of the Shreveport Municipal Airport. The Shreveport, Louisiana, Times, states:

> **Sgt. Marvin V. Thomas, 26, of Squadron K, Barksdale Field was flying when he saw a bright silver object shaped like a saucer. Thomas said that he flew toward the object for five minutes, and then veered to the right and left, trying to determine his distance from it but without success. It looked about the size of the moon and looked thin as it turned."** 113

Boise Evening Statesman aviation writer Dave Johnson became keenly interested in such sightings. He was friends not only with Kenneth Arnold but came to know Captain Smith of the United Airlines Flight 105 Case too. In fact, up until 1953 when unnamed military officials suggested he tone down his enthusiasm, Johnson investigated many of the more significant UFO sightings. The following article is very revealing because it documents his first efforts to learn more about this strange phenomenon:

> **Idaho Newsman-Pilot Given 'Dream Assignment'**
> **'Get Picture of Saucers Or Bring One Back Alive'**
>
> **By DAVE JOHNSON**
> **(Idaho Statesman Aviation Editor)**
>
> **Boise—July 6--AP--FIew instruments this afternoon for a couple of hours with the Idaho national guard. A lieutenant colonel sat up in front and watched for discs while I struggled with the gauges and the radio beam. We got back into Gowen field's pattern, and the control tower called to report some people in Ontario, Ore., had told the CAA they saw some saucers wheeling through the sky. Now, there's one thing about these saucers. I've never seen one, so on the way home I dropped into the Statesman office with an idea. That was to take the Early-Bird No. 3, our airplane, and be up tonight and prowl around the airways, just looking.**
>
> **Gets Expense Dough**
>
> **I broached that to the city editor and blew the foam off of it, and a you-know-what look spread over his face, just like somebody had tossed a brick into a mud puddle. He talked for a few minutes and I listened. The upshot of it was that I walked out of the office with expense dough in my pocket and a date with Kenneth Arnold, the Boise man who two weeks ago saw the discs come roaring around Mt Rainier in Washington.**

> **I have one of those things called a general assignment. I'm going disc hunting with Arnold in the Statesman plane.**
>
> **Started In Idaho**
>
> **The city editor had said:**
>
> **"Dave, I was just about to give you a call and discuss this damn saucer business with you. The thing started here in Boise with Arnold and it is getting out of hand. The wire services are moving more copy on it than any single story in years except the war, and no ' one knows any more about it now than when they were doubting this fellow Arnold who first reported seeing whatever it is that is being looked at, real or imaginary."**
>
> **"As I said before, this business started in Boise and it is up to us if we can do it to help get it brought**

down to earth. I hope you can lasso one of the damn things and bring it in for display, but on the other hand, it might be a good idea to be ready to duck if you see something skipping along."

Dream Assignment

I might interject here that the boss doesn't fly.

"Crank up your airplane," he said, "and go up around the Hanford atom plant area in Washington and stay there until you either find something or give it up. See if this fellow Arnold wants to go along (he jumped at the chance) and take the best camera equipment you can find and stay as long as you want to."

Such an assignment- stay as long as you want to- is not to be accepted lightly. "Fly around that area," said the city editor, "because my hunch is that if these things can come from any place they are coming from some project like Hanford. The army has denied this possibility but the army has been making denials a major business for years. In one case an Army man said there's nothing to get excited about, "if there were anything to the saucers the army would have notified us."

Also... Good Luck!

If you see anything that answers the description—or the hundreds of descriptions-- grab a picture and high-tail for Boise." "Oh yes," he added. "Good luck to you."

They take the insurance out of my check.I phoned Arnold. We are taking off bright and early in the morning. Arnold has a new movie camera with a telephoto lens and we're fortified for pictures. From somewhere up in eastern Washington tomorrow night you'll hear from us, providing, of course, we don't run into something that proves these reports to be the McCoy and it runs over us.

The city desk says he'll stand behind us." [114]

Saucer sightings also came from Spokane, Washington; Cambridge, Massachusetts; Osburn, Idaho; Lakeview, Oregon; Rutland, Vermont; Wisconsin; and 17 cases originated in Illinois. [115]

A very notable incident on the 7th, for example, occurred around noon near Willow Springs, Illinois, when Robert Meegan and his 14 year old son John heard a buzzing noise overhead. They were working in the fields on their farm near the Des Plains River not far from the Argonne National Laboratories. Looking up they saw "13 round objects all going east, single file in a straight line." They described the objects as round with flat bottoms estimated about as big as a house and bluish-grey in color. They stated that the craft flew on a straight and level course toward the east. [116]

By noontime that day Deputy Army Air Force Chief of Staff Hoyt Vandenberg gave up any hope of getting to regular business. His entire day proved to be dominated by phone calls on the sightings. In fact, while at Hensley Field in Dallas, Texas, that afternoon, he stated publicly that the Army Air Force was receiving thousands of queries on the disc sightings. [117]

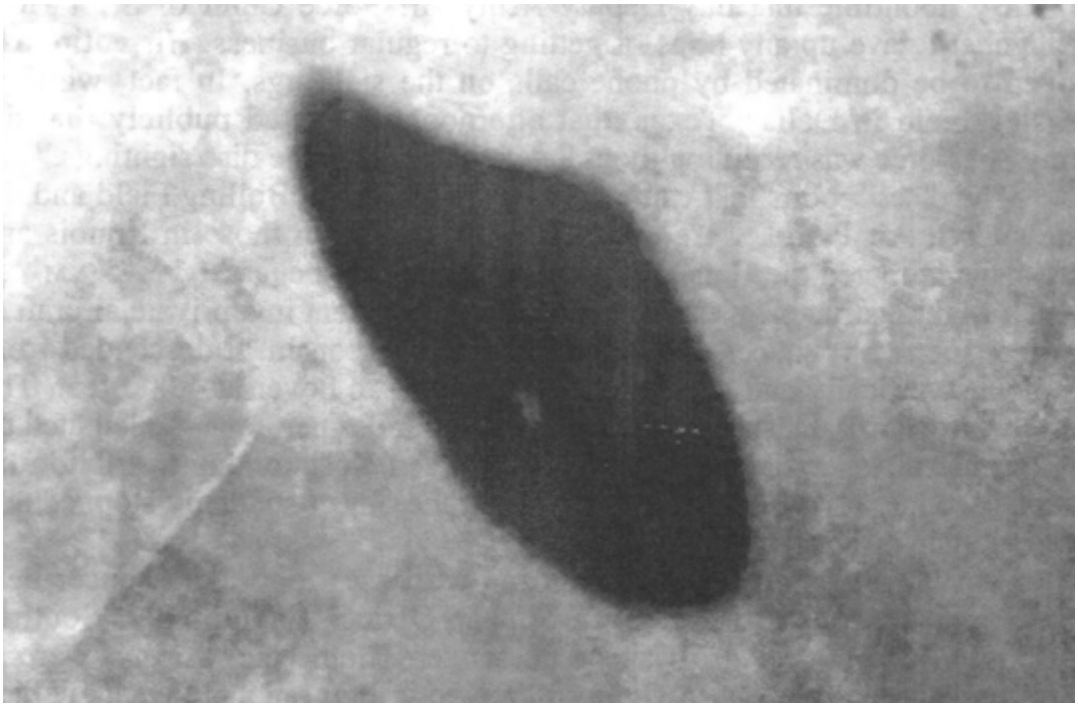
The discs reports that came out of Wisconsin, via Boiling Field and the state's Civil Air Patrol, were even more stunning than those in Illinois and must have attracted the General's attention. The first began at 11:45 A.M. CST when a flight instructor, Kenneth Jones, and his student in a private aircraft at 800 feet spotted a "saucer" near Koshkonong, Wisconsin. It descended from the clouds vertically and edgewise until stopping to hover at 4,000 feet. The craft then took off at a speed estimated at 6,000 miles per hour—calculated by the 25 mile distance the object covered between Koshkonong to Elkhorn in fifteen seconds. At the end of its speedy run the object suddenly stopped and hovered, then disappeared in the distance.

At 2:30 P.M another set of airborne witnesses reported a saucer near East Troy, Wisconsin. Pilot Wing Supply Officer Captain R.J. Southey (Burlington Civil Air Patrol) and a passenger, Clem Hackworthy, were at 3,500 feet when they saw a flying disc below them at 2,500 feet. It then covered the 22 mile distance between Eagle to Muskego in twenty seconds, placing its speed at 3,960 miles per hour. These two cases represent the best sightings of 1947, but are never discussed because their investigative case files are today missing from the Blue Book files released to the

National Archives. Further information may never be found although the few details presented here come from a recent discovery by researcher Jan Aldrich. [118]

An early investigated case from 1947 that did survive the years, reports a sighting at 4:00 P.M. MST in Phoenix, Arizona. In this instance William A. Rhodes captured two photographs of an elliptical, flat, gray, heel-shaped object flying between 400 and 600 miles per hour.

The images reveal a dark irregularly-shaped disc that looks surprisingly like the description of a sighting made between 1:00 and 4:00 P.M. EST that same day, but on the opposite side of the country just east of Lakeland, Florida. That report came from a man who heard a swishing noise followed by the appearance of five shiny unidentifiable objects moving northeast. After the encounter, the observer made a model of one of the objects. The photo of his replica, although of very poor quality, is still in the archival files and shows a cloverleaf-shaped craft with a small vertical fin and a dome on top. [119]



Researcher Dr. James McDonald interviewed Rhodes in 1968 and expressed some concern in a letter to NICAP acting director Richard Hall over Rhodes' credibility. McDonald did, however, say the circumstances of Rhodes' photographs, one of which is depicted above, checked out. Alfred Loedding also interviewed Rhodes in 1948, becoming impressed by his story. And prior to that, the Brown and Davidson Army Intelligence team interviewed Rhodes in late July, 1947 as did the FBI somewhat later. Brown and Davidson even talked in confidence with Kenneth Arnold and Captain Smith about the case on July 31st—showing them the photo. Arnold then responded, to their surprise, that the Rhodes' heel-shaped image looked like one of the nine disks he saw. Arnold stressed that point because only one of the "saucers" he observed on June 24th looked distinctively different—in fact it looked heel-shaped! Up until that point Arnold had confided that detail to no one because he had not even remembered it himself until hearing the description of the Rhodes' sighting from Brown and Davidson. The Rhodes photo, however, was printed

by the Arizona Republic as early as July 9th. The original negatives were later turned over by Rhodes to representatives from Army Intelligence and the FBI but he was never able to get them returned. Ironically, Arnold was given a copy of the photos by an official at Hamilton Field which he later gave to UFO researcher Dr. James McDonald.

The archival photo of the model made from the Lakeland, Florida, sighting.

California produced more sightings by late afternoon: The most notable involved two teenagers. At 3:10 P.M. PST they observed a "flat glistening object" fly in from out over the ocean. It then rapidly lost altitude and dove into the water about 400 yards from shore. As it hit, a tall column of water rose up, and the unknown craft could momentarily be seen on the surface before it disappeared beneath the turning waves. [120] Another good sighting that day occurred around 4:40 P.M. MST. This report should have made it into Air Force files with an accompanying investigation but did not. Thus, all we have is a newspaper clipping. The most interesting aspect of the account tells of possible electromagnetic disturbances being generated as a result of the UFO encounter. Termed EM effects, it is a common component of later sightings but rarely documented in the earlier incidents:

Sergeant C.F. Clifton, Bergstrom Field aerial radioman reported seeing one of the flying saucers bound toward San Antonio as his plane was leaving there. Other members of the crew also saw the disc. "I think it was about 18 feet in diameter and looked as though it was made of glass," Sgt. Clifton said. "It was extremely bright and kept flashing." Sgt Clifton said that the crew figured that it must have been flying 1,440 miles an hour because it overtook and passed their plane in such a short time. It was round and was flying at a slightly tilted angle. "The disc seemed to be spinning as it flew," Sgt. Clifton reported. "It blurred radio reception slightly." Lieutenant Charles O. Anderson was piloting the plane which the disc passed about 4:30 p.m. [121]

Another interesting EM effect befell the town of Acampo, California, the night before around dawn. Citizens of that community noted a "spectacular glow in the sky" accompanied by a loud roar just before a complete area-wide power failure. Not long after that a mysterious flying object was seen at low altitude over the nearby town of Lodi. In later years very similar UFO related blackouts have occurred, but this is one of the earliest examples of such an event. [122] One curious discovery from interviews conducted with Alfred Loedding's relatives, reveal that he was one of the first officials to recognize this important facet. Other early investigators only theorized about nuclear propulsion as a possible power plant for the discs. Loedding, for whatever reason, seemed to have a very clear understanding that many of the UFOs displayed electromagnetic properties.

Around 5:20 P.M. a secretary in the Engineering Department of Dupont's Chester, Pennsylvania, division had a more common encounter when witnessing five dull gray objects fly over in a V-formation. [123] Much further south a strange encounter occurred over the Gulf of Mexico:

> **Captain Marian Ruffner of Midnight Pass was proceeding in her deep sea fishing boat when she saw something that she first thought was a dirigible heading out over the Gulf. It was heading southwest, moving fast and appeared to be round and flat. It appeared and disappeared as she watched. "It flashed in the sun and appeared to be silver in color." Mrs. Ruffner described herself as "flabbergasted" by the sight of an object that she had previously taken as a joke. She reported that she was cold sober at the tirne.** [124]

That night at 6:30 P.M. EST a Tampa, Florida, man, George Gortez, and several others saw a V formation of three "golden colored" objects slowly flying overhead. [125] Further west at 8:30 P.M. CST John W. Hawkins and Virgil Ashley reported seeing a "flying disc" pass over St. Joseph, Missouri, at a high speed heading toward the north. They noticed the craft while sitting out in the back yard of the Ashley home, one mile north of the city. The UFO appeared luminous and disc-shaped with a silver glow. Estimated to have been around 300 feet in the air, it gave off a faint buzzing sound. Then at 9:17 P.M. a phone call came into the St. Joseph Gazette, stating that a flying disc had just been spotted over the city. Reporters looked outside but did not see anything. [126] Around that same time period a single disc was seen over St. Louis, and University City, Missouri. [127]

Back east on the Atlantic coast at 9:30 P.M. EST a "flying saucer" zoomed over Wilmington, North Carolina heading north.. Witnesses noted its high rate of speed and unusual brightness with an orange tint. [128] About the same time two college kids, Albert Dugan and Charles Cross, reported seeing a large luminous object speed overhead just ten miles outside of Raleigh, North Carolina. They initially thought it to be a star, but then realized the object was an elliptical flying machine that radiated blue lights from its edges as it moved in a circular orbit. After about three minutes it vanished into the clouds which were later confirmed by the Weather Bureau to be at a ceiling of 5,500 feet. An independent observation also described a luminous object moving north over Asheville, North Carolina. [129] Before the day was out, Mexico City claimed several saucer sightings, reporting discs identical to those seen all over the United States. [130]

Tuesday 8 July

Early the next day around 7:05 A.M. CST a private pilot viewed a very strange sight from his small

aircraft while over Cook Springs, Alabama. Silhouetted against a nearby mountain, he noted a circular object with a mirror-like finish. The pilot attempted to close in, but its speed was so great, it soon flew out of sight. [131]

At 8:15 A.M. Arizona State Highway Department workers Henry Varela, R.N. Villa, and Henry Hodges observed two "flying saucers streak high over the city of Yuma." Villa and Hodges saw them first and when Varela heard his friends talking he thought they must be describing aircraft. But Varela had seen an aircraft pass over just moments earlier and what he then witnessed looked nothing like it. All three men described the objects as saucer-shaped. They stated that they were silver in color and appeared to be just alike with one flying behind the other. The one thing that so amazed the men concerned the absolute lack of sound associated with the incident despite the fact the objects were at a fairly high altitude. The actual altitude could not be estimated, but all agreed the saucers were very high and traveled extremely fast in a straight line until they disappeared out of sight to the northeast. James Gordon of the US Weather Bureau suggested that the men could have simply made a misidentification of the planet Venus despite the fact that two distinct objects were seen in the same area of sky at the same time. [132]

78. Alfred Loedding and The Great Flying Saucer Wave of 1947

Around 9:30 or 10:00 A.M. PST at Muroc Army Air Force Base, California, (today Edwards AFB) Lieutenant Joseph C. McHenry viewed with three other witnesses, two silver spherical objects traveling about 300 miles per hour in level flight. The unknown craft moved northward toward Mojave, California, against the prevailing wind at 8,000 feet when a third object appeared—heading in the same direction but making several tight circles.

McHenry told intelligence officers that no aircraft he knew of could have performed such sharp maneuvers. Yet that was not the end of the story that day at the super secret Muroc test grounds. [133] By 11:50 A.M. at nearby Rogers Dry Lake, two technicians observed another strange event. They reported seeing a luminous round object for about 90 seconds. The men had been watching two P-82 fighters and an A-26 attack plane that were preparing for a seat ejection test when the UFO came into view. At first the men thought the object might be the parachute from the test, but that occurred later. The object did, however, very much resemble a fabric-like object not quite as dense as a parachute canopy with a white aluminum color. It flew silently at a little under 20,000 feet until descending at about three times the rate of the parachute, which was visible during the ejection test. As it came lower its silhouette presented a distinctive oval shape with two projections on the upper surface which seemed to slowly oscillate. The UFO moved against the wind in a northwesterly direction toward Mount Wilson until it was lost from sight as it descended level with the tops of a nearby mountain range. [134]

Still later at 3:50 P.M., 40 miles south of Muroc, a P-51 pilot at 20,000 feet spotted a wingless, tailless "flat object of light-reflecting nature." He twice attempted an intercept but could not climb high enough. Intelligence later took great note of that incident because they determined that no military or civilian aircraft were in the area. [135]

That night at 9:20 P.M. spherical objects were again seen in the area, this time at 8,000 feet still moving against the wind at around 300 miles per hour. This was reminiscent of a sighting just the day before at 10:10 A.M. when Muroc test pilot Major J.C. Wise, while preparing his XP-84 aircraft for takeoff, observed one yellowish-white spherical object traveling at 200 to 225 miles per hour at 10,000 feet. It headed east with an oscillating motion. [136]

These disc sightings over Muroc really shook-up the Pentagon. Known collectively as the Muroc Sightings, the incidents led the Army Air Force to issue classified orders requiring reports of any

"saucer-like" objects to be

given to the T-2 branch (the Technical Intelligence office—redesignated the Technical Intelligence Division or TID in August) of the Air Materiel Command at Wright Field in Dayton, Ohio. A post-war version of the highly secret T-2 wartime intelligence group, the Technical Intelligence (later Division) specialized in collecting data on enemy aircraft.

T-2 at the Air Materiel Command had been "unofficially interested" in the disc reports which had filtered in via the Pentagon and various Air Force commands—namely the Fourth Air Force. [137] In fact, beginning with the July 4th Independence Day Sightings a directive came down from Army Air Force Chief of Staff General Carl Spaatz who wanted the 4th AAF Intelligence at Hamilton Field to "open a file," although he specified that they should then report their findings to the Air Materiel Command. Yet the Muroc incidents threw matters into high gear and motivated the Pentagon to ask for a maximum effort from intelligence units around the world. Orders were then sent to all US Army air bases requiring sightings near their area to be investigated and reports sent directly to Wright Field with paperwork also going to the Pentagon. Actually, research shows that most of the early casework went directly to the Pentagon, and Wright Field did not get a complete set of files until September of 1947—by which time Loedding was working in a meaningful way with the investigations and personally lobbying for the reports.

By July 8th investigators from Wright Field, along with Alfred Loedding, began to speculate the flying disc phenomenon may be advanced German Third Reich weapons and/or aircraft being designed and flown over the United States by the Soviet Union's military forces. Specifically suspect were the wartime designs of flying-wing style aircraft inspired by the Horten brothers, Reimar and Walter of-Goettingen. One of their jet propelled flying wing designs had made its way to Wright Labs after the war and was undoubtedly studied by Loedding and the T-2 office.

Shortly after July 8th Technical Intelligence at Wright Field requested that the US Army Counter Intelligence Corps-Europe, or ECIC, help in the investigation. [138] Their agents in Germany scoured the allied occupation zones for clues to the existence of any models of Horten-like aircraft but found nothing. [139] Thus, without doubt, the government already began feeling pressure to solve the saucer mystery as early as July 8th. Although, it is unknown just how much reactive concern the Truman administration placed on the Pentagon and subsequently to Intelligence. Yet, between July 8th and

July 9th, the wheels began turning very fast. Washington released the following statement:

> **Washington, July 9 (UP)—Official Washington was sure today that it knew what the flying saucers were not-but it hadn't the faintest idea what they were. The Army Air Forces said they had the matter under investigation. Preliminary study has disclosed that the flying discs are not:**
>
> **1. Secret bacteriological weapons designed by some foreign**
> **2. New-type Army rockets.**
> **3. Spaceships.** [140]

In reaction, Army Air Force Requirements Intelligence branch chief, Brigadier General George F. Schulgen, called on the FBI to give additional assistance. Schulgen also brought in one of the Muroc pilots to the Pentagon to be interrogated by a host of generals, scientists, and even psychologists. Despite a thorough grilling, the pilot remained convinced that he had seen a "flying disk." [141] (See Appendix II.)

Schulgen also worked on the flying disc phenomenon with Pentagon Intelligence Collections branch executive Colonel Robert Taylor and his right-hand man, Lieutenant Colonel George D. Garrett. It was Garrett and the Collection branch that Loedding would coordinate with in his liaison work. But, documents do show Loedding had meetings in person with Schulgen as well. Taylor and Garrett were also the military connection to the FBI. They utilized FBI Special Agent S.W. Reynolds for the first inquiries into the by-then nation-wide rash of disc sightings.

In late July, Colonel Garrett, perhaps after networking with Loedding, decided to write up a report and send it to both the FBI and the upper echelons of the Pentagon. His memo basically served as a preliminary estimate of the current UFO situation. The intention in compiling the paper may have also been to bring the issue to a head.

In other words, this report hoped to establish a position on the phenomenon. Garrett, and certainly Loedding, first of all wanted to know if the discs represented a secret American project. (See Appendix III.) After that their more overwhelming fears centered around something of foreign—namely Soviet origin. All of these men, however, quickly became frustrated with the higher echelons of the military in their attempts to crack the mystery. Distinguished UFO researcher Professor Michael Swords writes in reference to this:

> **As July wore on into August, Garrett, Schulgen, and Reynolds became confused by a void of interest or pressure emanating from the high echelons of the Pentagon. They had gone through an investigative furor, which they considered to be similar to the flying disks, the previous year when hundreds of "ghost rocket" reports were made in Sweden and other European countries. In the 1946 experience, though, the top brass had exerted continuous pressure to find an answer. But here, the brass had gone completely quiet. This puzzling void has been termed "the Silence from Topside." It was very peculiar to Garrett and the FBI. Their mutual suspicion was that the very highest brass knew what this phenomenon was already.** [142]

The Silence from Topside refers to a connection to the Roswell Incident. Some researchers feel that physical evidence was recovered during that event, proving the flying discs to represent a real technology. The assumption is of course that the "technology" was of extraterrestrial origin and that the "top brass" were involved in a cover up of evidence. Others feel that if there was a suspicion that the high brass "knew the real answer," it involved the idea of a secret insight into captured Nazi technology. The FBI simply wanted to know up front if the phenomenon was something that actually required their expertise as the Bureau's manpower was limited. In other words, as Loren Gross wrote in his book on the 1947 wave: "If the saucers were not due to Communist agents making false reports, there wasn't much to keep the FBI busy." [143] (See Appendix IV for example of FBI memos expressing concern.) Yet, the military was truly concerned about a Soviet link. Even as late as 1952, some Pentagon officials would be speculating about a German/Soviet connection to the disc mystery. Following is an intriguing letter which came into Air Force Intelligence in 1952. It would seem to support such an assertion if it is indeed a genuine account:

Rudolf Goy
Menehek-Power
P.O. Box 2000
Mont Joli, P. Q,Canada 5 September 1952
Vice-Chief of Staff of U.S. Air Force
Gentlemen:
I'm sorry if I send this letter to you, but I have something to tall (sic) you about the "Flying Saucers." I am a German, and my trade is Aeronautical Engineer. Please dont(sic) think I look for a job in this trade. No, I just wont (sic) tall (sic) you, was happend (sic) about this plane before all is over. I am sorry if I writh (sic) in the German laguage (sic) below, my english grammar is too bad to tall (sic) you right."
[Translator's note: these first three paragraphs are

in English in the original text and I have copied them verbatim.] I would like to stress once more that by writing you this letter, I am not looking for a position nor do I want to make my name famous in an easy way. To start with, I would refuse this. Since there is so much clamor going on, I think it is time for me to tell you something about it and for this reason I am writing you a few lines. All this noise about these flying apparatus is known to you, but I would like to tell you not to believe in the visits from other planets or in the meteorological phenomena, because I believe that all this is a big mistake. In 1944 I worked with a small group of scientists and technicians on flying apparatus which resembled exactly this "Flying Saucer." Due to the air raids our group was sent to Silesia in order to work undisturbed. The experiments were only model tests and they were supposed to be realized in great haste since, according to Teich Marshal Goring's directive, this was Hitler's "Mystery Weapon." We were subordinate directly to him (Goring) and cut off from every outside communication. Even the letters which I wrote to my wife had to be addressed via Berlin where they were subject to censorship. The end came in 1945. We wanted to save at least something, so we separated and tried to reach the west individually. As I found out, not everyone succeeded because three of our group were captured and with them a part of the test results as well as some technical drawings. This was reported to me by a colleague who succeeded in escaping at the last moment. This is what I have to say on this point. Now, let's go to the apparatus itself. After the wind-tunnel tests, an experimental model was built of 3.6 m (in diameter). The driving motor was the same as " the one used for the experimental rockets. The steering gear was remotely controlled and similar to the FX-Bombs, which I know you are familiar with. From the aerotechnical standpoint, the results were amazing and they surpassed all expectations. However, it would take too long to give you all the details. You have a staff of scientists and technicians and I can only advise you to work a full steam so that the technique will not be 10 years ahead in a certain part of the world, while you believe yourselves to be in the first place. I am thinking of the jets in Korea. But please, do not think that I, as a small man, would like to propose something. I don't. But do not be misled about things which do exist. Perhaps you will say: "Who does he think he is, this German guy, he can't teach us, Americans, etc. ..." Please, gentlemen, the question now is not "who invented this thing," the only thing that matters now is not to be the last one and, at a decisive moment, find oneself confronted with the facts. By then, of course, it would be too late. Just look at 1939-1945, and I believe we learned enough. I hope that you do not misunderstand me. Even though my duty is not to gossip about these things, nevertheless, the existence of these things released me from the secrecy-oath given at that time to the constructor. I wish you every success in this work and I remain Sincerely, Rudolf Goy

P.S. I am reported the same to the Vice-Chief of Staff of the Royal Canadian Air Force. 144

In late July Colonel Garrett finished his preliminary estimate of the current UFO situation:

From detailed study of reports selected for their impression of veracity and reliability, several conclusions have been formed:
(a) This "flying saucer" situation is not all imaginary or seeing too much in some natural phenomenon. Something is really flying around.
(b) Lack of topside inquiries, when compared to the prompt and demanding inquires that have originated topside upon former events, give more ordinary weight to the possibility that this is a domestic project, about which the President, etc. know.
(c) Whatever the objects are, this much can be said of their physical appearance:
1. The surface of these objects is metallic, indicating a metallic skin, at least.
2. When a trail is observed, it is lightly colored, a Blue-Brown haze, that is similar to a rocket engine's exhaust. Contrary to a rocket of the solid type, one observation indicates that the fuel may be throttled which would indicate a liquid rocket engine.
3. As to shape, all observations state that the object is circular or at least elliptical, flat on the bottom and slightly domed on the top. The size estimates place it somewhere near the size of a C-54 or a Constellation.
4. Some reports described two tabs, located at the rear and symmetrical about the axis of flight motion.
5. Flights have been reported, from three to nine of them, flying good formation on each other, with speeds always above 300 knots.
6. The discs oscillate laterally while flying along, which could be snaking. 145

The report did force the Pentagon to start eliminating possibilities. The Chief of Research and Development, General Curtis E. LeMay, dispelled the first assumption. He stated, that "the Army Air Force has no project with the characteristics similar to those which have been associated with the Flying Discs." 146 Nevertheless, something from somewhere was definitely flying over US air space that July. The people concerned, like Loedding, had but one other possibility to eliminate—a Soviet connection.

On that watershed day of the 8th of July, UFO activity proved active elsewhere in the country. At 1:00 P.M. PST in Avalon, California, several hundred witnesses on Santa Catalina Island off Long Beach observed a formation of "saucers." Most observers agreed that there were six disc-shaped objects in the formation which passed over the island. Among those were Army Air Corps veterans Bob Jung, Kenneth Johnson, and Alvio Russo. Jung

actually got a photo of the objects as did Alvio Russo. Russo, who had piloted 35 combat missions over Europe, estimated their speed at 850 miles per hour. Jung clarified the details by stating that they were flying in two elements of three each about as fast as a Navy Tiny Tim rocket. He said the formation came in from the northeast and disappeared over the hills to the south of AvalonBay. 147

By 3:30 P.M. PST in Seattle, Washington, a "very shiny" oval-shaped disc with a "glass dome on top" flew in a northwest direction over the city. 148 In St. Joseph, Missouri, at 4:20 P.M. CST Mrs. La Verla McCord and neighbor Mrs. Frances Illines reported a white luminous round object traveling slowly to the northeast. The craft seemed to be high, but the women were surprised that it made no noise. Many tried to convince them that they had seen a balloon despite the fact that the wind at that time was from the east. Weather Bureau observer Arthur Van Cleave confirmed this although admitted winds above 8,000 feet were from the northwest, but did not think they could have been capable of blowing a balloon northeast. Then, just as the excitement over the first sighting died down, another disc report came at 6:00 P.M. from St. Joseph. 149

One of the most credible accounts of the early sightings came out of an incident over Alton, New Hampshire, at 4:26 P.M. EST. The report was made by private pilot Thomas Dale, the son of noted Governor Charles M. Dale and a highly respected pilot during WWII. For that reason the press took great interest in his story and undoubtedly accounts of the incident were monitored by Loedding and

others in Dayton as well as the Pentagon. Furthermore, Dale was not alone at the time. His friend Jere Stetson was in the aircraft with him and both told an identical account.

They stated that while flying southwest over Alton at an altitude of 2,800 feet, a strange object appeared two miles to the east and some 1,500 feet below their plane. It then approached them at "excessive speed" in a matter of 15 to 18 seconds as it veered north over Alton Bay and Lake Winnipesaukee, toward Moultenboro. Both men were careful not to assume anything. Dale, in fact, stated that "I'm not saying it was a 'flying saucer,' or disc." But the men did agree that it did not "in any way, shape or manner" resemble any type of known aircraft. They then went on to stress that it was definitely of metal construction, about 20 feet long, and "not exactly round in shape." When they first spotted the object it was observed in profile against the trees below. They said the sight left them "flabbergasted." [150]

That evening numerous sightings came from Philadelphia and southern New Jersey. Although only a few reports were printed by area newspapers, hundreds of witnesses in the city and area suburbs saw a huge flying cone-shaped object that was colored gray. [151] Researchers, however, are always hesitant when reading accounts of cone shaped objects simply because that is a prime characteristic of the large research balloons—just starting to come into use at that time.

Around 9:50 P.M. PST a huge formation of luminous "flying saucers" were spotted over Fraser Valley, British Columbia, heading west at great speed. [152] Finally at 11:05 P.M. PST, UFOs appeared over Chino, California which topped a list of dozens of sightings in the state that day which involved hundreds of witnesses. [153]

Other headlines from the 8th came from all over North America, but exact times for the sightings are hard to pin down. Saucer reports, for example, came from parts of Ohio, but no times were recorded. [154] Similarly, a very good sighting came from Corapeak, North Carolina, that day. Many valuable details were provided by a news article—all but the time of sighting:

> **A Farmer saw an object shaped like an enormous pancake, something like a flounder with its tail cut off. It appeared to be about 20-30 feet in diameter and moving about 800 miles per hour at about 2,000 feet. The object had two window-shaped openings. The body seemed to be of stainless steel or aluminum with a glow. The witness heard an almost inaudible sound as the object passed out of his sight in three or four seconds. It had several protruding pipe-shaped extensions which emitted vapor.** [155]

A report from Norfolk, Virginia, places other strange aerial phenomena over the East Coast:

> **Lt. Cmdr. L.D. Patterson of the Naval Station reported five yellowish discs like the moon, flying in formation over the Air Station from the West. Patterson said the formation was surrounded by a mist, and the bodies each left trails.**
>
> **Walter Hurst who telephoned the Ledger-Dispatch for Patterson, said that Patterson, a pilot of considerable time in the air, was unable to establish the altitude having no point for calculation.** [156]

86. Alfred Loedding and The Great Flying Saucer Wave of 1947

Even far distant American bases experienced UFO incidents during the summer wave. It was on the 8th at 5:33 P.M. HST that one hundred Navy men at Pearl Harbor witnessed a mysterious

"silvery colored" object with no wings or tail sail over Honolulu at rapid speed in a zig-zagging flight heading east. Five of the observers familiar with weather balloons commented that it just could not have been any type of balloon. Yeoman 1st Class Douglas Kahcerle of New Bedford, Massachusetts, stated: "It moved extremely fast for a short period, seemed to slow down, then disappeared high in the air." [157]

On the other side of the world in Australia, "flying saucers" were reported over Sydney on the 7th and 8th. The sightings occurred at night over the suburb of Kensington when two "white shiny discs" traveled quickly to the west toward Parramatta at about 10,000 feet. "Flying saucers" moving in a V formation were also reported over South Africa by Johannesburg residents. [158]

28. In his book on the 1947 wave, Bloecher tells of another sighting of a V formation of discs in Auburn, California, just an hour earlier to the Twin Falls case. Bloecher wrote: "Kjell Qvale, an automobile salesman in Alameda and a former Navy pilot for five years, reported that he and a group of 50 other witnesses had watched a triangular formation of disc-like objects near Auburn at 2:30 P.M. PST, flying south. Qvale said that the discs, seen first directly overhead, 'appeared to be made of metal and looked like bright silver,' He added that their round outline was clearly distinguishable. The objects were in view 'for three or four minutes,' he said. 'I have seen a lot of airplanes, and these were not airplanes. The only clue I could get as to their height, size and speed was the fact that they disappeared one at a time, high in the sky, and not over the horizon. This effect would be caused if they were very, very large and very high, and flying at a terrific

speed—1,000 miles an hour,' he said." Bloecher also sites a sighting of a V formation of discs that night in Denver, Colorado as well as two sightings of similar V formations over New Orleans on July 6th.

Chapter Five
A Very Serious Business

The Muroc Sightings were the pivotal event which activated the United States military into concerted action on the saucer mystery. After that point, as Edward Ruppelt recalls, it was indeed a very serious business. In the middle of this was poised Alfred Loedding.

Dayton started to receive firsthand UFO reports by Wednesday, July 9th. One of these came

from Idaho when Boise Evening Statesman writer Dave Johnson, who after three days of trying, finally caught a glimpse of a UFO. Flying out of Go wan Field in an AT-6 from his National Guard unit, he observed at 12:17 P.M. MST a strange looking dark object. Johnson tried to make sense of the weird sight as it became silhouetted against the clouds. The UFO then made a half-roll and entered a stair-step climb. Johnson at first thought it might be a balloon. (Many of the early meteorological balloons were made from neoprene which would turn smoky gray or black in the sunlight.) [1] No apparent balloon launches, however, could account for the incident. [2] Later, Johnson learned that three ground observers at Gowan Field who were National Guard pilots had also reported a similar object. [3] Like Johnson, they too were mystified as to what it was they had seen that day.

Another sighting came in from the 1380th Army Air Force Base in Fort Pepperell, Newfoundland. It related a story near Grand Falls, when a police constable's wife and mother-in-law observed four "egg-shaped phosphorus colored discs." Each disc passed over in a side-by-side formation around 11:30 P.M. ADT. Ten minutes later a similar object, which the constable saw himself, darted across the sky with a "jellyfish-like flash." [4]

A report that never reached Dayton, but is of interest came from two men flying over Glacier Park, Montana, at 3:53 P.M. MST. They spotted seven flying saucers heading in a northwesterly direction. The two men, Ed Johnson and Joe Dimio, noted that the craft were only visible for a short period—indicating they traveled at a fairly fast rate. [5]

Less than three to five percent of UFO incidents were reported to Air Force Intelligence. [6] For example, another very good sighting that was only documented by the newspapers came at 5:45 P.M. CST from the nationally known News-Press editor, Helen Culver Gettys. She witnessed a flying saucer pass over her car near the St. Joseph (Missouri) Country Club. Mrs. Gettys had just left the club with her mother and Mrs. Charles Culver when a flash in the sky caught her eye. All of the ladies were then quite startled to look up and see one of the famous saucers. As it flew northward at about 1,000 feet, they commented on how the sun reflected off its shiny metal surface. The disc appeared in full view for a matter of seconds, indicating it traversed the area at a high rate of speed. All three women possessed solid reputations and Mrs. Gettys stressed in her own article about the incident that prior to the sighting they had consumed only "one bottle apiece of a local bottler's very soft drink." [7]

At 8:00 P.M. CST a Liano, Texas, man, T.A. Smith, reported a disc going southeast. Smith described it as a whirling wash tub throwing off sparks. [8] Finally, that night a West Virginia man decided to do something about the unsettling wave of saucer sightings. When discs appeared over Johnny Johnson's Bluefield home, he fired upon them with his shotgun! The irate West Virginian failed to do any visible damage to the saucers. But if this account is accurate, the UFOs in this case had to have been flying at a very low altitude in order to come into gun range. [9]

Thursday 10 July

Saucer sightings were reported by newspapers on the following morning from Ontario, Canada; Westminster, Colorado; Douglas, Arizona; Burien and Seattle, Washington; and Niwot and Aurora, Colorado. [10] That afternoon George Dey and Roy Wilson reported to newsmen that they had seen at 1:20 P.M. MST, seven "flying saucers" over the Joel Hart ranch west of Buhl, Idaho. They said at first the objects were shiny and flying in formation, but then they broke up and sped out of sight. [11]

At 4:30 P.M. EST a Logan, West Virginia, man, George Vance, observed a "round-shaped object with a sort of a turtle back" glistening intensely as it flew in a straight line. [12]

As the sightings continued one of the top US astronomers from the Department of Meteoritics at the University of New Mexico, Dr. Lincoln La Paz, his wife, and two teenaged daughters, reported seeing an elliptical object very high among the clouds. The incident occurred at 4:47 P.M. MST while they were driving from Clovis to Clines Corner, New Mexico.

La Paz estimated, with the aid of a pencil held at arm's length, that the object was 20 to 30 miles from his position, ellipsoidal and rigid, 160 feet long and 65 feet thick, traveling 120 to 180 miles per hour horizontally and 600 to 900 miles per hour vertically. It appeared silent and "self-luminous" against the dark clouds with a sort of "wobbling motion" and no exhaust or vapor trail could be observed. The object had "a sharp and firm regular outline, namely one of a smooth elliptical character much harder and sharper than the edges of the clouds." It remained in view for at least 30 seconds and " then ascended upward and disappeared for five seconds behind a cloud until it **"' reappeared at a two degree elevation and about a five degree elevation north of true west. Finally, it vanished into the clouds for good. La Paz stated that , the ascent he saw the object make "thoroughly convinced me that we were ^ dealing with an absolutely novel airborne device." [13]

There is a possibility this sighting could have represented a balloon. Large polyethylene envelopes were just then coming into use for research balloons and could easily reflect the sun's rays, yet would never travel that fast if his calculations were correct. [14] Despite this, interest in the sighting continued for many years. The case was first made public by Life magazine in 1952 but withheld La Paz's name. The sighting was examined by the Air Force and a file compiled, but all evidence of the paperwork was removed before release of UFO files to the National Archive's in late 1975. Today the case is not even listed in the Blue Book Index which is now also a part of the National Archives' collection.

More sightings came from the West that day. In Cheyenne, Wyoming, two silver discs shaped like saucers with a dome on top slowly passed over in a clear sky. [15] In Temple, Texas, a former Army Air Corps colonel, Smith Tarrant, observed two flying "discs" from the door of a local welding shop. He estimated they were at 1,500 feet, flying against the wind, heading along a straight course at about 200 to 250 miles per hour. They headed out of sight over the course of three minutes to the south with no indication of sound or smoke or means of propulsion. [16]

That same day numerous individuals observed discs fly through the skies of Missouri, although few of these sightings sound like balloons either.

It all began with 60 eyewitnesses at an ice cream social on the John Cox farm six miles northeast of Mercer. They witnessed groups of saucers in twos and threes pass over north to south. Some did fly by themselves, but most were in formation.

A mile south of Princeton, Missouri, (fourteen miles south of Mercer) those same flights of discs were observed by Mr. and Mrs. Dykes and Mr. and Mrs. J.W. Buren and their families while driving down US Highway 65. The sight so startled them that they pulled off the road only to be joined by

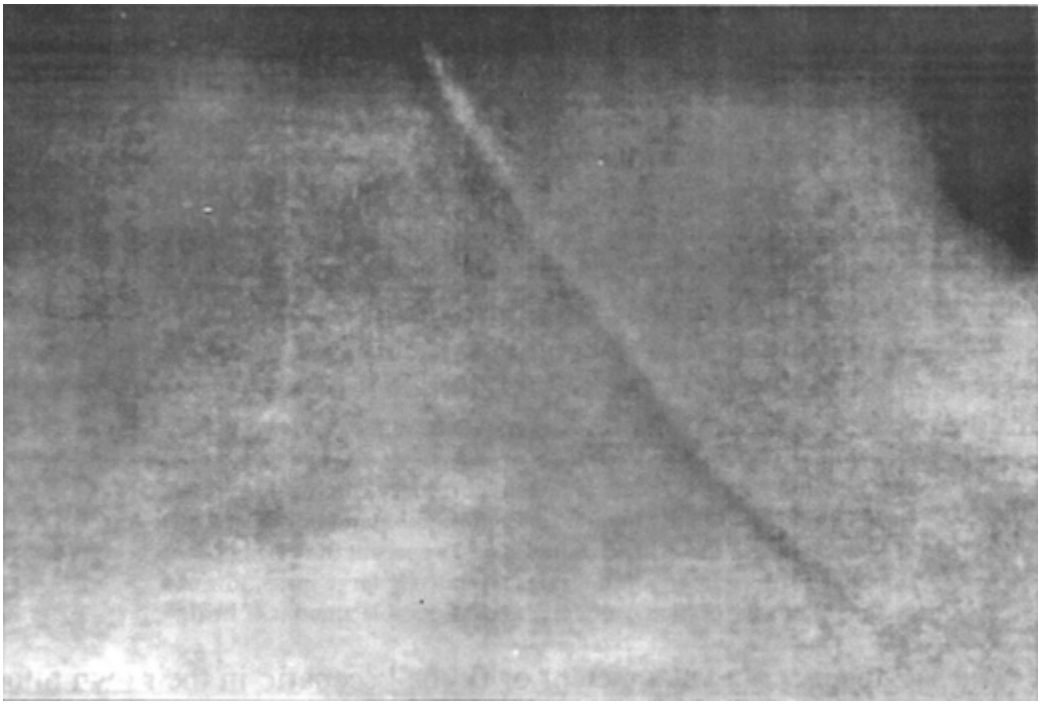
other motorists. Among those were Mr. and Mrs. W.S. Thompson with their friend, J.M. Beets. Other observers included Mr. and Mrs. Rit Thompson and Mr. and Mrs. W.H. Nell. All gave a similar account to the one that happened at the Cox farm, stating that the saucers came over singularly and in groups for almost a half hour. In fact, on a farm one mile east of Princeton, Mr. and Mrs. Parvin Woodward and their guest, Perry Coon, confirmed this same "saucer show." [17]

At 7:00 P.M. MST near Brockton, Montana, Ray Carpenter and his wife observed a shiny object illuminated against a dark cloud bank. A former manager of the Wolf Point airport, Carpenter judged it to be about the same size as a private aircraft traveling very quickly. [18] Then at 8:00 P.M. a pilot for the Lee Geophysical Company, saw a shiny craft zooming southward near Tulsa, Oklahoma. [19] At that same time another Tulsa man, J.C. Penman, reported seeing a "circular fluorescent lamp" move in a northeasterly direction. Penman was a former Army Air Force crew chief and had never seen anything like it before. [20] A half hour later one more disc appeared over a mountainous area northeast of Salt Lake City, Utah. Described as an "aluminum type of thing," it remained in view for two minutes as it moved with a fast but "funny" motion. [21] Then in Indianapolis, Indiana, Mrs. Bernie Hollingsworth had a sighting at 9:30 P.M. CST. She described a "flying saucer" pass near her home headed east, stating that it looked like a "shining piece of oblong steel." [22] By 11:55 P.M. EST a flying saucer was seen southeast of Dover, Delaware. Mrs. Hilda Dinsmore characterized the object she saw as a round dull colored object "sailing across the sky." [23]

Another report came from Newfoundland on the 10th from two Pan-American Airways mechanics near Harmon Field, AAFB, Stephenville Cross. At 5:30 P.M. ADT they (and a third man) were driving up a mountain road six

miles south-southwest of the base when all three of them, J.N. Mehrman, A.R. Leidy, and I.E. Woodruff, observed a silver circular disc at about 10,000 feet. It passed in horizontal flight along a great curved course. The disc's size, they stated, approximated the wingspan of a C-54 transport aircraft and looked to be cutting a bluish-black trail about fifteen miles long as it literally parted a path through the clouds over Harmon.

The trail passed over the base and out toward the north-northeast—being compared to the afterglow of a powerful searchlight when suddenly switched off. Weather records confirmed scattered clouds between 8,000 to 10,000 feet which supported the original altitude estimate.



Some personnel of the 1388th at Harmon Field also saw this great cut made in the clouds and acquired two Kodachrome pictures taken by one of the mechanics who first witnessed the event. Today copies of these images are in the Blue Book files and although very poor reproductions, they show the spectacular aerial trail. Above is the best of those two photos. [24]

Known as the Harmon Field Case, this incident received the first intensive investigation by Army Air Force Intelligence. The sighting became especially relevant to Intelligence officials both at Wright Field and the Pentagon because of the concern of a Soviet connection to the saucer mystery. The reasoning basically followed the assumption that if the USSR was flying spy flights over the United States, the missions would logically have to pass

over some area of Canada or the far north. For that reason the sighting just twelve hours earlier in Newfoundland coupled with this one, and a disc report out of Alaska the very next day, stirred up a lot of excitement. [25]

The initial report was filed by base intelligence officers on the 16th, but by the 21st a more detailed report was forwarded to the Pentagon. General Schulgen then ordered intelligence at Wright Field in Dayton to send a top-level assessment team to Harmon Field "immediately." [26]

The T-2 chief, Colonel Howard M. McCoy, dispatched a team by the 30th that may have included T-3 (engineer section) specialist Alfred Loedding. McCoy's team was also asked by Schulgen to report directly to the Pentagon following their investigation. Interestingly, at that time, Schulgen also asked McCoy what the T-2 analysis and the T-3 engineering sections had "prepared" to date on the disc phenomenon. McCoy's notes do not tell us if Analysis Division Chief Colonel William R. Clingerman had any answers or if the T-3 section at Wright Labs had compiled any analysis. McCoy himself was working on the German/Soviet technology angle. He, in fact, had even interviewed the famous successor to Count Zeppelin's dirigible empire, Hugo Eckener. Eckener was then in America consulting with the Goodyear company to try to revive the era of the great airships

following WWII. [27]

The T-2 investigation of the Harmon Field Case really shook up their own aeronautical engineers in the T-3 section. Part of the report had the ring of Alfred Loedding's expertise and read as follows:

> **The bluish-black trail seems to indicate ordinary combustion from a turbo-jet engine, athodyd motor, or some combination of these types of power plants. The absence of noise and apparent dissolving of the clouds to form a clear path indicates a relatively large mass flow of a rectangular cross section containing a considerable amount of heat. [28]**

The T-2 team excluded a meteor or fireball scenario in their own minds despite the fact that an astronomical event became the official conclusion on the case file. Behind the scenes, T-2 and Washington were still focused on a Soviet connection. Wright Field investigators spoke with the commander of Harmon Field and others to make sure that no British or Canadian aircraft had been in the area at the time. And since they knew no American aircraft were to blame, they privately concluded something of "foreign origin" made that curious split in the clouds over Newfoundland.

Although, by 1948, "foreign origin" would become a catch word in Dayton to refer to extraterrestrial space craft, these men where only talking about a Russian threat at that time. Their concern grew, In fact, because Newfoundland seemed to be especially attractive to the discs. Early the next morning at 2:20 A.M. Codroy residents reported seeing a "flying saucer" with a cone-shaped tail. Two men saw the object when they were standing outside a local store and had their attention drawn to the sky by a very bright disc streaking across with a yellowish cone-shaped after-glow. They described it as a luminous object traveling at great speed from the northwest and heading east at about 6,000 feet. [29] Both men felt certain they could not have mistaken it for a plane or falling star. A third man then saw the same aerial phenomenon. He had served in the civilian Air Detection Corps during the war and possessed great experience with identifying aircraft. He also became convinced the disc was "not a plane, but definitely some flying object."30 Overseas in Norway, European papers were talking about "flying saucers":

> **A "flying saucer" was observed Thursday evening near Skotfoss. At about 19:30 my wife told me that she had seen an object in the sky, says one of the three persons who observed "the saucer." It moved in between the clouds at an undetermined altitude, blinking like a star or like a mirror when the sun is reflected in it. As it entered the shadow it became dark and round or oval. It is completely out of the question that it was an airplane. There was no sound from the saucer, which was about the size of an airplane. The object was in view for four minutes and then disappeared towards the southeast. [31]**

Before the day was out discs were also seen in Amsterdam, and Leyden, Netherlands; Birmingham, England; Santiago, Chile; Kagoshima Bay, Japan; and then back in North America over New York, California, and Ripley, Ontario. [32]

Friday 11 July

UFO activity started early in the morning of the llth at 2:30 A.M. MST when Mrs. Anna Potts of Yuma, Arizona, rose from bed frustrated by her barking dog. She got up and went outside to quiet him when suddenly, and to her great amazement, she saw a disc-shaped object go over at high speed with a spinning or rotating motion. The craft passed without a sound in a matter of

just five seconds. This suggested that the craft must have been at a relatively low altitude as it became lost from view after crossing the tops of nearby homes. Mrs. Potts reported the event to the Daily Sun, absolutely convinced she had seen a flying saucer. [33] Perhaps the same object flashed in front of Mr. Ernest Tiffany's bedroom window one hour later in Tulsa, Oklahoma. [34]

In Longview, Washington, at 6:30 P.M. PST two groups of a dozen or more shiny objects were observed flying with bright flashes as they turned and caught the sun's reflection. [35] By 7:20 P.M. EST a report came out of High Point, North Carolina, when pilots flying at 1,000 feet saw a "ball of fire." It appeared as a huge object, round on top with a black band through the center. "The bottom part of the object was revolving, and periodically bursts of fire came from underneath, as if some sort of exhaust." [36]

Later that day around 10:00 A.M. GMT while ferrying a Viking transport aircraft to Argentina, Captain Norman E. Waugh of London's Airwork Ltd. had a very interesting UFO sighting over the Bay of Biscay. Waugh was near 8,000 feet when he spotted ahead, and above him, an elongated oval or "tadpole" shaped craft flying at about 16,000 feet. First Officer Peter Roberts and Radio Officer Stuart Chinneck both agreed with Captain Waugh that the object looked grayish in color and of unusual design. At one point they came within five to six miles of the UFO. It then passed the starboard side of their aircraft at lightning speed, leaving a long vapor trail. During that time the flight crew estimated the object to be traveling about 600 miles per hour at 7,000 feet above their aircraft. Waugh, a former Bomber Command and Transport Command pilot with sixteen years flying experience, and Roberts, a former wartime Squadron Leader, knew no aircraft outside the US proving grounds at Muroc had that kind of performance. They later told reporters that neither of them had seen anything like it before. [37]

On that same side of the world during a small country fair, a "flying saucer" appeared over the Irish town of Cahirciveen. It approached from the northwest at about 1,000 feet at great speed and appeared to be revolving as if it were on an invisible axis. The craft had a kind of white halo and passed over without making a sound. Many observers were from outside the area, only being in town for the fair. Three names that were recorded as witnesses were Michael J. O'Sullivan, J. Coffey, and Patrick O'Shea, all from Cahirciveen. The total time of the sighting approximated eleven seconds. [38]

Then, in Italy at 10:30 P.M. local time, multiple "luminous discs" were seen above Garsenda. They flew from north to south as many local citizens watched the spectacle. [39] Interesting, cases also came from South America in Paramaribo, Surinam, on the llth. [40] Yet, unexplainably, after this day widespread UFO activity suddenly slowed. Just like turning off a switch, people stopped seeing a phenomenon that had spanned the world and accounted for hundreds of reports. In comparison to the onslaught of sightings from the 4th to llth, less than two dozen good incidents would be reported during the rest of the year. Did the news media simply stop covering the sightings or did the phenomenon actually change in character?

Only a few UFO reports, for example, can be found for the 12th. One comes from Spring Coulee, Alberta, Canada, but sounds suspiciously like a balloon sighting. [41] Then a man reported a

"silver ball" flying with a purring noise over Silver Lake, Washington, at noon. [42] Again in this case, it could be attributed to an IFO or identified flying object — very possibly a distant jet.

Five incidents were reported in the American West on the 13th. Three came from Grand Forks, North Dakota, in the afternoon. All describe bright revolving objects traversing the sky. Then at 5:15 P.M. CST a Milwaukee Railroad signal crew in Mussellshell, Montana, observed an irregularly moving round white object. [43] At 7:00 P.M. PST over Baker Valley, near Wingville, Oregon, a round object flying with a "dipping motion" was seen by many witnesses and several aircraft pilots who tried in vain to pursue it. [44]

On the 14th two reports came from Idaho only ten minutes apart. The first sighting occurred at 7:20 P.M. MST south of Idaho Falls. In this case a man described seeing a turning and twisting craft fly by on an irregular westward course. Ten minutes later, and to the west, in Nampa, Idaho, a dozen "flying discs" were seen by Mr. and Mrs. O.B. Warnock. [45]

Two unrelated reports came from the 15th, although both describe a strange "fiery object." Distantly separated, however, the first incident occurred in Indonesia and the second in Utah. [46] On the 16th a sketchy report came from South America and one from Rugby, North Dakota. In the latter case, a luminous revolving object was seen at 1:00 A.M. CST only 200 feet off the ground. [47]

Just one account is evident for the 17th, but it is a very unique sighting. In that instance multiple objects appeared at various levels above Helena, Montana, from 2:45 to 3:00 P.M. MST. Although, those accounts do liken them to simple balloon clusters known to be in use at the time by the military. [48] On the 18th, however, two very notable daylight disc sightings can be found. They begin with Mr. and Mrs. Roger Morin of Arlee, Montana, who spotted two discs at 10:00 P.M. MST heading west. By 11:30 P.M. CST in Joplin, Missouri, one disc zoomed to the southeast looking like a "silver meat platter." [49] No reports have surfaced for the 19th and only one for the 20th which occurred in Texas at 10:35 P.M. and very likely describes a rocket test. [50] The 21st has just one sighting in Boise, Idaho, describing a fast moving oval object. [51] Only one report is of note for the 22nd. That case involves a sighting of a green fireball above Fort McPherson, Georgia. That is of interest because one year later, green fireball sightings would be a widely reported phenomena above many military bases in the West. [52] Actually, the next day another green fireball did appear "under the clouds" over Belgium around midnight. It is the only reliable UFO report for the 23rd. [53] On the 24th, nighttime disc sightings came ^ from Arvada, Wyoming, and Wolf Point, Montana. [54] Then on the 25th another evening sighting of a "luminous saucer" once again appeared over Montana near Whitetail. [55] That day a saucer sighting came from the other side of the Atlantic. In that case numerous witnesses spotted a flat disc-shaped object travel over Odensala, Sweden, flying at about 400 meters altitude in an easterly direction around 5:00 P.M. [56]

26 July

In Washington D.C. at noon President Truman waited on board the presidential aircraft Sacred Cow to sign some important documents before hurrying back to Missouri and his dying mother. Soon a courier arrived at National Airport carrying what proved to be far reaching legislation. With the signing of the National Security Act of 1947 and Executive Order 9877, the Army, Navy, and now the Air Force were coordinated as one military establishment under a single Secretary of Defense, James Forrestal.

This allowed the Army Air Force to become a separate branch of the armed services under a new name, the United States Air Force, or USAF. Stuart Symington served as the first Secretary of the Air Force. (The three departments were separately presided over by a civilian Secretary, each of which became members of the new National Security Council.) On September 26th General Carl Spaatz became the first Chief of Staff of the new USAF. (Each service's chief of staff would become members of the Joint Chiefs of Staff.) General Hoyt Vandenberg then became Vice Chief of Staff on October 1st. Symington, Spaatz, and Vandenberg seldom spoke publicly on UFOs, and what they did say seemed to indicate that the sightings posed no defense concerns. Whether they actually believed that may never be known, but the new Air Force via men like Alfred Loedding is known to have had a very real interest by this date in the curious flying disc reports.

28 July

A sighting very similar to the United Airlines Flight 105 Case occurred on this date on the same run as that noted July 4th incident. Captain Charles F. Gibian and First Officer Jack Harvey of this July 28th Flight 105 trip were preparing for a landing into Boise, Idaho, at 8:34 P.M. MST. As they lost altitude over Mountain Home (45 miles out from Boise), Harvey spotted a strange craft far ahead of their DC-3. Just as Captain Smith described twenty-four days earlier, Harvey characterized the bizarre object as silhouetted against a bright western sky. Captain Gibian then noticed the object and accounted that it appeared to be at 9,000 feet as their aircraft began descending from that same height to 8,000 feet. He described it as weaving as if "it was going through choppy air." Gibian also stated that it was "going like hell when it disappeared" toward the northwest. Both pilots agreed the object to be about the size of their own aircraft and about 40 miles distant. They also felt certain what they saw that day could not have been an aircraft. Each stressed that they had never seen such a thing before and publicly expressed concern that possible military experiments were being carried out in commercial air lanes. [57]

29 July

A sighting at Hamilton Field, California, at the end of July represented one of those few truly exceptional cases that finished out the year. It definitely contributed to Loedding's mounting interest in flying discs and determination to investigate deeper.

Known as the Hamilton Field Incident, it began at 2:50 P.M. PST when Lieutenant Ward L. Stewart in the 415th reserve training unit landed in an AT-6 from a routine training flight and parked his aircraft near hangar 59. The Assistant Operations Officer, Captain William H. Ryherd, then called his attention to an odd object flying above the hangar. It headed right over a P-80 jet fighter coming in on a preliminary landing approach at around 6,000 feet.

The P-80 flew in excess of 250 miles per hour as the unknowns proceeded to pass by the jet "as

if it was standing still." A second object then appeared, flying a left to right "protective" maneuver over the first craft until they each passed southward toward Oakland and then out over the ocean. Both the captain and the lieutenant agreed the objects were 15 to 25 feet in diameter, shiny white in color, and circular-shaped. The total duration of their sighting lasted about fifteen seconds as the craft sped by in a clear sky. No noise could be detected, but the observers felt they could not fairly judge that they were completely silent because of the background roar of the P-80.

Lieutenant Stewart piloted B-29 bombers during the war and had considerable experience as a flyer. He conveyed authority to Intelligence officers when questioned, stating that the objects were "unlike any conventional type of aircraft he had ever seen." Captain Ryherd also conveyed a highly impressive evaluation of the sighting with an extreme degree of sincerity throughout his testimony. [58] Given the opportunity, investigators should scan some of the Oakland papers to see if any other UFO reports were made in connection with the Hamilton Field Incident. Many cases listed in this book have been discovered in just such a way. Uncovered in newspapers from areas near documented sightings, these secondary sources make it all the more evident something truly amazing took place in 1947.

One other good sighting for the 29th is found in the files of the FBI. It is of interest because it also describes an object not too dissimilar than the two objects seen over Hamilton Field that day. Note the similarities in the report:

At or about 12:05 p.m., July 29, 1947, a sedan, driven by Steve Berrmann and carrying R.J. (Bob) Madden in the front seat and Karl Herman in the rear seat, was proceeding northwesterly along the road leading from Canyon Ferry to York, both in Montana some 25 miles N.E. of Helena.

When at a point approximately 1/4 mile N.W. of Canyon Ferry, (as shown on Forest Service Map to be in the NE1/4 of NE1/4 of Sec. 10 TION R1W) Karl suddenly shouted "See it! See it! There's a flying saucer!" Steve immediately slowed down and gradually brought the sedan to a stop, he and Bob meanwhile scanning the sky i in the direction pointed by Karl in an effort to see the "flying saucer," but without success.

Approximately ten seconds elapsed between the time Karl

reported seeing the "saucer," coming over the horizon at high speed from the southwest, (Karl first thought it a meteor) and traveling northeasterly, and the bringing of the car to a stop.

As the car came to a stop, Steve, Karl and Bob, simultaneously, saw the following:

Directly ahead, (N.W.) 2 to 3 miles distant and approximately 3000 ft. above the ground, a bright disc hovering and fluttering in the air. Descending and rising through a vertical distance of fifty or a hundred feet for a period of about five seconds then, while at the top of an ascent, the "disc" suddenly swooped to the Northeast at tremendous speed and disappeared into the clear air within a distance of 200 ft. That is to say it did not pass beyond an obstruction to further visibility but "melted into thin air" as if because of tremendous speed.

This disc was, from the viewpoint of the observers, apparently 3 ft. diameter, circular and of no great thickness — approximately 3 or 4 inches.

The sky was blue with scattered small clouds, the sun was shining brightly and the disc gleamed and shimmered in the bright sunlight as if covered with highly polished nickel.

After the "disc" disappeared from view, the sedan and its occupants proceeded northwesterly along the road, but could discern no evidence of the presence of the "disc" along or adjacent to that thoroughfare.

It is to be remembered that the dimensions as stated above were as they appeared to the observers some 2 or 3 miles from the "disc" and the true dimensions must be considerably greater. [59]

30 July

Ending out the last UFO report for the phenomenal month of July, this particular account deserves to be quoted in full. Although sightings dramatically fell off by this point, the case is extremely note worthy as evidence that very good encounters did occasionally occur during the rest of the year. The witness involved was returning to his home in Estevan, Saskatchewan, from the Canadian town of Torquay:

> **A motorist driving close to daybreak with his headlights on was watching storm clouds in the northeast. As he watched, something swept out of the clouds and passed overhead moving in a southeasterly direction. It glided down near the ground and then rose again and disappeared at a rapid rate of speed. The unidentified**

> **object did not seem to be very high in the air. "At first it looked like an aircraft wing that was on fire at both ends but when it passed overhead I could see that it was circular in shape. It looked to be about the size of a tractor wheel and about four foot thick. It was revolving and appeared to have flames or fire at the outside edges."**
>
> **I have laughed at the stories of these things, but not any more; I was scared. The object was real. I kept looking around for someone else to witness it but there was nobody else in sight at the time."**
>
> **The motorist said the object was silent and remained visible for about 20 seconds.** 60

The Hoaxes, 1 August

Hoaxes have always existed in connection with any type of mysterious phenomenon. It is regrettable, but that's human nature. Often UFO reports, legitimate or not, tell us more about the observer than the observation they make. Fortunately, because so many dedicated researchers over the years have become interested in UFO activity, most hoaxes are eventually exposed. The serious approach taken by military intelligence in the early years also helped weed out and expose pranksters.

Those investigators were very leery about hoaxes and feared the public, and especially the Pentagon's reaction, if they were found to have been taken in by such a ruse. In typical military fashion intelligence officers did not "fool around," and routinely relied on the FBI for background checks. Alfred Loedding, in particular, was careful to only concentrate on cases involving highly credible observers such as pilots. He also had that scientific knack for looking at data as a whole and not making conclusions based on any one particular event.

Undoubtedly, however, witnesses who produced photos or physical evidence received the most attention by investigators. There are actually a good number of cases in the 1947 files of people claiming to have discovered pieces of "flying saucers" that had supposedly crashed or exploded somewhere near them. Equally surprising is that few of these were attempts to perpetrate a hoax. In almost all of those cases, Intelligence and/or the FBI determined the witnesses were genuinely fooled by objects that were indeed mysterious, but only in the manner in which they were discovered.

There is even reference in both Air Force and FBI files to the Mogul balloon project. This concerned one of those physical evidence cases and referred to several inquiries made by an Intelligence officer, and later FBI field agents, as to whether a particular fragment could have been a piece of

debris from a "Mogul." [61] (This obviously proves the Mogul project was not as secretive an operation as present-day Air Force officials claim when debunking the Roswell Incident.) [62]

The first well-documented UFO hoax in the early files concerns two individuals by the name of Harold A. Dahl and Fred Lee Crisman. They had made the claim that six low-flying UFOs hovered over their boat on June 21st while they were looking for floating lumber off Maury Island near Tacoma, Washington. Subsequently it became known as the Maury Island Incident when they confessed under FBI interrogation to a hoax. This occurred after the Brown and Davidson Army Intelligence team was tragically killed returning from Tacoma after interviewing Dahl and Crisman. Attributed simply to an unfortunate plane crash, their accident had no real connection to the case.

It is also unfortunate that Kenneth Arnold became a victim of these hoaxers. Although he did not lose his life as the result of their ignorant deeds, he did lose something he considered just as valuable, his reputation. This concern for his reputation had made Arnold desperate to learn more about the curious flying saucers following his own sighting in June and a second one on July29th. [63]

Arnold sought any proof he could and became interested in the Maury Island case after the editor of Amazing Stories magazine, Ray Palmer, agreed to put up $200 to help him investigate their claim. Arnold, however, could not have been kept away from such a story. It was outwardly such a good sighting because the witnesses were actually claiming to have pieces of "slag" expelled by one of the saucers after it had supposedly encountered mechanical problems. They also purportedly captured the saucers on film which captivated Arnold more than anything else. Even Captain E.J. Smith of the United Airlines Flight 105 Case became taken by the hoaxers out of that same need—the need for proof.

Seeking to substantiate any possible proof that did exist, Arnold had personally convinced Lieutenant Brown, who had worked on his case, to travel to Tacoma. Brown and Davidson both took advantage of the offer and flew up to Tacoma to meet with Dahl and Chrisman while they were being interviewed by Arnold and Smith in a hotel room at the Winthrop.

Once on the scene the more experienced Brown and Davidson saw the story as an obvious hoax, but because the officers held such a high degree of respect for both Arnold and Smith, they did not indicate to them their feelings and subsequently allowed themselves to be talked into taking some of the alleged fragments back for study.

Flying back to Hamilton Field to take part in the Air Force Day ceremonies, an engine caught fire and the wing came off of their B-25 near Kelso, Washington, killing both Brown and Davidson. The fragments were recovered from the wreckage, and after careful analysis proved to be simple slag from a local Tacoma steel mill. The military threatened to prosecute Dahl and Chrisman but never carried through with it. But because they hesitated to disclose the case as a hoax while considering

prosecution, many thought the sighting to represent a true event.

The press made a lot out of it at the time and for some reason even erroneously stated that the Air Force had ceased disc investigations altogether. When the real story came out months later, buried on the back pages, people missed the explanation. As a result, some still naively detail the Maury Island Incident, alluding that it may not have been a hoax. [64]

Because of that mistaken perception, so pervasive at the time, the first step had been taken which, over the years, would make the military more and more defensive in regard to the media. Even Arnold, held in high regard by early investigators, is treated only with ridicule following the whole tragic event. Afterward, when an article came out critical of the Arnold sighting, TID clerks automatically added it to his file. Intelligence officers around the country felt they had learned a valuable lesson from the incident—caution.

4 August

Every researcher has their own favorite cases for certain periods. The following sighting from Alaska is a particularly attractive story for two reasons. First, this incident received detailed documentation in the military files which usually was not the case with a sighting in such a distant location. Secondly, the incident is typical of a lot of air-to-air sightings of the early days, not only in the manner in which it occurred, but the description of the object seen. In fact, when compared to the United Airlines Flight 105 Case of July 4th, the similarities are striking. Also comparable is the time of day in which both sightings took place. Surprisingly, this account is seldom mentioned in the popular literature.

The incident began northwest of Bethel, Alaska, when DC-3 Captain Jack Peck and copilot Vince Daly of Al Jones Flying Service were on a

routine cargo run. At dusk they suddenly sighted a black saucer-shaped object cross their flight path. It had come in at a right angle to their aircraft and Peck instinctively made a precautionary climb from 1,000 to 1,200 feet to avoid any chance of collision. He then swung in behind the disc and chased the peculiar looking craft as it became silhouetted against a brilliant evening sky. Peck pursued at 170 miles per hour until losing sight of it four minutes later.

During the incident they noted that the disc had a smooth streamlined surface with no visible means of propulsion. The speed of the object was subsequently computed at 510 miles per hour, based on the assumption that the UFO traveled 34 miles in four minutes while the DC-3 moved eleven miles in the same period. If correct, this would also infer that the craft was more than twenty miles distant when last seen. To be able to see an object at that distance, it would indicate a diameter of at least 50 feet and suggests a length of about 500 feet.

Aside from such startling figures, the Bethel Alaska Case drew attention within Intelligence among men like Loedding because of the quality of observers. The airline also considered Captain Peck as a man with an "excellent reputation." A letter in the Air Force files speaks to his character, stating "no one here doubts in the least but that he actually saw this object." [65]

6 August

By the fall of 1947 the FBI had become very active in UFO investigations. The following FBI

memorandum was drafted by the Philadelphia, Pennsylvania, field office and addressed to FBI Director J. Edgar Hover. It demonstrates that although Intelligence in Dayton would soon begin a twenty-two year investigations into UFOs, other organizations like the FBI did substantial work as well in these early years.

This memo did make it into Intelligence files at Wright Field but not all of the FBI paperwork seems to have been shared with them. Correspondence from August even indicates Loedding urging the T-2 Analysis Division (which he was working for on the disc sighting) to give direction to A-2 Intelligence, Fourth Air Force at Hamilton Field, and via them direction to the FBI. Was this a show of frustration that Wright Field may not have been receiving the cooperation that they should have as directed by Washington following the Muroc Sightings? This memo does shows a sincere and worthy effort by Special Agents to conduct an investigation into this particular sighting:

_____Philadelphia, who is employed by the _____, Philadelphia, advised as follows:

Between 10:30 and 10:45 p.m. on August 6, 1947, she was sitting on the steps of her home with _____. She was facing north and observed a large white object traveling at a very fast rate of speed to the south. There was a buzzing sound, not too loud but plainly audible, just after this object passed through the air. This white object left in its trail a thin streak of smoke, which was grayish in color.

Miss _____, Philadelphia, who is employed by the _____, INC., _____ Philadelphia, stated she was sitting on the steps of _____ home on the evening of August 6, 1947, around 10:45 p.m. engaging in conversation with _____ when _____ abruptly stopped in the middle of her conversation and appeared to be frightened. _____ at that time was sitting in a position in which she was facing south. She did not see any object in the sky after noting _____ change of expression, but she did hear a slight buzzing sound.

_____ Philadelphia, an insurance agent, who was a former pilot of B-24's in the Army Air Corps, advised as follows:

He was sitting on the steps of his home around 10:45 p.m. on August 6, 1947, with his wife; and his neighbors, the _____ family, were sitting on their steps next door to the residence of _____. All of the above parties were facing east. _____ noticed at this time an object, emitting a bluish white flame, passing quickly through the air. The object was traveling from northeast to southwest. Using his experience in the Army Air Corps as a guide, _____ estimated the above object was between 1000 and 3000 feet in the air and traveling at a rate of between 400 to 500 miles an hour. This object did not lose elevation as it passed through the air and left either smoke or a condensation trail in its former path, which lasted for about two seconds. A hissing sound accompanied the passing of this object. This sound was moderate and not nearly as loud as the noise accompanying the passage of a rocket ship.

_____ who is a retired police officer of the Philadelphia Police Department, advised as follows:

Around 10:45 p.m. on August 6, 1947, he and his wife were sitting on the steps of their home, when _____ noticed an object, resembling to him a giant firecracker, pass quickly through the air. _____heard no noise, but the object had completely passed from view in a southern direction within a split second. It left a fiery trail for 100 feet. August 6, 1947, was a clear night, and no storm was brewing. _____ was sure the object he saw was no falling star, and he noticed the above object did not seem to be falling but maintained the same altitude.

The wives of ____ and _____ verified the accounts of their husbands as to the above-mentioned object.

It is to be noted the _____ and the _____ live in Northeast Philadelphia near Oxford Circle, which is about ten miles removed from the residence of _____ . _____ residence is located in the western part of Philadelphia. The _____ and _____ are not known to the above mentioned _____ and _____ . It is further noted the observation of Miss _____ the _____ and the _____roughly correspond. All the above persons seem reliable and not the type to seek publicity or to spread rumors.

_____ called the "Inquirer." Philadelphia newspaper, and inquired if it could offer any explanation as to what they had seen. A representative of that paper had advised _____ that the object they saw may have been some product of an oil refinery or chemical company in their neighborhood.

Both the Offices of Naval Intelligence and Army Intelligence in Philadelphia were requested by the Philadelphia Office to ascertain if either the Army or the Navy was doing any experimental work on new types of planes or equipment, in the vicinity of Philadelphia. Such was done with negative results. The Office of Naval Intelligence indicated that an explosion had occurred at the Charles Lennig Chemical Company on August 6, 1947.

_____, Safety Department of the Charles Lennig Chemical Company. Inc., 5000 Richmond Street, Philadelphia, advised as follows:

The above company is a manufacturer and distributor of chemicals- A fire had occurred on a dump of the company on August 6, 1947, but was quickly gotten under control. Such fire was confined to the company's premises and could not have been observed from outside the plant.

The Charles Lennig Company is about two and one-half miles southeast from Oxford Circle. The account of the fire does not seem to fit into the general pattern of the above-mentioned flying object, for it is noted that the flying object was allegedly traveling from a position northeast of Oxford Circle to a south-westerly direction in Philadelphia. _____ pointed out that, to the best of his knowledge, there are no oil refineries and chemical companies located around Oxford Circle or north of such, but that all of the companies of this type are several miles south of Oxford Circle.

All logical investigation having been conducted, no further action will be taken on the instant matter unless advised to the contrary by the Bureau.

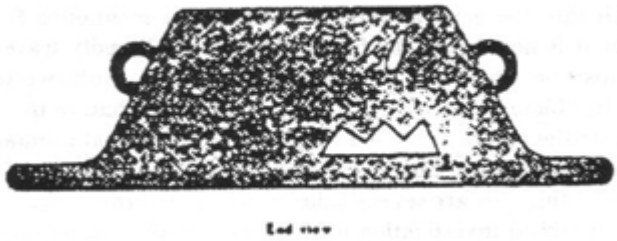
13 August

One of the most interesting features of the 1947 period is the sheer number of disc sightings. This is not to say there was not a diversity of phenomena reported, but many of these "disc or saucer accounts" are extremely noteworthy because few other periods had such high percentages of observations describing true "nuts and bolts" type objects. For example, an above average daylight disc sighting of late 1947 comes from the Smoke River Canyon near Twin Falls, Idaho. On this date at 1:00 P.M. MST a blue disc-shaped object actually flew beneath the walls of that canyon river valley! On its flight, the strange craft sped above a well respected area trout farmer, A.C. Urie. His two sons, Keith and Billy, also witnessed the event as they were coming across the river to meet their father with a boat. All three witnesses then watched it pass about 75 feet over a stand of Mormon Poplars, causing the tree tops to bend and sway as if caught in a vacuum. By that point the craft, which had descended as much as 300 feet below the 400 feet high canyon rim, became silhouetted against its steep walls, resembling an "inverted pie-plate." Urie estimated it to be about

twenty feet wide by ten feet thick with a horizontal pipe or pole sticking out which emitted bright flames. [67] The former county sheriff and a county commissioner, L.W. Hawkins, also reported a similar disc sighting at 9:30 A.M. that day about twenty miles southwest of Twin Falls near the Salmon Dam. Eventually FBI investigators checked all of the witnesses and gave them and Urie a very good recommendation. [68]



This Air Force sketch was inspired by a very similar rendition in the Twin Falls Times News which was taken from several drawings A.C. Urie made depicting a washtub-shaped object. Urie made no references to jet exhaust in his account, although, both the Times News and Air Force sketch added this detail—apparently as an explanation for the buffs of smoke observers saw coming from the object.

That morning another interesting sighting occurred over Redmond, Washington, at 9:00 A.M. PST. The resulting FBI report is quoted here to illustrate that when a UFO report appeared in a news article, there definitely were officials taking notice:

FBI SEATTLE 8-14-47 5-21PM FB
DIRECTOR FBI URGENT
L.R. BRUMMETT. SID DECKER. FLYING DISCS. INTERNAL SECURITY ___. AUGUST FOURTEEN NINETEEN FORTYSEVEN SEATTLE POST INTELLIGENCER PUBLISHED ARTICLE TO EFFECT THAT L.R. BRUMMETT, BOX TWO FIVE FOUR REDMOND, WASH, AND SIDNEY DECKER BOX TWO NINE SIX REDMOND, WASHINGTON HAD SIGHTED TWO DISCS AT APPROXIMATELY NINE AM AUGUST THIRTEEN NINETEEN FORTYSEVEN. UPON INTERVIEW DECKER STATED THAT TWO VERY BRIGHT OBJECTS TRAVELING AT AN EXTREME RATE OF SPEED WERE NOTICED BY HIM AS HE WAS STANDING NEAR THE REDMOND POST OFFICE. DECKER DESCRIBED THE OBJECTS AS HAVING NO WINGS, NO TAIL, AND BOTH ENDS WERE TAPERED. DECKER ADDED THAT THE OBJECTS RESEMBLED A BELLY TANK AND THAT THEY WERE NOISELESS. THE OBJECTS WERE VERY BRIGHT AND TRAVELING IN A NORTHEASTERLY DIRECTION OVER REDMOND, WASHINGTON. ONE A BIT BEHIND AND A LITTLE ABOVE THE OTHER MAINTAINING EQUAL RATES OF SPEED FOR APPROXIMATELY EIGHT SECONDS AT WHICH TIME THEY DISAPPEARED FROM VIEW. DECKER ADDED THAT THEY WERE HIGHER THAN A PLANE GENERALLY TRAVELS. BRUMMETT ADVISED THAT HE NOTICED THE OBJECTS AND CALLED DECKERS ATTENTION TO THEM AND ALSO POINTED THEM OUT TO A MRS MAMIE ENGLISH. BRUMMETT STATED THAT HE SAW TWO OBJECTS FLYING AT A FORTY FIVE DEGREE ANGLE NORTHEASTERLY OVER REDMOND AND TRAVELING AT LEAST THREE TIMES FASTER THAN A PLANE. BRUMMETT ADDED THAT HE WATCHED THE OBJECTS FROM FIVE TO EIGHT SECONDS AT WHICH TIME THEY DISAPPEARED FROM SIGHT. ACCORDING TO BRUMMETT THE OBJECTS WERE DESCRIBED AS BEING NOISELESS, HAVING NO WINGS OR TAIL, LIGHTER THAN ALUMINUM, TAPERED AT BOTH ENDS AND ONE STAYED A LITTLE

BEHIND AND A BIT ABOVE THE OTHER AND BOTH MAINTAINED EQUAL RATES OF SPEED. FROM BRUMMETTS OBSERVATION HE WAS UNABLE TO DECIDE WHETHER THE OBJECTS WERE FLAT OR ROUND. MRS MAMIE ENGLISH STATED THAT WHEN BRUMMETT CALLED HER ATTENTION TO THE OBJECTS SHE TOOK A PASSING GLANCE AT THE SKY AND COULD OFFER NO DESCRIPTION OTHER THAN THEY LOOKED LIKE TWO SILVER BALLS TRAVELING AT A FAST RATE OF SPEED

14 August

On the Pacific island of Guam, American enlisted men reported seeing crescent-shaped objects flying past the US military base there. They stated that they flew on a zig-zag course at least twice as fast as a conventional airplane. [70] These authors could not track down the primary source for this account but the incident is listed in an index of sightings in the Fourth Air Force files, although no case analysis is evident. [71]

17 August

In the Mt. Josephine, Skagit County forest of Washington State, a ranger observed a flying disc similar to the object seen in Twin Falls, Idaho. That UFO descended rapidly from the northeast and flew with a slight angular pitch, but righted itself as it came lower. Finally the unusual machine flew off to the southeast at great speed. [72]

Also that day two army officers at Fort Richardson, Alaska, stated that they saw an unusual object flying above them at a tremendous rate of speed below the cloud layer then at 10,000 feet. The records state that the officers described the craft as sphere shaped—not saucer-like. They noted, however, that unlike a balloon it definitely moved against the wind and had a metallic appearance. [73]

19 August

Another sighting comes from Twin Falls, Idaho, at 9:39 P.M. MST when numerous people sighted multiple groups of flying objects in the night sky. These formations resembled a "glow in the air" the color of electric lights. The "lights" traveled at "terrific speed" and flew in triangular formations. At one point three of them peeled-off of a larger group of ten and sped away in a different direction. Due to an overcast, the observers felt that they were not astronomical anomalies. [74]

Apparently many agencies were looking into this sighting including the FBI. On August 22nd the following memo was composed by the FBI:

In accordance with your request, this matter was checked with Army Air Forces. Lieutenant Colonel Garrett advised Special Agent _____ that extensive inquiries within the Army Air Forces revealed that no research or experiments were being conducted by the AAF in the vicinity of Twin Falls, Idaho on or

about August 19, 1947. Colonel Garrett stated that he had no information which would throw any light on the matter reported in the teletype. [75]

If, on the other hand, the Idaho UFOs could have been explained away as aircraft or meteors, it would have surprised few. By August the Gallup poll revealed over 90 percent of adult Americans had heard of flying saucers, but that people continued to feel they represented secret military craft or natural phenomena. [76] Thus, even after the summer wave of 1947, the public still looked upon human achievements in science and engineering with the same sense of wonder they had since the beginning of the modern technological revolution around the time of the 1897 UFO wave. Our present-day mind set associating "flying saucers" with extraterrestrial visitors simply had not yet taken hold. It is interesting to note that even research scientist at the Holloman AFB, who worked around the latest technologies, made no conclusions when they had discs sightings themselves that month. The events are detailed by an official statement drawn up by Operations and Projects Group, Electronic and Atmosphere Division personnel which Alfred Loedding spoke to a year later—actually while investigating an entirely different case:

During the latter part of August, 1947, this organization was carrying on several test runs with a modified SCR-270 at this base. I had released a corner reflector and two balloons and was watching them in their flight as they drifted to the southeast from this base. While watching the balloons through a pair of ten power binoculars, a white object, appearing to be round, came into my field of vision, I followed the objects as far as possible but lost it within seconds after picking it up. The object was traveling at an unprecedented rate of speed and appeared to be several thousand feet over the top of the Sacramento mountain range, traveling in horizontal flight south to north ... it was definitely not a balloon and apparently not manned judging from the violent maneuvers which were performed at a high rate of speed. [77]

3 September

On this day at 12:15 P.M. PST twelve to fifteen circular-shaped objects appeared high above Oswego, Oregon. Each of the strange craft were described as

"very silvery in the afternoon sun." While such a report sounds like it might simply be a misidentification of aircraft or meteors, Intelligence officers could find no such solution. They became sufficiently impressed with the observation to list it as unidentified in the Air Force's record system of sightings started by 1948. As stated before, that classification was never lightly given and even exceptional cases such as the DC-3 encounter over Bethel, Alaska, did not receive such a discriminating designation. [78]

12 September

Although most UFO reports in 1947 do describe saucer-shaped objects, nighttime lights again appeared on this date. This strange incident involved a Pan American flight eastbound from Midway Island to Cahu. Just after passing Necher Island at 1:00 A.M. local time, the crew spotted an intense incandescent white light off the starboard side of their aircraft. At first the pilot thought it might be the navigation lights of another plane, but it was far too bright for that. The flight crew tracked the unknown object and determined it held a true course of 350 degrees while holding at a steady

altitude of 9,500 feet.

The captain estimated its distance from their aircraft at five miles. But just as he took the plane off automatic pilot, the light approached within one mile. After that the UFO quickly veered off to a course of 190 degrees at which time the light split into two parts. The two separate orbs then changed to a less bright reddish hue and flew in a side-to-side formation until zooming out of sight at tremendous speed, estimated at over 1,000 miles per hour.

Investigators calculated the total duration of the observation at only six seconds, but as any pilot will attest to, that is a long time when an unknown object is near your aircraft. Despite the brevity of the sighting, Naval Intelligence took a great deal of interest in the case. The pilots were interviewed by Naval officers who tried to find an astronomical solution to their unprecedented encounter but realized the pilots had good familiarity with meteor phenomena. The pilots told Navy officers that they were certain they had not seen a meteor because it consistently held a steady altitude. The captain of the flight had ten years flying experience with Pan American with 7,000 hours in the air, much of it over the Atlantic and Pacific air routes. His second officer had 1,700 hours and eleven years of flying experience—four years of which were spent in B-24s flying East Coast training duty and combat missions in the South Pacific. Both pilots impressed intelligence officers as keen observers. [79]

63. Few people have heard the story of Kenneth Arnold's second UFO sighting. It occurred at 6:55 A.M. when Arnold was flying over Union, Oregon. On this occasion he saw 20 to 25 discs which were rough appearing on top and lighter on the bottom. As these objects flew, Arnold estimated them to be 24 to 30 inches in diameter and flying at speeds faster than 200 miles per hour. He also commented that the discs fluttered and flipped on edge as they headed north. Surprisingly, this second sighting by Arnold received almost no news play.

Chapter Six
The Birth of Project Sign

The Air Materiel Command's Technical Intelligence Division (hereafter referred to as AMC and TID) developed a growing interest in such diverse reports as those from the Pacific. Since the Muroc Sightings, TID officers had compiled information which formed the basis of later case files. Most of the paperwork, however, was first generated by Air Force or Naval Intelligence officers from military bases nearest to a sighting or from the headquarters of the 4th Air Force at Hamilton Field. Recent releases of federal records indicate that the FBI was also engaged in extensive field work and interrogation of witnesses. At times military intelligence officers even "warned" some witnesses not to talk about their reports.[1] By September, growing demands for an answer to the incidents led to increasing pressure on the newly formed USAF. On September 23, 1947, AMC commander, Lieutenant General Nathan F. Twining, replied to a verbal request from Brigadier General Schulgen of Pentagon Intelligence for TID's analysis to date. Now known as the Twining Memo, it made some interesting conclusions:

> **1. As requested by AC/AS-2 there is presented below the considered opinion of this command concerning the so-called "Flying Discs." This opinion is based on interrogation report data furnished by AC/AS-2 and preliminary studies by personnel of T-2 and Aircraft Laboratory, Engineering Division T-3. This opinion was arrived at in a conference between personnel from the Air Institute of Technology, Intelligence T-2, Office, Chief of Engineering Division, and the Aircraft, Power Plant and Propeller Laboratories of Engineering Division T-3.**
>
> **2. It is the opinion that:**
> **a. The phenomenon is something real and not visionary or fictitious.**
> **b. There are objects probably approximating the shape of a disc, of such appreciable size as to appear to be as large as man-made aircraft**
> **c. There is a possibility that some of the incidents may be caused by natural phenomena, such as meteors.**
> **d. The reported operating characteristics such as extreme rates of _____climb, maneuverability (particularly in roll), and motion which must 1**

> **be considered evasive when sighted or contacted by friendly aircraft and radar, lend belief to the possibility that some of the objects are controlled either manually, automatically or remotely.**
>
> **e. The apparent common description is as follows:**
> **(1) Metallic or light reflecting surface.**
> **(2) Absence of trail, except in a few instances where the object apparently was operating under high performance conditions.**
> **(3) Circular or elliptical in shape, flat on bottom and domed on top.**
> **(4) Several reports of well kept formation flights varying from three to nine objects.**
> **(5) Normally no associated sound, except in three instances a substantial rumbling roar was noted.**
> **(6) Level flight speeds normally above 300 knots are estimated.**

f. It is possible within the present U.S. knowledge—provided extensive detailed development is undertaken—to construct a piloted aircraft which has the general description of the object in subparagraph (e) above which would be capable of an approximate range of 7000 miles at subsonic speeds.
g. Any development in this country along the lines indicated would be extremely expensive, time consuming and at the considerable expense of current projects and therefore, if directed, should be set up independently of existing projects.
h. Due consideration must be given the following:
(1) The possibility that these objects are of domestic origin—the product of some high security project not known to AC/AS-2 or this Command.
(2) The lack of physical evidence in the shape of crash recovered exhibits which would undeniably prove the existence of these subjects.
(3) The possibility that some foreign nation has a form of propulsion possibly nuclear, which is outside of our domestic knowledge.

3. It is recommended that:-
a. Headquarters, Army Air Forces issue a directive assigning a priority, security classification and Code name for a detailed study of this matter to include the preparation of complete sets of all available and pertinent data which will then be made available to the Army, Navy, Atomic Energy Commission, JRDB, the Air Force Scientific Advisory Group, NACA, and the RAND and NEPA projects for comments and recommendations, with a preliminary report to be forwarded within 15 days of receipt of the data and a detailed report thereafter every 30 days as the investigation develops. A complete interchange of data should be affected.

4. Awaiting a specific directive AMC will continue the investigation within its current resources in order to more closely define the nature of the phenomenon. Detailed Essential Elements of Information will be formulated immediately for transmittal through channels. [2]

The Twining Memo strongly urged that a permanent project be established to investigate and analyze future UFO reports. On December 30, Major General Laurence C. Craigie, Director of Research and Development, Headquarters, USAF, issued an order approving a group "to collect, collate, evaluate and distribute to interested government agencies and contractors all information concerning sightings and phenomena in the atmosphere which can be construed to be of concern to the national security."

This led to the establishment at the Air Materiel Command of Project HT-304, code name "Project Sign," under Air Force Technical Instruction No. TI-2185. Quarterly progress reports were ordered to be submitted beginning July 1, 1948, although only one of those reports have been found in the records from the time.

Much of the same thinking from earlier that summer which linked UFOs to German/Soviet technology lay at the heart of the Twining Memo and the creation of Sign. For that reason most researchers believe TID commander Colonel Howard M. McCoy actually drafted the document—as it was worded from the perspective of his wartime experience in T-2 Intelligence.

McCoy had been a key figure in the recovery of German technology during the war. Although he did not work directly on Operation PaperClip to recruit German scientists, he did value the expertise they could provide. Many of these groups mentioned in the Twining Memo like the Rand Think Tank and the Air Force Scientific Advisory Group (NASA's predecessor) utilized German scientific breakthroughs in their own work.

The Twining Memo called for an Essential Elements of Information or EEI document—which also referenced the military's wartime experience with evaluating technology. The EEI served as a check list of important details to note about a sighting—for example shape of object, trajectory, time

of event, etc. Alfred Loedding and Pentagon consultant Dr Charles Carroll drew up the EEI. It was then sent to all Army Air Force commands to serve as a basis for investigating a UFO incident.

In late 1947 the EEI, combined with a detailed Collection Memorandum from General Schulgen, was hand-distributed within the European Command by Lieutenant Colonel Malcolm Seashore (a former chief of T-2 Analysis section).

It is apparent from reading the memo that Intelligence still wanted European commands to be on the lookout for a possible German/Soviet link to the discs. Frequent mention of the Horten brother's flying wing designs in this document is the most striking example of this concern. Many of its points clearly stress Alfred Loedding's input from an aeronautical engineering perspective:

AIR INTELLIGENCE GUIDE
For
ALLEGED "FLYING SAUCER TYPE AIRCRAFT"

An alleged "Flying Saucer" Type aircraft or object in flight!' approximating the shape of a disc has been reported by many observers from widely scattered places, such as the United States,, Alaska, Canada, Hungary, the Island of Guam, Japan, etc. This object has been reported by many competent observers. Sightings have been made from the ground as well as from the air.

Commonly reported features that are very significant and which may aid in the investigation are as follows:
a. Relatively flat bottom with extremely light reflecting ability.
b. Absence of sound except for an occasional roar when operating under super performance conditions.
c. Extreme maneuverability and apparent ability to almost hover.
d. A plan form approximating that of an oval or disc with a dome shape on the top surface.
e. The absence of an exhaust trail except in a few instances when it was reported to have bluish color like a Diesel exhaust which persisted for approximately one hour. Other reports indicated a brownish smoke trail that could be the results of a special catalyst or chemical agent for extra power.
f. The ability to quickly disappear by high speed or by complete disintegration.
g. The ability to suddenly appear without warning as if from an extremely high altitude.
h. The size most reported approximated that of a C-54 or Constellation aircraft
i. The ability to group together very quickly in a tight formation when more than one aircraft were together.
j. Evasive action ability indicates possibility of being manually operated, or possibly by electronic or remote control devices.
k. Under certain conditions, the craft seems to have the ability to cut a clear path through clouds—width estimated to be approximately one-half mile. Only one incident indicated this phenomenon.

The first sightings in the U.S. were reported around the middle of May. The last reported sighting took place in Toronto, Canada, 14 September 1947. The greatest activity in the U.S. was during the last week of June and the first week of July.

This strange object or phenomenon may be considered, in view of certain observations, as a long-range aircraft capable of a high rate of climb, high cruising speed (possibly subsonic at all times) and highly maneuverable and capable of being low in very tight formation. For the purpose of analysis and evaluation of the so-called "Flying Saucer" phenomenon, the object sighted is being assumed to be a manned aircraft, of Russian origin, and based on the perspective thinking and actual accomplishments of the German. There is also the possibility that the Horten Brothers perspective thinking may

have inspired this type of aircraft and particularly the "Parabola" which has a crescent plan form. Records show that a glider version only was built of this type aircraft. It is reported to have been built in Heilengenberg, Germany, but was destroyed by fire before having ever flown. The Horten Brothers latest trend of perspective thinking was definitely toward aircraft configurations of low aspect ratio. The younger brother, Reimar, stated that the "Parabola" configuration would have the least induced drag which is a very significant statement. The theory supporting this statement should be obtained.

The German High Command indicated a definite interest in the Horten type of flying wing and were about to embark on a rigorous campaign to develop such aircraft toward the end of the war. A Horten design known as the IX which was designated as the Go-8-229 and Go-P-60 (night fighter) was to be manufactured by the Gotha Plant. It is reported that a contract of fifty such aircraft was planned but only three or four were built. This plant is in the hands of the Russians. A recent report indicates that the Russians are now planning to build a fleet of 1800 Horten VIII (six engine pusher) type flying wing aircraft The wing span is about 131 feet The sweep-back angle is 30 degrees. The Russian version is reported to be jet propelled. Answers to the following questions, therefore, are requested:

a. What German scientist had a better than average knowledge of the Horten Brothers work and perspective thinking; where are these scientists now located, and what is their present activity? Contact and interrogate them.
b. What Russian factories are building the Horten VIII design?
c. Why are the Russians building 1800 of the Horten VIII design?
d. What is their contemplated tactical purpose?
e. What is the present activity of the Horten Brothers, Walter and Reimar?
f. What is known of the whereabouts of the entire Horten family, particularly the sister? All should be contacted and interrogated
regarding any contemplated plans or perspective thinking the Horten Brothers and any interest shown by the Russians to develop their aircraft.
g. Are any efforts being made to develop the Horten "Parabola" or modify this configuration to approximate an oval or disc?
h. What is the Horten perspective thinking on internal controls or controls that are effective mainly by streams of air or gas originating from within the aircraft to supplant conventional external surface controls?

For any aircraft approximating that of an oval, disc or saucer, information regarding the following items is requested.
a. Boundary layer control method by suction, blowing or a combination of both.
b. Special controls for effective maneuverability at very slow speeds or extremely high altitudes.
c. Openings either in the leading edge top and bottom surfaces that

are employed chiefly to accomplish boundary layer control or for the purpose of reducing the induced drag. Any openings in the leading edge should be reported and described as to shape, size, etc. This investigation is significant to justify a disc shape configuration for long-range application.
d. Approximate airfoil shape in the center and near the tips.
e. Front view and rear view shape.

Items of Construction
a. Material whether metal, ferrous, non-ferrous, or non-metallic.
b. Composite or sandwich construction utilizing various combinations of metals, plastics, and perhaps balsa wood.

c. Unusual fabrication methods to achieve extreme light weight and structural stability particularly in connection with great capacity for fuel storage.

Items of Arrangement
a. Special provisions such as retractable domes to provide unusual observation for the pilot or crew members.
b. Crew number and accommodation facilities.
c. Pressurized cabin equipment
d. High altitude or high speed escarpment methods.
e. Methods of pressurization or supercharging from auxiliary units or from the prime power plant
f. Provisions for towing especially with short fixed bar and for refueling in flight.
g. Provisions for assisted take off applications.
h. Bombay provisions, such as dimensions, approximate location, and unusual features regarding the opening and closing of the doors.

Landing Gear
a. Indicate type of landing gear whether conventional, tricycle, multiple wheel, etc.
b. Retractable and jettison features for hand gear.
c. Provisions for take-off from ice, snow, or water.
d. Skid arrangements for either take-off or landing.

Power Plant Item
a. Information is needed regarding the propulsion system used in the aircraft Possible types of engines that could be employed include:
(1) Reciprocating (piston type) engine or gas turbine. Either or both of these could be used to drive propellers of conventional or special design, rotating vanes, ducked fans or compressors.
(2) Jet propulsion engines including turbo jets, rockets, ramjets, pulse jets or a combination of all four.
(3) Nuclear propulsion (atomic energy). Atomic energy engines would probably be unlike any familiar type of engine, although atomic energy might be employed in combination with any of the above types. Aircraft would be characterized by lack of fuel storage space. The power plant would likely be an integral part of the aircraft and could possibly not be distinguished as an item separated from the

aircraft.

If jet propulsion is used, large air handling capacity characterized by a large air inlet area and large exhaust nozzle should be evident. The size of entrance and exit areas would be of interest.

It is possible that the propulsive jet is governed or influenced for control of the aircraft. The presence of vanes or control surfaces in the exhaust or methods of changing the direction of the jet should be observed.

Information desired on the propulsion systems pertains to the following items:
a. Type of power plant or power plants.
b. General description.
c. Rating (thrust, horsepower, or air flow).
d. Type of fuel.
e. Catalytic agents for super-performance or normal cruising power. 3

Officially Sign began on Feb. 11, 1948, although work under that code name had already commenced on January 26th. When General Craigie gave tentative approval to the project back on December 30th, he appointed Sign a "2A priority," the second highest, and a security classification of "restricted," the lowest rating. Sign and later Grudge code names were kept secret, but their existence became widely known and referred to in the press as "Project Saucer." Sign worked

through a system of channels. Air Force Intelligence officers stationed at the nearest air base to a sighting, or in some cases Naval Intelligence, usually conducted the first investigations. After that, cases went to AMC and from there down to TID's Sign officers within the Analysis division. A Sign investigator or extra staff person from somewhere within TID or even AMC would then sometimes be dispatched to a sighting location if further investigation was warranted. At times the FBI did the initial interrogation of witnesses and their reports were literary cut and pasted together to form many of the Sign case files. Other files were completed by the Sign team and/or by other intelligence personnel closer to a given UFO event. These were filed not just in Dayton, but with any government agency which could be of assistance, including some original paperwork going directly to Air Force Headquarters in the Pentagon. Some of the initial investigative paperwork, in fact, apparently never went through the Sign project at all, but straight to Washington. By early 1948 Air Force Headquarters ordered TID to make copies of all their UFO files and forward them to the Office of Naval Intelligence and other government agencies that could be of assistance. By that point many of the Sign files began to be

microfilmed but were of poor quality, indicating that they were meant only for inter-service use.

Some investigative work may have been conducted by military units eventually designated ATIC Detachment 1, 2, and 3. These were classified units which had been established during World War II to recover Japanese Fugo balloons. Fugos, loaded with incendiary bombs, were launched into the jet stream as a desperate attempt by the Japanese to strike back at the United States. When the Japanese started to seriously consider arming the balloons with biological weapons, the Western Defense Command surrounded the recovery units with secrecy. After the war many of the teams were apparently kept in place in the event other countries might try to threaten North America with similar balloon warfare. Air Force Colonel Robert Friend later stated that these units were used to conduct UFO investigations up through 1953. They, however, reported to an intermediate level in Virginia and their reports did not go directly to Sign or the later Grudge and Blue Book projects. [4]

Captain Robert R. Sneider technically headed up the Sign team (referred to as MCIAXO-3) while serving under TID Chief, Colonel McCoy, and TID Analysis division Chief, Colonel William R. Clingerman. Sneider, however, seems to have merely been the military administrator with Loedding initially assuming the role of a working director of the team. A few notable members on the Sneider/Loedding staff were, Lawrence H. Truettner (missile specialist), Nicholas Post, John H. Zell, George W. Towles, John "Red" Honnacker, Lieutenant Colonel Miles Goll (who may have technically supervised engineering specialists like Loedding while at Intelligence), Major Raymond A. Llewellyn, and Lieutenant Howard W. Smith. Major Melvin W. Faulk also lent assistance until transferred in June of 1948. By early 1948 Albert Bonnelle Deyarmond (a reserve Army Air Force colonel) also became a key team member. Most of these individuals were highly trained technical intelligence engineers who had worked on UFO related casework as early as July while serving in or assisting TID's Analysis division.

Alfred Loedding, as stated, had come to Wright Labs back in 1938 where he won a reputation as a brilliant technical innovator in the T-3 Engineering section. Loedding consulted on early UFO investigations not only because he was a leading authority on flying wing aircraft design, but he was also recognized as one of the few in the United States who had personal experience in rocketry. He had, in fact, become chief of the first Jet Propulsion Laboratory at Wright Field in 1940. In Loedding's resume he stated that while there, "I pioneered the work in rocket type engines ... I

initiated and monitored all work that finally resulted in a modern and complete Jet Propulsion Laboratory in 1943." [5] After that Loedding went to work at the Armament Laboratory on the development of another project of his, the hydrobomb. The hydrobomb was a type of underwater rocket-propelled torpedo that was to be carried by aircraft for anti-ship warfare. While in this project Loedding served as the chief liaison with private contractors but apparently ran against military procedure in his work. As a result of that he resigned from the project in disgust with the wasteful management of time and resources that the military bureaucracy exhibited in its own efforts to develop weapons systems.

After that Loedding realized weapons production must be entrusted with private industry. Nevertheless, Wright Field continued to use him as a military liaison and trouble shooter with other industries involved in 1 ^ government war production contracts. This included work on the B-29 project and its successor, the B-50. During this time Loedding personally contributed to the solving of the engine fires that plagued so many B-29s coming out of the first production runs. He was then sent to coordinate on the first stages of development of the huge nuclear B-36 bomber. While on the B-36 project he assisted with the shaping and forming of magnesium alloy sheet metal at the B-36 plant in Fort Worth, Texas. After the war he briefly worked full time at Patterson Field for the T-2 intelligence section. We do not know what he worked on at the time, but soon Alfred was back to work in the T-3 Engineering section. Apparently by then he worked mainly in research and development projects and was still used as a corporate liaison and technical assistant. He wrote that at that time, "I visited major aircraft companies and manufacturing concerns, such as the Aluminum Company of America and their sub-contractors to solve manufacturing difficulties and tooling problems. I also visited various other plants throughout the country and was solely responsible for examination of their manufacturing ability and then recommending the awarding of contracts to Procurement Division." By February 17, 1946 Loedding returned to T-2. He wrote that at that time:

> **I joined the Analysis Division . . . and took a leading part in organizing the Aircraft Section. I created the Supersonic Unit and became Chief for approximately two months. I was then advanced to Civilian Chief, Aircraft Section, and supervised the Section jointly with the Military Chief, which was the policy at that time. I held that position from April until June, and was then loaned to the Office of the Technical Assistant in order to replace Major Ryan, who was scheduled to leave in July; I took complete charge of the Office of the Technical Assistant on 1 August 1946, after Major Ryan resigned in July.** [6]

From August 1946 to May 1949 Loedding officially worked as the "Technical Assistant to the Chief of the Technical Analysis Division of MCI A." (MCIA was TID's WWII era predecessor which was called the Materiel Command Intelligence or MCI of | the Air Technical Service Command—forerunner to AMC. In this case Intelligence Analysis was called MCIA—A for Analysis.) During this time, aside from what would become an active job in UFO investigations, Loedding also supervised the offices of Guided Missiles and Foreign Industrial Facilities. It is unclear why, but although Loedding was technically employed by T-2 Intelligence then based at Patterson Field, he retained his office at Wright Field and may have still worked in some capacity for T-3 Engineering. In Loedding's resume he characterized his duties at this time as follows:

Alfred Loedding

I was authorized to sign all routine correspondence under the jurisdiction of the Technical Assistant's Office when on a Division level. I was responsible for approving all outgoing correspondence and technical reports from my office and the offices of Guided Missiles and Foreign Industrial Facilities. My principle duties consisted of 1) advising the Chief and his Deputies regarding technical matters of an engineering nature, a technical intelligence nature, and broad plans for accomplishing the overall intelligence mission, 2) acting as the Chief's representative on important conferences that would effect the entire Division, 3) acting as an engineering consultant for all the sections of the Division, 4) monitoring continuous projects, such as the Air Force College Thesis Program and Foreign Aeronautical Trends Report, etc., 5) approved all technical reports including those of the German scientists, for technical or engineering correctness, as well as the technical intelligence aspects, 6) review and recommend security classification of important documents as requested by the Chief, 7) present talks to various governmental and outside agencies regarding highly technical subjects pertinent to the mission of the Division, 8) other routine and special duties befitting that of a Technical Assistant as requested by both the Chief of the Division and the Chief of the Intelligence Department, such as initiating and monitoring Project "Sign" (Flying Saucers). [7]

On September 5th of 1947 he served as TID's Intelligence as well as

Engineering liaison with the Pentagon on the UFO subject. This involved a meeting with General Schulgen and Dr. Charles Carroll who was a mathematics and missile expert. They met initially to discuss a radar sighting in Fukuoka, Japan, but Loedding attended other meetings as well on the disc sightings. Loedding also worked with Lieutenant Colonel Garrett from the Air Force Intelligence, Collections Division in the Pentagon. As already examined, Loedding may have assisted Garrett on his preliminary estimate of the current UFO situation back in July. (See page 83.)

Loedding initially concentrated on a German/Soviet answer to the disc sightings as many did. Perhaps this was because at the time he was working with many of the former Nazi rocket scientists who were then being utilized by Wright Labs. But Loedding, along with Garrett, would by the end of 1947 become supporters of an extraterrestrial hypothesis for the origin of the flying disc phenomenon. Loedding's excitement over the disc sightings, in fact, stimulated a movement to have many of the Pentagon's UFO files transferred to Wright Field in September of 1947. Beyond that no one will ever know the full influence of Alfred Loedding, but his personal papers do characterize him as the "initiator of Project Sign." Certainly it is fair to speculate that he may have been a key

figure pushing for the establishment of such an investigation because he was the man being used as a liaison between Washington and Dayton. Having talked to Loedding's brother and son, it is the belief of these authors that Alfred Loedding may have suggested the code name of Sign.[8]

Albert Deyarmond also did important liaison work with the Pentagon. In fact, research conducted by researcher Wendy Connors indicates Deyarmond may have been the main Pentagon contact, but not until mid 1948. This could have been a result of the fact that Deyarmond had been a very close friend and wartime companion of Colonel McCoy. During the war Deyarmond and McCoy along with Colonel Harold Watson were all key figures in the operation to recover secret German technology. After the war Deyarmond assisted Colonel McCoy in building a technical data base at Wright Field from German documents.

Albert B. Deyarmond

Deyarmond, like all the Sign staff, was well versed in many disciplines. Deyarmond did not officially join the Sign team until May of 1948 because he had taken a job at the Ryan Aeronautical Company in San Diego from December 1946 to April 1948. He had left active service at the end of 1946 due to minor health problems but retained his rank as a reserve officer. It is believed McCoy requested Deyarmond's return to active duty to help with the saucer investigation as early as July 1947, but his health prevented it. McCoy, however, finally got Deyarmond on the team by 1948 as a civilian employee. His influence in the project's later work is very evident. Like Loedding, he was a gifted engineer and also had an aptitude for missile aerodynamics. Yet, Deyarmond was not as outwardly vocal on the possibility of an extraterrestrial connection to UFOs as Loedding.

That belief in an extraterrestrial connection seems to have become a very touchy subject. Surprisingly, it was not because of the fantastic nature of such a theory but the politics within the Air Force itself. It is important to keep in mind that there were many different people within Air Force Intelligence who affected military policy on UFOs. Individuals gravitated to groups which formed factions, not just within the Pentagon but Dayton too. Many of these names can not all be detailed here, but the reader should keep the following passage in mind as the complicated history of Air Force involvement unfolds.

First the Pentagon. In 1947 Carl Spaatz as Chief of Staff was the top authority figure. However,

Spaatz figures very little into the UFO story because his junior executive, General Hoyt Vandenberg, would soon replace him. Under both Spaatz and Vandenberg was the office of Intelligence known as The Directorate of Intelligence, eventually referred to as AFOIN. General George McDonald served as Chief of Air Force Intelligence in 1947. But, like Spaatz, he figures very little into the UFO picture because it would be his executive officer, Brigadier George Schulgen, who would affect policy. We have already seen how Schulgen mobilized the first efforts to look into the UFO sightings after the July 8th Muroc Sightings. He also inspired the Twining Memo later that year which led to the formation of Project Sign by 1948. But following in McDonald's and Schulgen's shoes in 1948 was Major General Charles Pearre Cabell. Cabell would end up having significant influence on Air Force policy concerning UFOs, setting the stage for Project Blue Book in late 1951.

Pentagon Intelligence had its own divisions. Under AFOIN were the Air Force Office of Intelligence Requirements branch or AFOIR and the Air Force Office of Air Intelligence or AFOAI. The former (AFOIR) included the Collections branch known as AFOIR-CO. It was in this office we find Colonel Garrett working under his executive officer Colonel Robert Taylor.

As we have seen, Garrett was the one who worked with the FBI and soon Alfred Loedding from Dayton. He also became personally sympathetic with the developing viewpoint that many of the flying disc reports represent "real technological objects." Like Loedding, this at first meant German technology but their belief changed to an extraterrestrial hypothesis by the beginning of 1948.

Not only were Garrett, and soon Taylor, among this pro-UFO Pentagon faction, but also Colonel Frank Dunn, who worked in the main office. (Dunn would later be head of Intelligence at Dayton from September 1951 to August 1952 during the heyday of Project Blue Book.) Major William A. Adams of the Documents and Dissemination Office was also an open-minded individual working in Pentagon Intelligence. Adams, like Dunn, would be very influential in the UFO picture by 1952. [9]

On the other side of the Pentagon spectrum were officers from AFOAI. These men served as an "analysis" division. Under that heading could be found those who were "non sympathetic" to the UFO phenomenon. Such individuals worked in the AFOAI's Defense Air branch (AFOAI-DA) and the Air Estimates branch (AFOAI-AE). All of these men became known as "violently anti-UFO." Researchers can grasp a clear insight into why some people became "pro-UFO," or on the other hand how someone may choose to discount the sightings. But no one can explain the motivation behind that Pentagon faction which chose to debunk the phenomenon at all costs. Officers like Colonel Harold Watson, (a key man on McDonald's staff) went so far as to criticize the character of pilots who saw UFOs. He even did this publicly and went out of his way to talk to reporters about the silliness of UFOs and those who claimed to have seen them. Yet all who were associated with Watson knew him to be the first to defend Air Force pilots in any other matter. He was an outstanding officer—no one ever said anything to the contrary. In his early days he had also been a highly respected test pilot at Wright Field. During the war he distinguished himself as head of Operation Lusty—an endeavor to recover German aircraft technology. The small group of men he lead around Europe during that mission became known as Watson's Wizards and they all had great admiration for their commander.

Watson would replace McCoy in mid 1949 as head of Intelligence in Dayton. His arrival, in fact, came just after the end of Project Sign and the creation of a very ineffective successor project called Grudge. He served that post until the creation of a reorganized UFO investigation in September of 1951 when Colonel Frank Dunn replaced him. During Watson's tenure at Dayton he, in association with James Rodgers, used Project Grudge to debunk UFO sightings. Ironically, Watson would return

to head up Intelligence in

Dayton in 1953 just as the heyday of Project Blue Book, under the very objective administration of Captain Edward Ruppelt, came to an end.

Other "saucer killers" were Pentagon assistants to the Director of Estimate, Major Aaron Jerry Boggs and Colonel JJ. Porter. Both Boggs and Porter (Porter soon became Director of Estimates) and especially Watson would affect UFO policy up through 1951, with Porter staying on the crusade through 1952. Yet these were not poor officers nor men who lent themselves to anything other than objectivity. They were some of the best minds in their field, but they held more senior positions than the pro-UFO faction. Thus, many researchers have wondered if there is a secret, yet unknown, reason for their unexplainable aggressive hatred of the UFO phenomenon. Some researchers feel they may have had first-hand knowledge and involvement in a cover-up of physical evidence stemming from the Roswell Incident, although this idea has not been documented and remains only speculative conjecture at this point in time.

As the Air Materiel Command at the newly renamed Wright-Patterson AFB complex in Dayton became involved in UFO research, factions formed there as well. The head of the AMC at this time was Lieutenant General Nathan F. Twining. Under his office came five basic operations. The most well known were the Air Force's Technical Research and Development engineering operation or T-3, and the Technical Intelligence group or T-2—which became the Technical Intelligence Division (TID) in August. T-3 was based at Wright Field, comprising the aviation laboratories and headed up by Major General Alden Crawford with General P.O. Carroll serving as director of research and development (often termed R&D). That is where Loedding first worked (in building 11A Room 252) until assisting almost full time at T-2 by 1947. The T-2 offices, however, were located at Patterson Field—five miles away from the older Wright Field. (The other divisions of AMC were T-l—personnel, T-4—supply, and T-5—plans.)

Colonel Howard McCoy served as the director of AMC's T-2/TID group. It had four subdivisions: Collection, Intelligence Analysis, Air Documents, and Photographic. Known as Mac, Colonel McCoy was an outstanding engineer in his own right. He had initially moved from a T-3 engineering division during the war into intelligence work when men with his experience were needed to recover Germany's advanced aviation technology. McCoy then got into the role of analyzing German technical documents which led his division into a general enemy air power analysis mission. That is how the Intelligence Analysis division formed under TID's WWII era predecessor which was called the Material Command Intelligence or MCI of the Air Technical Service Command—forerunner to AMC.

Analysis is where Colonel Clingerman comes into the picture. He

served as executive officer of MCI—Analysis by 1947. It was his office that Alfred Loedding assisted with at almost every level but concentrating on supervising the offices of Guided Missiles and Foreign Industrial Facilities. Loedding worked well with Patterson Field Intelligence legends McCoy and Clingerman—who were both engineers at heart. But interestingly, Loedding seems to

have kept his Wright Field office in building 11A throughout 1947 and part of 1948 even though his title changed to Analysis Division Technical Assistant of the TID intelligence department as early as 1946. Although the WWII era prefix MCIA was still used for a long time for TID's Analysis division, it was composed of two sections. One became known as the Operations Section or MCIAO and the other as Technical Analysis Section or MCIAT.

MCIAT had a number of branches like Special Analysis—MCIAXB, where Nicholas Post worked. Another was Special Projects—MCIAXO, headed by Major Raymond Llewellyn. A third was Foreign Liaison—MCIAXL. Then Aircraft and Guided Missiles \ Analysis—MCIAXA, where John Zell and Lawrence Truettner resided.

Special Projects or MCIAXO actually became the birth cradle of Sign because that is where innovative ad hoc committees formed. Alfred Loedding, in fact, may have lobbied for such a special (UFO) project out of the Special Projects group before authorization even came down from the Pentagon. But, because all these offices were very fluid, one can now see why the Sign team all formed from different areas within the vast TID organization.

It is still the personal opinion of these authors that Loedding inspired the project name of SIGN. After all, Edward Ruppelt once stated that each project name had a meaning behind it, and Loedding did come to believe that the discs could be of extraterrestrial origin.[10] As stated, Alfred Loedding, who worked in all the offices at one time or another—sometimes simultaneously, had a particular enthusiasm for the phenomenon. This may have been generated by his own sighting during October of 1932. Primarily, however, his experiences during 1947 proved to Loedding that something very significant was taking place.

Fortunately, the authors recently tracked down a son and the brother of Sign civilian team leader Alfred C. Loedding. In two different interviews with a follow-up intensive interview of son Donald Loedding by Wendy Connors and then a third session with both Hall and Connors present, these gentlemen detailed facts never before known about Alfred C. Loedding or the Sign project. Aside from the relevant UFO-related stories, the authors learned that Alfred Loedding had indeed been an extremely gifted aeronautical engineer.

This is a very critical point because UFO debunkers have always downplayed the Sign project by continually focusing on one point—the inexperience of the team members. Research conducted by the authors finally dispels this myth.[11]

The best information from Loedding's Project Sign days comes from his son Donald. Donald was in the transition from grade school to high school in those years and recalls numerous impressions from the time. One of the most stunning is a clear memory of his father talking about "landing cases," yet today the Project Sign documents released through the Blue Book Files by the National Archives do not include any investigative paperwork on true unexplained landing incidents. Donald, however, recalls not one but numerous trips his father made to investigate such events including incidents in which UFOs interfered with the electrical systems of automobiles. Such cases of electrical magnetic effects were not officially documented by Air Force investigations until 1957. Could this be why Alfred was the first to examine an electromagnetic connection to the phenomena while others only concentrated on ram jet or nuclear propulsion theories? He also recalls his father being especially interested in UFO reports filed by airline pilots. The Sign files do speak of such cases but detail far fewer incidents than are remembered to have attracted Alfred Loedding's attention.

On the other hand, unlike many of the sensational stories currently in print on the Roswell

Incident, Donald Loeding emphatically states that his father (who had a "Secret"—later "Top Secret"—security clearance) never spoke of any such event and is certain that his father would have known about a crash of a UFO if it had occurred. His brother Fred confirmed that. In Fred's mind, Alfred had no knowledge of a UFO crash at Roswell. Fred Loedding does, however, tell a now rather familiar story about a hanger that was off bounds when visiting his brother at Wright Field around 1947 or 1948. Alfred could not tell Fred what was in that hanger because he himself had no access, but the implication was that is was UFO related.[12]

Loedding, like all the Sign members were the highest valued experts employed by the Air Force. By the end of 1948 the Sneider/Loedding team looked into 243 sightings with a high degree of care.[13] Unlike later Air Force investigations, participating intelligence officers and Pentagon brass alike took this project very seriously. FBI agents continued to be utilized to research the backgrounds of witnesses. Ohio State University, under contract with the AMC, also served as a resource. That's how the late Dr. J. Alien Hynek came to work as a consultant. In 1947 he taught astronomy at Ohio State. He was the only astronomer near Dayton and in later years described his long association with the Air Force as an accident of geography. Members

of the Scientific Advisory Board to the Chief of Staff of the USAF like Dr. George E. Valley supplied their services as well in a consulting capacity.[14] Although no one knew what they might find, their interest primarily centered around fears that the Soviets might be responsible for the disc mystery.[15]

14 October

UFO activity in the fall of 1947 remained very spotty although interesting reports continued to be documented. One such case marked unidentified, occurred eleven miles north of Cave Creek, Arizona, when two Phoenix mine operators saw a black flying-wing shaped UFO around noon that day. It zoomed over them at about 8,000 to 10,000 feet, moving around 350 miles per hour. Both men had experience with military aircraft, one with five years service as a fighter pilot and the other with two years training as an Army Air Force gunner and a pilot himself—yet neither could even make a guess as to what it was that they had seen.[16]

On that same day Captain Charles E. Yeager broke the sound barrier and reached 760.5 miles per hour in the Bell XS-1. Until then only captured V-2 missiles flew at such speeds. Conventional jets could seldom exceed 600 miles per hour, and the German rocket designs only flew in restricted test areas of the American West and regions of Soviet Siberia. The next generation of rockets like Sputnik, that were capable of intercontinental flight or orbiting the Earth, were still a decade away.

12 November

Boise, Idaho Statesman, reporter Dave Johnson continued to express great interest in UFOs. Whenever a good case came along he conscientiously sought to gather the facts. This excerpt details a notable sighting from this date that took place off the American West Coast. Observations of unidentified aircraft at sea always attracted the attention of Intelligence officials due to the possibility that they could originate from Soviet submarines. For that reason a clipping of this article ended up in the files of the 4th Air Force: (Alfred Loedding indicated in an interview in 1954 that

Wright Field was keeping a similar file of correspondence and clippings in the late 40s, but unfortunately this material was apparently later disposed of.) [17]

Talks About Aviation
by Dave Johnson

One of the greatest aeronautical mysteries of all time—that of the flying discs—has come to life again. Objects which where reported seen by thousands of persons on the ground and by scores of pilots in the air, have been sighted off the Pacific coast.

The oceanic appearance of flying discs was the subject of a message transmitted to naval intelligence in San Diego, San Francisco and Seattle. The report also was relayed to the U.S. hydrographic office in ".." San Francisco. It originated with the second officer of the tanker S.S. Ticonderoga.

The tanker was at a position 300 miles north of San Francisco, and 25 miles off the coast on Nov. 12 when the officer reported that he saw two flying discs.

This is the report: "Two flying discs were sighted flying southwest at f high speed. They appeared about 36 feet in diameter and were 20 feet apart. They emitted a very bright glow and left a streak about 50 feet behind them.

They were first sighted bearing north and disappeared bearing west at 0620 Greenwich central time. The fix (position of the vessel) was latitude 43 degrees 15 minutes north and 124 degrees 54 minutes west"

After receiving a report that the discs had been sighted at sea, we telephoned an intelligence officer assigned to one of the air forces in the United States. This air force had received "orders from the top" to expand every effort in tracking down the possible source of flying discs. We cannot give this officer's name. But he said he is now convinced that something has been flying over the United States, and the source of that something, as far as he understands, is not known either to the Army or the Navy.

We have also learned that the Army has asked what it considers its most creditable witnesses of flying discs to draw pictures of what they saw. These drawings have all been generally the same. These sketches are of an object with a rounded nose and a tail with a sharp point, much like a tadpole. The officer with whom we talked appeared extremely interested in the blue light which glared over a 250-mile area of southern Idaho and eastern Oregon a few weeks ago. He said he was not convinced it was a meteoric display. Three men, two United Airlines pilots and a CAA air center inspector riding with them, observed this light from a point near Baker, Ore. They said that after the light expired there was a trail of luminescent particles in the air which slowly assumed an arch of 180 degrees and vanished. [18]

15 November

It is hard to find detailed information on UFO sightings in foreign countries during 1947. Many of the accounts we do have are very vague. But whatever

it was that this report represented—47,000 people at a baseball game in Managua, Nicaragua, saw it. Most of the stories described two silver oscillating "platillos valadores" that slowly flew down over the stadium and briefly hovered before zooming off at terrific speed. Spanish for flying saucers, platillos valadores or "flying plates" could only be so characterized by people throughout the world because they resembled no known aircraft.[19]

18 November

By November there were efforts by the Air Force to plot the trajectory of UFO activity in North America based on the sightings that they had then collected—which only amounted to about three to five percent of known incidents. Alfred Loedding and Pentagon consultant Dr. Charles Carroll seem to have coordinated on this but only one record speaks to this effort.[20] Because the files from this time are so sparse, only bits and pieces of the types of discussions going on at Wright Field can be ascertained in regard to UFOs. One curious topic we know of did center around Spain. Colonel McCoy remained very interested in any possible link to German technology that could account for the saucer sightings and continued to leave no stone unturned. One theory centered around the possibility that some German scientists had escaped to Spain at the end of the war and were developing radical aircraft designs. Today we know the Spanish were producing aircraft based on German designs, but these all dated back to pre-war or WWII models. In fact one of these many aircraft built in Spanish aircraft plants, a virtual copy of a German JU-52 transport, is today on display at the Air Force Museum in Dayton, Ohio. Yet, it is curious to note that at the end of 1947 Colonel McCoy sent a memorandum asking that all references to aircraft development in Spain be upgraded to "Secret." No files on this subject postdating that memo have been declassified.[21] (This notion of Spain serving as a point of origin for flying saucers gained public attention after a syndicated newspaper story, written by Lionel Shapiro, detailing weapons development in Spain.)

Added to the mysteries of this time is a story out of Greece where numerous flying disc reports originated at the end of 1947. The Greek government became very concerned over the incidents because of recent Soviet attempts to promote political instability as well as coerce democratic

movements in the region. Greek authorities thus decided to conduct an investigation. They assigned their top physicist, Paul Santorini, to the case. Santorini was a brilliant scientist and a close friend of Dr. Albert Einstein. Santorini looked into the possibility that the sightings could be the result of Russian missiles or aircraft. It was common knowledge that the Soviets were seeking to influence the political situation in Greece, and this stood as a perfectly logical conclusion. Santorini, however, established that the reports were not attributed to known mechanical devices.

Logically one would think that the American military would have been very interested in any such studies so near the Soviet border dealing with even the possibility of Russian missile activity. For that reason it is very odd that the Pentagon instructed the Greek government to terminate Santorini's studies when they received word of his conclusions. A team of American scientists then flew to Greece to interview Santorini, but no records have been uncovered to shed any more light on this unique series of developments.[22] It is interesting to speculate weather Alfred Loedding and missile expert Lawrence Truettner might have been on that trip to Greece. It certainly would have dovetailed with their duties as members of the Analysis division.

UFO activity overseas must have been rather significant that late fall and winter. As stated, less than five percent of sightings were reported to the US military in 1947, and only a percentage made news stories after the summer onslaught. So the sightings we do know of from Europe and the Middle East at that time suggest more than may be presently recorded. These include disc sightings in the Persian Gulf on November 5th, Oslo, Norway, on December 12th, the Antarctic around the very end of 1947 or early 1948, and reports in Finland by the first of 1948.[23]

Colonel McCoy was not the only one still trying to link disc sightings to European or Soviet

matters. By December the public was just as anxious to find out if there could somehow be a Soviet connection to the saucer mystery. Oregon Congressman Harris Ellsworth even made the statement that, "he had received information concerning the development of high-velocity missiles by Soviet scientists." [24] The implication expressed by Ellsworth's statement attempted to address fears over the hundreds of unexplained sightings of discs that had occurred in his state since early summer.

Scientists were also serious about the subject even though most did not speak out on the topic. Dr. D.C Wylie of the University of Iowa stood out as an exception. At the annual winter meeting of the American Association for the Advancement of Science, Wylie addressed a session attended by astronomers, urging that a nationwide "sky-patrol" be established to

investigate the flying disc phenomena. He, like other scientists, felt that the disc mystery may involve matters of national security. His concern therefore stemmed from a sense for national preparedness and not necessarily matters of scientific curiosity. This is an important point because it demonstrates that even by late 1947 the public in large part perceived flying saucers as earth-born phenomena. In later years scientists would become interested in UFOs because of the implication to extraterrestrial visitation. By then, however, those same scientists would remain hesitant to speak out on the subject. This time it was not for reasons of indifference but fear of ridicule. Over the course of the years following 1947, the concept of spaceships from another world would be lightheartedly addressed by the press and after 1948 even by the Air Force itself. Largely because of that treatment, by 1949, the cinema and popular literature would equate UFOs not only with spaceships but do so in a negative stereotypical fashion which promoted that very air of ridicule.

18 December

Because UFO sightings were still popping up in the news, the Air Force continued to feel public pressure for answers to the flying saucer mystery. The degree of pressure the government was then exerting on the USAF is not yet fully documented, but for some reason Air Force Chief of Staff, General Carl Spaatz, chose to comment on the issue this day. He stated that he was not convinced of the existence of such objects but then contradicted his position by stressing that the Air Force could not discard the possibility that the saucers were the result of foreign technology. Obviously, reporters took this reference to be synonymous with Soviet aircraft. But did he have a different inference in the back of his head? Others like Loedding, were just starting to seriously consider spacecraft from other worlds as a possible answer.

Although the military did important preliminary investigations in 1947, many of the files it generated were mysteriously "lost." What remain today are listed in the first cases of the United States Air Force Blue Book files. Edward J. Ruppelt, later an Air Force project leader of UFO investigations from 1951 to 1953, had the opportunity to view a more complete set of files in late 1950. Fortunately, he summarizes many of his observations in his 1956 book, Report on Unidentified Flying Objects. His personal papers, now under the capable administration of Professor Michael Swords of the Department of Science at Western Michigan University, also reveal unique insights.

Ruppelt stated that the 1947-48 correspondence of TID showed "that the UFO situation was considered to be serious, in fact, very serious." Only the best in intelligence came together to work on Sign. As a result, security became very strict concerning media investigations into the subject as the

Pentagon did not know if UFOs were Soviet secret weapons, the Navy XF-5-U-l project, or "non-earthly" in origin. He confirms many at TID began to regard UFOs as the latter. By 1948 "the Soviets were practically eliminated as a UFO source . ...those in ATIC were openly discussing the possibility of interplanetary visitors without others tapping their heads or looking smug." (When Ruppelt refers to ATIC, he means TID which in 1951 was renamed Air Technical Intelligence Center.)

Ruppelt also found a memo in the old Project Sign files which, in his words, stated, "Those who were convinced that UFOs were of Soviet origin now began to eye outer space, not because there was any evidence that UFOs did come from outer space but because they were convinced that UFOs existed and only some unknown race with a highly developed state of technology could build such vehicles." [25]

By the end of the year, 109 case reports of strange flying objects were accounted for in the Project Sign office. Nine cases still remain classified as unidentified in today's declassified (Project Blue Book) Air Force files.[26] (Earlier Air Force figures listed 12 unidentified cases for 1947, but the index released by the National Archives in 1976 reveal only 9. In addition, the Air Force's official statistics from 1969 list 122 total reports for 1947 but today only 108 cases plus an unnumbered report are present.)

Dr. James McDonald, a noted UFO researcher during the 1960s, reinvestigated many of the 1947 cases. He acquired names of witnesses from the Air Force and tracked down some of those individuals. McDonald's papers, now available to serious researchers at the University of Arizona, prove the 1947 wave was not just a "fly over" phenomenon as often suggested. Rather, the sightings from that year reflect all aspects of UFO behavior as evidenced by later waves. Other scholars in the field of UFO studies such as Ted Bloecher, Aime Michel, Richard Hall, Jan Aldrich, and Loren Gross have concurred with McDonald. At one time or another in their writings they have stated that all aspects of the phenomenon are exemplified by the 1947 sightings with the exception of abduction cases. This even includes radar cases. Recent research by Jan Aldrich indicates that the first 1947 radar case may have occurred as early as January 16th over the North Sea. The Far East Air Force had three such cases in Japan during July, August, and September. The Humble Oil Company also had an anomalous radar incident at their research facility near Houston, Texas, on September 19th. To date, Jan Aldrich is continuing his very important research into 1947 and is the most qualified to draw the final conclusions on the great UFO wave of 1947.

Conclusion

1948

The Short Heyday of Sign

The year following 1947 witnessed the formal activation of Project Sign. Unfortunately the heyday of Sign lasted but a brief period. Four specific case investigations during 1948 tell a great deal of the story of Alfred Loedding and his beloved Sign project. In fact, if ever there was a time in which a group of highly technical people sought answers to the complex UFO mystery, it was during that watershed period. In that year Loedding, Sneider, and other team members were literally looking for a sign to explain the events which had transpired during the past year—something to help explain the perplexing sightings of unusual aerial phenomena that were still occurring.

On January 7th, 1948, they thought they had one. On that day Kentucky Air National Guard pilot Captain Thomas F. Mantell, Jr. died when his F-51 fighter crashed southwest of Franklin, Kentucky, after intercepting a high flying UFO. Soon known as the Mantell Incident, the case is considered one of the most famous flying saucer stories of all time.

The fateful intercept began at 2:30 P.M. CST near Louisville after personnel of Fort Knox's Godman Air Field became concerned over the presence of a strange object overhead. It had been in sight since 1:45 P.M. when tower operator Sergeant Quinton Blackwell received a call alerting him to the UFO by the fort's security police. Tower commander Colonel Guy F. Hix later confirmed an

unknown over the area along with Captain Gary Carter, also in the tower at the time. Carter, with the aid of 6 x 50 field glasses, described it as a round white object which appeared very high and at times seemed to hover. PFC Stanley Oliver, also in the tower, described the UFO more akin to a high altitude balloon, stating that it looked like "an ice cream cone topped with red." Others had a similar description, likening it to a "parachute with the bright sun shining on top of the silk." [1]

Hix really didn't know what to think but decided he would try to find

out. About that time just such a means came to his disposal when Mantell's flight of four F-51 fighters neared Louisville on a return ferry mission from Marietta Air Base in Georgia. Hix asked the group to pursue and identify, although, one of the planes was running low on fuel so continued on to the flight's planned destination at Standiford AFB in northern Kentucky. The remaining three F-5 Is then began climbing as Mantell took the lead. At 2:45 P.M. Mantell gained visual contact with the UFO—stating that it was "in sight above and [a]head of me, and it appears to be moving at about half my speed or approximately 180 miles per hour." Already over 10,000 feet, Mantell led his flight still higher despite the fact they had no oxygen on board. Even as they approached the danger level of 15,000 feet, where no pilot is advised to fly without oxygen, Mantell pursued the UFO. He then reported: "It appears to be a metallic object or possibly a reflection of sun from a metallic object, and it is of tremendous size." Abruptly banking right, he continued his climb.

At 16,000 feet Mantell's right wingman, 1st Lieutenant Albert Clements,' tried to match the maneuver but started to fall behind. His other wingman, 2nd Lieutenant B.A. Hammond, also fell behind, becoming very concerned about their altitude. By that point they were over Bowling Green at 20,000 feet with Clements and Hammond quite a bit behind Mantell. The two wingmen had not yet seen the object nor were they even sure of what they were looking for. Mantell then radioed to them: "Look, there it is out there at 12 o'clock!" Clements could only "discern a bright-appearing object, very small, and so far away [that I was] unable to identify it as to size, shape, color ... Its position was slightly lower and to the left of the sun." Clements then urged his leader to level off and try to catch up with it from below. Mantell ignored the advice and radioed back that he wanted to follow it up to 25,000 feet for ten minutes and if he didn't get any closer, would then abandon the chase. Mantell then called Godman Tower around 3:15 P.M., stating: "I'm still climbing, the object is above and ahead of me moving at about my speed or faster. I'm going to close in for a better look."

Those were the last words ever heard from Mantell. The two other planes had broken off at 22,500 feet and headed for Standiford. All they could see as they left was their flight leader above them in the sun, still stubbornly climbing higher. At around 25,000 feet heading south, Mantell had pushed his luck still further but lost. He blacked out from oxygen deprivation at about 3:17 P.M. as his plane continued to climb to 30,000 feet. At that altitude the aircraft lumbered over and entered a circling descent. Soon the plane began an uncorrectable looping power dive, breaking up between 20,000 and 10,000 feet. Mantell must have regained consciousness sometime before the crash because throttle, mixture, and prop-pitch were all altered to slow the aircraft. Unfortunately that attempt only served to over-stress the aircraft and may

have caused its actual breakup. [2]

The aircraft crashed on the William J. Phillips farm outside Franklin, Kentucky, just 750 feet from the owner's house. Mantell's body was partially decapitated yet still inside the aircraft. It was not burned, radioactive, nor riddled with bullets as later sensationalized accounts claimed.[3] His watch, however, had stopped at 3:18 P.M., a minute or so before the aircraft had hit the ground. Godman Tower did not observe Mantell's crash, but kept sight of the UFO until 3:50 P.M., more than two hours since the sighting began. By that time Clements had refueled at Standiford and returned to the area but did not see anything unusual.

This now famous UFO case had actually begun earlier that day at 1:15 P.M. when state police received civilian reports of an odd flying object over Maysville, Kentucky (80 miles to the east of Louisville). Their report initially put Fort Knox police on alert which in turn placed Godman Tower on the lookout for a UFO. But unexplainably another sighting came at 1:35 P.M. west of Louisville and Godman Tower near Owensboro and Irvington. This report described a circular object about 250 to 300 feet in diameter. If correct, the UFO should have already passed the north edge of Godman field prior to their first sighting at 1:45 P.M. [4]

That night more than a dozen AFB control towers around the Midwest reported UFOs "low on the horizon." The first sighting came from the Clinton County Air Base near Wilmington, Ohio, at 7:35 P.M. EST. There, officers described seeing a light that seemed to be "dancing" up and down as it changed color from red to green. It then abruptly left to the southwest with a trailing exhaust. Then, just to the southwest of Clinton near Columbus's Lockbourne Air Base, tower operators saw a brilliant light descend as it trailed an amber-colored exhaust. Appearing perfectly spherical or orb-like, the object proceeded to make three tight circling maneuvers as it passed over the entire base. The light next streaked up at tremendous velocity to abruptly stop at a stationary position below an overcast sky. Yet, it soon rapidly descended straight back down. Coming much closer to the ground, the orb hovered for ten seconds—only to rise straight back up once again. The mysterious light returned to a spot just below the clouds before it sped off to the northwest. [5]

The Air Force publicly blamed the planet Venus as the cause for all of the series of sightings, including the daylight incident in Kentucky. In actuality, however, many of the intelligence officers in TID's Sign project were slowly becoming convinced UFOs were extraterrestrial in origin during

the course of the long accident investigation that continued through April. Loedding and Sneider got the Venus idea from Dr. Hynek who had only offhandedly suggested the planet as one possible explanation. They, however, used it as a cover or a quick fix to explain away what, at the time, became a very widely publicized incident in the midst of what was obviously going to be a long investigation. Sign team members thought they might have to suggest a far more shocking conclusion, but not before they had the time to develop the theory.

Edward Ruppelt, head of a later UFO investigation named Project Blue Book, confirmed as much in his memoirs. He stated that many at TID had adopted the "interplanetary" option by the end of the investigation because all others were exhausted. For that reason the Sign staff, in Ruppelt's opinion, looked only for evidence suggesting "spaceships" and nothing else in the Mantell case. Not finding any, they stuck to the Venus excuse to keep it under wraps. A sighting of the planet Venus would serve that purpose as well as any, but in their haste they did not even bother to check to see if Venus would have been bright enough to have been visible by Mantell or Godman Tower.

Asking that question to Dr. Hynek in 1951 when Edward Ruppelt headed a reinvestigation of the

case, they discovered that Venus would have been too dim to have been seen on the afternoon of January 7th. Ruppelt then discovered evidence suggesting that some or all of the Kentucky sightings could have been caused by a 100 foot diameter Navy "skyhook" research balloon released that morning at the Clinton County AFB in Ohio. Skyhooks were used for high altitude cosmic-ray research and were very secret at the time. He also discovered that the wind currents that day were right to take a skyhook over Kentucky, yet the best evidence was still to come. In the files, he read about two observers who just hours after the Louisville incident sighted a balloon. Both individuals, one in Kentucky and the other in Tennessee, had initially had their attention drawn skyward to what appeared to be a very unusual object to the naked eye, but then they easily identified it through their telescopes as a balloon. [6] It seemed the final proof, but despite Ruppelt's discovery, the Air Force never officially backed down from its unplausible celestial explanation and has thus caused newspapers and magazines to continually sensationalize the story. To this day the case's details are so distorted that it remains not only the most talked about of the "Classic cases," but the most confusing as well.

Yet Ruppelt's theory, although quite plausible, does leave serious questions unanswered. Mantell's last radio transmission clearly indicated the UFO was out-pacing his 400 mile per hour F-51. Skyhook balloons, even when caught in the jet stream cannot travel that fast. Of course if it was a

skyhook, it could have been as high as 60,000 feet causing Mantell to only think it outperformed his fast plane when in actuality he was seeing something much higher and further away. That might explain why the object remained in view from Godman for over two hours. But Mantell did have 2,867 flying hours, 67 of them in the F-51. He was a very experienced flyer and a veteran of the Normandy Invasion—having also won a Distinguished Flying Medal. He was also then operating his own flying school. At 22,000 feet or higher could he not have recognized a high altitude balloon that should have resembled a cone-shaped object, much like ground observer PFC Oliver described?

A close friend of Mantell went on record indicating that his friend had been a very cautious pilot and could not understand what would make him exceed the dangerous limit of 15,000 feet without oxygen. Even a flying cadet has the knowledge hammered into him at an early point that no one under any circumstances endangers himself or his aircraft by going above 15,000 feet without oxygen. Mantell's fellow pilot stated: "The only thing I can think was that he was after something that he believed to be more important than his life or family." [7]

Thomas Mantell

Two other amazing but less well known cases came into TID during the long Mantell investigation that further influenced the Sign team's opinion. One concerned a "flying wing" report from the Central Philippines. Filed by 1st Lieutenant Robert W. Meyers, the sighting took place on April 1st 1948 at 9:55 A.M. local time on a clear day with unlimited visibility as the experienced aviator led a flight of three P-47s of the 67th Fighter Group. Meyers was at 1,500 feet when he noticed the unusual craft three miles east of his position. Shaped like a flying wing or "half-moon" with a "turtle back," the object resembled nothing then in the Pacific. The strange craft flew below him at about 1,000 feet and traveled around 200 miles per hour. He estimated its span to be 30 feet by 20 feet long, with an overall silver color. Meyers attempted to contact the other three aircraft in his group, but his radio went out.

Finally, curiosity got the best of him, and Meyers decided to try to get a

better look. He made a 240 degree left turn, but as he did the UFO made a 90 degree left turn and leveled out to accelerate away at great speed in a matter of only seconds. No sound, power units, landing gear, cockpit, or exhaust trails were detectable, but he did notice that the craft had a small dorsal fin. [8]

Loedding, with his knowledge and expertise of flying wing designs must have took a special interest in this case. He also had reports of Meyers reputation as a pilot. By all accounts Meyers was a "reliable, non-excitable individual who appeared quite positive about his statements." This, coupled with the fact that the Northrop Flying Wing (the XB-35 and YB-49 models) were the only aircraft anywhere in the world that met the characteristics of the craft he saw, made this a truly remarkable sighting. [9] Because those aircraft never left the United States, the Sign team knew Meyers saw something of "foreign origin." But by then even the diehards in the project were becoming doubtful that such aircraft could be of Soviet construction. Loedding and a majority of the team therefore theorized by that spring that many of the UFO incidents could possibly represent something from outside this world. [10]

A report that strengthened their position came just four days later. It involved three trained balloon observers from the Geophysics Lab Section at Holloman AFB, New Mexico. On April 5th they and project leader J.W. Peoples, were working on a secret project connected with the Air Force's Watson Laboratory field studies. In the middle of their tests they noticed a round white object with a golden hue fly very high over the base at "tremendous speed." The third man then briefly caught sight of a second UFO. One of the men described what he saw as an irregularly rounded craft, slightly concave on top. The duration of the incident only spanned 30 seconds, but in that time the unknown made at least one vertical loop and then disappeared westward.

Although the knowledgeable balloon men said the object looked a lot like a balloon, they were certain that it was not because three facts discounted the possibility of a lighter-than-air object. First, its violent maneuvers surpassed the stress limits of any known balloon design then in use. Secondly, the high level winds up to 65,000 feet were measured that day as coming from the west at only ten to fifteen miles per hour and no balloon flies against the wind. Finally, if high velocity winds were present, and they had blown from the east, a balloon could not attain such speeds even if caught in strong winds. The only fact that likened it to a balloon was that at no time could sound be detected nor could their sensitive 400-meter atmospheric noise receiver, then in operation, record any signal.[11]

Highly trained aerial observers such as these carry a lot of weight in a UFO investigation. Alfred Loedding and an assistant from Clingerman's office, Lieutenant Colonel J.C. Beam, went out to New Mexico to investigate the case in person. Unfortunately, when they arrived Peoples and the other witnesses were away on other duty, but they were interviewed later at Watson Labs in New Jersey.

Loedding and Beam did talk to a Lieutenant Markley while at Holloman. Markley indicated that unusual radar returns had been noted at the base. He also told them of a sighting he had in August of 1947 and observations of "flat, round aeroforms"on two other occasions. (See page 109.) Loedding and Beam took advantage of their trip to investigate another older case. They traveled to Phoenix, Arizona, and interviewed William A. Rhodes who had captured a heel-shaped flying disc on film on July 7th, 1947.

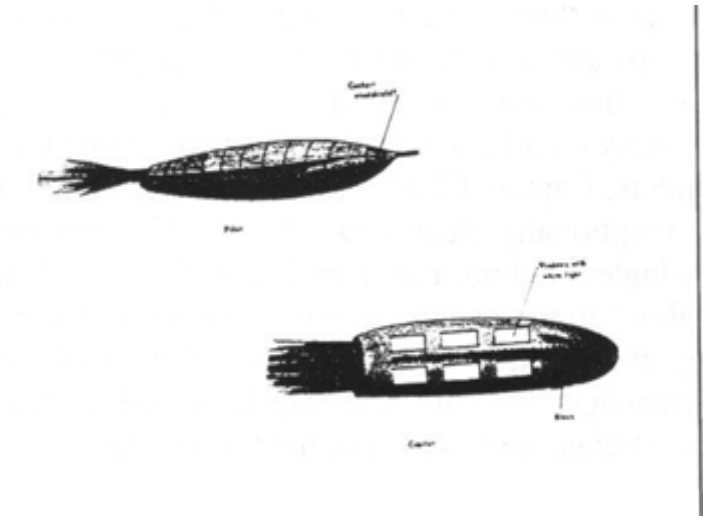
After Peoples and the original observers in the Holloman incident were later interviewed at Watson Labs, investigators became personally convinced that they had seen something that flew "faster than any known object." Sign logged this case as the first of only seven unidentified sightings for 1948. Still very conservative with that designation, even incidents like the flying wing report from the Philippines did not make the unidentified list. This shows that even the biased Sign team gave out unidentified ratings very sparingly and despite modern day claims were not so obsessed by the extraterrestrial hypothesis as to have it affect their objectivity.

The fourth and most important event that shaped Sign's position came on July 24th when Eastern Airlines DC-3 Flight 576 took evasive action at 2:45 A.M. EST to avoid an air-to-air collision with a UFO! The frightened crew were at 5,000 feet and 20 miles southwest of Montgomery, Alabama, when the unknown flashed out of the northeast. It came as close as 700 feet to the right of their aircraft at a speed of at least 800 miles per hour but produced no propwash as a meteor might be expected to cause. The object then pulled up and flew into some light, broken clouds at 6,000 feet. But barring those patchy clouds, it was a bright moonlit night. In fact, it was so clear that the pilots, Captain Clarence S. Chiles and First Officer John B. Whitted, had an exceptionally clear view of the UFO. They described it as a 100 foot long, wingless cylindrical-shaped object. The craft appeared to have a "deep blue glow" to the underside, with "two rows of windows from which bright lights

glowed" and a "50 foot trail of orange red flame" shooting out the back. One passenger on board, Clarence L. McKelvie, saw the object and described it as a "strange, eerie streak of light, very intense." [12]

Quickly becoming well-publicized, the now famous Chiles-Whitted Sighting remains one of the most notable of all UFO cases. In fact, right after the Eastern flight landed, the pilots reported their incident to the airline manager. Eastern then released the details of the spectacular event to newspapers that day. From there the story hit the national news, generating sensational headlines. These news accounts also reached the Pentagon and the new Intelligence Chief Major General Charles P. Cabell. Cabell had Dayton on the phone immediately, ordering Colonel McCoy to initiate a prompt investigation. By the afternoon of the 25th McCoy had Alfred Loedding, Albert Deyarmond, and Major Raymond Llewellyn on an Air Force plane headed to Atlanta. Losing no time, the Sign team quickly had Chiles and Whitted under interrogation on the 26th at the Henry Grudy Hotel. Loedding and Deyarmond questioned the pilots over and over and became impressed by the consistency of their accounts. Loedding and Deyarmond also became impressed by the military service of Chiles and Whitted and in particular Chiles' outstanding record in commercial aviation. In the meantime Llewellyn tracked down the lone passenger who had also seen the object. He had not actually been able to observe much, only commenting on the object's bright red-orange exhaust. A preliminary report was then sent to the Pentagon, and the team returned to Dayton more convinced than ever that something beyond human origin had been responsible for this and other incidents.

That is somewhat ironic because for whatever reason, the "pro-saucer" Sign staff told the pilots that the incident resulted from a rare astronomical event known as a fireball. Chiles and Whitted, however, refused to accept the explanation and both pilots went public, maintaining that they had seen a manufactured craft of some sort.



These sketches depict the UFO seen by Chiles and Whitted. It is significant to note that as the years went by the Chiles-Whitted Sighting remained an impressive case in the eyes of researchers. One of the foremost UFO investigators of all time, Dr. James McDonald, interviewed both of the pilots in the 1960s and stated that he became convinced of the fact that they saw clearly defined openings or windows on the craft that buzzed their plane that night. No one in fact ever doubted the credibility of Chiles or Whitted. Both men,

for example, were described as "utterly reliable" by famed pilot and Eastern Airlines president, Captain Eddie Rickenbacker.

Edward Ruppelt states in his memoirs that regardless of what that crew saw, the Sign officers were becoming convinced that UFOs were "interplanetary" in origin. Captain Sneider seemed to be another key advocate of that proposal. Sneider even attached a one-page report to the Chiles-Whitted file in which he argued that a wingless rocket-shaped object could be aerodynamically feasible. Sneider stated: "That this development is possibly of foreign origin would seem to be a logical premise." That seems to be the real significance of the Chiles-Whitted case because by "foreign origin," Sneider meant outer space! His influence would soon lead to the drafting of a dramatic and formal report by Sign staff that would force the Pentagon to take a stand on the subject one way or the other.[13]

Chiles and Whitted after their famous UFO sighting.

After the Chiles-Whitted Sighting, TID's Sign team sponsored, apparently under Loedding's sole authorship, a classified top secret document for inter-service distribution which traced the history of UFO investigations all the way back to the ghost rocket sightings of 1946. Like all such military evaluations involving a study up to a specific point in time, it received the term "estimate of the situation." The document has now become famous for the term. According to Ruppelt, this Estimate of the Situation reached a dramatic conclusion, stating that many of the UFO sightings investigated by Project Sign may be "interplanetary" in origin. Although the most startling part of the report advocated that the military should be put on an "alert footing" in the wake of the unexplainable sightings.[14] (That UFO alert was actually issued that fall by the Pentagon.) [15]

Needless to say the report drew considerable attention as it went up through the chain of command and passed by Air Force scientific advisors—all the way to Chief of Staff, General Hoyt Vandenberg.

Vandenberg, however, refused to have it distributed due to what he saw as a lack of any physical evidence to support their conclusion. He and other top brass were just not ready to go on record with such a fantastic position without hard proof—physical proof. And that was the one thing no Sign officer could provide no matter how hard he wished he could. Correspondence of this time shows Pentagon officials were also mindful of the panic caused by the radio broadcast The War of the Worlds on October 30, 1938. [16]

Because of the panic generated from that incident, no general would have wanted to answer to the President if an Air Force press release about UFOs had led to a similar disaster. Vandenberg, a decorated commander from WW II and a career military officer, intended to focus all of his efforts on organizing and building up the image of the new USAF. Even if UFOs were from another planet, Estimate conceded that they could not prove a direct threat to national security, and thus the Pentagon chose a wait and see attitude. [17]

Unfortunately, Vandenberg's official lack of interest in TID's Estimate led to low morale among Project Sign staff. Despite a trip to the Pentagon by Sign team members Lawrence Truettner, Albert Deyarmond, and Alfred Loedding to lobby for Estimate, the Pentagon refused to be swayed into sanctioning the document.[18] No matter the significance of their conclusion, Sign could not share their opinions outside TID.[19]

Only a handful of the thick, black-covered, legal-sized Estimate reports were ever reproduced, and those were soon ordered burned. A few copies apparently survived up until 1951 when Ruppelt reviewed the intelligence files. He claimed that by that time the report had been declassified, but this is unlikely when one considers its conclusions and the fact that no copy of

Estimate has ever surfaced. But, Ruppelt did claim to see the document with his own eyes. If any copies of Estimate survived beyond that point, they probably were taken as souvenirs along with some other early files known to have met that fate. Today they may very well be collecting dust in someone's attic. Some researchers erroneously claim that Air Intelligence Report Number 100-203-79, "Analysis of Flying Object Incidents in the United States," a joint study by the USAF Directorate of Intelligence (DI) and the Office of Naval Intelligence (ONI) approved on December 10, 1948, and declassified in March 5, 1985, is a modified version of Estimate. [20] Although the Navy sent a letter to the USAF in January of 1948 desiring to assist in the analysis of UFOs, their subsequent joint study superseded Estimate which was only an estimate of the situation up to the time that Sign submitted it. [21]

Nevertheless, Air Intelligence Report Number 100-203-79 is an amazing document in its own right. It is so notable because its main conclusion suggested that a number of UFO events had a high probability of being the result of Soviet activity. In fact, a later Blue Book officer, Dewey Fournet, urged that this document be kept classified because even in 1952 he and others (although open-minded to an extraterrestrial explanation) still felt that the Soviets may be responsible for many of the incidents. [22] This is of such significance because today, with the opening-up of former Soviet records, historians now know that the USSR never flew spy missions over the United States with aircraft or guided missiles.

Dewey Fournet also made the statement that somewhere in the files awaiting declassification is a copy of Sign's Estimate. (He actually had a chance to see it as he did 100-203-79.) [23] It could be true. The National Archives has a nightmarish amount of former military files, some of which are no longer classified, but whose content has literally been lost because they are buried in virtual mountains of document clutter. Anyone who has ever waited at any one of the National Archives'

facilities will attest that it can take hours just to have the material in the catalog tracked down.

Who knows what is lost in that vast government paper shuffle not to mention the material still classified? So many government documents have accumulated that some 100 million are still awaiting declassification from WWI alone. Others predating just 1960 number over a billion pages of material. Even making a brief study of these could take teams of researchers a lifetime.

Although Dr. Hynek confirmed in the 1970s that Estimate did exist as Ruppelt and Fournet claimed, Ruppelt's book is the only first hand account we have of the draft and merely teases us with a few of its points. [24] One interesting passage suggests that the Air Force had an interest in UFOs before 1947 and that the English had actually tracked some of the "Ghost Rockets" in 1946 on radar. [25] If so, this would contradict the Air Force's consistent refusal to this very day to recognize the phenomena's existence before June 24, 1947.

Donald Loedding clearly remembers the controversy surrounding the rejection of his father's "Estimate of the Situation" draft to General Vandenberg and the resulting deep disappointment by his father. Donald had the impression that Alfred Loedding, who had been a rising star at Wright Field, officially fell from favor as a result of his personal belief that many of the flying disc sightings could represent craft of extraterrestrial origin. When he personally authored that carefully reached conclusion in the "Estimate" draft, Loedding severely hurt his career.

Researchers know that with the end of 1948 a drastic change took place in Project Sign. The great sense of importance that the Pentagon had previously bestowed on the project suddenly ceased. Dropped almost overnight, it happened in the midst of one of the most unsettling series of UFO sightings over American military bases then to date. By mid-1949 the leaders of the project like Sneider and Loedding would be ousted and, barring a period in the early 1950s, the AMC staff would never again openly talk about the origin of UFOs. Perhaps the extreme conclusions of the Estimate draft and the summary of the Project Sign final report (drawn up in late 1948 by Truettner and Deyarmond, and finished in February 1949) became just too much for the Pentagon to handle. Titled Unidentified Aerial Objects—Project Sign, a great deal can be interpreted by reading between the lines of the passages of that final report.

Even the introductory passages are important because they use some very interesting phrases. In the Foreword, for example, the Rand study is mentioned along with the intent to explore the possibility that some observed

objects may represent "spaceships" or "satellite vehicles." (On July 21st the Pentagon had ordered a study to be made by the Rand Corporation to evaluate that possibility.) [26] This is stunning terminology regarding the Rand study because everyone who would have then read that report knew full well that not only did the United States not possess anything that could attain earth orbit, neither did the Soviets. In fact, it would be nine years before such an event occurred with Sputnik—considered much ahead of its time then.

The Introduction of the Sign final report has another intriguing passage. In the second paragraph it clearly states that this report is not a final estimate of the situation. This may very well have been a

way of stating that the Sign report was not able to draw the conclusions it did in Loedding's Estimate of the situation.

Another sentence in the final report also seems to draw something from the earlier Estimate report when it speaks of assessing the possibility of a threat to national security presented by "such large numbers of unidentified flying objects." In the original Estimate report, Dr. Hynek confirmed that the Sign team called for an official UFO alert to be proclaimed—somewhat as was actually issued late that fall. Therefore, although the Pentagon always outwardly ignored the UFO situation by stating that no threat was presented to national security—the fear was clearly there.

Aside from that, the sentence is also of note because for the first time the term unidentified flying object is used. The summary again uses that phrase and speaks of The Books of Charles Fort, which was one of the first works detailing unusual aerial phenomena in earlier times. This is significant because officially the Air Force has always refused to recognize the UFO phenomenon before June of 1947. One wonders how much discussion of this was present in the Estimate draft.

Many more pages follow the introductory pages, including an appendix by James E. Lipp of the Rand Corporation that contained the conclusions of their contracted study. It actually considered the possibility that UFOs could originate from either Venus or Mars. (Prior to NASA's planetary probes in the 1960s and '70s even reputable scientists openly considered without ridicule the possibility that civilizations could exist in our own solar system.) Travel from other star systems, however, was considered improbable even then because Lipp's report stated that "the actions attributed to the 'flying objects' reported during 1947 and 1948 seem inconsistent with space travel [because of the vast distances between stars]."

The report was released only to specific government and military offices as the ominous end of Sign came when the Air Force changed the

name of Project Sign to Project Grudge at the request of the Director of Research and Development. Officially indexed as the "Detailed Study of Flying Discs," Grudge marked a sudden attitude change in UFO investigations. That revised project began in 1949 by building a public relations campaign to downplay UFO sightings. [27]

At the same time the elite of the TID intelligence officers, almost all of which had gravitated to Project Sign, were on their way out. Ruppelt wrote that many in intelligence "drastically and hurriedly changed their minds about UFOs when they thought the Pentagon was no longer sympathetic to the UFO cause." He stated that others who had not changed their minds were "purged." Other officers who had even briefly considered the extraterrestrial hypothesis eventually found themselves replaced by new personnel. The Pentagon used Grudge to "put an end to UFO reports" by explaining every sighting and telling the public just how the Air Force used expert investigation methods to reach their conclusions. This sudden change in policy was so pronounced that Ruppelt wondered if there was not some hidden reason behind it. He wrote of an underlying feeling he had when taking over UFO investigations in 1951:

> **This period of mind changing bothered me. Here were people deciding that there was nothing to this UFO business right at a time when the reports seemed to be getting better—maybe I was just playing the front man to a big cover-up. I didn't like it because if somebody above me knew that UFOs were really spacecraft, I could make a big fool out of myself if the truth came out" [28]**

Dr. Hynek also spoke of that period in his writings. He described this change at TID as occurring virtually overnight. Donald Loedding confirms that Alfred Loedding was "fired" from Project Sign

by 1949 as a result of his position. Although he did remain in Dayton doing work for the Air Force until 1951, the pressure continued.

Donald feels that officials at AMC attempted to "phase his father out" as is often done in the corporate world. Records do show, in fact, that Alfred Loedding's efficiency rating reports went from excellent in 1948 to lower and lower grades until he resigned on February 16th, 1951. At that time Loedding secured a job as director of jet research at Unexcelled Chemical Corporation in Cranbury, New Jersey. After Vandenberg's death in 1954, Alfred Loedding once again found the Air Force interested in his skills. In 1955 Loedding returned to Dayton and Wright-Patterson AFB. By 1960 he was working out of Langley AFB in Virginia as the Air Force's liaison officer to NASA. The records indicate that he served only as a civilian consultant in that role, but the

implication posed by his family is that there may have been a connection with CIA headquarters at Langley. But from 1951 until his death in 1963, Loedding, according to Donald, never again worked on or talked about UFOs—so deep was his disappointment and disgust with being "fired" from Project Sign for his views.

Alfred C. Loedding was of strong German descent, ingrained with a high moral work ethic and dedication to family and country—the United States of America. When Loedding helped draft the Sign position on the extraterrestrial thesis, he did so with great thought and devotion. Vandenberg's rebuff severely hurt Loedding's pride. Also professionally injured at the time by his views, Loedding never again became involved in UFO research. Another man may have compromised his stand, especially when it clearly affected his career for the worse. But Loedding was too dedicated and true to himself to be a "yes man." Thus, the worst that can be said about Alfred Loedding is that he was not a diplomat as later Blue Book notables Edward Ruppelt and Robert Friend were. As a result, Loedding's time in ufology was brief but very notable.29

This Headquarters has also requested the cooperation of the Departments of the Army and the Navy, and the Coast Guard, in instructing their installations along the same lines."

16. It is interesting to note that at the height of the UFO wave in the summer of 1947, Welles made a very amusing statement to the press:

> Orson Welles said today he'd bet 10 to one that the "flying saucers" will fizzle into fancy just like his "invasion from Mars" broadcast that fooled the nation in 1938.
>
> "I want everybody to know that I didn't have anything to do with this saucer hoax," though. He added, "I scared the shirts off Americans once. That was enough."
>
> The actor-producer-director-writer, currently filming 'Macbeth,' pointed out that during his famed radio dramatization many Americans reported seeing space ships landing. Others claimed they saw armies of Martians.
>
> "People are imaginative and gullible," said Welles. "Nine years ago they believed they saw Martians and now they see strange objects in the sky and think they're flying saucers."
>
> "But in case they do turn out to be from Mars," he grinned, "I've been predicting that sort of thing for a long time."—Toronto, Canada, Daily Tribune, 8 July 1947.

21. Thanks here goes to Jan L. Aldrich's expertise in the analysis of declassified documents. He convincingly suggests that because the USAF Directorate of Intelligence is superior in authority to TID and Sign, that their jointly sponsored study with the Navy simply superseded Estimate. Thus Air Intelligence Report No. 100-203-79, is not a "ghost version of Estimate" as suggested by other researchers but a uniquely different document.

Final Word

There are a number of other very interesting sightings that shed more light on the aftermath of the great UFO wave of 1947 and Alfred Loedding's influence on Project Sign. Two very intriguing reports from July 29th and 31st 1948 seem to support Loedding's dramatic findings expressed in the Estimate draft. They come from Indianapolis, Indiana, and remain listed unidentified in Air Force files. The first sighting took place at 9:55 A.M. CST on the 29th when James Toney and Robert Huggins were driving near the wooded area of Fall Creek. Just after crossing the creek via a cantilever bridge, they neared the intersection of East 56th Street and Fall Creek Boulevard. At that point Toney and Huggins observed a strange looking flying machine pass about 200 feet from them.

It appeared to be of shiny aluminum construction moving at a slow speed of not more than 30 miles per hour as it flew about 30 feet above the tree tops. The craft did not resemble anything the men had ever seen in the skies before, looking like a "broad short propeller" or boomerang with "cups" on its upper sides. The object had a three to one ratio, approximately six to eight feet long by about two feet high. The strange machine made no noise as it then passed out of sight over the tree line.

Sign extensively investigated the case with the initial field work being supervised by Colonel James A. Ronin, commander of the 331st AFB reserve training unit at Stout Field near Indianapolis. They quickly determined it could not have been a glider or aircraft. TID officers even wrote to the General Electric Company in Schenectady, New York, in the belief it might have been the result of their roto-chute experimental vehicle, but found that it had never flown in that area of the country.

When a very similar sighting took place in the city two days later, intelligence officers became even more interested. Mr. & Mrs. Vernon Swigert in the south central part of town witnessed this second event. The object they saw flew over at 8:25 A.M.. on the 31st. It appeared white and had the same general three to one proportional shape as in the earlier sighting. Yet that object looked much more like the traditional flying saucer. This unknown craft resembled a "cymbal," and moved silently by at very great speed. The two observers felt it may have traveled as fast as 1,800 miles per hour at a height of 2,000 feet. At no time did it deviate from a level flight path and left

no exhaust trail. [1]

Because no other aircraft or balloons of any sort could be found to explain the Indianapolis Sightings, they were both marked unidentified. [2] Already self-conscious about having no proof to back up their Estimate conclusions, Sign officials like Loedding went to great lengths to continue to run a very tight and professional investigation throughout the rest of the year. Unidentified listings were therefore still sparingly given.

By August UFO incidents in the US, like those from Indianapolis, seemed to have peaked for the year just as rumors of disc sightings started to filter out of Eastern Block countries and the far reaches of Asia. Most were strikingly similar to the disc reports in North America during 1947. Many of these, in fact, came from areas of the globe where the term "flying saucer" had never been heard. [3]

Few of those foreign reports were evaluated by Sign, but an interesting sighting from August 3, 1948, reached AMC's TID from, of all places, Moscow. This fact is significant because although a rash of UFO incidents occurred over Russia that year, it was also the high point of the Berlin Airlift. Tensions between East and West were so strong that many expected a third world war might soon break out. Reports on UFO activity behind the Iron Curtain were therefore few and far between—accounts of which are only now becoming known.

Thus somewhat of a curiosity among early intelligence personnel, primarily for its Cold War era location, this case is known as the Moscow Report. The file did not really represent an especially good account, being compiled only from the recollection of an undisclosed American newspaper reporter. His sighting took place about twenty miles northwest of the city at sunset when he and a Russian friend viewed a long narrow cigar-shaped object proceeding at a high but not excessive speed toward the northeast. No wings or stabilizers were visible likening it to an aircraft or rocket, although the sunlight reflecting off its surface did suggest that the craft had a metal skin. The reporter and his acquaintance both watched the spectacle as it passed by without making a sound. They agreed that the object looked like a rigid airship, so familiar to anyone who had lived through the great age of the large dirigibles in the 1920s and 1930s. Yet both also said it moved far too fast for a lighter-than-air craft. Neither had any idea what the strange object could have been, "it might

have been anything the reporter himself

concludes." [4] Because the Air Force had no way to investigate such a sighting, this is the type of report often filed under the handy category: "insufficient data."

Another type of classification used in the Air Force files reads "unreliable." Unreliable became the conclusion of case number 198 because its witnesses were children. Case 198 is however a notable mystery in the Sign files. Not only is it one of very few reports describing a UFO landing, but also the size of the file seems unwarranted when taking into account that the unreliable designation was given early on in the investigation. Experience will tell any researcher that when so many pages are found on an Air Force UFO case, strong attention was given to it by someone.

The incident involves two children ages ten and eight. They were playing in their backyard on a Hamel, Minnesota, farm on August 11, 1948, when they had their attention drawn skyward. Above them in the noontime sky the children noticed a dull gray metallic craft descending downward. Each of them described it as two inverted plates stuck together which, in their words, then gently touched down with a "clanking noise." It soon started making a whistling noise and rose up to twenty feet, stopped and hovered, and then maneuvered over the tree tops and telephone lines before flying off.

The first investigator on the scene was from the AMC and his immediate conclusion stated: "This apparent bit of fantasy is hardly worth further consideration." [5] Such a designation, especially after funds were expended for travel out of Dayton, always killed further investigation then and there. But despite that early conclusion, a large amount of attention was soon displayed on the case as evidenced from the correspondence. Soil samples were collected and photos taken documenting the landing sight. Numerous government agencies including the FBI then requested access to the samples. Usually only lieutenants and maybe a captain are involved in such an investigation, but correspondence in the files shows a Lieutenant Colonel Allison initiating a "resurvey" of the landing sight. This would seem to indicate that at some point the initial investigation was overruled and a more detailed study ordered. Who decided such a sighting with only children as observers warranted so much attention? Why did the FBI end up analyzing the soil samples and not Wright-Patterson labs? Why does the FBI correspondence show J. Edgar Hoover personally involved in the administration of the soil analysis? [6] Case 198 has plenty of questions to go around.

A sighting from September 23rd that year from San Pablo, California,

stumped Air Force investigators sufficiently to label the case "unidentified." It involved two highly respected witnesses, Sylvester Bentham and retired US Army Colonel Horace Eakins, who spotted a very odd-looking flying object around noon. Initially it attracted their attention not because of its amoeba-like shape, but speed—described once again as faster than that of any known aircraft. For over three minutes the attentive observers watched it traverse due east in a straight line at a constant speed. They estimated that the object had to have been at least a mile above a low flying bomber then in view. The men, in fact, could not agree on the exact shape or dimension because it was so high. They did note that unlike the early jets of the time, it made no noise and left no exhaust. The Air Force ruled out an astronomical cause. They could only find a west-bound United Airlines plane

as a possible solution yet felt this was highly unlikely because it would have been moving in the opposite direction. [7]

A much more well-known case became the third of the UFO Classics when North Dakota Air National Guard F-51 pilot George F. German had a very strange encounter while he attempted a nighttime landing into the Fargo airport at 9:00 P.M. CST, October 1, 1948. German had just completed a crosscountry flight when on final approach his fighter passed within 1,000 yards of a sharply outlined orb. Described as a "blinking light" just inches in diameter and making "remarkable revolutions," the experienced flyer had no idea what to make of it. German pursued the light repeatedly in order to identify, but after 27 minutes the object climbed out of sight.

Because of a hair-raising series of intricate maneuvers made during that intercept, this case has often been referred to as the German Dogfight. It's an apt title because during each of his persistent passes toward the light, the object rushed straight at the F-51. And each time German tried to turn around and pursue, he found it necessary to make an extensive series of turns, only to end up repeating the same scenario all over again. During the ordeal the light appeared to travel in excess of his own speed which ranged from 300 to 400 miles per hour yet produced no exhaust trail nor sound. [8]

Four other observers, including two pilots in a Piper Cub flying just below him, corroborated Gorman's story. The chief of the control tower also followed the event with binoculars. In fact, it was because the extraordinary encounter had so many good witnesses that the Air Force followed up with an extensive investigation. Sign/TID investigators Lawrence Truettner and Major Paul Lmbela flew to Fargo and headed up the case. Eyewitness accounts were checked and rechecked, and the plane itself was thoroughly gone over. Surprisingly, the aircraft's metal skin revealed radioactive exposure. To make sure, four separate Geigers were used to confirm the readings.

It did sound like an exceptional incident at the time, but the facts soon pointed to some rather obvious solutions. The evidence suggested that the mysterious nocturnal orb might have merely been a small lighted weather balloon. Following other such incidents over the Caribbean, Intelligence found that when an aircraft approaches a lighted balloon at night, even an experienced pilot can have his perspective distorted. The balloon, in other words, appears to rush toward the plane when actually it is the plane rushing toward the balloon. Because the balloon is moving so slowly, it is the aircraft that then makes the evasive action. When the aircraft attempts another pass, it has to make a complete 180 degree turn only to find itself rushing once again by the balloon so fast that the pilot can not identify it. Another lesson bestowed on general aviation from this would-be UFO case concerned the mysterious radiation. After further study, TID investigators discovered that any aircraft flying at high altitudes in the thin upper atmosphere is prone to absorb cosmic radioactivity. [9]

This incident is now a standard in UFO lore. This is puzzling because correspondence of the time shows Alfred Loedding, the most open minded to an extraterrestrial hypothesis, writing a memo expressing caution in regard to over emphasizing the Gorman incident. Such insights were not, however, made public and over the years much speculation has circulated in regard to this sighting.

This is unfortunate because debunkers often seize on these sensationalized stories. When discussing the early history of UFO phenomena, they almost exclusively focus on classics like the Gorman Dogfight or the Mantel Incident. That's natural because those are the easy ones to explain. Most debunkers never even bother to research, let alone discuss, the other sightings of the time. As a result, people are lead to believe that all of the early cases have equally reasonable conclusions.

When putting the event into historical perspective one understands this mind set. It must be

remembered that even by this date the Air Force had not yet released any kind of official report on UFOs and as a whole still hesitated to take a position. Most of their investigations, even of such publicized incidents, were stamped "RESTRICTED" or "SECRET" and could not be disseminated to the general public until declassified. When the Blue Book Files were finally made public in 1976, few people bothered to research other cases from these early years—being so infatuated with the legends like the Gorman incident.

While the Gorman Case has been discussed in almost every book published on UFOs, a much better sighting twelve days later has never been dealt with. It took place in South Bend, Indiana, on a clear and cloudless day

at 11:45 A.M. CST when two office workers standing at a window of the Studebaker Corporation observed a silvery flat disc-shaped object speed silently through the sky at around 1,500 feet. The UFO appeared just a little smaller than a DC-3, although it moved about three times as fast.

Both witnesses were uncertain if the craft was spinning. They used the description "flashing" because the sun's rays reflected from it just as brightly as it would a chrome surface, thus at least giving the appearance of a rotating machine. During the brief eight to ten second sighting, the object came from the northwest on a straight southeasterly heading. It flew with no visible means of propulsion, wings or rudders. Neither observer had any idea of what they saw, but felt certain it could not have been a balloon or aircraft. Both office workers held important positions in the company's engineering department and were described by Studebaker management as being of "a high type of caliber," and highly reliable. [10]

It is the mass of this and many other obscure cases rather than just the three famous Classics that led Sign to its developing belief in extraterrestrial visitation. Loedding, Sneider, Truettner, and even Deyarmond had to have been impressed by the repeated similarities of reported details among these many cases—especially when most of them were not known to the general public. [11]

The single best sighting of 1948 and perhaps the best case then to date is also overlooked, or perhaps overshadowed, by the so-called Classics. It was the first truly notable incident in which radar data combined with trained visual observation to produce a stunning UFO case. The initial report came into TID from Japan and involved a twin engine F-61 Black Widow night fighter from the 68th Fighter Squadron. While on patrol the night of October 15, 1948, its crew had a very curious encounter at 11:05 P.M. local time.

The incident occurred over the Fukuoka area between the islands of Shigamo Shima and Fusae Shima on a clear and moonlit night when the F-61's radar detected an unknown object five miles away and below them at 2,305 feet. At the time of detection, radar clocked the UFO at a speed of 200 miles per hour. Curious as to what could be flying over a then occupied Japan, the pilot increased his speed to 220 miles per hour, deciding to close in for a visual confirmation. He guessed it would probably turn out to be an F-51 Mustang fighter from another squadron but decided they could use the practice anyhow. He nosed down and approached within 12,000 feet of the would-be fighter but the unknown target then surprised him. It suddenly dived down under his F-61 in a "split S" maneuver, making a 180 degree turn and increasing its speed to over 1,200 miles per hour (almost three times their own

speed). The UFO's burst of power appeared only temporary because the object soon slowed to its original velocity. By that point, however, both the pilot and his radar operator knew that their target could not possibly be an F-51, but they decided to try to find out just what it was that they were chasing.

Attempting another intercept, the pilot again closed to a relatively close distance merely to have the UFO go down and off at tremendous speed, slowing only after putting about nine miles distance from their aircraft. Four more times the same scenario took place as if the strange machine was playing a game with them. Ground radar could not confirm the presence of the UFO, although it tracked the F-61. Operators did say that because the incident occurred at such a relatively low altitude, ground clutter interfered with surface-to-air tracking.

Similar UFO intercepts would follow, yet this case stands out because the crew twice gained visual confirmation, thus excluding any possibility of a radar malfunction. The aircraft's radar operator, 2nd Lieutenant Barton Halter, had 300 hours logged in his position and became convinced they had encountered some new type of experimental aircraft. The pilot, 1st Lieutenant Oliver Hemphill, had 900 hours flying time with 350 of those in combat in a B-17 over Europe. He stated that the UFO behaved much like the ME-163 German rocket planes did when attacking our bomber formations. But Hemphill stressed it did not look like a ME-163 nor any aircraft he had ever seen.

In the Sign files there are pages and pages of reports and even a drawing of the object as seen by the pilot. The general description likened it to a "rifle bullet," about 20 to 30 feet long with no discernible exhaust trail, flames, power plant, wings, stabilizers, fins, or crew canopy. Yet the UFO must have been real because Hemphill noted at one point that its silhouette was projected on the clouds by the full moon. In the investigation that followed, it was firmly established that there were no other aircraft then in the area. Intelligence officers also learned that the weather conditions were good with five to six miles visibility, but that even with the moon there would not have been enough light for visual sightings at any great distance.

Everyone at TID very much wanted to know what the F-61 crew saw that night in the dark skies over Japan, but no clues could be found. The case went down as the first unidentified in a special category called "radar-visual." [12] A few Intelligence personnel, however, felt the October 15th incident over Japan could have represented an attempted intercept of a Soviet spy plane. It has only recently been discovered that Britain would soon fly nighttime reconnaissance missions over Russia, and America had overflights of Siberia as early as 1946 by way of the North Pole. The USAF also made

incursions into the eastern borders of the USSR throughout 1949. By 1956 the CIA would direct hundreds of deep penetration missions into Soviet territory with the famous U-2 spy plane. Some thought all along that the flying saucer reports were attributable to the Soviets conducting the same type of surveillance that we were doing to them, but only a few Project Sign cases seem to substantiate the claim. Following is a good example of a report from November 4, 1948, that obviously represents a foreign spy plane:

> **Unidentified aircraft observed at 1043 14 Nov [sic] 1948 over Army Observation Post #1 at 37O 57'N-125O 31'E, in South Korea, flying east to west at an altitude of 5000 feet. The same aircraft was sighted by army observation post #2 37O 51' N-125O 17' E, 4, 37O 57' N-125O 26' E and 5, 37O 56' N-125O 29'. Subject**

aircraft circled observation post number 2, then headed north. Aircraft was twin engine bomber type, and is believed definitely to have been Soviet. [13]

A second good radar-visual report followed the October 15th case. This time it occurred on the other side of the world in Germany and involved an experienced F-80 jet pilot of the 23rd Fighter Squadron stationed at the Furstenfeldbruck AFB. While out walking on the night of November 23rd, the Air Force captain observed from his base a reddish starlike object as it was simultaneously detected by ground radar. The crew in the radar station judged it to be at 27,000 feet traveling between 200-500 miles per hour. It then climbed to 40,000 feet and circled 40 miles south of Munich. [14]

Those are the basic facts present today in the Sign files, but when Edward Ruppelt described this incident in his 1956 book, he stated that radar had tracked the object at speeds up to 900 miles per hour and that they detected it climbing 23,000 feet in a matter of seconds! Those figures are not in the documents released by the National Archives in 1976. Though anyone who has read Ruppelt and has checked his facts with other files, knows that he was a stickler for details. This could not have been a simple mistake. What reports did he see that are no longer detailed in the declassified files? [15] If his facts are correct, it is a stunning admission because no man-made aircraft in 1948 could match that performance.

Another mysterious nocturnal phenomenon known as Green Fireballs appeared in the New Mexico night skies during that November and December—seen by hundreds of witnesses up through 1949. After investigations by Project Sign and noted scientists like Dr. Edward Teller and meteorite expert Dr. Lincoln La Paz, (who himself had observed these lights) no conclusions were reached. La Paz, who had a UFO sighting in 1947,

became convinced they were not identifiable as a known astronomical activity. [16]

The more La Paz studied the phenomenon the more he could be certain that they were not meteors. Unlike meteors, the fireballs flew nearly horizontal at about 40,000 to 60,000 feet. And whereas almost all meteor impacts can be discovered from projecting their observed trajectory, no green fireball could ever be found to have hit the earth.

La Paz even concluded that the green fireballs were surely artificial objects and perhaps represented radio-controlled missiles. If true, they were not of domestic origin because the United States military didn't have a clue when the fireballs began to fly over the super-secret Sandia lab at Kirtland AFB in New Mexico where America's atomic weapons were being built. Then the Hanford nuclear facility in Washington State had a sighting as well as the Los Alamos, New Mexico, nuclear research laboratory. Since these were the three most vital facilities to nuclear weapons production in the country, their administrators became frantic for answers and the Air Force was the organization expected to provide them. [17]

The USAF subsequently created a special study called Project Twinkle to investigate this new spin on the UFO phenomenon. It finally became a research project under the Geophysics Research Division of the Air Force and ! the Cambridge Research Laboratory in February of 1950, more than a year after the largest number of sightings had taken place. Dr. Louis Elterman served as a central figure in the project. He contracted with the Land Air Co. to provide technical personnel during a scheduled period from April 1 to October 1, 1950, and from October 1, 1950, to March 31, 1951. But with the start of war in Korea on June 25, 1950, the project wound down. In the summer of 1951 Major Edward A. Doty took control, and by December Twinkle had closed down. [18]

Ruppelt claims that Twinkle was administratively formed earlier, in the late summer of 1949, when the green fireballs were still frequently being reported. [19] Twinkle then decided its best chance to document the phenomena would be through the use of three special cinetheodolite (Askania) cameras. A cinetheodolite was basically a theodolite range finder with a movie camera attached. The trick with such a device is to get at least two or more cinetheodolites triangulated on the same object in order to determine altitude, speed and size. The Air Force, of course, with typical military bureaucracy initially allocated only one cinetheodolite to Twinkle and frequently moved it

so often to where sightings had already just occurred that no one area was consistently scanned.

Dr. Elterman's final report on Twinkle in November 1951 stated in scientific terms what Ruppelt had said about the study: "Project Twinkle was a bust." [20] No triangulation was ever achieved, although on April 27, 1950, four objects 30 feet in diameter were recorded by a Twinkle team at 150,000 feet over Holloman AFB traveling at high speed. [21]

The real question, however, is why did Project Sign not come into the investigation of the new UFO phenomena in a more meaningful way. In fact, some of the most spectacular reports of that or any other year would occur in the very last quarter of 1948. Yet right in the middle of this unsettling rash of events, Sign found itself increasingly ignored and underutilized by the Pentagon. Green fireballs were actually but a small offshoot of this new and larger phenomena which involved varying types of nocturnal lights appearing over a whole host of military installations. Not all of the cases seem to be in the files, but it is apparent from the available records that a great deal of concern arose with no guesses as to what could be causing the events.
