Subject: Re: Orange Globes

There may be an easy explanation for the orange globes that are regularly being seen. Last night (3/17) on the Discovery channels show Sci-Trek (Sci-Tek?) they had a show on called "Earth Lights" that documented these type of lights all over the world for a very long time.

They are almost always associated with a seismic fault and are usually the precursor to an earthquake (up to several years in advance). The earths electro-magnetic field rises up to 1,000 times normal during these occurences. They have observed many balls of different color and size with random movement sometimes splitting or elongating.

I was distracted several times during the show and missed many of the details. When it is shown again it should be watched by those having seen this phenomena. They offer substantial scientific data and evidence to back up this terrestrial event.

Definitely something I'd like to see.

Flares???? NOT!

Grant
