The following was classified as a "loon" posting.

However about 7 years ago one of our computer techs. was on a flight
somewhere and he found himself sitting next to a computer engineer who
worked for the military.

They started talking shop - hard drives etc., and the military guy
volunteered that they were already using a hard drive that was essentially
biological.

It had a terrabyte capacity, was cube shaped, and would easily fit in the
palm of your hand.

Apparently it was packed with microbes (or some such) that would all align
in one direction when hit with a laser from one side, and then align in the
opposite direction with a laser stimulation from a different side. Thus
eliminating the need for magnetic devices.

True story, and at least 7 years old.

Tony Craddock

        "Intel using captured alien technology to build a revolutionary
          processor"
        Area 51, Nellis AFB, Nevada
        By Jim Brooks
        June 6, 1997, 5:55 p.m. PST

        Documents declassified by the Freedom of Information Act that
        was passed by Congress, and supporting testimony from Bob Lazar,
        have revealed that Intel Corporation has spent the last
        several years examining alien technology and has now been able
        to use it build a microprocessor that is considered to be
        several centuries ahead of its time.
